 **Check Point 6** Verify the identity:  $\frac{\cos x}{1 + \sin x} = \frac{1 - \sin x}{\cos x}$ .

**EXAMPLE 7** Changing to Sines and Cosines to Verify an Identity

Verify the identity:  $\frac{\tan x - \sin(-x)}{1 + \cos x} = \tan x$ .

**SOLUTION**

We begin with the left side. Our goal is to obtain  $\tan x$ , the expression on the right.

$$\frac{\tan x - \sin(-x)}{1 + \cos x} = \frac{\tan x - (-\sin x)}{1 + \cos x} \quad \text{The sine function is odd: } \sin(-x) = -\sin x.$$

$$= \frac{\tan x + \sin x}{1 + \cos x} \quad \text{Simplify.}$$

$$= \frac{\frac{\sin x}{\cos x} + \sin x}{1 + \cos x} \quad \text{Apply a quotient identity: } \tan x = \frac{\sin x}{\cos x}.$$

$$\begin{aligned}
& \frac{\sin x}{\cos x} + \frac{\sin x \cos x}{\cos x} && \text{Express the terms in the numerator with the least common denominator, } \cos x. \\
= & \frac{\sin x + \sin x \cos x}{1 + \cos x} \\
= & \frac{\sin x + \sin x \cos x}{\cos x} && \text{Add in the numerator.} \\
= & \frac{\sin x + \sin x \cos x}{\cos x} \div \frac{1 + \cos x}{1} && \text{Rewrite the main fraction bar as } \div. \\
= & \frac{\sin x + \sin x \cos x}{\cos x} \cdot \frac{1}{1 + \cos x} && \text{Invert the divisor and multiply.} \\
= & \frac{\sin x(1 + \cos x)}{\cos x} \cdot \frac{1}{1 + \cos x} && \text{Factor and simplify.} \\
= & \frac{\sin x}{\cos x} && \text{Multiply the remaining factors in the numerator and in the denominator.} \\
= & \tan x && \text{Apply a quotient identity.}
\end{aligned}$$

The left side simplifies to  $\tan x$ , the right side of the given equation. Thus, the identity is verified. ...

 **Check Point 7** Verify the identity:  $\frac{\sec x + \csc(-x)}{\sec x \csc x} = \sin x - \cos x$ .

Is every identity verified by working with only one side? No. You can sometimes work with each side separately and show that both sides are equal to the same trigonometric expression. This is illustrated in Example 8.

### EXAMPLE 8 Working with Both Sides Separately to Verify an Identity

Verify the identity:  $\frac{1}{1 + \cos \theta} + \frac{1}{1 - \cos \theta} = 2 + 2 \cot^2 \theta$ .

#### SOLUTION

We begin by working with the left side.

$$\begin{aligned}
& \frac{1}{1 + \cos \theta} + \frac{1}{1 - \cos \theta} && \text{The least common denominator is } (1 + \cos \theta)(1 - \cos \theta). \\
= & \frac{1(1 - \cos \theta)}{(1 + \cos \theta)(1 - \cos \theta)} + \frac{1(1 + \cos \theta)}{(1 + \cos \theta)(1 - \cos \theta)} && \text{Rewrite each fraction with the least common denominator.} \\
= & \frac{1 - \cos \theta + 1 + \cos \theta}{(1 + \cos \theta)(1 - \cos \theta)} && \text{Add numerators. Put this sum over the least common denominator.} \\
= & \frac{2}{(1 + \cos \theta)(1 - \cos \theta)} && \text{Simplify the numerator: } -\cos \theta + \cos \theta = 0 \text{ and } 1 + 1 = 2. \\
= & \frac{2}{1 - \cos^2 \theta} && \text{Multiply the factors in the denominator.}
\end{aligned}$$

Now we work with the right side. Our goal is to transform this side into the simplified form attained for the left side,  $\frac{2}{1 - \cos^2 \theta}$ .

$$\begin{aligned}
 2 + 2 \cot^2 \theta &= 2 + 2 \left( \frac{\cos^2 \theta}{\sin^2 \theta} \right) && \text{Use a quotient identity: } \cot \theta = \frac{\cos \theta}{\sin \theta}. \\
 &= \frac{2 \sin^2 \theta}{\sin^2 \theta} + \frac{2 \cos^2 \theta}{\sin^2 \theta} && \text{Rewrite each term with the least common denominator, } \sin^2 \theta. \\
 &= \frac{2 \sin^2 \theta + 2 \cos^2 \theta}{\sin^2 \theta} && \text{Add numerators. Put this sum over the least common denominator.} \\
 &= \frac{2(\sin^2 \theta + \cos^2 \theta)}{\sin^2 \theta} && \text{Factor out the greatest common factor, 2.} \\
 &= \frac{2}{\sin^2 \theta} && \text{Apply a Pythagorean identity: } \sin^2 \theta + \cos^2 \theta = 1. \\
 &= \frac{2}{1 - \cos^2 \theta} && \text{Use a variation of } \sin^2 \theta + \cos^2 \theta = 1 \text{ and solve for } \sin^2 \theta: \sin^2 \theta = 1 - \cos^2 \theta.
 \end{aligned}$$

The identity is verified because both sides are equal to  $\frac{2}{1 - \cos^2 \theta}$ . ...

 **Check Point 8** Verify the identity:  $\frac{1}{1 + \sin \theta} + \frac{1}{1 - \sin \theta} = 2 + 2 \tan^2 \theta$ .

### Guidelines for Verifying Trigonometric Identities

There is often more than one correct way to solve a puzzle, although one method may be shorter and more efficient than another. The same is true for verifying an identity. For example, how would you verify

$$\frac{\csc^2 x - 1}{\csc^2 x} = \cos^2 x?$$

One approach is to use a Pythagorean identity,  $1 + \cot^2 x = \csc^2 x$ , on the left side. Then change the resulting expression to sines and cosines.

$$\begin{aligned}
 \frac{\csc^2 x - 1}{\csc^2 x} &= \frac{(1 + \cot^2 x) - 1}{\csc^2 x} = \frac{\cot^2 x}{\csc^2 x} = \frac{\frac{\cos^2 x}{\sin^2 x}}{\frac{1}{\sin^2 x}} = \frac{\cos^2 x}{\cancel{\sin^2 x}} \cdot \frac{\cancel{\sin^2 x}}{1} = \cos^2 x
 \end{aligned}$$

Apply a Pythagorean identity:  
 $1 + \cot^2 x = \csc^2 x$ .

Use  $\cot x = \frac{\cos x}{\sin x}$  and  
 $\csc x = \frac{1}{\sin x}$  to change  
to sines and cosines.

Invert the  
divisor and  
multiply.

A more efficient strategy for verifying this identity may not be apparent at first glance. Work with the left side and divide each term in the numerator by the denominator,  $\csc^2 x$ .

$$\frac{\csc^2 x - 1}{\csc^2 x} = \frac{\csc^2 x}{\csc^2 x} - \frac{1}{\csc^2 x} = 1 - \sin^2 x = \cos^2 x$$

Apply a reciprocal  
identity:  $\sin x = \frac{1}{\csc x}$ .

Use  $\sin^2 x + \cos^2 x = 1$   
and solve for  $\cos^2 x$ .

With this strategy, we again obtain  $\cos^2 x$ , the expression on the right side, and it takes fewer steps than the first approach.

An even longer strategy to verify  $\frac{\csc^2 x - 1}{\csc^2 x} = \cos^2 x$ , but one that works, is to replace each of the two occurrences of  $\csc^2 x$  on the left side by  $\frac{1}{\sin^2 x}$ . This may be the approach that you first consider, particularly if you become accustomed to rewriting the more complicated side in terms of sines and cosines. The selection of an appropriate fundamental identity to solve the puzzle most efficiently is learned through lots of practice.

The more identities you prove, the more confident and efficient you will become. Although practice is the only way to learn how to verify identities, there are some guidelines developed throughout the section that should help you get started.

### Guidelines for Verifying Trigonometric Identities

- Work with each side of the equation independently of the other side. Start with the more complicated side and transform it in a step-by-step fashion until it looks exactly like the other side.
- Analyze the identity and look for opportunities to apply the fundamental identities.
- Try using one or more of the following techniques:
  1. Rewrite the more complicated side in terms of sines and cosines.
  2. Factor out the greatest common factor.
  3. Separate a single-term quotient into two terms:

$$\frac{a + b}{c} = \frac{a}{c} + \frac{b}{c} \quad \text{and} \quad \frac{a - b}{c} = \frac{a}{c} - \frac{b}{c}.$$

4. Combine fractional expressions using the least common denominator.
  5. Multiply the numerator and the denominator by a binomial factor that appears on the other side of the identity.
- Don't be afraid to stop and start over again if you are not getting anywhere. Creative puzzle solvers know that strategies leading to dead ends often provide good problem-solving ideas.

### CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

1. To verify an identity, start with the more \_\_\_\_\_ side and transform it in a step-by-step fashion until it is identical to the \_\_\_\_\_ side.
2. It is sometimes helpful to verify an identity by rewriting one of the sides in terms of \_\_\_\_\_ and \_\_\_\_\_, and then simplifying the result.
3. True or false: To verify the identity

$$\frac{\sin x}{1 + \cos x} = \frac{1 - \cos x}{\sin x},$$

we should begin by multiplying both sides by  $\sin x(1 + \cos x)$ , the least common denominator. \_\_\_\_\_

4.  $\frac{1}{\csc x - 1} - \frac{1}{\csc x + 1}$  can be simplified using \_\_\_\_\_ as the least common denominator.
5. You can use your graphing calculator to provide evidence of an identity. Graph the left side and the right side separately, and see if the two graphs are \_\_\_\_\_.

### EXERCISE SET 5.1

#### Practice Exercises

In Exercises 1–60, verify each identity.

1.  $\sin x \sec x = \tan x$
2.  $\cos x \csc x = \cot x$
3.  $\tan(-x)\cos x = -\sin x$
4.  $\cot(-x)\sin x = -\cos x$
5.  $\tan x \csc x \cos x = 1$
6.  $\cot x \sec x \sin x = 1$
7.  $\sec x - \sec x \sin^2 x = \cos x$
8.  $\csc x - \csc x \cos^2 x = \sin x$
9.  $\cos^2 x - \sin^2 x = 1 - 2 \sin^2 x$
10.  $\cos^2 x - \sin^2 x = 2 \cos^2 x - 1$
11.  $\csc \theta - \sin \theta = \cot \theta \cos \theta$
12.  $\tan \theta + \cot \theta = \sec \theta \csc \theta$
13.  $\frac{\tan \theta \cot \theta}{\csc \theta} = \sin \theta$
14.  $\frac{\cos \theta \sec \theta}{\cot \theta} = \tan \theta$

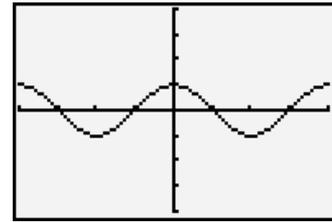

15.  $\sin^2 \theta(1 + \cot^2 \theta) = 1$       16.  $\cos^2 \theta(1 + \tan^2 \theta) = 1$   
 17.  $\sin t \tan t = \frac{1 - \cos^2 t}{\cos t}$       18.  $\cos t \cot t = \frac{1 - \sin^2 t}{\sin t}$   
 19.  $\frac{\csc^2 t}{\cot t} = \csc t \sec t$       20.  $\frac{\sec^2 t}{\tan t} = \sec t \csc t$   
 21.  $\frac{\tan^2 t}{\sec t} = \sec t - \cos t$       22.  $\frac{\cot^2 t}{\csc t} = \csc t - \sin t$   
 23.  $\frac{1 - \cos \theta}{\sin \theta} = \csc \theta - \cot \theta$       24.  $\frac{1 - \sin \theta}{\cos \theta} = \sec \theta - \tan \theta$   
 25.  $\frac{\sin t}{\csc t} + \frac{\cos t}{\sec t} = 1$   
 26.  $\frac{\sin t}{\tan t} + \frac{\cos t}{\cot t} = \sin t + \cos t$   
 27.  $\tan t + \frac{\cos t}{1 + \sin t} = \sec t$       28.  $\cot t + \frac{\sin t}{1 + \cos t} = \csc t$   
 29.  $1 - \frac{\sin^2 x}{1 + \cos x} = \cos x$       30.  $1 - \frac{\cos^2 x}{1 + \sin x} = \sin x$   
 31.  $\frac{\cos x}{1 - \sin x} + \frac{1 - \sin x}{\cos x} = 2 \sec x$   
 32.  $\frac{\sin x}{\cos x + 1} + \frac{\cos x - 1}{\sin x} = 0$   
 33.  $\sec^2 x \csc^2 x = \sec^2 x + \csc^2 x$   
 34.  $\csc^2 x \sec x = \sec x + \csc x \cot x$   
 35.  $\frac{\sec x - \csc x}{\sec x + \csc x} = \frac{\tan x - 1}{\tan x + 1}$       36.  $\frac{\csc x - \sec x}{\csc x + \sec x} = \frac{\cot x - 1}{\cot x + 1}$   
 37.  $\frac{\sin^2 x - \cos^2 x}{\sin x + \cos x} = \sin x - \cos x$   
 38.  $\frac{\tan^2 x - \cot^2 x}{\tan x + \cot x} = \tan x - \cot x$   
 39.  $\tan^2 2x + \sin^2 2x + \cos^2 2x = \sec^2 2x$   
 40.  $\cot^2 2x + \cos^2 2x + \sin^2 2x = \csc^2 2x$   
 41.  $\frac{\tan 2\theta + \cot 2\theta}{\csc 2\theta} = \sec 2\theta$       42.  $\frac{\tan 2\theta + \cot 2\theta}{\sec 2\theta} = \csc 2\theta$   
 43.  $\frac{\tan x + \tan y}{1 - \tan x \tan y} = \frac{\sin x \cos y + \cos x \sin y}{\cos x \cos y - \sin x \sin y}$   
 44.  $\frac{\cot x + \cot y}{1 - \cot x \cot y} = \frac{\cos x \sin y + \sin x \cos y}{\sin x \sin y - \cos x \cos y}$   
 45.  $(\sec x - \tan x)^2 = \frac{1 - \sin x}{1 + \sin x}$   
 46.  $(\csc x - \cot x)^2 = \frac{1 - \cos x}{1 + \cos x}$   
 47.  $\frac{\sec t + 1}{\tan t} = \frac{\tan t}{\sec t - 1}$       48.  $\frac{\csc t - 1}{\cot t} = \frac{\cot t}{\csc t + 1}$   
 49.  $\frac{1 + \cos t}{1 - \cos t} = (\csc t + \cot t)^2$   
 50.  $\frac{\cos^2 t + 4 \cos t + 4}{\cos t + 2} = \frac{2 \sec t + 1}{\sec t}$   
 51.  $\cos^4 t - \sin^4 t = 1 - 2 \sin^2 t$   
 52.  $\sin^4 t - \cos^4 t = 1 - 2 \cos^2 t$   
 53.  $\frac{\sin \theta - \cos \theta}{\sin \theta} + \frac{\cos \theta - \sin \theta}{\cos \theta} = 2 - \sec \theta \csc \theta$   
 54.  $\frac{\sin \theta}{1 - \cot \theta} - \frac{\cos \theta}{\tan \theta - 1} = \sin \theta + \cos \theta$   
 55.  $(\tan^2 \theta + 1)(\cos^2 \theta + 1) = \tan^2 \theta + 2$   
 56.  $(\cot^2 \theta + 1)(\sin^2 \theta + 1) = \cot^2 \theta + 2$

57.  $(\cos \theta - \sin \theta)^2 + (\cos \theta + \sin \theta)^2 = 2$   
 58.  $(3 \cos \theta - 4 \sin \theta)^2 + (4 \cos \theta + 3 \sin \theta)^2 = 25$   
 59.  $\frac{\cos^2 x - \sin^2 x}{1 - \tan^2 x} = \cos^2 x$   
 60.  $\frac{\sin x + \cos x}{\sin x} - \frac{\cos x - \sin x}{\cos x} = \sec x \csc x$

### Practice Plus

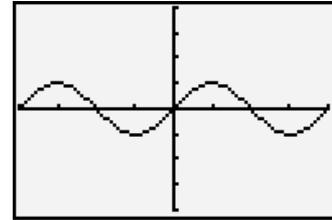

In Exercises 61–66, half of an identity and the graph of this half are given. Use the graph to make a conjecture as to what the right side of the identity should be. Then prove your conjecture.

61.  $\frac{(\sec x + \tan x)(\sec x - \tan x)}{\sec x} = ?$

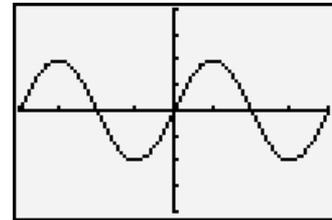

$[-2\pi, 2\pi, \frac{\pi}{2}]$  by  $[-4, 4, 1]$

62.  $\frac{\sec^2 x \csc x}{\sec^2 x + \csc^2 x} = ?$

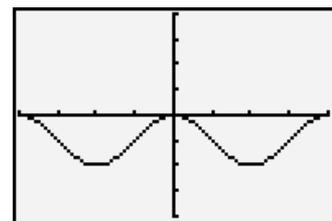

$[-2\pi, 2\pi, \frac{\pi}{2}]$  by  $[-4, 4, 1]$

63.  $\frac{\cos x + \cot x \sin x}{\cot x} = ?$

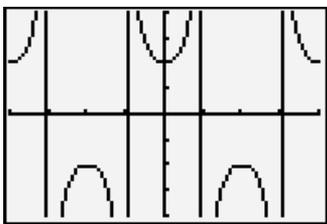

$[-2\pi, 2\pi, \frac{\pi}{2}]$  by  $[-4, 4, 1]$

64.  $\frac{\cos x \tan x - \tan x + 2 \cos x - 2}{\tan x + 2} = ?$

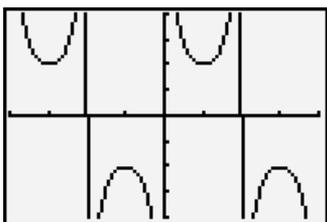

$[-2\pi, 2\pi, \frac{\pi}{2}]$  by  $[-4, 4, 1]$

65. 
$$\frac{1}{\sec x + \tan x} + \frac{1}{\sec x - \tan x} = ?$$

$[-2\pi, 2\pi, \frac{\pi}{2}]$  by  $[-4, 4, 1]$

66. 
$$\frac{1 + \cos x}{\sin x} + \frac{\sin x}{1 + \cos x} = ?$$

$[-2\pi, 2\pi, \frac{\pi}{2}]$  by  $[-4, 4, 1]$

In Exercises 67–74, rewrite each expression in terms of the given function or functions.

67. 
$$\frac{\tan x + \cot x}{\csc x}; \cos x$$

68. 
$$\frac{\sec x + \csc x}{1 + \tan x}; \sin x$$

69. 
$$\frac{\cos x}{1 + \sin x} + \tan x; \cos x$$

70. 
$$\frac{1}{\sin x \cos x} - \cot x; \cot x$$

71. 
$$\frac{1}{1 - \cos x} - \frac{\cos x}{1 + \cos x}; \csc x$$

72. 
$$(\sec x + \csc x)(\sin x + \cos x) - 2 - \cot x; \tan x$$

73. 
$$\frac{1}{\csc x - \sin x}; \sec x \text{ and } \tan x$$

74. 
$$\frac{1 - \sin x}{1 + \sin x} - \frac{1 + \sin x}{1 - \sin x}; \sec x \text{ and } \tan x$$

### Writing in Mathematics

75. Explain how to verify an identity.  
 76. Describe two strategies that can be used to verify identities.  
 77. Describe how you feel when you successfully verify a difficult identity. What other activities do you engage in that evoke the same feelings?  
 78. A 10-point question on a quiz asks students to verify the identity

$$\frac{\sin^2 x - \cos^2 x}{\sin x + \cos x} = \sin x - \cos x.$$

One student begins with the left side and obtains the right side as follows:

$$\frac{\sin^2 x - \cos^2 x}{\sin x + \cos x} = \frac{\sin^2 x}{\sin x} - \frac{\cos^2 x}{\cos x} = \sin x - \cos x.$$

How many points (out of 10) would you give this student? Explain your answer.

### Technology Exercises

In Exercises 79–87, graph each side of the equation in the same viewing rectangle. If the graphs appear to coincide, verify that the equation is an identity. If the graphs do not appear to coincide, this indicates the equation is not an identity. In these exercises, find a value of  $x$  for which both sides are defined but not equal.

79. 
$$\tan x = \sec x(\sin x - \cos x) + 1$$

80. 
$$\sin x = -\cos x \tan(-x)$$

81. 
$$\sin\left(x + \frac{\pi}{4}\right) = \sin x + \sin \frac{\pi}{4}$$

82. 
$$\cos\left(x + \frac{\pi}{4}\right) = \cos x + \cos \frac{\pi}{4}$$

83. 
$$\cos(x + \pi) = \cos x$$

84. 
$$\sin(x + \pi) = \sin x$$

85. 
$$\frac{\sin x}{1 - \cos^2 x} = \csc x$$

86. 
$$\sin x - \sin x \cos^2 x = \sin^3 x$$

87. 
$$\sqrt{\sin^2 x + \cos^2 x} = \sin x + \cos x$$

### Critical Thinking Exercises

**Make Sense?** In Exercises 88–91, determine whether each statement makes sense or does not make sense, and explain your reasoning.

88. The word *identity* is used in different ways in additive identity, multiplicative identity, and trigonometric identity.  
 89. To prove a trigonometric identity, I select one side of the equation and transform it until it is the other side of the equation, or I manipulate both sides to a common trigonometric expression.  
 90. In order to simplify  $\frac{\cos x}{1 - \sin x} - \frac{\sin x}{\cos x}$ , I need to know how to subtract rational expressions with unlike denominators.  
 91. The most efficient way that I can simplify  $\frac{(\sec x + 1)(\sec x - 1)}{\sin^2 x}$  is to immediately rewrite the expression in terms of cosines and sines.

In Exercises 92–95, verify each identity.

92. 
$$\frac{\sin^3 x - \cos^3 x}{\sin x - \cos x} = 1 + \sin x \cos x$$

93. 
$$\frac{\sin x - \cos x + 1}{\sin x + \cos x - 1} = \frac{\sin x + 1}{\cos x}$$

94. 
$$\ln|\sec x| = -\ln|\cos x|$$

95. 
$$\ln e^{\tan^2 x - \sec^2 x} = -1$$

96. Use one of the fundamental identities in the box on page 622 to create an original identity.

### Group Exercise

97. Group members are to write a helpful list of items for a pamphlet called “The Underground Guide to Verifying Identities.” The pamphlet will be used primarily by students who sit, stare, and freak out every time they are asked to verify an identity. List easy ways to remember the fundamental identities. What helpful guidelines can you offer from the perspective of a student that you probably won’t find in math books? If you have your own strategies that work particularly well, include them in the pamphlet.

## Preview Exercises

Exercises 98–100 will help you prepare for the material covered in the next section.

98. Give exact values for  $\cos 30^\circ$ ,  $\sin 30^\circ$ ,  $\cos 60^\circ$ ,  $\sin 60^\circ$ ,  $\cos 90^\circ$ , and  $\sin 90^\circ$ .
99. Use the appropriate values from Exercise 98 to answer each of the following.
- Is  $\cos(30^\circ + 60^\circ)$ , or  $\cos 90^\circ$ , equal to  $\cos 30^\circ + \cos 60^\circ$ ?
  - Is  $\cos(30^\circ + 60^\circ)$ , or  $\cos 90^\circ$ , equal to  $\cos 30^\circ \cos 60^\circ - \sin 30^\circ \sin 60^\circ$ ?
100. Use the appropriate values from Exercise 98 to answer each of the following.
- Is  $\sin(30^\circ + 60^\circ)$ , or  $\sin 90^\circ$ , equal to  $\sin 30^\circ + \sin 60^\circ$ ?
  - Is  $\sin(30^\circ + 60^\circ)$ , or  $\sin 90^\circ$ , equal to  $\sin 30^\circ \cos 60^\circ + \cos 30^\circ \sin 60^\circ$ ?

## SECTION 5.2

## Sum and Difference Formulas

## Objectives

- Use the formula for the cosine of the difference of two angles.
- Use sum and difference formulas for cosines and sines.
- Use sum and difference formulas for tangents.

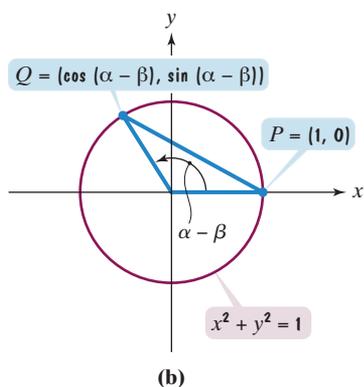

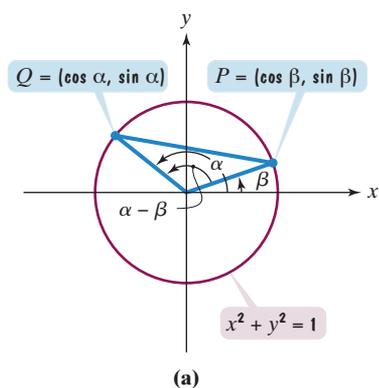

FIGURE 5.1 Using the unit circle and  $PQ$  to develop a formula for  $\cos(\alpha - \beta)$

Listen to the same note played on a piano and a violin. The notes have a different quality or “tone.” Tone depends on the way an instrument vibrates. However, the less than 1% of the population with amusia, or true tone deafness, cannot tell the two sounds apart. Even simple, familiar tunes such as “Happy Birthday” and “Jingle Bells” are mystifying to amusics.

When a note is played, it vibrates at a specific fundamental frequency and has a particular amplitude. Amusics cannot tell the difference between two sounds from tuning forks modeled by  $p = 3 \sin 2t$  and  $p = 2 \sin(2t + \pi)$ , respectively. However, they can recognize the difference between the two equations. Notice that the second equation contains the sine of the sum of two angles. In this section, we will be developing identities involving the sums or differences of two angles. These formulas are called the **sum and difference formulas**. We begin with

$\cos(\alpha - \beta)$ , the cosine of the difference of two angles.

## The Cosine of the Difference of Two Angles

## The Cosine of the Difference of Two Angles

$$\cos(\alpha - \beta) = \cos \alpha \cos \beta + \sin \alpha \sin \beta$$

The cosine of the difference of two angles equals the cosine of the first angle times the cosine of the second angle plus the sine of the first angle times the sine of the second angle.

We use **Figure 5.1** to prove the identity in the box. The graph in **Figure 5.1(a)** shows a unit circle,  $x^2 + y^2 = 1$ . The figure uses the definitions of the cosine and sine functions as the  $x$ - and  $y$ -coordinates of points along the unit circle. For example, point  $P$  corresponds to angle  $\beta$ . By definition, the  $x$ -coordinate of  $P$  is  $\cos \beta$  and the  $y$ -coordinate is  $\sin \beta$ . Similarly, point  $Q$  corresponds to angle  $\alpha$ . By definition, the  $x$ -coordinate of  $Q$  is  $\cos \alpha$  and the  $y$ -coordinate is  $\sin \alpha$ .

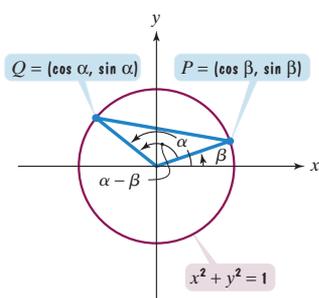

FIGURE 5.1(a) (repeated)

$$\begin{aligned}
 PQ &= \sqrt{(\cos \alpha - \cos \beta)^2 + (\sin \alpha - \sin \beta)^2} \\
 &= \sqrt{\cos^2 \alpha - 2 \cos \alpha \cos \beta + \cos^2 \beta + \sin^2 \alpha - 2 \sin \alpha \sin \beta + \sin^2 \beta} \\
 &= \sqrt{(\sin^2 \alpha + \cos^2 \alpha) + (\sin^2 \beta + \cos^2 \beta) - 2 \cos \alpha \cos \beta - 2 \sin \alpha \sin \beta} \\
 &= \sqrt{1 + 1 - 2 \cos \alpha \cos \beta - 2 \sin \alpha \sin \beta} \\
 &= \sqrt{2 - 2 \cos \alpha \cos \beta - 2 \sin \alpha \sin \beta}
 \end{aligned}$$

Apply the distance formula,  $d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$ , to find the distance between  $(\cos \beta, \sin \beta)$  and  $(\cos \alpha, \sin \alpha)$ .

Square each expression using  $(A - B)^2 = A^2 - 2AB + B^2$ .

Regroup terms to apply a Pythagorean identity.

Because  $\sin^2 x + \cos^2 x = 1$ , each expression in parentheses equals 1.

Simplify.

Next, we apply the distance formula in **Figure 5.1(b)** to obtain a second expression for  $PQ$ . We let  $(x_1, y_1) = (1, 0)$  and  $(x_2, y_2) = (\cos(\alpha - \beta), \sin(\alpha - \beta))$ .

$$\begin{aligned}
 PQ &= \sqrt{[\cos(\alpha - \beta) - 1]^2 + [\sin(\alpha - \beta) - 0]^2} \\
 &= \sqrt{\cos^2(\alpha - \beta) - 2 \cos(\alpha - \beta) + 1 + \sin^2(\alpha - \beta)}
 \end{aligned}$$

Using a Pythagorean identity,  $\sin^2(\alpha - \beta) + \cos^2(\alpha - \beta) = 1$ .

$$\begin{aligned}
 &= \sqrt{1 - 2 \cos(\alpha - \beta) + 1} \\
 &= \sqrt{2 - 2 \cos(\alpha - \beta)}
 \end{aligned}$$

Apply the distance formula to find the distance between  $(1, 0)$  and  $(\cos(\alpha - \beta), \sin(\alpha - \beta))$ .

Square each expression.

Use a Pythagorean identity.

Simplify.

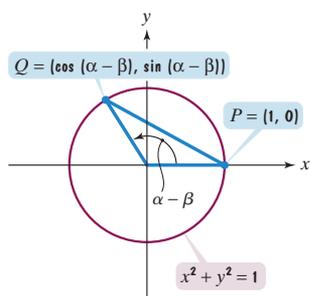

FIGURE 5.1(b) (repeated)

Now we equate the two expressions for  $PQ$ .

$$\begin{aligned}
 \sqrt{2 - 2 \cos(\alpha - \beta)} &= \sqrt{2 - 2 \cos \alpha \cos \beta - 2 \sin \alpha \sin \beta} \\
 2 - 2 \cos(\alpha - \beta) &= 2 - 2 \cos \alpha \cos \beta - 2 \sin \alpha \sin \beta \\
 -2 \cos(\alpha - \beta) &= -2 \cos \alpha \cos \beta - 2 \sin \alpha \sin \beta \\
 \cos(\alpha - \beta) &= \cos \alpha \cos \beta + \sin \alpha \sin \beta
 \end{aligned}$$

The rotation does not change the length of  $PQ$ .

Square both sides to eliminate radicals.

Subtract 2 from both sides of the equation.

Divide both sides of the equation by  $-2$ .

- Use the formula for the cosine of the difference of two angles.

This proves the identity for the cosine of the difference of two angles.

Now that we see where the identity for the cosine of the difference of two angles comes from, let's look at some applications of this result.

### Blitzer Bonus

#### Sound Quality and Amusia

People with true tone deafness cannot hear the difference among tones produced by a tuning fork, a flute, an oboe, and a violin. They cannot dance or tell the difference between harmony and dissonance. People with amusia appear to have been born without the wiring necessary to process music. Intriguingly, they show no overt signs of brain damage and their brain scans appear normal. Thus, they can visually recognize the difference among sound waves that produce varying sound qualities.

#### Varying Sound Qualities

- Tuning fork: Sound waves are rounded and regular, giving a pure and gentle tone.

- Flute: Sound waves are smooth and give a fluid tone.

- Oboe: Rapid wave changes give a richer tone.

- Violin: Jagged waves give a brighter harsher tone.

### EXAMPLE 1 Using the Difference Formula for Cosines to Find an Exact Value

Find the exact value of  $\cos 15^\circ$ .

#### SOLUTION

We know exact values for trigonometric functions of  $60^\circ$  and  $45^\circ$ . Thus, we write  $15^\circ$  as  $60^\circ - 45^\circ$  and use the difference formula for cosines.

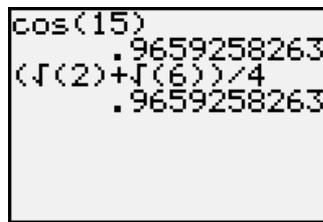

$$\begin{aligned}\cos 15^\circ &= \cos(60^\circ - 45^\circ) \\ &= \cos 60^\circ \cos 45^\circ + \sin 60^\circ \sin 45^\circ && \cos(\alpha - \beta) = \cos \alpha \cos \beta + \sin \alpha \sin \beta \\ &= \frac{1}{2} \cdot \frac{\sqrt{2}}{2} + \frac{\sqrt{3}}{2} \cdot \frac{\sqrt{2}}{2} && \text{Substitute exact values from memory or use} \\ &= \frac{\sqrt{2}}{4} + \frac{\sqrt{6}}{4} && \text{special right triangles.} \\ &= \frac{\sqrt{2} + \sqrt{6}}{4} && \text{Multiply.} \\ & && \text{Add.} \quad \dots\end{aligned}$$

### GREAT QUESTION!

Can I use my calculator to verify that

$$\cos 15^\circ = \frac{\sqrt{2} + \sqrt{6}}{4}?$$

Yes. Find approximations for  $\cos 15^\circ$  and  $\frac{\sqrt{2} + \sqrt{6}}{4}$ .

Because the approximations are the same, we have checked that

$$\cos 15^\circ = \frac{\sqrt{2} + \sqrt{6}}{4}.$$

- ✓ **Check Point 1** We know that  $\cos 30^\circ = \frac{\sqrt{3}}{2}$ . Obtain this exact value using  $\cos 30^\circ = \cos(90^\circ - 60^\circ)$  and the difference formula for cosines.

### EXAMPLE 2 Using the Difference Formula for Cosines to Find an Exact Value

Find the exact value of  $\cos 80^\circ \cos 20^\circ + \sin 80^\circ \sin 20^\circ$ .

#### SOLUTION

The given expression is the right side of the formula for  $\cos(\alpha - \beta)$  with  $\alpha = 80^\circ$  and  $\beta = 20^\circ$ .

$$\cos(\alpha - \beta) = \cos \alpha \cos \beta + \sin \alpha \sin \beta$$

$$\cos 80^\circ \cos 20^\circ + \sin 80^\circ \sin 20^\circ = \cos(80^\circ - 20^\circ) = \cos 60^\circ = \frac{1}{2} \quad \dots$$

- ✓ **Check Point 2** Find the exact value of

$$\cos 70^\circ \cos 40^\circ + \sin 70^\circ \sin 40^\circ.$$

**EXAMPLE 3** Verifying an Identity

Verify the identity:  $\frac{\cos(\alpha - \beta)}{\sin \alpha \cos \beta} = \cot \alpha + \tan \beta$ .

**SOLUTION**

We work with the left side.

$$\begin{aligned} \frac{\cos(\alpha - \beta)}{\sin \alpha \cos \beta} &= \frac{\cos \alpha \cos \beta + \sin \alpha \sin \beta}{\sin \alpha \cos \beta} \\ &= \frac{\cos \alpha \cos \beta}{\sin \alpha \cos \beta} + \frac{\sin \alpha \sin \beta}{\sin \alpha \cos \beta} \\ &= \frac{\cos \alpha}{\sin \alpha} \cdot \frac{\cos \beta}{\cos \beta} + \frac{\sin \alpha}{\sin \alpha} \cdot \frac{\sin \beta}{\cos \beta} \\ &= \cot \alpha \cdot 1 + 1 \cdot \tan \beta \\ &= \cot \alpha + \tan \beta \end{aligned}$$

Use the formula for  $\cos(\alpha - \beta)$ .

Divide each term in the numerator by  $\sin \alpha \cos \beta$ .

This step can be done mentally. We wanted you to see the substitutions that follow.

Use quotient identities.

Simplify.

We worked with the left side and arrived at the right side. Thus, the identity is verified. ●●●

**TECHNOLOGY****Graphic Connections**

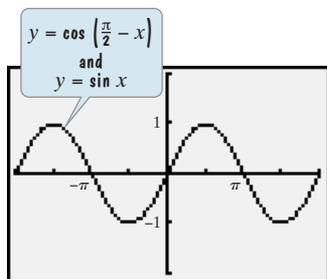

The graphs of

$$y = \cos\left(\frac{\pi}{2} - x\right)$$

and

$$y = \sin x$$

are shown in the same viewing rectangle. The graphs are the same. The displayed math on the right below with the voice balloon on top shows the equivalence algebraically.

- 2 Use sum and difference formulas for cosines and sines.

**Check Point 3** Verify the identity:  $\frac{\cos(\alpha - \beta)}{\cos \alpha \cos \beta} = 1 + \tan \alpha \tan \beta$ .

The difference formula for cosines is used to establish other identities. For example, in our work with right triangles, we noted that cofunctions of complements are equal. Thus, because  $\frac{\pi}{2} - \theta$  and  $\theta$  are complements,

$$\cos\left(\frac{\pi}{2} - \theta\right) = \sin \theta.$$

We can use the formula for  $\cos(\alpha - \beta)$  to prove this cofunction identity for all angles.

Apply  $\cos(\alpha - \beta)$  with  $\alpha = \frac{\pi}{2}$  and  $\beta = \theta$ .  
 $\cos(\alpha - \beta) = \cos \alpha \cos \beta + \sin \alpha \sin \beta$

$$\begin{aligned} \cos\left(\frac{\pi}{2} - \theta\right) &= \cos \frac{\pi}{2} \cos \theta + \sin \frac{\pi}{2} \sin \theta \\ &= 0 \cdot \cos \theta + 1 \cdot \sin \theta \\ &= \sin \theta \end{aligned}$$

**Sum and Difference Formulas for Cosines and Sines**

Our formula for  $\cos(\alpha - \beta)$  can be used to verify an identity for a sum involving cosines, as well as identities for a sum and a difference for sines.

**Sum and Difference Formulas for Cosines and Sines**

1.  $\cos(\alpha + \beta) = \cos \alpha \cos \beta - \sin \alpha \sin \beta$
2.  $\cos(\alpha - \beta) = \cos \alpha \cos \beta + \sin \alpha \sin \beta$
3.  $\sin(\alpha + \beta) = \sin \alpha \cos \beta + \cos \alpha \sin \beta$
4.  $\sin(\alpha - \beta) = \sin \alpha \cos \beta - \cos \alpha \sin \beta$

Up to now, we have concentrated on the second formula in the preceding box,  $\cos(\alpha - \beta) = \cos \alpha \cos \beta + \sin \alpha \sin \beta$ . The first identity,  $\cos(\alpha + \beta) = \cos \alpha \cos \beta - \sin \alpha \sin \beta$ , gives a formula for the cosine of the sum of two angles. It is proved as follows:

$$\begin{aligned}\cos(\alpha + \beta) &= \cos[\alpha - (-\beta)] && \text{Express addition as subtraction of an additive inverse.} \\ &= \cos \alpha \cos(-\beta) + \sin \alpha \sin(-\beta) && \text{Use the difference formula for cosines.} \\ &= \cos \alpha \cos \beta + \sin \alpha(-\sin \beta) && \text{Cosine is even: } \cos(-\beta) = \cos \beta. \\ & && \text{Sine is odd: } \sin(-\beta) = -\sin \beta. \\ &= \cos \alpha \cos \beta - \sin \alpha \sin \beta. && \text{Simplify.}\end{aligned}$$

Thus, the cosine of the sum of two angles equals the cosine of the first angle times the cosine of the second angle minus the sine of the first angle times the sine of the second angle.

The third identity in the box,  $\sin(\alpha + \beta) = \sin \alpha \cos \beta + \cos \alpha \sin \beta$ , gives a formula for  $\sin(\alpha + \beta)$ , the sine of the sum of two angles. It is proved as follows:

$$\begin{aligned}\sin(\alpha + \beta) &= \cos\left[\frac{\pi}{2} - (\alpha + \beta)\right] && \text{Use a cofunction identity:} \\ & && \sin \theta = \cos\left(\frac{\pi}{2} - \theta\right). \\ &= \cos\left[\left(\frac{\pi}{2} - \alpha\right) - \beta\right] && \text{Regroup.} \\ &= \cos\left(\frac{\pi}{2} - \alpha\right)\cos \beta + \sin\left(\frac{\pi}{2} - \alpha\right)\sin \beta && \text{Use the difference formula for cosines.} \\ &= \sin \alpha \cos \beta + \cos \alpha \sin \beta. && \text{Use cofunction identities.}\end{aligned}$$

Thus, the sine of the sum of two angles equals the sine of the first angle times the cosine of the second angle plus the cosine of the first angle times the sine of the second angle.

The final identity in the box,  $\sin(\alpha - \beta) = \sin \alpha \cos \beta - \cos \alpha \sin \beta$ , gives a formula for  $\sin(\alpha - \beta)$ , the sine of the difference of two angles. It is proved by writing  $\sin(\alpha - \beta)$  as  $\sin[\alpha + (-\beta)]$  and then using the formula for the sine of a sum.

#### EXAMPLE 4 Using the Sine of a Sum to Find an Exact Value

Find the exact value of  $\sin \frac{7\pi}{12}$  using the fact that  $\frac{7\pi}{12} = \frac{\pi}{3} + \frac{\pi}{4}$ .

#### SOLUTION

We apply the formula for the sine of a sum.

$$\begin{aligned}\sin \frac{7\pi}{12} &= \sin\left(\frac{\pi}{3} + \frac{\pi}{4}\right) \\ &= \sin \frac{\pi}{3} \cos \frac{\pi}{4} + \cos \frac{\pi}{3} \sin \frac{\pi}{4} && \sin(\alpha + \beta) = \sin \alpha \cos \beta + \cos \alpha \sin \beta \\ &= \frac{\sqrt{3}}{2} \cdot \frac{\sqrt{2}}{2} + \frac{1}{2} \cdot \frac{\sqrt{2}}{2} && \text{Substitute exact values.} \\ &= \frac{\sqrt{6} + \sqrt{2}}{4} && \text{Simplify.}\end{aligned}$$

 **Check Point 4** Find the exact value of  $\sin \frac{5\pi}{12}$  using the fact that

$$\frac{5\pi}{12} = \frac{\pi}{6} + \frac{\pi}{4}.$$

**EXAMPLE 5** Finding Exact Values

Suppose that  $\sin \alpha = \frac{12}{13}$  for a quadrant II angle  $\alpha$  and  $\sin \beta = \frac{3}{5}$  for a quadrant I angle  $\beta$ . Find the exact value of each of the following:

- a.  $\cos \alpha$       b.  $\cos \beta$       c.  $\cos(\alpha + \beta)$       d.  $\sin(\alpha + \beta)$ .

**SOLUTION**

- a. We find  $\cos \alpha$  using a sketch that illustrates

$$\sin \alpha = \frac{12}{13} = \frac{y}{r}.$$

**Figure 5.2** shows a quadrant II angle  $\alpha$  with  $\sin \alpha = \frac{12}{13}$ . We find  $x$  using  $x^2 + y^2 = r^2$ . Because  $\alpha$  lies in quadrant II,  $x$  is negative.

$$x^2 + 12^2 = 13^2$$

$$x^2 + y^2 = r^2$$

$$x^2 + 144 = 169$$

Square 12 and 13, respectively.

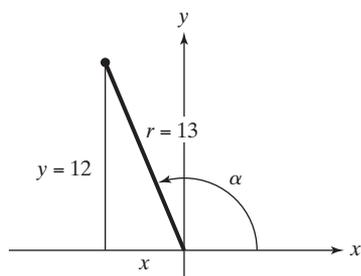

$$x^2 = 25$$

Subtract 144 from both sides.

$$x = -\sqrt{25} = -5$$

If  $x^2 = 25$ , then  $x = \pm\sqrt{25} = \pm 5$ .

Choose  $x = -\sqrt{25}$  because in quadrant II,  $x$  is negative.

**FIGURE 5.2**  $\sin \alpha = \frac{12}{13}$ ;  $\alpha$  lies in quadrant II.

Thus,

$$\cos \alpha = \frac{x}{r} = \frac{-5}{13} = -\frac{5}{13}.$$

- b. We find  $\cos \beta$  using a sketch that illustrates

$$\sin \beta = \frac{3}{5} = \frac{y}{r}.$$

**Figure 5.3** shows a quadrant I angle  $\beta$  with  $\sin \beta = \frac{3}{5}$ . We find  $x$  using  $x^2 + y^2 = r^2$ .

$$x^2 + 3^2 = 5^2$$

$$x^2 + y^2 = r^2$$

$$x^2 + 9 = 25$$

Square 3 and 5, respectively.

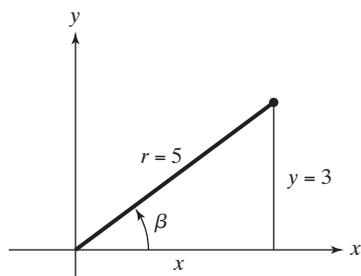

$$x^2 = 16$$

Subtract 9 from both sides.

$$x = \sqrt{16} = 4$$

If  $x^2 = 16$ , then  $x = \pm\sqrt{16} = \pm 4$ .

Choose  $x = \sqrt{16}$  because in quadrant I,  $x$  is positive.

**FIGURE 5.3**  $\sin \beta = \frac{3}{5}$ ;  $\beta$  lies in quadrant I.

Thus,

$$\cos \beta = \frac{x}{r} = \frac{4}{5}.$$

We use the given values and the exact values that we determined to find exact values for  $\cos(\alpha + \beta)$  and  $\sin(\alpha + \beta)$ .

These values are given.

$$\sin \alpha = \frac{12}{13}, \sin \beta = \frac{3}{5}$$

These are the values we found.

$$\cos \alpha = -\frac{5}{13}, \cos \beta = \frac{4}{5}$$

- c. We use the formula for the cosine of a sum.

$$\begin{aligned} \cos(\alpha + \beta) &= \cos \alpha \cos \beta - \sin \alpha \sin \beta \\ &= \left(-\frac{5}{13}\right)\left(\frac{4}{5}\right) - \frac{12}{13}\left(\frac{3}{5}\right) = -\frac{56}{65} \end{aligned}$$

d. We use the formula for the sine of a sum.

These values are given.

$$\sin \alpha = \frac{12}{13}, \sin \beta = \frac{3}{5}$$

These are the values we found.

$$\cos \alpha = -\frac{5}{13}, \cos \beta = \frac{4}{5}$$

$$\begin{aligned} \sin(\alpha + \beta) &= \sin \alpha \cos \beta + \cos \alpha \sin \beta \\ &= \frac{12}{13} \cdot \frac{4}{5} + \left(-\frac{5}{13}\right) \cdot \frac{3}{5} = \frac{33}{65} \end{aligned}$$

...

 **Check Point 5** Suppose that  $\sin \alpha = \frac{4}{5}$  for a quadrant II angle  $\alpha$  and  $\sin \beta = \frac{1}{2}$  for a quadrant I angle  $\beta$ . Find the exact value of each of the following:

- a.  $\cos \alpha$       b.  $\cos \beta$       c.  $\cos(\alpha + \beta)$       d.  $\sin(\alpha + \beta)$ .

### EXAMPLE 6 Verifying Observations on a Graphing Utility

**Figure 5.4** shows the graph of  $y = \sin\left(x - \frac{3\pi}{2}\right)$  in a  $\left[0, 2\pi, \frac{\pi}{2}\right]$  by  $[-2, 2, 1]$  viewing rectangle.

- a. Describe the graph using another equation.  
b. Verify that the two equations are equivalent.

#### SOLUTION

- a. The graph appears to be the cosine curve  $y = \cos x$ . It cycles through maximum, intercept, minimum, intercept, and back to maximum. Thus,  $y = \cos x$  also describes the graph.  
b. We must show that

$$\sin\left(x - \frac{3\pi}{2}\right) = \cos x.$$

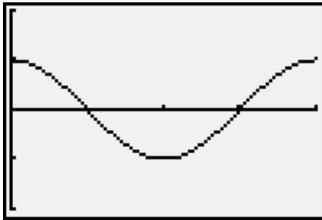

We apply the formula for the sine of a difference on the left side.

$$\begin{aligned} \sin\left(x - \frac{3\pi}{2}\right) &= \sin x \cos \frac{3\pi}{2} - \cos x \sin \frac{3\pi}{2} && \sin(\alpha - \beta) = \\ & && \sin \alpha \cos \beta - \cos \alpha \sin \beta \\ &= \sin x \cdot 0 - \cos x(-1) && \cos \frac{3\pi}{2} = 0 \text{ and } \sin \frac{3\pi}{2} = -1 \\ &= \cos x && \text{Simplify.} \end{aligned}$$

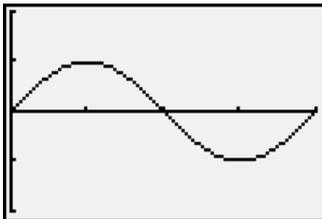

This verifies our observation that  $y = \sin\left(x - \frac{3\pi}{2}\right)$  and  $y = \cos x$  describe the same graph. ...

 **Check Point 6** **Figure 5.5** shows the graph of  $y = \cos\left(x + \frac{3\pi}{2}\right)$  in a  $\left[0, 2\pi, \frac{\pi}{2}\right]$  by  $[-2, 2, 1]$  viewing rectangle.

- a. Describe the graph using another equation.  
b. Verify that the two equations are equivalent.

**FIGURE 5.4** The graph of  $y = \sin\left(x - \frac{3\pi}{2}\right)$  in a  $\left[0, 2\pi, \frac{\pi}{2}\right]$  by  $[-2, 2, 1]$  viewing rectangle

**FIGURE 5.5**

- 3** Use sum and difference formulas for tangents.

### Sum and Difference Formulas for Tangents

By writing  $\tan(\alpha + \beta)$  as the quotient of  $\sin(\alpha + \beta)$  and  $\cos(\alpha + \beta)$ , we can develop a formula for the tangent of a sum. Writing subtraction as addition of an inverse leads to a formula for the tangent of a difference.

**DISCOVERY**

Derive the sum and difference formulas for tangents by working Exercises 55 and 56 in Exercise Set 5.2.

**Sum and Difference Formulas for Tangents**

$$\tan(\alpha + \beta) = \frac{\tan \alpha + \tan \beta}{1 - \tan \alpha \tan \beta}$$

The tangent of the sum of two angles equals the tangent of the first angle plus the tangent of the second angle divided by 1 minus their product.

$$\tan(\alpha - \beta) = \frac{\tan \alpha - \tan \beta}{1 + \tan \alpha \tan \beta}$$

The tangent of the difference of two angles equals the tangent of the first angle minus the tangent of the second angle divided by 1 plus their product.

**EXAMPLE 7** Verifying an Identity

Verify the identity:  $\tan\left(x - \frac{\pi}{4}\right) = \frac{\tan x - 1}{\tan x + 1}$ .

**SOLUTION**

We work with the left side.

$$\begin{aligned} \tan\left(x - \frac{\pi}{4}\right) &= \frac{\tan x - \tan \frac{\pi}{4}}{1 + \tan x \tan \frac{\pi}{4}} & \tan(\alpha - \beta) &= \frac{\tan \alpha - \tan \beta}{1 + \tan \alpha \tan \beta} \\ &= \frac{\tan x - 1}{1 + \tan x \cdot 1} & \tan \frac{\pi}{4} &= 1 \\ &= \frac{\tan x - 1}{\tan x + 1} \end{aligned}$$

 **Check Point 7** Verify the identity:  $\tan(x + \pi) = \tan x$ .

**CONCEPT AND VOCABULARY CHECK**

Fill in each blank so that the resulting statement is true.

- $\cos(x + y) =$  \_\_\_\_\_
- $\cos(x - y) =$  \_\_\_\_\_
- $\sin(C + D) =$  \_\_\_\_\_
- $\sin(C - D) =$  \_\_\_\_\_
- $\tan(\theta + \phi) =$  \_\_\_\_\_
- $\tan(\theta - \phi) =$  \_\_\_\_\_
- True or false: The cosine of the sum of two angles equals the sum of the cosines of those angles. \_\_\_\_\_
- True or false:  $\tan 75^\circ = \tan 30^\circ + \tan 45^\circ$  \_\_\_\_\_

**EXERCISE SET 5.2****Practice Exercises**

Use the formula for the cosine of the difference of two angles to solve Exercises 1–12.

In Exercises 1–4, find the exact value of each expression.

- $\cos(45^\circ - 30^\circ)$
- $\cos(120^\circ - 45^\circ)$
- $\cos\left(\frac{3\pi}{4} - \frac{\pi}{6}\right)$
- $\cos\left(\frac{2\pi}{3} - \frac{\pi}{6}\right)$

In Exercises 5–8, each expression is the right side of the formula for  $\cos(\alpha - \beta)$  with particular values for  $\alpha$  and  $\beta$ .

- Identify  $\alpha$  and  $\beta$  in each expression.
  - Write the expression as the cosine of an angle.
  - Find the exact value of the expression.
- $\cos 50^\circ \cos 20^\circ + \sin 50^\circ \sin 20^\circ$
  - $\cos 50^\circ \cos 5^\circ + \sin 50^\circ \sin 5^\circ$

7.  $\cos \frac{5\pi}{12} \cos \frac{\pi}{12} + \sin \frac{5\pi}{12} \sin \frac{\pi}{12}$

8.  $\cos \frac{5\pi}{18} \cos \frac{\pi}{9} + \sin \frac{5\pi}{18} \sin \frac{\pi}{9}$

In Exercises 9–12, verify each identity.

9.  $\frac{\cos(\alpha - \beta)}{\cos \alpha \sin \beta} = \tan \alpha + \cot \beta$

10.  $\frac{\cos(\alpha - \beta)}{\sin \alpha \sin \beta} = \cot \alpha \cot \beta + 1$

11.  $\cos\left(x - \frac{\pi}{4}\right) = \frac{\sqrt{2}}{2}(\cos x + \sin x)$

12.  $\cos\left(x - \frac{5\pi}{4}\right) = -\frac{\sqrt{2}}{2}(\cos x + \sin x)$

Use one or more of the six sum and difference identities to solve Exercises 13–54.

In Exercises 13–24, find the exact value of each expression.

13.  $\sin(45^\circ - 30^\circ)$

14.  $\sin(60^\circ - 45^\circ)$

15.  $\sin 105^\circ$

16.  $\sin 75^\circ$

17.  $\cos(135^\circ + 30^\circ)$

18.  $\cos(240^\circ + 45^\circ)$

19.  $\cos 75^\circ$

20.  $\cos 105^\circ$

21.  $\tan\left(\frac{\pi}{6} + \frac{\pi}{4}\right)$

22.  $\tan\left(\frac{\pi}{3} + \frac{\pi}{4}\right)$

23.  $\tan\left(\frac{4\pi}{3} - \frac{\pi}{4}\right)$

24.  $\tan\left(\frac{5\pi}{3} - \frac{\pi}{4}\right)$

In Exercises 25–32, write each expression as the sine, cosine, or tangent of an angle. Then find the exact value of the expression.

25.  $\sin 25^\circ \cos 5^\circ + \cos 25^\circ \sin 5^\circ$

26.  $\sin 40^\circ \cos 20^\circ + \cos 40^\circ \sin 20^\circ$

27.  $\frac{\tan 10^\circ + \tan 35^\circ}{1 - \tan 10^\circ \tan 35^\circ}$

28.  $\frac{\tan 50^\circ - \tan 20^\circ}{1 + \tan 50^\circ \tan 20^\circ}$

29.  $\sin \frac{5\pi}{12} \cos \frac{\pi}{4} - \cos \frac{5\pi}{12} \sin \frac{\pi}{4}$

30.  $\sin \frac{7\pi}{12} \cos \frac{\pi}{12} - \cos \frac{7\pi}{12} \sin \frac{\pi}{12}$

31.  $\frac{\tan \frac{\pi}{5} - \tan \frac{\pi}{30}}{1 + \tan \frac{\pi}{5} \tan \frac{\pi}{30}}$

32.  $\frac{\tan \frac{\pi}{5} + \tan \frac{4\pi}{5}}{1 - \tan \frac{\pi}{5} \tan \frac{4\pi}{5}}$

In Exercises 33–54, verify each identity.

33.  $\sin\left(x + \frac{\pi}{2}\right) = \cos x$

34.  $\sin\left(x + \frac{3\pi}{2}\right) = -\cos x$

35.  $\cos\left(x - \frac{\pi}{2}\right) = \sin x$

36.  $\cos(\pi - x) = -\cos x$

37.  $\tan(2\pi - x) = -\tan x$

38.  $\tan(\pi - x) = -\tan x$

39.  $\sin(\alpha + \beta) + \sin(\alpha - \beta) = 2 \sin \alpha \cos \beta$

40.  $\cos(\alpha + \beta) + \cos(\alpha - \beta) = 2 \cos \alpha \cos \beta$

41.  $\frac{\sin(\alpha - \beta)}{\cos \alpha \cos \beta} = \tan \alpha - \tan \beta$

42.  $\frac{\sin(\alpha + \beta)}{\cos \alpha \cos \beta} = \tan \alpha + \tan \beta$

43.  $\tan\left(\theta + \frac{\pi}{4}\right) = \frac{\cos \theta + \sin \theta}{\cos \theta - \sin \theta}$

44.  $\tan\left(\frac{\pi}{4} - \theta\right) = \frac{\cos \theta - \sin \theta}{\cos \theta + \sin \theta}$

45.  $\cos(\alpha + \beta) \cos(\alpha - \beta) = \cos^2 \beta - \sin^2 \alpha$

46.  $\sin(\alpha + \beta) \sin(\alpha - \beta) = \cos^2 \beta - \cos^2 \alpha$

47.  $\frac{\sin(\alpha + \beta)}{\sin(\alpha - \beta)} = \frac{\tan \alpha + \tan \beta}{\tan \alpha - \tan \beta}$

48.  $\frac{\cos(\alpha + \beta)}{\cos(\alpha - \beta)} = \frac{1 - \tan \alpha \tan \beta}{1 + \tan \alpha \tan \beta}$

49.  $\frac{\cos(x + h) - \cos x}{h} = \cos x \frac{\cos h - 1}{h} - \sin x \frac{\sin h}{h}$

50.  $\frac{\sin(x + h) - \sin x}{h} = \cos x \frac{\sin h}{h} + \sin x \frac{\cos h - 1}{h}$

51.  $\sin 2\alpha = 2 \sin \alpha \cos \alpha$

Hint: Write  $\sin 2\alpha$  as  $\sin(\alpha + \alpha)$ .

52.  $\cos 2\alpha = \cos^2 \alpha - \sin^2 \alpha$

Hint: Write  $\cos 2\alpha$  as  $\cos(\alpha + \alpha)$ .

53.  $\tan 2\alpha = \frac{2 \tan \alpha}{1 - \tan^2 \alpha}$

Hint: Write  $\tan 2\alpha$  as  $\tan(\alpha + \alpha)$ .

54.  $\tan\left(\frac{\pi}{4} + \alpha\right) - \tan\left(\frac{\pi}{4} - \alpha\right) = 2 \tan 2\alpha$

Hint: Use the result in Exercise 53.

55. Derive the identity for  $\tan(\alpha + \beta)$  using

$$\tan(\alpha + \beta) = \frac{\sin(\alpha + \beta)}{\cos(\alpha + \beta)}$$

After applying the formulas for sums of sines and cosines, divide the numerator and denominator by  $\cos \alpha \cos \beta$ .

56. Derive the identity for  $\tan(\alpha - \beta)$  using

$$\tan(\alpha - \beta) = \tan[\alpha + (-\beta)].$$

After applying the formula for the tangent of the sum of two angles, use the fact that the tangent is an odd function.

In Exercises 57–64, find the exact value of the following under the given conditions:

a.  $\cos(\alpha + \beta)$       b.  $\sin(\alpha + \beta)$       c.  $\tan(\alpha + \beta)$ .

57.  $\sin \alpha = \frac{3}{5}$ ,  $\alpha$  lies in quadrant I, and  $\sin \beta = \frac{5}{13}$ ,  $\beta$  lies in quadrant II.

58.  $\sin \alpha = \frac{4}{5}$ ,  $\alpha$  lies in quadrant I, and  $\sin \beta = \frac{7}{25}$ ,  $\beta$  lies in quadrant II.

59.  $\tan \alpha = -\frac{3}{4}$ ,  $\alpha$  lies in quadrant II, and  $\cos \beta = \frac{1}{3}$ ,  $\beta$  lies in quadrant I.

60.  $\tan \alpha = -\frac{4}{3}$ ,  $\alpha$  lies in quadrant II, and  $\cos \beta = \frac{2}{3}$ ,  $\beta$  lies in quadrant I.

61.  $\cos \alpha = \frac{8}{17}$ ,  $\alpha$  lies in quadrant IV, and  $\sin \beta = -\frac{1}{2}$ ,  $\beta$  lies in quadrant III.

62.  $\cos \alpha = \frac{1}{2}$ ,  $\alpha$  lies in quadrant IV, and  $\sin \beta = -\frac{1}{3}$ ,  $\beta$  lies in quadrant III.

63.  $\tan \alpha = \frac{3}{4}$ ,  $\pi < \alpha < \frac{3\pi}{2}$ , and  $\cos \beta = \frac{1}{4}$ ,  $\frac{3\pi}{2} < \beta < 2\pi$ .

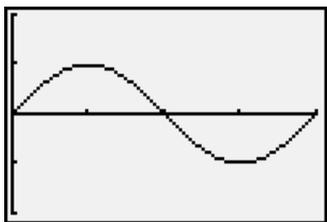

64.  $\sin \alpha = \frac{5}{6}$ ,  $\frac{\pi}{2} < \alpha < \pi$ , and  $\tan \beta = \frac{3}{7}$ ,  $\pi < \beta < \frac{3\pi}{2}$ .

In Exercises 65–68, the graph with the given equation is shown in a  $\left[0, 2\pi, \frac{\pi}{2}\right]$  by  $[-2, 2, 1]$  viewing rectangle.

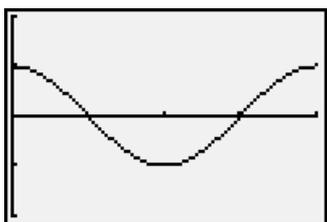

a. Describe the graph using another equation.

b. Verify that the two equations are equivalent.

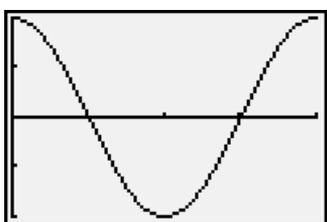

65.  $y = \sin(\pi - x)$

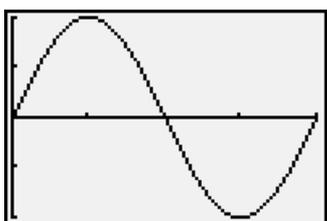

66.  $y = \cos(x - 2\pi)$

67.  $y = \sin\left(x + \frac{\pi}{2}\right) + \sin\left(\frac{\pi}{2} - x\right)$

68.  $y = \cos\left(x - \frac{\pi}{2}\right) - \cos\left(x + \frac{\pi}{2}\right)$

### Practice Plus

In Exercises 69–74, rewrite each expression as a simplified expression containing one term.

69.  $\cos(\alpha + \beta) \cos \beta + \sin(\alpha + \beta) \sin \beta$

70.  $\sin(\alpha - \beta) \cos \beta + \cos(\alpha - \beta) \sin \beta$

71.  $\frac{\sin(\alpha + \beta) - \sin(\alpha - \beta)}{\cos(\alpha + \beta) + \cos(\alpha - \beta)}$

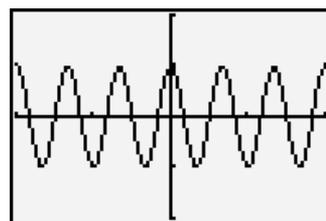

72.  $\frac{\cos(\alpha - \beta) + \cos(\alpha + \beta)}{-\sin(\alpha - \beta) + \sin(\alpha + \beta)}$

73.  $\cos\left(\frac{\pi}{6} + \alpha\right) \cos\left(\frac{\pi}{6} - \alpha\right) - \sin\left(\frac{\pi}{6} + \alpha\right) \sin\left(\frac{\pi}{6} - \alpha\right)$   
(Do not use four different identities to solve this exercise.)

74.  $\sin\left(\frac{\pi}{3} - \alpha\right) \cos\left(\frac{\pi}{3} + \alpha\right) + \cos\left(\frac{\pi}{3} - \alpha\right) \sin\left(\frac{\pi}{3} + \alpha\right)$   
(Do not use four different identities to solve this exercise.)

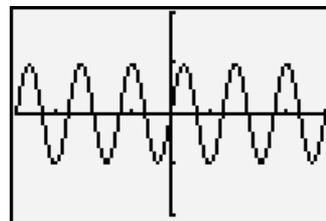

In Exercises 75–78, half of an identity and the graph of this half are given. Use the graph to make a conjecture as to what the right side of the identity should be. Then prove your conjecture.

75.  $\cos 2x \cos 5x + \sin 2x \sin 5x = ?$

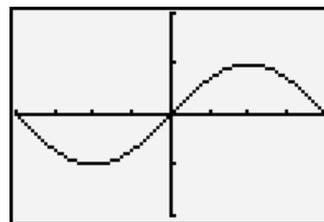

$[-2\pi, 2\pi, \frac{\pi}{2}]$  by  $[-2, 2, 1]$

76.  $\sin 5x \cos 2x - \cos 5x \sin 2x = ?$

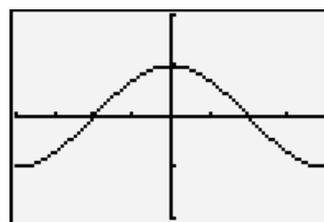

$[-2\pi, 2\pi, \frac{\pi}{2}]$  by  $[-2, 2, 1]$

77.  $\sin \frac{5x}{2} \cos 2x - \cos \frac{5x}{2} \sin 2x = ?$

$[-2\pi, 2\pi, \frac{\pi}{2}]$  by  $[-2, 2, 1]$

78.  $\cos \frac{5x}{2} \cos 2x + \sin \frac{5x}{2} \sin 2x = ?$

$[-2\pi, 2\pi, \frac{\pi}{2}]$  by  $[-2, 2, 1]$

### Application Exercises

79. A ball attached to a spring is raised 2 feet and released with an initial vertical velocity of 3 feet per second. The distance of the ball from its rest position after  $t$  seconds is given by  $d = 2 \cos t + 3 \sin t$ . Show that

$$2 \cos t + 3 \sin t = \sqrt{13} \cos(t - \theta),$$

where  $\theta$  lies in quadrant I and  $\tan \theta = \frac{3}{2}$ . Use the identity to find the amplitude and the period of the ball's motion.

80. A tuning fork is held a certain distance from your ears and struck. Your eardrums' vibrations after  $t$  seconds are given by  $p = 3 \sin 2t$ . When a second tuning fork is struck, the formula  $p = 2 \sin(2t + \pi)$  describes the effects of the sound on the eardrums' vibrations. The total vibrations are given by  $p = 3 \sin 2t + 2 \sin(2t + \pi)$ .

- Simplify  $p$  to a single term containing the sine.
- If the amplitude of  $p$  is zero, no sound is heard. Based on your equation in part (a), does this occur with the two tuning forks in this exercise? Explain your answer.

### Writing in Mathematics

In Exercises 81–86, use words to describe the formula for each of the following:

- the cosine of the difference of two angles.
- the cosine of the sum of two angles.
- the sine of the sum of two angles.
- the sine of the difference of two angles.
- the tangent of the difference of two angles.
- the tangent of the sum of two angles.
- The distance formula and the definitions for cosine and sine are used to prove the formula for the cosine of the difference of two angles. This formula logically leads the way to the other sum and difference identities. Using this development of ideas and formulas, describe a characteristic of mathematical logic.

### Technology Exercises

In Exercises 88–93, graph each side of the equation in the same viewing rectangle. If the graphs appear to coincide, verify that the equation is an identity. If the graphs do not appear to coincide, this indicates that the equation is not an identity. In these exercises, find a value of  $x$  for which both sides are defined but not equal.

- $\cos\left(\frac{3\pi}{2} - x\right) = -\sin x$
- $\tan(\pi - x) = -\tan x$

$$90. \sin\left(x + \frac{\pi}{2}\right) = \sin x + \sin \frac{\pi}{2}$$

$$91. \cos\left(x + \frac{\pi}{2}\right) = \cos x + \cos \frac{\pi}{2}$$

$$92. \cos 1.2x \cos 0.8x - \sin 1.2x \sin 0.8x = \cos 2x$$

$$93. \sin 1.2x \cos 0.8x + \cos 1.2x \sin 0.8x = \sin 2x$$

### Critical Thinking Exercises

**Make Sense?** In Exercises 94–97, determine whether each statement makes sense or does not make sense, and explain your reasoning.

- I've noticed that for sine, cosine, and tangent, the trig function for the sum of two angles is not equal to that trig function of the first angle plus that trig function of the second angle.
- After using an identity to determine the exact value of  $\sin 105^\circ$ , I verified the result with a calculator.
- Using sum and difference formulas, I can find exact values for sine, cosine, and tangent at any angle.
- After the difference formula for cosines is verified, I noticed that the other sum and difference formulas are verified relatively quickly.
- Verify the identity:

$$\frac{\sin(x - y)}{\cos x \cos y} + \frac{\sin(y - z)}{\cos y \cos z} + \frac{\sin(z - x)}{\cos z \cos x} = 0.$$

In Exercises 99–102, find the exact value of each expression. Do not use a calculator.

$$99. \sin\left(\cos^{-1}\frac{1}{2} + \sin^{-1}\frac{3}{5}\right)$$

$$100. \sin\left[\sin^{-1}\frac{3}{5} - \cos^{-1}\left(-\frac{4}{5}\right)\right]$$

$$101. \cos\left(\tan^{-1}\frac{4}{3} + \cos^{-1}\frac{5}{13}\right)$$

$$102. \cos\left[\cos^{-1}\left(-\frac{\sqrt{3}}{2}\right) - \sin^{-1}\left(-\frac{1}{2}\right)\right]$$

In Exercises 103–105, write each trigonometric expression as an algebraic expression (that is, without any trigonometric functions). Assume that  $x$  and  $y$  are positive and in the domain of the given inverse trigonometric function.

$$103. \cos(\sin^{-1} x - \cos^{-1} y)$$

$$104. \sin(\tan^{-1} x - \sin^{-1} y)$$

$$105. \tan(\sin^{-1} x + \cos^{-1} y)$$

## Group Exercise

106. Remembering the six sum and difference identities can be difficult. Did you have problems with some exercises because the identity you were using in your head turned out to be an incorrect formula? Are there easy ways to remember the six new identities presented in this section? Group members should address this question, considering one identity at a time. For each formula, list ways to make it easier to remember.

## Preview Exercises

Exercises 107–109 will help you prepare for the material covered in the next section.

107. Give exact values for  $\sin 30^\circ$ ,  $\cos 30^\circ$ ,  $\sin 60^\circ$ , and  $\cos 60^\circ$ .
108. Use the appropriate values from Exercise 107 to answer each of the following.
- Is  $\sin(2 \cdot 30^\circ)$ , or  $\sin 60^\circ$ , equal to  $2 \sin 30^\circ$ ?
  - Is  $\sin(2 \cdot 30^\circ)$ , or  $\sin 60^\circ$ , equal to  $2 \sin 30^\circ \cos 30^\circ$ ?
109. Use appropriate values from Exercise 107 to answer each of the following.
- Is  $\cos(2 \cdot 30^\circ)$ , or  $\cos 60^\circ$ , equal to  $2 \cos 30^\circ$ ?
  - Is  $\cos(2 \cdot 30^\circ)$ , or  $\cos 60^\circ$ , equal to  $\cos^2 30^\circ - \sin^2 30^\circ$ ?

## SECTION 5.3

## Double-Angle, Power-Reducing, and Half-Angle Formulas

## Objectives

- 1 Use the double-angle formulas.
- 2 Use the power-reducing formulas.
- 3 Use the half-angle formulas.

We have a long history of throwing things. Prior to 400 B.C., the Greeks competed in games that included discus throwing. In the seventeenth century, English soldiers organized cannonball-throwing competitions. In 1827, a Yale University student, disappointed over failing an exam, took out his frustrations at the passing of a collection plate in chapel. Seizing the monetary tray, he flung it in the direction of a

large open space on campus. Yale students see this act of frustration as the origin of the Frisbee.

In this section, we develop other important classes of identities, called the double-angle, power-reducing, and half-angle formulas. We will see how one of these formulas can be used by athletes to increase throwing distance.

## Double-Angle Formulas

A number of basic identities follow from the sum formulas for sine, cosine, and tangent. The first category of identities involves **double-angle formulas**.

## Double-Angle Formulas

$$\begin{aligned}\sin 2\theta &= 2 \sin \theta \cos \theta \\ \cos 2\theta &= \cos^2 \theta - \sin^2 \theta \\ \tan 2\theta &= \frac{2 \tan \theta}{1 - \tan^2 \theta}\end{aligned}$$

To prove each of these formulas, we replace  $\alpha$  and  $\beta$  by  $\theta$  in the sum formulas for  $\sin(\alpha + \beta)$ ,  $\cos(\alpha + \beta)$ , and  $\tan(\alpha + \beta)$ .

- 1 Use the double-angle formulas.

## GREAT QUESTION!

Isn't it easier to write  $\sin 2\theta = 2 \sin \theta$  and not bother memorizing the double-angle formula?

No. The 2 that appears in each of the double-angle expressions cannot be pulled to the front and written as a coefficient.

**Incorrect!**

$$\begin{aligned} \sin 2\theta &= 2 \sin \theta \\ \cos 2\theta &= 2 \cos \theta \\ \tan 2\theta &= 2 \tan \theta \end{aligned}$$

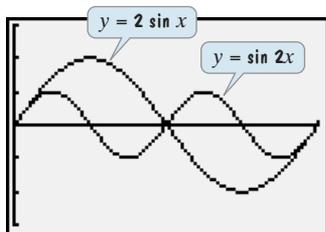

The figure shows that the graphs of

$$y = \sin 2x$$

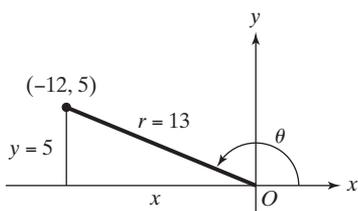

and

$$y = 2 \sin x$$

do not coincide:  $\sin 2x \neq 2 \sin x$ .

$[0, 2\pi, \frac{\pi}{2}]$  by  $[-3, 3, 1]$

**FIGURE 5.6**  $\sin \theta = \frac{5}{13}$  and  $\theta$  lies in quadrant II.

## DISCOVERY

Use a quotient identity and the results from parts (a) and (b) of Example 1 to find  $\tan 2\theta$ . Do you get the result in part (c)?

$$\bullet \sin 2\theta = \sin(\theta + \theta) = \sin \theta \cos \theta + \cos \theta \sin \theta = 2 \sin \theta \cos \theta$$

We use  
 $\sin(\alpha + \beta) = \sin \alpha \cos \beta + \cos \alpha \sin \beta$ .

$$\bullet \cos 2\theta = \cos(\theta + \theta) = \cos \theta \cos \theta - \sin \theta \sin \theta = \cos^2 \theta - \sin^2 \theta$$

We use  
 $\cos(\alpha + \beta) = \cos \alpha \cos \beta - \sin \alpha \sin \beta$ .

$$\bullet \tan 2\theta = \tan(\theta + \theta) = \frac{\tan \theta + \tan \theta}{1 - \tan \theta \tan \theta} = \frac{2 \tan \theta}{1 - \tan^2 \theta}$$

We use  
 $\tan(\alpha + \beta) = \frac{\tan \alpha + \tan \beta}{1 - \tan \alpha \tan \beta}$ .

## EXAMPLE 1 Using Double-Angle Formulas to Find Exact Values

If  $\sin \theta = \frac{5}{13}$  and  $\theta$  lies in quadrant II, find the exact value of each of the following:

- a.  $\sin 2\theta$       b.  $\cos 2\theta$       c.  $\tan 2\theta$ .

## SOLUTION

We begin with a sketch that illustrates

$$\sin \theta = \frac{5}{13} = \frac{y}{r}.$$

**Figure 5.6** shows a quadrant II angle  $\theta$  for which  $\sin \theta = \frac{5}{13}$ . We find  $x$  using  $x^2 + y^2 = r^2$ . Because  $\theta$  lies in quadrant II,  $x$  is negative.

$$x^2 + 5^2 = 13^2$$

$$x^2 + y^2 = r^2$$

$$x^2 + 25 = 169$$

Square 5 and 13, respectively.

$$x^2 = 144$$

Subtract 25 from both sides.

$$x = -\sqrt{144} = -12$$

If  $x^2 = 144$ , then  $x = \pm\sqrt{144} = \pm 12$ .

Choose  $x = -\sqrt{144}$  because in quadrant II,  $x$  is negative.

Now we can use values for  $x$ ,  $y$ , and  $r$  to find the required values. We will use

$$\cos \theta = \frac{x}{r} = -\frac{12}{13} \text{ and } \tan \theta = \frac{y}{x} = -\frac{5}{12}. \text{ We were given } \sin \theta = \frac{5}{13}.$$

$$\text{a. } \sin 2\theta = 2 \sin \theta \cos \theta = 2 \left( \frac{5}{13} \right) \left( -\frac{12}{13} \right) = -\frac{120}{169}$$

$$\text{b. } \cos 2\theta = \cos^2 \theta - \sin^2 \theta = \left( -\frac{12}{13} \right)^2 - \left( \frac{5}{13} \right)^2 = \frac{144}{169} - \frac{25}{169} = \frac{119}{169}$$

$$\begin{aligned} \text{c. } \tan 2\theta &= \frac{2 \tan \theta}{1 - \tan^2 \theta} = \frac{2 \left( -\frac{5}{12} \right)}{1 - \left( -\frac{5}{12} \right)^2} = \frac{-\frac{5}{6}}{1 - \frac{25}{144}} = \frac{-\frac{5}{6}}{\frac{119}{144}} \\ &= \left( -\frac{5}{6} \right) \left( \frac{144}{119} \right) = -\frac{120}{119} \end{aligned}$$

**Check Point 1** If  $\sin \theta = \frac{4}{5}$  and  $\theta$  lies in quadrant II, find the exact value of each of the following:

- a.  $\sin 2\theta$       b.  $\cos 2\theta$       c.  $\tan 2\theta$ .

**EXAMPLE 2** Using the Double-Angle Formula for Tangent to Find an Exact Value

Find the exact value of  $\frac{2 \tan 15^\circ}{1 - \tan^2 15^\circ}$ .

**SOLUTION**

The given expression is the right side of the formula for  $\tan 2\theta$  with  $\theta = 15^\circ$ .

$$\tan 2\theta = \frac{2 \tan \theta}{1 - \tan^2 \theta}$$

$$\frac{2 \tan 15^\circ}{1 - \tan^2 15^\circ} = \tan(2 \cdot 15^\circ) = \tan 30^\circ = \frac{\sqrt{3}}{3}$$

...

**Check Point 2** Find the exact value of  $\cos^2 15^\circ - \sin^2 15^\circ$ .

There are three forms of the double-angle formula for  $\cos 2\theta$ . The form we have seen involves both the cosine and the sine:

$$\cos 2\theta = \cos^2 \theta - \sin^2 \theta.$$

There are situations where it is more efficient to express  $\cos 2\theta$  in terms of just one trigonometric function. Using the Pythagorean identity  $\sin^2 \theta + \cos^2 \theta = 1$ , we can write  $\cos 2\theta = \cos^2 \theta - \sin^2 \theta$  in terms of the cosine only. We substitute  $1 - \cos^2 \theta$  for  $\sin^2 \theta$ .

$$\begin{aligned} \cos 2\theta &= \cos^2 \theta - \sin^2 \theta = \cos^2 \theta - (1 - \cos^2 \theta) \\ &= \cos^2 \theta - 1 + \cos^2 \theta = 2 \cos^2 \theta - 1 \end{aligned}$$

We can also use a Pythagorean identity to write  $\cos 2\theta$  in terms of sine only. We substitute  $1 - \sin^2 \theta$  for  $\cos^2 \theta$ .

$$\cos 2\theta = \cos^2 \theta - \sin^2 \theta = 1 - \sin^2 \theta - \sin^2 \theta = 1 - 2 \sin^2 \theta$$

**Three Forms of the Double-Angle Formula for  $\cos 2\theta$** 

$$\cos 2\theta = \cos^2 \theta - \sin^2 \theta$$

$$\cos 2\theta = 2 \cos^2 \theta - 1$$

$$\cos 2\theta = 1 - 2 \sin^2 \theta$$

**EXAMPLE 3** Verifying an Identity

Verify the identity:  $\cos 3\theta = 4 \cos^3 \theta - 3 \cos \theta$ .

**SOLUTION**

We begin by working with the left side. In order to obtain an expression for  $\cos 3\theta$ , we use the sum formula and write  $3\theta$  as  $2\theta + \theta$ .

$$\cos 3\theta = \cos(2\theta + \theta)$$

$$= \cos 2\theta \cos \theta - \sin 2\theta \sin \theta$$

$$2 \cos^2 \theta - 1$$

$$2 \sin \theta \cos \theta$$

$$= (2 \cos^2 \theta - 1) \cos \theta - 2 \sin \theta \cos \theta \sin \theta$$

$$= 2 \cos^3 \theta - \cos \theta - 2 \sin^2 \theta \cos \theta$$

$$1 - \cos^2 \theta$$

Write  $3\theta$  as  $2\theta + \theta$ .

$$\cos(\alpha + \beta)$$

$$= \cos \alpha \cos \beta - \sin \alpha \sin \beta$$

Substitute double-angle formulas. Because the right side of the given equation involves cosines only, use this form for  $\cos 2\theta$ . Multiply.

$$= 2 \cos^3 \theta - \cos \theta - 2(1 - \cos^2 \theta) \cos \theta$$

$$= 2 \cos^3 \theta - \cos \theta - 2 \cos \theta + 2 \cos^3 \theta$$

$$= 4 \cos^3 \theta - 3 \cos \theta$$

To get cosines only, use  $\sin^2 \theta + \cos^2 \theta = 1$  and substitute  $1 - \cos^2 \theta$  for  $\sin^2 \theta$ .

Multiply.

Simplify:

$$2 \cos^3 \theta + 2 \cos^3 \theta = 4 \cos^3 \theta$$

$$\text{and} \quad -\cos \theta - 2 \cos \theta = -3 \cos \theta.$$

We were required to verify  $\cos 3\theta = 4 \cos^3 \theta - 3 \cos \theta$ . By working with the left side,  $\cos 3\theta$ , and expressing it in a form identical to the right side, we have verified the identity. ●●●

 **Check Point 3** Verify the identity:  $\sin 3\theta = 3 \sin \theta - 4 \sin^3 \theta$ .

**2** Use the power-reducing formulas.

### Power-Reducing Formulas

The double-angle formulas are used to derive the **power-reducing formulas**:

#### Power-Reducing Formulas

$$\sin^2 \theta = \frac{1 - \cos 2\theta}{2} \quad \cos^2 \theta = \frac{1 + \cos 2\theta}{2} \quad \tan^2 \theta = \frac{1 - \cos 2\theta}{1 + \cos 2\theta}$$

We can prove the first two formulas in the box by working with two forms of the double-angle formula for  $\cos 2\theta$ .

This is the form with sine only.

$$\cos 2\theta = 1 - 2 \sin^2 \theta$$

This is the form with cosine only.

$$\cos 2\theta = 2 \cos^2 \theta - 1$$

Solve the formula on the left for  $\sin^2 \theta$ . Solve the formula on the right for  $\cos^2 \theta$ .

$$2 \sin^2 \theta = 1 - \cos 2\theta$$

$$2 \cos^2 \theta = 1 + \cos 2\theta$$

$$\sin^2 \theta = \frac{1 - \cos 2\theta}{2}$$

$$\cos^2 \theta = \frac{1 + \cos 2\theta}{2}$$

Divide both sides of each equation by 2.

These are the first two formulas in the box. The third formula in the box is proved by writing the tangent as the quotient of the sine and the cosine.

$$\tan^2 \theta = \frac{\sin^2 \theta}{\cos^2 \theta} = \frac{\frac{1 - \cos 2\theta}{2}}{\frac{1 + \cos 2\theta}{2}} = \frac{1 - \cos 2\theta}{2} \cdot \frac{2}{1 + \cos 2\theta} = \frac{1 - \cos 2\theta}{1 + \cos 2\theta}$$

Power-reducing formulas are quite useful in calculus. By reducing the power of trigonometric functions, calculus can better explore the relationship between a function and how it is changing at every single instant in time.

#### EXAMPLE 4 Reducing the Power of a Trigonometric Function

Write an equivalent expression for  $\cos^4 x$  that does not contain powers of trigonometric functions greater than 1.

## SOLUTION

Our goal is to rewrite  $\cos^4 x$  without powers of trigonometric functions greater than 1. To achieve this goal, we will apply the formula for  $\cos^2 \theta$  twice.

$$\begin{aligned}\cos^4 x &= (\cos^2 x)^2 \\ &= \left(\frac{1 + \cos 2x}{2}\right)^2 \\ &= \frac{1 + 2 \cos 2x + \cos^2 2x}{4}\end{aligned}$$

Use  $\cos^2 \theta = \frac{1 + \cos 2\theta}{2}$  with  $\theta = x$ .

Square the numerator:  
 $(A + B)^2 = A^2 + 2AB + B^2$ .  
Square the denominator.

$$= \frac{1}{4} + \frac{1}{2} \cos 2x + \frac{1}{4} \cos^2 2x$$

Divide each term in the numerator by 4.

We can reduce the power of  $\cos^2 2x$  using  
 $\cos^2 \theta = \frac{1 + \cos 2\theta}{2}$   
with  $\theta = 2x$ .

$$= \frac{1}{4} + \frac{1}{2} \cos 2x + \frac{1}{4} \left[ \frac{1 + \cos 2(2x)}{2} \right]$$

Use the power-reducing formula for  $\cos^2 \theta$  with  $\theta = 2x$ .

$$= \frac{1}{4} + \frac{1}{2} \cos 2x + \frac{1}{8} (1 + \cos 4x)$$

Multiply.

$$= \frac{1}{4} + \frac{1}{2} \cos 2x + \frac{1}{8} + \frac{1}{8} \cos 4x$$

Distribute  $\frac{1}{8}$  throughout parentheses.

$$= \frac{3}{8} + \frac{1}{2} \cos 2x + \frac{1}{8} \cos 4x$$

Simplify:  $\frac{1}{4} + \frac{1}{8} = \frac{2}{8} + \frac{1}{8} = \frac{3}{8}$ .

Thus,  $\cos^4 x = \frac{3}{8} + \frac{1}{2} \cos 2x + \frac{1}{8} \cos 4x$ . The expression for  $\cos^4 x$  does not contain powers of trigonometric functions greater than 1. ●●●

 **Check Point 4** Write an equivalent expression for  $\sin^4 x$  that does not contain powers of trigonometric functions greater than 1.

### 3 Use the half-angle formulas.

## GREAT QUESTION!

Isn't it easier to write

$\sin \frac{\theta}{2} = \frac{1}{2} \sin \theta$  and not bother memorizing the half-angle formula?

No. The  $\frac{1}{2}$  that appears in each of the half-angle formulas cannot be pulled to the front and written as a coefficient.

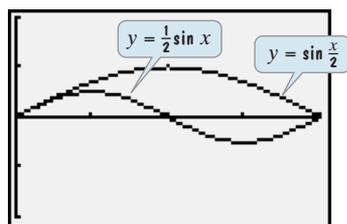

**Incorrect!**

~~$$\sin \frac{\theta}{2} = \frac{1}{2} \sin \theta$$~~

~~$$\cos \frac{\theta}{2} = \frac{1}{2} \cos \theta$$~~

~~$$\tan \frac{\theta}{2} = \frac{1}{2} \tan \theta$$~~

The figure shows that the graphs of  $y = \sin \frac{x}{2}$  and  $y = \frac{1}{2} \sin x$  do not coincide:  $\sin \frac{x}{2} \neq \frac{1}{2} \sin x$ .

$[0, 2\pi, \frac{\pi}{2}]$  by  $[-2, 2, 1]$

## Half-Angle Formulas

Useful equivalent forms of the power-reducing formulas can be obtained by replacing  $\theta$  with  $\frac{\alpha}{2}$ . Then solve for the trigonometric function on the left sides of the equations. The resulting identities are called the **half-angle formulas**:

### Half-Angle Formulas

$$\sin \frac{\alpha}{2} = \pm \sqrt{\frac{1 - \cos \alpha}{2}}$$

$$\cos \frac{\alpha}{2} = \pm \sqrt{\frac{1 + \cos \alpha}{2}}$$

$$\tan \frac{\alpha}{2} = \pm \sqrt{\frac{1 - \cos \alpha}{1 + \cos \alpha}}$$

The  $\pm$  symbol in each formula does not mean that there are two possible values for each function. Instead, the  $\pm$  indicates that you must determine the sign of the trigonometric function,  $+$  or  $-$ , based on the quadrant in which the half-angle  $\frac{\alpha}{2}$  lies.

If we know the exact value for the cosine of an angle, we can use the half-angle formulas to find exact values of sine, cosine, and tangent for half of that angle. For example, we know that  $\cos 225^\circ = -\frac{\sqrt{2}}{2}$ . In the next example, we find the exact value of the cosine of half of  $225^\circ$ , or  $\cos 112.5^\circ$ .

### EXAMPLE 5 Using a Half-Angle Formula to Find an Exact Value

Find the exact value of  $\cos 112.5^\circ$ .

#### SOLUTION

Because  $112.5^\circ = \frac{225^\circ}{2}$ , we use the half-angle formula for  $\cos \frac{\alpha}{2}$  with  $\alpha = 225^\circ$ . What sign should we use when we apply the formula? Because  $112.5^\circ$  lies in quadrant II, where only the sine and cosecant are positive,  $\cos 112.5^\circ < 0$ . Thus, we use the  $-$  sign in the half-angle formula.

$$\begin{aligned} \cos 112.5^\circ &= \cos \frac{225^\circ}{2} \\ &= -\sqrt{\frac{1 + \cos 225^\circ}{2}} && \text{Use } \cos \frac{\alpha}{2} = -\sqrt{\frac{1 + \cos \alpha}{2}} \text{ with } \alpha = 225^\circ. \\ &= -\sqrt{\frac{1 + \left(-\frac{\sqrt{2}}{2}\right)}{2}} && \cos 225^\circ = -\frac{\sqrt{2}}{2} \\ &= -\sqrt{\frac{2 - \sqrt{2}}{4}} && \text{Multiply the radicand by } \frac{2}{2}: \\ &= -\frac{\sqrt{2 - \sqrt{2}}}{2} && \frac{1 + \left(-\frac{\sqrt{2}}{2}\right)}{2} \cdot \frac{2}{2} = \frac{2 - \sqrt{2}}{4}. \\ & && \text{Simplify: } \sqrt{4} = 2. \end{aligned}$$

#### DISCOVERY

Use your calculator to find approximations for

$$-\frac{\sqrt{2 - \sqrt{2}}}{2}$$

and  $\cos 112.5^\circ$ . What do you observe?

### GREAT QUESTION!

**What's the relationship between  $\alpha$  and the signs I need to work with in the half-angle formulas?**

The sign *outside* the radical is determined by the half angle  $\frac{\alpha}{2}$ . By contrast, the sign of  $\cos \alpha$ , which appears *under* the radical, is determined by the full angle  $\alpha$ .

$$\sin \frac{\alpha}{2} = \pm \sqrt{\frac{1 - \cos \alpha}{2}}$$

The sign is determined by the quadrant of  $\frac{\alpha}{2}$ .

The sign of  $\cos \alpha$  is determined by the quadrant of  $\alpha$ .

 **Check Point 5** Use  $\cos 210^\circ = -\frac{\sqrt{3}}{2}$  to find the exact value of  $\cos 105^\circ$ .

There are alternate formulas for  $\tan \frac{\alpha}{2}$  that do not require us to determine what sign to use when applying the formula. These formulas are logically connected to the identities in Example 6 and Check Point 6.

**EXAMPLE 6** Verifying an IdentityVerify the identity:  $\tan \theta = \frac{1 - \cos 2\theta}{\sin 2\theta}$ .**SOLUTION**

We work with the right side.

$$\begin{aligned} \frac{1 - \cos 2\theta}{\sin 2\theta} &= \frac{1 - (1 - 2 \sin^2 \theta)}{2 \sin \theta \cos \theta} \\ &= \frac{2 \sin^2 \theta}{2 \sin \theta \cos \theta} \\ &= \frac{\sin \theta}{\cos \theta} \\ &= \tan \theta \end{aligned}$$

The form  $\cos 2\theta = 1 - 2 \sin^2 \theta$  is used because it produces only one term in the numerator. Use the double-angle formula for sine in the denominator.

Simplify the numerator.

Divide the numerator and denominator by  $2 \sin \theta$ .

Use a quotient identity:  $\tan \theta = \frac{\sin \theta}{\cos \theta}$ .

The right side simplifies to  $\tan \theta$ , the expression on the left side. Thus, the identity is verified. ...

**Check Point 6** Verify the identity:  $\tan \theta = \frac{\sin 2\theta}{1 + \cos 2\theta}$ .

Half-angle formulas for  $\tan \frac{\alpha}{2}$  can be obtained using the identities in Example 6 and Check Point 6:

$$\tan \theta = \frac{1 - \cos 2\theta}{\sin 2\theta} \quad \text{and} \quad \tan \theta = \frac{\sin 2\theta}{1 + \cos 2\theta}$$

Do you see how to do this? Replace each occurrence of  $\theta$  with  $\frac{\alpha}{2}$ . This results in the following identities:

**GREAT QUESTION!**

I'm suffering from identity overload! Where can I find a complete list of all the trigonometric identities I should know?

We've provided a box at the end of this section that contains all identities presented so far.

**Half-Angle Formulas for Tangent**

$$\begin{aligned} \tan \frac{\alpha}{2} &= \frac{1 - \cos \alpha}{\sin \alpha} \\ \tan \frac{\alpha}{2} &= \frac{\sin \alpha}{1 + \cos \alpha} \end{aligned}$$

**EXAMPLE 7** Verifying an IdentityVerify the identity:  $\tan \frac{\alpha}{2} = \csc \alpha - \cot \alpha$ .**SOLUTION**

We begin with the right side.

$$\csc \alpha - \cot \alpha = \frac{1}{\sin \alpha} - \frac{\cos \alpha}{\sin \alpha} = \frac{1 - \cos \alpha}{\sin \alpha} = \tan \frac{\alpha}{2}$$

Express functions in terms of sines and cosines.

This is the first of the two half-angle formulas in the preceding box.

We worked with the right side and arrived at the left side. Thus, the identity is verified. ...

**Check Point 7** Verify the identity:  $\tan \frac{\alpha}{2} = \frac{\sec \alpha}{\sec \alpha \csc \alpha + \csc \alpha}$ .

We conclude with a summary of the principal trigonometric identities developed in this section and the previous section. The fundamental identities can be found in the box on page 642.

### Principal Trigonometric Identities

#### Sum and Difference Formulas

$$\begin{aligned}\sin(\alpha + \beta) &= \sin \alpha \cos \beta + \cos \alpha \sin \beta & \sin(\alpha - \beta) &= \sin \alpha \cos \beta - \cos \alpha \sin \beta \\ \cos(\alpha + \beta) &= \cos \alpha \cos \beta - \sin \alpha \sin \beta & \cos(\alpha - \beta) &= \cos \alpha \cos \beta + \sin \alpha \sin \beta \\ \tan(\alpha + \beta) &= \frac{\tan \alpha + \tan \beta}{1 - \tan \alpha \tan \beta} & \tan(\alpha - \beta) &= \frac{\tan \alpha - \tan \beta}{1 + \tan \alpha \tan \beta}\end{aligned}$$

#### Double-Angle Formulas

$$\begin{aligned}\sin 2\theta &= 2 \sin \theta \cos \theta \\ \cos 2\theta &= \cos^2 \theta - \sin^2 \theta = 2 \cos^2 \theta - 1 = 1 - 2 \sin^2 \theta \\ \tan 2\theta &= \frac{2 \tan \theta}{1 - \tan^2 \theta}\end{aligned}$$

#### Power-Reducing Formulas

$$\sin^2 \theta = \frac{1 - \cos 2\theta}{2} \quad \cos^2 \theta = \frac{1 + \cos 2\theta}{2} \quad \tan^2 \theta = \frac{1 - \cos 2\theta}{1 + \cos 2\theta}$$

#### Half-Angle Formulas

$$\begin{aligned}\sin \frac{\alpha}{2} &= \pm \sqrt{\frac{1 - \cos \alpha}{2}} & \cos \frac{\alpha}{2} &= \pm \sqrt{\frac{1 + \cos \alpha}{2}} \\ \tan \frac{\alpha}{2} &= \pm \sqrt{\frac{1 - \cos \alpha}{1 + \cos \alpha}} = \frac{1 - \cos \alpha}{\sin \alpha} = \frac{\sin \alpha}{1 + \cos \alpha}\end{aligned}$$

### GREAT QUESTION!

Any hint to help remember the correct sign in the numerator in the first two power-reducing formulas and the first two half-angle formulas?

Remember *sinus-minus*—the sine is minus.

### CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- $\sin 2x = \underline{\hspace{2cm}}$
  - $\cos 2A = \cos^2 A - \underline{\hspace{2cm}} = \underline{\hspace{2cm}} - 1 = 1 - \underline{\hspace{2cm}}$
  - $\tan 2B = \underline{\hspace{2cm}}$
  - $\sin^2 \alpha = \frac{\underline{\hspace{2cm}}}{2}$
  - $\cos^2 \alpha = \frac{\underline{\hspace{2cm}}}{2}$
  - $\tan^2 y = \frac{\underline{\hspace{2cm}}}{1 + \cos 2y}$
  - $\sin \frac{x}{2} = \pm \sqrt{\frac{\underline{\hspace{2cm}}}{2}}$
  - $\cos \frac{y}{2} = \pm \sqrt{\frac{\underline{\hspace{2cm}}}{2}}$
  - $\tan \frac{\alpha}{2} = \pm \sqrt{\frac{\underline{\hspace{2cm}}}{1 + \cos \alpha}} = \frac{\underline{\hspace{2cm}}}{\sin \alpha} = \frac{\sin \alpha}{\underline{\hspace{2cm}}}$
  - True or false: The sine of twice an angle equals twice the sine of the angle.  $\underline{\hspace{2cm}}$
  - True or false:  $\frac{\cos 2A}{2} = \cos A$   $\underline{\hspace{2cm}}$
  - True or false: The tangent of half an angle equals half the tangent of the angle.  $\underline{\hspace{2cm}}$
- In Exercises 13–15, determine whether the positive or negative sign results in a true statement.*
- $\sin 100^\circ = \pm \sqrt{\frac{1 - \cos 200^\circ}{2}}$   $\underline{\hspace{2cm}}$
  - $\cos 100^\circ = \pm \sqrt{\frac{1 + \cos 200^\circ}{2}}$   $\underline{\hspace{2cm}}$
  - $\tan 200^\circ = \pm \sqrt{\frac{1 - \cos 400^\circ}{1 + \cos 400^\circ}}$   $\underline{\hspace{2cm}}$

## EXERCISE SET 5.3

## Practice Exercises

In Exercises 1–6, use the figures to find the exact value of each trigonometric function.

1.  $\sin 2\theta$       2.  $\cos 2\theta$       3.  $\tan 2\theta$   
 4.  $\sin 2\alpha$       5.  $\cos 2\alpha$       6.  $\tan 2\alpha$

In Exercises 7–14, use the given information to find the exact value of each of the following:

- a.  $\sin 2\theta$       b.  $\cos 2\theta$       c.  $\tan 2\theta$ .

7.  $\sin \theta = \frac{15}{17}$ ,  $\theta$  lies in quadrant II.  
 8.  $\sin \theta = \frac{12}{13}$ ,  $\theta$  lies in quadrant II.  
 9.  $\cos \theta = \frac{24}{25}$ ,  $\theta$  lies in quadrant IV.  
 10.  $\cos \theta = \frac{40}{41}$ ,  $\theta$  lies in quadrant IV.  
 11.  $\cot \theta = 2$ ,  $\theta$  lies in quadrant III.  
 12.  $\cot \theta = 3$ ,  $\theta$  lies in quadrant III.  
 13.  $\sin \theta = -\frac{9}{41}$ ,  $\theta$  lies in quadrant III.  
 14.  $\sin \theta = -\frac{2}{3}$ ,  $\theta$  lies in quadrant III.

In Exercises 15–22, write each expression as the sine, cosine, or tangent of a double angle. Then find the exact value of the expression.

15.  $2 \sin 15^\circ \cos 15^\circ$       16.  $2 \sin 22.5^\circ \cos 22.5^\circ$   
 17.  $\cos^2 75^\circ - \sin^2 75^\circ$       18.  $\cos^2 105^\circ - \sin^2 105^\circ$   
 19.  $2 \cos^2 \frac{\pi}{8} - 1$       20.  $1 - 2 \sin^2 \frac{\pi}{12}$   
 21.  $\frac{2 \tan \frac{\pi}{12}}{1 - \tan^2 \frac{\pi}{12}}$       22.  $\frac{2 \tan \frac{\pi}{8}}{1 - \tan^2 \frac{\pi}{8}}$

In Exercises 23–34, verify each identity.

23.  $\sin 2\theta = \frac{2 \tan \theta}{1 + \tan^2 \theta}$       24.  $\sin 2\theta = \frac{2 \cot \theta}{1 + \cot^2 \theta}$   
 25.  $(\sin \theta + \cos \theta)^2 = 1 + \sin 2\theta$   
 26.  $(\sin \theta - \cos \theta)^2 = 1 - \sin 2\theta$   
 27.  $\sin^2 x + \cos 2x = \cos^2 x$   
 28.  $1 - \tan^2 x = \frac{\cos 2x}{\cos^2 x}$   
 29.  $\cot x = \frac{\sin 2x}{1 - \cos 2x}$   
 30.  $\cot x = \frac{1 + \cos 2x}{\sin 2x}$   
 31.  $\sin 2t - \tan t = \tan t \cos 2t$   
 32.  $\sin 2t - \cot t = -\cot t \cos 2t$   
 33.  $\sin 4t = 4 \sin t \cos^3 t - 4 \sin^3 t \cos t$   
 34.  $\cos 4t = 8 \cos^4 t - 8 \cos^2 t + 1$

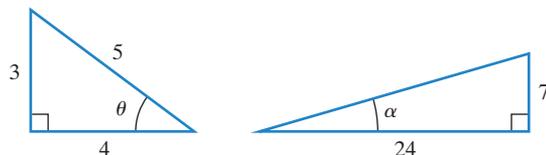

In Exercises 35–38, use the power-reducing formulas to rewrite each expression as an equivalent expression that does not contain powers of trigonometric functions greater than 1.

35.  $6 \sin^4 x$       36.  $10 \cos^4 x$   
 37.  $\sin^2 x \cos^2 x$       38.  $8 \sin^2 x \cos^2 x$

In Exercises 39–46, use a half-angle formula to find the exact value of each expression.

39.  $\sin 15^\circ$       40.  $\cos 22.5^\circ$       41.  $\cos 157.5^\circ$   
 42.  $\sin 105^\circ$       43.  $\tan 75^\circ$       44.  $\tan 112.5^\circ$   
 45.  $\tan \frac{7\pi}{8}$       46.  $\tan \frac{3\pi}{8}$

In Exercises 47–54, use the figures to find the exact value of each trigonometric function.

47.  $\sin \frac{\theta}{2}$       48.  $\cos \frac{\theta}{2}$       49.  $\tan \frac{\theta}{2}$   
 50.  $\sin \frac{\alpha}{2}$       51.  $\cos \frac{\alpha}{2}$       52.  $\tan \frac{\alpha}{2}$   
 53.  $2 \sin \frac{\theta}{2} \cos \frac{\theta}{2}$       54.  $2 \sin \frac{\alpha}{2} \cos \frac{\alpha}{2}$

In Exercises 55–58, use the given information to find the exact value of each of the following:

- a.  $\sin \frac{\alpha}{2}$       b.  $\cos \frac{\alpha}{2}$       c.  $\tan \frac{\alpha}{2}$ .  
 55.  $\tan \alpha = \frac{4}{3}$ ,  $180^\circ < \alpha < 270^\circ$   
 56.  $\tan \alpha = \frac{8}{15}$ ,  $180^\circ < \alpha < 270^\circ$   
 57.  $\sec \alpha = -\frac{13}{5}$ ,  $\frac{\pi}{2} < \alpha < \pi$   
 58.  $\sec \alpha = -3$ ,  $\frac{\pi}{2} < \alpha < \pi$

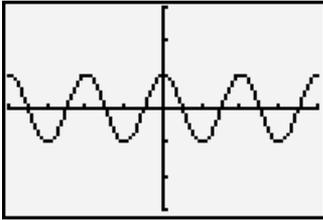

In Exercises 59–68, verify each identity.

59.  $\sin^2 \frac{\theta}{2} = \frac{\sec \theta - 1}{2 \sec \theta}$       60.  $\sin^2 \frac{\theta}{2} = \frac{\csc \theta - \cot \theta}{2 \csc \theta}$   
 61.  $\cos^2 \frac{\theta}{2} = \frac{\sin \theta + \tan \theta}{2 \tan \theta}$       62.  $\cos^2 \frac{\theta}{2} = \frac{\sec \theta + 1}{2 \sec \theta}$   
 63.  $\tan \frac{\alpha}{2} = \frac{\tan \alpha}{\sec \alpha + 1}$   
 64.  $2 \tan \frac{\alpha}{2} = \frac{\sin^2 \alpha + 1 - \cos^2 \alpha}{\sin \alpha(1 + \cos \alpha)}$   
 65.  $\cot \frac{x}{2} = \frac{\sin x}{1 - \cos x}$   
 66.  $\cot \frac{x}{2} = \frac{1 + \cos x}{\sin x}$   
 67.  $\tan \frac{x}{2} + \cot \frac{x}{2} = 2 \csc x$   
 68.  $\tan \frac{x}{2} - \cot \frac{x}{2} = -2 \cot x$

**Practice Plus**

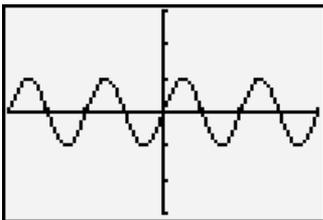

In Exercises 69–78, half of an identity and the graph of this half are given. Use the graph to make a conjecture as to what the right side of the identity should be. Then prove your conjecture.

69.  $\frac{\cot x - \tan x}{\cot x + \tan x} = ?$

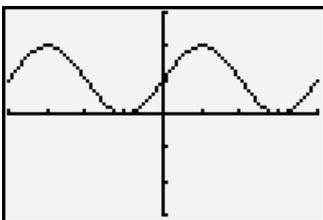

$[-2\pi, 2\pi, \frac{\pi}{2}]$  by  $[-3, 3, 1]$

70.  $\frac{2(\tan x - \cot x)}{\tan^2 x - \cot^2 x} = ?$

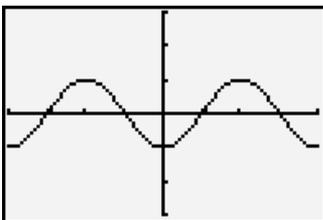

$[-2\pi, 2\pi, \frac{\pi}{2}]$  by  $[-3, 3, 1]$

71.  $\left(\sin \frac{x}{2} + \cos \frac{x}{2}\right)^2 = ?$

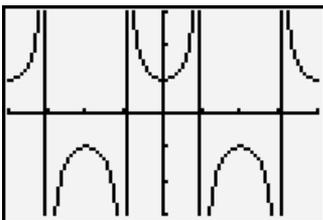

$[-2\pi, 2\pi, \frac{\pi}{2}]$  by  $[-3, 3, 1]$

72.  $\sin^2 \frac{x}{2} - \cos^2 \frac{x}{2} = ?$

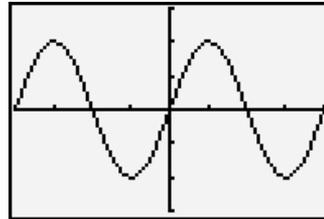

$[-2\pi, 2\pi, \frac{\pi}{2}]$  by  $[-3, 3, 1]$

73.  $\frac{\sin 2x}{\sin x} - \frac{\cos 2x}{\cos x} = ?$

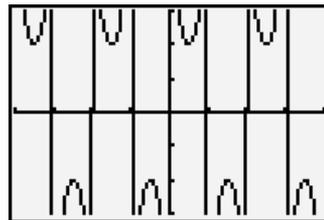

$[-2\pi, 2\pi, \frac{\pi}{2}]$  by  $[-3, 3, 1]$

74.  $\sin 2x \sec x = ?$

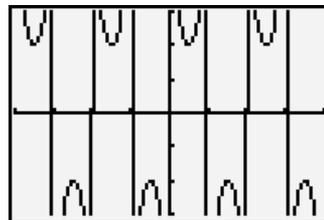

$[-2\pi, 2\pi, \frac{\pi}{2}]$  by  $[-3, 3, 1]$

75.  $\frac{\csc^2 x}{\cot x} = ?$

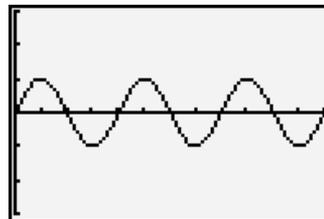

$[-2\pi, 2\pi, \frac{\pi}{2}]$  by  $[-3, 3, 1]$

76.  $\tan x + \cot x = ?$

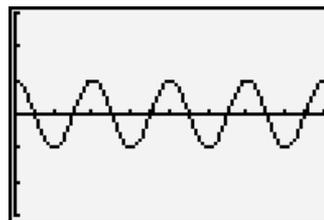

$[-2\pi, 2\pi, \frac{\pi}{2}]$  by  $[-3, 3, 1]$

77.  $\sin x(4 \cos^2 x - 1) = ?$

$[0, 2\pi, \frac{\pi}{6}]$  by  $[-3, 3, 1]$

78.  $1 - 8 \sin^2 x \cos^2 x = ?$

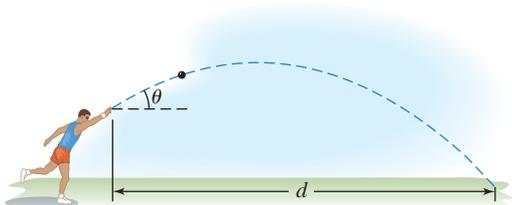

$[0, 2\pi, \frac{\pi}{8}]$  by  $[-3, 3, 1]$

## Application Exercises

79. Throwing events in track and field include the shot put, the discus throw, the hammer throw, and the javelin throw. The distance that the athlete can achieve depends on the initial speed of the object thrown and the angle above the horizontal at which the object leaves the hand. This angle is represented by  $\theta$  in the figure shown. The distance,  $d$ , in feet, that the athlete throws is modeled by the formula

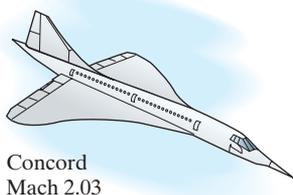

$$d = \frac{v_0^2}{16} \sin \theta \cos \theta,$$

in which  $v_0$  is the initial speed of the object thrown, in feet per second, and  $\theta$  is the angle, in degrees, at which the object leaves the hand.

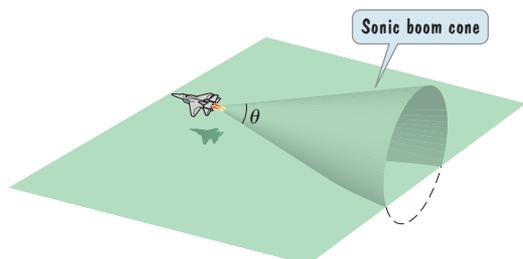

- Use an identity to express the formula so that it contains the sine function only.
- Use your formula from part (a) to find the angle,  $\theta$ , that produces the maximum distance,  $d$ , for a given initial speed,  $v_0$ .

Use this information to solve Exercises 80–81: The speed of a supersonic aircraft is usually represented by a Mach number, named after Austrian physicist Ernst Mach (1838–1916). A Mach number is the speed of the aircraft, in miles per hour, divided by the speed of sound, approximately 740 miles per hour. Thus, a plane flying at twice the speed of sound has a speed,  $M$ , of Mach 2.

If an aircraft has a speed greater than Mach 1, a sonic boom is heard, created by sound waves that form a cone with a vertex angle  $\theta$ , shown in the figure.

The relationship between the cone's vertex angle,  $\theta$ , and the Mach speed,  $M$ , of an aircraft that is flying faster than the speed of sound is given by

$$\sin \frac{\theta}{2} = \frac{1}{M}.$$

- If  $\theta = \frac{\pi}{6}$ , determine the Mach speed,  $M$ , of the aircraft. Express the speed as an exact value and as a decimal to the nearest tenth.
- If  $\theta = \frac{\pi}{4}$ , determine the Mach speed,  $M$ , of the aircraft. Express the speed as an exact value and as a decimal to the nearest tenth.

## Writing in Mathematics

In Exercises 82–89, use words to describe the formula for:

- the sine of double an angle.
- the cosine of double an angle. (Describe one of the three formulas.)
- the tangent of double an angle.
- the power-reducing formula for the sine squared of an angle.
- the power-reducing formula for the cosine squared of an angle.
- the sine of half an angle.
- the cosine of half an angle.
- the tangent of half an angle. (Describe one of the two formulas that does not involve a square root.)
- Explain how the double-angle formulas are derived.
- How can there be three forms of the double-angle formula for  $\cos 2\theta$ ?
- Without showing algebraic details, describe in words how to reduce the power of  $\cos^4 x$ .
- Describe one or more of the techniques you use to help remember the identities in the box on page 651.
- Your friend is about to compete as a shot-putter in a college field event. Using Exercise 79(b), write a short description to your friend on how to achieve the best distance possible in the throwing event.

## Technology Exercises

In Exercises 95–98, graph each side of the equation in the same viewing rectangle. If the graphs appear to coincide, verify that the equation is an identity. If the graphs do not appear to coincide, find a value of  $x$  for which both sides are defined but not equal.

- $3 - 6 \sin^2 x = 3 \cos 2x$
- $4 \cos^2 \frac{x}{2} = 2 + 2 \cos x$
- $\sin \frac{x}{2} = \frac{1}{2} \sin x$
- $\cos \frac{x}{2} = \frac{1}{2} \cos x$

In Exercises 99–101, graph each equation in a  $\left[-2\pi, 2\pi, \frac{\pi}{2}\right]$  by  $[-3, 3, 1]$  viewing rectangle. Then **a.** Describe the graph using another equation, and **b.** Verify that the two equations are equivalent.

- $y = \frac{1 - 2 \cos 2x}{2 \sin x - 1}$
- $y = \frac{2 \tan \frac{x}{2}}{1 + \tan^2 \frac{x}{2}}$
- $y = \csc x - \cot x$

### Critical Thinking Exercises

**Make Sense?** In Exercises 102–105, determine whether each statement makes sense or does not make sense, and explain your reasoning.

102. The double-angle identities are derived from the sum identities by adding an angle to itself.
103. I simplified a double-angle trigonometric expression by pulling 2 to the front and treating it as a coefficient.
104. When using the half-angle formulas for trigonometric functions of  $\frac{\alpha}{2}$ , I determine the sign based on the quadrant in which  $\alpha$  lies.
105. I used a half-angle formula to find the exact value of  $\cos 100^\circ$ .
106. Verify the identity:

$$\sin^3 x + \cos^3 x = (\sin x + \cos x) \left( 1 - \frac{\sin 2x}{2} \right).$$

In Exercises 107–110, find the exact value of each expression. Do not use a calculator.

107.  $\sin \left( 2 \sin^{-1} \frac{\sqrt{3}}{2} \right)$       108.  $\cos \left[ 2 \tan^{-1} \left( -\frac{4}{3} \right) \right]$

109.  $\cos^2 \left( \frac{1}{2} \sin^{-1} \frac{3}{5} \right)$       110.  $\sin^2 \left( \frac{1}{2} \cos^{-1} \frac{3}{5} \right)$

111. Use a right triangle to write  $\sin(2 \sin^{-1} x)$  as an algebraic expression. Assume that  $x$  is positive and in the domain of the given inverse trigonometric function.
112. Use the power-reducing formulas to rewrite  $\sin^6 x$  as an equivalent expression that does not contain powers of trigonometric functions greater than 1.

### Preview Exercises

Exercises 113–115 will help you prepare for the material covered in the next section. In each exercise, use exact values of trigonometric functions to show that the statement is true. Notice that each statement expresses the product of sines and/or cosines as a sum or a difference.

113.  $\sin 60^\circ \sin 30^\circ = \frac{1}{2} [\cos(60^\circ - 30^\circ) - \cos(60^\circ + 30^\circ)]$

114.  $\cos \frac{\pi}{2} \cos \frac{\pi}{3} = \frac{1}{2} \left[ \cos \left( \frac{\pi}{2} - \frac{\pi}{3} \right) + \cos \left( \frac{\pi}{2} + \frac{\pi}{3} \right) \right]$

115.  $\sin \pi \cos \frac{\pi}{2} = \frac{1}{2} \left[ \sin \left( \pi + \frac{\pi}{2} \right) + \sin \left( \pi - \frac{\pi}{2} \right) \right]$

## CHAPTER 5

### Mid-Chapter Check Point

**WHAT YOU KNOW:** Verifying an identity means showing that the expressions on each side are identical. Like solving puzzles, the process can be intriguing because there are sometimes several “best” ways to proceed. We presented some guidelines to help you get started (see page 630). We used fundamental trigonometric identities (see page 622), as well as sum and difference formulas, double-angle formulas, power-reducing formulas, and half-angle formulas (see page 651) to verify identities. We also used these formulas to find exact values of trigonometric functions.

### GREAT QUESTION!

**What’s the best way to organize what I should know for solving the exercises in this Mid-Chapter Check Point?**

Make copies of the boxes on pages 622 and 651 that contain the essential trigonometric identities. Mount these boxes on cardstock and add this reference sheet to the one you prepared for Chapter 4. (If you didn’t prepare a reference sheet for Chapter 4, it’s not too late: See the Great Question! feature on page 547.)

In Exercises 1–18, verify each identity.

1.  $\cos x(\tan x + \cot x) = \csc x$

2.  $\frac{\sin(x + \pi)}{\cos \left( x + \frac{3\pi}{2} \right)} = \tan^2 x - \sec^2 x$

3.  $(\sin \theta + \cos \theta)^2 + (\sin \theta - \cos \theta)^2 = 2$

4.  $\frac{\sin t - 1}{\cos t} = \frac{\cos t - \cot t}{\cos t \cot t}$

5.  $\frac{1 - \cos 2x}{\sin 2x} = \tan x$

6.  $\sin \theta \cos \theta + \cos^2 \theta = \frac{\cos \theta(1 + \cot \theta)}{\csc \theta}$

7.  $\frac{\sin x}{\tan x} + \frac{\cos x}{\cot x} = \sin x + \cos x$

8.  $\sin^2 \frac{t}{2} = \frac{\tan t - \sin t}{2 \tan t}$

9.  $\sin \alpha \cos \beta = \frac{1}{2} [\sin(\alpha + \beta) + \sin(\alpha - \beta)]$

10.  $\frac{1 + \csc x}{\sec x} - \cot x = \cos x$

11.  $\frac{\cot x - 1}{\cot x + 1} = \frac{1 - \tan x}{1 + \tan x}$

12.  $2 \sin^3 \theta \cos \theta + 2 \sin \theta \cos^3 \theta = \sin 2\theta$

13.  $\frac{\sin t + \cos t}{\sec t + \csc t} = \frac{\sin t}{\sec t}$

14.  $\sec 2x = \frac{\sec^2 x}{2 - \sec^2 x}$

15.  $\tan(\alpha + \beta) \tan(\alpha - \beta) = \frac{\tan^2 \alpha - \tan^2 \beta}{1 - \tan^2 \alpha \tan^2 \beta}$

16.  $\csc \theta + \cot \theta = \frac{\sin \theta}{1 - \cos \theta}$

17.  $\frac{1}{\csc 2x} = \frac{2 \tan x}{1 + \tan^2 x}$

18.  $\frac{\sec t - 1}{t \sec t} = \frac{1 - \cos t}{t}$

Use the following conditions to solve Exercises 19–22:

$$\sin \alpha = \frac{3}{5}, \quad \frac{\pi}{2} < \alpha < \pi$$

$$\cos \beta = -\frac{12}{13}, \quad \pi < \beta < \frac{3\pi}{2}$$

Find the exact value of each of the following.

19.  $\cos(\alpha - \beta)$

20.  $\tan(\alpha + \beta)$

21.  $\sin 2\alpha$

22.  $\cos \frac{\beta}{2}$

In Exercises 23–26, find the exact value of each expression. Do not use a calculator.

23.  $\sin\left(\frac{3\pi}{4} + \frac{5\pi}{6}\right)$

24.  $\cos^2 15^\circ - \sin^2 15^\circ$

25.  $\cos \frac{5\pi}{12} \cos \frac{\pi}{12} + \sin \frac{5\pi}{12} \sin \frac{\pi}{12}$

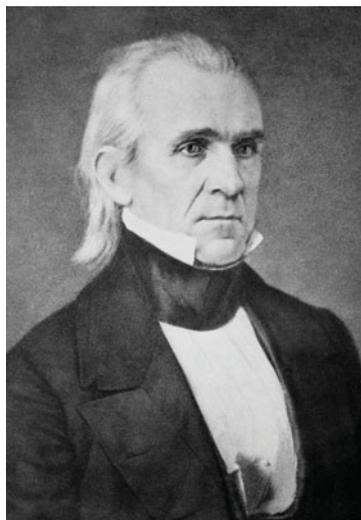

26.  $\tan 22.5^\circ$

## SECTION 5.4

### Product-to-Sum and Sum-to-Product Formulas

#### Objectives

- 1 Use the product-to-sum formulas.
- 2 Use the sum-to-product formulas.

James K. Polk  
Born November 2, 1795

Warren G. Harding  
Born November 2, 1865

Of all the U.S. presidents, two share a birthday (same month and day). The probability of two or more people in a group sharing a birthday rises sharply as the group's size increases. Above 50 people, the probability approaches certainty. (You can verify the mathematics of this surprising result by studying Sections 10.6 and 10.7, and working Exercise 73 in Exercise Set 10.7.) So, come November 2, we salute Presidents Polk and Harding with

112, 163-, 112, 196-, 110, 8521-, 008, 121-.

Were you aware that each button on a touch-tone phone produces a unique sound? If we treat the commas as pauses and the hyphens as held notes, this sequence of numbers is “Happy Birthday” on a touch-tone phone.

Although “Happy Birthday” isn’t Mozart or Sondheim, it is sinusoidal. Each of its touch-tone musical sounds can be described by the sum of two sine functions or the product of sines and cosines. In this section, we develop identities that enable us to use both descriptions. They are called the product-to-sum and sum-to-product formulas.

- 1 Use the product-to-sum formulas.

## GREAT QUESTION!

**Do I have to memorize the formulas in this section?**

Not necessarily. When you need these formulas, you can either refer to one of the two boxes in the section or perhaps even derive them using the methods shown.

## TECHNOLOGY

### Graphic Connections

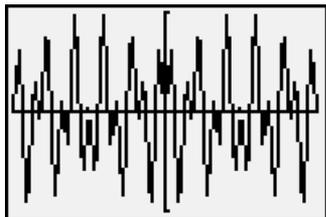

The graphs of

$$y = \sin 8x \sin 3x$$

and

$$y = \frac{1}{2}(\cos 5x - \cos 11x)$$

are shown in a  $\left[-2\pi, 2\pi, \frac{\pi}{2}\right]$  by  $[-1, 1, 1]$  viewing rectangle. The graphs coincide. This supports our algebraic work in Example 1(a).

## The Product-to-Sum Formulas

How do we write the products of sines and/or cosines as sums or differences? We use the following identities, which are called **product-to-sum formulas**:

### Product-to-Sum Formulas

$$\sin \alpha \sin \beta = \frac{1}{2}[\cos(\alpha - \beta) - \cos(\alpha + \beta)]$$

$$\cos \alpha \cos \beta = \frac{1}{2}[\cos(\alpha - \beta) + \cos(\alpha + \beta)]$$

$$\sin \alpha \cos \beta = \frac{1}{2}[\sin(\alpha + \beta) + \sin(\alpha - \beta)]$$

$$\cos \alpha \sin \beta = \frac{1}{2}[\sin(\alpha + \beta) - \sin(\alpha - \beta)]$$

Although these formulas are difficult to remember, they are fairly easy to derive. For example, let's derive the first identity in the box,

$$\sin \alpha \sin \beta = \frac{1}{2}[\cos(\alpha - \beta) - \cos(\alpha + \beta)].$$

We begin with the difference and sum formulas for the cosine, and subtract the second identity from the first:

$$\begin{aligned} \cos(\alpha - \beta) &= \cos \alpha \cos \beta + \sin \alpha \sin \beta \\ -[\cos(\alpha + \beta)] &= \cos \alpha \cos \beta - \sin \alpha \sin \beta \\ \hline \cos(\alpha - \beta) - \cos(\alpha + \beta) &= 0 + 2 \sin \alpha \sin \beta. \end{aligned}$$

Subtract terms on the left side.

Subtract terms on the right side:  $\cos \alpha \cos \beta - \cos \alpha \cos \beta = 0$ .

Subtract terms on the right side:  $\sin \alpha \sin \beta - (-\sin \alpha \sin \beta) = 2 \sin \alpha \sin \beta$ .

Now we use this result to derive the product-to-sum formula for  $\sin \alpha \sin \beta$ .

$$2 \sin \alpha \sin \beta = \cos(\alpha - \beta) - \cos(\alpha + \beta) \quad \text{Reverse the sides in the preceding equation.}$$

$$\sin \alpha \sin \beta = \frac{1}{2}[\cos(\alpha - \beta) - \cos(\alpha + \beta)] \quad \text{Multiply each side by } \frac{1}{2}.$$

This last equation is the desired formula. Likewise, we can derive the product-to-sum formula for cosine,  $\cos \alpha \cos \beta = \frac{1}{2}[\cos(\alpha - \beta) + \cos(\alpha + \beta)]$ . As we did for the previous derivation, begin with the difference and sum formulas for cosine. However, we *add* the formulas rather than subtracting them. Reversing both sides of this result and multiplying each side by  $\frac{1}{2}$  produces the formula for  $\cos \alpha \cos \beta$ . The last two product-to-sum formulas,  $\sin \alpha \cos \beta = \frac{1}{2}[\sin(\alpha + \beta) + \sin(\alpha - \beta)]$  and  $\cos \alpha \sin \beta = \frac{1}{2}[\sin(\alpha + \beta) - \sin(\alpha - \beta)]$ , are derived using the sum and difference formulas for sine in a similar manner.

### EXAMPLE 1 Using the Product-to-Sum Formulas

Express each of the following products as a sum or difference:

- a.  $\sin 8x \sin 3x$       b.  $\sin 4x \cos x$ .

### SOLUTION

The product-to-sum formula that we are using is shown in each of the voice balloons.

a.  $\sin \alpha \sin \beta = \frac{1}{2}[\cos(\alpha - \beta) - \cos(\alpha + \beta)]$

$$\sin 8x \sin 3x = \frac{1}{2}[\cos(8x - 3x) - \cos(8x + 3x)] = \frac{1}{2}(\cos 5x - \cos 11x)$$

b.  $\sin \alpha \cos \beta = \frac{1}{2}[\sin(\alpha + \beta) + \sin(\alpha - \beta)]$

$$\sin 4x \cos x = \frac{1}{2}[\sin(4x + x) + \sin(4x - x)] = \frac{1}{2}(\sin 5x + \sin 3x) \quad \dots$$

**Check Point 1** Express each of the following products as a sum or difference:

- a.  $\sin 5x \sin 2x$       b.  $\cos 7x \cos x$ .

- 2 Use the sum-to-product formulas.

### The Sum-to-Product Formulas

How do we write the sum or difference of sines and/or cosines as products? We use the following identities, which are called the **sum-to-product formulas**:

#### Sum-to-Product Formulas

$$\begin{aligned}\sin \alpha + \sin \beta &= 2 \sin \frac{\alpha + \beta}{2} \cos \frac{\alpha - \beta}{2} \\ \sin \alpha - \sin \beta &= 2 \sin \frac{\alpha - \beta}{2} \cos \frac{\alpha + \beta}{2} \\ \cos \alpha + \cos \beta &= 2 \cos \frac{\alpha + \beta}{2} \cos \frac{\alpha - \beta}{2} \\ \cos \alpha - \cos \beta &= -2 \sin \frac{\alpha + \beta}{2} \sin \frac{\alpha - \beta}{2}\end{aligned}$$

We verify these formulas using the product-to-sum formulas. Let's verify the first sum-to-product formula

$$\sin \alpha + \sin \beta = 2 \sin \frac{\alpha + \beta}{2} \cos \frac{\alpha - \beta}{2}.$$

We start with the right side of the formula, the side with the product. We can apply the product-to-sum formula for  $\sin \alpha \cos \beta$  to this expression. By doing so, we obtain the left side of the formula,  $\sin \alpha + \sin \beta$ . Here's how:

$$\begin{aligned}\sin \alpha \cos \beta &= \frac{1}{2} [\sin(\alpha + \beta) + \sin(\alpha - \beta)] \\ 2 \sin \frac{\alpha + \beta}{2} \cos \frac{\alpha - \beta}{2} &= 2 \cdot \frac{1}{2} \left[ \sin \left( \frac{\alpha + \beta}{2} + \frac{\alpha - \beta}{2} \right) + \sin \left( \frac{\alpha + \beta}{2} - \frac{\alpha - \beta}{2} \right) \right] \\ &= \sin \left( \frac{\alpha + \beta + \alpha - \beta}{2} \right) + \sin \left( \frac{\alpha + \beta - \alpha + \beta}{2} \right) \\ &= \sin \frac{2\alpha}{2} + \sin \frac{2\beta}{2} = \sin \alpha + \sin \beta.\end{aligned}$$

The three other sum-to-product formulas in the preceding box are verified in a similar manner. Start with the right side and obtain the left side using an appropriate product-to-sum formula.

#### EXAMPLE 2 Using the Sum-to-Product Formulas

Express each sum or difference as a product:

- a.  $\sin 9x + \sin 5x$       b.  $\cos 4x - \cos 3x$ .

#### SOLUTION

The sum-to-product formula that we are using is shown in each of the voice balloons.

a.

$$\begin{aligned}\sin \alpha + \sin \beta &= 2 \sin \frac{\alpha + \beta}{2} \cos \frac{\alpha - \beta}{2} \\ \sin 9x + \sin 5x &= 2 \sin \frac{9x + 5x}{2} \cos \frac{9x - 5x}{2} \\ &= 2 \sin \frac{14x}{2} \cos \frac{4x}{2} \\ &= 2 \sin 7x \cos 2x\end{aligned}$$

b.

$$\begin{aligned}\cos \alpha - \cos \beta &= -2 \sin \frac{\alpha + \beta}{2} \sin \frac{\alpha - \beta}{2} \\ \cos 4x - \cos 3x &= -2 \sin \frac{4x + 3x}{2} \sin \frac{4x - 3x}{2} \\ &= -2 \sin \frac{7x}{2} \sin \frac{x}{2}\end{aligned}$$

 **Check Point 2** Express each sum as a product:

a.  $\sin 7x + \sin 3x$

b.  $\cos 3x + \cos 2x$ .

Some identities contain a fraction on one side with sums and differences of sines and/or cosines. Applying the sum-to-product formulas in the numerator and the denominator is often helpful in verifying these identities.

**EXAMPLE 3** Using Sum-to-Product Formulas to Verify an Identity

Verify the identity:  $\frac{\cos 3x - \cos 5x}{\sin 3x + \sin 5x} = \tan x$ .

**SOLUTION**

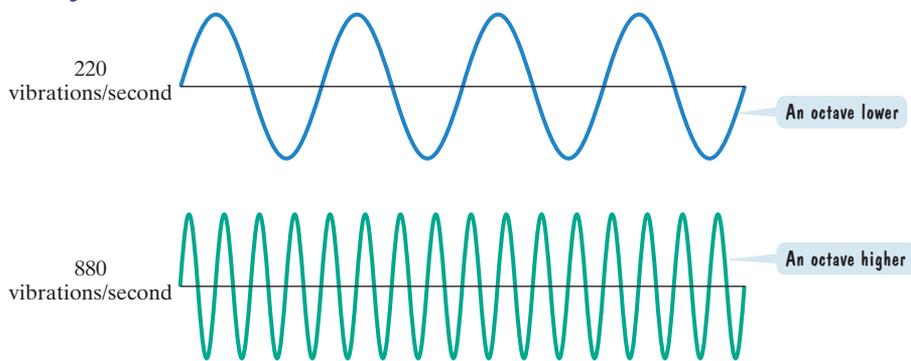

Because the left side is more complicated, we will work with it. We use sum-to-product formulas for the numerator and the denominator of the fraction on this side.

$$\begin{aligned} & \frac{\cos 3x - \cos 5x}{\sin 3x + \sin 5x} && \cos \alpha - \cos \beta = -2 \sin \frac{\alpha + \beta}{2} \sin \frac{\alpha - \beta}{2} \\ & = \frac{-2 \sin \frac{3x + 5x}{2} \sin \frac{3x - 5x}{2}}{\sin 3x + \sin 5x} \\ & = \frac{-2 \sin \frac{3x + 5x}{2} \sin \frac{3x - 5x}{2}}{2 \sin \frac{3x + 5x}{2} \cos \frac{3x - 5x}{2}} && \sin \alpha + \sin \beta = 2 \sin \frac{\alpha + \beta}{2} \cos \frac{\alpha - \beta}{2} \\ & = \frac{-2 \sin \frac{8x}{2} \sin \left( \frac{-2x}{2} \right)}{2 \sin \frac{8x}{2} \cos \left( \frac{-2x}{2} \right)} && \text{Perform the indicated additions and subtractions.} \\ & = \frac{-\cancel{2} \sin 4x \sin(-x)}{\cancel{2} \sin 4x \cos(-x)} && \text{Simplify.} \\ & = \frac{-(-\sin x)}{\cos x} && \text{The sine function is odd: } \sin(-x) = -\sin x. \text{ The cosine function is even: } \cos(-x) = \cos x. \\ & = \frac{\sin x}{\cos x} && \text{Simplify.} \\ & = \tan x && \text{Apply a quotient identity: } \tan x = \frac{\sin x}{\cos x}. \end{aligned}$$

We were required to verify  $\frac{\cos 3x - \cos 5x}{\sin 3x + \sin 5x} = \tan x$ . We worked with the left side and arrived at the right side,  $\tan x$ . Thus, the identity is verified. ...

 **Check Point 3** Verify the identity:  $\frac{\cos 3x - \cos x}{\sin 3x + \sin x} = -\tan x$ .

### Blitzer Bonus || Sinusoidal Sounds

higher-than-normal pressure and regions of lower-than-normal pressure. If we graph pressure,  $y$ , versus time,  $t$ , we get a sine wave that represents the note. The frequency of the sine wave is the number of high-low disturbances, or vibrations, per second. The greater the frequency, the higher the pitch; the lesser the frequency, the lower the pitch.

The amplitude of a note's sine wave is related to its loudness. The amplitude for the two sine waves shown above is the same. Thus, the notes have the same loudness, although they differ in pitch. The greater the amplitude, the louder the sound; the lesser the amplitude, the softer the sound. The amplitude and frequency are characteristic of every note—and thus of its graph—until the note dissipates.

Music is all around us. A mere snippet of a song from the past can trigger vivid memories, inducing emotions ranging from unabashed joy to deep sorrow. Trigonometric functions can explain how sound travels from its source and describe its pitch, loudness, and quality. Still unexplained is the remarkable influence music has on the brain, including the deepest question of all: Why do we appreciate music?

When a note is played, it disturbs nearby air molecules, creating regions of

## CONCEPT AND VOCABULARY CHECK

Because you may not be required to memorize the identities in this section, it's often tempting to pay no attention to them at all! Exercises 1–4 are provided to familiarize you with what these identities do. Fill in each blank using the word sum, difference, product, or quotient.

1. The formula

$$\sin \alpha \sin \beta = \frac{1}{2} [\cos(\alpha - \beta) - \cos(\alpha + \beta)]$$

can be used to change a \_\_\_\_\_ of two sines into the \_\_\_\_\_ of two cosine expressions.

2. The formula

$$\cos \alpha \cos \beta = \frac{1}{2} [\cos(\alpha - \beta) + \cos(\alpha + \beta)]$$

can be used to change a \_\_\_\_\_ of two cosines into the \_\_\_\_\_ of two cosine expressions.

3. The formula

$$\sin \alpha \cos \beta = \frac{1}{2} [\sin(\alpha + \beta) + \sin(\alpha - \beta)]$$

can be used to change a \_\_\_\_\_ of a sine and a cosine into the \_\_\_\_\_ of two sine expressions.

4. The formula

$$\cos \alpha \sin \beta = \frac{1}{2} [\sin(\alpha + \beta) - \sin(\alpha - \beta)]$$

can be used to change a \_\_\_\_\_ of a cosine and a sine into the \_\_\_\_\_ of two sine expressions.

Exercises 5–8 are provided to familiarize you with the second set of identities presented in this section. Fill in each blank using the word sum, difference, product, or quotient.

5. The formula

$$\sin \alpha + \sin \beta = 2 \sin \frac{\alpha + \beta}{2} \cos \frac{\alpha - \beta}{2}$$

can be used to change a \_\_\_\_\_ of two sines into the \_\_\_\_\_ of a sine and a cosine expression.

6. The formula

$$\sin \alpha - \sin \beta = 2 \sin \frac{\alpha - \beta}{2} \cos \frac{\alpha + \beta}{2}$$

can be used to change a \_\_\_\_\_ of two sines into the \_\_\_\_\_ of a sine and a cosine expression.

7. The formula

$$\cos \alpha + \cos \beta = 2 \cos \frac{\alpha + \beta}{2} \cos \frac{\alpha - \beta}{2}$$

can be used to change a \_\_\_\_\_ of two cosines into the \_\_\_\_\_ of two cosine expressions.

8. The formula

$$\cos \alpha - \cos \beta = -2 \sin \frac{\alpha + \beta}{2} \sin \frac{\alpha - \beta}{2}$$

can be used to change a \_\_\_\_\_ of two cosines into the \_\_\_\_\_ of two sine expressions.

## EXERCISE SET 5.4

## Practice Exercises

Be sure that you've familiarized yourself with the first set of formulas presented in this section by working 1–4 in the Concept and Vocabulary Check. In Exercises 1–8, use the appropriate formula to express each product as a sum or difference.

- $\sin 6x \sin 2x$
- $\sin 8x \sin 4x$
- $\cos 7x \cos 3x$
- $\cos 9x \cos 2x$
- $\sin x \cos 2x$
- $\sin 2x \cos 3x$
- $\cos \frac{3x}{2} \sin \frac{x}{2}$
- $\cos \frac{5x}{2} \sin \frac{x}{2}$

Be sure that you've familiarized yourself with the second set of formulas presented in this section by working 5–8 in the Concept and Vocabulary Check. In Exercises 9–22, express each sum or difference as a product. If possible, find this product's exact value.

- $\sin 6x + \sin 2x$
- $\sin 8x + \sin 2x$
- $\sin 7x - \sin 3x$
- $\sin 11x - \sin 3x$
- $\cos 4x + \cos 2x$
- $\cos 9x - \cos 7x$
- $\sin x + \sin 2x$
- $\sin x - \sin 2x$
- $\cos \frac{3x}{2} + \cos \frac{x}{2}$
- $\sin \frac{3x}{2} + \sin \frac{x}{2}$
- $\sin 75^\circ + \sin 15^\circ$
- $\cos 75^\circ - \cos 15^\circ$
- $\sin \frac{\pi}{12} - \sin \frac{5\pi}{12}$
- $\cos \frac{\pi}{12} - \cos \frac{5\pi}{12}$

In Exercises 23–30, verify each identity.

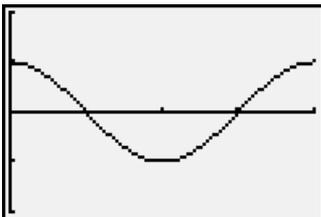

- $\frac{\sin 3x - \sin x}{\cos 3x - \cos x} = -\cot 2x$
- $\frac{\sin x + \sin 3x}{\cos x + \cos 3x} = \tan 2x$
- $\frac{\sin 2x + \sin 4x}{\cos 2x + \cos 4x} = \tan 3x$
- $\frac{\cos 4x - \cos 2x}{\sin 2x - \sin 4x} = \tan 3x$
- $\frac{\sin x - \sin y}{\sin x + \sin y} = \tan \frac{x-y}{2} \cot \frac{x+y}{2}$
- $\frac{\sin x + \sin y}{\sin x - \sin y} = \tan \frac{x+y}{2} \cot \frac{x-y}{2}$
- $\frac{\sin x + \sin y}{\cos x + \cos y} = \tan \frac{x+y}{2}$
- $\frac{\sin x - \sin y}{\cos x - \cos y} = -\cot \frac{x+y}{2}$

## Practice Plus

In Exercises 31–36, the graph with the given equation is shown in a  $\left[0, 2\pi, \frac{\pi}{2}\right]$  by  $[-2, 2, 1]$  viewing rectangle.

- Describe the graph using another equation.
- Verify that the two equations are equivalent.

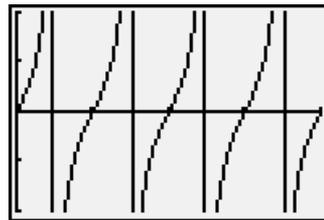

$$31. y = \frac{\sin x + \sin 3x}{2 \sin 2x}$$

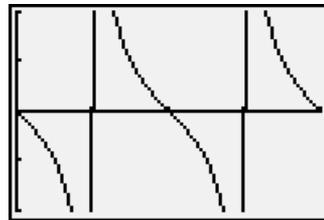

$$32. y = \frac{\cos x - \cos 3x}{\sin x + \sin 3x}$$

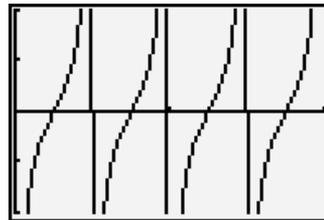

$$33. y = \frac{\cos x - \cos 5x}{\sin x + \sin 5x}$$

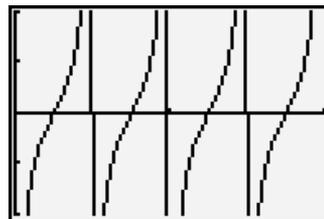

$$34. y = \frac{\cos 5x - \cos 3x}{\sin 5x + \sin 3x}$$

$$35. y = \frac{\sin x - \sin 3x}{\cos x - \cos 3x}$$

$$36. y = \frac{\sin 2x + \sin 6x}{\cos 6x - \cos 2x}$$

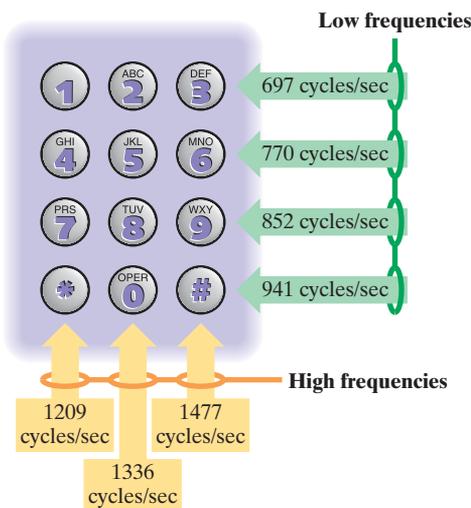

## Application Exercises

Use this information to solve Exercises 37–38. The sound produced by touching each button on a touch-tone phone is described by

$$y = \sin 2\pi lt + \sin 2\pi ht,$$

where  $l$  and  $h$  are the low and high frequencies in the figure shown. For example, what sound is produced by touching 5? The low frequency is  $l = 770$  cycles per second and the high frequency is  $h = 1336$  cycles per second. The sound produced by touching 5 is described by

$$y = \sin 2\pi(770)t + \sin 2\pi(1336)t.$$

37. The touch-tone phone sequence for that most naive of melodies is given as follows:

**Mary Had a Little Lamb**  
3212333,222,399,3212333322321.

- Many numbers do not appear in this sequence, including 7. If you accidentally touch 7 for one of the notes, describe this sound as the sum of sines.
- Describe this accidental sound as a product of sines and cosines.

38. The touch-tone phone sequence for “Jingle Bells” is given as follows:

**Jingle Bells**  
333,333,39123,666-663333322329,333,333,39123,666-6633,399621.

- The first six notes of the song are produced by repeatedly touching 3. Describe this repeated sound as the sum of sines.
- Describe the repeated sound as a product of sines and cosines.

## Writing in Mathematics

In Exercises 39–42, use words to describe the given formula.

39.  $\sin \alpha \sin \beta = \frac{1}{2}[\cos(\alpha - \beta) - \cos(\alpha + \beta)]$   
40.  $\cos \alpha \cos \beta = \frac{1}{2}[\cos(\alpha - \beta) + \cos(\alpha + \beta)]$

41.  $\sin \alpha + \sin \beta = 2 \sin \frac{\alpha + \beta}{2} \cos \frac{\alpha - \beta}{2}$

42.  $\cos \alpha + \cos \beta = 2 \cos \frac{\alpha + \beta}{2} \cos \frac{\alpha - \beta}{2}$

43. Describe identities that can be verified using the sum-to-product formulas.  
44. Why do the sounds produced by touching each button on a touch-tone phone have the same loudness? Answer the question using the equation described for Exercises 37 and 38,  $y = \sin 2\pi lt + \sin 2\pi ht$ , and determine the maximum value of  $y$  for each sound.

## Technology Exercises

In Exercises 45–48, graph each side of the equation in the same viewing rectangle. If the graphs appear to coincide, verify that the equation is an identity. If the graphs do not appear to coincide, find a value of  $x$  for which both sides are defined but not equal.

45.  $\sin x + \sin 2x = \sin 3x$   
46.  $\cos x + \cos 2x = \cos 3x$   
47.  $\sin x + \sin 3x = 2 \sin 2x \cos x$   
48.  $\cos x + \cos 3x = 2 \cos 2x \cos x$   
49. In Exercise 37(a), you wrote an equation for the sound produced by touching 7 on a touch-tone phone. Graph the equation in a  $[0, 0.01, 0.001]$  by  $[-2, 2, 1]$  viewing rectangle.  
50. In Exercise 38(a), you wrote an equation for the sound produced by touching 3 on a touch-tone phone. Graph the equation in a  $[0, 0.01, 0.001]$  by  $[-2, 2, 1]$  viewing rectangle.  
51. In this section, we saw how sums could be expressed as products. Sums of trigonometric functions can also be used to describe functions that are not trigonometric. French mathematician Jean Fourier (1768–1830) showed that *any function* can be described by a series of trigonometric functions. For example, the basic linear function  $f(x) = x$  can also be represented by

$$f(x) = 2 \left( \frac{\sin x}{1} - \frac{\sin 2x}{2} + \frac{\sin 3x}{3} - \frac{\sin 4x}{4} + \cdots \right).$$

- a. Graph

$$y = 2 \left( \frac{\sin x}{1} \right),$$

$$y = 2 \left( \frac{\sin x}{1} - \frac{\sin 2x}{2} \right),$$

$$y = 2 \left( \frac{\sin x}{1} - \frac{\sin 2x}{2} + \frac{\sin 3x}{3} \right)$$

and

$$y = 2 \left( \frac{\sin x}{1} - \frac{\sin 2x}{2} + \frac{\sin 3x}{3} - \frac{\sin 4x}{4} \right)$$

in a  $[-\pi, \pi, \frac{\pi}{2}]$  by  $[-3, 3, 1]$  viewing rectangle. What patterns do you observe?

## b. Graph

$$y = 2 \left( \frac{\sin x}{1} - \frac{\sin 2x}{2} + \frac{\sin 3x}{3} - \frac{\sin 4x}{4} + \frac{\sin 5x}{5} - \frac{\sin 6x}{6} \right. \\ \left. + \frac{\sin 7x}{7} - \frac{\sin 8x}{8} + \frac{\sin 9x}{9} - \frac{\sin 10x}{10} \right)$$

in a  $\left[-\pi, \pi, \frac{\pi}{2}\right]$  by  $[-3, 3, 1]$  viewing rectangle. Is a portion of the graph beginning to look like the graph of  $f(x) = x$ ? Obtain a better approximation for the line by graphing functions that contain more and more terms involving sines of multiple angles.

## c. Use

$$x = 2 \left( \frac{\sin x}{1} - \frac{\sin 2x}{2} + \frac{\sin 3x}{3} - \frac{\sin 4x}{4} + \dots \right)$$

and substitute  $\frac{\pi}{2}$  for  $x$  to obtain a formula for  $\frac{\pi}{2}$ . Show at least four nonzero terms. Then multiply both sides of your formula by 2 to write a nonending series of subtractions and additions that approaches  $\pi$ . Use this series to obtain an approximation for  $\pi$  that is more accurate than the one given by your graphing utility.

## Critical Thinking Exercises

**Make Sense?** In Exercises 52–55, determine whether each statement makes sense or does not make sense, and explain your reasoning.

52. The product-to-sum formulas are difficult to remember because they are all so similar to one another.
53. I can use the sum and difference formulas for cosines and sines to derive the product-to-sum formulas.
54. I expressed  $\sin 13^\circ \cos 48^\circ$  as  $\frac{1}{2}(\sin 61^\circ - \sin 35^\circ)$ .
55. I expressed  $\cos 47^\circ + \cos 59^\circ$  as  $2 \cos 53^\circ \cos 6^\circ$ .

Use the identities for  $\sin(\alpha + \beta)$  and  $\sin(\alpha - \beta)$  to solve Exercises 56–57.

56. Add the left and right sides of the identities and derive the product-to-sum formula for  $\sin \alpha \cos \beta$ .
57. Subtract the left and right sides of the identities and derive the product-to-sum formula for  $\cos \alpha \sin \beta$ .

In Exercises 58–59, verify the given sum-to-product formula. Start with the right side and obtain the expression on the left side by using an appropriate product-to-sum formula.

58.  $\sin \alpha - \sin \beta = 2 \sin \frac{\alpha - \beta}{2} \cos \frac{\alpha + \beta}{2}$

59.  $\cos \alpha + \cos \beta = 2 \cos \frac{\alpha + \beta}{2} \cos \frac{\alpha - \beta}{2}$

In Exercises 60–61, verify each identity.

60.  $\frac{\sin 2x + (\sin 3x + \sin x)}{\cos 2x + (\cos 3x + \cos x)} = \tan 2x$

61.  $4 \cos x \cos 2x \sin 3x = \sin 2x + \sin 4x + \sin 6x$

## Group Exercise

62. This activity should result in an unusual group display entitled “‘Frère Jacques’, A New Perspective.” Here is the touch-tone phone sequence:

**Frère Jacques**

**4564,4564,69#,69#,##\*#964,##\*#964,414,414.**

Group members should write every sound in the sequence as both the sum-of-sines and the product of sines and cosines. Use the sum-of-sines form and a graphing utility with a  $[0, 0.01, 0.001]$  by  $[-2, 2, 1]$  viewing rectangle to obtain a graph for every sound. Download these graphs. Use the graphs and equations to create your display in such a way that adults find the trigonometry of this naive melody interesting.

## Preview Exercises

Exercises 63–65 will help you prepare for the material covered in the next section.

63. Solve:  $2(1 - u^2) + 3u = 0$ .

64. Solve:  $u^3 - 3u = 0$ .

65. Solve:  $u^2 - u - 1 = 0$ .

## SECTION 5.5

## Trigonometric Equations

## Objectives

- 1 Find all solutions of a trigonometric equation.
- 2 Solve equations with multiple angles.
- 3 Solve trigonometric equations quadratic in form.
- 4 Use factoring to separate different functions in trigonometric equations.
- 5 Use identities to solve trigonometric equations.
- 6 Use a calculator to solve trigonometric equations.

- 1 Find all solutions of a trigonometric equation.

Exponential functions display the manic energies of uncontrolled growth. By contrast, trigonometric functions repeat their behavior. Do they embody, in their regularity, some basic rhythm of the universe? The cycles of periodic phenomena provide events that we can comfortably count on. When will the moon look just as it does at this moment? When can I count on 13.5 hours of daylight? When will my breathing be exactly as it is right now? Models with trigonometric functions embrace the periodic rhythms of our world. Equations containing trigonometric functions are used to answer questions about these models.

## Trigonometric Equations and Their Solutions

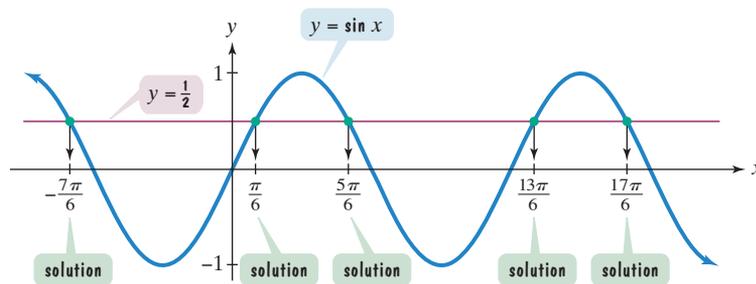

A **trigonometric equation** is an equation that contains a trigonometric expression with a variable, such as  $\sin x$ . We have seen that some trigonometric equations are identities, such as  $\sin^2 x + \cos^2 x = 1$ . These equations are true for every value of the variable for which the expressions are defined. In this section, we consider trigonometric equations that are true for only some values of the variable. The values that satisfy such an equation are its **solutions**. (There are trigonometric equations that have no solution.)

An example of a trigonometric equation is

$$\sin x = \frac{1}{2}.$$

A solution of this equation is  $\frac{\pi}{6}$  because  $\sin \frac{\pi}{6} = \frac{1}{2}$ . By contrast,  $\pi$  is not a solution because  $\sin \pi = 0 \neq \frac{1}{2}$ .

Is  $\frac{\pi}{6}$  the only solution of  $\sin x = \frac{1}{2}$ ? The answer is no. Because of the periodic nature of the sine function, there are infinitely many values of  $x$  for which  $\sin x = \frac{1}{2}$ . **Figure 5.7** shows five of the solutions, including  $\frac{\pi}{6}$ , for  $-\frac{3\pi}{2} \leq x \leq \frac{7\pi}{2}$ . Notice that the  $x$ -coordinates of the points where the graph of  $y = \sin x$  intersects the line  $y = \frac{1}{2}$  are the solutions of the equation  $\sin x = \frac{1}{2}$ .

**FIGURE 5.7** The equation  $\sin x = \frac{1}{2}$  has five solutions when  $x$  is restricted to the interval  $\left[-\frac{3\pi}{2}, \frac{7\pi}{2}\right]$ .

How do we represent all solutions of  $\sin x = \frac{1}{2}$ ? Because the period of the sine function is  $2\pi$ , first find all solutions in  $[0, 2\pi)$ . The solutions are

$$x = \frac{\pi}{6} \quad \text{and} \quad x = \pi - \frac{\pi}{6} = \frac{5\pi}{6}.$$

The sine is positive in quadrants I and II.

Any multiple of  $2\pi$  can be added to these values and the sine is still  $\frac{1}{2}$ . Thus, all solutions of  $\sin x = \frac{1}{2}$  are given by

$$x = \frac{\pi}{6} + 2n\pi \quad \text{or} \quad x = \frac{5\pi}{6} + 2n\pi,$$

where  $n$  is any integer. By choosing any two integers, such as  $n = 0$  and  $n = 1$ , we can find some solutions of  $\sin x = \frac{1}{2}$ . Thus, four of the solutions are determined as follows:

Let $n = 0$ .		Let $n = 1$ .	
$x = \frac{\pi}{6} + 2 \cdot 0\pi$	$x = \frac{5\pi}{6} + 2 \cdot 0\pi$	$x = \frac{\pi}{6} + 2 \cdot 1\pi$	$x = \frac{5\pi}{6} + 2 \cdot 1\pi$
$= \frac{\pi}{6}$	$= \frac{5\pi}{6}$	$= \frac{\pi}{6} + 2\pi$	$x = \frac{5\pi}{6} + 2\pi$
		$= \frac{\pi}{6} + \frac{12\pi}{6} = \frac{13\pi}{6}$	$= \frac{5\pi}{6} + \frac{12\pi}{6} = \frac{17\pi}{6}$

These four solutions are shown among the five solutions in **Figure 5.7**.

### Equations Involving a Single Trigonometric Function

To solve an equation containing a single trigonometric function:

- Isolate the function on one side of the equation.
- Solve for the variable.

#### EXAMPLE 1 Finding All Solutions of a Trigonometric Equation

Solve the equation:  $3 \sin x - 2 = 5 \sin x - 1$ .

#### SOLUTION

The equation contains a single trigonometric function,  $\sin x$ .

**Step 1 Isolate the function on one side of the equation.** We can solve for  $\sin x$  by collecting terms with  $\sin x$  on the left side and constant terms on the right side.

$$\begin{aligned}
 3 \sin x - 2 &= 5 \sin x - 1 && \text{This is the given equation.} \\
 3 \sin x - 5 \sin x - 2 &= 5 \sin x - 5 \sin x - 1 && \text{Subtract } 5 \sin x \text{ from both sides.} \\
 -2 \sin x - 2 &= -1 && \text{Simplify.} \\
 -2 \sin x &= 1 && \text{Add 2 to both sides.} \\
 \sin x &= -\frac{1}{2} && \text{Divide both sides by } -2 \text{ and solve for } \sin x.
 \end{aligned}$$

### GREAT QUESTION!

Why did you add  $\frac{\pi}{6}$  to  $\pi$  but subtract  $\frac{\pi}{6}$  from  $2\pi$ ?

We are using an acute reference angle,  $\frac{\pi}{6}$ , to find angles in different quadrants. We are interested in solutions where the sine is negative, namely in quadrants III and IV. Adding  $\frac{\pi}{6}$  to  $\pi$  puts us in quadrant III. Subtracting  $\frac{\pi}{6}$  from  $2\pi$  puts us in quadrant IV.

**Step 2 Solve for the variable.** We must solve for  $x$  in  $\sin x = -\frac{1}{2}$ . Because  $\sin \frac{\pi}{6} = \frac{1}{2}$ , the solutions of  $\sin x = -\frac{1}{2}$  in  $[0, 2\pi)$  are

$$x = \pi + \frac{\pi}{6} = \frac{6\pi}{6} + \frac{\pi}{6} = \frac{7\pi}{6} \quad x = 2\pi - \frac{\pi}{6} = \frac{12\pi}{6} - \frac{\pi}{6} = \frac{11\pi}{6}.$$

The sine is negative in quadrant III.

The sine is negative in quadrant IV.

Because the period of the sine function is  $2\pi$ , the solutions of the equation are given by

$$x = \frac{7\pi}{6} + 2n\pi \quad \text{and} \quad x = \frac{11\pi}{6} + 2n\pi,$$

where  $n$  is any integer.

 **Check Point 1** Solve the equation:  $5 \sin x = 3 \sin x + \sqrt{3}$ .

Now we will concentrate on finding solutions of trigonometric equations for  $0 \leq x < 2\pi$ . You can use a graphing utility to check the solutions of these equations. Graph the left side and graph the right side. The solutions are the  $x$ -coordinates of the points where the graphs intersect.

**2** Solve equations with multiple angles.

### Equations Involving Multiple Angles

Here are examples of two equations that include multiple angles:

$$\tan 3x = 1$$

The angle is a multiple of 3.

$$\sin \frac{x}{2} = \frac{\sqrt{3}}{2}$$

The angle is a multiple of  $\frac{1}{2}$ .

We will solve each equation for  $0 \leq x < 2\pi$ . The period of the function plays an important role in ensuring that we do not leave out any solutions.

#### EXAMPLE 2 Solving an Equation with a Multiple Angle

Solve the equation:  $\tan 3x = 1$ ,  $0 \leq x < 2\pi$ .

#### SOLUTION

The period of the tangent function is  $\pi$ . In the interval  $[0, \pi)$ , the only value for which the tangent function is 1 is  $\frac{\pi}{4}$ . This means that  $3x = \frac{\pi}{4}$ . Because the period is  $\pi$ , all the solutions to  $\tan 3x = 1$  are given by

$$3x = \frac{\pi}{4} + n\pi. \quad n \text{ is any integer.}$$

$$x = \frac{\pi}{12} + \frac{n\pi}{3} \quad \text{Divide both sides by 3 and solve for } x.$$

In the interval  $[0, 2\pi)$ , we obtain the solutions of  $\tan 3x = 1$  as follows:

Let  $n = 0$ .

$$\begin{aligned} x &= \frac{\pi}{12} + \frac{0\pi}{3} \\ &= \frac{\pi}{12} \end{aligned}$$

Let  $n = 1$ .

$$\begin{aligned} x &= \frac{\pi}{12} + \frac{1\pi}{3} \\ &= \frac{\pi}{12} + \frac{4\pi}{12} = \frac{5\pi}{12} \end{aligned}$$

Let  $n = 2$ .

$$\begin{aligned} x &= \frac{\pi}{12} + \frac{2\pi}{3} \\ &= \frac{\pi}{12} + \frac{8\pi}{12} = \frac{9\pi}{12} = \frac{3\pi}{4} \end{aligned}$$

Let  $n = 3$ .

$$\begin{aligned} x &= \frac{\pi}{12} + \frac{3\pi}{3} \\ &= \frac{\pi}{12} + \frac{12\pi}{12} = \frac{13\pi}{12} \end{aligned}$$

Let  $n = 4$ .

$$\begin{aligned} x &= \frac{\pi}{12} + \frac{4\pi}{3} \\ &= \frac{\pi}{12} + \frac{16\pi}{12} = \frac{17\pi}{12} \end{aligned}$$

Let  $n = 5$ .

$$\begin{aligned} x &= \frac{\pi}{12} + \frac{5\pi}{3} \\ &= \frac{\pi}{12} + \frac{20\pi}{12} = \frac{21\pi}{12} = \frac{7\pi}{4} \end{aligned}$$

If you let  $n = 6$ , you will obtain  $x = \frac{25\pi}{12}$ . This value exceeds  $2\pi$ . In the interval  $[0, 2\pi)$ , the solutions of  $\tan 3x = 1$  are  $\frac{\pi}{12}$ ,  $\frac{5\pi}{12}$ ,  $\frac{3\pi}{4}$ ,  $\frac{13\pi}{12}$ ,  $\frac{17\pi}{12}$ , and  $\frac{7\pi}{4}$ . These solutions are illustrated by the six intersection points in the technology box. ●●●

 **Check Point 2** Solve the equation:  $\tan 2x = \sqrt{3}$ ,  $0 \leq x < 2\pi$ .

#### EXAMPLE 3 Solving an Equation with a Multiple Angle

Solve the equation:  $\sin \frac{x}{2} = \frac{\sqrt{3}}{2}$ ,  $0 \leq x < 2\pi$ .

## TECHNOLOGY

### Graphic Connections

Shown below are the graphs of

$$y = \tan 3x$$

and

$$y = 1$$

in a  $\left[0, 2\pi, \frac{\pi}{2}\right]$  by  $[-3, 3, 1]$  viewing rectangle. The solutions of

$$\tan 3x = 1$$

in  $[0, 2\pi)$  are shown by the  $x$ -coordinates of the six intersection points.

## SOLUTION

The period of the sine function is  $2\pi$ . In the interval  $[0, 2\pi)$ , there are two values at which the sine function is  $\frac{\sqrt{3}}{2}$ . One of these values is  $\frac{\pi}{3}$ . The sine is positive in quadrant II; thus, the other value is  $\pi - \frac{\pi}{3}$ , or  $\frac{2\pi}{3}$ . This means that  $\frac{x}{2} = \frac{\pi}{3}$  or  $\frac{x}{2} = \frac{2\pi}{3}$ . Because the period is  $2\pi$ , all the solutions of  $\sin \frac{x}{2} = \frac{\sqrt{3}}{2}$  are given by

$$\frac{x}{2} = \frac{\pi}{3} + 2n\pi \quad \text{or} \quad \frac{x}{2} = \frac{2\pi}{3} + 2n\pi \quad n \text{ is any integer.}$$

$$x = \frac{2\pi}{3} + 4n\pi \quad x = \frac{4\pi}{3} + 4n\pi. \quad \text{Multiply both sides by 2 and solve for } x.$$

We see that  $x = \frac{2\pi}{3} + 4n\pi$  or  $x = \frac{4\pi}{3} + 4n\pi$ . If  $n = 0$ , we obtain  $x = \frac{2\pi}{3}$  from the first equation and  $x = \frac{4\pi}{3}$  from the second equation. If we let  $n = 1$ , we are adding  $4 \cdot 1 \cdot \pi$ , or  $4\pi$ , to  $\frac{2\pi}{3}$  and  $\frac{4\pi}{3}$ . These values of  $x$  exceed  $2\pi$ . Thus, in the interval  $[0, 2\pi)$ , the only solutions of  $\sin \frac{x}{2} = \frac{\sqrt{3}}{2}$  are  $\frac{2\pi}{3}$  and  $\frac{4\pi}{3}$ . ...

**Check Point 3** Solve the equation:  $\sin \frac{x}{3} = \frac{1}{2}$ ,  $0 \leq x < 2\pi$ .

- 3** Solve trigonometric equations quadratic in form.

## Trigonometric Equations Quadratic in Form

Some trigonometric equations are in the form of a quadratic equation  $au^2 + bu + c = 0$ , where  $u$  is a trigonometric function and  $a \neq 0$ . Here are two examples of trigonometric equations that are quadratic in form:

$$2 \cos^2 x + \cos x - 1 = 0 \quad 2 \sin^2 x - 3 \sin x + 1 = 0.$$

The form of this equation is  $2u^2 + u - 1 = 0$  with  $u = \cos x$ .

The form of this equation is  $2u^2 - 3u + 1 = 0$  with  $u = \sin x$ .

To solve this kind of equation, try using factoring. If the trigonometric expression does not factor, use another method, such as the quadratic formula or the square root property.

## TECHNOLOGY

## Graphic Connections

The graph of

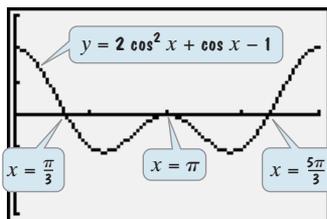

$$y = 2 \cos^2 x + \cos x - 1$$

is shown in a  $\left[0, 2\pi, \frac{\pi}{2}\right]$  by  $[-3, 3, 1]$  viewing rectangle.

The  $x$ -intercepts,  $\frac{\pi}{3}$ ,  $\pi$ , and  $\frac{5\pi}{3}$ , verify the three solutions of

$$2 \cos^2 x + \cos x - 1 = 0$$

in  $[0, 2\pi)$ .

## EXAMPLE 4 Solving a Trigonometric Equation Quadratic in Form

Solve the equation:  $2 \cos^2 x + \cos x - 1 = 0$ ,  $0 \leq x < 2\pi$ .

## SOLUTION

The given equation is in quadratic form  $2u^2 + u - 1 = 0$  with  $u = \cos x$ . Let us attempt to solve the equation by factoring.

$$\begin{aligned} 2 \cos^2 x + \cos x - 1 &= 0 && \text{This is the given equation.} \\ (2 \cos x - 1)(\cos x + 1) &= 0 && \text{Factor: Notice that } 2u^2 + u - 1 \\ &&& \text{factors as } (2u - 1)(u + 1). \end{aligned}$$

$$2 \cos x - 1 = 0 \quad \text{or} \quad \cos x + 1 = 0 \quad \begin{array}{l} \text{Set each factor equal to 0.} \\ \text{Solve for } \cos x. \end{array}$$

$$\begin{aligned} 2 \cos x &= 1 \\ \cos x &= \frac{1}{2} \end{aligned}$$

$$\cos x = -1$$

$$x = \frac{\pi}{3} \quad x = 2\pi - \frac{\pi}{3} = \frac{5\pi}{3} \quad x = \pi \quad \begin{array}{l} \text{Solve each equation for } x, \\ 0 \leq x < 2\pi. \end{array}$$

The cosine is positive in quadrants I and IV.

The solutions in the interval  $[0, 2\pi)$  are  $\frac{\pi}{3}$ ,  $\pi$ , and  $\frac{5\pi}{3}$ . ...

 **Check Point 4** Solve the equation:  $2 \sin^2 x - 3 \sin x + 1 = 0$ ,  $0 \leq x < 2\pi$ .

**EXAMPLE 5** Solving a Trigonometric Equation Quadratic in Form

Solve the equation:  $4 \sin^2 x - 1 = 0$ ,  $0 \leq x < 2\pi$ .

**SOLUTION**

The given equation is in quadratic form  $4u^2 - 1 = 0$  with  $u = \sin x$ . We can solve this equation by the square root property: If  $u^2 = c$ , then  $u = \pm\sqrt{c}$ .

$$4 \sin^2 x - 1 = 0 \quad \text{This is the given equation.}$$

$$4 \sin^2 x = 1 \quad \text{Add 1 to both sides.}$$

$$\sin^2 x = \frac{1}{4} \quad \text{Divide both sides by 4 and solve for } \sin^2 x.$$

$$\sin x = \sqrt{\frac{1}{4}} = \frac{1}{2} \quad \text{or} \quad \sin x = -\sqrt{\frac{1}{4}} = -\frac{1}{2} \quad \text{Apply the square root property: If } u^2 = c, \text{ then } u = \sqrt{c} \text{ or } u = -\sqrt{c}.$$

$$x = \frac{\pi}{6} \quad x = \pi - \frac{\pi}{6} = \frac{5\pi}{6} \quad x = \pi + \frac{\pi}{6} = \frac{7\pi}{6} \quad x = 2\pi - \frac{\pi}{6} = \frac{11\pi}{6} \quad \text{Solve each equation for } x, 0 \leq x < 2\pi.$$

The sine is positive in quadrants I and II.

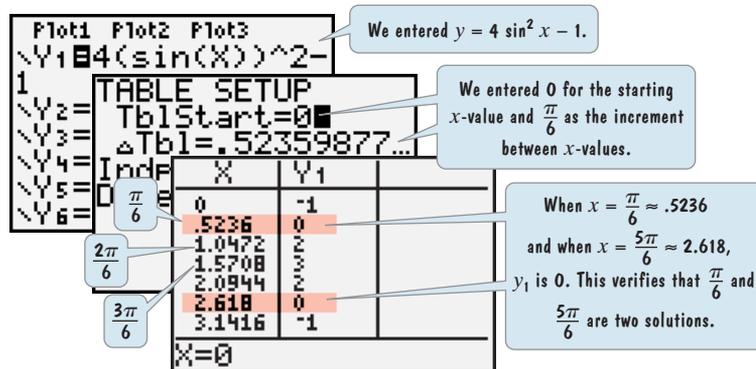

The sine is negative in quadrants III and IV.

The solutions in the interval  $[0, 2\pi)$  are  $\frac{\pi}{6}$ ,  $\frac{5\pi}{6}$ ,  $\frac{7\pi}{6}$ , and  $\frac{11\pi}{6}$ . ...

**TECHNOLOGY**

**Numeric Connections**

You can use a graphing utility's **TABLE** feature to verify that the solutions of  $4 \sin^2 x - 1 = 0$  in  $[0, 2\pi)$  are  $\frac{\pi}{6}$ ,  $\frac{5\pi}{6}$ ,  $\frac{7\pi}{6}$ , and  $\frac{11\pi}{6}$ . The table for  $y = 4 \sin^2 x - 1$ , shown on the right, verifies that  $\frac{\pi}{6}$  and  $\frac{5\pi}{6}$  are solutions. Scroll through the table to verify the other two solutions.

 **Check Point 5** Solve the equation:  $4 \cos^2 x - 3 = 0$ ,  $0 \leq x < 2\pi$ .

- 4** Use factoring to separate different functions in trigonometric equations.

**Using Factoring to Separate Two Different Trigonometric Functions in an Equation**

We have seen that factoring is used to solve some trigonometric equations that are quadratic in form. Factoring can also be used to solve some trigonometric equations that contain two different functions such as

$$\tan x \sin^2 x = 3 \tan x.$$

In such a case, move all terms to one side and obtain zero on the other side. Then try to use factoring to separate the different functions. Example 6 shows how this is done.

**GREAT QUESTION!**

Can I begin solving

$$\tan x \sin^2 x = 3 \tan x$$

by dividing both sides by  $\tan x$ ?

No. Division by zero is undefined.

If you divide by  $\tan x$ , you lose the two solutions for which  $\tan x = 0$ , namely 0 and  $\pi$ .

**EXAMPLE 6** Using Factoring to Separate Different Functions

Solve the equation:  $\tan x \sin^2 x = 3 \tan x$ ,  $0 \leq x < 2\pi$ .

**SOLUTION**

Move all terms to one side and obtain zero on the other side.

$$\begin{aligned} \tan x \sin^2 x &= 3 \tan x && \text{This is the given equation.} \\ \tan x \sin^2 x - 3 \tan x &= 0 && \text{Subtract } 3 \tan x \text{ from both sides.} \end{aligned}$$

We now have  $\tan x \sin^2 x - 3 \tan x = 0$ , which contains both tangent and sine functions. Use factoring to separate the two functions.

$$\begin{aligned} \tan x(\sin^2 x - 3) &= 0 && \text{Factor out } \tan x \text{ from the two terms on the left side.} \\ \tan x = 0 \quad \text{or} \quad \sin^2 x - 3 &= 0 && \text{Set each factor equal to 0.} \\ x = 0 \quad x = \pi \quad \sin^2 x &= 3 && \text{Solve for } x. \end{aligned}$$

This equation has no solution because  $\sin x$  cannot be greater than 1 or less than  $-1$ .

$$\sin x = \pm\sqrt{3}$$

The solutions in the interval  $[0, 2\pi)$  are 0 and  $\pi$ .

 **Check Point 6** Solve the equation:  $\sin x \tan x = \sin x$ ,  $0 \leq x < 2\pi$ .

**5** Use identities to solve trigonometric equations.

**Using Identities to Solve Trigonometric Equations**

Some trigonometric equations contain more than one function on the same side and these functions cannot be separated by factoring. For example, consider the equation

$$2 \cos^2 x + 3 \sin x = 0.$$

How can we obtain an equivalent equation that has only one trigonometric function? We use the identity  $\sin^2 x + \cos^2 x = 1$  and substitute  $1 - \sin^2 x$  for  $\cos^2 x$ . This forms the basis of our next example.

**EXAMPLE 7** Using an Identity to Solve a Trigonometric Equation

Solve the equation:  $2 \cos^2 x + 3 \sin x = 0$ ,  $0 \leq x < 2\pi$ .

**SOLUTION**

$$\begin{aligned} 2 \cos^2 x + 3 \sin x &= 0 && \text{This is the given equation.} \\ 2(1 - \sin^2 x) + 3 \sin x &= 0 && \cos^2 x = 1 - \sin^2 x \\ 2 - 2 \sin^2 x + 3 \sin x &= 0 && \text{Use the distributive property.} \\ -2 \sin^2 x + 3 \sin x + 2 &= 0 && \text{Write the equation in descending powers of } \sin x. \\ 2 \sin^2 x - 3 \sin x - 2 &= 0 && \text{Multiply both sides by } -1. \text{ The equation is in quadratic form } 2u^2 - 3u - 2 = 0 \text{ with } u = \sin x. \\ (2 \sin x + 1)(\sin x - 2) &= 0 && \text{Factor. Notice that } 2u^2 - 3u - 2 \text{ factors as } (2u + 1)(u - 2). \\ 2 \sin x + 1 = 0 \quad \text{or} \quad \sin x - 2 &= 0 && \text{Set each factor equal to 0.} \end{aligned}$$

It's easier to factor with a positive leading coefficient.

$$2 \sin x = -1 \qquad \sin x = 2$$

Solve  $2 \sin x + 1 = 0$   
and  $\sin x - 2 = 0$  for  $\sin x$ .

$$\sin x = -\frac{1}{2}$$

This equation has no solution because  $\sin x$  cannot be greater than 1.

$$x = \pi + \frac{\pi}{6} = \frac{7\pi}{6} \qquad x = 2\pi - \frac{\pi}{6} = \frac{11\pi}{6}$$

Solve for  $x$ .

$\sin \frac{\pi}{6} = \frac{1}{2}$ . The sine is negative in quadrants III and IV.

The solutions of  $2 \cos^2 x + 3 \sin x = 0$  in the interval  $[0, 2\pi)$  are  $\frac{7\pi}{6}$  and  $\frac{11\pi}{6}$ . ...

**Check Point 7** Solve the equation:  $2 \sin^2 x - 3 \cos x = 0$ ,  $0 \leq x < 2\pi$ .

### EXAMPLE 8

 Using an Identity to Solve a Trigonometric Equation

Solve the equation:  $\cos 2x + 3 \sin x - 2 = 0$ ,  $0 \leq x < 2\pi$ .

#### SOLUTION

The given equation contains a cosine function and a sine function. The cosine is a function of  $2x$  and the sine is a function of  $x$ . We want one trigonometric function of the same angle. This can be accomplished by using the double-angle identity  $\cos 2x = 1 - 2 \sin^2 x$  to obtain an equivalent equation involving  $\sin x$  only.

$$\begin{aligned} \cos 2x + 3 \sin x - 2 &= 0 && \text{This is the given equation.} \\ 1 - 2 \sin^2 x + 3 \sin x - 2 &= 0 && \cos 2x = 1 - 2 \sin^2 x \\ -2 \sin^2 x + 3 \sin x - 1 &= 0 && \text{Combine like terms.} \\ 2 \sin^2 x - 3 \sin x + 1 &= 0 && \text{Multiply both sides by } -1. \text{ The equation is in quadratic form } \\ &&& 2u^2 - 3u + 1 = 0 \text{ with } u = \sin x. \\ (2 \sin x - 1)(\sin x - 1) &= 0 && \text{Factor. Notice that } 2u^2 - 3u + 1 \\ &&& \text{factors as } (2u - 1)(u - 1). \\ 2 \sin x - 1 = 0 & \text{ or } & \sin x - 1 = 0 && \text{Set each factor equal to 0.} \\ \sin x = \frac{1}{2} & & \sin x = 1 && \text{Solve for } \sin x. \\ x = \frac{\pi}{6} & \quad x = \pi - \frac{\pi}{6} = \frac{5\pi}{6} & \quad x = \frac{\pi}{2} && \text{Solve each equation for } x, \\ &&& 0 \leq x < 2\pi. \end{aligned}$$

The sine is positive in quadrants I and II.

The solutions in the interval  $[0, 2\pi)$  are  $\frac{\pi}{6}$ ,  $\frac{\pi}{2}$ , and  $\frac{5\pi}{6}$ . ...

**Check Point 8** Solve the equation:  $\cos 2x + \sin x = 0$ ,  $0 \leq x < 2\pi$ .

Sometimes it is necessary to do something to both sides of a trigonometric equation before using an identity. For example, consider the equation

$$\sin x \cos x = \frac{1}{2}.$$

This equation contains both a sine and a cosine function. How can we obtain a single function? Multiply both sides by 2. In this way, we can use the double-angle identity  $\sin 2x = 2 \sin x \cos x$  and obtain  $\sin 2x$ , a single function, on the left side.

## TECHNOLOGY

### Graphic Connections

Shown below are the graphs of

$$y = \sin x \cos x$$

and

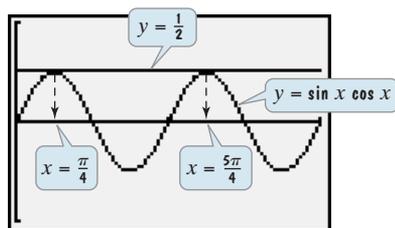

$$y = \frac{1}{2}$$

in a  $\left[0, 2\pi, \frac{\pi}{2}\right]$  by  $[-1, 1, 1]$

viewing rectangle. The solutions of

$$\sin x \cos x = \frac{1}{2}$$

are shown by the  $x$ -coordinates of the two intersection points.

## TECHNOLOGY

### Graphic Connections

A graphing utility can be used instead of an algebraic check. Shown are the graphs of

$$y = \sin x - \cos x$$

and

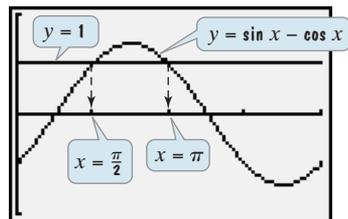

$$y = 1$$

in a  $\left[0, 2\pi, \frac{\pi}{2}\right]$  by  $[-2, 2, 1]$

viewing rectangle. The actual solutions of

$$\sin x - \cos x = 1$$

are shown by the  $x$ -coordinates of the two intersection points,  $\frac{\pi}{2}$  and  $\pi$ .

## EXAMPLE 9 Using an Identity to Solve a Trigonometric Equation

Solve the equation:  $\sin x \cos x = \frac{1}{2}$ ,  $0 \leq x < 2\pi$ .

### SOLUTION

$$\sin x \cos x = \frac{1}{2} \quad \text{This is the given equation.}$$

$$2 \sin x \cos x = 1 \quad \text{Multiply both sides by 2 in anticipation of using } \sin 2x = 2 \sin x \cos x.$$

$$\sin 2x = 1 \quad \text{Use a double-angle identity.}$$

Notice that we have an equation,  $\sin 2x = 1$ , with  $2x$ , a multiple angle. The period of the sine function is  $2\pi$ . In the interval  $[0, 2\pi)$ , the only value for which the sine function is 1 is  $\frac{\pi}{2}$ . This means that  $2x = \frac{\pi}{2}$ . Because the period is  $2\pi$ , all the solutions of  $\sin 2x = 1$  are given by

$$2x = \frac{\pi}{2} + 2n\pi \quad n \text{ is any integer.}$$

$$x = \frac{\pi}{4} + n\pi \quad \text{Divide both sides by 2 and solve for } x.$$

The solutions of  $\sin x \cos x = \frac{1}{2}$  in the interval  $[0, 2\pi)$  are obtained by letting  $n = 0$  and  $n = 1$ . The solutions are  $\frac{\pi}{4}$  and  $\frac{5\pi}{4}$ . ...

**Check Point 9** Solve the equation:  $\sin x \cos x = -\frac{1}{2}$ ,  $0 \leq x < 2\pi$ .

Let's look at another equation that contains two different functions,  $\sin x - \cos x = 1$ . Can you think of an identity that can be used to produce only one function? Perhaps  $\sin^2 x + \cos^2 x = 1$  might be helpful. The next example shows how we can use this identity after squaring both sides of the given equation. Remember that if we raise both sides of an equation to an even power, we have the possibility of introducing extraneous solutions. Thus, we must check each proposed solution in the given equation. Alternatively, we can use a graphing utility to verify actual solutions.

## EXAMPLE 10 Using an Identity to Solve a Trigonometric Equation

Solve the equation:  $\sin x - \cos x = 1$ ,  $0 \leq x < 2\pi$ .

### SOLUTION

We square both sides of the equation in anticipation of using  $\sin^2 x + \cos^2 x = 1$ .

$$\sin x - \cos x = 1 \quad \text{This is the given equation.}$$

$$(\sin x - \cos x)^2 = 1^2 \quad \text{Square both sides.}$$

$$\sin^2 x - 2 \sin x \cos x + \cos^2 x = 1 \quad \text{Square the left side using } (A - B)^2 = A^2 - 2AB + B^2.$$

$$\sin^2 x + \cos^2 x - 2 \sin x \cos x = 1 \quad \text{Rearrange terms.}$$

$$1 - 2 \sin x \cos x = 1 \quad \text{Apply a Pythagorean identity: } \sin^2 x + \cos^2 x = 1.$$

$$-2 \sin x \cos x = 0 \quad \text{Subtract 1 from both sides of the equation.}$$

$$\sin x \cos x = 0 \quad \text{Divide both sides of the equation by } -2.$$

$$\sin x = 0 \quad \text{or} \quad \cos x = 0 \quad \text{Set each factor equal to 0.}$$

$$x = 0 \quad x = \pi \quad x = \frac{\pi}{2} \quad x = \frac{3\pi}{2} \quad \text{Solve for } x \text{ in } [0, 2\pi).$$

We check these proposed solutions to see if any are extraneous.

**Check 0:**

$$\sin x - \cos x = 1$$

$$\sin 0 - \cos 0 \stackrel{?}{=} 1$$

$$0 - 1 \stackrel{?}{=} 1$$

$$-1 = 1, \text{ false}$$

0 is extraneous.

**Check  $\frac{\pi}{2}$ :**

$$\sin x - \cos x = 1$$

$$\sin \frac{\pi}{2} - \cos \frac{\pi}{2} \stackrel{?}{=} 1$$

$$1 - 0 \stackrel{?}{=} 1$$

$$1 = 1, \text{ true}$$

**Check  $\pi$ :**

$$\sin x - \cos x = 1$$

$$\sin \pi - \cos \pi \stackrel{?}{=} 1$$

$$0 - (-1) \stackrel{?}{=} 1$$

$$1 = 1, \text{ true}$$

**Check  $\frac{3\pi}{2}$ :**

$$\sin x - \cos x = 1$$

$$\sin \frac{3\pi}{2} - \cos \frac{3\pi}{2} \stackrel{?}{=} 1$$

$$-1 - 0 \stackrel{?}{=} 1$$

$$-1 = 1, \text{ false}$$

$\frac{3\pi}{2}$  is extraneous.

The actual solutions of  $\sin x - \cos x = 1$  in the interval  $[0, 2\pi)$  are  $\frac{\pi}{2}$  and  $\pi$ . ...

 **Check Point 10** Solve the equation:  $\cos x - \sin x = -1$ ,  $0 \leq x < 2\pi$ .

- 6** Use a calculator to solve trigonometric equations.

**Using a Calculator to Solve Trigonometric Equations**

In all our previous examples, the equations had solutions that were found by knowing the exact values of trigonometric functions of special angles, such as  $\frac{\pi}{6}$ ,  $\frac{\pi}{4}$ , and  $\frac{\pi}{3}$ . However, not all trigonometric equations involve these special angles. For those that do not, we will use the secondary keys marked  $\boxed{\text{SIN}^{-1}}$ ,  $\boxed{\text{COS}^{-1}}$ , and  $\boxed{\text{TAN}^{-1}}$  on a calculator. Recall that on most calculators, the inverse trigonometric function keys are the secondary functions for the buttons labelled  $\boxed{\text{SIN}}$ ,  $\boxed{\text{COS}}$ , and  $\boxed{\text{TAN}}$ , respectively.

**EXAMPLE 11 Solving Trigonometric Equations with a Calculator**

Solve each equation, correct to four decimal places, for  $0 \leq x < 2\pi$ :

a.  $\tan x = 12.8044$

b.  $\cos x = -0.4317$ .

**SOLUTION**

We begin by using a calculator to find  $\theta$ ,  $0 \leq \theta < \frac{\pi}{2}$  satisfying the following equations:

$$\tan \theta = 12.8044 \quad \cos \theta = 0.4317.$$

These numbers are the absolute values of the given range values.

Once  $\theta$  is determined, we use our knowledge of the signs of the trigonometric functions to find  $x$  in  $[0, 2\pi)$  satisfying  $\tan x = 12.8044$  and  $\cos x = -0.4317$ .

a.  $\tan x = 12.8044$

$$\tan \theta = 12.8044$$

$$\theta = \tan^{-1}(12.8044) \approx 1.4929$$

$$\tan x = 12.8044$$

$$x \approx 1.4929$$

The tangent is positive in quadrant I.

$$x \approx \pi + 1.4929 \approx 4.6345$$

The tangent is positive in quadrant III.

This is the given equation.

Use a calculator to solve this equation for  $\theta$ ,  $0 \leq \theta < \frac{\pi}{2}$ .

12.8044  $\boxed{2\text{nd}}$   $\boxed{\text{TAN}}$  or

$\boxed{2\text{nd}}$   $\boxed{\text{TAN}}$  12.8044  $\boxed{\text{ENTER}}$

Return to the given equation. Because the tangent is positive,  $x$  lies in quadrant I or III.

Solve for  $x$ ,  $0 \leq x < 2\pi$ .

**GREAT QUESTION!**

To find solutions in  $[0, 2\pi)$ , does my calculator have to be in radian mode?

Yes. Be careful. Most scientific calculators revert to degree mode every time they are cleared.

Correct to four decimal places, the solutions of  $\tan x = 12.8044$  in the interval  $[0, 2\pi)$  are 1.4929 and 4.6345. (Note: Slight differences in approximate solutions can occur due to rounding. If you don't round  $\tan^{-1}(12.8044)$  first, then  $x = \pi + \tan^{-1}(12.8044) \approx 4.6344$ .)

b.  $\cos x = -0.4317$

$\cos \theta = 0.4317$

This is the given equation.

Use a calculator to solve this equation for  $\theta$ ,  
 $0 \leq \theta < \frac{\pi}{2}$ .

$$\theta = \cos^{-1}(0.4317) \approx 1.1244 \quad .4317 \text{ [2nd] [COS] or [2nd] [COS] .4317 [ENTER]}$$

$\cos x = -0.4317$

Return to the given equation. Because the cosine is negative,  $x$  lies in quadrant II or III.

$$x \approx \pi - 1.1244 \approx 2.0172 \quad x \approx \pi + 1.1244 \approx 4.2660 \quad \text{Solve for } x, 0 \leq x < 2\pi.$$

The cosine is negative in quadrant II.

The cosine is negative in quadrant III.

Correct to four decimal places, the solutions of  $\cos x = -0.4317$  in the interval  $[0, 2\pi)$  are 2.0172 and 4.2660. ... **Check Point 11** Solve each equation, correct to four decimal places, for  $0 \leq x < 2\pi$ :

a.  $\tan x = 3.1044$

b.  $\sin x = -0.2315$ .

**EXAMPLE 12** Solving a Trigonometric Equation Using the Quadratic Formula and a CalculatorSolve the equation, correct to four decimal places, for  $0 \leq x < 2\pi$ :

$$\sin^2 x - \sin x - 1 = 0.$$

**SOLUTION**The given equation is in quadratic form  $u^2 - u - 1 = 0$  with  $u = \sin x$ . We use the quadratic formula to solve for  $\sin x$  because  $u^2 - u - 1$  cannot be factored. Begin by identifying the values for  $a$ ,  $b$ , and  $c$ .

$$\sin^2 x - \sin x - 1 = 0$$

$a = 1$

$b = -1$

$c = -1$

Substituting these values into the quadratic formula and simplifying gives the values for  $\sin x$ . Once we obtain these values, we will solve for  $x$ .

$$\sin x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} = \frac{-(-1) \pm \sqrt{(-1)^2 - 4(1)(-1)}}{2(1)} = \frac{1 \pm \sqrt{1 - (-4)}}{2} = \frac{1 \pm \sqrt{5}}{2}$$

$$\sin x = \frac{1 + \sqrt{5}}{2} \approx 1.6180 \quad \text{or} \quad \sin x = \frac{1 - \sqrt{5}}{2} \approx -0.6180$$

This equation has no solution because  $\sin x$  cannot be greater than 1.The sine is negative in quadrants III and IV. Use a calculator to solve  $\sin \theta = 0.6180$ ,  $0 \leq \theta < \frac{\pi}{2}$ .Using a calculator to solve  $\sin \theta = 0.6180$ , we have

$$\theta = \sin^{-1}(0.6180) \approx 0.6662.$$

We use 0.6662 to solve  $\sin x = -0.6180$ ,  $0 \leq x < 2\pi$ .

$$x \approx \pi + 0.6662 \approx 3.8078 \quad x \approx 2\pi - 0.6662 \approx 5.6170$$

The sine is negative in quadrant III.

The sine is negative in quadrant IV.

Correct to four decimal places, the solutions of  $\sin^2 x - \sin x - 1 = 0$  in the interval  $[0, 2\pi)$  are 3.8078 and 5.6170. ...

 **Check Point 12** Solve the equation, correct to four decimal places, for  $0 \leq x < 2\pi$ :

$$\cos^2 x + 5 \cos x + 3 = 0.$$

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- The solutions of  $\sin x = \frac{\sqrt{2}}{2}$  in  $[0, 2\pi)$  are  $x = \frac{\pi}{4}$  and  $x = \underline{\hspace{2cm}}$ . If  $n$  is any integer, all solutions of  $\sin x = \frac{\sqrt{2}}{2}$  are given by  $x = \underline{\hspace{2cm}}$  and  $x = \underline{\hspace{2cm}}$ .
- The solution of  $\tan x = -\sqrt{3}$  in  $[0, \pi)$  is  $x = \pi - \frac{\pi}{3}$ , or  $x = \underline{\hspace{2cm}}$ . If  $n$  is any integer, all solutions of  $\tan x = -\sqrt{3}$  are given by  $\underline{\hspace{2cm}}$ .
- True or false: If  $3x = \frac{\pi}{4} + n\pi$  for any integer  $n$ , then  $x = \frac{\pi}{12} + n\pi$ .  $\underline{\hspace{2cm}}$
- True or false: If  $\cos \frac{x}{3} = \frac{1}{2}$ , then  $\frac{x}{3} = \frac{\pi}{3} + 2n\pi$  or  $\frac{x}{3} = \frac{5\pi}{3} + 2n\pi$  for any integer  $n$ .  $\underline{\hspace{2cm}}$
- True or false: If  $\tan 3x = 1$ , then  $x = \frac{\pi}{4} + n\pi$  for any integer  $n$ .  $\underline{\hspace{2cm}}$
- If  $2 \cos^2 x - 9 \cos x - 5 = 0$ , then  $\underline{\hspace{2cm}} = 0$  or  $\underline{\hspace{2cm}} = 0$ . Of these two equations, the equation that has no solution is  $\underline{\hspace{2cm}}$ .
- If  $2 \sin x \cos x + \sqrt{2} \cos x = 0$ , then  $\underline{\hspace{2cm}} = 0$  or  $\underline{\hspace{2cm}} = 0$ .
- The first step in solving the equation  $4 \cos^2 x + 4 \sin x - 5 = 0$ ,  $0 \leq x < 2\pi$ , is to replace  $\underline{\hspace{2cm}}$  with  $\underline{\hspace{2cm}}$ .
- If  $\sin 0.9695 \approx 0.8246$ , then the solutions of  $\sin x = -0.8246$ ,  $0 \leq x < 2\pi$ , are given by  $x \approx \underline{\hspace{2cm}} + 0.9695$  and  $x \approx \underline{\hspace{2cm}} - 0.9695$ .

## EXERCISE SET 5.5

### Practice Exercises

In Exercises 1–10, use substitution to determine whether the given  $x$ -value is a solution of the equation.

- $\cos x = \frac{\sqrt{2}}{2}$ ,  $x = \frac{\pi}{4}$
- $\tan x = \sqrt{3}$ ,  $x = \frac{\pi}{3}$
- $\sin x = \frac{\sqrt{3}}{2}$ ,  $x = \frac{\pi}{6}$
- $\sin x = \frac{\sqrt{2}}{2}$ ,  $x = \frac{\pi}{3}$
- $\cos x = -\frac{1}{2}$ ,  $x = \frac{2\pi}{3}$
- $\cos x = -\frac{1}{2}$ ,  $x = \frac{4\pi}{3}$
- $\tan 2x = -\frac{\sqrt{3}}{3}$ ,  $x = \frac{5\pi}{12}$
- $\cos \frac{2x}{3} = -\frac{1}{2}$ ,  $x = \pi$
- $\cos x = \sin 2x$ ,  $x = \frac{\pi}{3}$
- $\cos x + 2 = \sqrt{3} \sin x$ ,  $x = \frac{\pi}{6}$

In Exercises 11–24, find all solutions of each equation.

- $\sin x = \frac{\sqrt{3}}{2}$
- $\cos x = \frac{\sqrt{3}}{2}$
- $\tan x = 1$
- $\tan x = \sqrt{3}$
- $\cos x = -\frac{1}{2}$
- $\sin x = -\frac{\sqrt{2}}{2}$
- $\tan x = 0$
- $\sin x = 0$
- $2 \cos x + \sqrt{3} = 0$
- $2 \sin x + \sqrt{3} = 0$

- $4 \sin \theta - 1 = 2 \sin \theta$
- $5 \sin \theta + 1 = 3 \sin \theta$
- $3 \sin \theta + 5 = -2 \sin \theta$
- $7 \cos \theta + 9 = -2 \cos \theta$

Exercises 25–38 involve equations with multiple angles. Solve each equation on the interval  $[0, 2\pi)$ .

- $\sin 2x = \frac{\sqrt{3}}{2}$
- $\cos 2x = \frac{\sqrt{2}}{2}$
- $\cos 4x = -\frac{\sqrt{3}}{2}$
- $\sin 4x = -\frac{\sqrt{2}}{2}$
- $\tan 3x = \frac{\sqrt{3}}{3}$
- $\tan 3x = \sqrt{3}$
- $\tan \frac{x}{2} = \sqrt{3}$
- $\tan \frac{x}{2} = \frac{\sqrt{3}}{3}$
- $\sin \frac{2\theta}{3} = -1$
- $\cos \frac{2\theta}{3} = -1$
- $\sec \frac{3\theta}{2} = -2$
- $\cot \frac{3\theta}{2} = -\sqrt{3}$
- $\sin\left(2x + \frac{\pi}{6}\right) = \frac{1}{2}$
- $\sin\left(2x - \frac{\pi}{4}\right) = \frac{\sqrt{2}}{2}$

Exercises 39–52 involve trigonometric equations quadratic in form. Solve each equation on the interval  $[0, 2\pi)$ .

- $2 \sin^2 x - \sin x - 1 = 0$
- $2 \sin^2 x + \sin x - 1 = 0$
- $2 \cos^2 x + 3 \cos x + 1 = 0$
- $\cos^2 x + 2 \cos x - 3 = 0$
- $2 \sin^2 x = \sin x + 3$
- $2 \sin^2 x = 4 \sin x + 6$

45.  $\sin^2 \theta - 1 = 0$       46.  $\cos^2 \theta - 1 = 0$   
 47.  $4 \cos^2 x - 1 = 0$       48.  $4 \sin^2 x - 3 = 0$   
 49.  $9 \tan^2 x - 3 = 0$       50.  $3 \tan^2 x - 9 = 0$   
 51.  $\sec^2 x - 2 = 0$       52.  $4 \sec^2 x - 2 = 0$

In Exercises 53–62, solve each equation on the interval  $[0, 2\pi)$ .

53.  $(\tan x - 1)(\cos x + 1) = 0$   
 54.  $(\tan x + 1)(\sin x - 1) = 0$   
 55.  $(2 \cos x + \sqrt{3})(2 \sin x + 1) = 0$   
 56.  $(2 \cos x - \sqrt{3})(2 \sin x - 1) = 0$   
 57.  $\cot x(\tan x - 1) = 0$       58.  $\cot x(\tan x + 1) = 0$   
 59.  $\sin x + 2 \sin x \cos x = 0$       60.  $\cos x - 2 \sin x \cos x = 0$   
 61.  $\tan^2 x \cos x = \tan^2 x$       62.  $\cot^2 x \sin x = \cot^2 x$

In Exercises 63–84, use an identity to solve each equation on the interval  $[0, 2\pi)$ .

63.  $2 \cos^2 x + \sin x - 1 = 0$       64.  $2 \cos^2 x - \sin x - 1 = 0$   
 65.  $\sin^2 x - 2 \cos x - 2 = 0$   
 66.  $4 \sin^2 x + 4 \cos x - 5 = 0$   
 67.  $4 \cos^2 x = 5 - 4 \sin x$       68.  $3 \cos^2 x = \sin^2 x$   
 69.  $\sin 2x = \cos x$       70.  $\sin 2x = \sin x$   
 71.  $\cos 2x = \cos x$       72.  $\cos 2x = \sin x$   
 73.  $\cos 2x + 5 \cos x + 3 = 0$       74.  $\cos 2x + \cos x + 1 = 0$   
 75.  $\sin x \cos x = \frac{\sqrt{2}}{4}$       76.  $\sin x \cos x = \frac{\sqrt{3}}{4}$   
 77.  $\sin x + \cos x = 1$       78.  $\sin x + \cos x = -1$   
 79.  $\sin\left(x + \frac{\pi}{4}\right) + \sin\left(x - \frac{\pi}{4}\right) = 1$   
 80.  $\sin\left(x + \frac{\pi}{3}\right) + \sin\left(x - \frac{\pi}{3}\right) = 1$   
 81.  $\sin 2x \cos x + \cos 2x \sin x = \frac{\sqrt{2}}{2}$   
 82.  $\sin 3x \cos 2x + \cos 3x \sin 2x = 1$   
 83.  $\tan x + \sec x = 1$       84.  $\tan x - \sec x = 1$

In Exercises 85–96, use a calculator to solve each equation, correct to four decimal places, on the interval  $[0, 2\pi)$ .

85.  $\sin x = 0.8246$       86.  $\sin x = 0.7392$   
 87.  $\cos x = -\frac{2}{5}$       88.  $\cos x = -\frac{4}{7}$   
 89.  $\tan x = -3$       90.  $\tan x = -5$   
 91.  $\cos^2 x - \cos x - 1 = 0$   
 92.  $3 \cos^2 x - 8 \cos x - 3 = 0$   
 93.  $4 \tan^2 x - 8 \tan x + 3 = 0$   
 94.  $\tan^2 x - 3 \tan x + 1 = 0$   
 95.  $7 \sin^2 x - 1 = 0$   
 96.  $5 \sin^2 x - 1 = 0$

In Exercises 97–116, use the most appropriate method to solve each equation on the interval  $[0, 2\pi)$ . Use exact values where possible or give approximate solutions correct to four decimal places.

97.  $2 \cos 2x + 1 = 0$       98.  $2 \sin 3x + \sqrt{3} = 0$   
 99.  $\sin 2x + \sin x = 0$       100.  $\sin 2x + \cos x = 0$

101.  $3 \cos x - 6\sqrt{3} = \cos x - 5\sqrt{3}$   
 102.  $\cos x - 5 = 3 \cos x + 6$   
 103.  $\tan x = -4.7143$       104.  $\tan x = -6.2154$   
 105.  $2 \sin^2 x = 3 - \sin x$       106.  $2 \sin^2 x = 2 - 3 \sin x$   
 107.  $\cos x \csc x = 2 \cos x$       108.  $\tan x \sec x = 2 \tan x$   
 109.  $5 \cot^2 x - 15 = 0$       110.  $5 \sec^2 x - 10 = 0$   
 111.  $\cos^2 x + 2 \cos x - 2 = 0$   
 112.  $\cos^2 x + 5 \cos x - 1 = 0$   
 113.  $5 \sin x = 2 \cos^2 x - 4$   
 114.  $7 \cos x = 4 - 2 \sin^2 x$   
 115.  $2 \tan^2 x + 5 \tan x + 3 = 0$   
 116.  $3 \tan^2 x - \tan x - 2 = 0$

### Practice Plus

In Exercises 117–120, graph  $f$  and  $g$  in the same rectangular coordinate system for  $0 \leq x \leq 2\pi$ . Then solve a trigonometric equation to determine points of intersection and identify these points on your graphs.

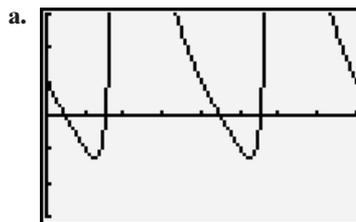

117.  $f(x) = 3 \cos x, g(x) = \cos x - 1$   
 118.  $f(x) = 3 \sin x, g(x) = \sin x - 1$   
 119.  $f(x) = \cos 2x, g(x) = -2 \sin x$   
 120.  $f(x) = \cos 2x, g(x) = 1 - \sin x$

In Exercises 121–126, solve each equation on the interval  $[0, 2\pi)$ .

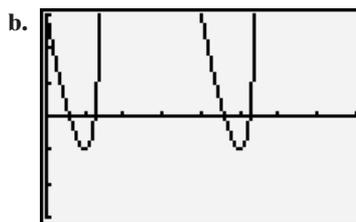

121.  $|\cos x| = \frac{\sqrt{3}}{2}$       122.  $|\sin x| = \frac{1}{2}$   
 123.  $10 \cos^2 x + 3 \sin x - 9 = 0$   
 124.  $3 \cos^2 x - \sin x = \cos^2 x$   
 125.  $2 \cos^3 x + \cos^2 x - 2 \cos x - 1 = 0$  (Hint: Use factoring by grouping.)  
 126.  $2 \sin^3 x - \sin^2 x - 2 \sin x + 1 = 0$  (Hint: Use factoring by grouping.)

In Exercises 127–128, find the  $x$ -intercepts, correct to four decimal places, of the graph of each function. Then use the  $x$ -intercepts to match the function with its graph. The graphs are labeled (a) and (b).

127.  $f(x) = \tan^2 x - 3 \tan x + 1$   
 128.  $g(x) = 4 \tan^2 x - 8 \tan x + 3$

$[0, 2\pi, \frac{\pi}{4}]$  by  $[-3, 3, 1]$

$[0, 2\pi, \frac{\pi}{4}]$  by  $[-3, 3, 1]$

## Application Exercises

Use this information to solve Exercises 129–130. Our cycle of normal breathing takes place every 5 seconds. Velocity of air flow,  $y$ , measured in liters per second, after  $x$  seconds is modeled by

$$y = 0.6 \sin \frac{2\pi}{5}x.$$

Velocity of air flow is positive when we inhale and negative when we exhale.

- 129.** Within each breathing cycle, when are we inhaling at a rate of 0.3 liter per second? Round to the nearest tenth of a second.
- 130.** Within each breathing cycle, when are we exhaling at a rate of 0.3 liter per second? Round to the nearest tenth of a second.

Use this information to solve Exercises 131–132. The number of hours of daylight in Boston is given by

$$y = 3 \sin \left[ \frac{2\pi}{365}(x - 79) \right] + 12,$$

where  $x$  is the number of days after January 1.

- 131.** Within a year, when does Boston have 10.5 hours of daylight? Give your answer in days after January 1 and round to the nearest day.
- 132.** Within a year, when does Boston have 13.5 hours of daylight? Give your answer in days after January 1 and round to the nearest day.

Use this information to solve Exercises 133–134. A ball on a spring is pulled 4 inches below its rest position and then released. After  $t$  seconds, the ball's distance,  $d$ , in inches from its rest position is given by

$$d = -4 \cos \frac{\pi}{3}t.$$

- 133.** Find all values of  $t$  for which the ball is 2 inches above its rest position.
- 134.** Find all values of  $t$  for which the ball is 2 inches below its rest position.

Use this information to solve Exercises 135–136. When throwing an object, the distance achieved depends on its initial velocity,  $v_0$ , and the angle above the horizontal at which the object is thrown,  $\theta$ . The distance,  $d$ , in feet, that describes the range covered is given by

$$d = \frac{v_0^2}{16} \sin \theta \cos \theta,$$

where  $v_0$  is measured in feet per second.

- 135.** You and your friend are throwing a baseball back and forth. If you throw the ball with an initial velocity of  $v_0 = 90$  feet per second, at what angle of elevation,  $\theta$ , to the nearest degree, should you direct your throw so that it can be easily caught by your friend located 170 feet away?
- 136.** In Exercise 135, you increase the distance between you and your friend to 200 feet. With this increase, at what angle of elevation,  $\theta$ , to the nearest degree, should you direct your throw?

## Writing in Mathematics

- 137.** What are the solutions of a trigonometric equation?
- 138.** Describe the difference between verifying a trigonometric identity and solving a trigonometric equation.

- 139.** Without actually solving the equation, describe how to solve  $3 \tan x - 2 = 5 \tan x - 1$ .

- 140.** In the interval  $[0, 2\pi)$ , the solutions of  $\sin x = \cos 2x$  are  $\frac{\pi}{6}$ ,  $\frac{5\pi}{6}$ , and  $\frac{3\pi}{2}$ . Explain how to use graphs generated by a graphing utility to check these solutions.
- 141.** Suppose you are solving equations in the interval  $[0, 2\pi)$ . Without actually solving equations, what is the difference between the number of solutions of  $\sin x = \frac{1}{2}$  and  $\sin 2x = \frac{1}{2}$ ? How do you account for this difference?

In Exercises 142–143, describe a general strategy for solving each equation. Do not solve the equation.

- 142.**  $2 \sin^2 x + 5 \sin x + 3 = 0$
- 143.**  $\sin 2x = \sin x$
- 144.** Describe a natural periodic phenomenon. Give an example of a question that can be answered by a trigonometric equation in the study of this phenomenon.
- 145.** A city's tall buildings and narrow streets reduce the amount of sunlight. If  $h$  is the average height of the buildings and  $w$  is the width of the street, the angle of elevation from the street to the top of the buildings is given by the trigonometric equation

$$\tan \theta = \frac{h}{w}.$$

A value of  $\theta = 63^\circ$  can result in an 85% loss of illumination. Some people experience depression with loss of sunlight. Determine whether such a person should live on a city street that is 80 feet wide with buildings whose heights average 400 feet. Explain your answer and include  $\theta$ , to the nearest degree, in your argument.

## Technology Exercises

- 146.** Use a graphing utility to verify the solutions of any five equations that you solved in Exercises 63–84.

In Exercises 147–151, use a graphing utility to approximate the solutions of each equation in the interval  $[0, 2\pi)$ . Round to the nearest hundredth of a radian.

- 147.**  $15 \cos^2 x + 7 \cos x - 2 = 0$
- 148.**  $\cos x = x$
- 149.**  $2 \sin^2 x = 1 - 2 \sin x$
- 150.**  $\sin 2x = 2 - x^2$
- 151.**  $\sin x + \sin 2x + \sin 3x = 0$

## Critical Thinking Exercises

**Make Sense?** In Exercises 152–155, determine whether each statement makes sense or does not make sense, and explain your reasoning.

- 152.** I solved  $4 \cos^2 x = 5 - 4 \sin x$  by working independently with the left side, applying a Pythagorean identity, and transforming the left side into  $5 - 4 \sin x$ .
- 153.** There are similarities and differences between solving  $4x + 1 = 3$  and  $4 \sin \theta + 1 = 3$ : In the first equation, I need to isolate  $x$  to get the solution. In the trigonometric equation, I need to first isolate  $\sin \theta$ , but then I must continue to solve for  $\theta$ .
- 154.** I solved  $\cos(x - \frac{\pi}{3}) = -1$  by first applying the formula for the cosine of the difference of two angles.

155. Using the equation for simple harmonic motion described in Exercises 133–134, I need to solve a trigonometric equation to determine the ball's distance from its rest position after 2 seconds.

In Exercises 156–159, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

156. The equation  $(\sin x - 3)(\cos x + 2) = 0$  has no solution.  
 157. The equation  $\tan x = \frac{\pi}{2}$  has no solution.  
 158. A trigonometric equation with an infinite number of solutions is an identity.  
 159. The equations  $\sin 2x = 1$  and  $\sin 2x = \frac{1}{2}$  have the same number of solutions on the interval  $[0, 2\pi)$ .

In Exercises 160–162, solve each equation on the interval  $[0, 2\pi)$ . Do not use a calculator.

160.  $2 \cos x - 1 + 3 \sec x = 0$   
 161.  $\sin 3x + \sin x + \cos x = 0$   
 162.  $\sin x + 2 \sin \frac{x}{2} = \cos \frac{x}{2} + 1$

### Preview Exercises

Exercises 163–165 will help you prepare for the material covered in the first section of the next chapter. Solve each equation by using the cross-products principle to clear fractions from the proportion:

$$\text{If } \frac{a}{b} = \frac{c}{d}, \text{ then } ad = bc. (b \neq 0 \text{ and } d \neq 0)$$

Round to the nearest tenth.

163. Solve for  $a$ :  $\frac{a}{\sin 46^\circ} = \frac{56}{\sin 63^\circ}$ .  
 164. Solve for  $B$ ,  $0 < B < 180^\circ$ :  $\frac{81}{\sin 43^\circ} = \frac{62}{\sin B}$ .  
 165. Solve for  $B$ :  $\frac{51}{\sin 75^\circ} = \frac{71}{\sin B}$ .

## CHAPTER 5

### Summary, Review, and Test

## SUMMARY

### DEFINITIONS AND CONCEPTS

#### 5.1 Verifying Trigonometric Identities

- Identities are trigonometric equations that are true for all values of the variable for which the expressions are defined.
- Fundamental trigonometric identities are given in the box on page 622.
- Guidelines for verifying trigonometric identities are given in the box on page 630.

### EXAMPLES

Ex. 1, p. 623;  
 Ex. 2, p. 624;  
 Ex. 3, p. 625;  
 Ex. 4, p. 625;  
 Ex. 5, p. 626;  
 Ex. 6, p. 627;  
 Ex. 7, p. 627;  
 Ex. 8, p. 628

#### 5.2 Sum and Difference Formulas

- Sum and difference formulas are given in the box on page 636 and the box on page 640.
- Sum and difference formulas can be used to find exact values of trigonometric functions.
- Sum and difference formulas can be used to verify trigonometric identities.

Ex. 1, p. 635;  
 Ex. 2, p. 635;  
 Ex. 4, p. 637;  
 Ex. 5, p. 638  
 Ex. 3, p. 636;  
 Ex. 6, p. 639;  
 Ex. 7, p. 640

## DEFINITIONS AND CONCEPTS

## EXAMPLES

## 5.3 Double-Angle, Power-Reducing, and Half-Angle Formulas

- a. Double-angle, power-reducing, and half-angle formulas are given in the box on page 651.
- b. Double-angle and half-angle formulas can be used to find exact values of trigonometric functions. Ex. 1, p. 645;  
Ex. 2, p. 646;  
Ex. 5, p. 649
- c. Double-angle and half-angle formulas can be used to verify trigonometric identities. Ex. 3, p. 646;  
Ex. 6, p. 650;  
Ex. 7, p. 650
- d. Power-reducing formulas can be used to reduce the powers of trigonometric functions. Ex. 4, p. 647

## 5.4 Product-to-Sum and Sum-to-Product Formulas

- a. The product-to-sum formulas are given in the box on page 657. Ex. 1, p. 657
- b. The sum-to-product formulas are given in the box on page 658. These formulas are useful to verify identities with fractions that contain sums and differences of sines and/or cosines. Ex. 2, p. 658;  
Ex. 3, p. 659

## 5.5 Trigonometric Equations

- a. The values that satisfy a trigonometric equation are its solutions.
- b. To solve an equation containing a single trigonometric function, isolate the function on one side and solve for the variable. Ex. 1, p. 665
- c. When solving equations involving multiple angles, the period plays an important role in ensuring that we do not leave out any solutions. Ex. 2, p. 666;  
Ex. 3, p. 666
- d. Trigonometric equations quadratic in form can be expressed as  $au^2 + bu + c = 0$ , where  $u$  is a trigonometric function and  $a \neq 0$ . Such equations can be solved by factoring, the square root property, or the quadratic formula. Ex. 4, p. 667;  
Ex. 5, p. 668;  
Ex. 12, p. 673
- e. Factoring can be used to separate two different trigonometric functions in an equation. Ex. 6, p. 669
- f. Identities are used to solve some trigonometric equations. Ex. 7, p. 669;  
Ex. 8, p. 670;  
Ex. 9, p. 671;  
Ex. 10, p. 671
- g. Some trigonometric equations have solutions that cannot be determined by knowing the exact values of trigonometric functions of special angles. Such equations are solved using a calculator's inverse trigonometric function feature. Ex. 11, p. 672;  
Ex. 12, p. 673

## REVIEW EXERCISES

## 5.1

In Exercises 1–13, verify each identity.

- $\sec x - \cos x = \tan x \sin x$
- $\cos x + \sin x \tan x = \sec x$
- $\sin^2 \theta (1 + \cot^2 \theta) = 1$
- $(\sec \theta - 1)(\sec \theta + 1) = \tan^2 \theta$
- $\frac{1 - \tan x}{\sin x} = \csc x - \sec x$
- $\frac{1}{\sin t - 1} + \frac{1}{\sin t + 1} = -2 \tan t \sec t$
- $\frac{1 + \sin t}{\cos^2 t} = \tan^2 t + 1 + \tan t \sec t$
- $\frac{\cos x}{1 - \sin x} = \frac{1 + \sin x}{\cos x}$
- $1 - \frac{\sin^2 x}{1 + \cos x} = \cos x$
- $(\tan \theta + \cot \theta)^2 = \sec^2 \theta + \csc^2 \theta$

$$11. \frac{1}{\sin \theta + \cos \theta} + \frac{1}{\sin \theta - \cos \theta} = \frac{2 \sin \theta}{\sin^4 \theta - \cos^4 \theta}$$

$$12. \frac{\cos t}{\cot t - 5 \cos t} = \frac{1}{\csc t - 5}$$

$$13. \frac{1 - \cos t}{1 + \cos t} = (\csc t - \cot t)^2$$

## 5.2 and 5.3

In Exercises 14–19, use a sum or difference formula to find the exact value of each expression.

$$14. \cos(45^\circ + 30^\circ) \qquad 15. \sin 195^\circ$$

$$16. \tan\left(\frac{4\pi}{3} - \frac{\pi}{4}\right) \qquad 17. \tan \frac{5\pi}{12}$$

$$18. \cos 65^\circ \cos 5^\circ + \sin 65^\circ \sin 5^\circ$$

$$19. \sin 80^\circ \cos 50^\circ - \cos 80^\circ \sin 50^\circ$$

In Exercises 20–31, verify each identity.

$$20. \sin\left(x + \frac{\pi}{6}\right) - \cos\left(x + \frac{\pi}{3}\right) = \sqrt{3} \sin x$$

$$21. \tan\left(x + \frac{3\pi}{4}\right) = \frac{\tan x - 1}{1 + \tan x}$$

$$22. \sec(\alpha + \beta) = \frac{\sec \alpha \sec \beta}{1 - \tan \alpha \tan \beta}$$

$$23. \frac{\cos(\alpha - \beta)}{\cos \alpha \cos \beta} = 1 + \tan \alpha \tan \beta$$

$$24. \cos^4 t - \sin^4 t = \cos 2t$$

$$25. \sin t - \cos 2t = (2 \sin t - 1)(\sin t + 1)$$

$$26. \frac{\sin 2\theta - \sin \theta}{\cos 2\theta + \cos \theta} = \frac{1 - \cos \theta}{\sin \theta}$$

$$27. \frac{\sin 2\theta}{1 - \sin^2 \theta} = 2 \tan \theta$$

$$28. \tan 2t = 2 \sin t \cos t \sec 2t$$

$$29. \cos 4t = 1 - 8 \sin^2 t \cos^2 t$$

$$30. \tan \frac{x}{2} (1 + \cos x) = \sin x$$

$$31. \tan \frac{x}{2} = \frac{\sec x - 1}{\tan x}$$

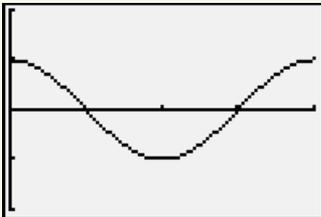

In Exercises 32–34, the graph with the given equation is shown in

a  $\left[0, 2\pi, \frac{\pi}{2}\right]$  by  $[-2, 2, 1]$  viewing rectangle.

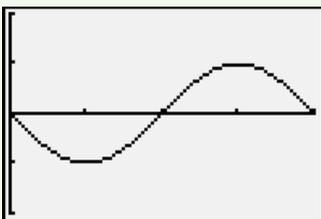

a. Describe the graph using another equation.

b. Verify that the two equations are equivalent.

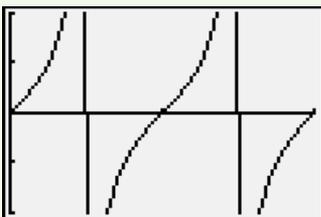

$$32. y = \sin\left(x - \frac{3\pi}{2}\right)$$

$$33. y = \cos\left(x + \frac{\pi}{2}\right)$$

$$34. y = \frac{\tan x - 1}{1 - \cot x}$$

In Exercises 35–38, find the exact value of the following under the given conditions:

a.  $\sin(\alpha + \beta)$

b.  $\cos(\alpha - \beta)$

c.  $\tan(\alpha + \beta)$

d.  $\sin 2\alpha$

e.  $\cos \frac{\beta}{2}$

35.  $\sin \alpha = \frac{3}{5}$ ,  $0 < \alpha < \frac{\pi}{2}$ , and  $\sin \beta = \frac{12}{13}$ ,  $\frac{\pi}{2} < \beta < \pi$ .

36.  $\tan \alpha = \frac{4}{3}$ ,  $\pi < \alpha < \frac{3\pi}{2}$ , and  $\tan \beta = \frac{5}{12}$ ,  $0 < \beta < \frac{\pi}{2}$ .

37.  $\tan \alpha = -3$ ,  $\frac{\pi}{2} < \alpha < \pi$ , and  $\cot \beta = -3$ ,  $\frac{3\pi}{2} < \beta < 2\pi$ .

38.  $\sin \alpha = -\frac{1}{3}$ ,  $\pi < \alpha < \frac{3\pi}{2}$ , and  $\cos \beta = -\frac{1}{3}$ ,  $\pi < \beta < \frac{3\pi}{2}$ .

In Exercises 39–42, use double- and half-angle formulas to find the exact value of each expression.

39.  $\cos^2 15^\circ - \sin^2 15^\circ$

40.  $\frac{2 \tan \frac{5\pi}{12}}{1 - \tan^2 \frac{5\pi}{12}}$

41.  $\sin 22.5^\circ$

42.  $\tan \frac{\pi}{12}$

## 5.4

In Exercises 43–44, express each product as a sum or difference.

43.  $\sin 6x \sin 4x$

44.  $\sin 7x \cos 3x$

In Exercises 45–46, express each sum or difference as a product. If possible, find this product's exact value.

45.  $\sin 2x - \sin 4x$

46.  $\cos 75^\circ + \cos 15^\circ$

In Exercises 47–48, verify each identity.

47.  $\frac{\cos 3x + \cos 5x}{\cos 3x - \cos 5x} = \cot x \cot 4x$

48.  $\frac{\sin 2x + \sin 6x}{\sin 2x - \sin 6x} = -\tan 4x \cot 2x$

49. The graph with the given equation is shown in a  $\left[0, 2\pi, \frac{\pi}{2}\right]$  by  $[-2, 2, 1]$  viewing rectangle.

$$y = \frac{\cos 3x + \cos x}{\sin 3x - \sin x}$$

a. Describe the graph using another equation.

b. Verify that the two equations are equivalent.

## 5.5

In Exercises 50–53, find all solutions of each equation.

50.  $\cos x = -\frac{1}{2}$

51.  $\sin x = \frac{\sqrt{2}}{2}$

52.  $2 \sin x + 1 = 0$

53.  $\sqrt{3} \tan x - 1 = 0$

In Exercises 54–67, solve each equation on the interval  $[0, 2\pi)$ . Use exact values where possible or give approximate solutions correct to four decimal places.

54.  $\cos 2x = -1$                       55.  $\sin 3x = 1$   
 56.  $\tan \frac{x}{2} = -1$                       57.  $\tan x = 2 \cos x \tan x$   
 58.  $\cos^2 x - 2 \cos x = 3$               59.  $2 \cos^2 x - \sin x = 1$   
 60.  $4 \sin^2 x = 1$                       61.  $\cos 2x - \sin x = 1$   
 62.  $\sin 2x = \sqrt{3} \sin x$               63.  $\sin x = \tan x$   
 64.  $\sin x = -0.6031$                   65.  $5 \cos^2 x - 3 = 0$   
 66.  $\sec^2 x = 4 \tan x - 2$               67.  $2 \sin^2 x + \sin x - 2 = 0$

68. A ball on a spring is pulled 6 inches below its rest position and then released. After  $t$  seconds, the ball's distance,  $d$ , in inches from its rest position is given by

$$d = -6 \cos \frac{\pi}{2} t.$$

Find all values of  $t$  for which the ball is 3 inches below its rest position.

69. You are playing catch with a friend located 100 feet away. If you throw the ball with an initial velocity of  $v_0 = 90$  feet per second, at what angle of elevation,  $\theta$ , to the nearest degree should you direct your throw so that it can be caught easily? Use the formula

$$d = \frac{v_0^2}{16} \sin \theta \cos \theta.$$

## CHAPTER 5 TEST

Use the following conditions to solve Exercises 1–4:

$$\begin{aligned} \sin \alpha &= \frac{4}{5}, \frac{\pi}{2} < \alpha < \pi \\ \cos \beta &= \frac{5}{13}, 0 < \beta < \frac{\pi}{2} \end{aligned}$$

Find the exact value of each of the following.

1.  $\cos(\alpha + \beta)$                       2.  $\tan(\alpha - \beta)$   
 3.  $\sin 2\alpha$                               4.  $\cos \frac{\beta}{2}$   
 5. Use  $105^\circ = 135^\circ - 30^\circ$  to find the exact value of  $\sin 105^\circ$ .

In Exercises 6–11, verify each identity.

6.  $\cos x \csc x = \cot x$               7.  $\frac{\sec x}{\cot x + \tan x} = \sin x$   
 8.  $1 - \frac{\cos^2 x}{1 + \sin x} = \sin x$               9.  $\cos\left(\theta + \frac{\pi}{2}\right) = -\sin \theta$   
 10.  $\frac{\sin(\alpha - \beta)}{\sin \alpha \cos \beta} = 1 - \cot \alpha \tan \beta$   
 11.  $\sin t \cos t(\tan t + \cot t) = 1$

In Exercises 12–18, solve each equation on the interval  $[0, 2\pi)$ . Use exact values where possible or give approximate solutions correct to four decimal places.

12.  $\sin 3x = -\frac{1}{2}$   
 13.  $\sin 2x + \cos x = 0$   
 14.  $2 \cos^2 x - 3 \cos x + 1 = 0$   
 15.  $2 \sin^2 x + \cos x = 1$   
 16.  $\cos x = -0.8092$   
 17.  $\tan x \sec x = 3 \tan x$   
 18.  $\tan^2 x - 3 \tan x - 2 = 0$

## CUMULATIVE REVIEW EXERCISES (CHAPTERS P–5)

Solve each equation or inequality in Exercises 1–5.

1.  $x^3 + x^2 - x + 15 = 0$   
 2.  $11^{x-1} = 125$   
 3.  $x^2 + 2x - 8 > 0$   
 4.  $\cos 2x + 3 = 5 \cos x$ ,  $0 \leq x < 2\pi$   
 5.  $\tan x + \sec^2 x = 3$ ,  $0 \leq x < 2\pi$

In Exercises 6–11, graph each equation.

6.  $y = \sqrt{x+2} - 1$ ; Use transformations of the graph of  $y = \sqrt{x}$ .  
 7.  $(x-1)^2 + (y+2)^2 = 9$   
 8.  $y + 2 = \frac{1}{3}(x-1)$   
 9.  $y = 3 \cos 2x$ ,  $-2\pi \leq x \leq 2\pi$   
 10.  $y = 2 \sin \frac{x}{2} + 1$ ,  $-2\pi \leq x \leq 2\pi$   
 11.  $f(x) = (x-1)^2(x-3)$   
 12. If  $f(x) = x^2 + 3x - 1$ , find  $\frac{f(a+h) - f(a)}{h}$ .

13. Find the exact value of  $\sin 225^\circ$ .  
 14. Verify the identity:  $\sec^4 x - \sec^2 x = \tan^4 x + \tan^2 x$ .  
 15. Convert  $320^\circ$  to radians.  
 16. How long would it take for any amount of money, compounded continuously at 5.75% per year, to triple? Round to the nearest tenth of a year.  
 17. If  $f(x) = \frac{2x+1}{x-3}$ , find  $f^{-1}(x)$ .  
 18. If  $C$  is a right angle in triangle  $ABC$  with  $A = 23^\circ$  and  $a = 12$ , solve the triangle.  
 19. A formula for calculating an infant's dosage for medication is  

$$\text{Infant's dose} = \frac{\text{age of infant in months}}{150} \times \text{adult dose}.$$
 If a 12-month-old infant is to receive 8.5 mg of medication, find the equivalent adult dose to the nearest milligram.  
 20. From a point on the ground 12 feet from the base of a flagpole, the angle of elevation to the top of the pole is  $53^\circ$ . Approximate the height of the flagpole to the nearest tenth of a foot.

# ADDITIONAL TOPICS IN TRIGONOMETRY

## CHAPTER

# 6

*Can mathematical models* be created for events that appear to involve random behavior, such as stock market fluctuations or air turbulence? Chaos theory, a new frontier of mathematics, offers models and computer-generated images that reveal order and underlying patterns where only the erratic and the unpredictable had been observed. Because most behavior is chaotic, the computer has become a canvas that looks more like the real world than anything previously seen. Magnified portions of these computer images yield repetitions of the original structure, as well as new and unexpected patterns. The computer generates these visualizations of chaos by plotting large numbers of points for functions whose domains are complex numbers involving the square root of negative one.

### HERE'S WHERE YOU'LL FIND THESE APPLICATIONS

We present a trigonometric approach to  $\sqrt{-1}$ , or  $i$ , in Section 6.5, hinting at chaotic possibilities in the section opener and the Blitzer Bonus on page 735. If you are intrigued by how the trigonometry of complex numbers in Section 6.5 reveals that the world is not random (rather, the underlying patterns are far more intricate than we had previously assumed), we suggest reading *Chaos* by James Gleick, published by Penguin Books.

## SECTION 6.1

## The Law of Sines

## Objectives

- 1 Use the Law of Sines to solve oblique triangles.
- 2 Use the Law of Sines to solve, if possible, the triangle or triangles in the ambiguous case.
- 3 Find the area of an oblique triangle using the sine function.
- 4 Solve applied problems using the Law of Sines.

Point Reyes National Seashore, 40 miles north of San Francisco, consists of 75,000 acres with miles of pristine surf-pummeled beaches, forested ridges, and bays flanked by white cliffs. A few people, inspired by nature in the raw, live on private property adjoining the National Seashore. In 1995, a fire in the park burned 12,350 acres and destroyed 45 homes.

Fire is a necessary part of the life cycle in many wilderness areas. It is also an ongoing threat to those who choose to live surrounded by nature's unspoiled beauty. In this section, we see how trigonometry can be used to locate small wilderness fires before they become raging infernos. To do this,

we begin by considering triangles other than right triangles.

## GREAT QUESTION!

Does what I know about right triangles also apply to oblique triangles?

No. Up until now, our work with triangles has involved right triangles. **Do not apply relationships that are valid for right triangles to oblique triangles.** Avoid the error of using the Pythagorean Theorem,  $a^2 + b^2 = c^2$ , to find a missing side of an oblique triangle. This relationship among the three sides applies only to right triangles.

## GREAT QUESTION!

Do I have to write the Law of Sines with the sines in the denominator?

No. The Law of Sines can be expressed with the sines in the numerator:

$$\frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c}.$$

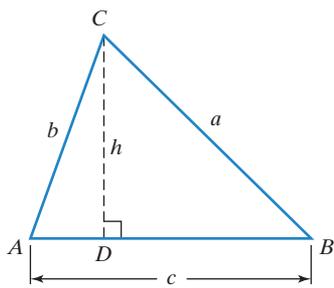

FIGURE 6.2 Drawing an altitude to prove the Law of Sines

## The Law of Sines and Its Derivation

An **oblique triangle** is a triangle that does not contain a right angle. **Figure 6.1** shows that an oblique triangle has either three acute angles or two acute angles and one obtuse angle. Notice that the angles are labeled  $A$ ,  $B$ , and  $C$ . The sides opposite each angle are labeled as  $a$ ,  $b$ , and  $c$ , respectively.

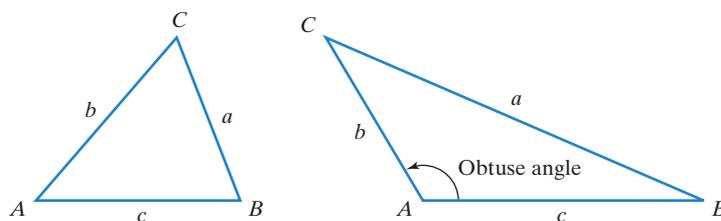

FIGURE 6.1 Oblique triangles

The relationships among the sides and angles of right triangles defined by the trigonometric functions are not valid for oblique triangles. Thus, we must observe and develop new relationships in order to work with oblique triangles.

Many relationships exist among the sides and angles in oblique triangles. One such relationship is called the **Law of Sines**.

## The Law of Sines

If  $A$ ,  $B$ , and  $C$  are the measures of the angles of a triangle, and  $a$ ,  $b$ , and  $c$  are the lengths of the sides opposite these angles, then

$$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}.$$

The ratio of the length of the side of any triangle to the sine of the angle opposite that side is the same for all three sides of the triangle.

To prove the Law of Sines, we draw an altitude of length  $h$  from one of the vertices of the triangle. In **Figure 6.2**, the altitude is drawn from vertex  $C$ . Two smaller triangles are formed, triangles  $ACD$  and  $BCD$ . Note that both are right triangles. Thus, we can use the definition of the sine of an angle of a right triangle.

$$\begin{aligned} \sin B &= \frac{h}{a} & \sin A &= \frac{h}{b} & \sin \theta &= \frac{\text{opposite}}{\text{hypotenuse}} \\ h &= a \sin B & h &= b \sin A & \text{Solve each equation for } h. \end{aligned}$$

Because we have found two expressions for  $h$ , we can set these expressions equal to each other.

$$\begin{aligned} a \sin B &= b \sin A && \text{Equate the expressions for } h. \\ \frac{a \sin B}{\sin A \sin B} &= \frac{b \sin A}{\sin A \sin B} && \text{Divide both sides by } \sin A \sin B. \\ \frac{a}{\sin A} &= \frac{b}{\sin B} && \text{Simplify.} \end{aligned}$$

This proves part of the Law of Sines. If we use the same process and draw an altitude of length  $h$  from vertex  $A$ , we obtain the following result:

$$\frac{b}{\sin B} = \frac{c}{\sin C}.$$

When this equation is combined with the previous equation, we obtain the Law of Sines. Because the sine of an angle is equal to the sine of  $180^\circ$  minus that angle, the Law of Sines is derived in a similar manner if the oblique triangle contains an obtuse angle.

- 1 Use the Law of Sines to solve oblique triangles.

### Solving Oblique Triangles

**Solving an oblique triangle** means finding the lengths of its sides and the measurements of its angles. The Law of Sines can be used to solve a triangle in which one side and two angles are known. The three known measurements can be abbreviated using SAA (a side and two angles are known) or ASA (two angles and the side between them are known).

#### EXAMPLE 1 Solving an SAA Triangle Using the Law of Sines

Solve the triangle shown in **Figure 6.3** with  $A = 46^\circ$ ,  $C = 63^\circ$ , and  $c = 56$  inches. Round lengths of sides to the nearest tenth.

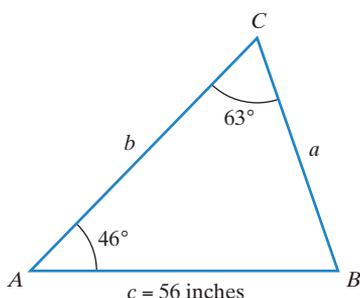

FIGURE 6.3 Solving an oblique SAA triangle

#### SOLUTION

We begin by finding  $B$ , the third angle of the triangle. We do not need the Law of Sines to do this. Instead, we use the fact that the sum of the measures of the interior angles of a triangle is  $180^\circ$ .

$$\begin{aligned} A + B + C &= 180^\circ \\ 46^\circ + B + 63^\circ &= 180^\circ && \text{Substitute the given values:} \\ &&& A = 46^\circ \text{ and } C = 63^\circ. \\ 109^\circ + B &= 180^\circ && \text{Add.} \\ B &= 71^\circ && \text{Subtract } 109^\circ \text{ from both sides.} \end{aligned}$$

**When we use the Law of Sines, we must be given one of the three ratios.** In this example, we are given  $c$  and  $C$ :  $c = 56$  and  $C = 63^\circ$ . Thus, we use the ratio  $\frac{c}{\sin C}$ , or  $\frac{56}{\sin 63^\circ}$ , to find the other two sides. Use the Law of Sines to find  $a$ .

$$\frac{a}{\sin A} = \frac{c}{\sin C} \quad \text{The ratio of any side to the sine of its opposite angle equals the ratio of any other side to the sine of its opposite angle.}$$

$$\frac{a}{\sin 46^\circ} = \frac{56}{\sin 63^\circ} \quad A = 46^\circ, c = 56, \text{ and } C = 63^\circ.$$

$$a = \frac{56 \sin 46^\circ}{\sin 63^\circ} \quad \text{Multiply both sides by } \sin 46^\circ \text{ and solve for } a.$$

$$a \approx 45.2 \text{ inches} \quad \text{Use a calculator.}$$

### GREAT QUESTION!

**Do I have to set up the Law of Sines with the unknown side in the upper left position?**

No. However, many students find it easier to solve for the unknown sides when they are placed in the upper left position.

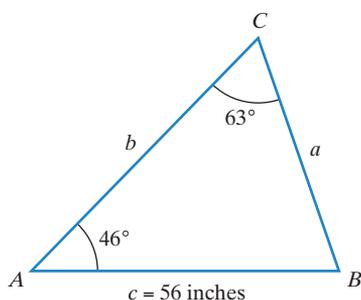

FIGURE 6.3 (repeated)

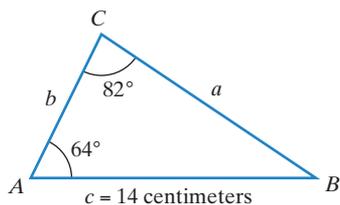

FIGURE 6.4

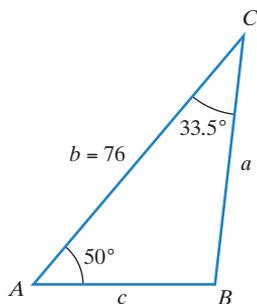

FIGURE 6.5 Solving an ASA triangle

Use the Law of Sines again, this time to find  $b$ .

$$\frac{b}{\sin B} = \frac{c}{\sin C}$$

We use the given ratio,  $\frac{c}{\sin C}$ , to find  $b$ .

$$\frac{b}{\sin 71^\circ} = \frac{56}{\sin 63^\circ}$$

We found that  $B = 71^\circ$ . We are given  $c = 56$  and  $C = 63^\circ$ .

$$b = \frac{56 \sin 71^\circ}{\sin 63^\circ}$$

Multiply both sides by  $\sin 71^\circ$  and solve for  $b$ .

$$b \approx 59.4 \text{ inches}$$

Use a calculator.

The solution is  $B = 71^\circ$ ,  $a \approx 45.2$  inches, and  $b \approx 59.4$  inches. ...

**Check Point 1** Solve the triangle shown in **Figure 6.4** with  $A = 64^\circ$ ,  $C = 82^\circ$ , and  $c = 14$  centimeters. Round as in Example 1.

### EXAMPLE 2 Solving an ASA Triangle Using the Law of Sines

Solve triangle  $ABC$  if  $A = 50^\circ$ ,  $C = 33.5^\circ$ , and  $b = 76$ . Round measures to the nearest tenth.

#### SOLUTION

We begin by drawing a picture of triangle  $ABC$  and labeling it with the given information. **Figure 6.5** shows the triangle that we must solve. We begin by finding  $B$ .

$$A + B + C = 180^\circ$$

The sum of the measures of a triangle's interior angles is  $180^\circ$ .

$$50^\circ + B + 33.5^\circ = 180^\circ$$

$A = 50^\circ$  and  $C = 33.5^\circ$ .

$$83.5^\circ + B = 180^\circ$$

Add.

$$B = 96.5^\circ$$

Subtract  $83.5^\circ$  from both sides.

**Keep in mind that we must be given one of the three ratios to apply the Law of Sines.** In this example, we are given that  $b = 76$  and we found that  $B = 96.5^\circ$ .

Thus, we use the ratio  $\frac{b}{\sin B}$ , or  $\frac{76}{\sin 96.5^\circ}$ , to find the other two sides. Use the Law of Sines to find  $a$  and  $c$ .

**Find  $a$ :**

**Find  $c$ :**

$$\frac{a}{\sin A} = \frac{b}{\sin B}$$

$$\frac{c}{\sin C} = \frac{b}{\sin B}$$

$$\frac{a}{\sin 50^\circ} = \frac{76}{\sin 96.5^\circ}$$

$$\frac{c}{\sin 33.5^\circ} = \frac{76}{\sin 96.5^\circ}$$

$$a = \frac{76 \sin 50^\circ}{\sin 96.5^\circ} \approx 58.6$$

$$c = \frac{76 \sin 33.5^\circ}{\sin 96.5^\circ} \approx 42.2$$

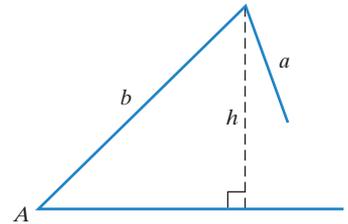

The solution is  $B = 96.5^\circ$ ,  $a \approx 58.6$ , and  $c \approx 42.2$ . ...

 **Check Point 2** Solve triangle  $ABC$  if  $A = 40^\circ$ ,  $C = 22.5^\circ$ , and  $b = 12$ . Round as in Example 2.

- 2 Use the Law of Sines to solve, if possible, the triangle or triangles in the ambiguous case.

### The Ambiguous Case (SSA)

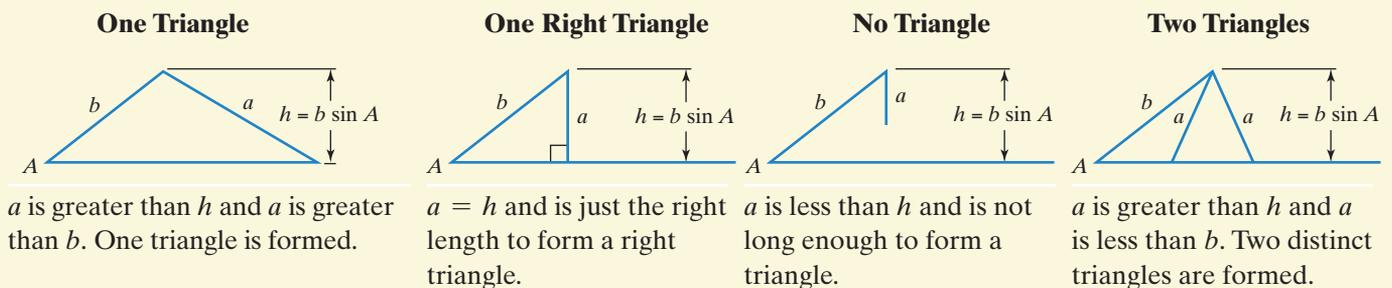

If we are given two sides and an angle opposite one of them (SSA), does this determine a unique triangle? Can we solve this case using the Law of Sines? Such a case is called the **ambiguous case** because the given information may result in one triangle, two triangles, or no triangle at all. For example, in **Figure 6.6**, we are given  $a$ ,  $b$ , and  $A$ . Because  $a$  is shorter than  $h$ , it is not long enough to form a triangle. The number of possible triangles, if any, that can be formed in the SSA case depends on  $h$ , the length of the altitude, where  $h = b \sin A$ .

**FIGURE 6.6** Given SSA, no triangle may result.

### The Ambiguous Case (SSA)

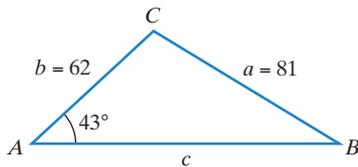

Consider a triangle in which  $a$ ,  $b$ , and  $A$  are given. This information may result in

In an SSA situation, it is not necessary to draw an accurate sketch like those shown in the box. The Law of Sines determines the number of triangles, if any, and gives the solution for each triangle.

### EXAMPLE 3 Solving an SSA Triangle Using the Law of Sines (One Solution)

Solve triangle  $ABC$  if  $A = 43^\circ$ ,  $a = 81$ , and  $b = 62$ . Round lengths of sides to the nearest tenth and angle measures to the nearest degree.

**FIGURE 6.7** Solving an SSA triangle; the ambiguous case

### SOLUTION

We begin with the sketch in **Figure 6.7**. The known ratio is  $\frac{a}{\sin A}$ , or  $\frac{81}{\sin 43^\circ}$ . Because side  $b$  is given, we use the Law of Sines to find angle  $B$ .

$$\begin{aligned} \frac{a}{\sin A} &= \frac{b}{\sin B} && \text{Apply the Law of Sines.} \\ \frac{81}{\sin 43^\circ} &= \frac{62}{\sin B} && a = 81, b = 62, \text{ and } A = 43^\circ. \\ 81 \sin B &= 62 \sin 43^\circ && \text{Cross multiply: If } \frac{a}{b} = \frac{c}{d}, \text{ then } ad = bc. \\ \sin B &= \frac{62 \sin 43^\circ}{81} && \text{Divide both sides by 81 and solve for } \sin B. \\ \sin B &\approx 0.5220 && \text{Use a calculator.} \end{aligned}$$

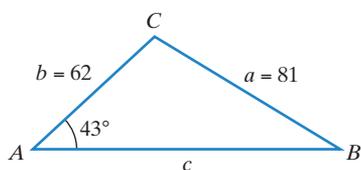

FIGURE 6.7 (repeated)

There are two angles  $B$  between  $0^\circ$  and  $180^\circ$  for which  $\sin B \approx 0.5220$ .

$$B_1 \approx 31^\circ$$

$$B_2 \approx 180^\circ - 31^\circ = 149^\circ$$

Obtain the acute angle with your calculator in degree mode:  $\sin^{-1} 0.5220$ .

The sine is positive in quadrant II.

Look at **Figure 6.7**. Given that  $A = 43^\circ$ , can you see that  $B_2 \approx 149^\circ$  is impossible? By adding  $149^\circ$  to the given angle,  $43^\circ$ , we exceed a  $180^\circ$  sum:

$$43^\circ + 149^\circ = 192^\circ.$$

Thus, the only possibility is that  $B_1 \approx 31^\circ$ . We find  $C$  using this approximation for  $B_1$  and the measure that was given for  $A$ :  $A = 43^\circ$ .

$$C = 180^\circ - B_1 - A \approx 180^\circ - 31^\circ - 43^\circ = 106^\circ$$

Side  $c$  that lies opposite this  $106^\circ$  angle can now be found using the Law of Sines.

$$\frac{c}{\sin C} = \frac{a}{\sin A}$$

Apply the Law of Sines.

$$\frac{c}{\sin 106^\circ} = \frac{81}{\sin 43^\circ}$$

$a = 81$ ,  $C \approx 106^\circ$ , and  $A = 43^\circ$ .

$$c = \frac{81 \sin 106^\circ}{\sin 43^\circ} \approx 114.2$$

Multiply both sides by  $\sin 106^\circ$  and solve for  $c$ .

There is one triangle and the solution is  $B_1$ (or  $B$ )  $\approx 31^\circ$ ,  $C \approx 106^\circ$ , and  $c \approx 114.2$ . ...

**Check Point 3** Solve triangle  $ABC$  if  $A = 57^\circ$ ,  $a = 33$ , and  $b = 26$ . Round as in Example 3.

#### EXAMPLE 4 Solving an SSA Triangle Using the Law of Sines (No Solution)

Solve triangle  $ABC$  if  $A = 75^\circ$ ,  $a = 51$ , and  $b = 71$ .

#### SOLUTION

The known ratio is  $\frac{a}{\sin A}$ , or  $\frac{51}{\sin 75^\circ}$ . Because side  $b$  is given, we use the Law of Sines to find angle  $B$ .

$$\frac{a}{\sin A} = \frac{b}{\sin B}$$

Use the Law of Sines.

$$\frac{51}{\sin 75^\circ} = \frac{71}{\sin B}$$

Substitute the given values.

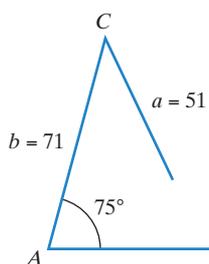

$$51 \sin B = 71 \sin 75^\circ$$

Cross multiply: If  $\frac{a}{b} = \frac{c}{d}$ , then  $ad = bc$ .

$$\sin B = \frac{71 \sin 75^\circ}{51} \approx 1.34$$

Divide by 51 and solve for  $\sin B$ .

Because the sine can never exceed 1, there is no angle  $B$  for which  $\sin B \approx 1.34$ . There is no triangle with the given measurements, as illustrated in **Figure 6.8**. ...

FIGURE 6.8  $a$  is not long enough to form a triangle.

**Check Point 4** Solve triangle  $ABC$  if  $A = 50^\circ$ ,  $a = 10$ , and  $b = 20$ .

**EXAMPLE 5** Solving an SSA Triangle Using the Law of Sines (Two Solutions)

Solve triangle  $ABC$  if  $A = 40^\circ$ ,  $a = 54$ , and  $b = 62$ . Round lengths of sides to the nearest tenth and angle measures to the nearest degree.

**SOLUTION**

The known ratio is  $\frac{a}{\sin A}$ , or  $\frac{54}{\sin 40^\circ}$ . We use the Law of Sines to find angle  $B$ .

$$\begin{aligned} \frac{a}{\sin A} &= \frac{b}{\sin B} && \text{Use the Law of Sines.} \\ \frac{54}{\sin 40^\circ} &= \frac{62}{\sin B} && \text{Substitute the given values.} \\ 54 \sin B &= 62 \sin 40^\circ && \text{Cross multiply: If } \frac{a}{b} = \frac{c}{d}, \text{ then } ad = bc. \\ \sin B &= \frac{62 \sin 40^\circ}{54} \approx 0.7380 && \text{Divide by 54 and solve for } \sin B. \end{aligned}$$

There are two angles  $B$  between  $0^\circ$  and  $180^\circ$  for which  $\sin B \approx 0.7380$ .

$$B_1 \approx 48^\circ \qquad B_2 \approx 180^\circ - 48^\circ = 132^\circ$$

Find  $\sin^{-1} 0.7380$   
with your calculator.

The sine is positive in  
quadrant II.

If you add either angle to the given angle,  $40^\circ$ , the sum does not exceed  $180^\circ$ . Thus, there are two triangles with the given conditions, shown in **Figure 6.9(a)**. The triangles,  $AB_1C_1$  and  $AB_2C_2$ , are shown separately in **Figure 6.9(b)** and **Figure 6.9(c)**.

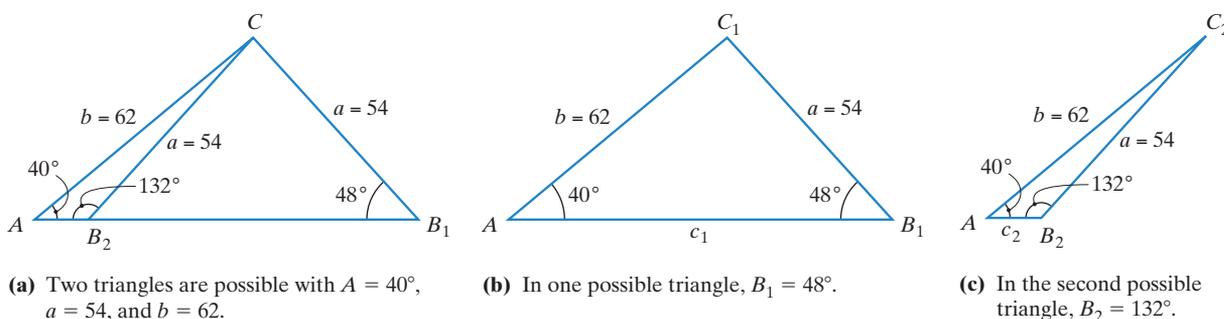

FIGURE 6.9

We find angles  $C_1$  and  $C_2$  using a  $180^\circ$  angle sum in each of the two triangles.

$$\begin{aligned} C_1 &= 180^\circ - A - B_1 && C_2 = 180^\circ - A - B_2 \\ &\approx 180^\circ - 40^\circ - 48^\circ && \approx 180^\circ - 40^\circ - 132^\circ \\ &= 92^\circ && = 8^\circ \end{aligned}$$

We use the Law of Sines to find  $c_1$  and  $c_2$ .

$$\begin{aligned} \frac{c_1}{\sin C_1} &= \frac{a}{\sin A} && \frac{c_2}{\sin C_2} = \frac{a}{\sin A} \\ \frac{c_1}{\sin 92^\circ} &= \frac{54}{\sin 40^\circ} && \frac{c_2}{\sin 8^\circ} = \frac{54}{\sin 40^\circ} \\ c_1 &= \frac{54 \sin 92^\circ}{\sin 40^\circ} \approx 84.0 && c_2 = \frac{54 \sin 8^\circ}{\sin 40^\circ} \approx 11.7 \end{aligned}$$

There are two triangles. In one triangle, the solution is  $B_1 \approx 48^\circ$ ,  $C_1 \approx 92^\circ$ , and  $c_1 \approx 84.0$ . In the other triangle,  $B_2 \approx 132^\circ$ ,  $C_2 \approx 8^\circ$ , and  $c_2 \approx 11.7$ . ●●●

**GREAT QUESTION!**

**Do I have to draw the two triangles in Figure 6.9 to solve Example 5?**

The two triangles shown in **Figure 6.9** are helpful in organizing the solutions. However, if you keep track of the two triangles, one with the given information and  $B_1 = 48^\circ$ , and the other with the given information and  $B_2 = 132^\circ$ , you do not have to draw the figure to solve the triangles.

- 3 Find the area of an oblique triangle using the sine function.

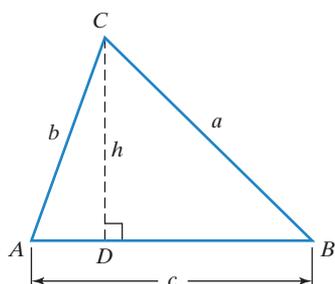

FIGURE 6.10

**Check Point 5** Solve triangle  $ABC$  if  $A = 35^\circ$ ,  $a = 12$ , and  $b = 16$ . Round as in Example 5.

### The Area of an Oblique Triangle

A formula for the area of an oblique triangle can be obtained using the procedure for proving the Law of Sines. We draw an altitude of length  $h$  from one of the vertices of the triangle, as shown in **Figure 6.10**. We apply the definition of the sine of angle  $A$ ,  $\frac{\text{opposite}}{\text{hypotenuse}}$ , in right triangle  $ACD$ :

$$\sin A = \frac{h}{b}, \quad \text{so} \quad h = b \sin A.$$

The area of a triangle is  $\frac{1}{2}$  the product of any side and the altitude drawn to that side. Using the altitude  $h$  in **Figure 6.10**, we have

$$\text{Area} = \frac{1}{2}ch = \frac{1}{2}cb \sin A.$$

Use the result from above:  $h = b \sin A$ .

This result,  $\text{Area} = \frac{1}{2}cb \sin A$ , or  $\frac{1}{2}bc \sin A$ , indicates that the area of the triangle is one-half the product of  $b$  and  $c$  times the sine of their included angle. If we draw altitudes from the other two vertices, we see that we can use any two sides to compute the area.

#### Area of an Oblique Triangle

The area of a triangle equals one-half the product of the lengths of two sides times the sine of their included angle. In **Figure 6.10**, this wording can be expressed by the formulas

$$\text{Area} = \frac{1}{2}bc \sin A = \frac{1}{2}ab \sin C = \frac{1}{2}ac \sin B.$$

### EXAMPLE 6 Finding the Area of an Oblique Triangle

Find the area of a triangle having two sides of lengths 24 meters and 10 meters and an included angle of  $62^\circ$ . Round to the nearest square meter.

#### SOLUTION

The triangle is shown in **Figure 6.11**. Its area is half the product of the lengths of the two sides times the sine of the included angle.

$$\text{Area} = \frac{1}{2}(24)(10)(\sin 62^\circ) \approx 106$$

The area of the triangle is approximately 106 square meters. ...

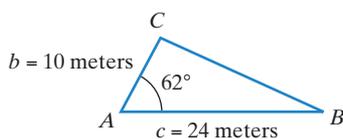

FIGURE 6.11 Finding the area of an SAS triangle

- 4 Solve applied problems using the Law of Sines.

**Check Point 6** Find the area of a triangle having two sides of lengths 8 meters and 12 meters and an included angle of  $135^\circ$ . Round to the nearest square meter.

### Applications of the Law of Sines

We have seen how the trigonometry of right triangles can be used to solve many different kinds of applied problems. The Law of Sines enables us to work with triangles that are not right triangles. As a result, this law can be used to solve problems involving surveying, engineering, astronomy, navigation, and the environment. Example 7 illustrates the use of the Law of Sines in detecting potentially devastating fires.

**EXAMPLE 7** An Application of the Law of Sines

Two fire-lookout stations are 20 miles apart, with station B directly east of station A. Both stations spot a fire on a mountain to the north. The bearing from station A to the fire is N50°E (50° east of north). The bearing from station B to the fire is N36°W (36° west of north). How far, to the nearest tenth of a mile, is the fire from station A?

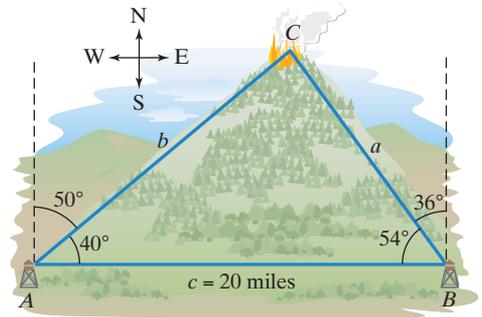

FIGURE 6.12

**Figure 6.12** shows the information given in the problem. The distance from station A to the fire is represented by  $b$ . Notice that the angles describing the bearing from each station to the fire,  $50^\circ$  and  $36^\circ$ , are not interior angles of triangle  $ABC$ . Using a north-south line, the interior angles are found as follows:

$$A = 90^\circ - 50^\circ = 40^\circ \quad B = 90^\circ - 36^\circ = 54^\circ.$$

To find  $b$  using the Law of Sines, we need a known side and an angle opposite that side. Because  $c = 20$  miles, we find angle  $C$  using a  $180^\circ$  angle sum in the triangle. Thus,

$$C = 180^\circ - A - B = 180^\circ - 40^\circ - 54^\circ = 86^\circ.$$

The ratio  $\frac{c}{\sin C}$ , or  $\frac{20}{\sin 86^\circ}$ , is now known. We use this ratio and the Law of Sines to find  $b$ .

$$\frac{b}{\sin B} = \frac{c}{\sin C} \quad \text{Use the Law of Sines.}$$

$$\frac{b}{\sin 54^\circ} = \frac{20}{\sin 86^\circ} \quad c = 20, B = 54^\circ, \text{ and } C = 86^\circ.$$

$$b = \frac{20 \sin 54^\circ}{\sin 86^\circ} \approx 16.2 \quad \text{Multiply both sides by } \sin 54^\circ \text{ and solve for } b.$$

The fire is approximately 16.2 miles from station A. ...

**Check Point 7** Two fire-lookout stations are 13 miles apart, with station B directly east of station A. Both stations spot a fire. The bearing of the fire from station A is N35°E and the bearing of the fire from station B is N49°W. How far, to the nearest tenth of a mile, is the fire from station B?

**CONCEPT AND VOCABULARY CHECK**

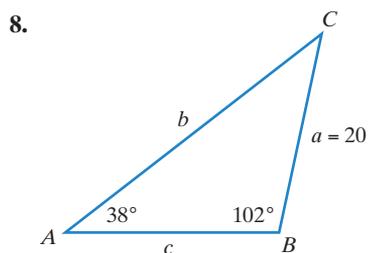

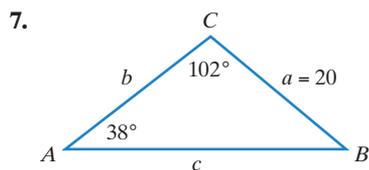

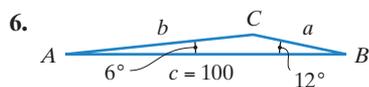

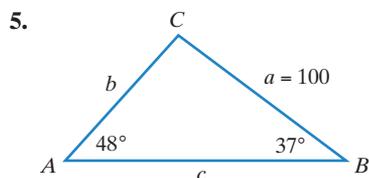

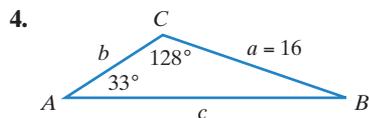

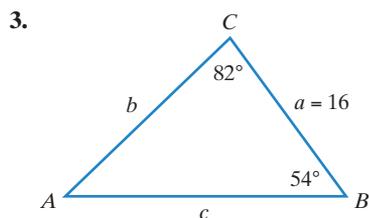

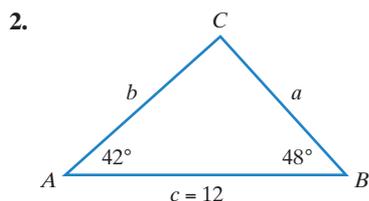

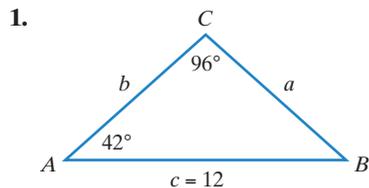

Fill in each blank so that the resulting statement is true.

- A triangle that does not contain a right angle is called a/an \_\_\_\_\_ triangle. Solving such a triangle means finding the lengths of its \_\_\_\_\_ and the measurements of its \_\_\_\_\_.
- If  $A$ ,  $B$ , and  $C$  are the measures of the angles of a triangle, and  $a$ ,  $b$ , and  $c$  are the lengths of the sides opposite these angles, then the Law of Sines states that \_\_\_\_\_.
- We can always use the Law of Sines to find missing parts of triangles in which one \_\_\_\_\_ and two \_\_\_\_\_ are known.
- True or false: A triangle in which two sides and an angle opposite one of them are given (SSA) always results in at least one triangle. \_\_\_\_\_
- If two sides  $a$  and  $b$  and the included angle  $C$  are known in a triangle, then the area of the triangle is found using the formula  $\text{Area} =$  \_\_\_\_\_.

## EXERCISE SET 6.1

## Practice Exercises

In Exercises 1–8, solve each triangle. Round lengths of sides to the nearest tenth and angle measures to the nearest degree.

In Exercises 9–16, solve each triangle. Round lengths to the nearest tenth and angle measures to the nearest degree.

9.  $A = 44^\circ, B = 25^\circ, a = 12$
10.  $A = 56^\circ, C = 24^\circ, a = 22$
11.  $B = 85^\circ, C = 15^\circ, b = 40$
12.  $A = 85^\circ, B = 35^\circ, c = 30$
13.  $A = 115^\circ, C = 35^\circ, c = 200$
14.  $B = 5^\circ, C = 125^\circ, b = 200$
15.  $A = 65^\circ, B = 65^\circ, c = 6$
16.  $B = 80^\circ, C = 10^\circ, a = 8$

In Exercises 17–32, two sides and an angle (SSA) of a triangle are given. Determine whether the given measurements produce one triangle, two triangles, or no triangle at all. Solve each triangle that results. Round to the nearest tenth and the nearest degree for sides and angles, respectively.

17.  $a = 20, b = 15, A = 40^\circ$
18.  $a = 30, b = 20, A = 50^\circ$
19.  $a = 10, c = 8.9, A = 63^\circ$
20.  $a = 57.5, c = 49.8, A = 136^\circ$
21.  $a = 42.1, c = 37, A = 112^\circ$
22.  $a = 6.1, b = 4, A = 162^\circ$
23.  $a = 10, b = 40, A = 30^\circ$
24.  $a = 10, b = 30, A = 150^\circ$
25.  $a = 16, b = 18, A = 60^\circ$
26.  $a = 30, b = 40, A = 20^\circ$
27.  $a = 12, b = 16.1, A = 37^\circ$
28.  $a = 7, b = 28, A = 12^\circ$
29.  $a = 22, c = 24.1, A = 58^\circ$
30.  $a = 95, c = 125, A = 49^\circ$
31.  $a = 9.3, b = 41, A = 18^\circ$
32.  $a = 1.4, b = 2.9, A = 142^\circ$

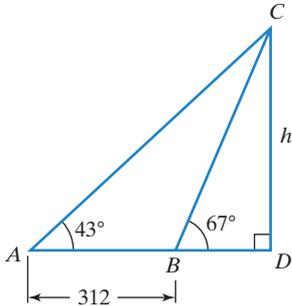

In Exercises 33–38, find the area of the triangle having the given measurements. Round to the nearest square unit.

33.  $A = 48^\circ, b = 20$  feet,  $c = 40$  feet
34.  $A = 22^\circ, b = 20$  feet,  $c = 50$  feet
35.  $B = 36^\circ, a = 3$  yards,  $c = 6$  yards
36.  $B = 125^\circ, a = 8$  yards,  $c = 5$  yards
37.  $C = 124^\circ, a = 4$  meters,  $b = 6$  meters
38.  $C = 102^\circ, a = 16$  meters,  $b = 20$  meters

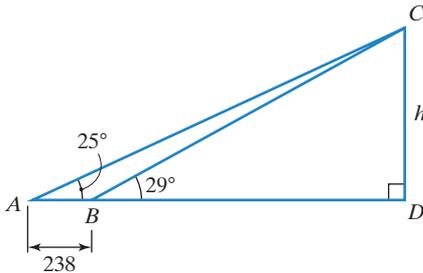

**Practice Plus**

In Exercises 39–40, find  $h$  to the nearest tenth. Begin by using the Law of Sines to find the length of  $BC$ .

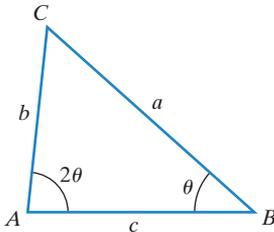

39.

40.

In Exercises 41–42, use the given measurements to solve the following triangle. Round lengths of sides to the nearest tenth and angle measures to the nearest degree.

41.  $a = 300, b = 200$

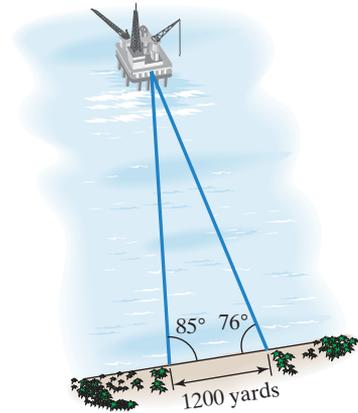

42.  $a = 400, b = 300$

**Application Exercises**

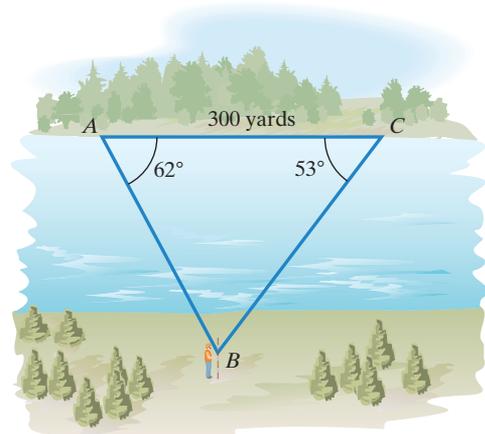

43. Two fire-lookout stations are 10 miles apart, with station B directly east of station A. Both stations spot a fire. The bearing of the fire from station A is  $N25^\circ E$  and the bearing of the fire from station B is  $N56^\circ W$ . How far, to the nearest tenth of a mile, is the fire from each lookout station?

44. The Federal Communications Commission is attempting to locate an illegal radio station. It sets up two monitoring stations, A and B, with station B 40 miles east of station A. Station A measures the illegal signal from the radio station as coming from a direction of  $48^\circ$  east of north. Station B measures the signal as coming from a point  $34^\circ$  west of north. How far is the illegal radio station from monitoring stations A and B? Round to the nearest tenth of a mile.

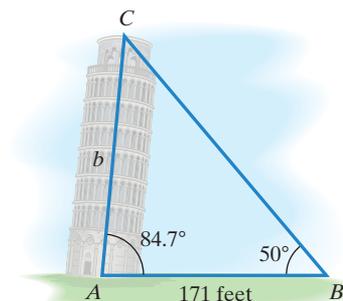

45. The figure shows a 1200-yard-long sand beach and an oil platform in the ocean. The angle made with the platform from one end of the beach is  $85^\circ$  and from the other end is  $76^\circ$ . Find the distance of the oil platform, to the nearest tenth of a yard, from each end of the beach.

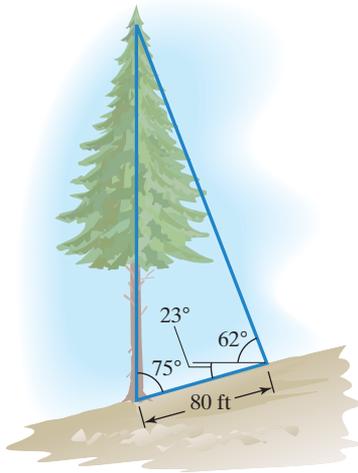

46. A surveyor needs to determine the distance between two points that lie on opposite banks of a river. The figure shows that 300 yards are measured along one bank. The angles from each end of this line segment to a point on the opposite bank are  $62^\circ$  and  $53^\circ$ . Find the distance between A and B to the nearest tenth of a yard.

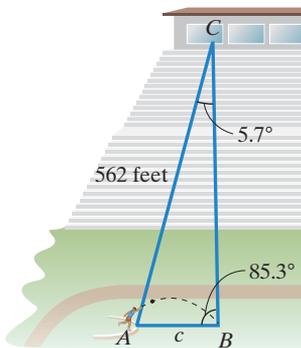

47. The Leaning Tower of Pisa in Italy leans at an angle of about  $84.7^\circ$ . The figure shows that 171 feet from the base of the tower, the angle of elevation to the top is  $50^\circ$ . Find the distance, to the nearest tenth of a foot, from the base to the top of the tower.

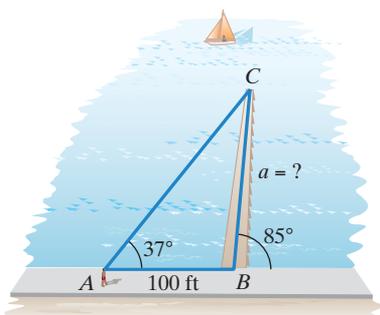

48. A pine tree growing on a hillside makes a  $75^\circ$  angle with the hill. From a point 80 feet up the hill, the angle of elevation to the top of the tree is  $62^\circ$  and the angle of depression to the bottom is  $23^\circ$ . Find, to the nearest tenth of a foot, the height of the tree.

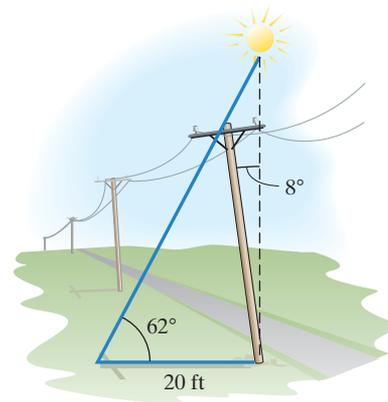

49. The figure shows a shot-put ring. The shot is tossed from  $A$  and lands at  $B$ . Using modern electronic equipment, the distance of the toss can be measured without the use of measuring tapes. When the shot lands at  $B$ , an electronic transmitter placed at  $B$  sends a signal to a device in the official's booth above the track. The device determines the angles at  $B$  and  $C$ . At a track meet, the distance from the official's booth to the shot-put ring is 562 feet. If  $B = 85.3^\circ$  and  $C = 5.7^\circ$ , determine the length of the toss to the nearest tenth of a foot.

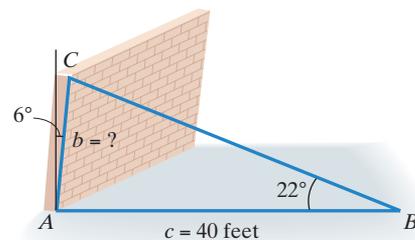

50. A pier forms an  $85^\circ$  angle with a straight shore. At a distance of 100 feet from the pier, the line of sight to the tip forms a  $37^\circ$  angle. Find the length of the pier to the nearest tenth of a foot.

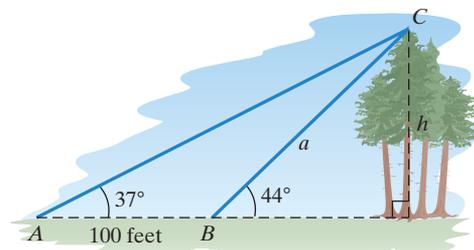

51. When the angle of elevation of the sun is  $62^\circ$ , a telephone pole that is tilted at an angle of  $8^\circ$  directly away from the sun casts a shadow 20 feet long. Determine the length of the pole to the nearest tenth of a foot.

52. A leaning wall is inclined  $6^\circ$  from the vertical. At a distance of 40 feet from the wall, the angle of elevation to the top is  $22^\circ$ . Find the height of the wall to the nearest tenth of a foot.

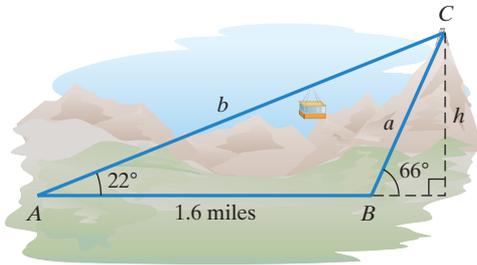

53. Redwood trees in California's Redwood National Park are hundreds of feet tall. The height of one of these trees is represented by  $h$  in the figure shown.

- Use the measurements shown to find  $a$ , to the nearest tenth of a foot, in oblique triangle  $ABC$ .
  - Use the right triangle shown to find the height, to the nearest tenth of a foot, of a typical redwood tree in the park.
54. The figure at the top of the next page shows a cable car that carries passengers from  $A$  to  $C$ . Point  $A$  is 1.6 miles from the base of the mountain. The angles of elevation from  $A$  and  $B$  to the mountain's peak are  $22^\circ$  and  $66^\circ$ , respectively.
- Determine, to the nearest tenth of a foot, the distance covered by the cable car.
  - Find  $a$ , to the nearest tenth of a foot, in oblique triangle  $ABC$ .

- c. Use the right triangle to find the height of the mountain to the nearest tenth of a foot.

55. Lighthouse B is 7 miles west of lighthouse A. A boat leaves A and sails 5 miles. At this time, it is sighted from B. If the bearing of the boat from B is  $N62^\circ E$ , how far from B is the boat? Round to the nearest tenth of a mile.
56. After a wind storm, you notice that your 16-foot flagpole may be leaning, but you are not sure. From a point on the ground 15 feet from the base of the flagpole, you find that the angle of elevation to the top is  $48^\circ$ . Is the flagpole leaning? If so, find the acute angle, to the nearest degree, that the flagpole makes with the ground.

### Writing in Mathematics

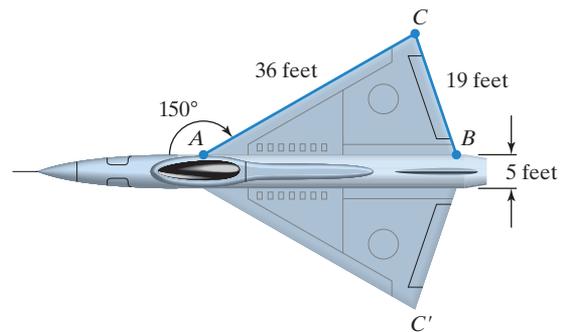

57. What is an oblique triangle?
58. Without using symbols, state the Law of Sines in your own words.
59. Briefly describe how the Law of Sines is proved.
60. What does it mean to solve an oblique triangle?
61. What do the abbreviations SAA and ASA mean?
62. Why is SSA called the ambiguous case?
63. How is the sine function used to find the area of an oblique triangle?
64. Write an original problem that can be solved using the Law of Sines. Then solve the problem.
65. Use Exercise 49 to describe how the Law of Sines is used for throwing events at track and field meets. Why aren't tape measures used to determine tossing distance?
66. You are cruising in your boat parallel to the coast, looking at a lighthouse. Explain how you can use your boat's speed and a device for measuring angles to determine the distance at any instant from your boat to the lighthouse.

### Critical Thinking Exercises

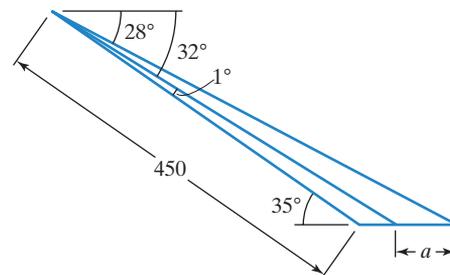

**Make Sense?** In Exercises 67–70, determine whether each statement makes sense or does not make sense, and explain your reasoning.

67. I began using the Law of Sines to solve an oblique triangle in which the measures of two sides and the angle between them were known.
68. If I know the measures of the sides and angles of an oblique triangle, I have three ways of determining the triangle's area.
69. When solving an SSA triangle using the Law of Sines, my calculator gave me both the acute and obtuse angles  $B$  for which  $\sin B = 0.5833$ .

70. Under certain conditions, a fire can be located by superimposing a triangle onto the situation and applying the Law of Sines.
71. If you are given two sides of a triangle and their included angle, you can find the triangle's area. Can the Law of Sines be used to solve the triangle with this given information? Explain your answer.
72. Two buildings of equal height are 800 feet apart. An observer on the street between the buildings measures the angles of elevation to the tops of the buildings as  $27^\circ$  and  $41^\circ$ . How high, to the nearest foot, are the buildings?
73. The figure shows the design for the top of the wing of a jet fighter. The fuselage is 5 feet wide. Find the wing span  $CC'$ .

74. Find  $a$  to the nearest tenth.

### Preview Exercises

Exercises 75–77 will help you prepare for the material covered in the next section.

75. Find the obtuse angle  $B$ , rounded to the nearest degree, satisfying

$$\cos B = \frac{6^2 + 4^2 - 9^2}{2 \cdot 6 \cdot 4}.$$

76. Simplify and round to the nearest whole number:

$$\sqrt{26(26 - 12)(26 - 16)(26 - 24)}.$$

77. Two airplanes leave an airport at the same time on different runways. The first plane, flying on a bearing of  $N66^\circ W$ , travels 650 miles after two hours. The second plane, flying on a bearing of  $S26^\circ W$ , travels 600 miles after two hours. Illustrate the situation with an oblique triangle that shows how far apart the airplanes will be after two hours.

## SECTION 6.2

## The Law of Cosines

## Objectives

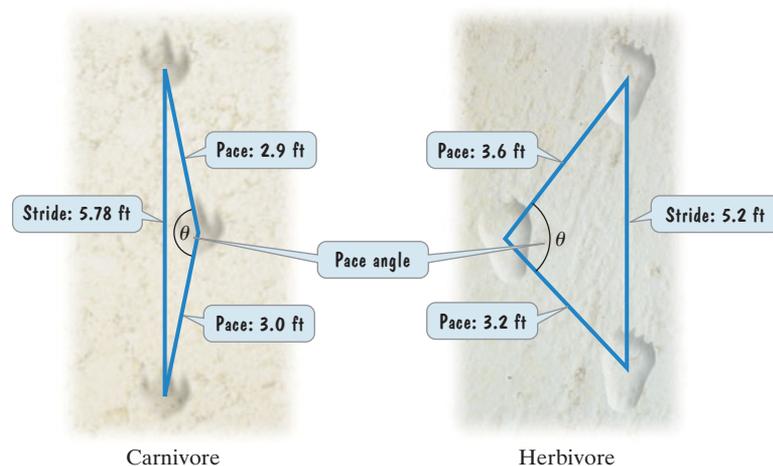

- 1 Use the Law of Cosines to solve oblique triangles.
- 2 Solve applied problems using the Law of Cosines.
- 3 Use Heron's formula to find the area of a triangle.

Paleontologists use trigonometry to study the movements made by dinosaurs millions of years ago. **Figure 6.13**, based on data collected at Dinosaur Valley State Park in Glen Rose, Texas, shows footprints made by a two-footed carnivorous (meat-eating) dinosaur and the hindfeet of a herbivorous (plant-eating) dinosaur.

For each dinosaur, the figure indicates the *pace* and the *stride*. The pace is the distance from the left footprint to the right footprint, and vice versa. The stride is the distance from the left footprint to the next left footprint or from the right footprint to the next right footprint. Also shown in **Figure 6.13** is the pace angle, designated by  $\theta$ . Notice that neither dinosaur moves with a pace angle of  $180^\circ$ , meaning that the footprints are directly in line. The footprints show a “zig-zig” pattern that is numerically described by the pace

angle. A dinosaur that is an efficient walker has a pace angle close to  $180^\circ$ , minimizing zig-zag motion and maximizing forward motion.

**FIGURE 6.13** Dinosaur Footprints  
Source: Glen J. Kuban, *An Overview of Dinosaur Tracking*

How can we determine the pace angles for the carnivore and the herbivore in **Figure 6.13**? Problems such as this, in which we know the measures of three sides of a triangle and we need to find the measurement of a missing angle, cannot be solved by the Law of Sines. To numerically describe which dinosaur in **Figure 6.13** made more forward progress with each step, we turn to the Law of Cosines.

### The Law of Cosines and Its Derivation

We now look at another relationship that exists among the sides and angles in an oblique triangle. The **Law of Cosines** is used to solve triangles in which two sides and the included angle (SAS) are known, or those in which three sides (SSS) are known.

## DISCOVERY

What happens to the Law of Cosines

$$c^2 = a^2 + b^2 - 2ab \cos C$$

if  $C = 90^\circ$ ? What familiar theorem do you obtain?

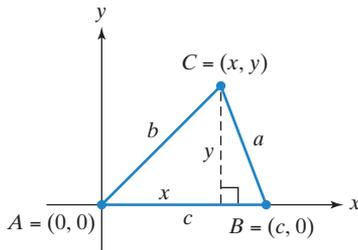

FIGURE 6.14

### The Law of Cosines

If  $A$ ,  $B$ , and  $C$  are the measures of the angles of a triangle, and  $a$ ,  $b$ , and  $c$  are the lengths of the sides opposite these angles, then

$$a^2 = b^2 + c^2 - 2bc \cos A$$

$$b^2 = a^2 + c^2 - 2ac \cos B$$

$$c^2 = a^2 + b^2 - 2ab \cos C.$$

The square of a side of a triangle equals the sum of the squares of the other two sides minus twice their product times the cosine of their included angle.

To prove the Law of Cosines, we place triangle  $ABC$  in a rectangular coordinate system. **Figure 6.14** shows a triangle with three acute angles. The vertex  $A$  is at the origin and side  $c$  lies along the positive  $x$ -axis. The coordinates of  $C$  are  $(x, y)$ . Using the right triangle that contains angle  $A$ , we apply the definitions of the cosine and the sine.

$$\cos A = \frac{x}{b}$$

$$\sin A = \frac{y}{b}$$

$$x = b \cos A$$

$$y = b \sin A$$

Multiply both sides of each equation by  $b$  and solve for  $x$  and  $y$ , respectively.

Thus, the coordinates of  $C$  are  $(x, y) = (b \cos A, b \sin A)$ . Although triangle  $ABC$  in **Figure 6.14** shows angle  $A$  as an acute angle, if  $A$  were obtuse, the coordinates of  $C$  would still be  $(b \cos A, b \sin A)$ . This means that our proof applies to both kinds of oblique triangles.

We now apply the distance formula to the side of the triangle with length  $a$ . Notice that  $a$  is the distance from  $(x, y)$  to  $(c, 0)$ .

$$a = \sqrt{(x - c)^2 + (y - 0)^2}$$

Use the distance formula.

$$a^2 = (x - c)^2 + y^2$$

Square both sides of the equation.

$$a^2 = (b \cos A - c)^2 + (b \sin A)^2$$

$x = b \cos A$  and  $y = b \sin A$ .

$$a^2 = b^2 \cos^2 A - 2bc \cos A + c^2 + b^2 \sin^2 A$$

Square the two expressions.

$$a^2 = b^2 \sin^2 A + b^2 \cos^2 A + c^2 - 2bc \cos A$$

Rearrange terms.

$$a^2 = b^2(\sin^2 A + \cos^2 A) + c^2 - 2bc \cos A$$

Factor  $b^2$  from the first two terms.

$$a^2 = b^2 + c^2 - 2bc \cos A$$

$\sin^2 A + \cos^2 A = 1$

The resulting equation is one of the three formulas for the Law of Cosines. The other two formulas are derived in a similar manner.

- 1 Use the Law of Cosines to solve oblique triangles.

### Solving Oblique Triangles

If you are given two sides and an included angle (SAS) of an oblique triangle, none of the three ratios in the Law of Sines is known. This means that we do not begin solving the triangle using the Law of Sines. Instead, we apply the Law of Cosines and the following procedure:

#### Solving an SAS Triangle

1. Use the Law of Cosines to find the side opposite the given angle.
2. Use the Law of Sines to find the angle opposite the shorter of the two given sides. This angle is always acute.
3. Find the third angle by subtracting the measure of the given angle and the angle found in step 2 from  $180^\circ$ .

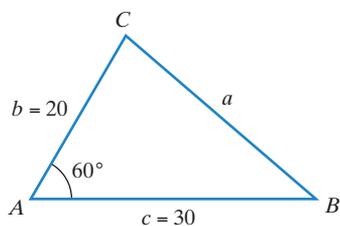

FIGURE 6.15 Solving an SAS triangle

**EXAMPLE 1** Solving an SAS Triangle

Solve the triangle in **Figure 6.15** with  $A = 60^\circ$ ,  $b = 20$ , and  $c = 30$ . Round lengths of sides to the nearest tenth and angle measures to the nearest degree.

**SOLUTION**

We are given two sides and an included angle. Therefore, we apply the three-step procedure for solving an SAS triangle.

**Step 1 Use the Law of Cosines to find the side opposite the given angle.** Thus, we will find  $a$ .

$$a^2 = b^2 + c^2 - 2bc \cos A \quad \text{Apply the Law of Cosines to find } a.$$

$$a^2 = 20^2 + 30^2 - 2(20)(30) \cos 60^\circ \quad b = 20, c = 30, \text{ and } A = 60^\circ.$$

$$= 400 + 900 - 1200(0.5) \quad \text{Perform the indicated operations.}$$

$$= 700$$

$$a = \sqrt{700} \approx 26.5 \quad \text{Take the square root of both sides and solve for } a.$$

In this example, we know the exact value of  $\cos 60^\circ$ :  $\cos 60^\circ = 0.5$ . If the exact value of the cosine is not available, you can calculate  $b^2 + c^2 - 2bc \cos A$  in one step with a calculator.

**Step 2 Use the Law of Sines to find the angle opposite the shorter of the two given sides. This angle is always acute.** The shorter of the two given sides is  $b = 20$ . Thus, we will find acute angle  $B$ .

$$\frac{b}{\sin B} = \frac{a}{\sin A} \quad \text{Apply the Law of Sines.}$$

$$\frac{20}{\sin B} = \frac{\sqrt{700}}{\sin 60^\circ} \quad \text{We are given } b = 20 \text{ and } A = 60^\circ. \text{ Use the value of } a, \sqrt{700}, \text{ from step 1.}$$

$$\sqrt{700} \sin B = 20 \sin 60^\circ \quad \text{Cross multiply: If } \frac{a}{b} = \frac{c}{d}, \text{ then } ad = bc.$$

$$\sin B = \frac{20 \sin 60^\circ}{\sqrt{700}} \approx 0.6547 \quad \text{Divide by } \sqrt{700} \text{ and solve for } \sin B.$$

$$B \approx 41^\circ \quad \text{Find } \sin^{-1} 0.6547 \text{ using a calculator.}$$

**Step 3 Find the third angle. Subtract the measure of the given angle and the angle found in step 2 from  $180^\circ$ .**

$$C = 180^\circ - A - B \approx 180^\circ - 60^\circ - 41^\circ = 79^\circ$$

The solution is  $a \approx 26.5$ ,  $B \approx 41^\circ$ , and  $C \approx 79^\circ$ . ...

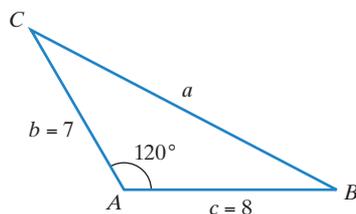

FIGURE 6.16

**Check Point 1** Solve the triangle shown in **Figure 6.16** with  $A = 120^\circ$ ,  $b = 7$ , and  $c = 8$ . Round as in Example 1.

If you are given three sides of a triangle (SSS), solving the triangle involves finding the three angles. We use the following procedure:

**Solving an SSS Triangle**

1. Use the Law of Cosines to find the angle opposite the longest side.
2. Use the Law of Sines to find either of the two remaining acute angles.
3. Find the third angle by subtracting the measures of the angles found in steps 1 and 2 from  $180^\circ$ .

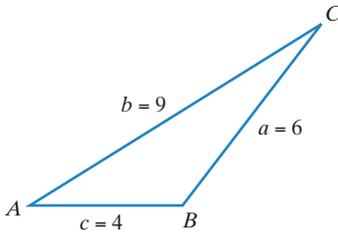

FIGURE 6.17 Solving an SSS triangle

**EXAMPLE 2** Solving an SSS Triangle

Solve triangle  $ABC$  if  $a = 6$ ,  $b = 9$ , and  $c = 4$ . Round angle measures to the nearest degree.

**SOLUTION**

We are given three sides. Therefore, we apply the three-step procedure for solving an SSS triangle. The triangle is shown in **Figure 6.17**.

**Step 1** Use the Law of Cosines to find the angle opposite the longest side. The longest side is  $b = 9$ . Thus, we will find angle  $B$ .

$$\begin{aligned} b^2 &= a^2 + c^2 - 2ac \cos B && \text{Apply the Law of Cosines to find } B. \\ 2ac \cos B &= a^2 + c^2 - b^2 && \text{Solve for } \cos B. \\ \cos B &= \frac{a^2 + c^2 - b^2}{2ac} \\ \cos B &= \frac{6^2 + 4^2 - 9^2}{2 \cdot 6 \cdot 4} = -\frac{29}{48} && a = 6, b = 9, \text{ and } c = 4. \end{aligned}$$

Using a calculator,  $\cos^{-1}\left(\frac{29}{48}\right) \approx 53^\circ$ . Because  $\cos B$  is negative,  $B$  is an obtuse angle. Thus,

$$B \approx 180^\circ - 53^\circ = 127^\circ.$$

Because the domain of  $y = \cos^{-1} x$  is  $[0, \pi]$ , you can use a calculator to find  $\cos^{-1}\left(-\frac{29}{48}\right) \approx 127^\circ$ .

**Step 2** Use the Law of Sines to find either of the two remaining acute angles. We will find angle  $A$ .

$$\begin{aligned} \frac{a}{\sin A} &= \frac{b}{\sin B} && \text{Apply the Law of Sines.} \\ \frac{6}{\sin A} &= \frac{9}{\sin 127^\circ} && \text{We are given } a = 6 \text{ and } b = 9. \text{ We found that } B \approx 127^\circ. \\ 9 \sin A &= 6 \sin 127^\circ && \text{Cross multiply.} \\ \sin A &= \frac{6 \sin 127^\circ}{9} \approx 0.5324 && \text{Divide by 9 and solve for } \sin A. \\ A &\approx 32^\circ && \text{Find } \sin^{-1} 0.5324 \text{ using a calculator.} \end{aligned}$$

**Step 3** Find the third angle. Subtract the measures of the angles found in steps 1 and 2 from  $180^\circ$ .

$$C = 180^\circ - B - A \approx 180^\circ - 127^\circ - 32^\circ = 21^\circ$$

The solution is  $B \approx 127^\circ$ ,  $A \approx 32^\circ$ , and  $C \approx 21^\circ$ . ...

**GREAT QUESTION!**

**In Step 2, do I have to use the Law of Sines to find either of the remaining angles?**

No. You can also use the Law of Cosines to find either angle. However, it is simpler to use the Law of Sines. Because the largest angle has been found, the remaining angles must be acute. Thus, there is no need to be concerned about two possible triangles or an ambiguous case.

- 2 Solve applied problems using the Law of Cosines.

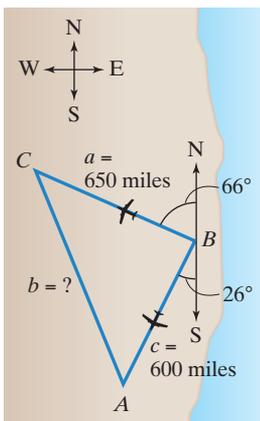

FIGURE 6.18

**Check Point 2** Solve triangle  $ABC$  if  $a = 8$ ,  $b = 10$ , and  $c = 5$ . Round angle measures to the nearest degree.

**Applications of the Law of Cosines**

Applied problems involving SAS and SSS triangles can be solved using the Law of Cosines.

**EXAMPLE 3** An Application of the Law of Cosines

Two airplanes leave an airport at the same time on different runways. One flies on a bearing of  $N66^\circ W$  at 325 miles per hour. The other airplane flies on a bearing of  $S26^\circ W$  at 300 miles per hour. How far apart will the airplanes be after two hours?

**SOLUTION**

After two hours, the plane flying at 325 miles per hour travels  $325 \cdot 2$  miles, or 650 miles. Similarly, the plane flying at 300 miles per hour travels 600 miles. The situation is illustrated in **Figure 6.18**.

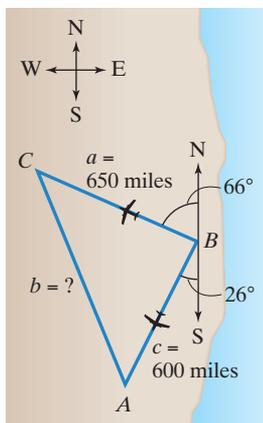

FIGURE 6.18 (repeated)

Let  $b$  = the distance between the planes after two hours. We can use a north-south line to find angle  $B$  in triangle  $ABC$ . Thus,

$$B = 180^\circ - 66^\circ - 26^\circ = 88^\circ.$$

We now have  $a = 650$ ,  $c = 600$ , and  $B = 88^\circ$ . We use the Law of Cosines to find  $b$  in this SAS situation.

$$b^2 = a^2 + c^2 - 2ac \cos B$$

Apply the Law of Cosines.

$$b^2 = 650^2 + 600^2 - 2(650)(600) \cos 88^\circ$$

Substitute:  $a = 650$ ,  $c = 600$ , and  $B = 88^\circ$ .

$$\approx 755,278$$

Use a calculator.

$$b \approx \sqrt{755,278} \approx 869$$

Take the square root and solve for  $b$ .

After two hours, the planes are approximately 869 miles apart. ●●●

 **Check Point 3** Two airplanes leave an airport at the same time on different runways. One flies directly north at 400 miles per hour. The other airplane flies on a bearing of  $N75^\circ E$  at 350 miles per hour. How far apart will the airplanes be after two hours?

**3** Use Heron's formula to find the area of a triangle.

### Heron's Formula

Approximately 2000 years ago, the Greek mathematician Heron of Alexandria derived a formula for the area of a triangle in terms of the lengths of its sides. A more modern derivation uses the Law of Cosines and can be found in the appendix.

#### Heron's Formula for the Area of a Triangle

The area of a triangle with sides  $a$ ,  $b$ , and  $c$  is

$$\text{Area} = \sqrt{s(s-a)(s-b)(s-c)},$$

where  $s$  is one-half its perimeter:  $s = \frac{1}{2}(a + b + c)$ .

#### EXAMPLE 4 Using Heron's Formula

Find the area of the triangle with  $a = 12$  yards,  $b = 16$  yards, and  $c = 24$  yards. Round to the nearest square yard.

#### SOLUTION

Begin by calculating one-half the perimeter:

$$s = \frac{1}{2}(a + b + c) = \frac{1}{2}(12 + 16 + 24) = 26.$$

Use Heron's formula to find the area:

$$\begin{aligned} \text{Area} &= \sqrt{s(s-a)(s-b)(s-c)} \\ &= \sqrt{26(26-12)(26-16)(26-24)} \\ &= \sqrt{7280} \approx 85. \end{aligned}$$

The area of the triangle is approximately 85 square yards. ●●●

 **Check Point 4** Find the area of the triangle with  $a = 6$  meters,  $b = 16$  meters, and  $c = 18$  meters. Round to the nearest square meter.

## CONCEPT AND VOCABULARY CHECK

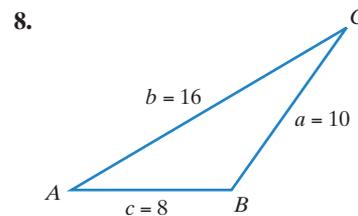

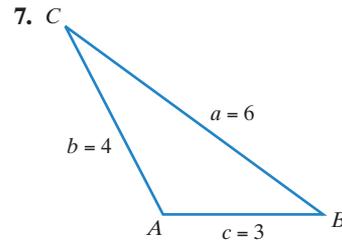

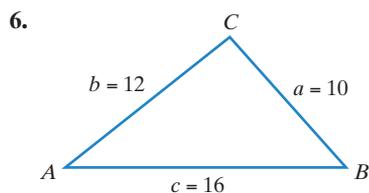

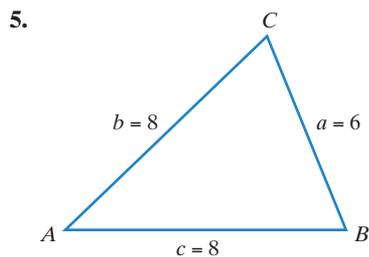

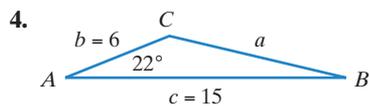

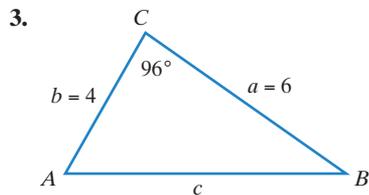

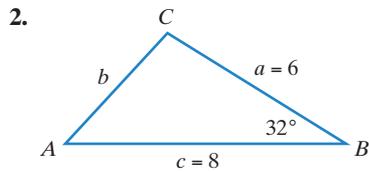

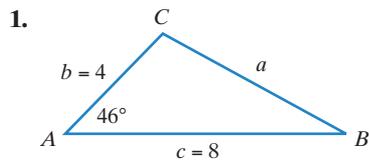

Fill in each blank so that the resulting statement is true.

- If  $A$ ,  $B$ , and  $C$  are the measures of the angles of a triangle, and  $a$ ,  $b$ , and  $c$  are the lengths of the sides opposite these angles, then the Law of Cosines states that  $a^2 =$  \_\_\_\_\_.
- To solve an oblique triangle given two sides and an included angle (SAS), the first step is to find the missing \_\_\_\_\_ using the Law of \_\_\_\_\_. Then we use the Law of \_\_\_\_\_ to find the angle opposite the shorter of the two given sides. This angle is always \_\_\_\_\_. The third angle is found by subtracting the measure of the given angle and the angle found in the second step from \_\_\_\_\_.
- To solve an oblique triangle given three sides (SSS), the first step is to find the angle opposite the longest side using the Law of \_\_\_\_\_. Then we find either of the two remaining acute angles using the Law of \_\_\_\_\_.
- Heron's formula for the area of a triangle with sides  $a$ ,  $b$ , and  $c$  is Area = \_\_\_\_\_, where  $s =$  \_\_\_\_\_.

## EXERCISE SET 6.2

### Practice Exercises

In Exercises 1–8, solve each triangle. Round lengths of sides to the nearest tenth and angle measures to the nearest degree.

In Exercises 9–24, solve each triangle. Round lengths to the nearest tenth and angle measures to the nearest degree.

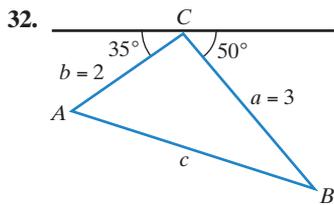

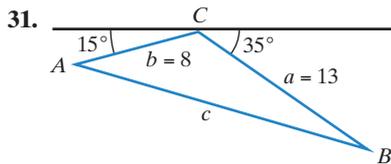

- $a = 5, b = 7, C = 42^\circ$
- $a = 10, b = 3, C = 15^\circ$
- $b = 5, c = 3, A = 102^\circ$
- $b = 4, c = 1, A = 100^\circ$
- $a = 6, c = 5, B = 50^\circ$
- $a = 4, c = 7, B = 55^\circ$
- $a = 5, c = 2, B = 90^\circ$
- $a = 7, c = 3, B = 90^\circ$
- $a = 5, b = 7, c = 10$
- $a = 4, b = 6, c = 9$
- $a = 3, b = 9, c = 8$
- $a = 4, b = 7, c = 6$
- $a = 3, b = 3, c = 3$
- $a = 5, b = 5, c = 5$
- $a = 63, b = 22, c = 50$
- $a = 66, b = 25, c = 45$

In Exercises 25–30, use Heron's formula to find the area of each triangle. Round to the nearest square unit.

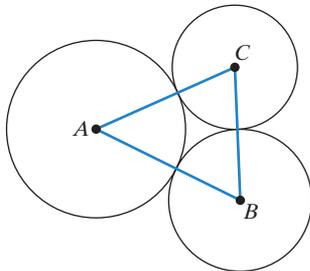

- 25.  $a = 4$  feet,  $b = 4$  feet,  $c = 2$  feet
- 26.  $a = 5$  feet,  $b = 5$  feet,  $c = 4$  feet
- 27.  $a = 14$  meters,  $b = 12$  meters,  $c = 4$  meters
- 28.  $a = 16$  meters,  $b = 10$  meters,  $c = 8$  meters
- 29.  $a = 11$  yards,  $b = 9$  yards,  $c = 7$  yards
- 30.  $a = 13$  yards,  $b = 9$  yards,  $c = 5$  yards

**Practice Plus**

In Exercises 31–32, solve each triangle. Round lengths of sides to the nearest tenth and angle measures to the nearest degree.

In Exercises 33–34, the three circles are arranged so that they touch each other, as shown in the figure. Use the given radii for the circles with centers  $A$ ,  $B$ , and  $C$ , respectively, to solve triangle  $ABC$ . Round angle measures to the nearest degree.

- 33. 5.0, 4.0, 3.5
- 34. 7.5, 4.3, 3.0

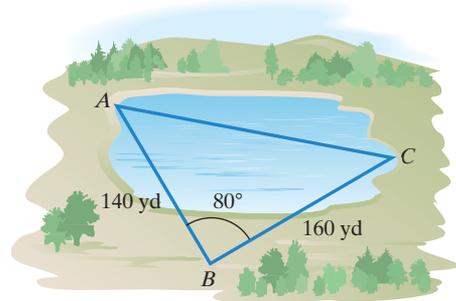

In Exercises 35–36, the three given points are the vertices of a triangle. Solve each triangle, rounding lengths of sides to the nearest tenth and angle measures to the nearest degree.

- 35.  $A(0, 0)$ ,  $B(-3, 4)$ ,  $C(3, -1)$
- 36.  $A(0, 0)$ ,  $B(4, -3)$ ,  $C(1, -5)$

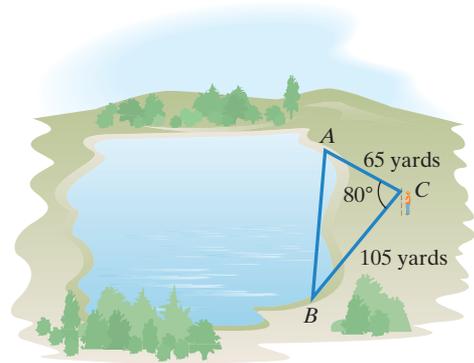

**Application Exercises**

- 37. Use **Figure 6.13** on page 694 to find the pace angle, to the nearest degree, for the carnivore. Does the angle indicate that this dinosaur was an efficient walker? Describe your answer.
- 38. Use **Figure 6.13** on page 694 to find the pace angle, to the nearest degree, for the herbivore. Does the angle indicate that this dinosaur was an efficient walker? Describe your answer.

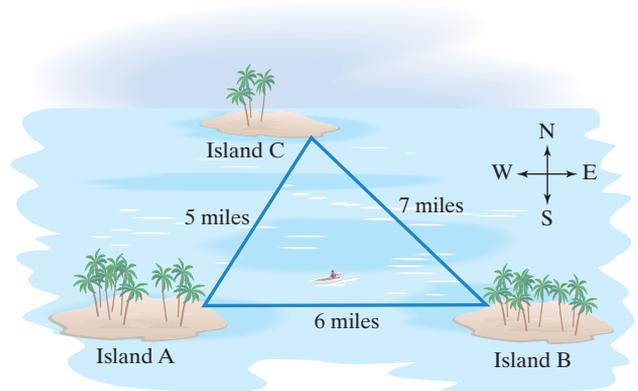

- 39. Two ships leave a harbor at the same time. One ship travels on a bearing of  $S12^\circ W$  at 14 miles per hour. The other ship travels on a bearing of  $N75^\circ E$  at 10 miles per hour. How far apart will the ships be after three hours? Round to the nearest tenth of a mile.
- 40. A plane leaves airport  $A$  and travels 580 miles to airport  $B$  on a bearing of  $N34^\circ E$ . The plane later leaves airport  $B$  and travels to airport  $C$  400 miles away on a bearing of  $S74^\circ E$ . Find the distance from airport  $A$  to airport  $C$  to the nearest tenth of a mile.
- 41. Find the distance across the lake from  $A$  to  $C$ , to the nearest yard, using the measurements shown in the figure.

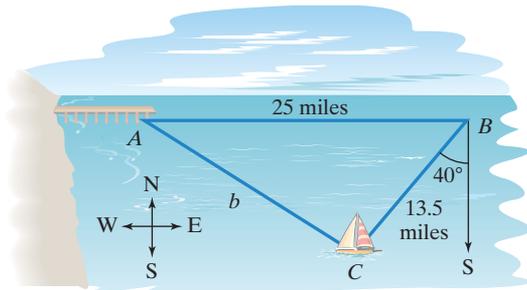

- 42. To find the distance across a protected cove at a lake, a surveyor makes the measurements shown in the figure. Use these measurements to find the distance from  $A$  to  $B$  to the nearest yard.

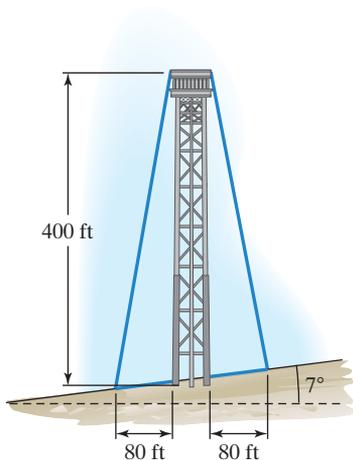

The diagram shows three islands in Florida Bay. You rent a boat and plan to visit each of these remote islands. Use the diagram to solve Exercises 43–44.

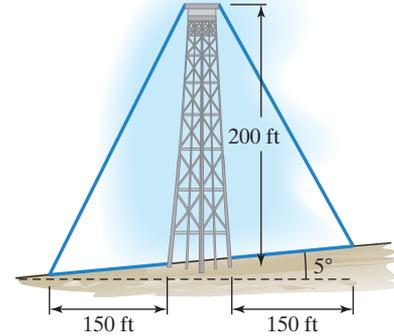

43. If you are on island A, on what bearing should you navigate to go to island C?
44. If you are on island B, on what bearing should you navigate to go to island C?
45. You are on a fishing boat that leaves its pier and heads east. After traveling for 25 miles, there is a report warning of rough seas directly south. The captain turns the boat and follows a bearing of S40°W for 13.5 miles.
- At this time, how far are you from the boat's pier? Round to the nearest tenth of a mile.
  - What bearing could the boat have originally taken to arrive at this spot?

46. You are on a fishing boat that leaves its pier and heads east. After traveling for 30 miles, there is a report warning of rough seas directly south. The captain turns the boat and follows a bearing of S45°W for 12 miles.
- At this time, how far are you from the boat's pier? Round to the nearest tenth of a mile.
  - What bearing could the boat have originally taken to arrive at this spot?
47. The figure shows a 400-foot tower on the side of a hill that forms a 7° angle with the horizontal. Find the length of each of the two guy wires that are anchored 80 feet uphill and downhill from the tower's base and extend to the top of the tower. Round to the nearest tenth of a foot.

48. The figure shows a 200-foot tower on the side of a hill that forms a 5° angle with the horizontal. Find the length of each of the two guy wires that are anchored 150 feet uphill and downhill from the tower's base and extend to the top of the tower. Round to the nearest tenth of a foot.

49. A Major League baseball diamond has four bases forming a square whose sides measure 90 feet each. The pitcher's mound is 60.5 feet from home plate on a line joining home plate and second base. Find the distance from the pitcher's mound to first base. Round to the nearest tenth of a foot.
50. A Little League baseball diamond has four bases forming a square whose sides measure 60 feet each. The pitcher's mound is 46 feet from home plate on a line joining home plate and second base. Find the distance from the pitcher's mound to third base. Round to the nearest tenth of a foot.
51. A piece of commercial real estate is priced at \$3.50 per square foot. Find the cost, to the nearest dollar, of a triangular lot measuring 240 feet by 300 feet by 420 feet.
52. A piece of commercial real estate is priced at \$4.50 per square foot. Find the cost, to the nearest dollar, of a triangular lot measuring 320 feet by 510 feet by 410 feet.

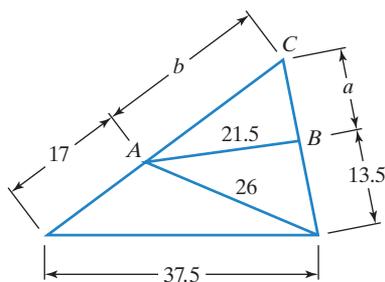

### Writing in Mathematics

53. Without using symbols, state the Law of Cosines in your own words.
54. Why can't the Law of Sines be used in the first step to solve an SAS triangle?
55. Describe a strategy for solving an SAS triangle.
56. Describe a strategy for solving an SSS triangle.
57. Under what conditions would you use Heron's formula to find the area of a triangle?
58. Describe an applied problem that can be solved using the Law of Cosines but not the Law of Sines.
59. The pitcher on a Little League team is studying angles in geometry and has a question. "Coach, suppose I'm on the pitcher's mound facing home plate. I catch a fly ball hit in my direction. If I turn to face first base and throw the ball, through how many degrees should I turn for a direct throw?" Use the information given in Exercise 50 and write an answer to the pitcher's question. Without getting too technical, describe to the pitcher how you obtained this angle.
60. Explain why the Pythagorean Theorem is a special case of the Law of Cosines.

### Critical Thinking Exercises

**Make Sense?** In Exercises 61–64, determine whether each statement makes sense or does not make sense, and explain your reasoning.

- The Law of Cosines is similar to the Law of Sines, with all the sines replaced with cosines.
- If I know the measures of all three angles of an oblique triangle, neither the Law of Sines nor the Law of Cosines can be used to find the length of a side.
- I noticed that for a right triangle, the Law of Cosines reduces to the Pythagorean Theorem.
- Solving an SSS triangle, I do not have to be concerned about the ambiguous case when using the Law of Sines.
- The lengths of the diagonals of a parallelogram are 20 inches and 30 inches. The diagonals intersect at an angle of  $35^\circ$ . Find the lengths of the parallelogram's sides. (*Hint:* Diagonals of a parallelogram bisect one another.)
- Use the figure to solve triangle  $ABC$ . Round lengths of sides to the nearest tenth and angle measures to the nearest degree.

- The minute hand and the hour hand of a clock have lengths  $m$  inches and  $h$  inches, respectively. Determine the distance between the tips of the hands at 10:00 in terms of  $m$  and  $h$ .

### Group Exercise

- The group should design five original problems that can be solved using the Laws of Sines and Cosines. At least two problems should be solved using the Law of Sines, one should be the ambiguous case, and at least two problems should be solved using the Law of Cosines. At least one problem should be an application problem using the Law of Sines and at least one problem should involve an application using the Law of Cosines. The group should turn in both the problems and their solutions.

### Preview Exercises

Exercises 69–71 will help you prepare for the material covered in the next section.

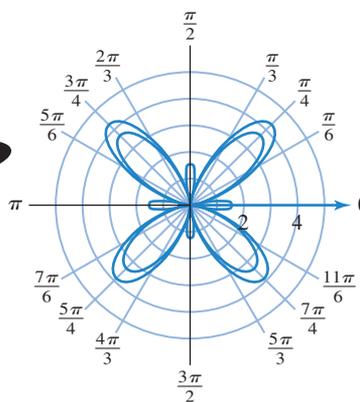

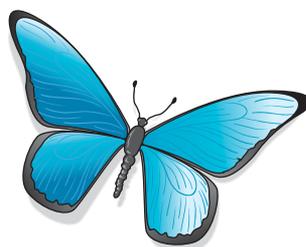

- Graph:  $y = 3$ .
- Graph:  $x^2 + (y - 1)^2 = 1$ .
- Complete the square and write the equation in standard form:  $x^2 + 6x + y^2 = 0$ . Then give the center and radius of the circle, and graph the equation.

## SECTION 6.3

### Polar Coordinates

#### Objectives

- Plot points in the polar coordinate system.
- Find multiple sets of polar coordinates for a given point.
- Convert a point from polar to rectangular coordinates.
- Convert a point from rectangular to polar coordinates.
- Convert an equation from rectangular to polar coordinates.
- Convert an equation from polar to rectangular coordinates.

Butterflies are among the most celebrated of all insects. It's hard not to notice their beautiful colors and graceful flight. Their symmetry can be explored with trigonometric functions and a system for plotting points called the *polar coordinate system*. In many cases, polar coordinates are simpler and easier to use than rectangular coordinates.

#### Plotting Points in the Polar Coordinate System

The foundation of the polar coordinate system is a horizontal ray that extends to the right. The ray is called the **polar axis** and is shown in **Figure 6.19** at the top of the next page. The endpoint of the ray is called the **pole**.

- 1 Plot points in the polar coordinate system.

A point  $P$  in the polar coordinate system is represented by an ordered pair of numbers  $(r, \theta)$ . **Figure 6.20** shows  $P = (r, \theta)$  in the polar coordinate system.

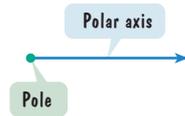

FIGURE 6.19

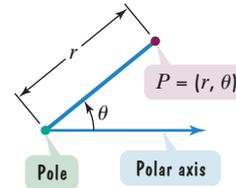

FIGURE 6.20 Representing a point in the polar coordinate system

- $r$  is a directed distance from the pole to  $P$ . (We shall see that  $r$  can be positive, negative, or zero.)
- $\theta$  is an angle from the polar axis to the line segment from the pole to  $P$ . This angle can be measured in degrees or radians. Positive angles are measured counterclockwise from the polar axis. Negative angles are measured clockwise from the polar axis.

We refer to the ordered pair  $(r, \theta)$  as the **polar coordinates** of  $P$ .

Let's look at a specific example. Suppose that the polar coordinates of a point  $P$  are  $(3, \frac{\pi}{4})$ . Because  $\theta$  is positive, we locate this point by drawing  $\theta = \frac{\pi}{4}$  counterclockwise from the polar axis. Then we count out a distance of three units along the terminal side of the angle to reach the point  $P$ . **Figure 6.21** shows that  $(r, \theta) = (3, \frac{\pi}{4})$  lies three units from the pole on the terminal side of the angle  $\theta = \frac{\pi}{4}$ .

The sign of  $r$  is important in locating  $P = (r, \theta)$  in polar coordinates.

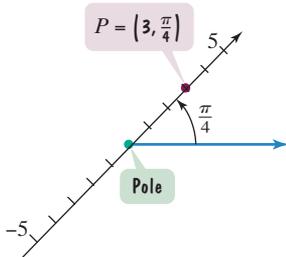

FIGURE 6.21 Locating a point in polar coordinates

### The Sign of $r$ and a Point's Location in Polar Coordinates

The point  $P = (r, \theta)$  is located  $|r|$  units from the pole. If  $r > 0$ , the point lies on the terminal side of  $\theta$ . If  $r < 0$ , the point lies along the ray opposite the terminal side of  $\theta$ . If  $r = 0$ , the point lies at the pole, regardless of the value of  $\theta$ .

### EXAMPLE 1 Plotting Points in a Polar Coordinate System

Plot the points with the following polar coordinates:

- a.  $(2, 135^\circ)$       b.  $(-3, \frac{3\pi}{2})$       c.  $(-1, -\frac{\pi}{4})$ .

### SOLUTION

- a. To plot the point  $(r, \theta) = (2, 135^\circ)$ , begin with the  $135^\circ$  angle. Because  $135^\circ$  is a positive angle, draw  $\theta = 135^\circ$  counterclockwise from the polar axis. Now consider  $r = 2$ . Because  $r > 0$ , plot the point by going out two units on the terminal side of  $\theta$ . **Figure 6.22(a)** shows the point. The concentric circles in the figure are drawn to help plot the point at the appropriate distance from the pole.

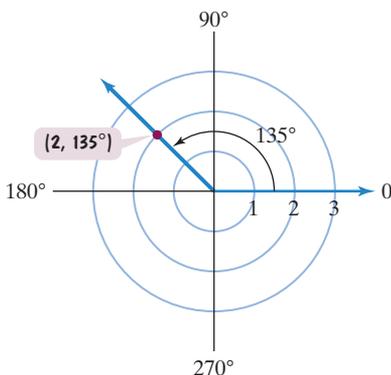

FIGURE 6.22(a) Plotting  $(2, 135^\circ)$

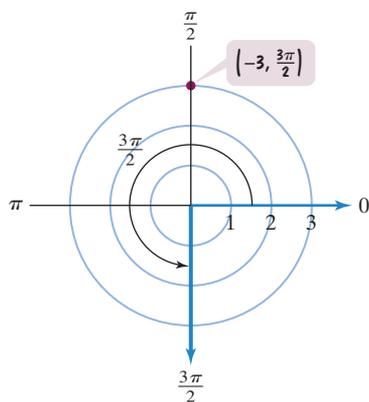

FIGURE 6.22(b) Plotting  $(-3, \frac{3\pi}{2})$

- b. To plot the point  $(r, \theta) = (-3, \frac{3\pi}{2})$ , begin with the  $\frac{3\pi}{2}$  angle. Because  $\frac{3\pi}{2}$  is a positive angle, we draw  $\theta = \frac{3\pi}{2}$  counterclockwise from the polar axis. Now consider  $r = -3$ . Because  $r < 0$ , plot the point by going out three units along the ray *opposite* the terminal side of  $\theta$ . **Figure 6.22(b)** shows the point.

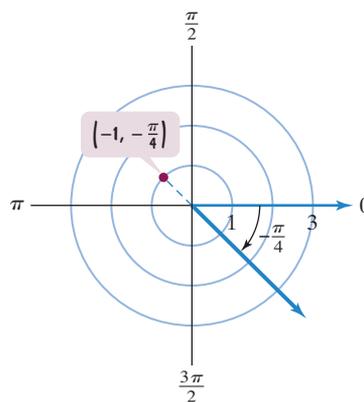

FIGURE 6.22(c) Plotting  $(-1, -\frac{\pi}{4})$

- c. To plot the point  $(r, \theta) = (-1, -\frac{\pi}{4})$ , begin with the  $-\frac{\pi}{4}$  angle. Because  $-\frac{\pi}{4}$  is a negative angle, draw  $\theta = -\frac{\pi}{4}$  clockwise from the polar axis. Now consider  $r = -1$ . Because  $r < 0$ , plot the point by going out one unit along the ray *opposite* the terminal side of  $\theta$ . **Figure 6.22(c)** shows the point. ●●●

 **Check Point 1** Plot the points with the following polar coordinates:

- a.  $(3, 315^\circ)$       b.  $(-2, \pi)$       c.  $(-1, -\frac{\pi}{2})$ .

- 2 Find multiple sets of polar coordinates for a given point.

## DISCOVERY

Illustrate the statements in the voice balloons by plotting the points with the following polar coordinates:

- a.  $(1, \frac{\pi}{2})$  and  $(1, \frac{5\pi}{2})$   
 b.  $(3, \frac{\pi}{4})$  and  $(-3, \frac{5\pi}{4})$ .

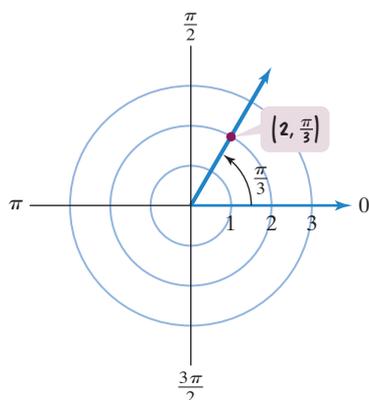

FIGURE 6.23 Finding other representations of a given point

## Multiple Representations of Points in the Polar Coordinate System

In rectangular coordinates, each point  $(x, y)$  has exactly one representation. By contrast, any point in polar coordinates can be represented in infinitely many ways. For example,

$$(r, \theta) = (r, \theta + 2\pi) \quad \text{and} \quad (r, \theta) = (-r, \theta + \pi).$$

Adding 1 revolution, or  $2\pi$  radians, to the angle does not change the point's location.

Adding  $\frac{1}{2}$  revolution, or  $\pi$  radians, to the angle and replacing  $r$  with  $-r$  does not change the point's location.

Thus, to find two other representations for the point  $(r, \theta)$ ,

- Add  $2\pi$  to the angle and do not change  $r$ .
- Add  $\pi$  to the angle and replace  $r$  with  $-r$ .

Continually adding or subtracting  $2\pi$  in either of these representations does not change the point's location.

### Multiple Representations of Points

If  $n$  is any integer, the point  $(r, \theta)$  can be represented as

$$(r, \theta) = (r, \theta + 2n\pi) \quad \text{or} \quad (r, \theta) = (-r, \theta + \pi + 2n\pi).$$

### EXAMPLE 2 Finding Other Polar Coordinates for a Given Point

The point  $(2, \frac{\pi}{3})$  is plotted in **Figure 6.23**. Find another representation of this point in which

- $r$  is positive and  $2\pi < \theta < 4\pi$ .
- $r$  is negative and  $0 < \theta < 2\pi$ .
- $r$  is positive and  $-2\pi < \theta < 0$ .

## SOLUTION

- a. We want  $r > 0$  and  $2\pi < \theta < 4\pi$ . Using  $\left(2, \frac{\pi}{3}\right)$ , add  $2\pi$  to the angle and do not change  $r$ .

$$\left(2, \frac{\pi}{3}\right) = \left(2, \frac{\pi}{3} + 2\pi\right) = \left(2, \frac{\pi}{3} + \frac{6\pi}{3}\right) = \left(2, \frac{7\pi}{3}\right)$$

- b. We want  $r < 0$  and  $0 < \theta < 2\pi$ . Using  $\left(2, \frac{\pi}{3}\right)$ , add  $\pi$  to the angle and replace  $r$  with  $-r$ .

$$\left(2, \frac{\pi}{3}\right) = \left(-2, \frac{\pi}{3} + \pi\right) = \left(-2, \frac{\pi}{3} + \frac{3\pi}{3}\right) = \left(-2, \frac{4\pi}{3}\right)$$

- c. We want  $r > 0$  and  $-2\pi < \theta < 0$ . Using  $\left(2, \frac{\pi}{3}\right)$ , subtract  $2\pi$  from the angle and do not change  $r$ .

$$\left(2, \frac{\pi}{3}\right) = \left(2, \frac{\pi}{3} - 2\pi\right) = \left(2, \frac{\pi}{3} - \frac{6\pi}{3}\right) = \left(2, -\frac{5\pi}{3}\right) \quad \dots$$

 **Check Point 2** Find another representation of  $\left(5, \frac{\pi}{4}\right)$  in which

- $r$  is positive and  $2\pi < \theta < 4\pi$ .
- $r$  is negative and  $0 < \theta < 2\pi$ .
- $r$  is positive and  $-2\pi < \theta < 0$ .

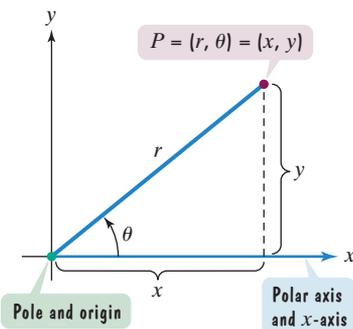

## Relations between Polar and Rectangular Coordinates

We now consider both polar and rectangular coordinates simultaneously. **Figure 6.24** shows the two coordinate systems. The polar axis coincides with the positive  $x$ -axis and the pole coincides with the origin. A point  $P$ , other than the origin, has rectangular coordinates  $(x, y)$  and polar coordinates  $(r, \theta)$ , as indicated in the figure. We wish to find equations relating the two sets of coordinates. From the figure, we see that

$$x^2 + y^2 = r^2$$

$$\sin \theta = \frac{y}{r} \quad \cos \theta = \frac{x}{r} \quad \tan \theta = \frac{y}{x}.$$

These relationships hold when  $P$  is in any quadrant and when  $r > 0$  or  $r < 0$ .

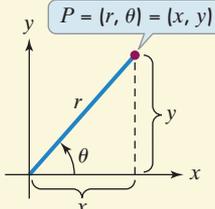

**FIGURE 6.24** Polar and rectangular coordinate systems

## Relations between Polar and Rectangular Coordinates

$$x = r \cos \theta$$

$$y = r \sin \theta$$

$$x^2 + y^2 = r^2$$

$$\tan \theta = \frac{y}{x}$$

- 3** Convert a point from polar to rectangular coordinates.

## Point Conversion from Polar to Rectangular Coordinates

To convert a point from polar coordinates  $(r, \theta)$  to rectangular coordinates  $(x, y)$ , use the formulas  $x = r \cos \theta$  and  $y = r \sin \theta$ .

**EXAMPLE 3** Polar-to-Rectangular Point Conversion

Find the rectangular coordinates of the points with the following polar coordinates:

a.  $\left(2, \frac{3\pi}{2}\right)$       b.  $\left(-8, \frac{\pi}{3}\right)$ .

**SOLUTION**We find  $(x, y)$  by substituting the given values for  $r$  and  $\theta$  into  $x = r \cos \theta$  and  $y = r \sin \theta$ .

a. We begin with the rectangular coordinates of the point  $(r, \theta) = \left(2, \frac{3\pi}{2}\right)$ .

$$x = r \cos \theta = 2 \cos \frac{3\pi}{2} = 2 \cdot 0 = 0$$

$$y = r \sin \theta = 2 \sin \frac{3\pi}{2} = 2(-1) = -2$$

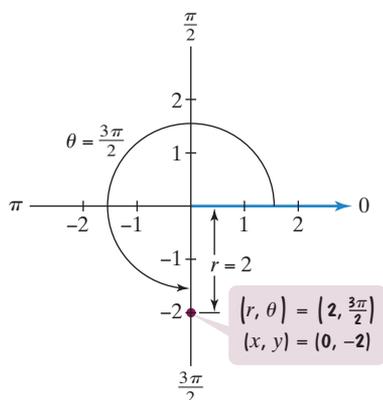

The rectangular coordinates of  $\left(2, \frac{3\pi}{2}\right)$  are  $(0, -2)$ . See **Figure 6.25**.

b. We now find the rectangular coordinates of the point  $(r, \theta) = \left(-8, \frac{\pi}{3}\right)$ .

$$x = r \cos \theta = -8 \cos \frac{\pi}{3} = -8\left(\frac{1}{2}\right) = -4$$

$$y = r \sin \theta = -8 \sin \frac{\pi}{3} = -8\left(\frac{\sqrt{3}}{2}\right) = -4\sqrt{3}$$

The rectangular coordinates of  $\left(-8, \frac{\pi}{3}\right)$  are  $(-4, -4\sqrt{3})$ . ...

**FIGURE 6.25** Converting  $\left(2, \frac{3\pi}{2}\right)$  to rectangular coordinates

**TECHNOLOGY**

Some graphing utilities can convert a point from polar coordinates to rectangular coordinates. Consult your manual. The screen on the right verifies the polar-rectangular conversion in Example 3(a). It shows that the rectangular coordinates of  $(r, \theta) = \left(2, \frac{3\pi}{2}\right)$  are  $(0, -2)$ . Notice that the  $x$ - and  $y$ -coordinates are displayed separately.

P>R>x(2, 3π/2)	0
P>R>y(2, 3π/2)	-2

**Check Point 3** Find the rectangular coordinates of the points with the following polar coordinates:

a.  $(3, \pi)$       b.  $\left(-10, \frac{\pi}{6}\right)$ .

**4** Convert a point from rectangular to polar coordinates.

**Point Conversion from Rectangular to Polar Coordinates**

Conversion from rectangular coordinates  $(x, y)$  to polar coordinates  $(r, \theta)$  is a bit more complicated. Keep in mind that there are infinitely many representations for a point in polar coordinates. If the point  $(x, y)$  lies in one of the four quadrants, we will use a representation in which

- $r$  is positive, and
- $\theta$  is the smallest positive angle with the terminal side passing through  $(x, y)$ .

These conventions provide the following procedure:

### Converting a Point from Rectangular to Polar Coordinates ( $r > 0$ and $0 \leq \theta < 2\pi$ )

1. Plot the point  $(x, y)$ .
2. Find  $r$  by computing the distance from the origin to  $(x, y)$ :  $r = \sqrt{x^2 + y^2}$ .
3. Find  $\theta$  using  $\tan \theta = \frac{y}{x}$  with the terminal side of  $\theta$  passing through  $(x, y)$ .

#### EXAMPLE 4 Rectangular-to-Polar Point Conversion

Find polar coordinates of the point whose rectangular coordinates are  $(-1, \sqrt{3})$ .

#### SOLUTION

We begin with  $(x, y) = (-1, \sqrt{3})$  and use our three-step procedure to find a set of polar coordinates  $(r, \theta)$ .

**Step 1 Plot the point  $(x, y)$ .** The point  $(-1, \sqrt{3})$  is plotted in quadrant II in Figure 6.26.

**Step 2 Find  $r$  by computing the distance from the origin to  $(x, y)$ .**

$$r = \sqrt{x^2 + y^2} = \sqrt{(-1)^2 + (\sqrt{3})^2} = \sqrt{1 + 3} = \sqrt{4} = 2$$

**Step 3 Find  $\theta$  using  $\tan \theta = \frac{y}{x}$  with the terminal side of  $\theta$  passing through  $(x, y)$ .**

$$\tan \theta = \frac{y}{x} = \frac{\sqrt{3}}{-1} = -\sqrt{3}$$

We know that  $\tan \frac{\pi}{3} = \sqrt{3}$ . Because  $\theta$  lies in quadrant II,

$$\theta = \pi - \frac{\pi}{3} = \frac{3\pi}{3} - \frac{\pi}{3} = \frac{2\pi}{3}.$$

One representation of  $(-1, \sqrt{3})$  in polar coordinates is  $(r, \theta) = \left(2, \frac{2\pi}{3}\right)$ . ...

#### TECHNOLOGY

The screen shows the rectangular-polar conversion for  $(-1, \sqrt{3})$  on a graphing utility. In Example 4, we showed that  $(x, y) = (-1, \sqrt{3})$  can be represented in polar coordinates as  $(r, \theta) = \left(2, \frac{2\pi}{3}\right)$ .

Using  $\frac{2\pi}{3} \approx 2.09439510239$  verifies that our conversion is correct. Notice that the  $r$ - and (approximate)  $\theta$ -coordinates are displayed separately.

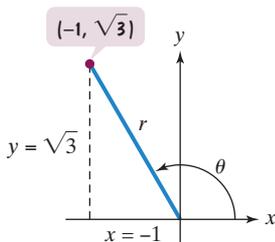

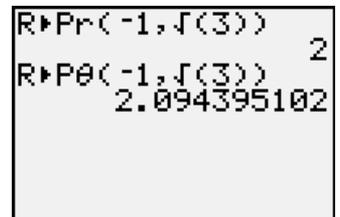

FIGURE 6.26 Converting  $(-1, \sqrt{3})$  to polar coordinates

**Check Point 4** Find polar coordinates of the point whose rectangular coordinates are  $(1, -\sqrt{3})$ .

If a point  $(x, y)$  lies on a positive or negative axis, we use a representation in which

- $r$  is positive, and
- $\theta$  is the smallest quadrantal angle that lies on the same positive or negative axis as  $(x, y)$ .

In these cases, you can find  $r$  and  $\theta$  by plotting  $(x, y)$  and inspecting the figure. Let's see how this is done.

**EXAMPLE 5** Rectangular-to-Polar Point Conversion

Find polar coordinates of the point whose rectangular coordinates are  $(-2, 0)$ .

**SOLUTION**

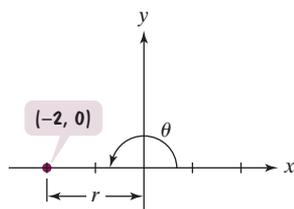

We begin with  $(x, y) = (-2, 0)$  and find a set of polar coordinates  $(r, \theta)$ .

**Step 1 Plot the point  $(x, y)$ .** The point  $(-2, 0)$  is plotted in **Figure 6.27**.

**Step 2 Find  $r$ , the distance from the origin to  $(x, y)$ .** Can you tell by looking at **Figure 6.27** that this distance is 2?

$$r = \sqrt{x^2 + y^2} = \sqrt{(-2)^2 + 0^2} = \sqrt{4} = 2$$

**Step 3 Find  $\theta$  with  $\theta$  lying on the same positive or negative axis as  $(x, y)$ .** The point  $(-2, 0)$  is on the negative  $x$ -axis. Thus,  $\theta$  lies on the negative  $x$ -axis and  $\theta = \pi$ . One representation of  $(-2, 0)$  in polar coordinates is  $(2, \pi)$ . ●●●

**FIGURE 6.27** Converting  $(-2, 0)$  to polar coordinates

 **Check Point 5** Find polar coordinates of the point whose rectangular coordinates are  $(0, -4)$ . Express  $\theta$  in radians.

- 5** Convert an equation from rectangular to polar coordinates.

**Equation Conversion from Rectangular to Polar Coordinates**

A **polar equation** is an equation whose variables are  $r$  and  $\theta$ . Two examples of polar equations are

$$r = \frac{5}{\cos \theta + \sin \theta} \quad \text{and} \quad r = 3 \csc \theta.$$

To convert a rectangular equation in  $x$  and  $y$  to a polar equation in  $r$  and  $\theta$ , replace  $x$  with  $r \cos \theta$  and  $y$  with  $r \sin \theta$ .

**EXAMPLE 6** Converting Equations from Rectangular to Polar Coordinates

Convert each rectangular equation to a polar equation that expresses  $r$  in terms of  $\theta$ :

**a.**  $x + y = 5$       **b.**  $(x - 1)^2 + y^2 = 1$ .

**SOLUTION**

Our goal is to obtain equations in which the variables are  $r$  and  $\theta$  rather than  $x$  and  $y$ . We use  $x = r \cos \theta$  and  $y = r \sin \theta$ . We then solve the equations for  $r$ , obtaining equivalent equations that give  $r$  in terms of  $\theta$ .

**a.**  $x + y = 5$

*This is the given equation in rectangular coordinates. The graph is a line passing through  $(5, 0)$  and  $(0, 5)$ .*

$$r \cos \theta + r \sin \theta = 5$$

*Replace  $x$  with  $r \cos \theta$  and  $y$  with  $r \sin \theta$ .*

$$r(\cos \theta + \sin \theta) = 5$$

*Factor out  $r$ .*

$$r = \frac{5}{\cos \theta + \sin \theta}$$

*Divide both sides of the equation by  $\cos \theta + \sin \theta$  and solve for  $r$ .*

Thus, the polar equation for  $x + y = 5$  is  $r = \frac{5}{\cos \theta + \sin \theta}$ .

b.  $(x - 1)^2 + y^2 = 1$

The standard form of a circle's equation is  $(x - h)^2 + (y - k)^2 = r^2$ , with radius  $r$  and center at  $(h, k)$ .

This is the given equation in rectangular coordinates. The graph is a circle with radius 1 and center at  $(h, k) = (1, 0)$ .

$$(r \cos \theta - 1)^2 + (r \sin \theta)^2 = 1$$

$$r^2 \cos^2 \theta - 2r \cos \theta + 1 + r^2 \sin^2 \theta = 1$$

Replace  $x$  with  $r \cos \theta$  and  $y$  with  $r \sin \theta$ . Use  $(A - B)^2 = A^2 - 2AB + B^2$  to square  $r \cos \theta - 1$ .

$$r^2 \cos^2 \theta + r^2 \sin^2 \theta - 2r \cos \theta = 0$$

Subtract 1 from both sides and rearrange terms.

$$r^2 - 2r \cos \theta = 0$$

Simplify:  $r^2 \cos^2 \theta + r^2 \sin^2 \theta = r^2(\cos^2 \theta + \sin^2 \theta) = r^2 \cdot 1 = r^2$ .

$$r(r - 2 \cos \theta) = 0$$

Factor out  $r$ .

$$r = 0 \quad \text{or} \quad r - 2 \cos \theta = 0$$

Set each factor equal to 0.

$$r = 2 \cos \theta$$

Solve for  $r$ .

The graph of  $r = 0$  is a single point, the pole. Because the pole also satisfies the equation  $r = 2 \cos \theta$  (for  $\theta = \frac{\pi}{2}$ ,  $r = 0$ ), it is not necessary to include the equation  $r = 0$ . Thus, the polar equation for  $(x - 1)^2 + y^2 = 1$  is  $r = 2 \cos \theta$ . ●●●

 **Check Point 6** Convert each rectangular equation to a polar equation that expresses  $r$  in terms of  $\theta$ :

a.  $3x - y = 6$

b.  $x^2 + (y + 1)^2 = 1$ .

**6** Convert an equation from polar to rectangular coordinates.

### Equation Conversion from Polar to Rectangular Coordinates

When we convert an equation from polar to rectangular coordinates, our goal is to obtain an equation in which the variables are  $x$  and  $y$  rather than  $r$  and  $\theta$ . We use one or more of the following equations:

$$r^2 = x^2 + y^2 \quad r \cos \theta = x \quad r \sin \theta = y \quad \tan \theta = \frac{y}{x}$$

To use these equations, it is sometimes necessary to do something to the given polar equation. This could include squaring both sides, using an identity, taking the tangent of both sides, or multiplying both sides by  $r$ .

#### EXAMPLE 7 Converting Equations from Polar to Rectangular Form

Convert each polar equation to a rectangular equation in  $x$  and  $y$ :

a.  $r = 5$     b.  $\theta = \frac{\pi}{4}$     c.  $r = 3 \csc \theta$     d.  $r = -6 \cos \theta$ .

#### SOLUTION

In each case, let's express the rectangular equation in a form that enables us to recognize its graph.

a. We use  $r^2 = x^2 + y^2$  to convert the polar equation  $r = 5$  to a rectangular equation.

$$r = 5 \quad \text{This is the given polar equation.}$$

$$r^2 = 25 \quad \text{Square both sides.}$$

$$x^2 + y^2 = 25 \quad \text{Use } r^2 = x^2 + y^2 \text{ on the left side.}$$

The rectangular equation for  $r = 5$  is  $x^2 + y^2 = 25$ . The graph is a circle with center at  $(0, 0)$  and radius 5.

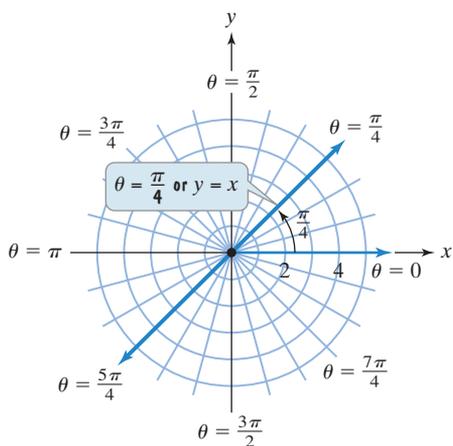

FIGURE 6.28

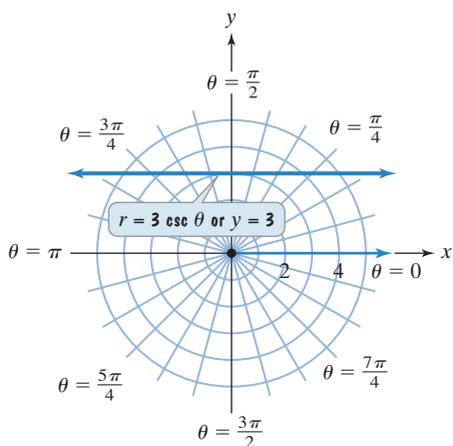

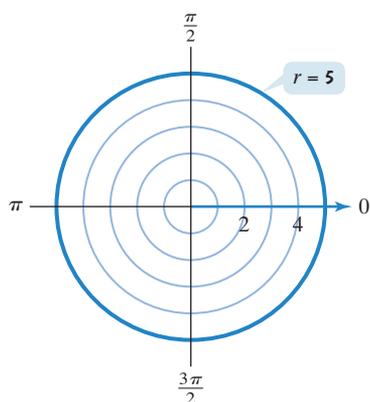

FIGURE 6.29

FIGURE 6.30 The equations  $r = 5$  and  $x^2 + y^2 = 25$  have the same graph.

- b. We use  $\tan \theta = \frac{y}{x}$  to convert the polar equation  $\theta = \frac{\pi}{4}$  to a rectangular equation in  $x$  and  $y$ .

$$\theta = \frac{\pi}{4} \quad \text{This is the given polar equation.}$$

$$\tan \theta = \tan \frac{\pi}{4} \quad \text{Take the tangent of both sides.}$$

$$\tan \theta = 1 \quad \tan \frac{\pi}{4} = 1$$

$$\frac{y}{x} = 1 \quad \text{Use } \tan \theta = \frac{y}{x} \text{ on the left side.}$$

$$y = x \quad \text{Multiply both sides by } x.$$

The rectangular equation for  $\theta = \frac{\pi}{4}$  is  $y = x$ . The graph is a line that bisects quadrants I and III. **Figure 6.28** shows the line drawn in a polar coordinate system.

- c. We use  $r \sin \theta = y$  to convert the polar equation  $r = 3 \csc \theta$  to a rectangular equation. To do this, we express the cosecant in terms of the sine.

$$r = 3 \csc \theta \quad \text{This is the given polar equation.}$$

$$r = \frac{3}{\sin \theta} \quad \csc \theta = \frac{1}{\sin \theta}$$

$$r \sin \theta = 3 \quad \text{Multiply both sides by } \sin \theta.$$

$$y = 3 \quad \text{Use } r \sin \theta = y \text{ on the left side.}$$

The rectangular equation for  $r = 3 \csc \theta$  is  $y = 3$ . The graph is a horizontal line three units above the  $x$ -axis. **Figure 6.29** shows the line drawn in a polar coordinate system.

- d. To convert  $r = -6 \cos \theta$  to rectangular coordinates, we multiply both sides by  $r$ . Then we use  $r^2 = x^2 + y^2$  on the left side and  $r \cos \theta = x$  on the right side.

$$r = -6 \cos \theta \quad \text{This is the given polar equation.}$$

$$r^2 = -6r \cos \theta \quad \text{Multiply both sides by } r.$$

$$x^2 + y^2 = -6x \quad \text{Convert to rectangular coordinates: } r^2 = x^2 + y^2 \text{ and } r \cos \theta = x.$$

$$x^2 + 6x + y^2 = 0 \quad \text{Add } 6x \text{ to both sides.}$$

$$x^2 + 6x + 9 + y^2 = 9 \quad \text{Complete the square on } x: \frac{1}{2} \cdot 6 = 3 \text{ and } 3^2 = 9.$$

$$(x + 3)^2 + y^2 = 9 \quad \text{Factor.}$$

The rectangular equation for  $r = -6 \cos \theta$  is  $(x + 3)^2 + y^2 = 9$ . This last equation is the standard form of the equation of a circle,  $(x - h)^2 + (y - k)^2 = r^2$ , with radius  $r$  and center at  $(h, k)$ . Thus, the graph of  $(x + 3)^2 + y^2 = 9$  is a circle with center at  $(-3, 0)$  and radius 3. ●●●

Converting a polar equation to a rectangular equation may be a useful way to develop or check a graph. For example, the graph of the polar equation  $r = 5$  consists of all points that are five units from the pole. Thus, the graph is a circle centered at the pole with radius 5. The rectangular equation for  $r = 5$ , namely,  $x^2 + y^2 = 25$ , has precisely the same graph (see **Figure 6.30**). We will discuss graphs of polar equations in the next section.

 **Check Point 7** Convert each polar equation to a rectangular equation in  $x$  and  $y$ :

- a.  $r = 4$       b.  $\theta = \frac{3\pi}{4}$       c.  $r = -2 \sec \theta$       d.  $r = 10 \sin \theta$ .

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- The foundation of the polar coordinate system consists of a point, called the \_\_\_\_\_, and a ray extending out from it, called the \_\_\_\_\_.
- The origin in the rectangular coordinate system coincides with the \_\_\_\_\_ in polar coordinates. The positive  $x$ -axis in rectangular coordinates coincides with the \_\_\_\_\_ in polar coordinates.

For each point with the given polar coordinates in Exercises 3–8 determine the quadrant in which the point lies if it is graphed in a rectangular coordinate system.

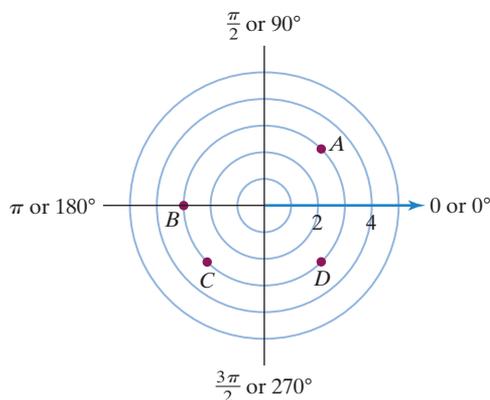

- $(4, 135^\circ)$ ; quadrant \_\_\_\_\_
- $(-4, 135^\circ)$ ; quadrant \_\_\_\_\_
- $(2, \frac{5\pi}{3})$ ; quadrant \_\_\_\_\_
- $(-3, \frac{\pi}{4})$ ; quadrant \_\_\_\_\_
- $(5, -\frac{\pi}{4})$ ; quadrant \_\_\_\_\_

- $(-2, -\frac{\pi}{4})$ ; quadrant \_\_\_\_\_
- $(r, \theta) = (\text{_____}, \theta + 2\pi)$
- $(r, \theta) = (\text{_____}, \theta + \pi)$
- The equation  $x + y = 7$  can be converted to a polar equation by replacing  $x$  with \_\_\_\_\_ and replacing  $y$  with \_\_\_\_\_.
- The equation  $r = 3$  can be converted to a rectangular equation by \_\_\_\_\_ both sides and then replacing  $r^2$  with \_\_\_\_\_.
- The equation  $\theta = \frac{5\pi}{4}$  can be converted to a rectangular equation by taking the \_\_\_\_\_ of both sides and then replacing  $\tan \theta$  with \_\_\_\_\_.
- The equation  $r = 4 \sin \theta$  can be converted to a rectangular equation by \_\_\_\_\_ both sides by \_\_\_\_\_ and then replacing  $r^2$  with \_\_\_\_\_ and  $r \sin \theta$  with \_\_\_\_\_.

## EXERCISE SET 6.3

### Practice Exercises

In Exercises 1–10, indicate if the point with the given polar coordinates is represented by A, B, C, or D on the graph.

- $(3, 225^\circ)$
- $(3, 315^\circ)$
- $(-3, \frac{5\pi}{4})$
- $(-3, \frac{\pi}{4})$
- $(3, \pi)$
- $(-3, 0)$
- $(3, -135^\circ)$
- $(3, -315^\circ)$
- $(-3, -\frac{3\pi}{4})$
- $(-3, -\frac{5\pi}{4})$

In Exercises 11–20, use a polar coordinate system like the one shown for Exercises 1–10 to plot each point with the given polar coordinates.

- $(2, 45^\circ)$
- $(1, 45^\circ)$
- $(3, 90^\circ)$
- $(2, 270^\circ)$
- $(3, \frac{4\pi}{3})$
- $(3, \frac{7\pi}{6})$

- $(-1, \pi)$
- $(-3, -\pi)$
- $(-1, \frac{3\pi}{2})$
- $(-2, -\frac{\pi}{2})$

In Exercises 21–26, use a polar coordinate system like the one shown for Exercises 1–10 to plot each point with the given polar coordinates. Then find another representation  $(r, \theta)$  of this point in which

- $r > 0, 2\pi < \theta < 4\pi$ .
- $r < 0, 0 < \theta < 2\pi$ .
- $r > 0, -2\pi < \theta < 0$ .

- $(5, \frac{\pi}{6})$
- $(8, \frac{\pi}{6})$
- $(10, \frac{3\pi}{4})$
- $(12, \frac{2\pi}{3})$
- $(4, \frac{\pi}{2})$
- $(6, \frac{\pi}{2})$

In Exercises 27–32, select the representations that do not change the location of the given point.

- $(7, 140^\circ)$ 
  - $(-7, 320^\circ)$
  - $(-7, -40^\circ)$
  - $(-7, 220^\circ)$
  - $(7, -220^\circ)$
- $(4, 120^\circ)$ 
  - $(-4, 300^\circ)$
  - $(-4, -240^\circ)$
  - $(4, -240^\circ)$
  - $(4, 480^\circ)$
- $(2, -\frac{3\pi}{4})$ 
  - $(2, -\frac{7\pi}{4})$
  - $(2, \frac{5\pi}{4})$
  - $(-2, -\frac{\pi}{4})$
  - $(-2, -\frac{7\pi}{4})$

30.  $\left(-2, \frac{7\pi}{6}\right)$

a.  $\left(-2, -\frac{5\pi}{6}\right)$

b.  $\left(-2, -\frac{\pi}{6}\right)$

c.  $\left(2, -\frac{\pi}{6}\right)$

d.  $\left(2, \frac{\pi}{6}\right)$

31.  $\left(-5, -\frac{\pi}{4}\right)$

a.  $\left(-5, \frac{7\pi}{4}\right)$

b.  $\left(5, -\frac{5\pi}{4}\right)$

c.  $\left(-5, \frac{11\pi}{4}\right)$

d.  $\left(5, \frac{\pi}{4}\right)$

32.  $(-6, 3\pi)$

a.  $(6, 2\pi)$

b.  $(6, -\pi)$

c.  $(-6, \pi)$

d.  $(-6, -2\pi)$

In Exercises 33–40, polar coordinates of a point are given. Find the rectangular coordinates of each point.

33.  $(4, 90^\circ)$

34.  $(6, 180^\circ)$

35.  $\left(2, \frac{\pi}{3}\right)$

36.  $\left(2, \frac{\pi}{6}\right)$

37.  $\left(-4, \frac{\pi}{2}\right)$

38.  $\left(-6, \frac{3\pi}{2}\right)$

39.  $(7.4, 2.5)$

40.  $(8.3, 4.6)$

In Exercises 41–48, the rectangular coordinates of a point are given. Find polar coordinates of each point. Express  $\theta$  in radians.

41.  $(-2, 2)$

42.  $(2, -2)$

43.  $(2, -2\sqrt{3})$

44.  $(-2\sqrt{3}, 2)$

45.  $(-\sqrt{3}, -1)$

46.  $(-1, -\sqrt{3})$

47.  $(5, 0)$

48.  $(0, -6)$

In Exercises 49–58, convert each rectangular equation to a polar equation that expresses  $r$  in terms of  $\theta$ .

49.  $3x + y = 7$

50.  $x + 5y = 8$

51.  $x = 7$

52.  $y = 3$

53.  $x^2 + y^2 = 9$

54.  $x^2 + y^2 = 16$

55.  $(x - 2)^2 + y^2 = 4$

56.  $x^2 + (y + 3)^2 = 9$

57.  $y^2 = 6x$

58.  $x^2 = 6y$

In Exercises 59–74, convert each polar equation to a rectangular equation. Then use a rectangular coordinate system to graph the rectangular equation.

59.  $r = 8$

60.  $r = 10$

61.  $\theta = \frac{\pi}{2}$

62.  $\theta = \frac{\pi}{3}$

63.  $r \sin \theta = 3$

64.  $r \cos \theta = 7$

65.  $r = 4 \csc \theta$

66.  $r = 6 \sec \theta$

67.  $r = \sin \theta$

68.  $r = \cos \theta$

69.  $r = 12 \cos \theta$

70.  $r = -4 \sin \theta$

71.  $r = 6 \cos \theta + 4 \sin \theta$

72.  $r = 8 \cos \theta + 2 \sin \theta$

73.  $r^2 \sin 2\theta = 2$

74.  $r^2 \sin 2\theta = 4$

### Practice Plus

In Exercises 75–78, show that each statement is true by converting the given polar equation to a rectangular equation.

75. Show that the graph of  $r = a \sec \theta$  is a vertical line  $a$  units to the right of the  $y$ -axis if  $a > 0$  and  $|a|$  units to the left of the  $y$ -axis if  $a < 0$ .

76. Show that the graph of  $r = a \csc \theta$  is a horizontal line  $a$  units above the  $x$ -axis if  $a > 0$  and  $|a|$  units below the  $x$ -axis if  $a < 0$ .

77. Show that the graph of  $r = a \sin \theta$  is a circle with center at  $\left(0, \frac{a}{2}\right)$  and radius  $\frac{a}{2}$ .

78. Show that the graph of  $r = a \cos \theta$  is a circle with center at  $\left(\frac{a}{2}, 0\right)$  and radius  $\frac{a}{2}$ .

In Exercises 79–80, convert each polar equation to a rectangular equation. Then determine the graph's slope and  $y$ -intercept.

79.  $r \sin\left(\theta - \frac{\pi}{4}\right) = 2$

80.  $r \cos\left(\theta + \frac{\pi}{6}\right) = 8$

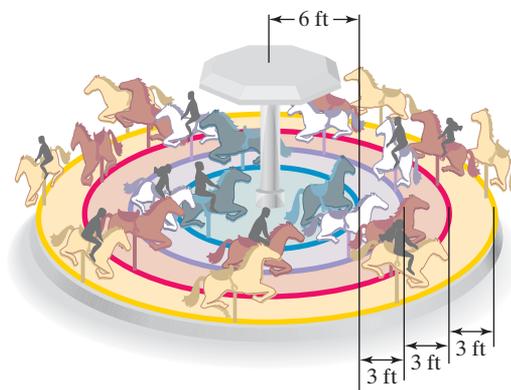

In Exercises 81–82, find the rectangular coordinates of each pair of points. Then find the distance, in simplified radical form, between the points.

81.  $\left(2, \frac{2\pi}{3}\right)$  and  $\left(4, \frac{\pi}{6}\right)$

82.  $(6, \pi)$  and  $\left(5, \frac{7\pi}{4}\right)$

### Application Exercises

Use the figure of the merry-go-round to solve Exercises 83–84. There are four circles of horses. Each circle is three feet from the next circle. The radius of the inner circle is 6 feet.

83. If a horse in the outer circle is  $\frac{2}{3}$  of the way around the merry-go-round, give its polar coordinates.

84. If a horse in the inner circle is  $\frac{5}{6}$  of the way around the merry-go-round, give its polar coordinates.

The wind is blowing at 10 knots. Sailboat racers look for a sailing angle to the 10-knot wind that produces maximum sailing speed. In this application,  $(r, \theta)$  describes the sailing speed,  $r$ , in knots, at an angle  $\theta$  to the 10-knot wind. Use this information to solve Exercises 85–87.

85. Interpret the polar coordinates:  $(6.3, 50^\circ)$ .

86. Interpret the polar coordinates:  $(7.4, 85^\circ)$ .

## SECTION 6.4

## Graphs of Polar Equations

*Objectives*

- 1 Use point plotting to graph polar equations.
- 2 Use symmetry to graph polar equations.

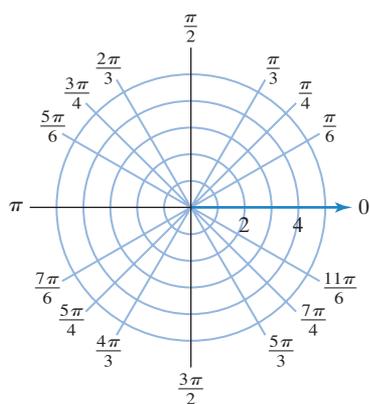

FIGURE 6.31 A polar coordinate grid

- 1 Use point plotting to graph polar equations.

The America's Cup is the supreme event in ocean sailing. Competition is fierce and the costs are huge. Competitors look to mathematics to provide the critical innovation that can make the difference between winning and losing. In this section's Exercise Set, you will see how graphs of polar equations play a role in sailing faster using mathematics.

### Using Polar Grids to Graph Polar Equations

Recall that a **polar equation** is an equation whose variables are  $r$  and  $\theta$ . The **graph of a polar equation** is the set of all points whose polar coordinates satisfy the equation.

We use **polar grids** like the one shown in **Figure 6.31** to graph polar equations.

The grid consists of circles with centers at the pole. This polar grid shows five such

circles. A polar grid also shows lines passing through the pole. In this grid, each line represents an angle for which we know the exact values of the trigonometric functions.

Many polar coordinate grids show more circles and more lines through the pole than in **Figure 6.31**. See if your campus bookstore has paper with polar grids and use the polar graph paper throughout this section.

### Graphing a Polar Equation by Point Plotting

One method for graphing a polar equation such as  $r = 4 \cos \theta$  is the **point-plotting method**. First, we make a table of values that satisfy the equation. Next, we plot these ordered pairs as points in the polar coordinate system. Finally, we connect the points with a smooth curve. This often gives us a picture of all ordered pairs  $(r, \theta)$  that satisfy the equation.

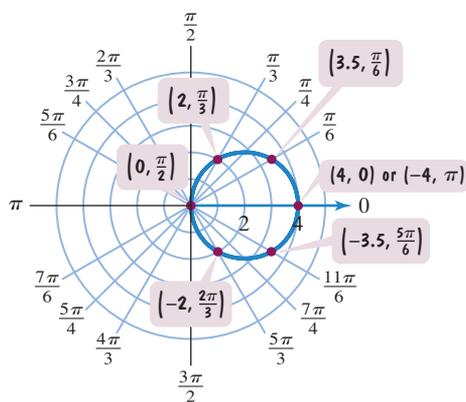

#### EXAMPLE 1 Graphing an Equation Using the Point-Plotting Method

Graph the polar equation  $r = 4 \cos \theta$  with  $\theta$  in radians.

#### SOLUTION

We construct a partial table of coordinates for  $r = 4 \cos \theta$  using multiples of  $\frac{\pi}{6}$ . Then we plot the points and join them with a smooth curve, as shown in

**Figure 6.32**.

 FIGURE 6.32 The graph of  $r = 4 \cos \theta$ 

$\theta$	$r = 4 \cos \theta$	$(r, \theta)$
0	$4 \cos 0 = 4 \cdot 1 = 4$	$(4, 0)$
$\frac{\pi}{6}$	$4 \cos \frac{\pi}{6} = 4 \cdot \frac{\sqrt{3}}{2} = 2\sqrt{3} \approx 3.5$	$(3.5, \frac{\pi}{6})$
$\frac{\pi}{3}$	$4 \cos \frac{\pi}{3} = 4 \cdot \frac{1}{2} = 2$	$(2, \frac{\pi}{3})$
$\frac{\pi}{2}$	$4 \cos \frac{\pi}{2} = 4 \cdot 0 = 0$	$(0, \frac{\pi}{2})$
$\frac{2\pi}{3}$	$4 \cos \frac{2\pi}{3} = 4 \left(-\frac{1}{2}\right) = -2$	$(-2, \frac{2\pi}{3})$
$\frac{5\pi}{6}$	$4 \cos \frac{5\pi}{6} = 4 \left(-\frac{\sqrt{3}}{2}\right) = -2\sqrt{3} \approx -3.5$	$(-3.5, \frac{5\pi}{6})$
$\pi$	$4 \cos \pi = 4(-1) = -4$	$(-4, \pi)$
The points repeat.		

The graph of  $r = 4 \cos \theta$  in **Figure 6.32** looks like a circle of radius 2 whose center is at the point  $(x, y) = (2, 0)$ . We can verify this observation by changing the polar equation to a rectangular equation.

$$r = 4 \cos \theta \quad \text{This is the given polar equation.}$$

$$r^2 = 4r \cos \theta \quad \text{Multiply both sides by } r.$$

$$x^2 + y^2 = 4x \quad \text{Convert to rectangular coordinates: } r^2 = x^2 + y^2 \text{ and } r \cos \theta = x.$$

$$x^2 - 4x + y^2 = 0 \quad \text{Subtract } 4x \text{ from both sides.}$$

$$x^2 - 4x + 4 + y^2 = 4 \quad \text{Complete the square on } x: \frac{1}{2}(-4) = -2 \text{ and } (-2)^2 = 4. \text{ Add 4 to both sides.}$$

$$(x - 2)^2 + y^2 = 2^2 \quad \text{Factor.}$$

This last equation is the standard form of the equation of a circle,  $(x - h)^2 + (y - k)^2 = r^2$ , with radius  $r$  and center at  $(h, k)$ . Thus, the radius is 2 and the center is at  $(h, k) = (2, 0)$ .

In general, circles have simpler equations in polar form than in rectangular form.

## TECHNOLOGY

A graphing utility can be used to obtain the graph of a polar equation. Use the polar mode with angle measure in radians. You must enter the minimum and maximum values for  $\theta$  and an increment setting for  $\theta$ , called  $\theta$  step.  $\theta$  step determines the number of points that the graphing utility will plot. Make  $\theta$  step relatively small so that a significant number of points are plotted.

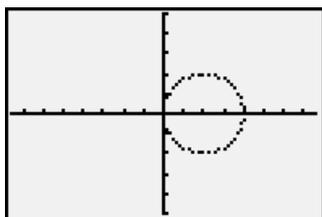

Shown is the graph of  $r = 4 \cos \theta$  in a  $[-7.5, 7.5, 1]$  by  $[-5, 5, 1]$  viewing rectangle with

$$\theta \text{ min} = 0$$

$$\theta \text{ max} = 2\pi$$

$$\theta \text{ step} = \frac{\pi}{48}$$

A square setting was used.

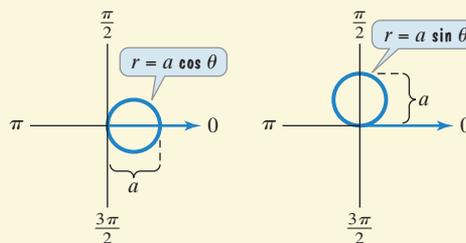

## Circles in Polar Coordinates

The graphs of

$$r = a \cos \theta \quad \text{and} \quad r = a \sin \theta, \quad a > 0,$$

are circles.

 **Check Point 1** Graph the equation  $r = 4 \sin \theta$  with  $\theta$  in radians. Use multiples of  $\frac{\pi}{6}$  from 0 to  $\pi$  to generate coordinates for points  $(r, \theta)$ .

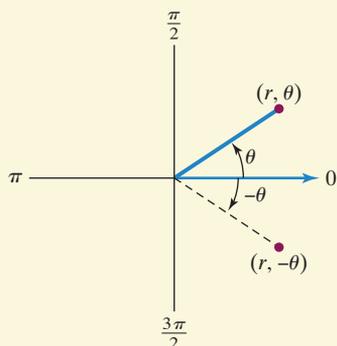

- 2 Use symmetry to graph polar equations.

### Graphing a Polar Equation Using Symmetry

If the graph of a polar equation exhibits symmetry, you may be able to graph it more quickly. Three types of symmetry can be helpful.

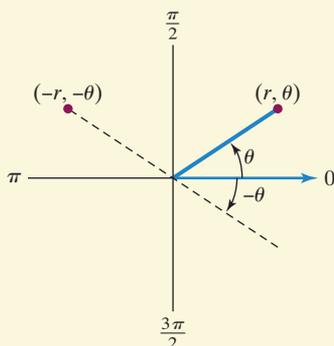

#### Tests for Symmetry in Polar Coordinates

##### Symmetry with Respect to the Polar Axis (x-Axis)

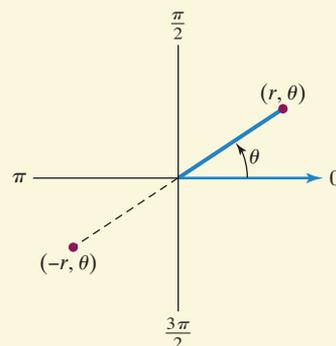

Replace  $\theta$  with  $-\theta$ . If an equivalent equation results, the graph is symmetric with respect to the polar axis.

##### Symmetry with Respect to the Line $\theta = \frac{\pi}{2}$ (y-Axis)

Replace  $(r, \theta)$  with  $(-r, -\theta)$ . If an equivalent equation results, the graph is symmetric with respect to  $\theta = \frac{\pi}{2}$ .

##### Symmetry with Respect to the Pole (Origin)

Replace  $r$  with  $-r$ . If an equivalent equation results, the graph is symmetric with respect to the pole.

If a polar equation passes a symmetry test, then its graph exhibits that symmetry. By contrast, if a polar equation fails a symmetry test, then its graph *may or may not* have that kind of symmetry. Thus, the graph of a polar equation may have a symmetry even if it fails a test for that particular symmetry. Nevertheless, the symmetry tests are useful. If we detect symmetry, we can obtain a graph of the equation by plotting fewer points.

#### EXAMPLE 2 Graphing a Polar Equation Using Symmetry

Check for symmetry and then graph the polar equation:

$$r = 1 - \cos \theta.$$

#### SOLUTION

We apply each of the tests for symmetry.

**Polar Axis:** Replace  $\theta$  with  $-\theta$  in  $r = 1 - \cos \theta$ :

$$r = 1 - \cos(-\theta) \quad \text{Replace } \theta \text{ with } -\theta \text{ in } r = 1 - \cos \theta.$$

$$r = 1 - \cos \theta \quad \text{The cosine function is even: } \cos(-\theta) = \cos \theta.$$

Because the polar equation does not change when  $\theta$  is replaced with  $-\theta$ , the graph is symmetric with respect to the polar axis.

**The Line  $\theta = \frac{\pi}{2}$ :** Replace  $(r, \theta)$  with  $(-r, -\theta)$  in  $r = 1 - \cos \theta$ :

$$-r = 1 - \cos(-\theta) \quad \text{Replace } r \text{ with } -r \text{ and } \theta \text{ with } -\theta \text{ in } r = 1 - \cos \theta.$$

$$-r = 1 - \cos \theta \quad \cos(-\theta) = \cos \theta.$$

$$r = \cos \theta - 1 \quad \text{Multiply both sides by } -1.$$

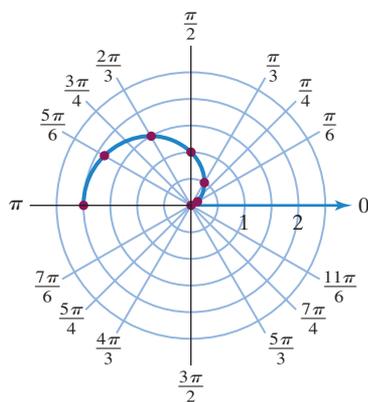

FIGURE 6.33(a) Graphing  $r = 1 - \cos \theta$  for  $0 \leq \theta \leq \pi$

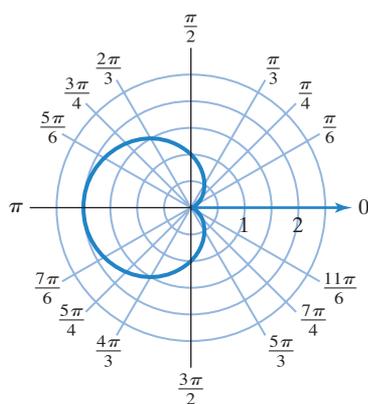

FIGURE 6.33(b) A complete graph of  $r = 1 - \cos \theta$

Because the polar equation  $r = 1 - \cos \theta$  changes to  $r = \cos \theta - 1$  when  $(r, \theta)$  is replaced with  $(-r, -\theta)$ , the equation fails this symmetry test. The graph may or may not be symmetric with respect to the line  $\theta = \frac{\pi}{2}$ .

**The Pole:** Replace  $r$  with  $-r$  in  $r = 1 - \cos \theta$ :

$$-r = 1 - \cos \theta \quad \text{Replace } r \text{ with } -r \text{ in } r = 1 - \cos \theta.$$

$$r = \cos \theta - 1 \quad \text{Multiply both sides by } -1.$$

Because the polar equation  $r = 1 - \cos \theta$  changes to  $r = \cos \theta - 1$  when  $r$  is replaced with  $-r$ , the equation fails this symmetry test. The graph may or may not be symmetric with respect to the pole.

Now we are ready to graph  $r = 1 - \cos \theta$ . Because the period of the cosine function is  $2\pi$ , we need not consider values of  $\theta$  beyond  $2\pi$ . Recall that we discovered the graph of the equation  $r = 1 - \cos \theta$  has symmetry with respect to the polar axis. Because the graph has this symmetry, we can obtain a complete graph by plotting fewer points. Let's start by finding the values of  $r$  for values of  $\theta$  from 0 to  $\pi$ .

$\theta$	0	$\frac{\pi}{6}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{5\pi}{6}$	$\pi$
$r$	0	0.13	0.5	1	1.5	1.87	2

The values for  $r$  and  $\theta$  are shown in the table. These values can be obtained using your calculator or possibly with the **TABLE** feature on some graphing calculators. The points in the table are plotted in **Figure 6.33(a)**. Examine the graph. Keep in mind that the graph must be symmetric with respect to the polar axis. Thus, if we reflect the graph in **Figure 6.33(a)** about the polar axis, we will obtain a complete graph of  $r = 1 - \cos \theta$ . This graph is shown in **Figure 6.33(b)**. ●●●

 **Check Point 2** Check for symmetry and then graph the polar equation:

$$r = 1 + \cos \theta.$$

### EXAMPLE 3 Graphing a Polar Equation

Graph the polar equation:  $r = 1 + 2 \sin \theta$ .

#### SOLUTION

We first check for symmetry.

$$r = 1 + 2 \sin \theta$$

Polar Axis	The Line $\theta = \frac{\pi}{2}$	The Pole
Replace $\theta$ with $-\theta$ .	Replace $(r, \theta)$ with $(-r, -\theta)$ .	Replace $r$ with $-r$ .
$r = 1 + 2 \sin(-\theta)$	$-r = 1 + 2 \sin(-\theta)$	$-r = 1 + 2 \sin \theta$
$r = 1 + 2(-\sin \theta)$	$-r = 1 - 2 \sin \theta$	$r = -1 - 2 \sin \theta$
$r = 1 - 2 \sin \theta$	$r = -1 + 2 \sin \theta$	

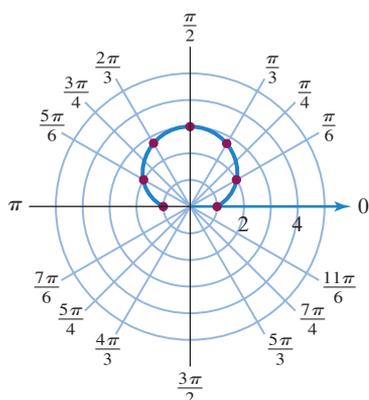

None of these equations are equivalent to  $r = 1 + 2 \sin \theta$ . Thus, the graph may or may not have each of these kinds of symmetry.

Now we are ready to graph  $r = 1 + 2 \sin \theta$ . Because the period of the sine function is  $2\pi$ , we need not consider values of  $\theta$  beyond  $2\pi$ . We identify points on the graph of  $r = 1 + 2 \sin \theta$  by assigning values to  $\theta$  and calculating the corresponding values of  $r$ . The values for  $r$  and  $\theta$  are in the tables above **Figure 6.34(a)**, **Figure 6.34(b)**, and **Figure 6.34(c)**. The complete graph of  $r = 1 + 2 \sin \theta$  is shown in **Figure 6.34(c)**. The inner loop indicates that the graph passes through the pole twice.

$\theta$	0	$\frac{\pi}{6}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{5\pi}{6}$	$\pi$
$r$	1	2	2.73	3	2.73	2	1

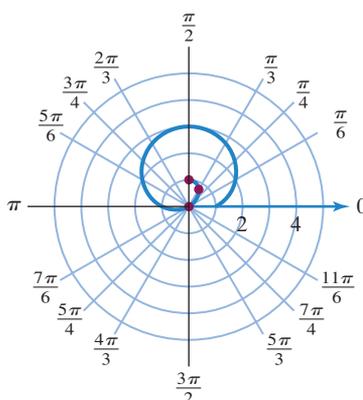

$\theta$	$\frac{7\pi}{6}$	$\frac{4\pi}{3}$	$\frac{3\pi}{2}$
$r$	0	-0.73	-1

$\theta$	$\frac{5\pi}{3}$	$\frac{11\pi}{6}$	$2\pi$
$r$	-0.73	0	1

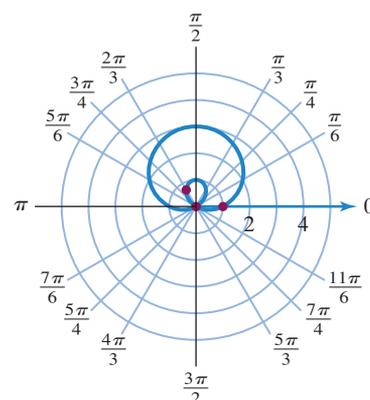

(a) The graph of  $r = 1 + 2 \sin \theta$  for  $0 \leq \theta \leq \pi$

**FIGURE 6.34** Graphing  $r = 1 + 2 \sin \theta$

(b) The graph of  $r = 1 + 2 \sin \theta$  for  $0 \leq \theta \leq \frac{3\pi}{2}$

(c) The complete graph of  $r = 1 + 2 \sin \theta$  for  $0 \leq \theta \leq 2\pi$

Although the polar equation  $r = 1 + 2 \sin \theta$  failed the test for symmetry with respect to the line  $\theta = \frac{\pi}{2}$  (the  $y$ -axis), its graph in **Figure 6.34(c)** reveals this kind of symmetry. ●●●

We're not quite sure if the polar graph in **Figure 6.34(c)** looks like a snail. However, the graph is called a *limaçon*, pronounced “LEE-ma-sohn,” which is a French word for snail. Limaçons come with and without inner loops.

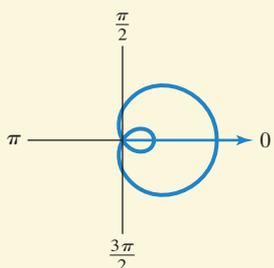

### Limaçons

The graphs of

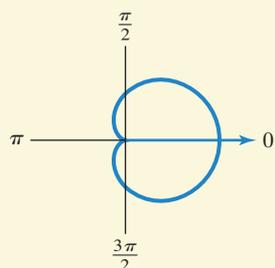

$$\begin{aligned} r &= a + b \sin \theta, & r &= a - b \sin \theta, \\ r &= a + b \cos \theta, & r &= a - b \cos \theta, \end{aligned} \quad a > 0, b > 0$$

are called **limaçons**. The ratio  $\frac{a}{b}$  determines a limaçon's shape.

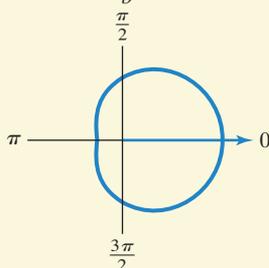

Inner loop if  $\frac{a}{b} < 1$

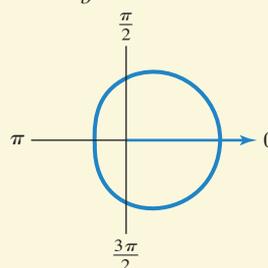

Heart-shaped if  $\frac{a}{b} = 1$  and called cardioids

Dimpled with no inner loop if  $1 < \frac{a}{b} < 2$

No dimple and no inner loop if  $\frac{a}{b} \geq 2$

**Check Point 3** Graph the polar equation:  $r = 1 - 2 \sin \theta$ .

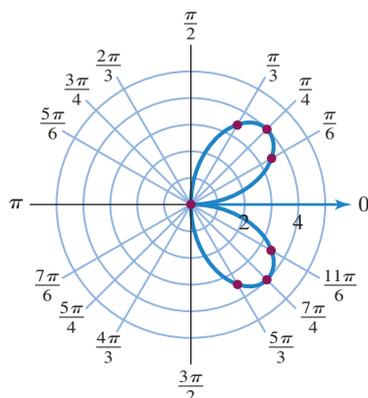

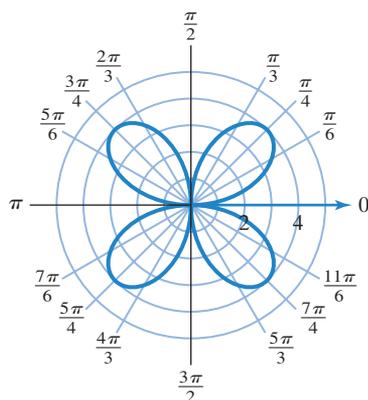

**EXAMPLE 4** Graphing a Polar Equation

 Graph the polar equation:  $r = 4 \sin 2\theta$ .

**SOLUTION**

We first check for symmetry.

$$r = 4 \sin 2\theta$$

**FIGURE 6.35** The graph of  $r = 4 \sin 2\theta$  for  $0 \leq \theta \leq \pi$ 

**FIGURE 6.36** The graph of  $r = 4 \sin 2\theta$  for  $0 \leq \theta \leq 2\pi$ 

Polar Axis	The Line $\theta = \frac{\pi}{2}$	The Pole
Replace $\theta$ with $-\theta$ . $r = 4 \sin 2(-\theta)$ $r = 4 \sin (-2\theta)$ $r = -4 \sin 2\theta$ Equation changes and fails this symmetry test.	Replace $(r, \theta)$ with $(-r, -\theta)$ . $-r = 4 \sin 2(-\theta)$ $-r = 4 \sin (-2\theta)$ $-r = -4 \sin 2\theta$ $r = 4 \sin 2\theta$ Equation does not change.	Replace $r$ with $-r$ . $-r = 4 \sin 2\theta$ $r = -4 \sin 2\theta$ Equation changes and fails this symmetry test.

Thus, we can be sure that the graph is symmetric with respect to  $\theta = \frac{\pi}{2}$ . The graph may or may not be symmetric with respect to the polar axis or the pole.

Now we are ready to graph  $r = 4 \sin 2\theta$ . In **Figure 6.35**, we plot points on the graph of  $r = 4 \sin 2\theta$  using values of  $\theta$  from 0 to  $\pi$  and the corresponding values of  $r$ . These coordinates are shown in the table below.

$\theta$	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	$\pi$
$r$	0	3.46	4	3.46	0	-3.46	-4	-3.46	0

Now we can use symmetry with respect to the line  $\theta = \frac{\pi}{2}$  (the y-axis) to complete the graph. By reflecting the graph in **Figure 6.35** about the y-axis, we obtain the complete graph of  $r = 4 \sin 2\theta$  from 0 to  $2\pi$ . The graph is shown in **Figure 6.36**.

Although the polar equation  $r = 4 \sin 2\theta$  failed the tests for symmetry with respect to the polar axis (the x-axis) and the pole (the origin), its graph in **Figure 6.36** reveals all three types of symmetry. ●●●

The curve in **Figure 6.36** is called a **rose with four petals**. We can use a trigonometric equation to confirm the four angles that give the location of the petal points. The petal points of  $r = 4 \sin 2\theta$  are located at values of  $\theta$  for which  $r = 4$  or  $r = -4$ .

$4 \sin 2\theta = 4$	or	$4 \sin 2\theta = -4$	Use $r = 4 \sin 2\theta$ and set $r$ equal to 4 or -4.
$\sin 2\theta = 1$		$\sin 2\theta = -1$	Divide both sides by 4.
$2\theta = \frac{\pi}{2} + 2n\pi$		$2\theta = \frac{3\pi}{2} + 2n\pi$	Solve for $2\theta$ , where $n$ is any integer.
$\theta = \frac{\pi}{4} + n\pi$		$\theta = \frac{3\pi}{4} + n\pi$	Divide both sides by 2 and solve for $\theta$ .
If $n = 0$ , $\theta = \frac{\pi}{4}$ .		If $n = 0$ , $\theta = \frac{3\pi}{4}$ .	
If $n = 1$ , $\theta = \frac{5\pi}{4}$ .		If $n = 1$ , $\theta = \frac{7\pi}{4}$ .	

**Figure 6.36** confirms that the four angles giving the locations of the petal points are  $\frac{\pi}{4}$ ,  $\frac{3\pi}{4}$ ,  $\frac{5\pi}{4}$ , and  $\frac{7\pi}{4}$ .

## TECHNOLOGY

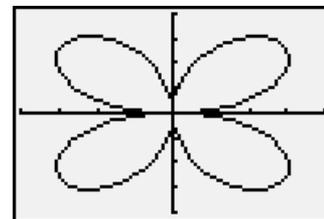

The graph of

$$r = 4 \sin 2\theta$$

was obtained using a  $[-4, 4, 1]$  by  $[-4, 4, 1]$  viewing rectangle and

$$\theta \text{ min} = 0, \quad \theta \text{ max} = 2\pi,$$

$$\theta \text{ step} = \frac{\pi}{48}.$$

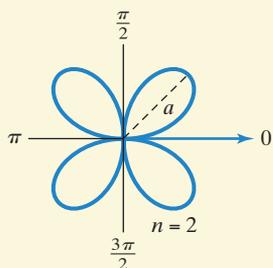

## Rose Curves

The graphs of

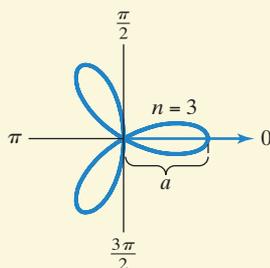

$$r = a \sin n\theta \quad \text{and} \quad r = a \cos n\theta, \quad a \neq 0,$$

are called **rose curves**. If  $n$  is even, the rose has  $2n$  petals. If  $n$  is odd, the rose has  $n$  petals.

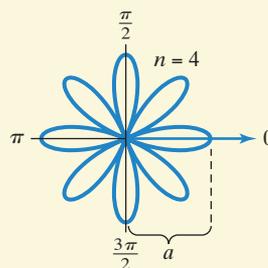

$r = a \sin 2\theta$   
Rose curve with 4 petals

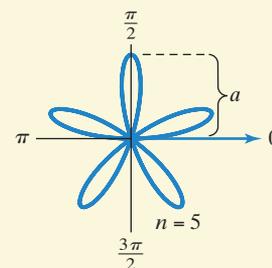

$r = a \cos 3\theta$   
Rose curve with 3 petals

$r = a \cos 4\theta$   
Rose curve with 8 petals

$r = a \sin 5\theta$   
Rose curve with 5 petals

**Check Point 4** Graph the polar equation:  $r = 3 \cos 2\theta$ .

## EXAMPLE 5 Graphing a Polar Equation

Graph the polar equation:  $r^2 = 4 \sin 2\theta$ .

## SOLUTION

We first check for symmetry.

$$r^2 = 4 \sin 2\theta$$

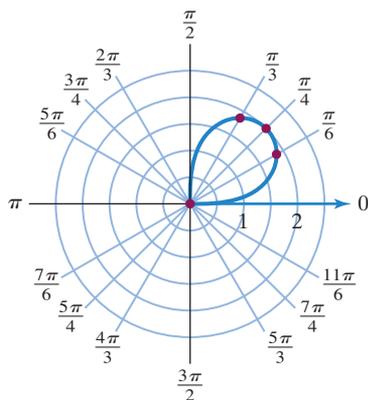

Polar Axis	The Line $\theta = \frac{\pi}{2}$	The Pole
Replace $\theta$ with $-\theta$ . $r^2 = 4 \sin 2(-\theta)$ $r^2 = 4 \sin (-2\theta)$ $r^2 = -4 \sin 2\theta$ Equation changes and fails this symmetry test.	Replace $(r, \theta)$ with $(-r, -\theta)$ . $(-r)^2 = 4 \sin 2(-\theta)$ $r^2 = 4 \sin (-2\theta)$ $r^2 = -4 \sin 2\theta$ Equation changes and fails this symmetry test.	Replace $r$ with $-r$ . $(-r)^2 = 4 \sin 2\theta$ $r^2 = 4 \sin 2\theta$ Equation does not change.

Thus, we can be sure that the graph is symmetric with respect to the pole. The graph may or may not be symmetric with respect to the polar axis or the line  $\theta = \frac{\pi}{2}$ .

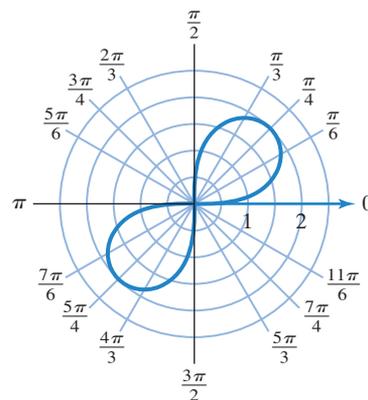

Now we are ready to graph  $r^2 = 4 \sin 2\theta$ . In **Figure 6.37(a)**, we plot points on the graph by using values of  $\theta$  from 0 to  $\frac{\pi}{2}$  and the corresponding values of  $r$ . These coordinates are shown in the table to the left of **Figure 6.37(a)**. Notice that the points in **Figure 6.37(a)** are shown for  $r \geq 0$ . Because the graph is symmetric with respect to the pole, we can reflect the graph in **Figure 6.37(a)** about the pole and obtain the graph in **Figure 6.37(b)**.

$\theta$	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$
$r$	0	$\pm 1.9$	$\pm 2$	$\pm 1.9$	0

(a) The graph of  $r^2 = 4 \sin 2\theta$  for  $0 \leq \theta \leq \frac{\pi}{2}$  and  $r \geq 0$

(b) Using symmetry with respect to the pole on the graph of  $r^2 = 4 \sin 2\theta$

FIGURE 6.37 Graphing  $r^2 = 4 \sin 2\theta$

Does **Figure 6.37(b)** show a complete graph of  $r^2 = 4 \sin 2\theta$  or do we need to continue graphing for angles greater than  $\frac{\pi}{2}$ ? If  $\theta$  is in quadrant II,  $2\theta$  is in quadrant III or IV, where  $\sin 2\theta$  is negative. Thus,  $4 \sin 2\theta$  is negative. However,  $r^2 = 4 \sin 2\theta$  and  $r^2$  cannot be negative. The same observation applies to quadrant IV. This means that there are no points on the graph in quadrants II or IV. Thus, **Figure 6.37(b)** shows the complete graph of  $r^2 = 4 \sin 2\theta$ . ●●●

The curve in **Figure 6.37(b)** is shaped like a propeller and is called a *lemniscate*.

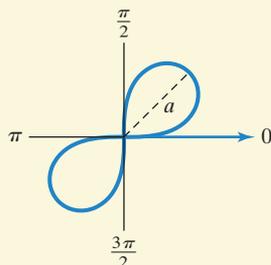

### Lemniscates

The graphs of

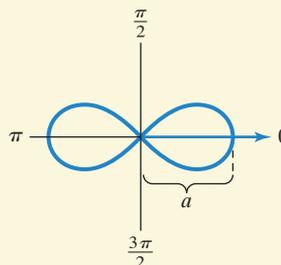

$$r^2 = a^2 \sin 2\theta \quad \text{and} \quad r^2 = a^2 \cos 2\theta, \quad a \neq 0$$

are called **lemniscates**.

$r^2 = a^2 \sin 2\theta$  is symmetric with respect to the pole.

$r^2 = a^2 \cos 2\theta$  is symmetric with respect to the polar axis,  $\theta = \frac{\pi}{2}$ , and the pole.

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- One method for graphing a polar equation is the point-plotting method. We substitute convenient values of \_\_\_\_\_ into the equation and then determine the values for \_\_\_\_\_.
- In polar coordinates, the graphs of  $r = a \cos \theta$  and  $r = a \sin \theta$  are \_\_\_\_\_.
- To test whether the graph of a polar equation may be symmetric with respect to the polar axis ( $x$ -axis), replace \_\_\_\_\_ with \_\_\_\_\_.
- To test whether the graph of a polar equation may be symmetric with respect to the line  $\theta = \frac{\pi}{2}$  ( $y$ -axis), replace \_\_\_\_\_ with \_\_\_\_\_.
- To test whether the graph of a polar equation may be symmetric with respect to the pole (origin), replace \_\_\_\_\_ with \_\_\_\_\_.
- True or false: The graph of a polar equation may have symmetry even if it fails a test for that particular symmetry. \_\_\_\_\_
- The graphs of  $r = a + b \sin \theta$ ,  $r = a - b \sin \theta$ ,  $r = a + b \cos \theta$ , and  $r = a - b \cos \theta$ ,  $a > 0$ ,  $b > 0$ , are called \_\_\_\_\_, a French word for snail. The ratio  $\frac{a}{b}$  determines the graph's shape. If  $\frac{a}{b} = 1$ , the graph is shaped like a heart and called a/an \_\_\_\_\_. If  $\frac{a}{b} < 1$ , the graph has an inner \_\_\_\_\_.
- The graphs of  $r = a \sin n\theta$  and  $r = a \cos n\theta$ ,  $a \neq 0$ , are called rose curves. If  $n$  is even, the rose has \_\_\_\_\_ petals. If  $n$  is odd, the rose has \_\_\_\_\_ petals.
- The graphs of  $r^2 = a^2 \sin 2\theta$  and  $r^2 = a^2 \cos 2\theta$ ,  $a \neq 0$ , are shaped like propellers and called \_\_\_\_\_. The graph of  $r^2 = a^2 \sin 2\theta$  is symmetric with respect to the \_\_\_\_\_. The graph of  $r^2 = a^2 \cos 2\theta$  is symmetric with respect to the \_\_\_\_\_, the \_\_\_\_\_, and \_\_\_\_\_.

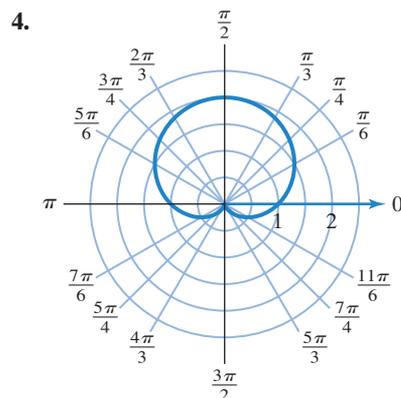

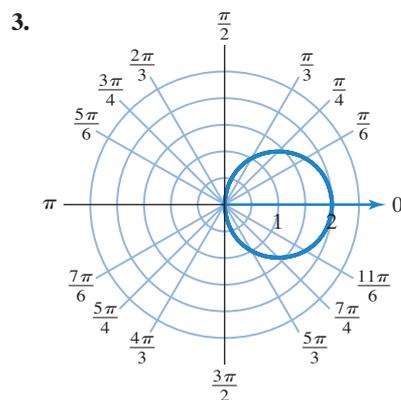

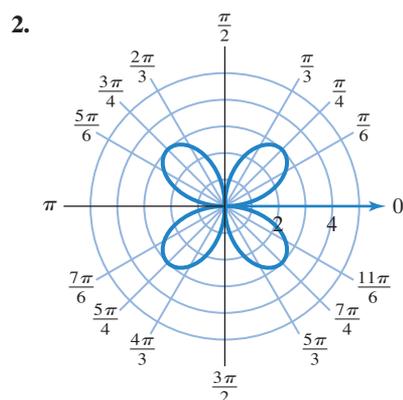

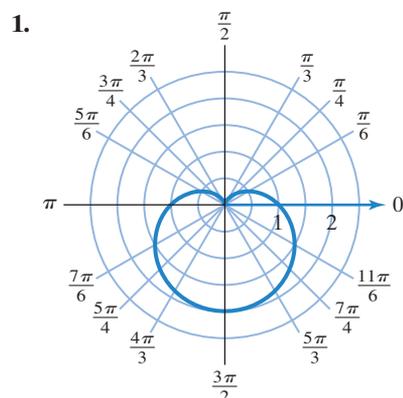

## EXERCISE SET 6.4

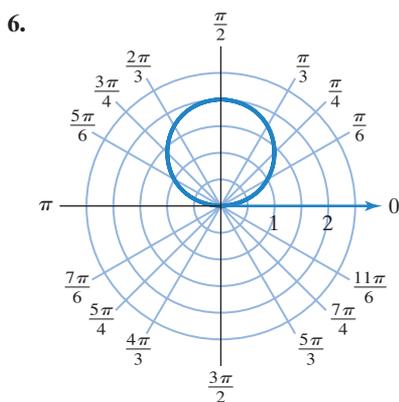

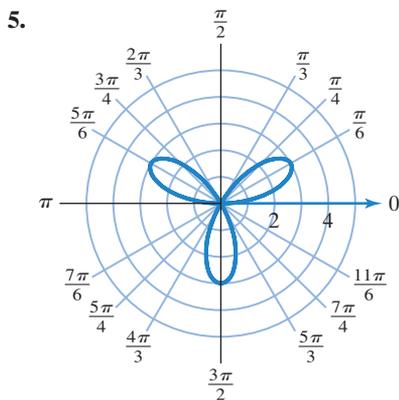

### Practice Exercises

In Exercises 1–6, the graph of a polar equation is given. Select the polar equation for each graph from the following options.

$$r = 2 \sin \theta, \quad r = 2 \cos \theta, \quad r = 1 + \sin \theta,$$

$$r = 1 - \sin \theta, \quad r = 3 \sin 2\theta, \quad r = 3 \sin 3\theta$$

In Exercises 7–12, test for symmetry with respect to

- a. the polar axis.    b. the line  $\theta = \frac{\pi}{2}$ .    c. the pole.

7.  $r = \sin \theta$                       8.  $r = \cos \theta$   
 9.  $r = 4 + 3 \cos \theta$             10.  $r = 2 \cos 2\theta$   
 11.  $r^2 = 16 \cos 2\theta$             12.  $r^2 = 16 \sin 2\theta$

In Exercises 13–34, test for symmetry and then graph each polar equation.

13.  $r = 2 \cos \theta$                     14.  $r = 2 \sin \theta$   
 15.  $r = 1 - \sin \theta$                 16.  $r = 1 + \sin \theta$   
 17.  $r = 2 + 2 \cos \theta$             18.  $r = 2 - 2 \cos \theta$   
 19.  $r = 2 + \cos \theta$                 20.  $r = 2 - \sin \theta$   
 21.  $r = 1 + 2 \cos \theta$             22.  $r = 1 - 2 \cos \theta$   
 23.  $r = 2 - 3 \sin \theta$             24.  $r = 2 + 4 \sin \theta$   
 25.  $r = 2 \cos 2\theta$                 26.  $r = 2 \sin 2\theta$   
 27.  $r = 4 \sin 3\theta$                 28.  $r = 4 \cos 3\theta$   
 29.  $r^2 = 9 \cos 2\theta$                 30.  $r^2 = 9 \sin 2\theta$   
 31.  $r = 1 - 3 \sin \theta$             32.  $r = 3 + \sin \theta$   
 33.  $r \cos \theta = -3$                 34.  $r \sin \theta = 2$

### Practice Plus

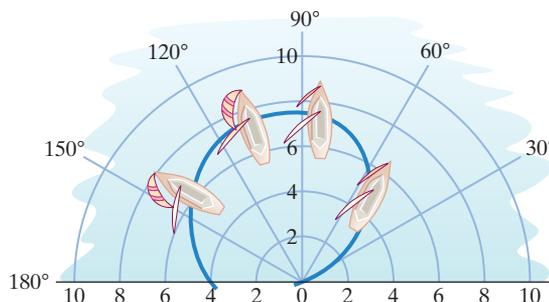

In Exercises 35–44, test for symmetry and then graph each polar equation.

35.  $r = \cos \frac{\theta}{2}$   
 36.  $r = \sin \frac{\theta}{2}$   
 37.  $r = \sin \theta + \cos \theta$

38.  $r = 4 \cos \theta + 4 \sin \theta$   
 39.  $r = \frac{1}{1 - \cos \theta}$   
 40.  $r = \frac{2}{1 - \cos \theta}$   
 41.  $r = \sin \theta \cos^2 \theta$   
 42.  $r = \frac{3 \sin 2\theta}{\sin^3 \theta + \cos^3 \theta}$   
 43.  $r = 2 + 3 \sin 2\theta$   
 44.  $r = 2 - 4 \cos 2\theta$

### Application Exercises

In Exercise Set 6.3, we considered an application in which sailboat racers look for a sailing angle to a 10-knot wind that produces maximum sailing speed. This situation is now represented by the polar graph in the figure shown. Each point  $(r, \theta)$  on the graph gives the sailing speed,  $r$ , in knots, at an angle  $\theta$  to the 10-knot wind. Use this information to solve Exercises 45–49.

45. What is the speed, to the nearest knot, of a sailboat sailing at a  $60^\circ$  angle to the wind?  
 46. What is the speed, to the nearest knot, of a sailboat sailing at a  $120^\circ$  angle to the wind?  
 47. What is the speed, to the nearest knot, of a sailboat sailing at a  $90^\circ$  angle to the wind?  
 48. What is the speed, to the nearest knot, of a sailboat sailing at a  $180^\circ$  angle to the wind?  
 49. What angle to the wind produces the maximum sailing speed? What is the speed? Round the angle to the nearest five degrees and the speed to the nearest half knot.

### Writing in Mathematics

50. What is a polar equation?  
 51. What is the graph of a polar equation?  
 52. Describe how to graph a polar equation.  
 53. Describe the test for symmetry with respect to the polar axis.  
 54. Describe the test for symmetry with respect to the line  $\theta = \frac{\pi}{2}$ .  
 55. Describe the test for symmetry with respect to the pole.  
 56. If an equation fails the test for symmetry with respect to the polar axis, what can you conclude?

## Technology Exercises

Use the polar mode of a graphing utility with angle measure in radians to solve Exercises 57–88. Unless otherwise indicated, use  $\theta \min = 0$ ,  $\theta \max = 2\pi$ , and  $\theta \text{ step} = \frac{\pi}{48}$ . If you are not pleased with the quality of the graph, experiment with smaller values for  $\theta \text{ step}$ . However, if  $\theta \text{ step}$  is extremely small, it can take your graphing utility a long period of time to complete the graph.

57. Use a graphing utility to verify any six of your hand-drawn graphs in Exercises 13–34.

In Exercises 58–75, use a graphing utility to graph the polar equation.

- |   |   |
|---|---|
| 58. $r = 4 \cos 5\theta$                            | 59. $r = 4 \sin 5\theta$                            |
| 60. $r = 4 \cos 6\theta$                            | 61. $r = 4 \sin 6\theta$                            |
| 62. $r = 2 + 2 \cos \theta$                         | 63. $r = 2 + 2 \sin \theta$                         |
| 64. $r = 4 + 2 \cos \theta$                         | 65. $r = 4 + 2 \sin \theta$                         |
| 66. $r = 2 + 4 \cos \theta$                         | 67. $r = 2 + 4 \sin \theta$                         |
| 68. $r = \frac{3}{\sin \theta}$                     | 69. $r = \frac{3}{\cos \theta}$                     |
| 70. $r = \cos \frac{3}{2}\theta$                    | 71. $r = \cos \frac{5}{2}\theta$                    |
| 72. $r = 3 \sin\left(\theta + \frac{\pi}{4}\right)$ | 73. $r = 2 \cos\left(\theta - \frac{\pi}{4}\right)$ |
| 74. $r = \frac{1}{1 - \sin \theta}$                 | 75. $r = \frac{1}{3 - 2 \sin \theta}$               |

In Exercises 76–78, find the smallest interval for  $\theta$  starting with  $\theta \min = 0$  so that your graphing utility graphs the given polar equation exactly once without retracing any portion of it.

- |                            |                          |
|----------------------------|--------------------------|
| 76. $r = 4 \sin \theta$    | 77. $r = 4 \sin 2\theta$ |
| 78. $r^2 = 4 \sin 2\theta$ |                          |

In Exercises 79–82, use a graphing utility to graph each butterfly curve. Experiment with the range setting, particularly  $\theta \text{ step}$ , to produce a butterfly of the best possible quality.

79.  $r = \cos^2 5\theta + \sin 3\theta + 0.3$
80.  $r = \sin^4 4\theta + \cos 3\theta$
81.  $r = \sin^5 \theta + 8 \sin \theta \cos^3 \theta$
82.  $r = 1.5^{\sin \theta} - 2.5 \cos 4\theta + \sin^7 \frac{\theta}{15}$  (Use  $\theta \min = 0$  and  $\theta \max = 20\pi$ .)
83. Use a graphing utility to graph  $r = \sin n\theta$  for  $n = 1, 2, 3, 4, 5$ , and 6. Use a separate viewing screen for each of the six graphs. What is the pattern for the number of loops that occur corresponding to each value of  $n$ ? What is happening to the shape of the graphs as  $n$  increases? For each graph, what is the smallest interval for  $\theta$  so that the graph is traced only once?
84. Repeat Exercise 83 for  $r = \cos n\theta$ . Are your conclusions the same as they were in Exercise 83?

85. Use a graphing utility to graph  $r = 1 + 2 \sin n\theta$  for  $n = 1, 2, 3, 4, 5$ , and 6. Use a separate viewing screen for each of the six graphs. What is the pattern for the number of large and small petals that occur corresponding to each value of  $n$ ? How are the large and small petals related when  $n$  is odd and when  $n$  is even?
86. Repeat Exercise 85 for  $r = 1 + 2 \cos n\theta$ . Are your conclusions the same as they were in Exercise 85?
87. Graph the spiral  $r = \theta$ . Use a  $[-30, 30, 1]$  by  $[-30, 30, 1]$  viewing rectangle. Let  $\theta \min = 0$  and  $\theta \max = 2\pi$ , then  $\theta \min = 0$  and  $\theta \max = 4\pi$ , and finally  $\theta \min = 0$  and  $\theta \max = 8\pi$ .
88. Graph the spiral  $r = \frac{1}{\theta}$ . Use a  $[-1, 1, 1]$  by  $[-1, 1, 1]$  viewing rectangle. Let  $\theta \min = 0$  and  $\theta \max = 2\pi$ , then  $\theta \min = 0$  and  $\theta \max = 4\pi$ , and finally  $\theta \min = 0$  and  $\theta \max = 8\pi$ .

## Critical Thinking Exercises

**Make Sense?** In Exercises 89–92, determine whether each statement makes sense or does not make sense, and explain your reasoning.

89. I'm working with a polar equation that failed the symmetry test with respect to  $\theta = \frac{\pi}{2}$ , so my graph will not have this kind of symmetry.
90. The graph of my limaçon exhibits none of the three kinds of symmetry discussed in this section.
91. There are no points on my graph of  $r^2 = 9 \cos 2\theta$  for which  $\frac{\pi}{4} < \theta < \frac{3\pi}{4}$ .
92. I'm graphing a polar equation in which for every value of  $\theta$  there is exactly one corresponding value of  $r$ , yet my polar coordinate graph fails the vertical line for functions.

In Exercises 93–94, graph  $r_1$  and  $r_2$  in the same polar coordinate system. What is the relationship between the two graphs?

93.  $r_1 = 4 \cos 2\theta$ ,  $r_2 = 4 \cos 2\left(\theta - \frac{\pi}{4}\right)$
94.  $r_1 = 2 \sin 3\theta$ ,  $r_2 = 2 \sin 3\left(\theta + \frac{\pi}{6}\right)$
95. Describe a test for symmetry with respect to the line  $\theta = \frac{\pi}{2}$  in which  $r$  is not replaced.

## Preview Exercises

Exercises 96–98 will help you prepare for the material covered in the next section. Refer to Section 2.1 if you need to review the basics of complex numbers. In each exercise, perform the indicated operation and write the result in the standard form  $a + bi$ .

96.  $(1 + i)(2 + 2i)$
97.  $(-1 + i\sqrt{3})(-1 + i\sqrt{3})(-1 + i\sqrt{3})$
98.  $\frac{2 + 2i}{1 + i}$

## CHAPTER 6

## Mid-Chapter Check Point

**WHAT YOU KNOW:** We learned to solve oblique triangles using the Law of Sines  $\left(\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}\right)$  and the Law of Cosines  $(a^2 = b^2 + c^2 - 2bc \cos A)$ . We applied the Law of Sines to SAA, ASA, and SSA (the ambiguous case) triangles. We applied the Law of Cosines to SAS and SSS triangles. We found areas of SAS triangles (area =  $\frac{1}{2}bc \sin A$ ) and SSS triangles (Heron's formula: area =  $\sqrt{s(s-a)(s-b)(s-c)}$ ,  $s$  is  $\frac{1}{2}$  the perimeter). We used the polar coordinate system to plot points and represented them in multiple ways. We used the relations between polar and rectangular coordinates

$$x = r \cos \theta, y = r \sin \theta, x^2 + y^2 = r^2, \tan \theta = \frac{y}{x}$$

to convert points and equations from one coordinate system to the other. Finally, we used point plotting and symmetry to graph polar equations.

*In Exercises 1–6, solve each triangle. Round lengths to the nearest tenth and angle measures to the nearest degree. If no triangle exists, state “no triangle.” If two triangles exist, solve each triangle.*

1.  $A = 32^\circ, B = 41^\circ, a = 20$     2.  $A = 42^\circ, a = 63, b = 57$   
 3.  $A = 65^\circ, a = 6, b = 7$     4.  $B = 110^\circ, a = 10, c = 16$   
 5.  $C = 42^\circ, a = 16, c = 13$     6.  $a = 5.0, b = 7.2, c = 10.1$

*In Exercises 7–8, find the area of the triangle having the given measurements. Round to the nearest square unit.*

7.  $C = 36^\circ, a = 5$  feet,  $b = 7$  feet  
 8.  $a = 7$  meters,  $b = 9$  meters,  $c = 12$  meters  
 9. Two trains leave a station on different tracks that make an angle of  $110^\circ$  with the station as vertex. The first train travels at an average rate of 50 miles per hour and the second train travels at an average rate of 40 miles per hour. How far apart, to the nearest tenth of a mile, are the trains after 2 hours?  
 10. Two fire-lookout stations are 16 miles apart, with station B directly east of station A. Both stations spot a fire on a mountain to the south. The bearing from station A to the fire is S56°E. The bearing from station B to the fire is S23°W. How far, to the nearest tenth of a mile, is the fire from station A?  
 11. A tree that is perpendicular to the ground sits on a straight line between two people located 420 feet apart. The angles of elevation from each person to the top of the tree measure  $50^\circ$  and  $66^\circ$ , respectively. How tall, to the nearest tenth of a foot, is the tree?

*In Exercises 12–15, convert the given coordinates to the indicated ordered pair.*

12.  $\left(-3, \frac{5\pi}{4}\right)$  to  $(x, y)$     13.  $\left(6, -\frac{\pi}{2}\right)$  to  $(x, y)$   
 14.  $(2, -2\sqrt{3})$  to  $(r, \theta)$     15.  $(-6, 0)$  to  $(r, \theta)$

*In Exercises 16–17, plot each point in polar coordinates. Then find another representation  $(r, \theta)$  of this point in which:*

a.  $r > 0, 2\pi < \theta < 4\pi$ .    b.  $r < 0, 0 < \theta < 2\pi$ .

c.  $r > 0, -2\pi < \theta < 0$ .

16.  $\left(4, \frac{3\pi}{4}\right)$     17.  $\left(\frac{5}{2}, \frac{\pi}{2}\right)$

*In Exercises 18–20, convert each rectangular equation to a polar equation that expresses  $r$  in terms of  $\theta$ .*

18.  $5x - y = 7$     19.  $y = -7$

20.  $(x + 1)^2 + y^2 = 1$

*In Exercises 21–25, convert each polar equation to a rectangular equation. Then use your knowledge of the rectangular equation to graph the polar equation in a polar coordinate system.*

21.  $r = 6$     22.  $\theta = \frac{\pi}{3}$   
 23.  $r = -3 \csc \theta$     24.  $r = -10 \cos \theta$   
 25.  $r = 4 \sin \theta \sec^2 \theta$

*In Exercises 26–27, test for symmetry with respect to*

a. the polar axis.    b. the line  $\theta = \frac{\pi}{2}$ .    c. the pole.

26.  $r = 1 - 4 \cos \theta$     27.  $r^2 = 4 \cos \theta$

*In Exercises 28–32, graph each polar equation. Be sure to test for symmetry.*

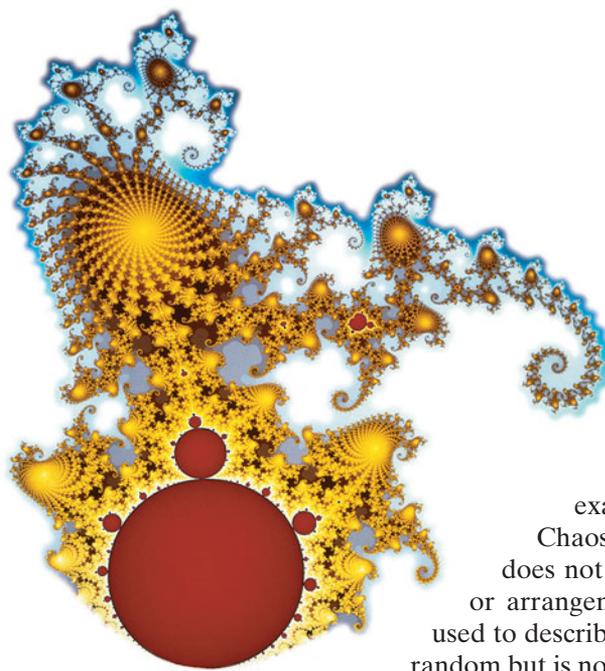

28.  $r = -4 \sin \theta$     29.  $r = 2 - 2 \cos \theta$   
 30.  $r = 2 - 4 \cos \theta$     31.  $r = 2 \sin 3\theta$   
 32.  $r^2 = 16 \sin 2\theta$

## SECTION 6.5

## Complex Numbers in Polar Form; DeMoivre's Theorem

*Objectives*

- 1 Plot complex numbers in the complex plane.
- 2 Find the absolute value of a complex number.
- 3 Write complex numbers in polar form.
- 4 Convert a complex number from polar to rectangular form.
- 5 Find products of complex numbers in polar form.
- 6 Find quotients of complex numbers in polar form.
- 7 Find powers of complex numbers in polar form.
- 8 Find roots of complex numbers in polar form.

A magnification of the Mandelbrot set

One of the new frontiers of mathematics suggests that there is an underlying order in things that appear to be random, such as the hiss and crackle of background noises as you tune a radio. Irregularities in the heartbeat, some of them severe enough to cause a heart attack, or irregularities in our sleeping patterns, such as insomnia, are examples of chaotic behavior.

Chaos in the mathematical sense does not mean a complete lack of form or arrangement. In mathematics, chaos is used to describe something that appears to be random but is not actually random. The patterns

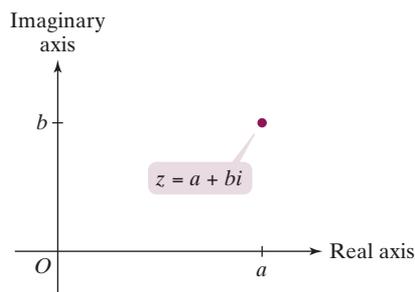

of chaos appear in images like the one shown here, called the Mandelbrot set. Magnified portions of this image yield repetitions of the original structure, as well as new and unexpected patterns. The Mandelbrot set transforms the hidden structure of chaotic events into a source of wonder and inspiration.

The Mandelbrot set is made possible by opening up graphing to include complex numbers in the form  $a + bi$ , where  $i = \sqrt{-1}$ . In this section, you will learn how to graph complex numbers and write them in terms of trigonometric functions.

- 1 Plot complex numbers in the complex plane.

**The Complex Plane**

We know that a real number can be represented as a point on a number line. By contrast, a complex number  $z = a + bi$  is represented as a point  $(a, b)$  in a coordinate plane, as shown in **Figure 6.38**. The horizontal axis of the coordinate plane is called the **real axis**. The vertical axis is called the **imaginary axis**. The coordinate system is called the **complex plane**. Every complex number corresponds to a point in the complex plane and every point in the complex plane corresponds to a complex number. When we represent a complex number as a point in the complex plane, we say that we are **plotting the complex number**.

**FIGURE 6.38** Plotting  $z = a + bi$  in the complex plane

**EXAMPLE 1** Plotting Complex Numbers

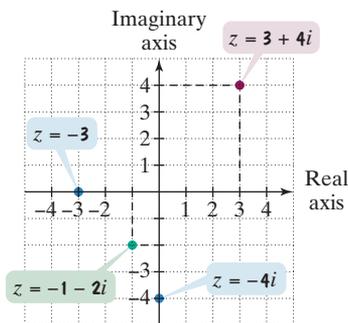

Plot each complex number in the complex plane:

- a.
- $z = 3 + 4i$
- b.
- $z = -1 - 2i$
- c.
- $z = -3$
- d.
- $z = -4i$

**SOLUTION**

 See **Figure 6.39**.

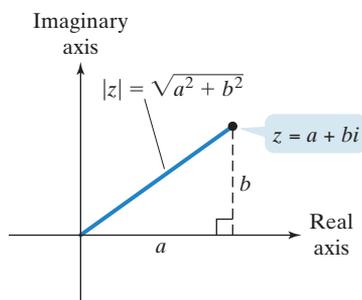

- We plot the complex number  $z = 3 + 4i$  the same way we plot  $(3, 4)$  in the rectangular coordinate system. We move three units to the right on the real axis and four units up parallel to the imaginary axis.
- The complex number  $z = -1 - 2i$  corresponds to the point  $(-1, -2)$  in the rectangular coordinate system. Plot the complex number by moving one unit to the left on the real axis and two units down parallel to the imaginary axis.
- Because  $z = -3 = -3 + 0i$ , this complex number corresponds to the point  $(-3, 0)$ . We plot  $-3$  by moving three units to the left on the real axis.
- Because  $z = -4i = 0 - 4i$ , this number corresponds to the point  $(0, -4)$ . We plot the complex number by moving four units down on the imaginary axis.

**FIGURE 6.39** Plotting complex numbers

 **Check Point 1** Plot each complex number in the complex plane:

- a.
- $z = 2 + 3i$
- b.
- $z = -3 - 5i$
- c.
- $z = -4$
- d.
- $z = -i$

- Find the absolute value of a complex number.

**FIGURE 6.40**

Recall that the absolute value of a real number is its distance from 0 on a number line. The **absolute value of the complex number**  $z = a + bi$ , denoted by  $|z|$ , is the distance from the origin to the point  $z$  in the complex plane. **Figure 6.40** illustrates that we can use the Pythagorean Theorem to represent  $|z|$  in terms of  $a$  and  $b$ :  $|z| = \sqrt{a^2 + b^2}$ .

**The Absolute Value of a Complex Number**

 The **absolute value** of the complex number  $a + bi$  is

$$|z| = |a + bi| = \sqrt{a^2 + b^2}.$$

**EXAMPLE 2** Finding the Absolute Value of a Complex Number

Determine the absolute value of each of the following complex numbers:

- a.
- $z = 3 + 4i$
- b.
- $z = -1 - 2i$

**SOLUTION**

- The absolute value of  $z = 3 + 4i$  is found using  $a = 3$  and  $b = 4$ .

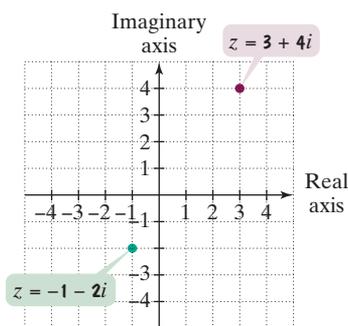

$$|z| = \sqrt{3^2 + 4^2} = \sqrt{9 + 16} = \sqrt{25} = 5 \quad \text{Use } |z| = \sqrt{a^2 + b^2} \text{ with } a = 3 \text{ and } b = 4.$$

Thus, the distance from the origin to the point  $z = 3 + 4i$ , shown in quadrant I in **Figure 6.41**, is five units.

- The absolute value of  $z = -1 - 2i$  is found using  $a = -1$  and  $b = -2$ .

$$|z| = \sqrt{(-1)^2 + (-2)^2} = \sqrt{1 + 4} = \sqrt{5} \quad \text{Use } |z| = \sqrt{a^2 + b^2} \text{ with } a = -1 \text{ and } b = -2.$$

Thus, the distance from the origin to the point  $z = -1 - 2i$ , shown in quadrant III in **Figure 6.41**, is  $\sqrt{5}$  units.

**FIGURE 6.41**

 **Check Point 2** Determine the absolute value of each of the following complex numbers:

a.  $z = 5 + 12i$

b.  $2 - 3i$ .

**3** Write complex numbers in polar form.

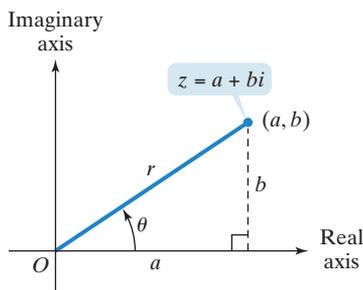

FIGURE 6.42

### Polar Form of a Complex Number

A complex number in the form  $z = a + bi$  is said to be in **rectangular form**. Suppose that its absolute value is  $r$ . In **Figure 6.42**, we let  $\theta$  be an angle in standard position whose terminal side passes through the point  $(a, b)$ . From the figure, we see that

$$r = \sqrt{a^2 + b^2}.$$

Likewise, according to the definitions of the trigonometric functions,

$$\cos \theta = \frac{a}{r} \qquad \sin \theta = \frac{b}{r} \qquad \tan \theta = \frac{b}{a}.$$

$$a = r \cos \theta$$

$$b = r \sin \theta$$

By substituting the expressions for  $a$  and  $b$  into  $z = a + bi$ , we write the complex number in terms of trigonometric functions.

$$z = a + bi = r \cos \theta + (r \sin \theta)i = r(\cos \theta + i \sin \theta)$$

$$a = r \cos \theta \text{ and } b = r \sin \theta.$$

Factor out  $r$  from each of the two previous terms.

The expression  $z = r(\cos \theta + i \sin \theta)$  is called the **polar form of a complex number**.

### Polar Form of a Complex Number

The complex number  $z = a + bi$  is written in **polar form** as

$$z = r(\cos \theta + i \sin \theta),$$

where  $a = r \cos \theta$ ,  $b = r \sin \theta$ ,  $r = \sqrt{a^2 + b^2}$ , and  $\tan \theta = \frac{b}{a}$ . The value of  $r$  is called the **modulus** (plural: moduli) of the complex number  $z$  and the angle  $\theta$  is called the **argument** of the complex number  $z$  with  $0 \leq \theta < 2\pi$ .

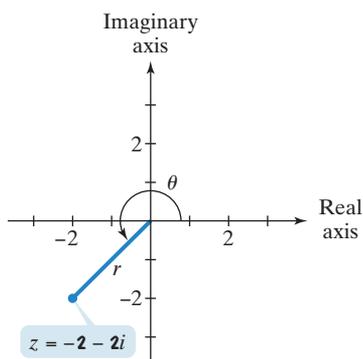

FIGURE 6.43 Plotting  $z = -2 - 2i$  and writing the number in polar form

### EXAMPLE 3 Writing a Complex Number in Polar Form

Plot  $z = -2 - 2i$  in the complex plane. Then write  $z$  in polar form.

#### SOLUTION

The complex number  $z = -2 - 2i$  is in rectangular form  $z = a + bi$ , with  $a = -2$  and  $b = -2$ . We plot the number by moving two units to the left on the real axis and two units down parallel to the imaginary axis, as shown in **Figure 6.43**.

By definition, the polar form of  $z$  is  $r(\cos \theta + i \sin \theta)$ . We need to determine the value for  $r$ , the modulus, and the value for  $\theta$ , the argument. **Figure 6.43** shows  $r$  and  $\theta$ . We use  $r = \sqrt{a^2 + b^2}$  with  $a = -2$  and  $b = -2$  to find  $r$ .

$$r = \sqrt{a^2 + b^2} = \sqrt{(-2)^2 + (-2)^2} = \sqrt{4 + 4} = \sqrt{8} = \sqrt{4 \cdot 2} = 2\sqrt{2}$$

We use  $\tan \theta = \frac{b}{a}$  with  $a = -2$  and  $b = -2$  to find  $\theta$ .

$$\tan \theta = \frac{b}{a} = \frac{-2}{-2} = 1$$

We know that  $\tan \frac{\pi}{4} = 1$ . **Figure 6.43** shows that the argument,  $\theta$ , satisfying  $\tan \theta = 1$  lies in quadrant III. Thus,

$$\theta = \pi + \frac{\pi}{4} = \frac{4\pi}{4} + \frac{\pi}{4} = \frac{5\pi}{4}.$$

We use  $r = 2\sqrt{2}$  and  $\theta = \frac{5\pi}{4}$  to write the polar form. The polar form of  $z = -2 - 2i$  is

$$z = r(\cos \theta + i \sin \theta) = 2\sqrt{2} \left( \cos \frac{5\pi}{4} + i \sin \frac{5\pi}{4} \right). \quad \dots$$

 **Check Point 3** Plot  $z = -1 - i\sqrt{3}$  in the complex plane. Then write  $z$  in polar form. Express the argument in radians. (We write  $-1 - i\sqrt{3}$ , rather than  $-1 - \sqrt{3}i$ , which could easily be confused with  $-1 - \sqrt{3}i$ .)

- 4 Convert a complex number from polar to rectangular form.

#### EXAMPLE 4 Writing a Complex Number in Rectangular Form

Write  $z = 2(\cos 60^\circ + i \sin 60^\circ)$  in rectangular form.

#### SOLUTION

The complex number  $z = 2(\cos 60^\circ + i \sin 60^\circ)$  is in polar form, with  $r = 2$  and  $\theta = 60^\circ$ . We use exact values for  $\cos 60^\circ$  and  $\sin 60^\circ$  to write the number in rectangular form.

$$2(\cos 60^\circ + i \sin 60^\circ) = 2 \left( \frac{1}{2} + i \frac{\sqrt{3}}{2} \right) = 1 + i\sqrt{3}$$

The rectangular form of  $z = 2(\cos 60^\circ + i \sin 60^\circ)$  is

$$z = 1 + i\sqrt{3}.$$

Write  $i$  before the radical to avoid confusion with  $\sqrt{3i}$ .

...

 **Check Point 4** Write  $z = 4(\cos 30^\circ + i \sin 30^\circ)$  in rectangular form.

- 5 Find products of complex numbers in polar form.

#### Products and Quotients in Polar Form

We can multiply and divide complex numbers fairly quickly if the numbers are expressed in polar form.

##### Product of Two Complex Numbers in Polar Form

Let  $z_1 = r_1(\cos \theta_1 + i \sin \theta_1)$  and  $z_2 = r_2(\cos \theta_2 + i \sin \theta_2)$  be two complex numbers in polar form. Their product,  $z_1 z_2$ , is

$$z_1 z_2 = r_1 r_2 [\cos(\theta_1 + \theta_2) + i \sin(\theta_1 + \theta_2)].$$

To multiply two complex numbers, multiply moduli and add arguments.

To prove that  $z_1 z_2 = r_1 r_2 [\cos(\theta_1 + \theta_2) + i \sin(\theta_1 + \theta_2)]$  we begin by multiplying  $z_1$  and  $z_2$  using the FOIL method. Then we simplify the product using the sum formulas for sine and cosine.

$$\begin{aligned}
 z_1 z_2 &= [r_1(\cos \theta_1 + i \sin \theta_1)][r_2(\cos \theta_2 + i \sin \theta_2)] \\
 &= r_1 r_2 (\cos \theta_1 + i \sin \theta_1)(\cos \theta_2 + i \sin \theta_2) && \text{Rearrange factors.} \\
 &= r_1 r_2 (\cos \theta_1 \cos \theta_2 + i \cos \theta_1 \sin \theta_2 + i \sin \theta_1 \cos \theta_2 + i^2 \sin \theta_1 \sin \theta_2) && \text{Use the FOIL method.} \\
 &= r_1 r_2 [\cos \theta_1 \cos \theta_2 + i(\cos \theta_1 \sin \theta_2 + \sin \theta_1 \cos \theta_2) + i^2 \sin \theta_1 \sin \theta_2] && \text{Factor } i \text{ from the second and third terms.} \\
 &= r_1 r_2 [\cos \theta_1 \cos \theta_2 + i(\cos \theta_1 \sin \theta_2 + \sin \theta_1 \cos \theta_2) - \sin \theta_1 \sin \theta_2] && i^2 = -1 \\
 &= r_1 r_2 [(\cos \theta_1 \cos \theta_2 - \sin \theta_1 \sin \theta_2) + i(\sin \theta_1 \cos \theta_2 + \cos \theta_1 \sin \theta_2)] && \text{Rearrange terms.} \\
 &= r_1 r_2 [\cos(\theta_1 + \theta_2) + i \sin(\theta_1 + \theta_2)] && \begin{array}{l} \text{This is } \cos(\theta_1 + \theta_2). \\ \text{This is } \sin(\theta_1 + \theta_2). \end{array}
 \end{aligned}$$

This result gives a rule for finding the product of two complex numbers in polar form. The two parts to the rule are shown in the following voice balloons.

$$z_1 z_2 = r_1 r_2 [\cos(\theta_1 + \theta_2) + i \sin(\theta_1 + \theta_2)]$$

Multiply moduli.
Add arguments.

### EXAMPLE 5 Finding Products of Complex Numbers in Polar Form

Find the product of the complex numbers. Leave the answer in polar form.

$$z_1 = 4(\cos 50^\circ + i \sin 50^\circ) \quad z_2 = 7(\cos 100^\circ + i \sin 100^\circ)$$

#### SOLUTION

$$\begin{aligned}
 z_1 z_2 &= [4(\cos 50^\circ + i \sin 50^\circ)][7(\cos 100^\circ + i \sin 100^\circ)] && \text{Form the product of the given numbers.} \\
 &= (4 \cdot 7)[\cos(50^\circ + 100^\circ) + i \sin(50^\circ + 100^\circ)] && \text{Multiply moduli and add arguments.} \\
 &= 28(\cos 150^\circ + i \sin 150^\circ) && \text{Simplify.} \quad \dots
 \end{aligned}$$

**Check Point 5** Find the product of the complex numbers. Leave the answer in polar form.

$$z_1 = 6(\cos 40^\circ + i \sin 40^\circ) \quad z_2 = 5(\cos 20^\circ + i \sin 20^\circ)$$

### 6 Find quotients of complex numbers in polar form.

Using algebraic methods for dividing complex numbers and the difference formulas for sine and cosine, we can obtain a rule for dividing complex numbers in polar form. The proof of this rule can be found in the appendix. You can derive the rule on your own by working Exercise 110 in this section's Exercise Set.

#### Quotient of Two Complex Numbers in Polar Form

Let  $z_1 = r_1(\cos \theta_1 + i \sin \theta_1)$  and  $z_2 = r_2(\cos \theta_2 + i \sin \theta_2)$  be two complex numbers in polar form. Their quotient,  $\frac{z_1}{z_2}$ , is

$$\frac{z_1}{z_2} = \frac{r_1}{r_2} [\cos(\theta_1 - \theta_2) + i \sin(\theta_1 - \theta_2)].$$

To divide two complex numbers, divide moduli and subtract arguments.

**EXAMPLE 6** Finding Quotients of Complex Numbers in Polar Form

Find the quotient  $\frac{z_1}{z_2}$  of the complex numbers. Leave the answer in polar form.

$$z_1 = 12\left(\cos \frac{3\pi}{4} + i \sin \frac{3\pi}{4}\right) \quad z_2 = 4\left(\cos \frac{\pi}{4} + i \sin \frac{\pi}{4}\right)$$

**SOLUTION**

$$\begin{aligned} \frac{z_1}{z_2} &= \frac{12\left(\cos \frac{3\pi}{4} + i \sin \frac{3\pi}{4}\right)}{4\left(\cos \frac{\pi}{4} + i \sin \frac{\pi}{4}\right)} && \text{Form the quotient of the given numbers.} \\ &= \frac{12}{4} \left[ \cos\left(\frac{3\pi}{4} - \frac{\pi}{4}\right) + i \sin\left(\frac{3\pi}{4} - \frac{\pi}{4}\right) \right] && \text{Divide moduli and subtract arguments.} \\ &= 3\left(\cos \frac{\pi}{2} + i \sin \frac{\pi}{2}\right) && \text{Simplify: } \frac{3\pi}{4} - \frac{\pi}{4} = \frac{2\pi}{4} = \frac{\pi}{2}. \quad \dots \end{aligned}$$

 **Check Point 6** Find the quotient  $\frac{z_1}{z_2}$  of the complex numbers. Leave the answer in polar form.

$$z_1 = 50\left(\cos \frac{4\pi}{3} + i \sin \frac{4\pi}{3}\right) \quad z_2 = 5\left(\cos \frac{\pi}{3} + i \sin \frac{\pi}{3}\right)$$

**7** Find powers of complex numbers in polar form.

**Powers of Complex Numbers in Polar Form**

We can use a formula to find powers of complex numbers if the complex numbers are expressed in polar form. This formula can be illustrated by repeatedly multiplying by  $r(\cos \theta + i \sin \theta)$ .

$$\begin{aligned} z &= r(\cos \theta + i \sin \theta) && \text{Start with } z. \\ z \cdot z &= r(\cos \theta + i \sin \theta)r(\cos \theta + i \sin \theta) && \text{Multiply } z \text{ by } z = r(\cos \theta + i \sin \theta). \\ z^2 &= r^2(\cos 2\theta + i \sin 2\theta) && \text{Multiply moduli: } r \cdot r = r^2. \text{ Add arguments: } \theta + \theta = 2\theta. \\ z^2 \cdot z &= r^2(\cos 2\theta + i \sin 2\theta)r(\cos \theta + i \sin \theta) && \text{Multiply } z^2 \text{ by } z = r(\cos \theta + i \sin \theta). \\ z^3 &= r^3(\cos 3\theta + i \sin 3\theta) && \text{Multiply moduli: } r^2 \cdot r = r^3. \text{ Add arguments: } 2\theta + \theta = 3\theta. \\ z^3 \cdot z &= r^3(\cos 3\theta + i \sin 3\theta)r(\cos \theta + i \sin \theta) && \text{Multiply } z^3 \text{ by } z = r(\cos \theta + i \sin \theta). \\ z^4 &= r^4(\cos 4\theta + i \sin 4\theta) && \text{Multiply moduli: } r^3 \cdot r = r^4. \text{ Add arguments: } 3\theta + \theta = 4\theta. \end{aligned}$$

Do you see a pattern forming? If  $n$  is a positive integer, it appears that  $z^n$  is obtained by raising the modulus to the  $n$ th power and multiplying the argument by  $n$ . The formula for the  $n$ th power of a complex number is known as **DeMoivre's Theorem** in honor of the French mathematician Abraham DeMoivre (1667–1754).

**DeMoivre's Theorem**

Let  $z = r(\cos \theta + i \sin \theta)$  be a complex number in polar form. If  $n$  is a positive integer, then  $z$  to the  $n$ th power,  $z^n$ , is

$$z^n = [r(\cos \theta + i \sin \theta)]^n = r^n(\cos n\theta + i \sin n\theta).$$

**EXAMPLE 7** Finding the Power of a Complex NumberFind  $[2(\cos 20^\circ + i \sin 20^\circ)]^6$ . Write the answer in rectangular form,  $a + bi$ .**SOLUTION**

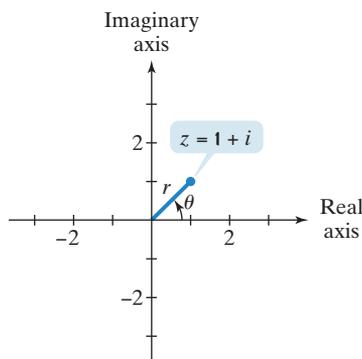

We begin by applying DeMoivre's Theorem.

$$\begin{aligned}
 & [2(\cos 20^\circ + i \sin 20^\circ)]^6 \\
 &= 2^6[\cos(6 \cdot 20^\circ) + i \sin(6 \cdot 20^\circ)] && \text{Raise the modulus to the 6th power} \\
 & && \text{and multiply the argument by 6.} \\
 &= 64(\cos 120^\circ + i \sin 120^\circ) && \text{Simplify.} \\
 &= 64\left(-\frac{1}{2} + i\frac{\sqrt{3}}{2}\right) && \text{Write the answer in rectangular form.} \\
 &= -32 + 32i\sqrt{3} && \text{Multiply and express the answer} \\
 & && \text{in } a + bi \text{ form.}
 \end{aligned}$$

 **Check Point 7** Find  $[2(\cos 30^\circ + i \sin 30^\circ)]^5$ . Write the answer in rectangular form.

**EXAMPLE 8** Finding the Power of a Complex NumberFind  $(1 + i)^8$  using DeMoivre's Theorem. Write the answer in rectangular form,  $a + bi$ .**SOLUTION**

DeMoivre's Theorem applies to complex numbers in polar form. Thus, we must first write  $1 + i$  in  $r(\cos \theta + i \sin \theta)$  form. Then we can use DeMoivre's Theorem. The complex number  $1 + i$  is plotted in **Figure 6.44**. From the figure, we obtain values for  $r$  and  $\theta$ .

**FIGURE 6.44** Plotting  $1 + i$  and writing the number in polar form

$$\begin{aligned}
 r &= \sqrt{a^2 + b^2} = \sqrt{1^2 + 1^2} = \sqrt{2} \\
 \tan \theta &= \frac{b}{a} = \frac{1}{1} = 1 \text{ and } \theta = \frac{\pi}{4} \text{ because } \theta \text{ lies in quadrant I.}
 \end{aligned}$$

Using these values,

$$1 + i = r(\cos \theta + i \sin \theta) = \sqrt{2}\left(\cos \frac{\pi}{4} + i \sin \frac{\pi}{4}\right).$$

Now we use DeMoivre's Theorem to raise  $1 + i$  to the 8th power.

$$\begin{aligned}
 & (1 + i)^8 \\
 &= \left[\sqrt{2}\left(\cos \frac{\pi}{4} + i \sin \frac{\pi}{4}\right)\right]^8 && \text{Work with the polar form of } 1 + i. \\
 &= (\sqrt{2})^8 \left[\cos\left(8 \cdot \frac{\pi}{4}\right) + i \sin\left(8 \cdot \frac{\pi}{4}\right)\right] && \text{Apply DeMoivre's Theorem. Raise the} \\
 & && \text{modulus to the 8th power and} \\
 & && \text{multiply the argument by 8.} \\
 &= 16(\cos 2\pi + i \sin 2\pi) && \text{Simplify: } (\sqrt{2})^8 = (2^{1/2})^8 = 2^4 = 16. \\
 &= 16(1 + 0i) && \cos 2\pi = 1 \text{ and } \sin 2\pi = 0. \\
 &= 16 \text{ or } 16 + 0i && \text{Simplify.}
 \end{aligned}$$

 **Check Point 8** Find  $(1 + i)^4$  using DeMoivre's Theorem. Write the answer in rectangular form.

**8** Find roots of complex numbers in polar form.

### Roots of Complex Numbers in Polar Form

In Example 7, we showed that

$$[2(\cos 20^\circ + i \sin 20^\circ)]^6 = 64(\cos 120^\circ + i \sin 120^\circ).$$

We say that  $2(\cos 20^\circ + i \sin 20^\circ)$  is a **complex sixth root** of  $64(\cos 120^\circ + i \sin 120^\circ)$ . It is one of six distinct complex sixth roots of  $64(\cos 120^\circ + i \sin 120^\circ)$ .

In general, if a complex number  $z$  satisfies the equation

$$z^n = w,$$

we say that  $z$  is a **complex  $n$ th root** of  $w$ . It is one of  $n$  distinct  $n$ th complex roots that can be found using the following theorem:

#### DeMoivre's Theorem for Finding Complex Roots

Let  $w = r(\cos \theta + i \sin \theta)$  be a complex number in polar form. If  $w \neq 0$ ,  $w$  has  $n$  distinct complex  $n$ th roots given by the formula

$$z_k = \sqrt[n]{r} \left[ \cos \left( \frac{\theta + 2\pi k}{n} \right) + i \sin \left( \frac{\theta + 2\pi k}{n} \right) \right] \quad (\text{radians})$$

$$\text{or } z_k = \sqrt[n]{r} \left[ \cos \left( \frac{\theta + 360^\circ k}{n} \right) + i \sin \left( \frac{\theta + 360^\circ k}{n} \right) \right] \quad (\text{degrees}),$$

where  $k = 0, 1, 2, \dots, n - 1$ .

By raising the radian or degree formula for  $z_k$  to the  $n$ th power, you can use DeMoivre's Theorem for powers to show that  $z_k^n = w$ . Thus, each  $z_k$  is a complex  $n$ th root of  $w$ .

DeMoivre's Theorem for finding complex roots states that every complex number has two distinct complex square roots, three distinct complex cube roots, four distinct complex fourth roots, and so on. Each root has the same modulus,  $\sqrt[n]{r}$ . Successive roots have arguments that differ by the same amount,  $\frac{2\pi}{n}$  or  $\frac{360^\circ}{n}$ . This means that if you plot all the complex roots of any number, they will be equally spaced on a circle centered at the origin, with radius  $\sqrt[n]{r}$ .

#### EXAMPLE 9 Finding the Roots of a Complex Number

Find all the complex fourth roots of  $16(\cos 120^\circ + i \sin 120^\circ)$ . Write roots in polar form, with  $\theta$  in degrees.

#### SOLUTION

There are exactly four fourth roots of the given complex number. From DeMoivre's Theorem for finding complex roots, the fourth roots of  $16(\cos 120^\circ + i \sin 120^\circ)$  are

$$z_k = \sqrt[4]{16} \left[ \cos \left( \frac{120^\circ + 360^\circ k}{4} \right) + i \sin \left( \frac{120^\circ + 360^\circ k}{4} \right) \right], \quad k = 0, 1, 2, 3.$$

Use  $z_k = \sqrt[n]{r} \left[ \cos \left( \frac{\theta + 360^\circ k}{n} \right) + i \sin \left( \frac{\theta + 360^\circ k}{n} \right) \right]$ .  
In  $16(\cos 120^\circ + i \sin 120^\circ)$ ,  $r = 16$  and  $\theta = 120^\circ$ .  
Because we are finding fourth roots,  $n = 4$ .

The four fourth roots are found by substituting 0, 1, 2, and 3 for  $k$  in the expression for  $z_k$ , repeated in the margin. Thus, the four complex fourth roots are as follows:

$$z_k = \sqrt[4]{16} \left[ \cos \left( \frac{120^\circ + 360^\circ k}{4} \right) + i \sin \left( \frac{120^\circ + 360^\circ k}{4} \right) \right] \quad z_0 = \sqrt[4]{16} \left[ \cos \left( \frac{120^\circ + 360^\circ \cdot 0}{4} \right) + i \sin \left( \frac{120^\circ + 360^\circ \cdot 0}{4} \right) \right]$$

The formula for the four fourth roots of  $16(\cos 120^\circ + i \sin 120^\circ)$ ,  $k = 0, 1, 2, 3$  (repeated)

$$= \sqrt[4]{16} \left( \cos \frac{120^\circ}{4} + i \sin \frac{120^\circ}{4} \right) = 2(\cos 30^\circ + i \sin 30^\circ)$$

$$z_1 = \sqrt[4]{16} \left[ \cos \left( \frac{120^\circ + 360^\circ \cdot 1}{4} \right) + i \sin \left( \frac{120^\circ + 360^\circ \cdot 1}{4} \right) \right]$$

$$= \sqrt[4]{16} \left( \cos \frac{480^\circ}{4} + i \sin \frac{480^\circ}{4} \right) = 2(\cos 120^\circ + i \sin 120^\circ)$$

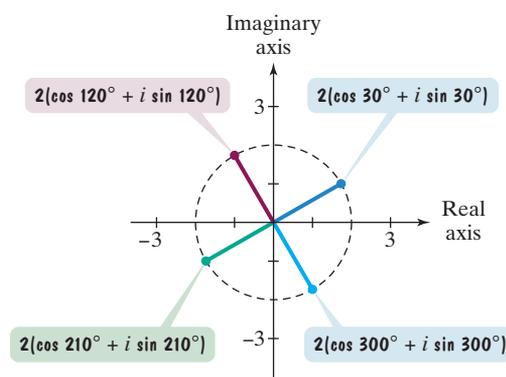

$$z_2 = \sqrt[4]{16} \left[ \cos \left( \frac{120^\circ + 360^\circ \cdot 2}{4} \right) + i \sin \left( \frac{120^\circ + 360^\circ \cdot 2}{4} \right) \right]$$

$$= \sqrt[4]{16} \left( \cos \frac{840^\circ}{4} + i \sin \frac{840^\circ}{4} \right) = 2(\cos 210^\circ + i \sin 210^\circ)$$

$$z_3 = \sqrt[4]{16} \left[ \cos \left( \frac{120^\circ + 360^\circ \cdot 3}{4} \right) + i \sin \left( \frac{120^\circ + 360^\circ \cdot 3}{4} \right) \right]$$

$$= \sqrt[4]{16} \left( \cos \frac{1200^\circ}{4} + i \sin \frac{1200^\circ}{4} \right) = 2(\cos 300^\circ + i \sin 300^\circ). \quad \dots$$

In **Figure 6.45**, we have plotted each of the four fourth roots of  $16(\cos 120^\circ + i \sin 120^\circ)$ . Notice that they are equally spaced at  $90^\circ$  intervals on a circle with radius 2.

**FIGURE 6.45** Plotting the four fourth roots of  $16(\cos 120^\circ + i \sin 120^\circ)$

 **Check Point 9** Find all the complex fourth roots of  $16(\cos 60^\circ + i \sin 60^\circ)$ . Write roots in polar form, with  $\theta$  in degrees.

### EXAMPLE 10 Finding the Roots of a Complex Number

Find all the cube roots of 8. Write roots in rectangular form.

#### SOLUTION

DeMoivre's Theorem for roots applies to complex numbers in polar form. Thus, we will first write 8, or  $8 + 0i$ , in polar form. We express  $\theta$  in radians, although degrees could also be used.

$$8 = r(\cos \theta + i \sin \theta) = 8(\cos 0 + i \sin 0)$$

There are exactly three cube roots of 8. From DeMoivre's Theorem for finding complex roots, the cube roots of 8 are

$$z_k = \sqrt[3]{8} \left[ \cos\left(\frac{0 + 2\pi k}{3}\right) + i \sin\left(\frac{0 + 2\pi k}{3}\right) \right], \quad k = 0, 1, 2.$$

Use  $z_k = \sqrt[n]{r} \left[ \cos\left(\frac{\theta + 2\pi k}{n}\right) + i \sin\left(\frac{\theta + 2\pi k}{n}\right) \right]$ .  
 In  $8(\cos 0 + i \sin 0)$ ,  $r = 8$  and  $\theta = 0$ .  
 Because we are finding cube roots,  $n = 3$ .

The three cube roots of 8 are found by substituting 0, 1, and 2 for  $k$  in the expression for  $z_k$  above the voice balloon. Thus, the three cube roots of 8 are

$$z_0 = \sqrt[3]{8} \left[ \cos\left(\frac{0 + 2\pi \cdot 0}{3}\right) + i \sin\left(\frac{0 + 2\pi \cdot 0}{3}\right) \right]$$

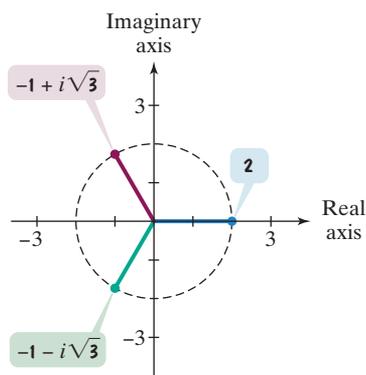

$$= 2(\cos 0 + i \sin 0) = 2(1 + i \cdot 0) = 2$$

$$z_1 = \sqrt[3]{8} \left[ \cos\left(\frac{0 + 2\pi \cdot 1}{3}\right) + i \sin\left(\frac{0 + 2\pi \cdot 1}{3}\right) \right]$$

$$= 2 \left( \cos \frac{2\pi}{3} + i \sin \frac{2\pi}{3} \right) = 2 \left( -\frac{1}{2} + i \cdot \frac{\sqrt{3}}{2} \right) = -1 + i\sqrt{3}$$

$$z_2 = \sqrt[3]{8} \left[ \cos\left(\frac{0 + 2\pi \cdot 2}{3}\right) + i \sin\left(\frac{0 + 2\pi \cdot 2}{3}\right) \right]$$

$$= 2 \left( \cos \frac{4\pi}{3} + i \sin \frac{4\pi}{3} \right) = 2 \left( -\frac{1}{2} + i \cdot \left( -\frac{\sqrt{3}}{2} \right) \right) = -1 - i\sqrt{3}$$

**FIGURE 6.46** The three cube roots of 8 are equally spaced at intervals of  $\frac{2\pi}{3}$  on a circle with radius 2.

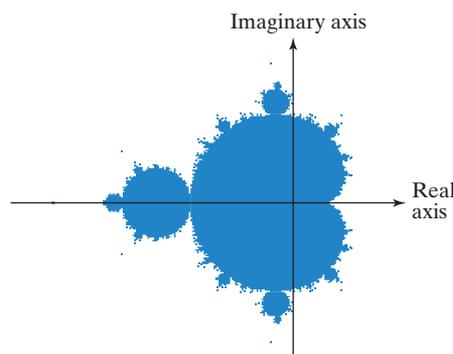

### DISCOVERY

Use DeMoivre's Theorem to cube  $-1 + i\sqrt{3}$  or  $-1 - i\sqrt{3}$  and obtain 8.

The three cube roots of 8 are plotted in **Figure 6.46**. ...

**Check Point 10** Find all the cube roots of 27. Write roots in rectangular form.

### Blitzer Bonus || The Mandelbrot Set

**FIGURE 6.47**

The set of all complex numbers for which the sequence

$$z, z^2 + z, (z^2 + z)^2 + z, [(z^2 + z)^2 + z]^2 + z, \dots$$

is bounded is called the **Mandelbrot set**. Plotting these complex numbers in the complex plane results in a graph that is “buglike” in shape, shown in **Figure 6.47**. Colors can be added to the boundary of the graph. At the boundary, color choices depend on how quickly the numbers in the boundary approach infinity when substituted into the sequence shown. The magnified boundary is shown in the introduction to this section. It includes the original buglike structure, as well as new and interesting patterns. With each level of magnification, repetition and unpredictable formations interact to create what has been called the most complicated mathematical object ever known.

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- In the complex plane, the horizontal axis is called the \_\_\_\_\_ axis and the vertical axis is called the \_\_\_\_\_ axis.
- The value  $\sqrt{a^2 + b^2}$  is the \_\_\_\_\_ of the complex number  $a + bi$ .
- In the polar form of a complex number,  $r(\cos \theta + i \sin \theta)$ ,  $r$  is called the \_\_\_\_\_ and  $\theta$  is called the \_\_\_\_\_,  $0 \leq \theta < 2\pi$ .
- To convert a complex number from rectangular form,  $z = a + bi$ , to polar form,  $z = r(\cos \theta + i \sin \theta)$ , we use the relationships  $r = \underline{\hspace{2cm}}$  and  $\tan \theta = \underline{\hspace{2cm}}$ , noting the quadrant in which the graph of  $z$  lies.
- $r_1(\cos \theta_1 + i \sin \theta_1) \cdot r_2(\cos \theta_2 + i \sin \theta_2) = \underline{\hspace{2cm}} [\cos(\underline{\hspace{2cm}}) + i \sin(\underline{\hspace{2cm}})]$   
The product of two complex numbers in polar form is found by \_\_\_\_\_ their moduli and \_\_\_\_\_ their arguments.

- $\frac{r_1(\cos \theta_1 + i \sin \theta_1)}{r_2(\cos \theta_2 + i \sin \theta_2)}$   
 $= \underline{\hspace{2cm}} [\cos(\underline{\hspace{2cm}}) + i \sin(\underline{\hspace{2cm}})]$   
The quotient of two complex numbers in polar form is found by \_\_\_\_\_ their moduli and \_\_\_\_\_ their arguments.
- DeMoivre's Theorem states that  
 $[r(\cos \theta + i \sin \theta)]^n$   
 $= \underline{\hspace{2cm}} (\cos \underline{\hspace{2cm}} + i \sin \underline{\hspace{2cm}})$ .
- Every nonzero complex number has \_\_\_\_\_ distinct complex  $n$ th roots.

## EXERCISE SET 6.5

### Practice Exercises

In Exercises 1–10, plot each complex number and find its absolute value.

- |                  |                   |
|------------------|-------------------|
| 1. $z = 4i$      | 2. $z = 3i$       |
| 3. $z = 3$       | 4. $z = 4$        |
| 5. $z = 3 + 2i$  | 6. $z = 2 + 5i$   |
| 7. $z = 3 - i$   | 8. $z = 4 - i$    |
| 9. $z = -3 + 4i$ | 10. $z = -3 - 4i$ |

In Exercises 11–26, plot each complex number. Then write the complex number in polar form. You may express the argument in degrees or radians.

- |                               |                              |
|-------------------------------|------------------------------|
| 11. $2 + 2i$                  | 12. $1 + i\sqrt{3}$          |
| 13. $-1 - i$                  | 14. $2 - 2i$                 |
| 15. $-4i$                     | 16. $-3i$                    |
| 17. $2\sqrt{3} - 2i$          | 18. $-2 + 2i\sqrt{3}$        |
| 19. $-3$                      | 20. $-4$                     |
| 21. $-3\sqrt{2} - 3i\sqrt{3}$ | 22. $3\sqrt{2} - 3i\sqrt{2}$ |
| 23. $-3 + 4i$                 | 24. $-2 + 3i$                |
| 25. $2 - i\sqrt{3}$           | 26. $1 - i\sqrt{5}$          |

In Exercises 27–36, write each complex number in rectangular form. If necessary, round to the nearest tenth.

- |   |   |
|---|---|
| 27. $6(\cos 30^\circ + i \sin 30^\circ)$                        | 28. $12(\cos 60^\circ + i \sin 60^\circ)$                       |
| 29. $4(\cos 240^\circ + i \sin 240^\circ)$                      | 30. $10(\cos 210^\circ + i \sin 210^\circ)$                     |
| 31. $8\left(\cos \frac{7\pi}{4} + i \sin \frac{7\pi}{4}\right)$ | 32. $4\left(\cos \frac{5\pi}{6} + i \sin \frac{5\pi}{6}\right)$ |

- |   |   |
|---|---|
| 33. $5\left(\cos \frac{\pi}{2} + i \sin \frac{\pi}{2}\right)$ | 34. $7\left(\cos \frac{3\pi}{2} + i \sin \frac{3\pi}{2}\right)$ |
| 35. $20(\cos 205^\circ + i \sin 205^\circ)$                   | 36. $30(\cos 2.3 + i \sin 2.3)$                                 |

In Exercises 37–44, find the product of the complex numbers. Leave answers in polar form.

- |  |   |
|--|---|
| 37. $z_1 = 6(\cos 20^\circ + i \sin 20^\circ)$<br>$z_2 = 5(\cos 50^\circ + i \sin 50^\circ)$   | 38. $z_1 = 4(\cos 15^\circ + i \sin 15^\circ)$<br>$z_2 = 7(\cos 25^\circ + i \sin 25^\circ)$  |
| 39. $z_1 = 3\left(\cos \frac{\pi}{5} + i \sin \frac{\pi}{5}\right)$<br>$z_2 = 4\left(\cos \frac{\pi}{10} + i \sin \frac{\pi}{10}\right)$ | 40. $z_1 = 3\left(\cos \frac{5\pi}{8} + i \sin \frac{5\pi}{8}\right)$<br>$z_2 = 10\left(\cos \frac{\pi}{16} + i \sin \frac{\pi}{16}\right)$ |
| 41. $z_1 = \cos \frac{\pi}{4} + i \sin \frac{\pi}{4}$<br>$z_2 = \cos \frac{\pi}{3} + i \sin \frac{\pi}{3}$                               | 42. $z_1 = \cos \frac{\pi}{6} + i \sin \frac{\pi}{6}$<br>$z_2 = \cos \frac{\pi}{4} + i \sin \frac{\pi}{4}$                                  |
| 43. $z_1 = 1 + i$<br>$z_2 = -1 + i$  | 44. $z_1 = 1 + i$<br>$z_2 = 2 + 2i$   |

In Exercises 45–52, find the quotient  $\frac{z_1}{z_2}$  of the complex numbers.

Leave answers in polar form. In Exercises 49–50, express the argument as an angle between  $0^\circ$  and  $360^\circ$ .

45.  $z_1 = 20(\cos 75^\circ + i \sin 75^\circ)$

$z_2 = 4(\cos 25^\circ + i \sin 25^\circ)$

46.  $z_1 = 50(\cos 80^\circ + i \sin 80^\circ)$

$z_2 = 10(\cos 20^\circ + i \sin 20^\circ)$

47.  $z_1 = 3\left(\cos \frac{\pi}{5} + i \sin \frac{\pi}{5}\right)$

$z_2 = 4\left(\cos \frac{\pi}{10} + i \sin \frac{\pi}{10}\right)$

48.  $z_1 = 3\left(\cos \frac{5\pi}{18} + i \sin \frac{5\pi}{18}\right)$

$z_2 = 10\left(\cos \frac{\pi}{16} + i \sin \frac{\pi}{16}\right)$

49.  $z_1 = \cos 80^\circ + i \sin 80^\circ$

$z_2 = \cos 200^\circ + i \sin 200^\circ$

50.  $z_1 = \cos 70^\circ + i \sin 70^\circ$

$z_2 = \cos 230^\circ + i \sin 230^\circ$

51.  $z_1 = 2 + 2i$

$z_2 = 1 + i$

52.  $z_1 = 2 - 2i$

$z_2 = 1 - i$

In Exercises 53–64, use DeMoivre's Theorem to find the indicated power of the complex number. Write answers in rectangular form.

53.  $[4(\cos 15^\circ + i \sin 15^\circ)]^3$

54.  $[2(\cos 10^\circ + i \sin 10^\circ)]^3$

55.  $[2(\cos 80^\circ + i \sin 80^\circ)]^3$

56.  $[2(\cos 40^\circ + i \sin 40^\circ)]^3$

57.  $\left[\frac{1}{2}\left(\cos \frac{\pi}{12} + i \sin \frac{\pi}{12}\right)\right]^6$

58.  $\left[\frac{1}{2}\left(\cos \frac{\pi}{10} + i \sin \frac{\pi}{10}\right)\right]^5$

59.  $\left[\sqrt{2}\left(\cos \frac{5\pi}{6} + i \sin \frac{5\pi}{6}\right)\right]^4$

60.  $\left[\sqrt{3}\left(\cos \frac{5\pi}{18} + i \sin \frac{5\pi}{18}\right)\right]^6$

61.  $(1 + i)^5$

62.  $(1 - i)^5$

63.  $(\sqrt{3} - i)^6$

64.  $(\sqrt{2} - i)^4$

In Exercises 65–68, find all the complex roots. Write roots in polar form with  $\theta$  in degrees.

65. The complex square roots of  $9(\cos 30^\circ + i \sin 30^\circ)$

66. The complex square roots of  $25(\cos 210^\circ + i \sin 210^\circ)$

67. The complex cube roots of  $8(\cos 210^\circ + i \sin 210^\circ)$

68. The complex cube roots of  $27(\cos 306^\circ + i \sin 306^\circ)$

In Exercises 69–76, find all the complex roots. Write roots in rectangular form. If necessary, round to the nearest tenth.

69. The complex fourth roots of  $81\left(\cos \frac{4\pi}{3} + i \sin \frac{4\pi}{3}\right)$

70. The complex fifth roots of  $32\left(\cos \frac{5\pi}{3} + i \sin \frac{5\pi}{3}\right)$

71. The complex fifth roots of 32

72. The complex sixth roots of 64

73. The complex cube roots of 1

74. The complex cube roots of  $i$

75. The complex fourth roots of  $1 + i$

76. The complex fifth roots of  $-1 + i$

### Practice Plus

In Exercises 77–80, convert to polar form and then perform the indicated operations. Express answers in polar and rectangular form.

77.  $i(2 + 2i)(-\sqrt{3} + i)$

78.  $(1 + i)(1 - i\sqrt{3})(-\sqrt{3} + i)$

79.  $\frac{(1 + i\sqrt{3})(1 - i)}{2\sqrt{3} - 2i}$

80.  $\frac{(-1 + i\sqrt{3})(2 - 2i\sqrt{3})}{4\sqrt{3} - 4i}$

In Exercises 81–86, solve each equation in the complex number system. Express solutions in polar and rectangular form.

81.  $x^6 - 1 = 0$

82.  $x^6 + 1 = 0$

83.  $x^4 + 16i = 0$

84.  $x^5 - 32i = 0$

85.  $x^3 - (1 + i\sqrt{3}) = 0$

86.  $x^3 - (1 - i\sqrt{3}) = 0$

In calculus, it can be shown that

$$e^{i\theta} = \cos \theta + i \sin \theta.$$

In Exercises 87–90, use this result to plot each complex number.

87.  $e^{\frac{\pi i}{4}}$

88.  $e^{\frac{\pi i}{6}}$

89.  $-e^{-\pi i}$

90.  $-2e^{-2\pi i}$

### Application Exercises

In Exercises 91–92, show that the given complex number  $z$  plots as a point in the Mandelbrot set.

a. Write the first six terms of the sequence

$$z_1, z_2, z_3, z_4, z_5, z_6, \dots$$

where

$z_1 = z$ : Write the given number.

$z_2 = z^2 + z$ : Square  $z_1$  and add the given number.

$z_3 = (z^2 + z)^2 + z$ : Square  $z_2$  and add the given number.

$z_4 = [(z^2 + z)^2 + z]^2 + z$ : Square  $z_3$  and add the given number.

$z_5$ : Square  $z_4$  and add the given number.

$z_6$ : Square  $z_5$  and add the given number.

b. If the sequence that you began writing in part (a) is bounded, the given complex number belongs to the Mandelbrot set. Show that the sequence is bounded by writing two complex numbers. One complex number should be greater in absolute value than the absolute values of the terms in the sequence. The second complex number should be less in absolute value than the absolute values of the terms in the sequence.

91.  $z = i$

92.  $z = -i$

**Writing in Mathematics**

93. Explain how to plot a complex number in the complex plane. Provide an example with your explanation.
94. How do you determine the absolute value of a complex number?
95. What is the polar form of a complex number?
96. If you are given a complex number in rectangular form, how do you write it in polar form?
97. If you are given a complex number in polar form, how do you write it in rectangular form?
98. Explain how to find the product of two complex numbers in polar form.
99. Explain how to find the quotient of two complex numbers in polar form.
100. Explain how to find the power of a complex number in polar form.
101. Explain how to use DeMoivre's Theorem for finding complex roots to find the two square roots of 9.
102. Describe the graph of all complex numbers with an absolute value of 6.
103. The image of the Mandelbrot set in the section opener exhibits self-similarity: Magnified portions repeat much of the pattern of the whole structure, as well as new and unexpected patterns. Describe an object in nature that exhibits self-similarity.

**Technology Exercises**

104. Use the rectangular-to-polar feature on a graphing utility to verify any four of your answers in Exercises 11–26. Be aware that you may have to adjust the angle for the correct quadrant.
105. Use the polar-to-rectangular feature on a graphing utility to verify any four of your answers in Exercises 27–36.

**Critical Thinking Exercises**

**Make Sense?** In Exercises 106–109, determine whether each statement makes sense or does not make sense, and explain your reasoning.

106. A complex number  $a + bi$  can be interpreted geometrically as the point  $(a, b)$  in the  $xy$ -plane.
107. I multiplied two complex numbers in polar form by first multiplying the moduli and then multiplying the arguments.
108. The proof of the formula for the product of two complex numbers in polar form uses the sum formulas for cosines and sines that I studied in the previous chapter.
109. My work with complex numbers verified that the only possible cube root of 8 is 2.
110. Prove the rule for finding the quotient of two complex numbers in polar form. Begin the proof as follows, using the conjugate of the denominator's second factor:
 
$$\frac{r_1(\cos \theta_1 + i \sin \theta_1)}{r_2(\cos \theta_2 + i \sin \theta_2)} = \frac{r_1(\cos \theta_1 + i \sin \theta_1)}{r_2(\cos \theta_2 + i \sin \theta_2)} \cdot \frac{(\cos \theta_2 - i \sin \theta_2)}{(\cos \theta_2 - i \sin \theta_2)}$$

Perform the indicated multiplications. Then use the difference formulas for sine and cosine.
111. Plot each of the complex fourth roots of 1.

**Group Exercise**

112. Group members should prepare and present a seminar on mathematical chaos. Include one or more of the following topics in your presentation: fractal images, the role of complex numbers in generating fractal images, algorithms, iterations, iteration number, and fractals in nature. Be sure to include visual images that will intrigue your audience.

**Preview Exercises**

Exercises 113–115 will help you prepare for the material covered in the next section.

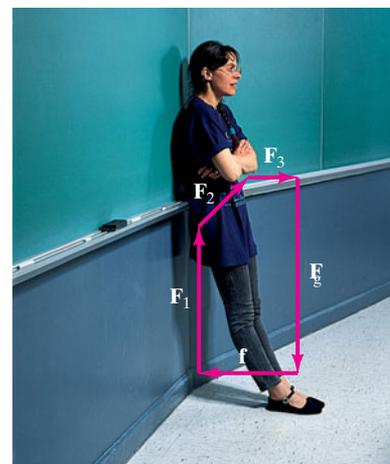

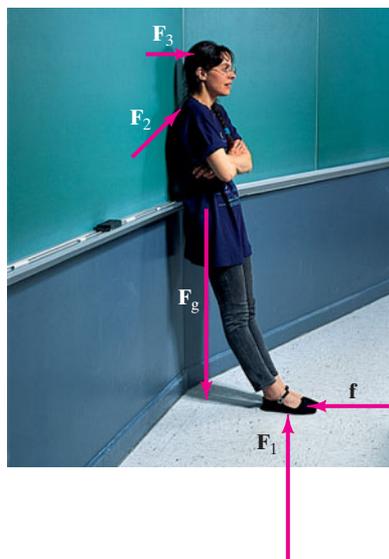

113. Use the distance formula to determine if the line segment with endpoints  $(-3, -3)$  and  $(0, 3)$  has the same length as the line segment with endpoints  $(0, 0)$  and  $(3, 6)$ .
114. Use slope to determine if the line through  $(-3, -3)$  and  $(0, 3)$  is parallel to the line through  $(0, 0)$  and  $(3, 6)$ .
115. Simplify:  $4(5x + 4y) - 2(6x - 9y)$ .

## SECTION 6.6

## Vectors

## Objectives

- 1 Use magnitude and direction to show vectors are equal.
- 2 Visualize scalar multiplication, vector addition, and vector subtraction as geometric vectors.
- 3 Represent vectors in the rectangular coordinate system.
- 4 Perform operations with vectors in terms of  $\mathbf{i}$  and  $\mathbf{j}$ .
- 5 Find the unit vector in the direction of  $\mathbf{v}$ .
- 6 Write a vector in terms of its magnitude and direction.
- 7 Solve applied problems involving vectors.

It's been a dynamic lecture, but now that it's over it's obvious that my professor is exhausted. She's slouching motionless against the board and—what's that? The forces acting against her body, including the pull of gravity, are appearing as arrows. I know that mathematics reveals the hidden patterns of the universe, but this is ridiculous. Does the arrangement of the arrows on the right have anything to do with the fact that my wiped-out professor is not sliding down the wall?

Ours is a world of pushes and pulls. For example, suppose you are pulling a cart up a  $30^\circ$  incline, requiring an effort of 100 pounds. This quantity is described by giving its magnitude (a number indicating size, including a unit of measure) and also its direction. The magnitude is 100 pounds and the direction is  $30^\circ$  from the horizontal. Quantities that involve both a magnitude and a direction are called **vector quantities**, or **vectors** for short. Here is another example of a vector:

You are driving due north at 50 miles per hour. The magnitude is the speed, 50 miles per hour. The direction of motion is due north.

Some quantities can be completely described by giving only their magnitudes. For example, the temperature of the lecture room that you just left is  $75^\circ$ . This temperature has magnitude,  $75^\circ$ , but no direction. Quantities that involve magnitude, but no direction, are called **scalar quantities**, or **scalars** for short. Thus, a scalar has only a numerical value. Another example of a scalar is your professor's height, which you estimate to be 5.5 feet.

In this section and the next, we introduce the world of vectors, which literally surround your every move. Because vectors have nonnegative magnitude as well as direction, we begin our discussion with directed line segments.

This sign shows a distance and direction for each city. Thus, the sign defines a vector for each destination.

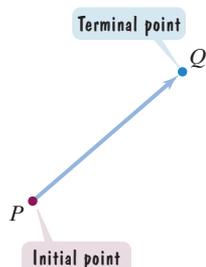

FIGURE 6.48 A directed line segment from  $P$  to  $Q$

## Directed Line Segments and Geometric Vectors

A line segment to which a direction has been assigned is called a **directed line segment**. Figure 6.48 shows a directed line segment from  $P$  to  $Q$ . We call  $P$  the **initial point** and  $Q$  the **terminal point**. We denote this directed line segment by

$$\overrightarrow{PQ}.$$

The **magnitude** of the directed line segment  $\overrightarrow{PQ}$  is its length. We denote this by  $\|\overrightarrow{PQ}\|$ . Thus,  $\|\overrightarrow{PQ}\|$  is the distance from point  $P$  to point  $Q$ . Because distance is nonnegative, vectors do not have negative magnitudes.

Geometrically, a **vector** is a directed line segment. Vectors are often denoted by boldface letters, such as  $\mathbf{v}$ . If a vector  $\mathbf{v}$  has the same magnitude and the same direction as the directed line segment  $\overrightarrow{PQ}$ , we write

$$\mathbf{v} = \overrightarrow{PQ}.$$

## GREAT QUESTION!

Because it's impossible for me to write boldface on paper, how should I denote a vector?

Use an arrow over a single letter.

	Representing Vectors in Print	Representing Vectors on Paper	Representing Magnitude of Vectors in Print	Representing Magnitude of Vectors on Paper
Vector $\mathbf{v}$	$\mathbf{v}$	$\vec{v}$	$\ \mathbf{v}\ $	$\ \vec{v}\ $
Vector $\mathbf{w}$	$\mathbf{w}$	$\vec{w}$	$\ \mathbf{w}\ $	$\ \vec{w}\ $

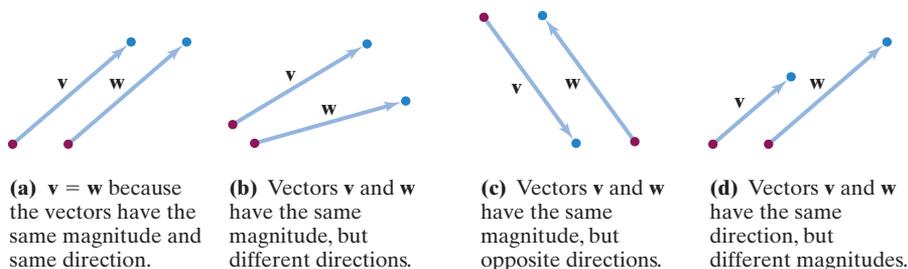

## GREAT QUESTION!

What's the difference between a ray and a vector?

A ray is a directed line that has only an initial point and extends forever in one direction. A vector is a directed line segment that has both an initial point and a terminal point.

- 1 Use magnitude and direction to show vectors are equal.

Figure 6.49 shows four possible relationships between vectors  $\mathbf{v}$  and  $\mathbf{w}$ . In Figure 6.49(a), the vectors have the same magnitude and the same direction, and are said to be *equal*. In general, vectors  $\mathbf{v}$  and  $\mathbf{w}$  are **equal** if they have the *same magnitude* and the *same direction*. We write this as  $\mathbf{v} = \mathbf{w}$ .

(a)  $\mathbf{v} = \mathbf{w}$  because the vectors have the same magnitude and same direction.

(b) Vectors  $\mathbf{v}$  and  $\mathbf{w}$  have the same magnitude, but different directions.

(c) Vectors  $\mathbf{v}$  and  $\mathbf{w}$  have the same magnitude, but opposite directions.

(d) Vectors  $\mathbf{v}$  and  $\mathbf{w}$  have the same direction, but different magnitudes.

FIGURE 6.49 Relationships between vectors

## EXAMPLE 1 Showing That Two Vectors Are Equal

Use Figure 6.50 to show that  $\mathbf{u} = \mathbf{v}$ .

### SOLUTION

Equal vectors have the same magnitude and the same direction. Use the distance formula to show that  $\mathbf{u}$  and  $\mathbf{v}$  have the same magnitude.

$$\begin{aligned} \text{Magnitude of } \mathbf{u} \quad \|\mathbf{u}\| &= \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2} = \sqrt{[0 - (-3)]^2 + [3 - (-3)]^2} \\ &= \sqrt{3^2 + 6^2} = \sqrt{9 + 36} = \sqrt{45} \quad (\text{or } 3\sqrt{5}) \end{aligned}$$

$$\begin{aligned} \text{Magnitude of } \mathbf{v} \quad \|\mathbf{v}\| &= \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2} = \sqrt{(3 - 0)^2 + (6 - 0)^2} \\ &= \sqrt{3^2 + 6^2} = \sqrt{9 + 36} = \sqrt{45} \quad (\text{or } 3\sqrt{5}) \end{aligned}$$

Thus,  $\mathbf{u}$  and  $\mathbf{v}$  have the same magnitude:  $\|\mathbf{u}\| = \|\mathbf{v}\|$ .

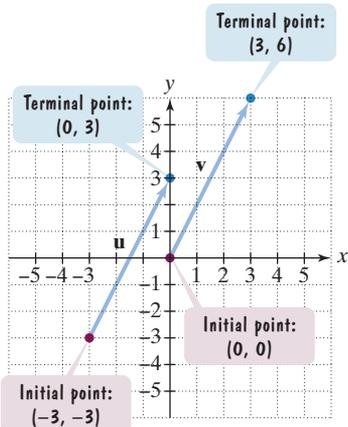

FIGURE 6.50

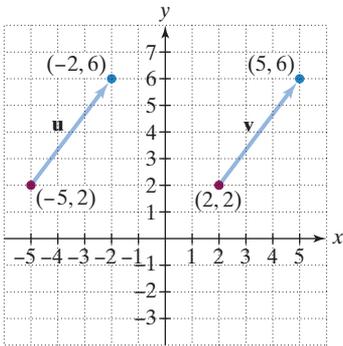

FIGURE 6.51

One way to show that  $\mathbf{u}$  and  $\mathbf{v}$  have the same direction is to find the slopes of the lines on which they lie. We continue to use **Figure 6.50** on the previous page.

Line on which  $\mathbf{u}$  lies  $m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{3 - (-3)}{0 - (-3)} = \frac{6}{3} = 2$   $\mathbf{u}$  lies on a line passing through  $(-3, -3)$  and  $(0, 3)$ .

Line on which  $\mathbf{v}$  lies  $m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{6 - 0}{3 - 0} = \frac{6}{3} = 2$   $\mathbf{v}$  lies on a line passing through  $(0, 0)$  and  $(3, 6)$ .

Because  $\mathbf{u}$  and  $\mathbf{v}$  are both directed toward the upper right on lines having the same slope, 2, they have the same direction.

Thus,  $\mathbf{u}$  and  $\mathbf{v}$  have the same magnitude and direction, and  $\mathbf{u} = \mathbf{v}$ . ...

**Check Point 1** Use **Figure 6.51** to show that  $\mathbf{u} = \mathbf{v}$ .

**2** Visualize scalar multiplication, vector addition, and vector subtraction as geometric vectors.

A vector can be multiplied by a real number. **Figure 6.52** shows three such multiplications:  $2\mathbf{v}$ ,  $\frac{1}{2}\mathbf{v}$ , and  $-\frac{3}{2}\mathbf{v}$ . **Multiplying a vector by any positive real number (except for 1) changes the magnitude of the vector but not its direction.** This can be seen by the blue and green vectors in **Figure 6.52**. Compare the black and blue vectors. Can you see that  $2\mathbf{v}$  has the same direction as  $\mathbf{v}$  but is twice the magnitude of  $\mathbf{v}$ ? Now, compare the black and green vectors:  $\frac{1}{2}\mathbf{v}$  has the same direction as  $\mathbf{v}$  but is half the magnitude of  $\mathbf{v}$ .

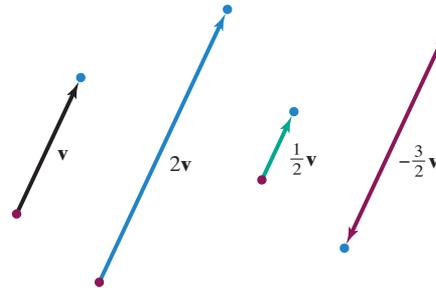

FIGURE 6.52 Multiplying vector  $\mathbf{v}$  by real numbers

Now compare the black and red vectors in **Figure 6.52**. **Multiplying a vector by a negative number reverses the direction of the vector.** Notice that  $-\frac{3}{2}\mathbf{v}$  has the opposite direction as  $\mathbf{v}$  and is  $\frac{3}{2}$  the magnitude of  $\mathbf{v}$ .

The multiplication of a real number  $k$  and a vector  $\mathbf{v}$  is called **scalar multiplication**. We write this product as  $k\mathbf{v}$ .

### Scalar Multiplication

If  $k$  is a real number and  $\mathbf{v}$  a vector, the vector  $k\mathbf{v}$  is called a **scalar multiple** of the vector  $\mathbf{v}$ . The magnitude and direction of  $k\mathbf{v}$  are given as follows:

The vector  $k\mathbf{v}$  has a *magnitude* of  $|k| \|\mathbf{v}\|$ . We describe this as the absolute value of  $k$  times the magnitude of vector  $\mathbf{v}$ .

The vector  $k\mathbf{v}$  has a *direction* that is

- the same as the direction of  $\mathbf{v}$  if  $k > 0$ , and
- opposite the direction of  $\mathbf{v}$  if  $k < 0$ .

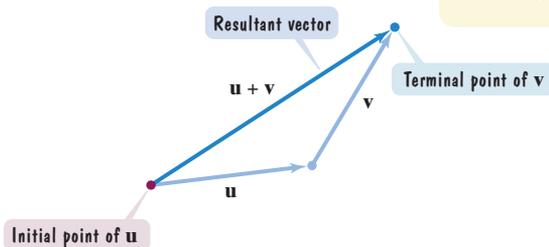

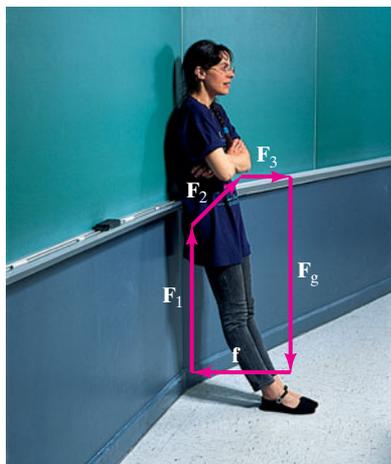

FIGURE 6.53 Vector addition  $\mathbf{u} + \mathbf{v}$ ; the terminal point of  $\mathbf{u}$  coincides with the initial point of  $\mathbf{v}$ .

A geometric method for adding two vectors is shown in **Figure 6.53**. The sum of  $\mathbf{u}$  and  $\mathbf{v}$ , denoted by  $\mathbf{u} + \mathbf{v}$  is called the **resultant vector**. Here is how we find this vector:

1. Position  $\mathbf{u}$  and  $\mathbf{v}$ , so that the terminal point of  $\mathbf{u}$  coincides with the initial point of  $\mathbf{v}$ .
2. The resultant vector,  $\mathbf{u} + \mathbf{v}$ , extends from the initial point of  $\mathbf{u}$  to the terminal point of  $\mathbf{v}$ .

## Blitzer Bonus

## Wiped Out, But Not Sliding Down the Wall

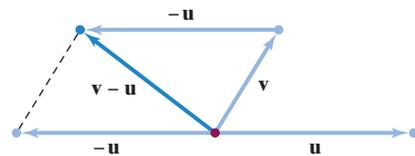

The figure shows the sum of five vectors:

$$\mathbf{F}_1 + \mathbf{F}_2 + \mathbf{F}_3 + \mathbf{F}_g + \mathbf{f}$$

Notice how the terminal point of each vector coincides with the initial point of the vector that's being added to it. The vector sum, from the initial point of  $\mathbf{F}_1$  to the terminal point of  $\mathbf{f}$ , is a single point. The magnitude of a single point is zero. These forces add up to a net force of zero, allowing the professor to be motionless.

- 3 Represent vectors in the rectangular coordinate system.

The **difference of two vectors**,  $\mathbf{v} - \mathbf{u}$ , is defined as  $\mathbf{v} - \mathbf{u} = \mathbf{v} + (-\mathbf{u})$ , where  $-\mathbf{u}$  is the scalar multiplication of  $\mathbf{u}$  and  $-1$ :  $-\mathbf{u}$ . The difference  $\mathbf{v} - \mathbf{u}$  is shown geometrically in **Figure 6.54**.

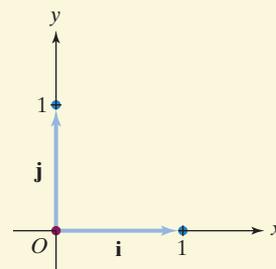

**FIGURE 6.54** Vector subtraction  $\mathbf{v} - \mathbf{u}$ ; the terminal point of  $\mathbf{v}$  coincides with the initial point of  $-\mathbf{u}$ .

### Vectors in the Rectangular Coordinate System

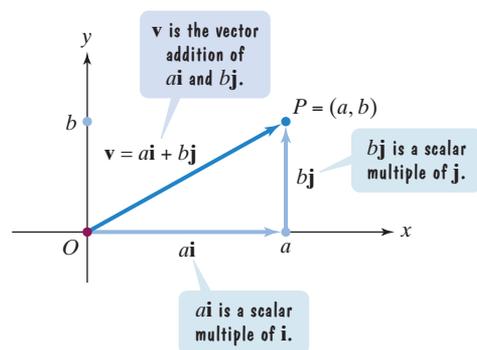

As you saw in Example 1, vectors can be shown in the rectangular coordinate system. Now let's see how we can use the rectangular coordinate system to represent vectors. We begin with two vectors that both have a magnitude of 1. Such vectors are called **unit vectors**.

#### The $\mathbf{i}$ and $\mathbf{j}$ Unit Vectors

Vector  $\mathbf{i}$  is the unit vector whose direction is along the positive  $x$ -axis. Vector  $\mathbf{j}$  is the unit vector whose direction is along the positive  $y$ -axis.

Why are the unit vectors  $\mathbf{i}$  and  $\mathbf{j}$  important? Vectors in the rectangular coordinate system can be represented in terms of  $\mathbf{i}$  and  $\mathbf{j}$ . For example, consider vector  $\mathbf{v}$  with initial point at the origin,  $(0, 0)$ , and terminal point at  $P = (a, b)$ . The vector  $\mathbf{v}$  is shown in **Figure 6.55**. We can represent  $\mathbf{v}$  using  $\mathbf{i}$  and  $\mathbf{j}$  as  $\mathbf{v} = a\mathbf{i} + b\mathbf{j}$ .

**FIGURE 6.55** Using vector addition, vector  $\mathbf{v}$  is represented as  $\mathbf{v} = a\mathbf{i} + b\mathbf{j}$ .

#### Representing Vectors in Rectangular Coordinates

Vector  $\mathbf{v}$ , from  $(0, 0)$  to  $(a, b)$ , is represented as

$$\mathbf{v} = a\mathbf{i} + b\mathbf{j}.$$

The real numbers  $a$  and  $b$  are called the **scalar components of  $\mathbf{v}$** . Note that

- $a$  is the **horizontal component** of  $\mathbf{v}$ , and
- $b$  is the **vertical component** of  $\mathbf{v}$ .

The vector sum  $a\mathbf{i} + b\mathbf{j}$  is called a **linear combination** of the vectors  $\mathbf{i}$  and  $\mathbf{j}$ . The magnitude of  $\mathbf{v} = a\mathbf{i} + b\mathbf{j}$  is given by

$$\|\mathbf{v}\| = \sqrt{a^2 + b^2}.$$

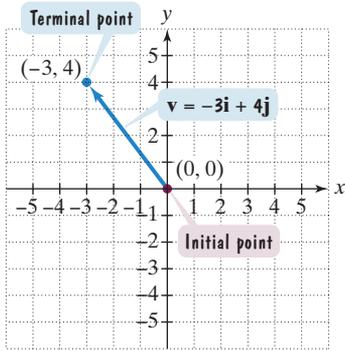

FIGURE 6.56 Sketching  $\mathbf{v} = -3\mathbf{i} + 4\mathbf{j}$  in the rectangular coordinate system

### EXAMPLE 2 Representing a Vector in Rectangular Coordinates and Finding Its Magnitude

Sketch the vector  $\mathbf{v} = -3\mathbf{i} + 4\mathbf{j}$  and find its magnitude.

#### SOLUTION

For the given vector  $\mathbf{v} = -3\mathbf{i} + 4\mathbf{j}$ ,  $a = -3$  and  $b = 4$ . The vector can be represented with its initial point at the origin,  $(0, 0)$ , as shown in **Figure 6.56**. The vector's terminal point is then  $(a, b) = (-3, 4)$ . We sketch the vector by drawing an arrow from  $(0, 0)$  to  $(-3, 4)$ . We determine the magnitude of the vector by using the distance formula. Thus, the magnitude is

$$\|\mathbf{v}\| = \sqrt{a^2 + b^2} = \sqrt{(-3)^2 + 4^2} = \sqrt{9 + 16} = \sqrt{25} = 5. \quad \dots$$

#### GREAT QUESTION!

In Example 2, since  $\mathbf{v} = -3\mathbf{i} + 4\mathbf{j}$ , is it ok if I write the magnitude of  $\mathbf{v}$  as

$$\|\mathbf{v}\| = \sqrt{(-3\mathbf{i})^2 + (4\mathbf{j})^2}?$$

No. The vectors  $\mathbf{i}$  and  $\mathbf{j}$  are not included when determining the magnitude of  $\mathbf{v} = a\mathbf{i} + b\mathbf{j}$ .

**Correct**

$$\mathbf{v} = a\mathbf{i} + b\mathbf{j}$$

$$\|\mathbf{v}\| = \sqrt{a^2 + b^2}$$

**Incorrect**

~~$$\mathbf{v} = a\mathbf{i} + b\mathbf{j}$$~~
~~$$\|\mathbf{v}\| = \sqrt{(a\mathbf{i})^2 + (b\mathbf{j})^2}$$~~

#### Check Point 2 Sketch the vector $\mathbf{v} = 3\mathbf{i} - 3\mathbf{j}$ and find its magnitude.

The vector in Example 2 was represented with its initial point at the origin. A vector whose initial point is at the origin is called a **position vector**. Any vector in rectangular coordinates whose initial point is not at the origin can be shown to be equal to a position vector. As shown in the following box, this gives us a way to represent vectors between any two points.

#### Representing Vectors in Rectangular Coordinates

Vector  $\mathbf{v}$  with initial point  $P_1 = (x_1, y_1)$  and terminal point  $P_2 = (x_2, y_2)$  is equal to the position vector

$$\mathbf{v} = (x_2 - x_1)\mathbf{i} + (y_2 - y_1)\mathbf{j}.$$

We can use congruent triangles, triangles with the same size and shape, to derive this formula. Begin with the right triangle in **Figure 6.57(a)**. This triangle shows vector  $\mathbf{v}$  from  $P_1 = (x_1, y_1)$  to  $P_2 = (x_2, y_2)$ . In **Figure 6.57(b)**, we move vector  $\mathbf{v}$ , without changing its magnitude or its direction, so that its initial point is at the origin. Using this position vector in **Figure 6.57(b)**, we see that

$$\mathbf{v} = a\mathbf{i} + b\mathbf{j},$$

where  $a$  and  $b$  are the components of  $\mathbf{v}$ . The equal vectors and the right angles in the right triangles in **Figure 6.57(a)** and **(b)** result in congruent triangles. The corresponding sides of these congruent triangles are equal, so that  $a = x_2 - x_1$  and  $b = y_2 - y_1$ . This means that  $\mathbf{v}$  may be expressed as

$$\mathbf{v} = a\mathbf{i} + b\mathbf{j} = (x_2 - x_1)\mathbf{i} + (y_2 - y_1)\mathbf{j}.$$

Horizontal component:  
x-coordinate of terminal  
point minus x-coordinate  
of initial point

Vertical component:  
y-coordinate of terminal  
point minus y-coordinate  
of initial point

Thus, any vector between two points in rectangular coordinates can be expressed in terms of  $\mathbf{i}$  and  $\mathbf{j}$ . In rectangular coordinates, the term *vector* refers to the position vector expressed in terms of  $\mathbf{i}$  and  $\mathbf{j}$  that is equal to it.

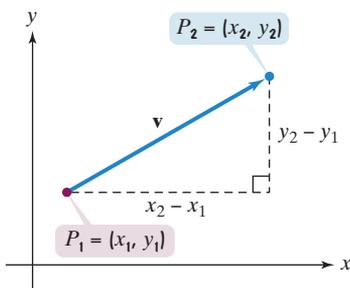

FIGURE 6.57(a)

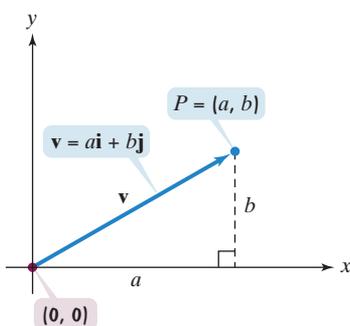

FIGURE 6.57(b)

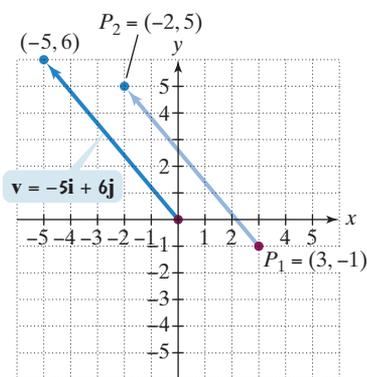

FIGURE 6.58 Representing the vector from  $(3, -1)$  to  $(-2, 5)$  as a position vector

### EXAMPLE 3 Representing a Vector in Rectangular Coordinates

Let  $\mathbf{v}$  be the vector from initial point  $P_1 = (3, -1)$  to terminal point  $P_2 = (-2, 5)$ . Write  $\mathbf{v}$  in terms of  $\mathbf{i}$  and  $\mathbf{j}$ .

#### SOLUTION

We identify the values for the variables in the formula.

$$P_1 = (3, -1) \qquad P_2 = (-2, 5)$$

$x_1$     $y_1$ 
 $x_2$     $y_2$

Using these values, we write  $\mathbf{v}$  in terms of  $\mathbf{i}$  and  $\mathbf{j}$  as follows:

$$\mathbf{v} = (x_2 - x_1)\mathbf{i} + (y_2 - y_1)\mathbf{j} = (-2 - 3)\mathbf{i} + [5 - (-1)]\mathbf{j} = -5\mathbf{i} + 6\mathbf{j}.$$

Figure 6.58 shows the vector from  $P_1 = (3, -1)$  to  $P_2 = (-2, 5)$  represented in terms of  $\mathbf{i}$  and  $\mathbf{j}$  and as a position vector. ...

### GREAT QUESTION!

**When representing a vector from an initial point to a terminal point, does the order in which I perform the subtractions make a difference?**

Yes. When writing the vector from  $P_1 = (x_1, y_1)$  to  $P_2 = (x_2, y_2)$ ,  $P_2$  must be the terminal point and the order in the subtractions is important:

$$\mathbf{v} = (x_2 - x_1)\mathbf{i} + (y_2 - y_1)\mathbf{j}.$$

$(x_2, y_2)$ , the terminal point, is used first in each subtraction.

Notice how this differs from finding the distance from  $P_1 = (x_1, y_1)$  to  $P_2 = (x_2, y_2)$ , where the order in which the subtractions are performed makes no difference:

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2} \quad \text{or} \quad d = \sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2}.$$

**Check Point 3** Let  $\mathbf{v}$  be the vector from initial point  $P_1 = (-1, 3)$  to terminal point  $P_2 = (2, 7)$ . Write  $\mathbf{v}$  in terms of  $\mathbf{i}$  and  $\mathbf{j}$ .

**4** Perform operations with vectors in terms of  $\mathbf{i}$  and  $\mathbf{j}$ .

### Operations with Vectors in Terms of $\mathbf{i}$ and $\mathbf{j}$

If vectors are expressed in terms of  $\mathbf{i}$  and  $\mathbf{j}$ , we can easily carry out operations such as vector addition, vector subtraction, and scalar multiplication. Recall the geometric definitions of these operations given earlier. Based on these ideas, we can add and subtract vectors using the following procedure:

#### Adding and Subtracting Vectors in Terms of $\mathbf{i}$ and $\mathbf{j}$

If  $\mathbf{v} = a_1\mathbf{i} + b_1\mathbf{j}$  and  $\mathbf{w} = a_2\mathbf{i} + b_2\mathbf{j}$ , then

$$\mathbf{v} + \mathbf{w} = (a_1 + a_2)\mathbf{i} + (b_1 + b_2)\mathbf{j}$$

$$\mathbf{v} - \mathbf{w} = (a_1 - a_2)\mathbf{i} + (b_1 - b_2)\mathbf{j}.$$

**EXAMPLE 4** Adding and Subtracting Vectors

If  $\mathbf{v} = 5\mathbf{i} + 4\mathbf{j}$  and  $\mathbf{w} = 6\mathbf{i} - 9\mathbf{j}$ , find each of the following vectors:

- a.  $\mathbf{v} + \mathbf{w}$       b.  $\mathbf{v} - \mathbf{w}$ .

**SOLUTION**

$$\begin{aligned} \text{a. } \mathbf{v} + \mathbf{w} &= (5\mathbf{i} + 4\mathbf{j}) + (6\mathbf{i} - 9\mathbf{j}) && \text{These are the given vectors.} \\ &= (5 + 6)\mathbf{i} + [4 + (-9)]\mathbf{j} && \text{Add the horizontal components.} \\ & && \text{Add the vertical components.} \\ &= 11\mathbf{i} - 5\mathbf{j} && \text{Simplify.} \end{aligned}$$

$$\begin{aligned} \text{b. } \mathbf{v} - \mathbf{w} &= (5\mathbf{i} + 4\mathbf{j}) - (6\mathbf{i} - 9\mathbf{j}) && \text{These are the given vectors.} \\ &= (5 - 6)\mathbf{i} + [4 - (-9)]\mathbf{j} && \text{Subtract the horizontal components.} \\ & && \text{Subtract the vertical components.} \\ &= -\mathbf{i} + 13\mathbf{j} && \text{Simplify.} \end{aligned}$$

 **Check Point 4** If  $\mathbf{v} = 7\mathbf{i} + 3\mathbf{j}$  and  $\mathbf{w} = 4\mathbf{i} - 5\mathbf{j}$ , find each of the following vectors:

- a.  $\mathbf{v} + \mathbf{w}$       b.  $\mathbf{v} - \mathbf{w}$ .

How do we perform scalar multiplication if vectors are expressed in terms of  $\mathbf{i}$  and  $\mathbf{j}$ ? We use the following procedure to multiply the vector  $\mathbf{v}$  by the scalar  $k$ :

**Scalar Multiplication with a Vector in Terms of  $\mathbf{i}$  and  $\mathbf{j}$** 

If  $\mathbf{v} = a\mathbf{i} + b\mathbf{j}$  and  $k$  is a real number, then the scalar multiplication of the vector  $\mathbf{v}$  and the scalar  $k$  is

$$k\mathbf{v} = (ka)\mathbf{i} + (kb)\mathbf{j}.$$

**EXAMPLE 5** Scalar Multiplication

If  $\mathbf{v} = 5\mathbf{i} + 4\mathbf{j}$ , find each of the following vectors:

- a.  $6\mathbf{v}$       b.  $-3\mathbf{v}$ .

**SOLUTION**

$$\begin{aligned} \text{a. } 6\mathbf{v} &= 6(5\mathbf{i} + 4\mathbf{j}) && \text{The scalar multiplication is expressed with} \\ & && \text{the given vector.} \\ &= (6 \cdot 5)\mathbf{i} + (6 \cdot 4)\mathbf{j} && \text{Multiply each component by 6.} \\ &= 30\mathbf{i} + 24\mathbf{j} && \text{Simplify.} \end{aligned}$$

$$\begin{aligned} \text{b. } -3\mathbf{v} &= -3(5\mathbf{i} + 4\mathbf{j}) && \text{The scalar multiplication is expressed with} \\ & && \text{the given vector.} \\ &= (-3 \cdot 5)\mathbf{i} + (-3 \cdot 4)\mathbf{j} && \text{Multiply each component by } -3. \\ &= -15\mathbf{i} - 12\mathbf{j} && \text{Simplify.} \end{aligned}$$

 **Check Point 5** If  $\mathbf{v} = 7\mathbf{i} + 10\mathbf{j}$ , find each of the following vectors:

- a.  $8\mathbf{v}$       b.  $-5\mathbf{v}$ .

**EXAMPLE 6** Vector OperationsIf  $\mathbf{v} = 5\mathbf{i} + 4\mathbf{j}$  and  $\mathbf{w} = 6\mathbf{i} - 9\mathbf{j}$ , find  $4\mathbf{v} - 2\mathbf{w}$ .**SOLUTION**

$$\begin{aligned}
 4\mathbf{v} - 2\mathbf{w} &= 4(5\mathbf{i} + 4\mathbf{j}) - 2(6\mathbf{i} - 9\mathbf{j}) \\
 &= 20\mathbf{i} + 16\mathbf{j} - 12\mathbf{i} + 18\mathbf{j} \\
 &= (20 - 12)\mathbf{i} + (16 + 18)\mathbf{j} \\
 &= 8\mathbf{i} + 34\mathbf{j}
 \end{aligned}$$

Operations are expressed with the given vectors.

Perform each scalar multiplication.

Add horizontal and vertical components to perform the vector addition.

Simplify. ... **Check Point 6** If  $\mathbf{v} = 7\mathbf{i} + 3\mathbf{j}$  and  $\mathbf{w} = 4\mathbf{i} - 5\mathbf{j}$ , find  $6\mathbf{v} - 3\mathbf{w}$ .

Properties involving vector operations resemble familiar properties of real numbers. For example, the order in which vectors are added makes no difference:

$$\mathbf{u} + \mathbf{v} = \mathbf{v} + \mathbf{u}.$$

Does this remind you of the commutative property  $a + b = b + a$ ?

Just as 0 plays an important role in the properties of real numbers, the **zero vector**  $\mathbf{0}$  plays exactly the same role in the properties of vectors.

**The Zero Vector**

The vector whose magnitude is 0 is called the **zero vector**,  $\mathbf{0}$ . The zero vector is assigned no direction. It can be expressed in terms of  $\mathbf{i}$  and  $\mathbf{j}$  using

$$\mathbf{0} = 0\mathbf{i} + 0\mathbf{j}.$$

Properties of vector addition and scalar multiplication are given as follows:

**Properties of Vector Addition and Scalar Multiplication**

If  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  are vectors, and  $c$  and  $d$  are scalars, then the following properties are true.

**Vector Addition Properties**

- |  |                      |
|--|----------------------|
| 1. $\mathbf{u} + \mathbf{v} = \mathbf{v} + \mathbf{u}$                               | Commutative property |
| 2. $(\mathbf{u} + \mathbf{v}) + \mathbf{w} = \mathbf{u} + (\mathbf{v} + \mathbf{w})$ | Associative property |
| 3. $\mathbf{u} + \mathbf{0} = \mathbf{0} + \mathbf{u} = \mathbf{u}$                  | Additive identity    |
| 4. $\mathbf{u} + (-\mathbf{u}) = (-\mathbf{u}) + \mathbf{u} = \mathbf{0}$            | Additive inverse     |

**Scalar Multiplication Properties**

- |   |                                 |
|---|---------------------------------|
| 1. $(cd)\mathbf{u} = c(d\mathbf{u})$                        | Associative property            |
| 2. $c(\mathbf{u} + \mathbf{v}) = c\mathbf{u} + c\mathbf{v}$ | Distributive property           |
| 3. $(c + d)\mathbf{u} = c\mathbf{u} + d\mathbf{u}$          | Distributive property           |
| 4. $1\mathbf{u} = \mathbf{u}$                               | Multiplicative identity         |
| 5. $0\mathbf{u} = \mathbf{0}$                               | Multiplication property of zero |
| 6. $\ c\mathbf{v}\  =  c \ \mathbf{v}\ $                    | Magnitude property              |

**5** Find the unit vector in the direction of  $\mathbf{v}$ .

**Unit Vectors**

A **unit vector** is defined to be a vector whose magnitude is one. In many applications of vectors, it is helpful to find the unit vector that has the same direction as a given vector.

## DISCOVERY

To find out why the procedure in the box produces a unit vector, work Exercise 112 in Exercise Set 6.6.

### Finding the Unit Vector that Has the Same Direction as a Given Nonzero Vector $\mathbf{v}$

For any nonzero vector  $\mathbf{v}$ , the vector

$$\frac{\mathbf{v}}{\|\mathbf{v}\|}$$

is the unit vector that has the same direction as  $\mathbf{v}$ . To find this vector, divide  $\mathbf{v}$  by its magnitude.

### EXAMPLE 7 Finding a Unit Vector

Find the unit vector in the same direction as  $\mathbf{v} = 5\mathbf{i} - 12\mathbf{j}$ . Then verify that the vector has magnitude 1.

#### SOLUTION

We find the unit vector in the same direction as  $\mathbf{v}$  by dividing  $\mathbf{v}$  by its magnitude. We first find the magnitude of  $\mathbf{v}$ .

$$\|\mathbf{v}\| = \sqrt{a^2 + b^2} = \sqrt{5^2 + (-12)^2} = \sqrt{25 + 144} = \sqrt{169} = 13$$

The unit vector in the same direction as  $\mathbf{v}$  is

$$\frac{\mathbf{v}}{\|\mathbf{v}\|} = \frac{5\mathbf{i} - 12\mathbf{j}}{13} = \frac{5}{13}\mathbf{i} - \frac{12}{13}\mathbf{j}. \quad \text{This is the scalar multiplication of } \mathbf{v} \text{ and } \frac{1}{13}.$$

Now we must verify that the magnitude of this vector is 1. Recall that the magnitude of  $a\mathbf{i} + b\mathbf{j}$  is  $\sqrt{a^2 + b^2}$ . Thus, the magnitude of  $\frac{5}{13}\mathbf{i} - \frac{12}{13}\mathbf{j}$  is

$$\sqrt{\left(\frac{5}{13}\right)^2 + \left(-\frac{12}{13}\right)^2} = \sqrt{\frac{25}{169} + \frac{144}{169}} = \sqrt{\frac{169}{169}} = \sqrt{1} = 1. \quad \dots$$

 **Check Point 7** Find the unit vector in the same direction as  $\mathbf{v} = 4\mathbf{i} - 3\mathbf{j}$ . Then verify that the vector has magnitude 1.

- 6 Write a vector in terms of its magnitude and direction.

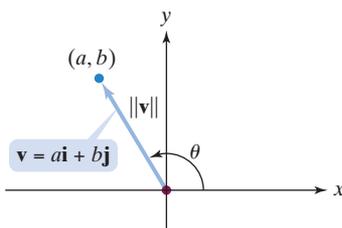

FIGURE 6.59 Expressing a vector in terms of its magnitude,  $\|\mathbf{v}\|$ , and its direction angle,  $\theta$

### Writing a Vector in Terms of Its Magnitude and Direction

Consider the vector  $\mathbf{v} = a\mathbf{i} + b\mathbf{j}$ . The components  $a$  and  $b$  can be expressed in terms of the magnitude of  $\mathbf{v}$  and the angle  $\theta$  that  $\mathbf{v}$  makes with the positive  $x$ -axis. This angle is called the **direction angle** of  $\mathbf{v}$  and is shown in **Figure 6.59**. By the definitions of sine and cosine, we have

$$\begin{aligned} \cos \theta &= \frac{a}{\|\mathbf{v}\|} & \text{and} & & \sin \theta &= \frac{b}{\|\mathbf{v}\|} \\ a &= \|\mathbf{v}\| \cos \theta & & & b &= \|\mathbf{v}\| \sin \theta. \end{aligned}$$

Thus,

$$\mathbf{v} = a\mathbf{i} + b\mathbf{j} = \|\mathbf{v}\| \cos \theta \mathbf{i} + \|\mathbf{v}\| \sin \theta \mathbf{j}.$$

### Writing a Vector in Terms of Its Magnitude and Direction

Let  $\mathbf{v}$  be a nonzero vector. If  $\theta$  is the direction angle measured from the positive  $x$ -axis to  $\mathbf{v}$ , then the vector can be expressed in terms of its magnitude and direction angle as

$$\mathbf{v} = \|\mathbf{v}\| \cos \theta \mathbf{i} + \|\mathbf{v}\| \sin \theta \mathbf{j}.$$

A vector that represents the direction and speed of an object in motion is called a **velocity vector**. In Example 8, we express a wind's velocity vector in terms of the wind's magnitude and direction.

### EXAMPLE 8 Writing a Vector Whose Magnitude and Direction Are Given

The wind is blowing at 20 miles per hour in the direction  $N30^\circ W$ . Express its velocity as a vector  $\mathbf{v}$  in terms of  $\mathbf{i}$  and  $\mathbf{j}$ .

#### SOLUTION

The vector  $\mathbf{v}$  is shown in **Figure 6.60**. The vector's direction angle, from the positive  $x$ -axis to  $\mathbf{v}$ , is

$$\theta = 90^\circ + 30^\circ = 120^\circ.$$

Because the wind is blowing at 20 miles per hour, the magnitude of  $\mathbf{v}$  is 20 miles per hour:  $\|\mathbf{v}\| = 20$ . Thus,

$$\mathbf{v} = \|\mathbf{v}\| \cos \theta \mathbf{i} + \|\mathbf{v}\| \sin \theta \mathbf{j}$$

Use the formula for a vector in terms of magnitude and direction.

$$= 20 \cos 120^\circ \mathbf{i} + 20 \sin 120^\circ \mathbf{j}$$

$\|\mathbf{v}\| = 20$  and  $\theta = 120^\circ$ .

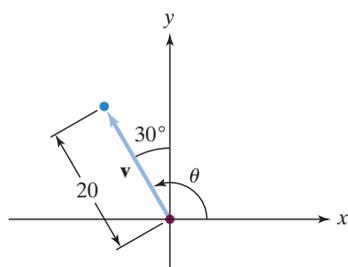

$$= 20 \left( -\frac{1}{2} \right) \mathbf{i} + 20 \left( \frac{\sqrt{3}}{2} \right) \mathbf{j}$$

$$\cos 120^\circ = -\frac{1}{2} \text{ and } \sin 120^\circ = \frac{\sqrt{3}}{2}.$$

$$= -10\mathbf{i} + 10\sqrt{3}\mathbf{j}$$

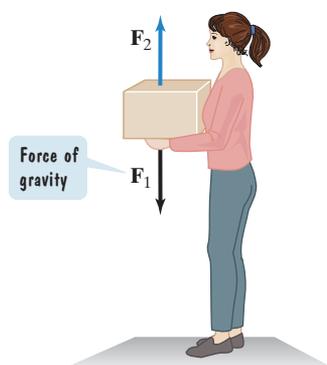

Simplify.

The wind's velocity can be expressed in terms of  $\mathbf{i}$  and  $\mathbf{j}$  as  $\mathbf{v} = -10\mathbf{i} + 10\sqrt{3}\mathbf{j}$ . ...

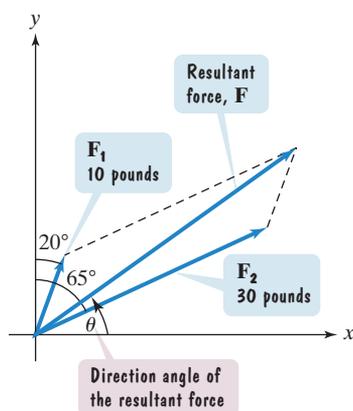

**FIGURE 6.60** Vector  $\mathbf{v}$  represents a wind blowing at 20 miles per hour in the direction  $N30^\circ W$ .

### 7 Solve applied problems involving vectors.

**FIGURE 6.61** Force vectors

**FIGURE 6.62**

### Check Point 8 The jet stream is blowing at 60 miles per hour in the direction $N45^\circ E$ . Express its velocity as a vector $\mathbf{v}$ in terms of $\mathbf{i}$ and $\mathbf{j}$ .

#### Application

Many physical concepts can be represented by vectors. A vector that represents a pull or push of some type is called a **force vector**. If you are holding a 10-pound package, two force vectors are involved. The force of gravity is exerting a force of magnitude 10 pounds directly downward. This force is shown by vector  $\mathbf{F}_1$  in **Figure 6.61**. Assuming there is no upward or downward movement of the package, you are exerting a force of magnitude 10 pounds directly upward. This force is shown by vector  $\mathbf{F}_2$  in **Figure 6.61**. It has the same magnitude as the force exerted on your package by gravity, but it acts in the opposite direction.

If  $\mathbf{F}_1$  and  $\mathbf{F}_2$  are two forces acting on an object, the net effect is the same as if just the resultant force,  $\mathbf{F}_1 + \mathbf{F}_2$ , acted on the object. If the object is not moving, as is the case with your 10-pound package, the vector sum of all forces is the zero vector.

### EXAMPLE 9 Finding the Resultant Force

Two forces,  $\mathbf{F}_1$  and  $\mathbf{F}_2$ , of magnitude 10 and 30 pounds, respectively, act on an object. The direction of  $\mathbf{F}_1$  is  $N20^\circ E$  and the direction of  $\mathbf{F}_2$  is  $N65^\circ E$ . Find the magnitude and the direction of the resultant force. Express the magnitude to the nearest hundredth of a pound and the direction angle to the nearest tenth of a degree.

#### SOLUTION

The vectors  $\mathbf{F}_1$  and  $\mathbf{F}_2$  are shown in **Figure 6.62**. The direction angle for  $\mathbf{F}_1$ , from the positive  $x$ -axis to the vector, is  $90^\circ - 20^\circ$ , or  $70^\circ$ . We express  $\mathbf{F}_1$  using the formula for a vector in terms of its magnitude and direction.

$$\begin{aligned}\mathbf{F}_1 &= \|\mathbf{F}_1\| \cos \theta \mathbf{i} + \|\mathbf{F}_1\| \sin \theta \mathbf{j} \\ &= 10 \cos 70^\circ \mathbf{i} + 10 \sin 70^\circ \mathbf{j} \\ &\approx 3.42\mathbf{i} + 9.40\mathbf{j}\end{aligned}$$

$$\|\mathbf{F}_1\| = 10 \text{ and } \theta = 70^\circ.$$

Use a calculator.

**Figure 6.62** illustrates that the direction angle for  $\mathbf{F}_2$ , from the positive  $x$ -axis to the vector, is  $90^\circ - 65^\circ$ , or  $25^\circ$ . We express  $\mathbf{F}_2$  using the formula for a vector in terms of its magnitude and direction.

$$\begin{aligned}\mathbf{F}_2 &= \|\mathbf{F}_2\| \cos \theta \mathbf{i} + \|\mathbf{F}_2\| \sin \theta \mathbf{j} \\ &= 30 \cos 25^\circ \mathbf{i} + 30 \sin 25^\circ \mathbf{j} \\ &\approx 27.19\mathbf{i} + 12.68\mathbf{j}\end{aligned}$$

$$\|\mathbf{F}_2\| = 30 \text{ and } \theta = 25^\circ.$$

Use a calculator.

The resultant force,  $\mathbf{F}$ , is  $\mathbf{F}_1 + \mathbf{F}_2$ . Thus,

$$\begin{aligned}\mathbf{F} &= \mathbf{F}_1 + \mathbf{F}_2 \\ &\approx (3.42\mathbf{i} + 9.40\mathbf{j}) + (27.19\mathbf{i} + 12.68\mathbf{j}) \\ &= (3.42 + 27.19)\mathbf{i} + (9.40 + 12.68)\mathbf{j} \\ &= 30.61\mathbf{i} + 22.08\mathbf{j}.\end{aligned}$$

Use  $F_1$  and  $F_2$ , found above.

Add the horizontal components.

Add the vertical components.

Simplify.

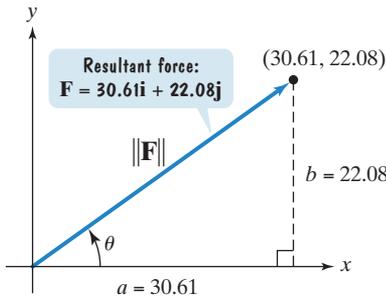

FIGURE 6.63

**Figure 6.63** shows the resultant force,  $\mathbf{F}$ , without showing  $\mathbf{F}_1$  and  $\mathbf{F}_2$ .

Now that we have the resultant force vector,  $\mathbf{F}$ , we can find its magnitude.

$$\|\mathbf{F}\| = \sqrt{a^2 + b^2} = \sqrt{(30.61)^2 + (22.08)^2} \approx 37.74$$

The magnitude of the resultant force is approximately 37.74 pounds.

To find  $\theta$ , the direction angle of the resultant force, we can use

$$\cos \theta = \frac{a}{\|\mathbf{F}\|} \quad \text{or} \quad \sin \theta = \frac{b}{\|\mathbf{F}\|}.$$

These ratios are illustrated for the right triangle in **Figure 6.63**.

Using the first formula, we obtain

$$\cos \theta = \frac{a}{\|\mathbf{F}\|} \approx \frac{30.61}{37.74}.$$

Thus,

$$\theta = \cos^{-1}\left(\frac{30.61}{37.74}\right) \approx 35.8^\circ. \quad \text{Use a calculator.}$$

The direction angle of the resultant force is approximately  $35.8^\circ$ .

In summary, the two given forces are equivalent to a single force of approximately 37.74 pounds with a direction angle of approximately  $35.8^\circ$ . ●●●

## GREAT QUESTION!

**In Figure 6.63, do I have to use the cosine or the sine to find the direction angle,  $\theta$ ?**

No. If  $\mathbf{F} = a\mathbf{i} + b\mathbf{j}$ , the direction angle,  $\theta$ , of  $\mathbf{F}$  can also be found using

$$\tan \theta = \frac{b}{a}.$$

 **Check Point 9** Two forces,  $\mathbf{F}_1$  and  $\mathbf{F}_2$ , of magnitude 30 and 60 pounds, respectively, act on an object. The direction of  $\mathbf{F}_1$  is  $N10^\circ E$  and the direction of  $\mathbf{F}_2$  is  $N60^\circ E$ . Find the magnitude, to the nearest hundredth of a pound, and the direction angle, to the nearest tenth of a degree, of the resultant force.

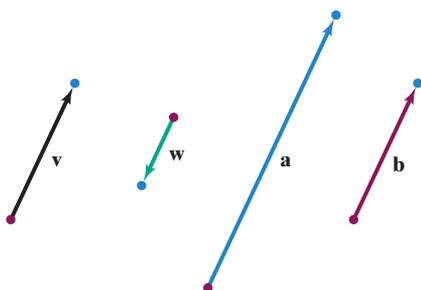

We have seen that velocity vectors represent the direction and speed of moving objects. Boats moving in currents and airplanes flying in winds are situations in which two velocity vectors act simultaneously. For example, suppose  $\mathbf{v}$  represents the velocity of a plane in still air. Further suppose that  $\mathbf{w}$  represents the velocity of the wind. The actual speed and direction of the plane is given by the vector  $\mathbf{v} + \mathbf{w}$ . This resultant vector describes the plane's speed and direction relative to the ground. Problems involving the resultant velocity of a boat or plane are solved using the same method that we used in Example 9 to find a single resultant force equivalent to two given forces.

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

1. A quantity that has both magnitude and direction is called a/an \_\_\_\_\_.
2. A quantity that has magnitude but no direction is called a/an \_\_\_\_\_.

In Exercises 3–5, refer to the vectors shown below.

3. The vectors that appear to be equal are \_\_\_\_\_ and \_\_\_\_\_.
4. The vector that appears to be a scalar multiple of  $\mathbf{v}$  is \_\_\_\_\_, where the scalar is positive and not 1.
5. The vector that appears to be a scalar multiple of  $\mathbf{v}$  is \_\_\_\_\_, where the scalar is negative.
6. The vectors  $\mathbf{i}$  and  $\mathbf{j}$  both have magnitudes of 1 and are called \_\_\_\_\_ vectors. The direction of vector  $\mathbf{i}$  is along the positive \_\_\_\_\_-axis. The direction of vector  $\mathbf{j}$  is along the positive \_\_\_\_\_-axis.

7. Consider vector  $\mathbf{v}$  from  $(0, 0)$  to  $(a, b)$ :

$$\mathbf{v} = a\mathbf{i} + b\mathbf{j}.$$

The horizontal component of  $\mathbf{v}$  is \_\_\_\_\_. The vertical component of  $\mathbf{v}$  is \_\_\_\_\_. The magnitude of  $\mathbf{v}$  is given by  $\|\mathbf{v}\| =$  \_\_\_\_\_.

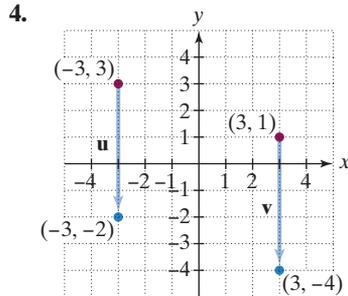

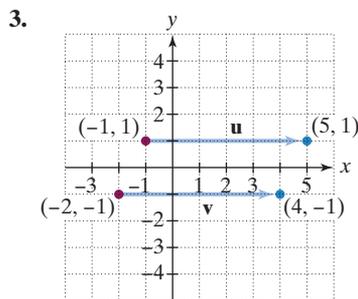

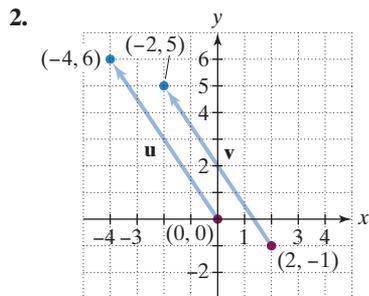

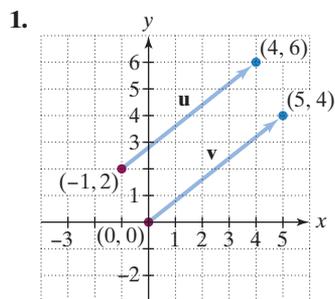

8. A vector whose initial point is at the origin is called a/an \_\_\_\_\_ vector.
9. Vector  $\mathbf{v}$  with initial point  $P_1 = (x_1, y_1)$  and terminal point  $P_2 = (x_2, y_2)$  is equal to the vector  $\mathbf{v} =$  (\_\_\_\_\_)  $\mathbf{i} +$  (\_\_\_\_\_)  $\mathbf{j}$ .
10. If  $\mathbf{v} = a_1\mathbf{i} + b_1\mathbf{j}$  and  $\mathbf{w} = a_2\mathbf{i} + b_2\mathbf{j}$ , then  $\mathbf{v} + \mathbf{w} =$  (\_\_\_\_\_)  $\mathbf{i} +$  (\_\_\_\_\_)  $\mathbf{j}$   
 $\mathbf{v} - \mathbf{w} =$  (\_\_\_\_\_)  $\mathbf{i} +$  (\_\_\_\_\_)  $\mathbf{j}$   
 $k\mathbf{v} =$  (\_\_\_\_\_)  $\mathbf{i} +$  (\_\_\_\_\_)  $\mathbf{j}$ .
11. For any nonzero vector  $\mathbf{v}$ , the unit vector that has the same direction as  $\mathbf{v}$  is \_\_\_\_\_. To find this vector, divide  $\mathbf{v}$  by its \_\_\_\_\_.
12. Let  $\mathbf{v}$  be a nonzero vector. If  $\theta$  is the direction angle measured from the positive  $x$ -axis to  $\mathbf{v}$ , then the vector can be expressed in terms of its magnitude and direction angle as  $\mathbf{v} = \|\mathbf{v}\|$  \_\_\_\_\_  $\mathbf{i} + \|\mathbf{v}\|$  \_\_\_\_\_  $\mathbf{j}$ .
13. If  $\mathbf{F}_1$  and  $\mathbf{F}_2$  are two forces acting on an object, the vector sum  $\mathbf{F}_1 + \mathbf{F}_2$  is called the \_\_\_\_\_ force.

## EXERCISE SET 6.6

### Practice Exercises

In Exercises 1–4,  $\mathbf{u}$  and  $\mathbf{v}$  have the same direction. In each exercise:

- a. Find  $\|\mathbf{u}\|$ .      b. Find  $\|\mathbf{v}\|$ .      c. Is  $\mathbf{u} = \mathbf{v}$ ? Explain.

In Exercises 5–12, sketch each vector as a position vector and find its magnitude.

5.  $\mathbf{v} = 3\mathbf{i} + \mathbf{j}$                       6.  $\mathbf{v} = 2\mathbf{i} + 3\mathbf{j}$   
 7.  $\mathbf{v} = \mathbf{i} - \mathbf{j}$                         8.  $\mathbf{v} = -\mathbf{i} - \mathbf{j}$   
 9.  $\mathbf{v} = -6\mathbf{i} - 2\mathbf{j}$                     10.  $\mathbf{v} = 5\mathbf{i} - 2\mathbf{j}$   
 11.  $\mathbf{v} = -4\mathbf{i}$                             12.  $\mathbf{v} = -5\mathbf{j}$

In Exercises 13–20, let  $\mathbf{v}$  be the vector from initial point  $P_1$  to terminal point  $P_2$ . Write  $\mathbf{v}$  in terms of  $\mathbf{i}$  and  $\mathbf{j}$ .

13.  $P_1 = (-4, -4), P_2 = (6, 2)$   
 14.  $P_1 = (2, -5), P_2 = (-6, 6)$   
 15.  $P_1 = (-8, 6), P_2 = (-2, 3)$   
 16.  $P_1 = (-7, -4), P_2 = (0, -2)$   
 17.  $P_1 = (-1, 7), P_2 = (-7, -7)$   
 18.  $P_1 = (-1, 6), P_2 = (7, -5)$   
 19.  $P_1 = (-3, 4), P_2 = (6, 4)$   
 20.  $P_1 = (4, -5), P_2 = (4, 3)$

In Exercises 21–38, let

$$\mathbf{u} = 2\mathbf{i} - 5\mathbf{j}, \mathbf{v} = -3\mathbf{i} + 7\mathbf{j}, \text{ and } \mathbf{w} = -\mathbf{i} - 6\mathbf{j}.$$

Find each specified vector or scalar.

21.  $\mathbf{u} + \mathbf{v}$                                 22.  $\mathbf{v} + \mathbf{w}$   
 23.  $\mathbf{u} - \mathbf{v}$                                 24.  $\mathbf{v} - \mathbf{w}$   
 25.  $\mathbf{v} - \mathbf{u}$                                 26.  $\mathbf{w} - \mathbf{v}$   
 27.  $5\mathbf{v}$                                     28.  $6\mathbf{v}$   
 29.  $-4\mathbf{w}$                                   30.  $-7\mathbf{w}$   
 31.  $3\mathbf{w} + 2\mathbf{v}$                           32.  $3\mathbf{u} + 4\mathbf{v}$   
 33.  $3\mathbf{v} - 4\mathbf{w}$                           34.  $4\mathbf{w} - 3\mathbf{v}$   
 35.  $\|2\mathbf{u}\|$                                 36.  $\|-2\mathbf{u}\|$   
 37.  $\|\mathbf{w} - \mathbf{u}\|$                           38.  $\|\mathbf{u} - \mathbf{w}\|$

In Exercises 39–46, find the unit vector that has the same direction as the vector  $\mathbf{v}$ .

39.  $\mathbf{v} = 6\mathbf{i}$                                 40.  $\mathbf{v} = -5\mathbf{j}$   
 41.  $\mathbf{v} = 3\mathbf{i} - 4\mathbf{j}$                         42.  $\mathbf{v} = 8\mathbf{i} - 6\mathbf{j}$   
 43.  $\mathbf{v} = 3\mathbf{i} - 2\mathbf{j}$                         44.  $\mathbf{v} = 4\mathbf{i} - 2\mathbf{j}$   
 45.  $\mathbf{v} = \mathbf{i} + \mathbf{j}$                             46.  $\mathbf{v} = \mathbf{i} - \mathbf{j}$

In Exercises 47–52, write the vector  $\mathbf{v}$  in terms of  $\mathbf{i}$  and  $\mathbf{j}$  whose magnitude  $\|\mathbf{v}\|$  and direction angle  $\theta$  are given.

47.  $\|\mathbf{v}\| = 6, \theta = 30^\circ$                 48.  $\|\mathbf{v}\| = 8, \theta = 45^\circ$   
 49.  $\|\mathbf{v}\| = 12, \theta = 225^\circ$             50.  $\|\mathbf{v}\| = 10, \theta = 330^\circ$   
 51.  $\|\mathbf{v}\| = \frac{1}{2}, \theta = 113^\circ$             52.  $\|\mathbf{v}\| = \frac{1}{4}, \theta = 200^\circ$

### Practice Plus

In Exercises 53–56, let

$$\mathbf{u} = -2\mathbf{i} + 3\mathbf{j}, \mathbf{v} = 6\mathbf{i} - \mathbf{j}, \mathbf{w} = -3\mathbf{i}.$$

Find each specified vector or scalar.

53.  $4\mathbf{u} - (2\mathbf{v} - \mathbf{w})$                     54.  $3\mathbf{u} - (4\mathbf{v} - \mathbf{w})$   
 55.  $\|\mathbf{u} + \mathbf{v}\|^2 - \|\mathbf{u} - \mathbf{v}\|^2$             56.  $\|\mathbf{v} + \mathbf{w}\|^2 - \|\mathbf{v} - \mathbf{w}\|^2$

In Exercises 57–60, let

$$\begin{aligned} \mathbf{u} &= a_1\mathbf{i} + b_1\mathbf{j} \\ \mathbf{v} &= a_2\mathbf{i} + b_2\mathbf{j} \\ \mathbf{w} &= a_3\mathbf{i} + b_3\mathbf{j}. \end{aligned}$$

Prove each property by obtaining the vector on each side of the equation. Have you proved a distributive, associative, or commutative property of vectors?

57.  $\mathbf{u} + \mathbf{v} = \mathbf{v} + \mathbf{u}$   
 58.  $(\mathbf{u} + \mathbf{v}) + \mathbf{w} = \mathbf{u} + (\mathbf{v} + \mathbf{w})$   
 59.  $c(\mathbf{u} + \mathbf{v}) = c\mathbf{u} + c\mathbf{v}$   
 60.  $(c + d)\mathbf{u} = c\mathbf{u} + d\mathbf{u}$

In Exercises 61–64, find the magnitude  $\|\mathbf{v}\|$ , to the nearest hundredth, and the direction angle  $\theta$ , to the nearest tenth of a degree, for each given vector  $\mathbf{v}$ .

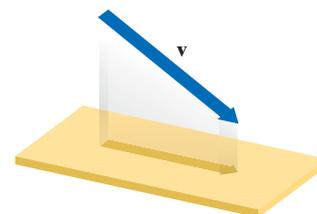

61.  $\mathbf{v} = -10\mathbf{i} + 15\mathbf{j}$                       62.  $\mathbf{v} = 2\mathbf{i} - 8\mathbf{j}$   
 63.  $\mathbf{v} = (4\mathbf{i} - 2\mathbf{j}) - (4\mathbf{i} - 8\mathbf{j})$   
 64.  $\mathbf{v} = (7\mathbf{i} - 3\mathbf{j}) - (10\mathbf{i} - 3\mathbf{j})$

### Application Exercises

In Exercises 65–68, a vector is described. Express the vector in terms of  $\mathbf{i}$  and  $\mathbf{j}$ . If exact values are not possible, round components to the nearest tenth.

65. A quarterback releases a football with a speed of 44 feet per second at an angle of  $30^\circ$  with the horizontal.  
 66. A child pulls a sled along level ground by exerting a force of 30 pounds on a handle that makes an angle of  $45^\circ$  with the ground.  
 67. A plane approaches a runway at 150 miles per hour at an angle of  $8^\circ$  with the runway.  
 68. A plane with an airspeed of 450 miles per hour is flying in the direction  $N35^\circ W$ .

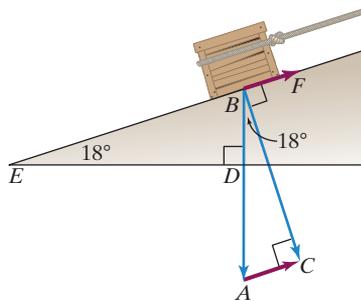

Vectors are used in computer graphics to determine lengths of shadows over flat surfaces. The length of the shadow for  $\mathbf{v}$  in the figure shown is the absolute value of the vector's horizontal component. In Exercises 69–70, the magnitude and direction angle of  $\mathbf{v}$  are given. Write  $\mathbf{v}$  in terms of  $\mathbf{i}$  and  $\mathbf{j}$ . Then find the length of the shadow to the nearest tenth of an inch.

69.  $\|\mathbf{v}\| = 1.5$  inches,  $\theta = 25^\circ$   
 70.  $\|\mathbf{v}\| = 1.8$  inches,  $\theta = 40^\circ$

71. The magnitude and direction of two forces acting on an object are 70 pounds, S56°E, and 50 pounds, N72°E, respectively. Find the magnitude, to the nearest hundredth of a pound, and the direction angle, to the nearest tenth of a degree, of the resultant force.
72. The magnitude and direction exerted by two tugboats towing a ship are 4200 pounds, N65°E, and 3000 pounds, S58°E, respectively. Find the magnitude, to the nearest pound, and the direction angle, to the nearest tenth of a degree, of the resultant force.
73. The magnitude and direction exerted by two tugboats towing a ship are 1610 kilograms, N35°W, and 1250 kilograms, S55°W, respectively. Find the magnitude, to the nearest kilogram, and the direction angle, to the nearest tenth of a degree, of the resultant force.
74. The magnitude and direction of two forces acting on an object are 64 kilograms, N39°W, and 48 kilograms, S59°W, respectively. Find the magnitude, to the nearest hundredth of a kilogram, and the direction angle, to the nearest tenth of a degree, of the resultant force.

The figure shows a box being pulled up a ramp inclined at  $18^\circ$  from the horizontal.

Use the following information to solve Exercises 75–76.

- $\overrightarrow{BA}$  = force of gravity
- $\|\overrightarrow{BA}\|$  = weight of the box
- $\|\overrightarrow{AC}\|$  = magnitude of the force needed to pull the box up the ramp
- $\|\overrightarrow{BC}\|$  = magnitude of the force of the box against the ramp

75. If the box weighs 100 pounds, find the magnitude of the force needed to pull it up the ramp.
76. If a force of 30 pounds is needed to pull the box up the ramp, find the weight of the box.

In Exercises 77–78, round answers to the nearest pound.

77. a. Find the magnitude of the force required to keep a 3500-pound car from sliding down a hill inclined at  $5.5^\circ$  from the horizontal.  
 b. Find the magnitude of the force of the car against the hill.
78. a. Find the magnitude of the force required to keep a 280-pound barrel from sliding down a ramp inclined at  $12.5^\circ$  from the horizontal.  
 b. Find the magnitude of the force of the barrel against the ramp.

The forces  $\mathbf{F}_1, \mathbf{F}_2, \mathbf{F}_3, \dots, \mathbf{F}_n$  acting on an object are in **equilibrium** if the resultant force is the zero vector:

$$\mathbf{F}_1 + \mathbf{F}_2 + \mathbf{F}_3 + \dots + \mathbf{F}_n = \mathbf{0}.$$

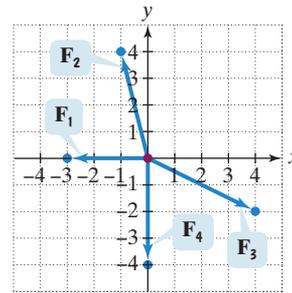

In Exercises 79–82, the given forces are acting on an object.

- a. Find the resultant force.  
 b. What additional force is required for the given forces to be in equilibrium?

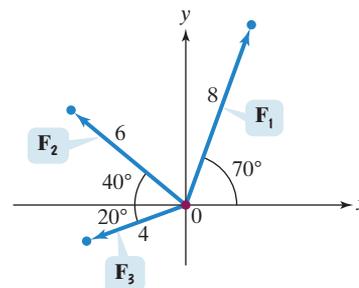

79.  $\mathbf{F}_1 = 3\mathbf{i} - 5\mathbf{j}$ ,  $\mathbf{F}_2 = 6\mathbf{i} + 2\mathbf{j}$

80.  $\mathbf{F}_1 = -2\mathbf{i} + 3\mathbf{j}$ ,  $\mathbf{F}_2 = \mathbf{i} - \mathbf{j}$ ,  $\mathbf{F}_3 = 5\mathbf{i} - 12\mathbf{j}$

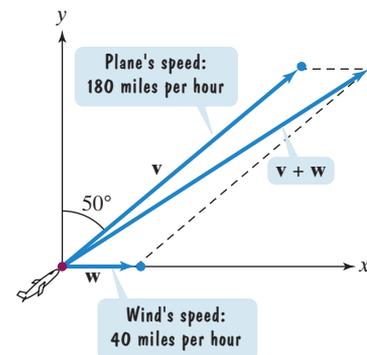

81.

82.

83. The figure shows a small plane flying at a speed of 180 miles per hour on a bearing of N50°E. The wind is blowing from west to east at 40 miles per hour. The figure indicates that  $\mathbf{v}$  represents the velocity of the plane in still air and  $\mathbf{w}$  represents the velocity of the wind.

- a. Express  $\mathbf{v}$  and  $\mathbf{w}$  in terms of their magnitudes and direction angles.  
 b. Find the resultant vector,  $\mathbf{v} + \mathbf{w}$ .  
 c. The magnitude of  $\mathbf{v} + \mathbf{w}$ , called the **ground speed** of the plane, gives its speed relative to the ground. Approximate the ground speed to the nearest mile per hour.  
 d. The direction angle of  $\mathbf{v} + \mathbf{w}$  gives the plane's true course relative to the ground. Approximate the true course to the nearest tenth of a degree. What is the plane's true bearing?

84. Use the procedure outlined in Exercise 83 to solve this exercise. A plane is flying at a speed of 400 miles per hour on a bearing of  $N50^\circ W$ . The wind is blowing at 30 miles per hour on a bearing of  $N25^\circ E$ .
- Approximate the plane's ground speed to the nearest mile per hour.
  - Approximate the plane's true course to the nearest tenth of a degree. What is its true bearing?
85. A plane is flying at a speed of 320 miles per hour on a bearing of  $N70^\circ E$ . Its ground speed is 370 miles per hour and its true course is  $30^\circ$ . Find the speed, to the nearest mile per hour, and the direction angle, to the nearest tenth of a degree, of the wind.
86. A plane is flying at a speed of 540 miles per hour on a bearing of  $S36^\circ E$ . Its ground speed is 500 miles per hour and its true bearing is  $S44^\circ E$ . Find the speed, to the nearest mile per hour, and the direction angle, to the nearest tenth of a degree, of the wind.

### Writing in Mathematics

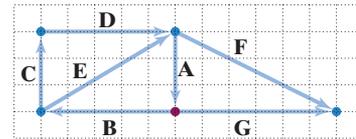

87. What is a directed line segment?
88. What are equal vectors?
89. If vector  $\mathbf{v}$  is represented by an arrow, how is  $-3\mathbf{v}$  represented?
90. If vectors  $\mathbf{u}$  and  $\mathbf{v}$  are represented by arrows, describe how the vector sum  $\mathbf{u} + \mathbf{v}$  is represented.
91. What is the vector  $\mathbf{i}$ ?
92. What is the vector  $\mathbf{j}$ ?
93. What is a position vector? How is a position vector represented using  $\mathbf{i}$  and  $\mathbf{j}$ ?
94. If  $\mathbf{v}$  is a vector between any two points in the rectangular coordinate system, explain how to write  $\mathbf{v}$  in terms of  $\mathbf{i}$  and  $\mathbf{j}$ .
95. If two vectors are expressed in terms of  $\mathbf{i}$  and  $\mathbf{j}$ , explain how to find their sum.
96. If two vectors are expressed in terms of  $\mathbf{i}$  and  $\mathbf{j}$ , explain how to find their difference.
97. If a vector is expressed in terms of  $\mathbf{i}$  and  $\mathbf{j}$ , explain how to find the scalar multiplication of the vector and a given scalar  $k$ .
98. What is the zero vector?
99. Describe one similarity between the zero vector and the number 0.
100. Explain how to find the unit vector in the direction of any given vector  $\mathbf{v}$ .
101. Explain how to write a vector in terms of its magnitude and direction.
102. You are on an airplane. The pilot announces the plane's speed over the intercom. Which speed do you think is being reported: the speed of the plane in still air or the speed after the effect of the wind has been accounted for? Explain your answer.
103. Use vectors to explain why it is difficult to hold a heavy stack of books perfectly still for a long period of time. As you become exhausted, what eventually happens? What does this mean in terms of the forces acting on the books?

### Critical Thinking Exercises

**Make Sense?** In Exercises 104–107, determine whether each statement makes sense or does not make sense, and explain your reasoning.

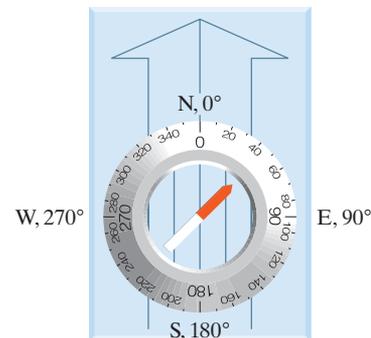

104. I used a vector to represent a wind velocity of 13 miles per hour from the west.
105. I used a vector to represent the average yearly rate of change in a man's height between ages 13 and 18.
106. Once I've found a unit vector  $\mathbf{u}$ , the vector  $-\mathbf{u}$  must also be a unit vector.
107. The resultant force of two forces that each have a magnitude of one pound is a vector whose magnitude is two pounds.

In Exercises 108–111, use the figure shown to determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

108.  $\mathbf{A} + \mathbf{B} = \mathbf{E}$
109.  $\mathbf{D} + \mathbf{A} + \mathbf{B} + \mathbf{C} = \mathbf{0}$
110.  $\mathbf{B} - \mathbf{E} = \mathbf{G} - \mathbf{F}$
111.  $\|\mathbf{A}\| = \|\mathbf{C}\|$
112. Let  $\mathbf{v} = a\mathbf{i} + b\mathbf{j}$ . Show that  $\frac{\mathbf{v}}{\|\mathbf{v}\|}$  is a unit vector in the direction of  $\mathbf{v}$ .

In Exercises 113–114, refer to the navigational compass shown in the figure. The compass is marked clockwise in degrees that start at north  $0^\circ$ .

113. An airplane has an air speed of 240 miles per hour and a compass heading of  $280^\circ$ . A steady wind of 30 miles per hour is blowing in the direction of  $265^\circ$ . What is the plane's true speed relative to the ground? What is its compass heading relative to the ground?
114. Two tugboats are pulling on a large ship that has gone aground. One tug pulls with a force of 2500 pounds in a compass direction of  $55^\circ$ . The second tug pulls with a force of 2000 pounds in a compass direction of  $95^\circ$ . Find the magnitude and the compass direction of the resultant force.

115. You want to fly your small plane due north, but there is a 75-kilometer wind blowing from west to east.
- Find the direction angle for where you should head the plane if your speed relative to the ground is 310 kilometers per hour.
  - If you increase your air speed, should the direction angle in part (a) increase or decrease? Explain your answer.

### Preview Exercises

Exercises 116–118 will help you prepare for the material covered in the next section.

116. Find the obtuse angle  $\theta$ , rounded to the nearest tenth of a degree, satisfying

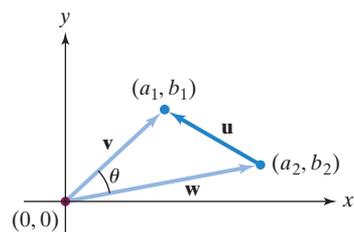

$$\cos \theta = \frac{3(-1) + (-2)(4)}{\|\mathbf{v}\|\|\mathbf{w}\|},$$

where  $\mathbf{v} = 3\mathbf{i} - 2\mathbf{j}$  and  $\mathbf{w} = -\mathbf{i} + 4\mathbf{j}$ .

117. If  $\mathbf{w} = -2\mathbf{i} + 6\mathbf{j}$ , find the following vector:

$$\frac{2(-2) + 4(-6)}{\|\mathbf{w}\|^2} \mathbf{w}.$$

118. Consider the triangle formed by vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$ .

- Use the magnitudes of the three vectors to write the Law of Cosines for the triangle shown in the figure:  $\|\mathbf{u}\|^2 = ?$ .
- Use the coordinates of the points shown in the figure to write algebraic expressions for  $\|\mathbf{u}\|$ ,  $\|\mathbf{u}\|^2$ ,  $\|\mathbf{v}\|$ ,  $\|\mathbf{v}\|^2$ ,  $\|\mathbf{w}\|$ , and  $\|\mathbf{w}\|^2$ .

## SECTION 6.7

### The Dot Product

#### Objectives

- Find the dot product of two vectors.
- Find the angle between two vectors.
- Use the dot product to determine if two vectors are orthogonal.
- Find the projection of a vector onto another vector.
- Express a vector as the sum of two orthogonal vectors.
- Compute work.

Talk about hard work! I can see the weightlifter's muscles quivering from the exertion of holding the barbell in a stationary position above her head. Still, I'm not sure if she's doing as much work as I am, sitting at my desk with my brain quivering from studying trigonometric functions and their applications.

Would it surprise you to know that neither you nor the weightlifter are doing any work at all? The definition of work in physics and mathematics is not the same as what we mean by "work" in everyday use. To understand what is involved in real work, we turn to a new vector operation called the dot product.

- 1 Find the dot product of two vectors.

### The Dot Product of Two Vectors

The operations of vector addition and scalar multiplication result in vectors. By contrast, the *dot product* of two vectors results in a scalar (a real number), rather than a vector.

#### Definition of the Dot Product

If  $\mathbf{v} = a_1\mathbf{i} + b_1\mathbf{j}$  and  $\mathbf{w} = a_2\mathbf{i} + b_2\mathbf{j}$  are vectors, the **dot product**  $\mathbf{v} \cdot \mathbf{w}$  is defined as follows:

$$\mathbf{v} \cdot \mathbf{w} = a_1a_2 + b_1b_2.$$

The dot product of two vectors is the sum of the products of their horizontal components and their vertical components.

#### EXAMPLE 1 Finding Dot Products

If  $\mathbf{v} = 5\mathbf{i} - 2\mathbf{j}$  and  $\mathbf{w} = -3\mathbf{i} + 4\mathbf{j}$ , find each of the following dot products:

- a.  $\mathbf{v} \cdot \mathbf{w}$       b.  $\mathbf{w} \cdot \mathbf{v}$       c.  $\mathbf{v} \cdot \mathbf{v}$ .

#### SOLUTION

To find each dot product, multiply the two horizontal components, and then multiply the two vertical components. Finally, add the two products.

a.  $\mathbf{v} \cdot \mathbf{w} = 5(-3) + (-2)(4) = -15 - 8 = -23$

Multiply the horizontal components and multiply the vertical components of  $\mathbf{v} = 5\mathbf{i} - 2\mathbf{j}$  and  $\mathbf{w} = -3\mathbf{i} + 4\mathbf{j}$ .

b.  $\mathbf{w} \cdot \mathbf{v} = -3(5) + 4(-2) = -15 - 8 = -23$

Multiply the horizontal components and multiply the vertical components of  $\mathbf{w} = -3\mathbf{i} + 4\mathbf{j}$  and  $\mathbf{v} = 5\mathbf{i} - 2\mathbf{j}$ .

c.  $\mathbf{v} \cdot \mathbf{v} = 5(5) + (-2)(-2) = 25 + 4 = 29$

Multiply the horizontal components and multiply the vertical components of  $\mathbf{v} = 5\mathbf{i} - 2\mathbf{j}$  and  $\mathbf{v} = 5\mathbf{i} - 2\mathbf{j}$ .

...

 **Check Point 1** If  $\mathbf{v} = 7\mathbf{i} - 4\mathbf{j}$  and  $\mathbf{w} = 2\mathbf{i} - \mathbf{j}$ , find each of the following dot products:

- a.  $\mathbf{v} \cdot \mathbf{w}$       b.  $\mathbf{w} \cdot \mathbf{v}$       c.  $\mathbf{w} \cdot \mathbf{w}$ .

In Example 1 and Check Point 1, did you notice that  $\mathbf{v} \cdot \mathbf{w}$  and  $\mathbf{w} \cdot \mathbf{v}$  produced the same scalar? The fact that  $\mathbf{v} \cdot \mathbf{w} = \mathbf{w} \cdot \mathbf{v}$  follows from the definition of the dot product. Properties of the dot product are given in the following box. Proofs for some of these properties are given in the appendix.

#### Properties of the Dot Product

If  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  are vectors, and  $c$  is a scalar, then

1.  $\mathbf{u} \cdot \mathbf{v} = \mathbf{v} \cdot \mathbf{u}$
2.  $\mathbf{u} \cdot (\mathbf{v} + \mathbf{w}) = \mathbf{u} \cdot \mathbf{v} + \mathbf{u} \cdot \mathbf{w}$
3.  $\mathbf{0} \cdot \mathbf{v} = 0$
4.  $\mathbf{v} \cdot \mathbf{v} = \|\mathbf{v}\|^2$
5.  $(c\mathbf{u}) \cdot \mathbf{v} = c(\mathbf{u} \cdot \mathbf{v}) = \mathbf{u} \cdot (c\mathbf{v})$

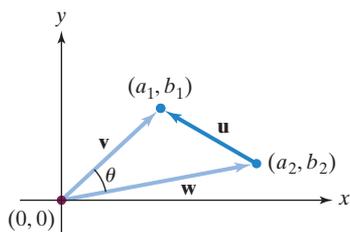

FIGURE 6.64

### The Angle between Two Vectors

The Law of Cosines can be used to derive another formula for the dot product. This formula will give us a way to find the angle between two vectors.

**Figure 6.64** shows vectors  $\mathbf{v} = a_1\mathbf{i} + b_1\mathbf{j}$  and  $\mathbf{w} = a_2\mathbf{i} + b_2\mathbf{j}$ . By the definition of the dot product, we know that  $\mathbf{v} \cdot \mathbf{w} = a_1a_2 + b_1b_2$ . Our new formula for the dot product involves the angle between the vectors, shown as  $\theta$  in the figure. Apply the Law of Cosines to the triangle shown in the figure.

$$\|\mathbf{u}\|^2 = \|\mathbf{v}\|^2 + \|\mathbf{w}\|^2 - 2\|\mathbf{v}\|\|\mathbf{w}\|\cos\theta \quad \text{Use the Law of Cosines.}$$

$$\begin{aligned} \mathbf{u} &= (a_1 - a_2)\mathbf{i} + (b_1 - b_2)\mathbf{j} & \mathbf{v} &= a_1\mathbf{i} + b_1\mathbf{j} & \mathbf{w} &= a_2\mathbf{i} + b_2\mathbf{j} \\ \|\mathbf{u}\| &= \sqrt{(a_1 - a_2)^2 + (b_1 - b_2)^2} & \|\mathbf{v}\| &= \sqrt{a_1^2 + b_1^2} & \|\mathbf{w}\| &= \sqrt{a_2^2 + b_2^2} \end{aligned}$$

$$(a_1 - a_2)^2 + (b_1 - b_2)^2 = (a_1^2 + b_1^2) + (a_2^2 + b_2^2) - 2\|\mathbf{v}\|\|\mathbf{w}\|\cos\theta$$

Substitute the squares of the magnitudes of vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  into the Law of Cosines.

$$a_1^2 - 2a_1a_2 + a_2^2 + b_1^2 - 2b_1b_2 + b_2^2 = a_1^2 + b_1^2 + a_2^2 + b_2^2 - 2\|\mathbf{v}\|\|\mathbf{w}\|\cos\theta$$

Square the binomials using  $(A - B)^2 = A^2 - 2AB + B^2$ .

$$-2a_1a_2 - 2b_1b_2 = -2\|\mathbf{v}\|\|\mathbf{w}\|\cos\theta$$

Subtract  $a_1^2$ ,  $a_2^2$ ,  $b_1^2$ , and  $b_2^2$  from both sides of the equation.

$$a_1a_2 + b_1b_2 = \|\mathbf{v}\|\|\mathbf{w}\|\cos\theta$$

Divide both sides by  $-2$ .

By definition,  
 $\mathbf{v} \cdot \mathbf{w} = a_1a_2 + b_1b_2$ .

$$\mathbf{v} \cdot \mathbf{w} = \|\mathbf{v}\|\|\mathbf{w}\|\cos\theta$$

Substitute  $\mathbf{v} \cdot \mathbf{w}$  for the expression on the left side of the equation.

#### Alternative Formula for the Dot Product

If  $\mathbf{v}$  and  $\mathbf{w}$  are two nonzero vectors and  $\theta$  is the smallest nonnegative angle between them, then

$$\mathbf{v} \cdot \mathbf{w} = \|\mathbf{v}\|\|\mathbf{w}\|\cos\theta.$$

- 2 Find the angle between two vectors.

Solving the formula in the box for  $\cos\theta$  gives us a formula for finding the angle between two vectors:

#### Formula for the Angle between Two Vectors

If  $\mathbf{v}$  and  $\mathbf{w}$  are two nonzero vectors and  $\theta$  is the smallest nonnegative angle between  $\mathbf{v}$  and  $\mathbf{w}$ , then

$$\cos\theta = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\|\|\mathbf{w}\|} \quad \text{and} \quad \theta = \cos^{-1}\left(\frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\|\|\mathbf{w}\|}\right).$$

#### EXAMPLE 2 Finding the Angle between Two Vectors

Find the angle  $\theta$  between the vectors  $\mathbf{v} = 3\mathbf{i} - 2\mathbf{j}$  and  $\mathbf{w} = -\mathbf{i} + 4\mathbf{j}$ , shown in **Figure 6.65** at the top of the next page. Round to the nearest tenth of a degree.

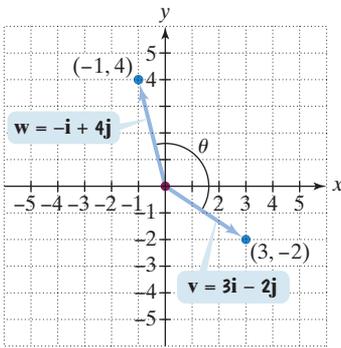

FIGURE 6.65 Finding the angle between two vectors

### SOLUTION

Use the formula for the angle between two vectors.

$$\begin{aligned}\cos \theta &= \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\| \|\mathbf{w}\|} \\ &= \frac{(3\mathbf{i} - 2\mathbf{j}) \cdot (-\mathbf{i} + 4\mathbf{j})}{\sqrt{3^2 + (-2)^2} \sqrt{(-1)^2 + 4^2}} \\ &= \frac{3(-1) + (-2)(4)}{\sqrt{13} \sqrt{17}} \\ &= -\frac{11}{\sqrt{221}}\end{aligned}$$

Begin with the formula for the cosine of the angle between two vectors.

Substitute the given vectors in the numerator. Find the magnitude of each vector in the denominator.

Find the dot product in the numerator. Simplify in the denominator.

Perform the indicated operations.

The angle  $\theta$  between the vectors is

$$\theta = \cos^{-1}\left(-\frac{11}{\sqrt{221}}\right) \approx 137.7^\circ.$$

Use a calculator.

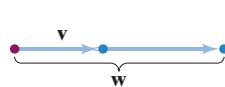

...

**Check Point 2** Find the angle between the vectors  $\mathbf{v} = 4\mathbf{i} - 3\mathbf{j}$  and  $\mathbf{w} = \mathbf{i} + 2\mathbf{j}$ . Round to the nearest tenth of a degree.

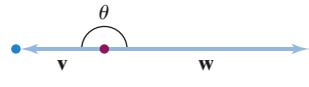

- 3 Use the dot product to determine if two vectors are orthogonal.

### Parallel and Orthogonal Vectors

Two vectors are **parallel** when the angle  $\theta$  between the vectors is  $0^\circ$  or  $180^\circ$ . If  $\theta = 0^\circ$ , the vectors point in the same direction. If  $\theta = 180^\circ$ , the vectors point in opposite directions. Figure 6.66 shows parallel vectors.

$\theta = 0^\circ$  and  $\cos \theta = 1$ .  
Vectors point in the same direction.

$\theta = 180^\circ$  and  $\cos \theta = -1$ . Vectors point in opposite directions.

FIGURE 6.66 Parallel vectors

Two vectors are **orthogonal** when the angle between the vectors is  $90^\circ$ , shown in Figure 6.67. (The word *orthogonal*, rather than *perpendicular*, is used to describe vectors that meet at right angles.) We know that  $\mathbf{v} \cdot \mathbf{w} = \|\mathbf{v}\| \|\mathbf{w}\| \cos \theta$ . If  $\mathbf{v}$  and  $\mathbf{w}$  are orthogonal, then

$$\mathbf{v} \cdot \mathbf{w} = \|\mathbf{v}\| \|\mathbf{w}\| \cos 90^\circ = \|\mathbf{v}\| \|\mathbf{w}\| (0) = 0.$$

Conversely, if  $\mathbf{v}$  and  $\mathbf{w}$  are vectors such that  $\mathbf{v} \cdot \mathbf{w} = 0$ , then  $\|\mathbf{v}\| = 0$  or  $\|\mathbf{w}\| = 0$  or  $\cos \theta = 0$ . If  $\cos \theta = 0$ , then  $\theta = 90^\circ$ , so  $\mathbf{v}$  and  $\mathbf{w}$  are orthogonal.

The preceding discussion is summarized as follows:

#### The Dot Product and Orthogonal Vectors

Two nonzero vectors  $\mathbf{v}$  and  $\mathbf{w}$  are orthogonal if and only if  $\mathbf{v} \cdot \mathbf{w} = 0$ . Because  $\mathbf{0} \cdot \mathbf{v} = 0$ , the zero vector is orthogonal to every vector  $\mathbf{v}$ .

#### EXAMPLE 3 Determining Whether Vectors Are Orthogonal

Are the vectors  $\mathbf{v} = 6\mathbf{i} - 3\mathbf{j}$  and  $\mathbf{w} = \mathbf{i} + 2\mathbf{j}$  orthogonal?

### SOLUTION

The vectors are orthogonal if their dot product is 0. Begin by finding  $\mathbf{v} \cdot \mathbf{w}$ .

$$\mathbf{v} \cdot \mathbf{w} = (6\mathbf{i} - 3\mathbf{j}) \cdot (\mathbf{i} + 2\mathbf{j}) = 6(1) + (-3)(2) = 6 - 6 = 0$$

The dot product is 0. Thus, the given vectors are orthogonal. They are shown in Figure 6.68.

...

**Check Point 3** Are the vectors  $\mathbf{v} = 2\mathbf{i} + 3\mathbf{j}$  and  $\mathbf{w} = 6\mathbf{i} - 4\mathbf{j}$  orthogonal?

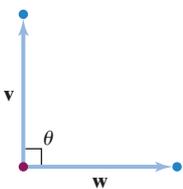

FIGURE 6.67 Orthogonal vectors:  $\theta = 90^\circ$  and  $\cos \theta = 0$

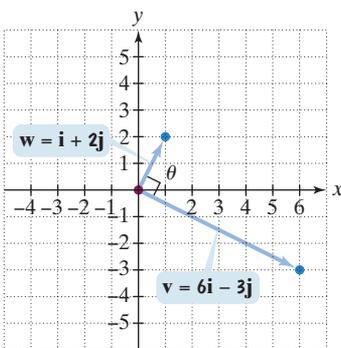

FIGURE 6.68 Orthogonal vectors

- 4 Find the projection of a vector onto another vector.

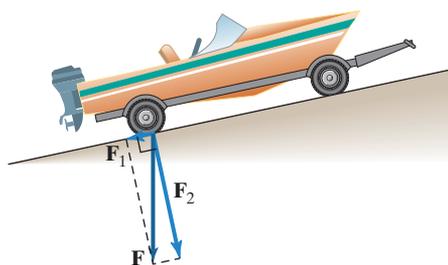

FIGURE 6.69

### Projection of a Vector onto Another Vector

You know how to add two vectors to obtain a resultant vector. We now reverse this process by expressing a vector as the sum of two orthogonal vectors. By doing this, you can determine how much force is applied in a particular direction. For example, **Figure 6.69** shows a boat on a tilted ramp. The force due to gravity,  $\mathbf{F}$ , is pulling straight down on the boat. Part of this force,  $\mathbf{F}_1$ , is pushing the boat down the ramp. Another part of this force,  $\mathbf{F}_2$ , is pressing the boat against the ramp, at a right angle to the incline. These two orthogonal vectors,  $\mathbf{F}_1$  and  $\mathbf{F}_2$ , are called the **vector components** of  $\mathbf{F}$ . Notice that

$$\mathbf{F} = \mathbf{F}_1 + \mathbf{F}_2.$$

A method for finding  $\mathbf{F}_1$  and  $\mathbf{F}_2$  involves projecting a vector onto another vector.

**Figure 6.70** shows two nonzero vectors,  $\mathbf{v}$  and  $\mathbf{w}$ , with the same initial point. The angle between the vectors,  $\theta$ , is acute in **Figure 6.70(a)** and obtuse in **Figure 6.70(b)**. A third vector, called the **vector projection of  $\mathbf{v}$  onto  $\mathbf{w}$** , is also shown in each figure, denoted by  $\text{proj}_{\mathbf{w}}\mathbf{v}$ .

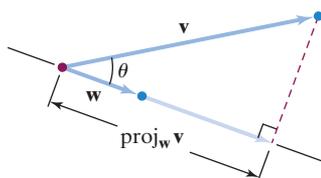

FIGURE 6.70(a)

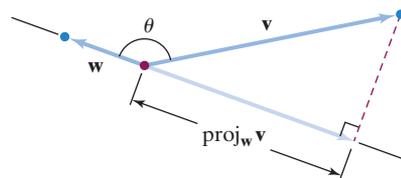

FIGURE 6.70(b)

How is the vector projection of  $\mathbf{v}$  onto  $\mathbf{w}$  formed? Draw the line segment from the terminal point of  $\mathbf{v}$  that forms a right angle with a line through  $\mathbf{w}$ , shown in red. The projection of  $\mathbf{v}$  onto  $\mathbf{w}$  lies on a line through  $\mathbf{w}$ , and is parallel to vector  $\mathbf{w}$ . This vector begins at the common initial point of  $\mathbf{v}$  and  $\mathbf{w}$ . It ends at the point where the dashed red line segment intersects the line through  $\mathbf{w}$ .

Our goal is to determine an expression for  $\text{proj}_{\mathbf{w}}\mathbf{v}$ . We begin with its magnitude. By the definition of the cosine function,

$$\cos \theta = \frac{\|\text{proj}_{\mathbf{w}}\mathbf{v}\|}{\|\mathbf{v}\|}$$

This is the magnitude of the vector projection of  $\mathbf{v}$  onto  $\mathbf{w}$ .

$$\|\mathbf{v}\| \cos \theta = \|\text{proj}_{\mathbf{w}}\mathbf{v}\| \quad \text{Multiply both sides by } \|\mathbf{v}\|.$$

$$\|\text{proj}_{\mathbf{w}}\mathbf{v}\| = \|\mathbf{v}\| \cos \theta. \quad \text{Reverse the two sides.}$$

We can rewrite the right side of this equation and obtain another expression for the magnitude of the vector projection of  $\mathbf{v}$  onto  $\mathbf{w}$ . To do so, use the alternate formula for the dot product,  $\mathbf{v} \cdot \mathbf{w} = \|\mathbf{v}\| \|\mathbf{w}\| \cos \theta$ .

Divide both sides of  $\mathbf{v} \cdot \mathbf{w} = \|\mathbf{v}\| \|\mathbf{w}\| \cos \theta$  by  $\|\mathbf{w}\|$ :

$$\frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|} = \|\mathbf{v}\| \cos \theta.$$

The expression on the right side of this equation,  $\|\mathbf{v}\| \cos \theta$ , is the same expression that appears in the formula for  $\|\text{proj}_{\mathbf{w}}\mathbf{v}\|$ . Thus,

$$\|\text{proj}_{\mathbf{w}}\mathbf{v}\| = \|\mathbf{v}\| \cos \theta = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|}.$$

We use the formula for the magnitude of  $\text{proj}_{\mathbf{w}}\mathbf{v}$  to find the vector itself. This is done by finding the scalar product of the magnitude and the unit vector in the direction of  $\mathbf{w}$ .

$$\text{proj}_{\mathbf{w}}\mathbf{v} = \left( \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|} \right) \left( \frac{\mathbf{w}}{\|\mathbf{w}\|} \right) = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2} \mathbf{w}$$

This is the magnitude of the vector projection of  $\mathbf{v}$  onto  $\mathbf{w}$ .

This is the unit vector in the direction of  $\mathbf{w}$ .

### The Vector Projection of $\mathbf{v}$ onto $\mathbf{w}$

If  $\mathbf{v}$  and  $\mathbf{w}$  are two nonzero vectors, the vector projection of  $\mathbf{v}$  onto  $\mathbf{w}$  is

$$\text{proj}_{\mathbf{w}}\mathbf{v} = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2} \mathbf{w}.$$

### EXAMPLE 4 Finding the Vector Projection of One Vector onto Another

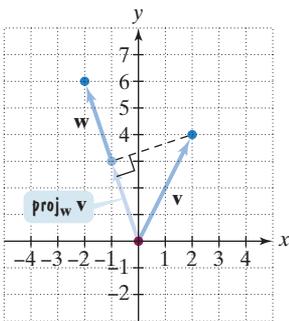

If  $\mathbf{v} = 2\mathbf{i} + 4\mathbf{j}$  and  $\mathbf{w} = -2\mathbf{i} + 6\mathbf{j}$ , find the vector projection of  $\mathbf{v}$  onto  $\mathbf{w}$ .

#### SOLUTION

The vector projection of  $\mathbf{v}$  onto  $\mathbf{w}$  is found using the formula for  $\text{proj}_{\mathbf{w}}\mathbf{v}$ .

$$\begin{aligned} \text{proj}_{\mathbf{w}}\mathbf{v} &= \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2} \mathbf{w} = \frac{(2\mathbf{i} + 4\mathbf{j}) \cdot (-2\mathbf{i} + 6\mathbf{j})}{(\sqrt{(-2)^2 + 6^2})^2} \mathbf{w} \\ &= \frac{2(-2) + 4(6)}{(\sqrt{40})^2} \mathbf{w} = \frac{20}{40} \mathbf{w} = \frac{1}{2}(-2\mathbf{i} + 6\mathbf{j}) = -\mathbf{i} + 3\mathbf{j} \end{aligned}$$

The three vectors,  $\mathbf{v}$ ,  $\mathbf{w}$ , and  $\text{proj}_{\mathbf{w}}\mathbf{v}$ , are shown in **Figure 6.71**. ...

**FIGURE 6.71** The vector projection of  $\mathbf{v}$  onto  $\mathbf{w}$

- 5** Express a vector as the sum of two orthogonal vectors.

**Check Point 4** If  $\mathbf{v} = 2\mathbf{i} - 5\mathbf{j}$  and  $\mathbf{w} = \mathbf{i} - \mathbf{j}$ , find the vector projection of  $\mathbf{v}$  onto  $\mathbf{w}$ .

We use the vector projection of  $\mathbf{v}$  onto  $\mathbf{w}$ ,  $\text{proj}_{\mathbf{w}}\mathbf{v}$ , to express  $\mathbf{v}$  as the sum of two orthogonal vectors.

### The Vector Components of $\mathbf{v}$

Let  $\mathbf{v}$  and  $\mathbf{w}$  be two nonzero vectors. Vector  $\mathbf{v}$  can be expressed as the sum of two orthogonal vectors,  $\mathbf{v}_1$  and  $\mathbf{v}_2$ , where  $\mathbf{v}_1$  is parallel to  $\mathbf{w}$  and  $\mathbf{v}_2$  is orthogonal to  $\mathbf{w}$ .

$$\mathbf{v}_1 = \text{proj}_{\mathbf{w}}\mathbf{v} = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2} \mathbf{w}, \quad \mathbf{v}_2 = \mathbf{v} - \mathbf{v}_1$$

Thus,  $\mathbf{v} = \mathbf{v}_1 + \mathbf{v}_2$ . The vectors  $\mathbf{v}_1$  and  $\mathbf{v}_2$  are called the **vector components** of  $\mathbf{v}$ . The process of expressing  $\mathbf{v}$  as  $\mathbf{v}_1 + \mathbf{v}_2$  is called the **decomposition** of  $\mathbf{v}$  into  $\mathbf{v}_1$  and  $\mathbf{v}_2$ .

### EXAMPLE 5 Decomposing a Vector into Two Orthogonal Vectors

Let  $\mathbf{v} = 2\mathbf{i} + 4\mathbf{j}$  and  $\mathbf{w} = -2\mathbf{i} + 6\mathbf{j}$ . Decompose  $\mathbf{v}$  into two vectors,  $\mathbf{v}_1$  and  $\mathbf{v}_2$ , where  $\mathbf{v}_1$  is parallel to  $\mathbf{w}$  and  $\mathbf{v}_2$  is orthogonal to  $\mathbf{w}$ .

## SOLUTION

The vectors  $\mathbf{v} = 2\mathbf{i} + 4\mathbf{j}$  and  $\mathbf{w} = -2\mathbf{i} + 6\mathbf{j}$  are the vectors we worked with in Example 4. We use the formulas in the box on the preceding page.

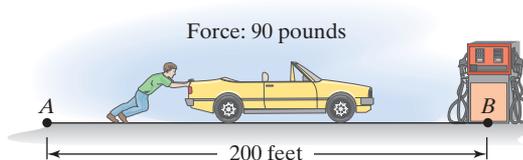

$$\begin{aligned}\mathbf{v}_1 &= \text{proj}_{\mathbf{w}}\mathbf{v} = -\mathbf{i} + 3\mathbf{j} && \text{We obtained this vector in Example 4.} \\ \mathbf{v}_2 &= \mathbf{v} - \mathbf{v}_1 = (2\mathbf{i} + 4\mathbf{j}) - (-\mathbf{i} + 3\mathbf{j}) = 3\mathbf{i} + \mathbf{j}\end{aligned}$$

 **Check Point 5** Let  $\mathbf{v} = 2\mathbf{i} - 5\mathbf{j}$  and  $\mathbf{w} = \mathbf{i} - \mathbf{j}$ . (These are the vectors from Check Point 4.) Decompose  $\mathbf{v}$  into two vectors,  $\mathbf{v}_1$  and  $\mathbf{v}_2$ , where  $\mathbf{v}_1$  is parallel to  $\mathbf{w}$  and  $\mathbf{v}_2$  is orthogonal to  $\mathbf{w}$ .

## 6 Compute work.

## Work: An Application of the Dot Product

The bad news: Your car just died. The good news: It died on a level road just 200 feet from a gas station. Exerting a constant force of 90 pounds, and not necessarily whistling as you work, you manage to push the car to the gas station.

Although you did not whistle, you certainly did work pushing the car 200 feet from point  $A$  to point  $B$ . How much work did you do? If a constant force  $\mathbf{F}$  is applied to an object, moving it from point  $A$  to point  $B$  in the direction of the force, the work,  $W$ , done is

$$W = (\text{magnitude of force})(\text{distance from } A \text{ to } B).$$

You pushed with a force of 90 pounds for a distance of 200 feet. The work done by your force is

$$W = (90 \text{ pounds})(200 \text{ feet})$$

or 18,000 foot-pounds. Work is often measured in foot-pounds or in newton-meters.

The photo on the left shows an adult pulling a small child in a wagon. Work is being done. However, the situation is not quite the same as pushing your car. Pushing the car, the force you applied was along the line of motion. By contrast, the force of the adult pulling the wagon is not applied along the line of the wagon's motion. In this case, the dot product is used to determine the work done by the force.

## Definition of Work

The work,  $W$ , done by a force  $\mathbf{F}$  moving an object from  $A$  to  $B$  is

$$W = \mathbf{F} \cdot \overrightarrow{AB}.$$

When computing work, it is often easier to use the alternative formula for the dot product. Thus,

$$W = \mathbf{F} \cdot \overrightarrow{AB} = \|\mathbf{F}\| \|\overrightarrow{AB}\| \cos \theta.$$

$\|\mathbf{F}\|$  is the magnitude of the force.

$\|\overrightarrow{AB}\|$  is the distance over which the constant force is applied.

$\theta$  is the angle between the force and the direction of motion.

It is correct to refer to  $W$  as either the work done or the work done by the force.

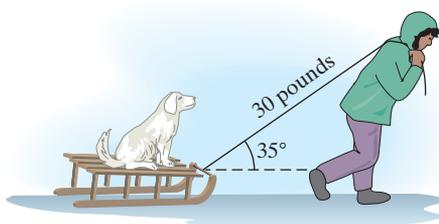

FIGURE 6.72 Computing work done pulling a sled 200 feet

### EXAMPLE 6 Computing Work

A child pulls a sled along level ground by exerting a force of 30 pounds on a rope that makes an angle of  $35^\circ$  with the horizontal. How much work is done pulling the sled 200 feet?

### SOLUTION

The situation is illustrated in **Figure 6.72**. The work done is

$$W = \|\mathbf{F}\| \|\overline{AB}\| \cos \theta = (30)(200) \cos 35^\circ \approx 4915.$$

Magnitude  
of the force  
is 30 pounds.

Distance  
is  
200 feet.

The angle  
between the  
force and the  
sled's motion  
is  $35^\circ$ .

Thus, the work done is approximately 4915 foot-pounds. ...

**Check Point 6** A child pulls a wagon along level ground by exerting a force of 20 pounds on a handle that makes an angle of  $30^\circ$  with the horizontal. How much work is done pulling the wagon 150 feet?

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- If  $\mathbf{v} = a_1\mathbf{i} + b_1\mathbf{j}$  and  $\mathbf{w} = a_2\mathbf{i} + b_2\mathbf{j}$  are vectors, the product  $\mathbf{v} \cdot \mathbf{w}$ , called the \_\_\_\_\_, is defined as  $\mathbf{v} \cdot \mathbf{w} =$  \_\_\_\_\_.
- If  $\mathbf{v}$  and  $\mathbf{w}$  are two nonzero vectors and  $\theta$  is the smallest nonnegative angle between them, then  $\mathbf{v} \cdot \mathbf{w} =$  \_\_\_\_\_.
- If  $\mathbf{v} \cdot \mathbf{w} = 0$ , then the vectors  $\mathbf{v}$  and  $\mathbf{w}$  are \_\_\_\_\_.
- True or false: Given two nonzero vectors  $\mathbf{v}$  and  $\mathbf{w}$ ,  $\mathbf{v}$  can be decomposed into two vectors, one parallel to  $\mathbf{w}$  and the other orthogonal to  $\mathbf{w}$ . \_\_\_\_\_
- True or false: The definition of work indicates that work is a vector. \_\_\_\_\_

## EXERCISE SET 6.7

### Practice Exercises

In Exercises 1–8, use the given vectors to find  $\mathbf{v} \cdot \mathbf{w}$  and  $\mathbf{v} \cdot \mathbf{v}$ .

- $\mathbf{v} = 3\mathbf{i} + \mathbf{j}$ ,  $\mathbf{w} = \mathbf{i} + 3\mathbf{j}$
- $\mathbf{v} = 3\mathbf{i} + 3\mathbf{j}$ ,  $\mathbf{w} = \mathbf{i} + 4\mathbf{j}$
- $\mathbf{v} = 5\mathbf{i} - 4\mathbf{j}$ ,  $\mathbf{w} = -2\mathbf{i} - \mathbf{j}$
- $\mathbf{v} = 7\mathbf{i} - 2\mathbf{j}$ ,  $\mathbf{w} = -3\mathbf{i} - \mathbf{j}$
- $\mathbf{v} = -6\mathbf{i} - 5\mathbf{j}$ ,  $\mathbf{w} = -10\mathbf{i} - 8\mathbf{j}$
- $\mathbf{v} = -8\mathbf{i} - 3\mathbf{j}$ ,  $\mathbf{w} = -10\mathbf{i} - 5\mathbf{j}$
- $\mathbf{v} = 5\mathbf{i}$ ,  $\mathbf{w} = \mathbf{j}$
- $\mathbf{v} = \mathbf{i}$ ,  $\mathbf{w} = -5\mathbf{j}$

In Exercises 9–16, let

$$\mathbf{u} = 2\mathbf{i} - \mathbf{j}, \quad \mathbf{v} = 3\mathbf{i} + \mathbf{j}, \quad \text{and} \quad \mathbf{w} = \mathbf{i} + 4\mathbf{j}.$$

Find each specified scalar.

- $\mathbf{u} \cdot (\mathbf{v} + \mathbf{w})$
- $\mathbf{v} \cdot (\mathbf{u} + \mathbf{w})$
- $\mathbf{u} \cdot \mathbf{v} + \mathbf{u} \cdot \mathbf{w}$
- $\mathbf{v} \cdot \mathbf{u} + \mathbf{v} \cdot \mathbf{w}$
- $(4\mathbf{u}) \cdot \mathbf{v}$
- $(5\mathbf{v}) \cdot \mathbf{w}$
- $4(\mathbf{u} \cdot \mathbf{v})$
- $5(\mathbf{v} \cdot \mathbf{w})$

In Exercises 17–22, find the angle between  $\mathbf{v}$  and  $\mathbf{w}$ . Round to the nearest tenth of a degree.

- $\mathbf{v} = 2\mathbf{i} - \mathbf{j}$ ,  $\mathbf{w} = 3\mathbf{i} + 4\mathbf{j}$
- $\mathbf{v} = -2\mathbf{i} + 5\mathbf{j}$ ,  $\mathbf{w} = 3\mathbf{i} + 6\mathbf{j}$
- $\mathbf{v} = -3\mathbf{i} + 2\mathbf{j}$ ,  $\mathbf{w} = 4\mathbf{i} - \mathbf{j}$
- $\mathbf{v} = \mathbf{i} + 2\mathbf{j}$ ,  $\mathbf{w} = 4\mathbf{i} - 3\mathbf{j}$
- $\mathbf{v} = 6\mathbf{i}$ ,  $\mathbf{w} = 5\mathbf{i} + 4\mathbf{j}$
- $\mathbf{v} = 3\mathbf{j}$ ,  $\mathbf{w} = 4\mathbf{i} + 5\mathbf{j}$

In Exercises 23–32, use the dot product to determine whether  $\mathbf{v}$  and  $\mathbf{w}$  are orthogonal.

- $\mathbf{v} = \mathbf{i} + \mathbf{j}$ ,  $\mathbf{w} = \mathbf{i} - \mathbf{j}$
- $\mathbf{v} = \mathbf{i} + \mathbf{j}$ ,  $\mathbf{w} = -\mathbf{i} + \mathbf{j}$
- $\mathbf{v} = 2\mathbf{i} + 8\mathbf{j}$ ,  $\mathbf{w} = 4\mathbf{i} - \mathbf{j}$
- $\mathbf{v} = 8\mathbf{i} - 4\mathbf{j}$ ,  $\mathbf{w} = -6\mathbf{i} - 12\mathbf{j}$
- $\mathbf{v} = 2\mathbf{i} - 2\mathbf{j}$ ,  $\mathbf{w} = -\mathbf{i} + \mathbf{j}$
- $\mathbf{v} = 5\mathbf{i} - 5\mathbf{j}$ ,  $\mathbf{w} = \mathbf{i} - \mathbf{j}$
- $\mathbf{v} = 3\mathbf{i}$ ,  $\mathbf{w} = -4\mathbf{i}$
- $\mathbf{v} = 5\mathbf{i}$ ,  $\mathbf{w} = -6\mathbf{i}$
- $\mathbf{v} = 3\mathbf{i}$ ,  $\mathbf{w} = -4\mathbf{j}$
- $\mathbf{v} = 5\mathbf{i}$ ,  $\mathbf{w} = -6\mathbf{j}$

In Exercises 33–38, find  $\text{proj}_{\mathbf{w}}\mathbf{v}$ . Then decompose  $\mathbf{v}$  into two vectors,  $\mathbf{v}_1$  and  $\mathbf{v}_2$ , where  $\mathbf{v}_1$  is parallel to  $\mathbf{w}$  and  $\mathbf{v}_2$  is orthogonal to  $\mathbf{w}$ .

33.  $\mathbf{v} = 3\mathbf{i} - 2\mathbf{j}$ ,  $\mathbf{w} = \mathbf{i} - \mathbf{j}$

34.  $\mathbf{v} = 3\mathbf{i} - 2\mathbf{j}$ ,  $\mathbf{w} = 2\mathbf{i} + \mathbf{j}$

35.  $\mathbf{v} = \mathbf{i} + 3\mathbf{j}$ ,  $\mathbf{w} = -2\mathbf{i} + 5\mathbf{j}$

36.  $\mathbf{v} = 2\mathbf{i} + 4\mathbf{j}$ ,  $\mathbf{w} = -3\mathbf{i} + 6\mathbf{j}$

37.  $\mathbf{v} = \mathbf{i} + 2\mathbf{j}$ ,  $\mathbf{w} = 3\mathbf{i} + 6\mathbf{j}$

38.  $\mathbf{v} = 2\mathbf{i} + \mathbf{j}$ ,  $\mathbf{w} = 6\mathbf{i} + 3\mathbf{j}$

### Practice Plus

In Exercises 39–42, let

$$\mathbf{u} = -\mathbf{i} + \mathbf{j}, \quad \mathbf{v} = 3\mathbf{i} - 2\mathbf{j}, \quad \text{and} \quad \mathbf{w} = -5\mathbf{j}.$$

Find each specified scalar or vector.

39.  $5\mathbf{u} \cdot (3\mathbf{v} - 4\mathbf{w})$

40.  $4\mathbf{u} \cdot (5\mathbf{v} - 3\mathbf{w})$

41.  $\text{proj}_{\mathbf{u}}(\mathbf{v} + \mathbf{w})$

42.  $\text{proj}_{\mathbf{u}}(\mathbf{v} - \mathbf{w})$

In Exercises 43–44, find the angle, in degrees, between  $\mathbf{v}$  and  $\mathbf{w}$ .

43.  $\mathbf{v} = 2 \cos \frac{4\pi}{3} \mathbf{i} + 2 \sin \frac{4\pi}{3} \mathbf{j}$ ,  $\mathbf{w} = 3 \cos \frac{3\pi}{2} \mathbf{i} + 3 \sin \frac{3\pi}{2} \mathbf{j}$

44.  $\mathbf{v} = 3 \cos \frac{5\pi}{3} \mathbf{i} + 3 \sin \frac{5\pi}{3} \mathbf{j}$ ,  $\mathbf{w} = 2 \cos \pi \mathbf{i} + 2 \sin \pi \mathbf{j}$

In Exercises 45–50, determine whether  $\mathbf{v}$  and  $\mathbf{w}$  are parallel, orthogonal, or neither.

45.  $\mathbf{v} = 3\mathbf{i} - 5\mathbf{j}$ ,  $\mathbf{w} = 6\mathbf{i} - 10\mathbf{j}$

46.  $\mathbf{v} = -2\mathbf{i} + 3\mathbf{j}$ ,  $\mathbf{w} = -6\mathbf{i} + 9\mathbf{j}$

47.  $\mathbf{v} = 3\mathbf{i} - 5\mathbf{j}$ ,  $\mathbf{w} = 6\mathbf{i} + 10\mathbf{j}$

48.  $\mathbf{v} = -2\mathbf{i} + 3\mathbf{j}$ ,  $\mathbf{w} = -6\mathbf{i} - 9\mathbf{j}$

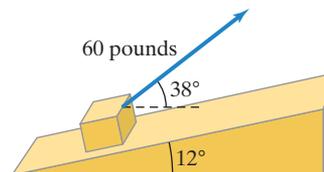

49.  $\mathbf{v} = 3\mathbf{i} - 5\mathbf{j}$ ,  $\mathbf{w} = 6\mathbf{i} + \frac{18}{5}\mathbf{j}$

50.  $\mathbf{v} = -2\mathbf{i} + 3\mathbf{j}$ ,  $\mathbf{w} = -6\mathbf{i} - 4\mathbf{j}$

### Application Exercises

51. The components of  $\mathbf{v} = 240\mathbf{i} + 300\mathbf{j}$  represent the respective number of gallons of regular and premium gas sold at a station. The components of  $\mathbf{w} = 2.90\mathbf{i} + 3.07\mathbf{j}$  represent the respective prices per gallon for each kind of gas. Find  $\mathbf{v} \cdot \mathbf{w}$  and describe what the answer means in practical terms.
52. The components of  $\mathbf{v} = 180\mathbf{i} + 450\mathbf{j}$  represent the respective number of one-day and three-day videos rented from a video store. The components of  $\mathbf{w} = 3\mathbf{i} + 2\mathbf{j}$  represent the prices to rent the one-day and three-day videos, respectively. Find  $\mathbf{v} \cdot \mathbf{w}$  and describe what the answer means in practical terms.
53. Find the work done in pushing a car along a level road from point  $A$  to point  $B$ , 80 feet from  $A$ , while exerting a constant force of 95 pounds. Round to the nearest foot-pound.
54. Find the work done when a crane lifts a 6000-pound boulder through a vertical distance of 12 feet. Round to the nearest foot-pound.

55. A wagon is pulled along level ground by exerting a force of 40 pounds on a handle that makes an angle of  $32^\circ$  with the horizontal. How much work is done pulling the wagon 100 feet? Round to the nearest foot-pound.
56. A wagon is pulled along level ground by exerting a force of 25 pounds on a handle that makes an angle of  $38^\circ$  with the horizontal. How much work is done pulling the wagon 100 feet? Round to the nearest foot-pound.
57. A force of 60 pounds on a rope is used to pull a box up a ramp inclined at  $12^\circ$  from the horizontal. The figure shows that the rope forms an angle of  $38^\circ$  with the horizontal. How much work is done pulling the box 20 feet along the ramp?

58. A force of 80 pounds on a rope is used to pull a box up a ramp inclined at  $10^\circ$  from the horizontal. The rope forms an angle of  $33^\circ$  with the horizontal. How much work is done pulling the box 25 feet along the ramp?
59. A force is given by the vector  $\mathbf{F} = 3\mathbf{i} + 2\mathbf{j}$ . The force moves an object along a straight line from the point  $(4, 9)$  to the point  $(10, 20)$ . Find the work done if the distance is measured in feet and the force is measured in pounds.
60. A force is given by the vector  $\mathbf{F} = 5\mathbf{i} + 7\mathbf{j}$ . The force moves an object along a straight line from the point  $(8, 11)$  to the point  $(18, 20)$ . Find the work done if the distance is measured in meters and the force is measured in newtons.
61. A force of 4 pounds acts in the direction of  $50^\circ$  to the horizontal. The force moves an object along a straight line from the point  $(3, 7)$  to the point  $(8, 10)$ , with distance measured in feet. Find the work done by the force.
62. A force of 6 pounds acts in the direction of  $40^\circ$  to the horizontal. The force moves an object along a straight line from the point  $(5, 9)$  to the point  $(8, 20)$ , with the distance measured in feet. Find the work done by the force.
63. Refer to **Figure 6.69** on page 758. Suppose a boat weighs 700 pounds and is on a ramp inclined at  $30^\circ$ . Represent the force due to gravity,  $\mathbf{F}$ , using
 
$$\mathbf{F} = -700\mathbf{j}.$$
  - Write a unit vector along the ramp in the upward direction.
  - Find the vector projection of  $\mathbf{F}$  onto the unit vector from part (a).
  - What is the magnitude of the vector projection in part (b)? What does this represent?
64. Refer to **Figure 6.69** on page 758. Suppose a boat weighs 650 pounds and is on a ramp inclined at  $30^\circ$ . Represent the force due to gravity,  $\mathbf{F}$ , using
 
$$\mathbf{F} = -650\mathbf{j}.$$
  - Write a unit vector along the ramp in the upward direction.
  - Find the vector projection of  $\mathbf{F}$  onto the unit vector from part (a).
  - What is the magnitude of the vector projection in part (b)? What does this represent?

### Writing in Mathematics

65. Explain how to find the dot product of two vectors.
66. Using words and no symbols, describe how to find the dot product of two vectors with the alternative formula
- $$\mathbf{v} \cdot \mathbf{w} = \|\mathbf{v}\|\|\mathbf{w}\|\cos \theta.$$
67. Describe how to find the angle between two vectors.
68. What are parallel vectors?
69. What are orthogonal vectors?
70. How do you determine if two vectors are orthogonal?
71. Draw two vectors,  $\mathbf{v}$  and  $\mathbf{w}$ , with the same initial point. Show the vector projection of  $\mathbf{v}$  onto  $\mathbf{w}$  in your diagram. Then describe how you identified this vector.
72. How do you determine the work done by a force  $\mathbf{F}$  in moving an object from  $A$  to  $B$  when the direction of the force is not along the line of motion?
73. A weightlifter is holding a barbell perfectly still above his head, his body shaking from the effort. How much work is the weightlifter doing? Explain your answer.
74. Describe one way in which the everyday use of the word *work* is different from the definition of work given in this section.

### Critical Thinking Exercises

**Make Sense?** In Exercises 75–78, determine whether each statement makes sense or does not make sense, and explain your reasoning.

75. Although I expected vector operations to produce another vector, the dot product of two vectors is not a vector, but a real number.
76. I've noticed that whenever the dot product is negative, the angle between the two vectors is obtuse.
77. I'm working with a unit vector, so its dot product with itself must be 1.
78. The weightlifter does more work in raising 300 kilograms above her head than Atlas, who is supporting the entire world.

In Exercises 79–81, use the vectors

$$\mathbf{u} = a_1\mathbf{i} + b_1\mathbf{j}, \quad \mathbf{v} = a_2\mathbf{i} + b_2\mathbf{j}, \quad \text{and} \quad \mathbf{w} = a_3\mathbf{i} + b_3\mathbf{j},$$

to prove the given property.

79.  $\mathbf{u} \cdot \mathbf{v} = \mathbf{v} \cdot \mathbf{u}$
80.  $(c\mathbf{u}) \cdot \mathbf{v} = c(\mathbf{u} \cdot \mathbf{v})$
81.  $\mathbf{u} \cdot (\mathbf{v} + \mathbf{w}) = \mathbf{u} \cdot \mathbf{v} + \mathbf{u} \cdot \mathbf{w}$
82. If  $\mathbf{v} = -2\mathbf{i} + 5\mathbf{j}$ , find a vector orthogonal to  $\mathbf{v}$ .
83. Find a value of  $b$  so that  $15\mathbf{i} - 3\mathbf{j}$  and  $-4\mathbf{i} + b\mathbf{j}$  are orthogonal.
84. Prove that the projection of  $\mathbf{v}$  onto  $\mathbf{i}$  is  $(\mathbf{v} \cdot \mathbf{i})\mathbf{i}$ .
85. Find two vectors  $\mathbf{v}$  and  $\mathbf{w}$  such that the projection of  $\mathbf{v}$  onto  $\mathbf{w}$  is  $\mathbf{v}$ .

### Group Exercise

86. Group members should research and present a report on unusual and interesting applications of vectors.

### Preview Exercises

Exercises 87–89 will help you prepare for the material covered in the first section of the next chapter.

87. a. Does  $(4, -1)$  satisfy  $x + 2y = 2$ ?  
b. Does  $(4, -1)$  satisfy  $x - 2y = 6$ ?
88. Graph  $x + 2y = 2$  and  $x - 2y = 6$  in the same rectangular coordinate system. At what point do the graphs intersect?
89. Solve:  $5(2x - 3) - 4x = 9$ .

## CHAPTER 6

## Summary, Review, and Test

## SUMMARY

## DEFINITIONS AND CONCEPTS

## EXAMPLES

## 6.1 and 6.2 The Law of Sines; The Law of Cosines

- a. The Law of Sines

$$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$$

Ex. 1, p. 683;

Ex. 2, p. 684;

Ex. 3, p. 685;

Ex. 4, p. 686

- b. The Law of Sines is used to solve SAA, ASA, and SSA (the ambiguous case) triangles. The ambiguous case may result in no triangle, one triangle, or two triangles; see the box on page 685.

Ex. 5, p. 687

- c. The area of a triangle equals one-half the product of the lengths of two sides times the sine of their included angle.

Ex. 6, p. 688

- d. The Law of Cosines

$$a^2 = b^2 + c^2 - 2bc \cos A$$

$$b^2 = a^2 + c^2 - 2ac \cos B$$

$$c^2 = a^2 + b^2 - 2ab \cos C$$

- e. The Law of Cosines is used to find the side opposite the given angle in an SAS triangle; see the box at the bottom of the page on page 695. The Law of Cosines is also used to find the angle opposite the longest side in an SSS triangle; see the box on page 696.

Ex. 1, p. 696;

Ex. 2, p. 697

- f. Heron's Formula for the Area of a Triangle

The area of a triangle with sides  $a$ ,  $b$ , and  $c$  is  $\sqrt{s(s-a)(s-b)(s-c)}$ , where  $s$  is one-half its perimeter:  
 $s = \frac{1}{2}(a + b + c)$ .

Ex. 4, p. 698

## 6.3 and 6.4 Polar Coordinates; Graphs of Polar Equations

- a. A point
- $P$
- in the polar coordinate system is represented by
- $(r, \theta)$
- , where
- $r$
- is the directed distance from the pole to the point and
- $\theta$
- is the angle from the polar axis to line segment
- $OP$
- . The elements of the ordered pair
- $(r, \theta)$
- are called the polar coordinates of
- $P$
- . See Figure 6.20 on page 703. When
- $r$
- in
- $(r, \theta)$
- is negative, a point is located
- $|r|$
- units along the ray opposite the terminal side of
- $\theta$
- . Important information about the sign of
- $r$
- and the location of the point
- $(r, \theta)$
- is found in the box on page 703.

Ex. 1, p. 703

- b. Multiple Representations of Points

If  $n$  is any integer,  $(r, \theta) = (r, \theta + 2n\pi)$  or  $(r, \theta) = (-r, \theta + \pi + 2n\pi)$ .

Ex. 2, p. 704

- c. Relations between Polar and Rectangular Coordinates

$$x = r \cos \theta, \quad y = r \sin \theta, \quad x^2 + y^2 = r^2, \quad \tan \theta = \frac{y}{x}$$

- d. To convert a point from polar coordinates
- $(r, \theta)$
- to rectangular coordinates
- $(x, y)$
- , use
- $x = r \cos \theta$
- and
- $y = r \sin \theta$
- .

Ex. 3, p. 706

- e. A point in rectangular coordinates
- $(x, y)$
- can be converted to polar coordinates
- $(r, \theta)$
- . Use the procedure in the box on page 707.

Ex. 4, p. 707;

Ex. 5, p. 708

- f. To convert a rectangular equation to a polar equation, replace
- $x$
- with
- $r \cos \theta$
- and
- $y$
- with
- $r \sin \theta$
- .

Ex. 6, p. 708

- g. To convert a polar equation to a rectangular equation, use one or more of

Ex. 7, p. 709

$$r^2 = x^2 + y^2, \quad r \cos \theta = x, \quad r \sin \theta = y, \quad \text{and} \quad \tan \theta = \frac{y}{x}.$$

It is often necessary to do something to the given polar equation before using the preceding expressions.

- h. A polar equation is an equation whose variables are
- $r$
- and
- $\theta$
- . The graph of a polar equation is the set of all points whose polar coordinates satisfy the equation.

Ex. 1, p. 714

- i. Polar equations can be graphed using point plotting and symmetry (see the box on page 716).

Ex. 2, p. 716

## DEFINITIONS AND CONCEPTS

- j.** The graphs of  $r = a \cos \theta$  and  $r = a \sin \theta$  are circles. See the box on page 715. The graphs of  $r = a \pm b \sin \theta$  and  $r = a \pm b \cos \theta$  are called limaçons ( $a > 0$  and  $b > 0$ ), shown in the box on page 718. The graphs of  $r = a \sin n\theta$  and  $r = a \cos n\theta$ ,  $a \neq 0$ , are rose curves with  $2n$  petals if  $n$  is even and  $n$  petals if  $n$  is odd. See the box on page 720. The graphs of  $r^2 = a^2 \sin 2\theta$  and  $r^2 = a^2 \cos 2\theta$ ,  $a \neq 0$ , are called lemniscates and are shown in the box on page 721.

Ex. 3, p. 717;  
Ex. 4, p. 719;  
Ex. 5, p. 720

## 6.5 Complex Numbers in Polar Form; DeMoivre's Theorem

- a.** The complex number  $z = a + bi$  is represented as a point  $(a, b)$  in the complex plane, shown in Figure 6.38 on page 726.
- b.** The absolute value of  $z = a + bi$  is  $|z| = |a + bi| = \sqrt{a^2 + b^2}$ .
- c.** The polar form of  $z = a + bi$  is  $z = r(\cos \theta + i \sin \theta)$ , where  $a = r \cos \theta$ ,  $b = r \sin \theta$ ,  $r = \sqrt{a^2 + b^2}$ , and  $\tan \theta = \frac{b}{a}$ . We call  $r$  the modulus and  $\theta$  the argument of  $z$ , with  $0 \leq \theta < 2\pi$ .
- d.** Multiplying Complex Numbers in Polar Form: Multiply moduli and add arguments. See the box on page 729.
- e.** Dividing Complex Numbers in Polar Form: Divide moduli and subtract arguments. See the box on page 730.
- f.** DeMoivre's Theorem is used to find powers of complex numbers in polar form.

Ex. 1, p. 727

Ex. 2, p. 727

Ex. 3, p. 728;  
Ex. 4, p. 729

Ex. 5, p. 730

Ex. 6, p. 731

Ex. 7, p. 732;  
Ex. 8, p. 732

- g.** DeMoivre's Theorem can be used to find roots of complex numbers in polar form. The  $n$  distinct  $n$ th roots of  $r(\cos \theta + i \sin \theta)$  are

Ex. 9, p. 733;  
Ex. 10, p. 734

$$\sqrt[n]{r} \left[ \cos \left( \frac{\theta + 2\pi k}{n} \right) + i \sin \left( \frac{\theta + 2\pi k}{n} \right) \right]$$

or

$$\sqrt[n]{r} \left[ \cos \left( \frac{\theta + 360^\circ k}{n} \right) + i \sin \left( \frac{\theta + 360^\circ k}{n} \right) \right],$$

where  $k = 0, 1, 2, \dots, n - 1$ .

## 6.6 Vectors

- a.** A vector is a directed line segment.
- b.** Equal vectors have the same magnitude and the same direction.
- c.** The vector  $k\mathbf{v}$ , the scalar multiple of the vector  $\mathbf{v}$  and the scalar  $k$ , has magnitude  $|k| \|\mathbf{v}\|$ . The direction of  $k\mathbf{v}$  is the same as that of  $\mathbf{v}$  if  $k > 0$  and opposite  $\mathbf{v}$  if  $k < 0$ .
- d.** The sum  $\mathbf{u} + \mathbf{v}$ , called the resultant vector, can be expressed geometrically. Position  $\mathbf{u}$  and  $\mathbf{v}$  so that the terminal point of  $\mathbf{u}$  coincides with the initial point of  $\mathbf{v}$ . The vector  $\mathbf{u} + \mathbf{v}$  extends from the initial point of  $\mathbf{u}$  to the terminal point of  $\mathbf{v}$ .
- e.** The difference of two vectors,  $\mathbf{u} - \mathbf{v}$ , is defined as  $\mathbf{u} + (-\mathbf{v})$ .
- f.** The vector  $\mathbf{i}$  is the unit vector whose direction is along the positive  $x$ -axis. The vector  $\mathbf{j}$  is the unit vector whose direction is along the positive  $y$ -axis.
- g.** Vector  $\mathbf{v}$ , from  $(0, 0)$  to  $(a, b)$ , called a position vector, is represented as  $\mathbf{v} = a\mathbf{i} + b\mathbf{j}$ , where  $a$  is the horizontal component and  $b$  is the vertical component. The magnitude of  $\mathbf{v}$  is given by  $\|\mathbf{v}\| = \sqrt{a^2 + b^2}$ .
- h.** Vector  $\mathbf{v}$  from  $(x_1, y_1)$  to  $(x_2, y_2)$  is equal to the position vector  $\mathbf{v} = (x_2 - x_1)\mathbf{i} + (y_2 - y_1)\mathbf{j}$ . In rectangular coordinates, the term "vector" refers to the position vector in terms of  $\mathbf{i}$  and  $\mathbf{j}$  that is equal to it.
- i.** Operations with Vectors in Terms of  $\mathbf{i}$  and  $\mathbf{j}$   
If  $\mathbf{v} = a_1\mathbf{i} + b_1\mathbf{j}$  and  $\mathbf{w} = a_2\mathbf{i} + b_2\mathbf{j}$ , then

Ex. 1, p. 740

Figure 6.52, p. 741

Figure 6.53, p. 741

Figure 6.54, p. 742

Ex. 2, p. 743

Ex. 3, p. 744

Ex. 4, p. 745;  
Ex. 5, p. 745;  
Ex. 6, p. 746

- $\mathbf{v} + \mathbf{w} = (a_1 + a_2)\mathbf{i} + (b_1 + b_2)\mathbf{j}$
- $\mathbf{v} - \mathbf{w} = (a_1 - a_2)\mathbf{i} + (b_1 - b_2)\mathbf{j}$
- $k\mathbf{v} = (ka_1)\mathbf{i} + (kb_1)\mathbf{j}$

- j.** The zero vector  $\mathbf{0}$  is the vector whose magnitude is 0 and is assigned no direction. Many properties of vector addition and scalar multiplication involve the zero vector. Some of these properties are listed in the box on page 746.

## EXAMPLES

## DEFINITIONS AND CONCEPTS

## EXAMPLES

- k. The vector  $\frac{\mathbf{v}}{\|\mathbf{v}\|}$  is the unit vector that has the same direction as  $\mathbf{v}$ . Ex. 7, p. 747
- l. A vector with magnitude  $\|\mathbf{v}\|$  and direction angle  $\theta$ , the angle that  $\mathbf{v}$  makes with the positive  $x$ -axis, can be expressed in terms of its magnitude and direction angle as Ex. 8, p. 748;  
Ex. 9, p. 748

$$\mathbf{v} = \|\mathbf{v}\| \cos \theta \mathbf{i} + \|\mathbf{v}\| \sin \theta \mathbf{j}.$$

## 6.7 The Dot Product

- a. Definition of the Dot Product Ex. 1, p. 755

If  $\mathbf{v} = a_1\mathbf{i} + b_1\mathbf{j}$  and  $\mathbf{w} = a_2\mathbf{i} + b_2\mathbf{j}$ , the dot product of  $\mathbf{v}$  and  $\mathbf{w}$  is defined by  $\mathbf{v} \cdot \mathbf{w} = a_1a_2 + b_1b_2$ .

- b. Alternative Formula for the Dot Product:  $\mathbf{v} \cdot \mathbf{w} = \|\mathbf{v}\|\|\mathbf{w}\| \cos \theta$ , where  $\theta$  is the smallest nonnegative angle between  $\mathbf{v}$  and  $\mathbf{w}$

- c. Angle between Two Vectors Ex. 2, p. 756

$$\cos \theta = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\|\|\mathbf{w}\|} \quad \text{and} \quad \theta = \cos^{-1}\left(\frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\|\|\mathbf{w}\|}\right)$$

- d. Two vectors are orthogonal when the angle between them is  $90^\circ$ . To show that two vectors are orthogonal, show that their dot product is zero. Ex. 3, p. 757

- e. The vector projection of  $\mathbf{v}$  onto  $\mathbf{w}$  is given by Ex. 4, p. 759

$$\text{proj}_{\mathbf{w}} \mathbf{v} = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2} \mathbf{w}.$$

- f. A vector may be expressed as the sum of two orthogonal vectors, called the vector components. See the box at the bottom of the page on page 759. Ex. 5, p. 759

- g. The work,  $W$ , done by a force  $\mathbf{F}$  moving an object from  $A$  to  $B$  is  $W = \mathbf{F} \cdot \overrightarrow{AB}$ . Ex. 6, p. 761  
Thus,  $W = \|\mathbf{F}\|\|\overrightarrow{AB}\| \cos \theta$ , where  $\theta$  is the angle between the force and the direction of motion.

## REVIEW EXERCISES

## 6.1 and 6.2

In Exercises 1–12, solve each triangle. Round lengths to the nearest tenth and angle measures to the nearest degree. If no triangle exists, state “no triangle.” If two triangles exist, solve each triangle.

- $A = 70^\circ, B = 55^\circ, a = 12$
- $B = 107^\circ, C = 30^\circ, c = 126$
- $B = 66^\circ, a = 17, c = 12$
- $a = 117, b = 66, c = 142$
- $A = 35^\circ, B = 25^\circ, c = 68$
- $A = 39^\circ, a = 20, b = 26$
- $C = 50^\circ, a = 3, c = 1$
- $A = 162^\circ, b = 11.2, c = 48.2$
- $a = 26.1, b = 40.2, c = 36.5$
- $A = 40^\circ, a = 6, b = 4$
- $B = 37^\circ, a = 12.4, b = 8.7$
- $A = 23^\circ, a = 54.3, b = 22.1$

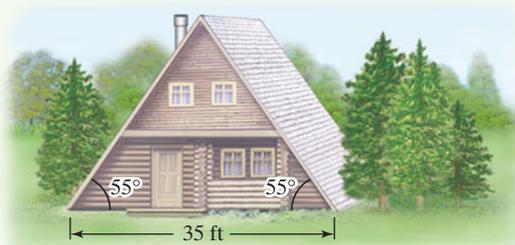

In Exercises 13–16, find the area of the triangle having the given measurements. Round to the nearest square unit.

- $C = 42^\circ, a = 4$  feet,  $b = 6$  feet
- $A = 22^\circ, b = 4$  feet,  $c = 5$  feet

15.  $a = 2$  meters,  $b = 4$  meters,  $c = 5$  meters

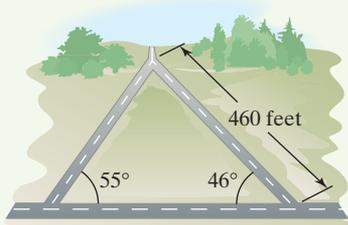

16.  $a = 2$  meters,  $b = 2$  meters,  $c = 2$  meters

17. The A-frame cabin shown below is 35 feet wide. The roof of the cabin makes a  $55^\circ$  angle with the cabin's base. Find the length of one side of the roof from its ground level to the peak. Round to the nearest tenth of a foot.

18. Two cars leave a city at the same time and travel along straight highways that differ in direction by  $80^\circ$ . One car averages 60 miles per hour and the other averages 50 miles per hour. How far apart will the cars be after 30 minutes? Round to the nearest tenth of a mile.

19. Two airplanes leave an airport at the same time on different runways. One flies on a bearing of N66.5°W at 325 miles per hour. The other airplane flies on a bearing of S26.5°W at 300 miles per hour. How far apart will the airplanes be after two hours?
20. The figure shows three roads that intersect to bound a triangular piece of land. Find the lengths of the other two sides of the land to the nearest foot.

21. A commercial piece of real estate is priced at \$5.25 per square foot. Find the cost, to the nearest dollar, of a triangular lot measuring 260 feet by 320 feet by 450 feet.

### 6.3 and 6.4

In Exercises 22–27, plot each point in polar coordinates and find its rectangular coordinates.

22.  $(4, 60^\circ)$       23.  $(3, 150^\circ)$       24.  $\left(-4, \frac{4\pi}{3}\right)$   
 25.  $\left(-2, \frac{5\pi}{4}\right)$       26.  $\left(-4, -\frac{\pi}{2}\right)$       27.  $\left(-2, -\frac{\pi}{4}\right)$

In Exercises 28–30, plot each point in polar coordinates. Then find another representation  $(r, \theta)$  of this point in which

- a.  $r > 0, 2\pi < \theta < 4\pi$ .  
 b.  $r < 0, 0 < \theta < 2\pi$ .  
 c.  $r > 0, -2\pi < \theta < 0$ .

28.  $\left(3, \frac{\pi}{6}\right)$       29.  $\left(2, \frac{2\pi}{3}\right)$       30.  $\left(3.5, \frac{\pi}{2}\right)$

In Exercises 31–36, the rectangular coordinates of a point are given. Find polar coordinates of each point.

31.  $(-4, 4)$       32.  $(3, -3)$       33.  $(5, 12)$   
 34.  $(-3, 4)$       35.  $(0, -5)$       36.  $(1, 0)$

In Exercises 37–39, convert each rectangular equation to a polar equation that expresses  $r$  in terms of  $\theta$ .

37.  $2x + 3y = 8$   
 38.  $x^2 + y^2 = 100$   
 39.  $(x - 6)^2 + y^2 = 36$

In Exercises 40–46, convert each polar equation to a rectangular equation. Then use your knowledge of the rectangular equation to graph the polar equation in a polar coordinate system.

40.  $r = 3$       41.  $\theta = \frac{3\pi}{4}$   
 42.  $r \cos \theta = -1$       43.  $r = 5 \csc \theta$   
 44.  $r = 3 \cos \theta$       45.  $4r \cos \theta + r \sin \theta = 8$   
 46.  $r^2 \sin 2\theta = -2$

In Exercises 47–49, test for symmetry with respect to

- a. the polar axis.      b. the line  $\theta = \frac{\pi}{2}$ .  
 c. the pole.

47.  $r = 5 + 3 \cos \theta$   
 48.  $r = 3 \sin \theta$   
 49.  $r^2 = 9 \cos 2\theta$

In Exercises 50–56, graph each polar equation. Be sure to test for symmetry.

50.  $r = 3 \cos \theta$       51.  $r = 2 + 2 \sin \theta$   
 52.  $r = \sin 2\theta$       53.  $r = 2 + \cos \theta$   
 54.  $r = 1 + 3 \sin \theta$       55.  $r = 1 - 2 \cos \theta$   
 56.  $r^2 = \cos 2\theta$

### 6.5

In Exercises 57–60, plot each complex number. Then write the complex number in polar form. You may express the argument in degrees or radians.

57.  $1 - i$       58.  $-2\sqrt{3} + 2i$   
 59.  $-3 - 4i$       60.  $-5i$

In Exercises 61–64, write each complex number in rectangular form. If necessary, round to the nearest tenth.

61.  $8(\cos 60^\circ + i \sin 60^\circ)$       62.  $4(\cos 210^\circ + i \sin 210^\circ)$   
 63.  $6\left(\cos \frac{2\pi}{3} + i \sin \frac{2\pi}{3}\right)$       64.  $0.6(\cos 100^\circ + i \sin 100^\circ)$

In Exercises 65–67, find the product of the complex numbers. Leave answers in polar form.

65.  $z_1 = 3(\cos 40^\circ + i \sin 40^\circ)$   
 $z_2 = 5(\cos 70^\circ + i \sin 70^\circ)$   
 66.  $z_1 = \cos 210^\circ + i \sin 210^\circ$   
 $z_2 = \cos 55^\circ + i \sin 55^\circ$   
 67.  $z_1 = 4\left(\cos \frac{3\pi}{7} + i \sin \frac{3\pi}{7}\right)$   
 $z_2 = 10\left(\cos \frac{4\pi}{7} + i \sin \frac{4\pi}{7}\right)$

In Exercises 68–70, find the quotient  $\frac{z_1}{z_2}$  of the complex numbers. Leave answers in polar form.

68.  $z_1 = 10(\cos 10^\circ + i \sin 10^\circ)$   
 $z_2 = 5(\cos 5^\circ + i \sin 5^\circ)$   
 69.  $z_1 = 5\left(\cos \frac{4\pi}{3} + i \sin \frac{4\pi}{3}\right)$   
 $z_2 = 10\left(\cos \frac{\pi}{3} + i \sin \frac{\pi}{3}\right)$   
 70.  $z_1 = 2\left(\cos \frac{5\pi}{3} + i \sin \frac{5\pi}{3}\right)$   
 $z_2 = \cos \frac{\pi}{2} + i \sin \frac{\pi}{2}$

In Exercises 71–75, use DeMoivre's Theorem to find the indicated power of the complex number. Write answers in rectangular form.

71.  $[2(\cos 20^\circ + i \sin 20^\circ)]^3$   
 72.  $[4(\cos 50^\circ + i \sin 50^\circ)]^3$   
 73.  $\left[\frac{1}{2}\left(\cos \frac{\pi}{14} + i \sin \frac{\pi}{14}\right)\right]^7$   
 74.  $(1 - i\sqrt{3})^2$   
 75.  $(-2 - 2i)^5$

In Exercises 76–77, find all the complex roots. Write roots in polar form with  $\theta$  in degrees.

76. The complex square roots of  $49(\cos 50^\circ + i \sin 50^\circ)$   
 77. The complex cube roots of  $125(\cos 165^\circ + i \sin 165^\circ)$

In Exercises 78–81, find all the complex roots. Write roots in rectangular form.

78. The complex fourth roots of  $16\left(\cos \frac{2\pi}{3} + i \sin \frac{2\pi}{3}\right)$   
 79. The complex cube roots of  $8i$   
 80. The complex cube roots of  $-1$   
 81. The complex fifth roots of  $-1 - i$

## 6.6

In Exercises 82–84, sketch each vector as a position vector and find its magnitude.

82.  $\mathbf{v} = -3\mathbf{i} - 4\mathbf{j}$   
 83.  $\mathbf{v} = 5\mathbf{i} - 2\mathbf{j}$   
 84.  $\mathbf{v} = -3\mathbf{j}$

In Exercises 85–86, let  $\mathbf{v}$  be the vector from initial point  $P_1$  to terminal point  $P_2$ . Write  $\mathbf{v}$  in terms of  $\mathbf{i}$  and  $\mathbf{j}$ .

85.  $P_1 = (2, -1)$ ,  $P_2 = (5, -3)$   
 86.  $P_1 = (-3, 0)$ ,  $P_2 = (-2, -2)$

In Exercises 87–90, let

$$\mathbf{v} = \mathbf{i} - 5\mathbf{j} \quad \text{and} \quad \mathbf{w} = -2\mathbf{i} + 7\mathbf{j}.$$

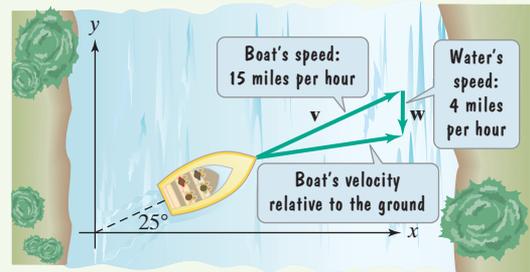

Find each specified vector or scalar.

87.  $\mathbf{v} + \mathbf{w}$   
 88.  $\mathbf{w} - \mathbf{v}$   
 89.  $6\mathbf{v} - 3\mathbf{w}$   
 90.  $\|-2\mathbf{v}\|$

In Exercises 91–92, find the unit vector that has the same direction as the vector  $\mathbf{v}$ .

91.  $\mathbf{v} = 8\mathbf{i} - 6\mathbf{j}$   
 92.  $\mathbf{v} = -\mathbf{i} + 2\mathbf{j}$

93. The magnitude and direction angle of  $\mathbf{v}$  are  $\|\mathbf{v}\| = 12$  and  $\theta = 60^\circ$ . Express  $\mathbf{v}$  in terms of  $\mathbf{i}$  and  $\mathbf{j}$ .  
 94. The magnitude and direction of two forces acting on an object are 100 pounds, N25°E, and 200 pounds, N80°E, respectively. Find the magnitude, to the nearest pound, and the direction angle, to the nearest tenth of a degree, of the resultant force.  
 95. Your boat is moving at a speed of 15 miles per hour at an angle of 25° upstream on a river flowing at 4 miles per hour. The situation is illustrated in the figure below.

- a. Find the vector representing your boat's velocity relative to the ground.  
 b. What is the speed of your boat, to the nearest mile per hour, relative to the ground?  
 c. What is the boat's direction angle, to the nearest tenth of a degree, relative to the ground?

## 6.7

96. If  $\mathbf{u} = 5\mathbf{i} + 2\mathbf{j}$ ,  $\mathbf{v} = \mathbf{i} - \mathbf{j}$ , and  $\mathbf{w} = 3\mathbf{i} - 7\mathbf{j}$ , find  $\mathbf{u} \cdot (\mathbf{v} + \mathbf{w})$ .

In Exercises 97–99, find the dot product  $\mathbf{v} \cdot \mathbf{w}$ . Then find the angle between  $\mathbf{v}$  and  $\mathbf{w}$  to the nearest tenth of a degree.

97.  $\mathbf{v} = 2\mathbf{i} + 3\mathbf{j}$ ,  $\mathbf{w} = 7\mathbf{i} - 4\mathbf{j}$   
 98.  $\mathbf{v} = 2\mathbf{i} + 4\mathbf{j}$ ,  $\mathbf{w} = 6\mathbf{i} - 11\mathbf{j}$   
 99.  $\mathbf{v} = 2\mathbf{i} + \mathbf{j}$ ,  $\mathbf{w} = \mathbf{i} - \mathbf{j}$

In Exercises 100–101, use the dot product to determine whether  $\mathbf{v}$  and  $\mathbf{w}$  are orthogonal.

100.  $\mathbf{v} = 12\mathbf{i} - 8\mathbf{j}$ ,  $\mathbf{w} = 2\mathbf{i} + 3\mathbf{j}$   
 101.  $\mathbf{v} = \mathbf{i} + 3\mathbf{j}$ ,  $\mathbf{w} = -3\mathbf{i} - \mathbf{j}$

In Exercises 102–103, find  $\text{proj}_{\mathbf{w}}\mathbf{v}$ . Then decompose  $\mathbf{v}$  into two vectors,  $\mathbf{v}_1$  and  $\mathbf{v}_2$ , where  $\mathbf{v}_1$  is parallel to  $\mathbf{w}$  and  $\mathbf{v}_2$  is orthogonal to  $\mathbf{w}$ .

102.  $\mathbf{v} = -2\mathbf{i} + 5\mathbf{j}$ ,  $\mathbf{w} = 5\mathbf{i} + 4\mathbf{j}$   
 103.  $\mathbf{v} = -\mathbf{i} + 2\mathbf{j}$ ,  $\mathbf{w} = 3\mathbf{i} - \mathbf{j}$   
 104. A heavy crate is dragged 50 feet along a level floor. Find the work done if a force of 30 pounds at an angle of  $42^\circ$  is used.

## CHAPTER 6 TEST

- In oblique triangle  $ABC$ ,  $A = 34^\circ$ ,  $B = 68^\circ$ , and  $a = 4.8$ . Find  $b$  to the nearest tenth.
- In oblique triangle  $ABC$ ,  $C = 68^\circ$ ,  $a = 5$ , and  $b = 6$ . Find  $c$  to the nearest tenth.
- In oblique triangle  $ABC$ ,  $a = 17$  inches,  $b = 45$  inches, and  $c = 32$  inches. Find the area of the triangle to the nearest square inch.
- Plot  $\left(4, \frac{5\pi}{4}\right)$  in the polar coordinate system. Then write two other ordered pairs  $(r, \theta)$  that name this point.
- If the rectangular coordinates of a point are  $(1, -1)$ , find polar coordinates of the point.
- Convert  $x^2 + (y + 8)^2 = 64$  to a polar equation that expresses  $r$  in terms of  $\theta$ .
- Convert to a rectangular equation and then graph:  
 $r = -4 \sec \theta$ .

In Exercises 8–9, graph each polar equation.

8.  $r = 1 + \sin \theta$                       9.  $r = 1 + 3 \cos \theta$

10. Write  $-\sqrt{3} + i$  in polar form.

In Exercises 11–13, perform the indicated operation. Leave answers in polar form.

11.  $5(\cos 15^\circ + i \sin 15^\circ) \cdot 10(\cos 5^\circ + i \sin 5^\circ)$

12. 
$$\frac{2\left(\cos \frac{\pi}{2} + i \sin \frac{\pi}{2}\right)}{4\left(\cos \frac{\pi}{3} + i \sin \frac{\pi}{3}\right)}$$

- $[2(\cos 10^\circ + i \sin 10^\circ)]^5$
- Find the three cube roots of 27. Write roots in rectangular form.
- If  $P_1 = (-2, 3)$ ,  $P_2 = (-1, 5)$ , and  $\mathbf{v}$  is the vector from  $P_1$  to  $P_2$ ,
  - Write  $\mathbf{v}$  in terms of  $\mathbf{i}$  and  $\mathbf{j}$ .
  - Find  $\|\mathbf{v}\|$ .

In Exercises 16–19, let

$$\mathbf{v} = -5\mathbf{i} + 2\mathbf{j} \quad \text{and} \quad \mathbf{w} = 2\mathbf{i} - 4\mathbf{j}.$$

Find the specified vector, scalar, or angle.

- $3\mathbf{v} - 4\mathbf{w}$
- $\mathbf{v} \cdot \mathbf{w}$
- the angle between  $\mathbf{v}$  and  $\mathbf{w}$ , to the nearest degree
- $\text{proj}_{\mathbf{w}} \mathbf{v}$
- A small fire is sighted from ranger stations A and B. Station B is 1.6 miles due east of station A. The bearing of the fire from station A is  $N35^\circ E$  and the bearing of the fire from station B is  $N50^\circ W$ . How far, to the nearest tenth of a mile, is the fire from station A?
- The magnitude and direction of two forces acting on an object are 250 pounds,  $N60^\circ E$ , and 150 pounds,  $S45^\circ E$ . Find the magnitude, to the nearest pound, and the direction angle, to the nearest tenth of a degree, of the resultant force.
- A child is pulling a wagon with a force of 40 pounds. How much work is done in moving the wagon 60 feet if the handle makes an angle of  $35^\circ$  with the ground? Round to the nearest foot-pound.

## CUMULATIVE REVIEW EXERCISES (CHAPTERS P–6)

Solve each equation or inequality in Exercises 1–4.

- $x^4 - x^3 - x^2 - x - 2 = 0$
- $2 \sin^2 \theta - 3 \sin \theta + 1 = 0$ ,  $0 \leq \theta < 2\pi$
- $x^2 + 2x + 3 > 11$
- $\sin \theta \cos \theta = -\frac{1}{2}$ ,  $0 \leq \theta < 2\pi$

In Exercises 5–6, graph one complete cycle.

- $y = 3 \sin(2x - \pi)$
- $y = -4 \cos \pi x$

In Exercises 7–8, verify each identity.

- $\sin \theta \csc \theta - \cos^2 \theta = \sin^2 \theta$
- $\cos\left(\theta + \frac{3\pi}{2}\right) = \sin \theta$
- Find the slope and y-intercept of the line whose equation is  $2x + 4y - 8 = 0$ .

In Exercises 10–11, find the exact value of each expression.

- $2 \sin \frac{\pi}{3} - 3 \tan \frac{\pi}{6}$
- $\sin(\tan^{-1} \frac{1}{2})$

In Exercises 12–13, find the domain of the function whose equation is given.

- $f(x) = \sqrt{5 - x}$
- $g(x) = \frac{x - 3}{x^2 - 9}$

14. A ball is thrown vertically upward from a height of 8 feet with an initial velocity of 48 feet per second. The ball's height,  $s(t)$ , in feet, after  $t$  seconds is given by

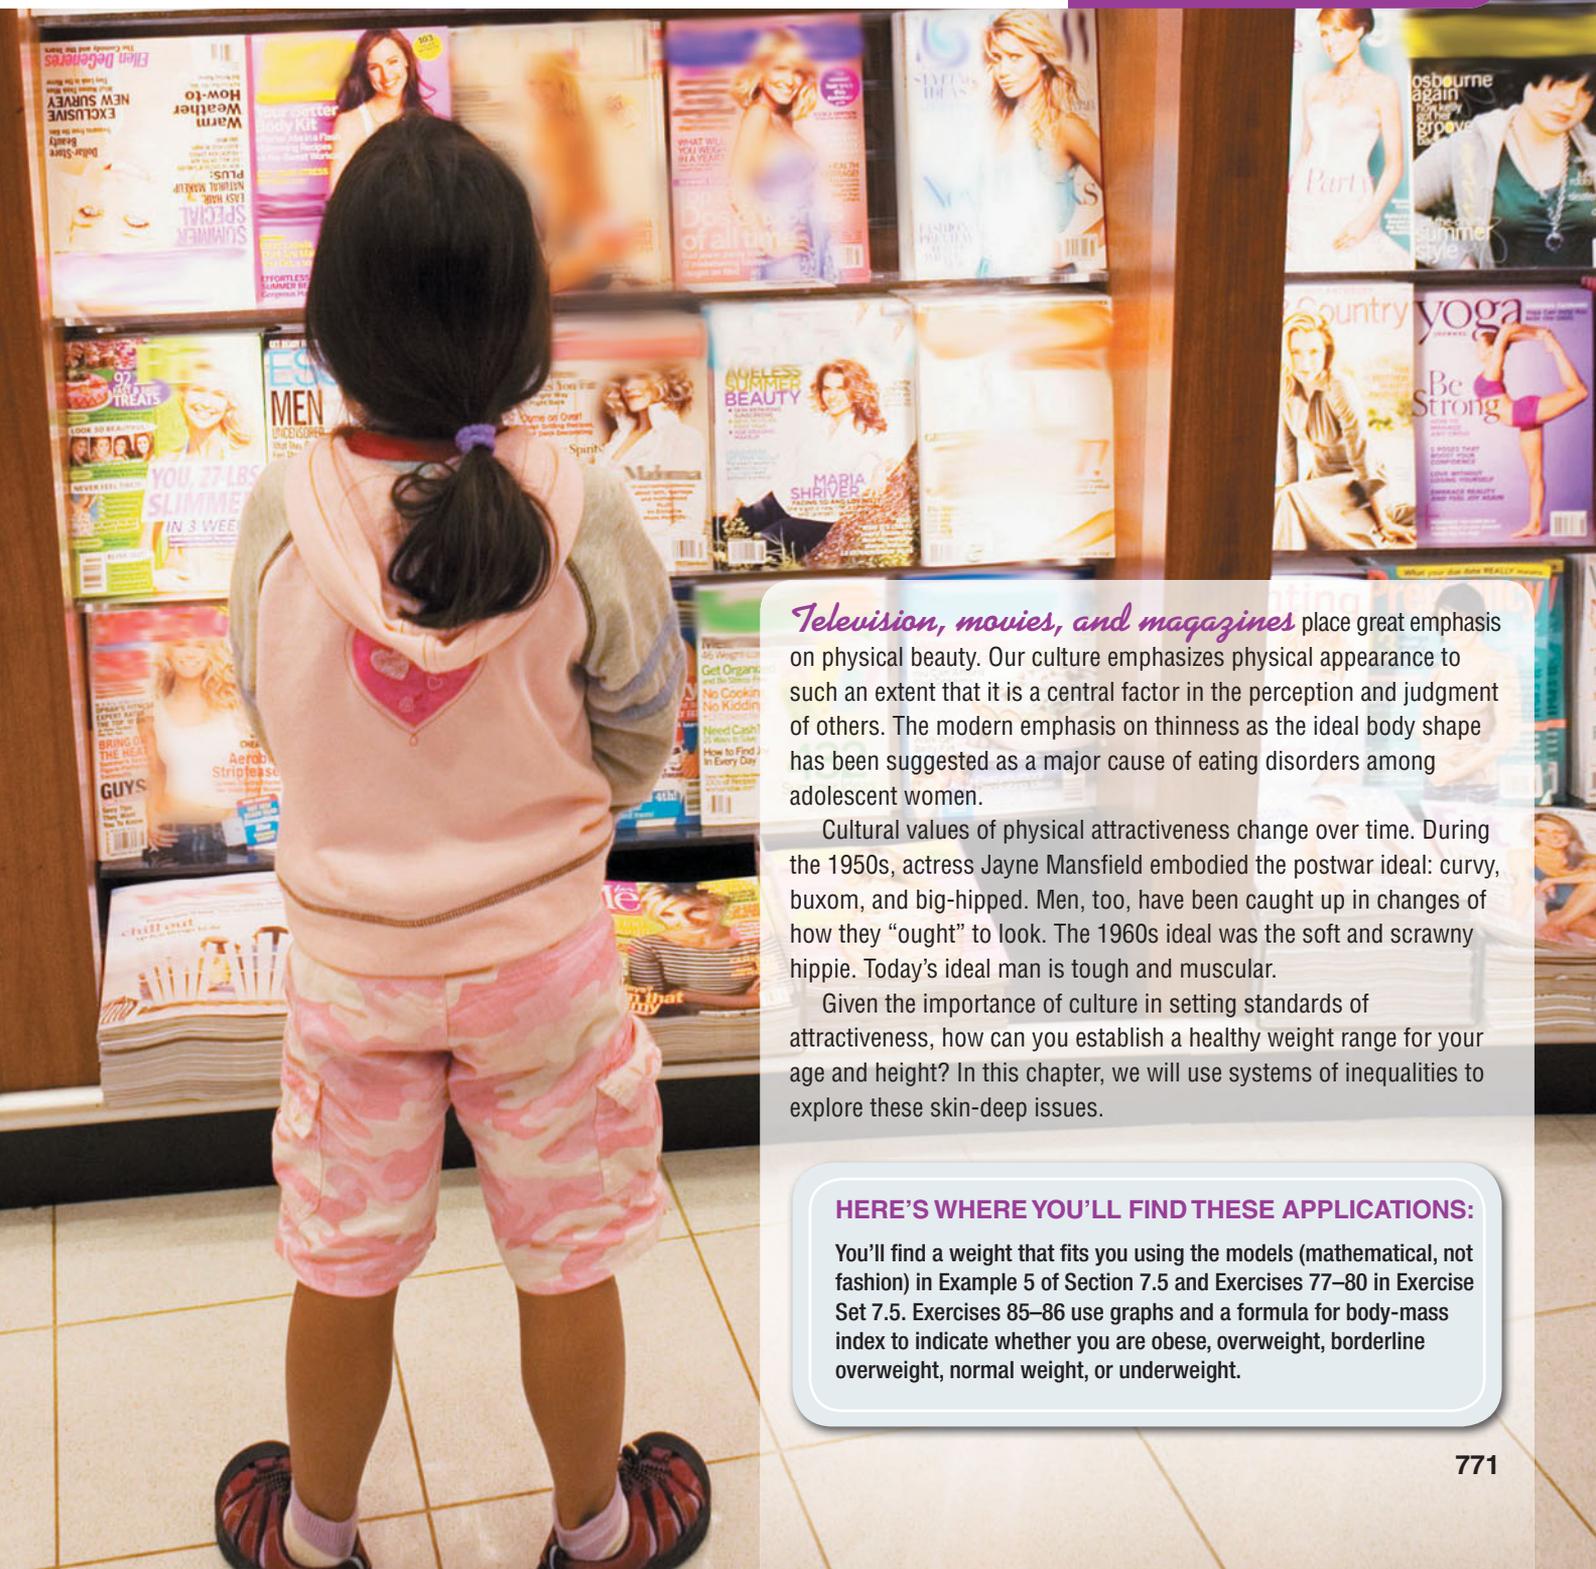

$$s(t) = -16t^2 + 48t + 8.$$

After how many seconds does the ball reach its maximum height? What is the maximum height?

15. An object moves in simple harmonic motion described by  $d = 4 \sin 5t$ , where  $t$  is measured in seconds and  $d$  in meters. Find **a.** the maximum displacement; **b.** the frequency; and **c.** the time required for one cycle.
16. Use a half-angle formula to find the exact value of  $\cos 22.5^\circ$ .
17. If  $\mathbf{v} = 2\mathbf{i} + 7\mathbf{j}$  and  $\mathbf{w} = \mathbf{i} - 2\mathbf{j}$ , find **a.**  $3\mathbf{v} - \mathbf{w}$  and **b.**  $\mathbf{v} \cdot \mathbf{w}$ .
18. Express as a single logarithm with a coefficient of 1:  $\frac{1}{2}\log_b x - \log_b(x^2 + 1)$ .
19. Write the slope-intercept form of the line passing through  $(4, -1)$  and  $(-8, 5)$ .
20. Psychologists can measure the amount learned,  $L$ , at time  $t$  using the model  $L = A(1 - e^{-kt})$ . The variable  $A$  represents the total amount to be learned and  $k$  is the learning rate. A student preparing for the SAT has 300 new vocabulary words to learn:  $A = 300$ . This particular student can learn 20 vocabulary words after 5 minutes: If  $t = 5$ ,  $L = 20$ .
- a.** Find  $k$ , the learning rate, correct to three decimal places.
- b.** Approximately how many words will the student have learned after 20 minutes?
- c.** How long will it take for the student to learn 260 words?

# SYSTEMS OF EQUATIONS AND INEQUALITIES

## CHAPTER 7

*Television, movies, and magazines* place great emphasis on physical beauty. Our culture emphasizes physical appearance to such an extent that it is a central factor in the perception and judgment of others. The modern emphasis on thinness as the ideal body shape has been suggested as a major cause of eating disorders among adolescent women.

Cultural values of physical attractiveness change over time. During the 1950s, actress Jayne Mansfield embodied the postwar ideal: curvy, buxom, and big-hipped. Men, too, have been caught up in changes of how they “ought” to look. The 1960s ideal was the soft and scrawny hippie. Today’s ideal man is tough and muscular.

Given the importance of culture in setting standards of attractiveness, how can you establish a healthy weight range for your age and height? In this chapter, we will use systems of inequalities to explore these skin-deep issues.

### HERE'S WHERE YOU'LL FIND THESE APPLICATIONS:

You'll find a weight that fits you using the models (mathematical, not fashion) in Example 5 of Section 7.5 and Exercises 77–80 in Exercise Set 7.5. Exercises 85–86 use graphs and a formula for body-mass index to indicate whether you are obese, overweight, borderline overweight, normal weight, or underweight.

## SECTION 7.1

## Systems of Linear Equations in Two Variables

## Objectives

- 1 Decide whether an ordered pair is a solution of a linear system.
- 2 Solve linear systems by substitution.
- 3 Solve linear systems by addition.
- 4 Identify systems that do not have exactly one ordered-pair solution.
- 5 Solve problems using systems of linear equations.

Researchers identified college students who generally were procrastinators or nonprocrastinators. The students were asked to report throughout the semester how many symptoms of physical illness they had experienced. **Figure 7.1** shows that by late in the semester, all students experienced increases in symptoms. Early in the semester, procrastinators reported fewer symptoms, but late in the semester, as work came due, they reported more symptoms than their nonprocrastinating peers.

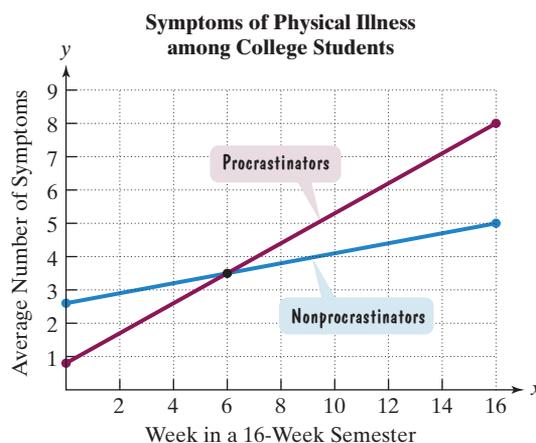

FIGURE 7.1

Source: Gerrig and Zimbardo, *Psychology and Life*, 18th Edition, Allyn and Bacon, 2008.

The data in **Figure 7.1** can be analyzed using a pair of linear models in two variables. The figure shows that by week 6, both groups reported the same number of symptoms of illness, an average of approximately 3.5 symptoms per group. In this section, you will learn two algebraic methods, called *substitution* and *addition*, that will reinforce this graphic observation, verifying  $(6, 3.5)$  as the point of intersection.

- 1 Decide whether an ordered pair is a solution of a linear system.

## Systems of Linear Equations and Their Solutions

All equations in the form  $Ax + By = C$  are straight lines when graphed. Two such equations are called a **system of linear equations** or a **linear system**. A **solution to a system of linear equations in two variables** is an ordered pair that satisfies both equations in the system. For example,  $(3, 4)$  satisfies the system

$$\begin{cases} x + y = 7 & (3 + 4 \text{ is, indeed, } 7.) \\ x - y = -1. & (3 - 4 \text{ is, indeed, } -1.) \end{cases}$$

Thus,  $(3, 4)$  satisfies both equations and is a solution of the system. The solution can be described by saying that  $x = 3$  and  $y = 4$ . The solution can also be described using set notation. The solution set to the system is  $\{(3, 4)\}$ —that is, the set consisting of the ordered pair  $(3, 4)$ .

A system of linear equations can have exactly one solution, no solution, or infinitely many solutions. We begin with systems that have exactly one solution.

## EXAMPLE 1 Determining Whether Ordered Pairs Are Solutions of a System

Consider the system:

$$\begin{cases} x + 2y = 2 \\ x - 2y = 6. \end{cases}$$

Determine if each ordered pair is a solution of the system:

- a.  $(4, -1)$       b.  $(-4, 3)$ .

## SOLUTION

- a. We begin by determining whether  $(4, -1)$  is a solution. Because 4 is the  $x$ -coordinate and  $-1$  is the  $y$ -coordinate of  $(4, -1)$ , we replace  $x$  with 4 and  $y$  with  $-1$ .

$$\begin{array}{rcl} x + 2y = 2 & & x - 2y = 6 \\ 4 + 2(-1) \stackrel{?}{=} 2 & & 4 - 2(-1) \stackrel{?}{=} 6 \\ 4 + (-2) \stackrel{?}{=} 2 & & 4 - (-2) \stackrel{?}{=} 6 \\ 2 = 2, \text{ true} & & 4 + 2 \stackrel{?}{=} 6 \\ & & 6 = 6, \text{ true} \end{array}$$

The pair  $(4, -1)$  satisfies both equations: It makes each equation true. Thus, the ordered pair is a solution of the system.

- b. To determine whether  $(-4, 3)$  is a solution, we replace  $x$  with  $-4$  and  $y$  with 3.

$$\begin{array}{rcl} x + 2y = 2 & & x - 2y = 6 \\ -4 + 2 \cdot 3 \stackrel{?}{=} 2 & & -4 - 2 \cdot 3 \stackrel{?}{=} 6 \\ -4 + 6 \stackrel{?}{=} 2 & & -4 - 6 \stackrel{?}{=} 6 \\ 2 = 2, \text{ true} & & -10 = 6, \text{ false} \end{array}$$

The pair  $(-4, 3)$  fails to satisfy *both* equations: It does not make both equations true. Thus, the ordered pair is not a solution of the system. ●●●

## GREAT QUESTION!

Can I use a rough sketch on scratch paper to solve a linear system by graphing?

No. When solving linear systems by graphing, neatly drawn graphs are essential for determining points of intersection.

- Use rectangular coordinate graph paper.
- Use a ruler or straightedge.
- Use a pencil with a sharp point.

The solution of a system of linear equations can sometimes be found by graphing both of the equations in the same rectangular coordinate system. For a system with one solution, the **coordinates of the point of intersection give the system's solution**. For example, the system in Example 1,

$$\begin{cases} x + 2y = 2 \\ x - 2y = 6, \end{cases}$$

is graphed in **Figure 7.2**. The solution of the system,  $(4, -1)$ , corresponds to the point of intersection of the lines.

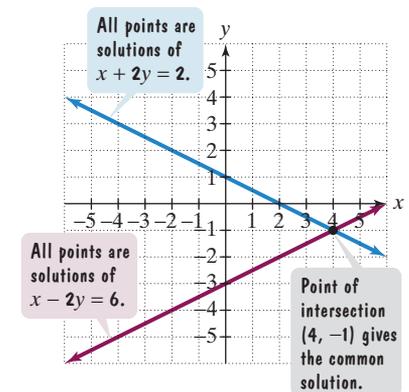

FIGURE 7.2 Visualizing a system's solution

 **Check Point 1** Consider the system:

$$\begin{cases} 2x - 3y = -4 \\ 2x + y = 4. \end{cases}$$

Determine if each ordered pair is a solution of the system:

- a.  $(1, 2)$                       b.  $(7, 6)$ .

- 2** Solve linear systems by substitution.

## Eliminating a Variable Using the Substitution Method

Finding the solution to a linear system by graphing equations may not be easy to do. For example, a solution of  $(-\frac{2}{3}, \frac{157}{29})$  would be difficult to “see” as an intersection point on a graph.

Let's consider a method that does not depend on finding a system's solution visually: the substitution method. This method involves converting the system to one equation in one variable by an appropriate substitution.

**GREAT QUESTION!**

**In the first step of the substitution method, how do I know which variable to isolate and in which equation?**

You can choose both the variable and the equation. If possible, solve for a variable whose coefficient is 1 or  $-1$  to avoid working with fractions.

**Solving Linear Systems by Substitution**

1. Solve either of the equations for one variable in terms of the other. (If one of the equations is already in this form, you can skip this step.)
2. Substitute the expression found in step 1 into the *other* equation. This will result in an equation in one variable.
3. Solve the equation containing one variable.
4. Back-substitute the value found in step 3 into one of the original equations. Simplify and find the value of the remaining variable.
5. Check the proposed solution in both of the system's given equations.

**EXAMPLE 2 Solving a System by Substitution**

Solve by the substitution method:

$$\begin{cases} 5x - 4y = 9 \\ x - 2y = -3. \end{cases}$$

**SOLUTION**

**Step 1 Solve either of the equations for one variable in terms of the other.** We begin by isolating one of the variables in either of the equations. By solving for  $x$  in the second equation, which has a coefficient of 1, we can avoid fractions.

$$\begin{aligned} x - 2y &= -3 && \text{This is the second equation in the given system.} \\ x &= 2y - 3 && \text{Solve for } x \text{ by adding } 2y \text{ to both sides.} \end{aligned}$$

**Step 2 Substitute the expression from step 1 into the other equation.** We substitute  $2y - 3$  for  $x$  in the first equation.

$$x = \boxed{2y - 3} \qquad \qquad \qquad 5\boxed{x} - 4y = 9$$

This gives us an equation in one variable, namely

$$5(2y - 3) - 4y = 9.$$

The variable  $x$  has been eliminated.

**Step 3 Solve the resulting equation containing one variable.**

$$\begin{aligned} 5(2y - 3) - 4y &= 9 && \text{This is the equation containing one variable.} \\ 10y - 15 - 4y &= 9 && \text{Apply the distributive property.} \\ 6y - 15 &= 9 && \text{Combine like terms.} \\ 6y &= 24 && \text{Add 15 to both sides.} \\ y &= 4 && \text{Divide both sides by 6.} \end{aligned}$$

**GREAT QUESTION!**

**When I back-substitute the value for one of the variables, which equation should I use?**

The equation from step 1, in which one variable is expressed in terms of the other, is equivalent to one of the original equations. It is often easiest to back-substitute the obtained value into this equation to find the value of the other variable. After obtaining both values, get into the habit of checking the ordered-pair solution in *both* equations of the system.

**Step 4 Back-substitute the obtained value into one of the original equations.** Now that we have the  $y$ -coordinate of the solution, we back-substitute 4 for  $y$  into one of the original equations to find  $x$ . Let's use both equations to show that we obtain the same value for  $x$  in either case.

**Using the first equation:**

$$\begin{aligned} 5x - 4y &= 9 \\ 5x - 4(4) &= 9 \\ 5x - 16 &= 9 \\ 5x &= 25 \\ x &= 5 \end{aligned}$$

**Using the second equation:**

$$\begin{aligned} x - 2y &= -3 \\ x - 2(4) &= -3 \\ x - 8 &= -3 \\ x &= 5 \end{aligned}$$

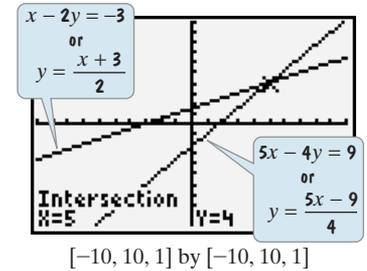

With  $x = 5$  and  $y = 4$ , the proposed solution is  $(5, 4)$ .

**Step 5 Check.** Take a moment to show that  $(5, 4)$  satisfies both given equations. The solution set is  $\{(5, 4)\}$ .

## TECHNOLOGY

## Graphic Connections

A graphing utility can be used to solve the system in Example 2. Solve each equation for  $y$ , graph the equations, and use the intersection feature. The utility displays the solution  $(5, 4)$  as  $x = 5, y = 4$ .

 **Check Point 2** Solve by the substitution method:

$$\begin{cases} 3x + 2y = 4 \\ 2x + y = 1. \end{cases}$$

**3** Solve linear systems by addition.

## Eliminating a Variable Using the Addition Method

The substitution method is most useful if one of the given equations has an isolated variable. A second, and frequently the easiest, method for solving a linear system is the addition method. Like the substitution method, the addition method involves eliminating a variable and ultimately solving an equation containing only one variable. However, this time we eliminate a variable by adding the equations.

For example, consider the following system of linear equations:

$$\begin{cases} 3x - 4y = 11 \\ -3x + 2y = -7. \end{cases}$$

When we add these two equations, the  $x$ -terms are eliminated. This occurs because the coefficients of the  $x$ -terms, 3 and  $-3$ , are opposites (additive inverses) of each other:

$$\begin{array}{r} \left\{ \begin{array}{l} 3x - 4y = 11 \\ -3x + 2y = -7 \\ \hline -2y = 4 \\ y = -2. \end{array} \right. \end{array}$$

The sum is an equation in one variable.

Divide both sides by  $-2$  and solve for  $y$ .

Now we can back-substitute  $-2$  for  $y$  into one of the original equations to find  $x$ . It does not matter which equation you use; you will obtain the same value for  $x$  in either case. If we use either equation, we can show that  $x = 1$  and the solution  $(1, -2)$  satisfies both equations in the system.

When we use the addition method, we want to obtain two equations whose sum is an equation containing only one variable. The key step is to **obtain, for one of the variables, coefficients that differ only in sign**. To do this, we may need to multiply one or both equations by some nonzero number so that the coefficients of one of the variables,  $x$  or  $y$ , become opposites. Then when the two equations are added, this variable is eliminated.

**GREAT QUESTION!**

**Isn't the addition method also called the elimination method?**

Although the addition method is also known as the elimination method, variables are eliminated when using both the substitution and addition methods. The name *addition method* specifically tells us that the elimination of a variable is accomplished by adding two equations.

**Solving Linear Systems by Addition**

1. If necessary, rewrite both equations in the form  $Ax + By = C$ .
2. If necessary, multiply either equation or both equations by appropriate nonzero numbers so that the sum of the  $x$ -coefficients or the sum of the  $y$ -coefficients is 0.
3. Add the equations in step 2. The sum is an equation in one variable.
4. Solve the equation in one variable.
5. Back-substitute the value obtained in step 4 into either of the given equations and solve for the other variable.
6. Check the solution in both of the original equations.

**EXAMPLE 3** Solving a System by the Addition Method

Solve by the addition method:

$$\begin{cases} 3x + 2y = 48 \\ 9x - 8y = -24. \end{cases}$$

**SOLUTION**

**Step 1 Rewrite both equations in the form  $Ax + By = C$ .** Both equations are already in this form. Variable terms appear on the left and constants appear on the right.

**Step 2 If necessary, multiply either equation or both equations by appropriate numbers so that the sum of the  $x$ -coefficients or the sum of the  $y$ -coefficients is 0.** We can eliminate  $x$  or  $y$ . Let's eliminate  $x$ . Consider the terms in  $x$  in each equation, that is,  $3x$  and  $9x$ . To eliminate  $x$ , we can multiply each term of the first equation by  $-3$  and then add the equations.

$$\begin{cases} 3x + 2y = 48 & \xrightarrow{\text{Multiply by } -3.} & -9x - 6y = -144 \\ 9x - 8y = -24 & \xrightarrow{\text{No change}} & 9x - 8y = -24 \end{cases}$$

**Step 3 Add the equations.** *Add:*  $-14y = -168$

**Step 4 Solve the equation in one variable.** We solve  $-14y = -168$  by dividing both sides by  $-14$ .

$$\frac{-14y}{-14} = \frac{-168}{-14} \quad \text{Divide both sides by } -14.$$

$$y = 12 \quad \text{Simplify.}$$

**Step 5 Back-substitute and find the value for the other variable.** We can back-substitute  $12$  for  $y$  into either one of the given equations. We'll use the first one.

$$3x + 2y = 48 \quad \text{This is the first equation in the given system.}$$

$$3x + 2(12) = 48 \quad \text{Substitute 12 for } y.$$

$$3x + 24 = 48 \quad \text{Multiply.}$$

$$3x = 24 \quad \text{Subtract 24 from both sides.}$$

$$x = 8 \quad \text{Divide both sides by 3.}$$

We found that  $y = 12$  and  $x = 8$ . The proposed solution is  $(8, 12)$ .

**Step 6 Check.** Take a few minutes to show that  $(8, 12)$  satisfies both of the original equations in the system. The solution set is  $\{(8, 12)\}$ . •••

 **Check Point 3** Solve by the addition method:

$$\begin{cases} 4x + 5y = 3 \\ 2x - 3y = 7. \end{cases}$$

Some linear systems have solutions that are not integers. If the value of one variable turns out to be a “messy” fraction, back-substitution might lead to cumbersome arithmetic. If this happens, you can return to the original system and use the addition method to find the value of the other variable.

#### EXAMPLE 4 Solving a System by the Addition Method

Solve by the addition method:

$$\begin{cases} 2x = 7y - 17 \\ 5y = 17 - 3x. \end{cases}$$

#### SOLUTION

**Step 1 Rewrite both equations in the form  $Ax + By = C$ .** We first arrange the system so that variable terms appear on the left and constants appear on the right. We obtain

$$\begin{cases} 2x - 7y = -17 & \text{Subtract } 7y \text{ from both sides of the first equation.} \\ 3x + 5y = 17. & \text{Add } 3x \text{ to both sides of the second equation.} \end{cases}$$

**Step 2 If necessary, multiply either equation or both equations by appropriate numbers so that the sum of the  $x$ -coefficients or the sum of the  $y$ -coefficients is 0.** We can eliminate  $x$  or  $y$ . Let's eliminate  $x$  by multiplying the first equation by 3 and the second equation by  $-2$ .

$$\begin{cases} 2x - 7y = -17 & \xrightarrow{\text{Multiply by } 3.} & \begin{cases} 6x - 21y = -51 \\ -6x - 10y = -34 \end{cases} \\ 3x + 5y = 17 & \xrightarrow{\text{Multiply by } -2.} & \end{cases}$$

**Step 3 Add the equations.** *Add:*  $-31y = -85$

**Step 4 Solve the equation in one variable.** We solve  $-31y = -85$  by dividing both sides by  $-31$ .

$$\begin{aligned} \frac{-31y}{-31} &= \frac{-85}{-31} && \text{Divide both sides by } -31. \\ y &= \frac{85}{31} && \text{Simplify.} \end{aligned}$$

**Step 5 Back-substitute and find the value for the other variable.** Back-substitution of  $\frac{85}{31}$  for  $y$  into either of the given equations results in cumbersome arithmetic. Instead, let's use the addition method on the given system in the form  $Ax + By = C$  to find the value for  $x$ . Thus, we eliminate  $y$  by multiplying the first equation by 5 and the second equation by 7.

$$\begin{cases} 2x - 7y = -17 & \xrightarrow{\text{Multiply by } 5.} & \begin{cases} 10x - 35y = -85 \\ 21x + 35y = 119 \end{cases} \\ 3x + 5y = 17 & \xrightarrow{\text{Multiply by } 7.} & \\ & \text{Add:} & 31x & = & 34 \\ & & x & = & \frac{34}{31} & \text{Divide both sides by } 31. \end{cases}$$

We found that  $y = \frac{85}{31}$  and  $x = \frac{34}{31}$ . The proposed solution is  $\left(\frac{34}{31}, \frac{85}{31}\right)$ .

**Step 6 Check.** For this system, a calculator is helpful in showing that  $\left(\frac{34}{31}, \frac{85}{31}\right)$  satisfies both of the original equations in the system. The solution set is  $\left\{\left(\frac{34}{31}, \frac{85}{31}\right)\right\}$ .

 **Check Point 4** Solve by the addition method:

$$\begin{cases} 2x = 9 + 3y \\ 4y = 8 - 3x. \end{cases}$$

- 4 Identify systems that do not have exactly one ordered-pair solution.

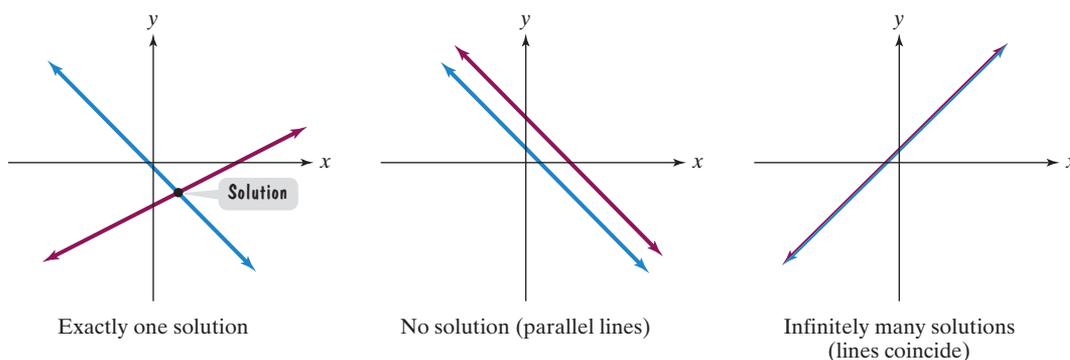

### Linear Systems Having No Solution or Infinitely Many Solutions

We have seen that a system of linear equations in two variables represents a pair of lines. The lines either intersect at one point, are parallel, or are identical. Thus, there are three possibilities for the number of solutions to a system of two linear equations in two variables.

#### The Number of Solutions to a System of Two Linear Equations

The number of solutions to a system of two linear equations in two variables is given by one of the following. (See **Figure 7.3**.)

Number of Solutions	What This Means Graphically
Exactly one ordered-pair solution	The two lines intersect at one point.
No solution	The two lines are parallel.
Infinitely many solutions	The two lines are identical.

**FIGURE 7.3** Possible graphs for a system of two linear equations in two variables

A linear system with no solution is called an **inconsistent system**. If you attempt to solve such a system by substitution or addition, you will eliminate both variables. A false statement, such as  $0 = 12$ , will be the result.

#### EXAMPLE 5 A System with No Solution

Solve the system:

$$\begin{cases} 4x + 6y = 12 \\ 6x + 9y = 12. \end{cases}$$

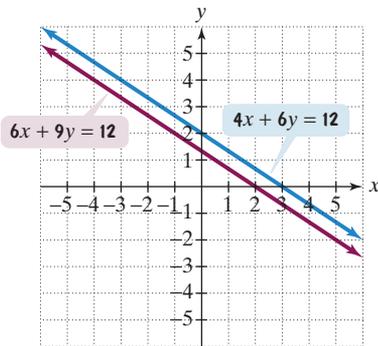

FIGURE 7.4 The graph of an inconsistent system

### SOLUTION

Because no variable is isolated, we will use the addition method. To obtain coefficients of  $x$  that differ only in sign, we multiply the first equation by 3 and multiply the second equation by  $-2$ .

$$\begin{cases} 4x + 6y = 12 \\ 6x + 9y = 12 \end{cases} \begin{array}{l} \xrightarrow{\text{Multiply by 3.}} \\ \xrightarrow{\text{Multiply by -2.}} \end{array} \begin{cases} 12x + 18y = 36 \\ -12x - 18y = -24 \end{cases} \begin{array}{l} \\ \text{Add:} \end{array} \begin{cases} 12x + 18y = 36 \\ -12x - 18y = -24 \\ \hline 0 = 12 \end{cases}$$

There are no values of  $x$  and  $y$  for which  $0 = 12$ . No values of  $x$  and  $y$  satisfy  $0x + 0y = 12$ .

The false statement  $0 = 12$  indicates that the system is inconsistent and has no solution. The solution set is the empty set,  $\emptyset$ . ●●●

The lines corresponding to the two equations in Example 5 are shown in Figure 7.4. The lines are parallel and have no point of intersection.

### DISCOVERY

Show that the graphs of  $4x + 6y = 12$  and  $6x + 9y = 12$  must be parallel lines by solving each equation for  $y$ . What are the slope and  $y$ -intercept for each line? What does this mean? If a linear system is inconsistent, what must be true about the slopes and  $y$ -intercepts for the system's graphs?

**Check Point 5** Solve the system:

$$\begin{cases} 5x - 2y = 4 \\ -10x + 4y = 7. \end{cases}$$

A linear system that has at least one solution is called a **consistent system**. Lines that intersect and lines that coincide both represent consistent systems. If the lines coincide, then the consistent system has infinitely many solutions, represented by every point on either line.

The equations in a linear system with infinitely many solutions are called **dependent**. If you attempt to solve such a system by substitution or addition, you will eliminate both variables. However, a true statement, such as  $10 = 10$ , will be the result.

### EXAMPLE 6 A System with Infinitely Many Solutions

Solve the system:

$$\begin{cases} y = 3x - 2 \\ 15x - 5y = 10. \end{cases}$$

### SOLUTION

Because the variable  $y$  is isolated in  $y = 3x - 2$ , the first equation, we can use the substitution method. We substitute the expression for  $y$  into the second equation.

$$\begin{aligned} y &= \boxed{3x - 2} & 15x - 5\boxed{y} &= 10 & \text{Substitute } 3x - 2 \text{ for } y. \\ & & 15x - 5(3x - 2) &= 10 & \text{The substitution results in an equation in one variable.} \\ & & 15x - 15x + 10 &= 10 & \text{Apply the distributive property.} \\ & & 10 &= 10 & \text{Simplify.} \end{aligned}$$

This statement is true for all values of  $x$  and  $y$ .

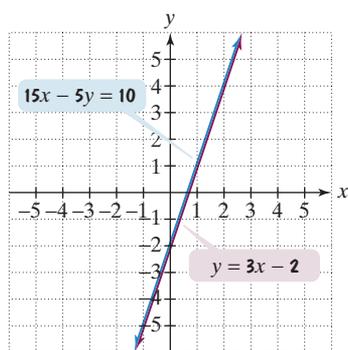

FIGURE 7.5 The graph of a system with infinitely many solutions

In our final step, both variables have been eliminated and the resulting statement,  $10 = 10$ , is true. This true statement indicates that the system has infinitely many solutions. The solution set consists of all points  $(x, y)$  lying on either of the coinciding lines,  $y = 3x - 2$  or  $15x - 5y = 10$ , as shown in **Figure 7.5**.

We express the solution set for the system in one of two equivalent ways:

$$\{(x, y) \mid y = 3x - 2\} \quad \text{or} \quad \{(x, y) \mid 15x - 5y = 10\}.$$

The set of all ordered pairs  $(x, y)$  such that  $y = 3x - 2$

The set of all ordered pairs  $(x, y)$  such that  $15x - 5y = 10$

## GREAT QUESTION!

**The system in Example 6 has infinitely many solutions. Does that mean that any ordered pair of numbers is a solution?**

No. Although the system in Example 6 has infinitely many solutions, this does not mean that any ordered pair of numbers you can form will be a solution. The ordered pair  $(x, y)$  must satisfy one of the system's equations,  $y = 3x - 2$  or  $15x - 5y = 10$ , and there are infinitely many such ordered pairs. Because the graphs are coinciding lines, the ordered pairs that are solutions of one of the equations are also solutions of the other equation.

 **Check Point 6** Solve the system:

$$\begin{cases} x = 4y - 8 \\ 5x - 20y = -40. \end{cases}$$

- 5 Solve problems using systems of linear equations.

## Applications

We begin with applications that involve two unknown quantities. We will let  $x$  and  $y$  represent these quantities. We then model the verbal conditions of the problem with a system of linear equations in  $x$  and  $y$ .

### Strategy for Problem Solving Using Systems of Equations

- Step 1** Read the problem carefully. Attempt to state the problem in your own words and state what the problem is looking for. Use variables to represent unknown quantities.
- Step 2** Write a system of equations that models the problem's conditions.
- Step 3** Solve the system and answer the problem's question.
- Step 4** Check the proposed solution in the original wording of the problem.

Chemists and pharmacists often have to change the concentration of solutions and other mixtures. In these situations, the amount of a particular ingredient in the solution or mixture is expressed as a percentage of the total.

### EXAMPLE 7 Solving a Mixture Problem

A chemist working on a flu vaccine needs to mix a 10% sodium-iodine solution with a 60% sodium-iodine solution to obtain 50 milliliters of a 30% sodium-iodine solution. How many milliliters of the 10% solution and of the 60% solution should be mixed?

### SOLUTION

**Step 1 Use variables to represent unknown quantities.**

Let  $x$  = the number of milliliters of the 10% solution to be used in the mixture.

Let  $y$  = the number of milliliters of the 60% solution to be used in the mixture.

**Step 2 Write a system of equations that models the problem's conditions.** The situation is illustrated in **Figure 7.6**.

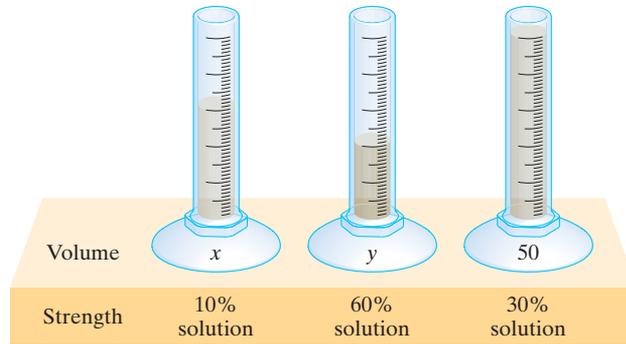

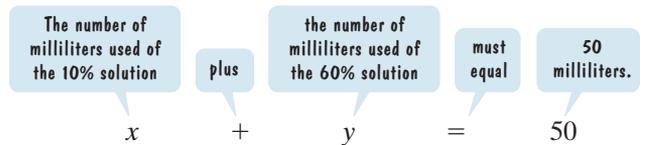

FIGURE 7.6

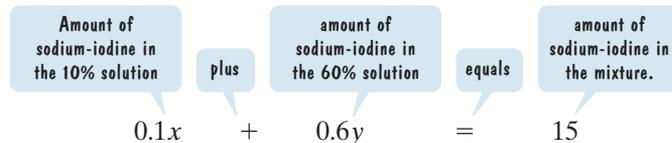

The chemist needs 50 milliliters of a 30% sodium-iodine solution. We form a table that shows the amount of sodium-iodine in each of the three solutions.

Solution	Number of milliliters	×	Percent of Sodium-Iodine	=	Amount of Sodium-Iodine
10% Solution	$x$		10% = 0.1		$0.1x$
60% Solution	$y$		60% = 0.6		$0.6y$
30% Mixture	50		30% = 0.3		$0.3(50) = 15$

The chemist needs to obtain a 50-milliliter mixture.

The 50-milliliter mixture must be 30% sodium-iodine. The amount of sodium-iodine must be 30% of 50, or  $(0.3)(50) = 15$  milliliters.

**Step 3 Solve the system and answer the problem's question.** The system

$$\begin{aligned}x + y &= 50 \\0.1x + 0.6y &= 15\end{aligned}$$

can be solved by substitution or addition. Let's use substitution. Solving the first equation for  $y$ , we obtain  $y = 50 - x$ .

$$y = \boxed{50 - x} \quad 0.1x + 0.6\boxed{y} = 15$$

We substitute  $50 - x$  for  $y$  in the second equation,  $0.1x + 0.6y = 15$ . This gives us an equation in one variable.

$$\begin{aligned}0.1x + 0.6(50 - x) &= 15 && \text{This equation contains one variable, } x. \\0.1x + 30 - 0.6x &= 15 && \text{Apply the distributive property.} \\-0.5x + 30 &= 15 && \text{Combine like terms.} \\-0.5x &= -15 && \text{Subtract 30 from both sides.} \\x &= \frac{-15}{-0.5} = 30 && \text{Divide both sides by } -0.5.\end{aligned}$$

Back-substituting 30 for  $x$  in either of the system's equations ( $x + y = 50$  is easier to use) gives  $y = 20$ . Because  $x$  represents the number of milliliters of the 10% solution and  $y$  the number of milliliters of the 60% solution, the chemist should mix 30 milliliters of the 10% solution with 20 milliliters of the 60% solution.

**Step 4 Check the proposed solution in the original wording of the problem.** The problem states that the chemist needs 50 milliliters of a 30% sodium-iodine solution. The amount of sodium-iodine in this mixture is  $0.3(50)$ , or 15 milliliters. The amount of sodium-iodine in 30 milliliters of the 10% solution is  $0.1(30)$ , or 3 milliliters. The amount of sodium-iodine in 20 milliliters of the 60% solution is  $0.6(20) = 12$  milliliters. The amount of sodium-iodine in the two solutions used in the mixture is 3 milliliters + 12 milliliters, or 15 milliliters, exactly as it should be. ●●●

 **Check Point 7** A chemist needs to mix an 18% acid solution with a 45% acid solution to obtain 12 liters of a 36% acid solution. How many liters of each of the acid solutions must be used?

We have seen that if an object moves at an average velocity  $v$ , the distance,  $s$ , covered in time  $t$  is given by the formula

$$s = vt \quad \text{Distance equals velocity times time.}$$

Recall that objects that move in accordance with this formula are said to be in **uniform motion**. Wind and water current have the effect of increasing or decreasing a traveler's velocity.

## GREAT QUESTION!

**Do I have to use  $x$  and  $y$  to represent a problem's variables?**

No. Select letters that help you remember what the variables represent. For example, in Example 8, you may prefer using  $p$  and  $w$  rather than  $x$  and  $y$ :

$p$  = plane's average velocity  
in still air

$w$  = wind's average velocity.

## EXAMPLE 8 Solving a Uniform Motion Problem

When a small airplane flies with the wind, it can travel 450 miles in 3 hours. When the same airplane flies in the opposite direction against the wind, it takes 5 hours to fly the same distance. Find the average velocity of the plane in still air and the average velocity of the wind.

### SOLUTION

**Step 1 Use variables to represent unknown quantities.**

Let  $x$  = the average velocity of the plane in still air.

Let  $y$  = the average velocity of the wind.

**Step 2 Write a system of equations that models the problem's conditions.** As it travels with the wind, the plane's average velocity is increased. The net average velocity is its average velocity in still air,  $x$ , plus the average velocity of the wind,  $y$ , given by the expression  $x + y$ . As it travels against the wind, the plane's average velocity is decreased. The net average velocity is its average velocity in still air,  $x$ , minus the average velocity of the wind,  $y$ , given by the expression  $x - y$ . Here is a chart that summarizes the problem's information and includes the increased and decreased velocities:

	Velocity	×	Time	=	Distance
<b>Trip with the Wind</b>	$x + y$		3		$3(x + y)$
<b>Trip against the Wind</b>	$x - y$		5		$5(x - y)$

The problem states that the distance in each direction is 450 miles. We use this information to write our system of equations.

The distance of the trip with the wind is 450 miles.

$$3(x + y) = 450$$

The distance of the trip against the wind is 450 miles.

$$5(x - y) = 450$$

**Step 3 Solve the system and answer the problem's question.** We can simplify the system by dividing both sides of the equations by 3 and 5, respectively.

$$\begin{cases} 3(x + y) = 450 & \xrightarrow{\text{Divide by 3.}} \\ 5(x - y) = 450 & \xrightarrow{\text{Divide by 5.}} \end{cases} \begin{cases} x + y = 150 \\ x - y = 90 \end{cases}$$

Solve the system on the right by the addition method.

$$\begin{array}{r} \begin{cases} x + y = 150 \\ x - y = 90 \end{cases} \\ \text{Add:} \quad \begin{array}{r} x + y = 150 \\ x - y = 90 \\ \hline 2x = 240 \end{array} \\ x = 120 \quad \text{Divide both sides by 2.} \end{array}$$

Back-substituting 120 for  $x$  in either of the system's equations gives  $y = 30$ . Because  $x = 120$  and  $y = 30$ , the average velocity of the plane in still air is 120 miles per hour and the average velocity of the wind is 30 miles per hour.

**Step 4 Check the proposed solution in the original wording of the problem.** The problem states that the distance in each direction is 450 miles. The average velocity of the plane with the wind is  $120 + 30 = 150$  miles per hour. In 3 hours, it travels  $150 \cdot 3$ , or 450 miles, which checks with the stated condition. Furthermore, the average velocity of the plane against the wind is  $120 - 30 = 90$  miles per hour. In 5 hours, it travels  $90 \cdot 5 = 450$  miles, which is the stated distance. ●●●

 **Check Point 8** With the current, a motorboat can travel 84 miles in 2 hours. Against the current, the same trip takes 3 hours. Find the average velocity of the boat in still water and the average velocity of the current.

### Functions of Business: Break-Even Analysis

Suppose that a company produces and sells  $x$  units of a product. Its *revenue* is the money generated by selling  $x$  units of the product. Its *cost* is the cost of producing  $x$  units of the product.

#### Revenue and Cost Functions

A company produces and sells  $x$  units of a product.

##### Revenue Function

$$R(x) = (\text{price per unit sold})x$$

##### Cost Function

$$C(x) = \text{fixed cost} + (\text{cost per unit produced})x$$

The point of intersection of the graphs of the revenue and cost functions is called the **break-even point**. The  $x$ -coordinate of the point reveals the number of units that a company must produce and sell so that money coming in, the revenue, is equal to money going out, the cost. The  $y$ -coordinate of the break-even point gives the amount of money coming in and going out. Example 9 illustrates the use of the substitution method in determining a company's break-even point.

#### EXAMPLE 9 Finding a Break-Even Point

Technology is now promising to bring light, fast, and beautiful wheelchairs to millions of people with disabilities. A company is planning to manufacture these radically different wheelchairs. Fixed cost will be \$500,000 and it will cost \$400 to produce each wheelchair. Each wheelchair will be sold for \$600.

- Write the cost function,  $C$ , of producing  $x$  wheelchairs.
- Write the revenue function,  $R$ , from the sale of  $x$  wheelchairs.
- Determine the break-even point. Describe what this means.

## SOLUTION

- a. The cost function is the sum of the fixed cost and variable cost.

Fixed cost of \$500,000 plus Variable cost: \$400 for each chair produced

$$C(x) = 500,000 + 400x$$

- b. The revenue function is the money generated from the sale of  $x$  wheelchairs.

Revenue per chair, \$600, times the number of chairs sold

$$R(x) = 600x$$

- c. The break-even point occurs where the graphs of  $C$  and  $R$  intersect. Thus, we find this point by solving the system

$$\begin{cases} C(x) = 500,000 + 400x \\ R(x) = 600x \end{cases} \quad \text{or} \quad \begin{cases} y = 500,000 + 400x \\ y = 600x. \end{cases}$$

Using substitution, we can substitute  $600x$  for  $y$  in the first equation:

$$\begin{aligned} 600x &= 500,000 + 400x && \text{Substitute } 600x \text{ for } y \text{ in} \\ &&& y = 500,000 + 400x. \\ 200x &= 500,000 && \text{Subtract } 400x \text{ from both sides.} \\ x &= 2500. && \text{Divide both sides by } 200. \end{aligned}$$

Back-substituting 2500 for  $x$  in either of the system's equations (or functions), we obtain

$$R(2500) = 600(2500) = 1,500,000.$$

We used  $R(x) = 600x$ .

The break-even point is  $(2500, 1,500,000)$ . This means that the company will break even if it produces and sells 2500 wheelchairs. At this level, the money coming in is equal to the money going out: \$1,500,000. ●●●

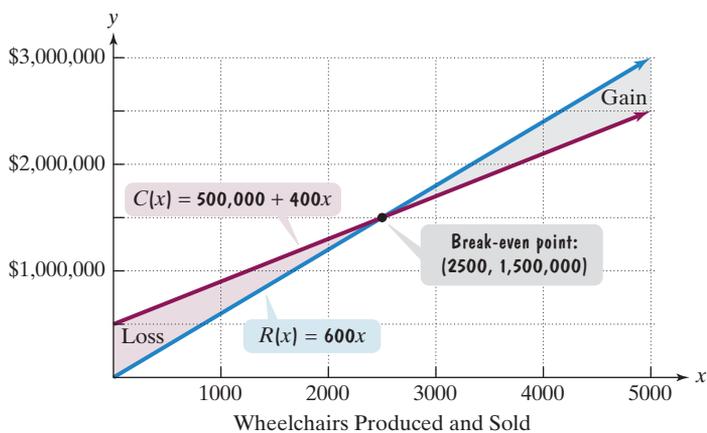

FIGURE 7.7

**Figure 7.7** shows the graphs of the revenue and cost functions for the wheelchair business. Similar graphs and models apply no matter how small or large a business venture may be.

The intersection point confirms that the company breaks even by producing and selling 2500 wheelchairs. Can you see what happens for  $x < 2500$ ? The red cost graph lies above the blue revenue graph. The cost is greater than the revenue and the business is losing money. Thus, if the company sells fewer than 2500 wheelchairs, the result is a *loss*. By contrast, look at what happens for  $x > 2500$ . The blue revenue graph lies above the red cost graph. The revenue is greater than the cost and the business is making money. Thus, if the company sells more than 2500 wheelchairs, the result is a *gain*.

 **Check Point 9** A company that manufactures running shoes has a fixed cost of \$300,000. Additionally, it costs \$30 to produce each pair of shoes. They are sold at \$80 per pair.

- Write the cost function,  $C$ , of producing  $x$  pairs of running shoes.
- Write the revenue function,  $R$ , from the sale of  $x$  pairs of running shoes.
- Determine the break-even point. Describe what this means.

What does every entrepreneur, from a kid selling lemonade to Mark Zuckerberg, want to do? Generate profit, of course. The *profit* made is the money taken in, or the revenue, minus the money spent, or the cost. This relationship between revenue and cost allows us to define the *profit function*,  $P(x)$ .

### The Profit Function

The profit,  $P(x)$ , generated after producing and selling  $x$  units of a product is given by the **profit function**

$$P(x) = R(x) - C(x),$$

where  $R$  and  $C$  are the revenue and cost functions, respectively.

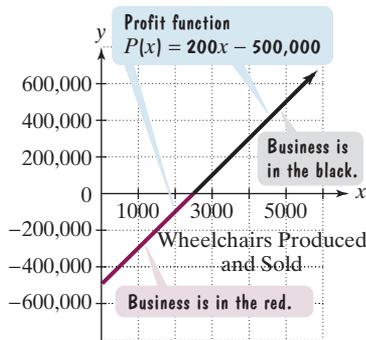

FIGURE 7.8

The profit function for the wheelchair business in Example 7 is

$$\begin{aligned} P(x) &= R(x) - C(x) \\ &= 600x - (500,000 + 400x) \\ &= 200x - 500,000. \end{aligned}$$

The graph of this profit function is shown in **Figure 7.8**. The red portion lies below the  $x$ -axis and shows a loss when fewer than 2500 wheelchairs are sold. The business is “in the red.” The black portion lies above the  $x$ -axis and shows a gain when more than 2500 wheelchairs are sold. The wheelchair business is “in the black.”

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

1. A solution to a system of linear equations in two variables is an ordered pair that \_\_\_\_\_.

2. When solving a system of linear equations by graphing, the system’s solution is determined by locating \_\_\_\_\_.

3. When solving

$$\begin{cases} 3x - 2y = 5 \\ y = 3x - 3 \end{cases}$$

by the substitution method, we obtain  $x = \frac{1}{3}$ , so the solution set is \_\_\_\_\_.

4. When solving

$$\begin{cases} 2x + 10y = 9 \\ 8x + 5y = 7 \end{cases}$$

by the addition method, we can eliminate  $y$  by multiplying the second equation by \_\_\_\_\_ and then adding the equations.

5. When solving

$$\begin{cases} 4x - 3y = 15 \\ 3x - 2y = 10 \end{cases}$$

by the addition method, we can eliminate  $y$  by multiplying the first equation by 2 and the second equation by \_\_\_\_\_, and then adding the equations.

6. When solving

$$\begin{cases} 12x - 21y = 24 \\ 4x - 7y = 7 \end{cases}$$

by the addition method, we obtain  $0 = 3$ , so the solution set is \_\_\_\_\_. The linear system is a/an \_\_\_\_\_ system. If you attempt to solve such a system by graphing, you will obtain two lines that are \_\_\_\_\_.

7. When solving

$$\begin{cases} x = 3y + 2 \\ 5x - 15y = 10 \end{cases}$$

by the substitution method, we obtain  $10 = 10$ , so the solution set is \_\_\_\_\_.

The equations in this system are called \_\_\_\_\_. If you attempt to solve such a system by graphing, you will obtain two lines that \_\_\_\_\_.

8. The total amount of acid in  $x$  milliliters of a 9% acid solution and  $y$  milliliters of a 60% acid solution is represented by \_\_\_\_\_.
9. If  $x$  represents the average velocity of a plane in still air and  $y$  represents the average velocity of the wind, the plane's velocity with the wind is represented by \_\_\_\_\_ and the plane's velocity against the wind is represented by \_\_\_\_\_.

10. If  $x + y$  represents a motorboat's average velocity with the current, in miles per hour, its distance after 4 hours is represented by \_\_\_\_\_.

11. A company's \_\_\_\_\_ function is the money generated by selling  $x$  units of its product. The difference between this function and the company's cost function is called its \_\_\_\_\_ function.

12. A company has a graph that shows the money it generates by selling  $x$  units of its product. It also has a graph that shows its cost of producing  $x$  units of its product. The point of intersection of these graphs is called the company's \_\_\_\_\_.

## EXERCISE SET 7.1

### Practice Exercises

In Exercises 1–4, determine whether the given ordered pair is a solution of the system.

1. (2, 3)

$$\begin{cases} x + 3y = 11 \\ x - 5y = -13 \end{cases}$$

2. (-3, 5)

$$\begin{cases} 9x + 7y = 8 \\ 8x - 9y = -69 \end{cases}$$

3. (2, 5)

$$\begin{cases} 2x + 3y = 17 \\ x + 4y = 16 \end{cases}$$

4. (8, 5)

$$\begin{cases} 5x - 4y = 20 \\ 3y = 2x + 1 \end{cases}$$

In Exercises 5–18, solve each system by the substitution method.

5. 
$$\begin{cases} x + y = 4 \\ y = 3x \end{cases}$$

6. 
$$\begin{cases} x + y = 6 \\ y = 2x \end{cases}$$

7. 
$$\begin{cases} x + 3y = 8 \\ y = 2x - 9 \end{cases}$$

8. 
$$\begin{cases} 2x - 3y = -13 \\ y = 2x + 7 \end{cases}$$

9. 
$$\begin{cases} x = 4y - 2 \\ x = 6y + 8 \end{cases}$$

10. 
$$\begin{cases} x = 3y + 7 \\ x = 2y - 1 \end{cases}$$

11. 
$$\begin{cases} 5x + 2y = 0 \\ x - 3y = 0 \end{cases}$$

12. 
$$\begin{cases} 4x + 3y = 0 \\ 2x - y = 0 \end{cases}$$

13. 
$$\begin{cases} 2x + 5y = -4 \\ 3x - y = 11 \end{cases}$$

14. 
$$\begin{cases} 2x + 5y = 1 \\ -x + 6y = 8 \end{cases}$$

15. 
$$\begin{cases} 2x - 3y = 8 - 2x \\ 3x + 4y = x + 3y + 14 \end{cases}$$

16. 
$$\begin{cases} 3x - 4y = x - y + 4 \\ 2x + 6y = 5y - 4 \end{cases}$$

17. 
$$\begin{cases} y = \frac{1}{3}x + \frac{2}{3} \\ y = \frac{5}{7}x - 2 \end{cases}$$

18. 
$$\begin{cases} y = -\frac{1}{2}x + 2 \\ y = \frac{3}{4}x + 7 \end{cases}$$

In Exercises 19–30, solve each system by the addition method.

19. 
$$\begin{cases} x + y = 1 \\ x - y = 3 \end{cases}$$

20. 
$$\begin{cases} x + y = 6 \\ x - y = -2 \end{cases}$$

21. 
$$\begin{cases} 2x + 3y = 6 \\ 2x - 3y = 6 \end{cases}$$

22. 
$$\begin{cases} 3x + 2y = 14 \\ 3x - 2y = 10 \end{cases}$$

23. 
$$\begin{cases} x + 2y = 2 \\ -4x + 3y = 25 \end{cases}$$

24. 
$$\begin{cases} 2x - 7y = 2 \\ 3x + y = -20 \end{cases}$$

25. 
$$\begin{cases} 4x + 3y = 15 \\ 2x - 5y = 1 \end{cases}$$

26. 
$$\begin{cases} 3x - 7y = 13 \\ 6x + 5y = 7 \end{cases}$$

27. 
$$\begin{cases} 3x - 4y = 11 \\ 2x + 3y = -4 \end{cases}$$

28. 
$$\begin{cases} 2x + 3y = -16 \\ 5x - 10y = 30 \end{cases}$$

29. 
$$\begin{cases} 3x = 4y + 1 \\ 3y = 1 - 4x \end{cases}$$

30. 
$$\begin{cases} 5x = 6y + 40 \\ 2y = 8 - 3x \end{cases}$$

In Exercises 31–42, solve by the method of your choice. Identify systems with no solution and systems with infinitely many solutions, using set notation to express their solution sets.

31. 
$$\begin{cases} x = 9 - 2y \\ x + 2y = 13 \end{cases}$$

32. 
$$\begin{cases} 6x + 2y = 7 \\ y = 2 - 3x \end{cases}$$

33. 
$$\begin{cases} y = 3x - 5 \\ 21x - 35 = 7y \end{cases}$$

34. 
$$\begin{cases} 9x - 3y = 12 \\ y = 3x - 4 \end{cases}$$

35. 
$$\begin{cases} 3x - 2y = -5 \\ 4x + y = 8 \end{cases}$$

36. 
$$\begin{cases} 2x + 5y = -4 \\ 3x - y = 11 \end{cases}$$

37. 
$$\begin{cases} x + 3y = 2 \\ 3x + 9y = 6 \end{cases}$$

38. 
$$\begin{cases} 4x - 2y = 2 \\ 2x - y = 1 \end{cases}$$

39. 
$$\begin{cases} \frac{x}{4} - \frac{y}{4} = -1 \\ x + 4y = -9 \end{cases}$$

40. 
$$\begin{cases} \frac{x}{6} - \frac{y}{2} = \frac{1}{3} \\ x + 2y = -3 \end{cases}$$

41. 
$$\begin{cases} 2x = 3y + 4 \\ 4x = 3 - 5y \end{cases}$$

42. 
$$\begin{cases} 4x = 3y + 8 \\ 2x = -14 + 5y \end{cases}$$

In Exercises 43–46, let  $x$  represent one number and let  $y$  represent the other number. Use the given conditions to write a system of equations. Solve the system and find the numbers.

43. The sum of two numbers is 7. If one number is subtracted from the other, their difference is -1. Find the numbers.

44. The sum of two numbers is 2. If one number is subtracted from the other, their difference is 8. Find the numbers.

45. Three times a first number decreased by a second number is 1. The first number increased by twice the second number is 12. Find the numbers.
46. The sum of three times a first number and twice a second number is 8. If the second number is subtracted from twice the first number, the result is 3. Find the numbers.

### Practice Plus

In Exercises 47–48, solve each system by the method of your choice.

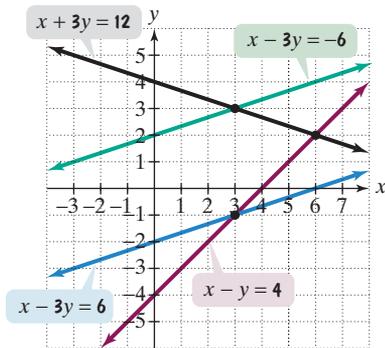

$$47. \begin{cases} \frac{x+2}{2} - \frac{y+4}{3} = 3 \\ \frac{x+y}{5} = \frac{x-y}{2} - \frac{5}{2} \end{cases} \quad 48. \begin{cases} \frac{x-y}{3} = \frac{x+y}{2} - \frac{1}{2} \\ \frac{x+2}{2} - 4 = \frac{y+4}{3} \end{cases}$$

In Exercises 49–50, solve each system for  $x$  and  $y$ , expressing either value in terms of  $a$  or  $b$ , if necessary. Assume that  $a \neq 0$  and  $b \neq 0$ .

$$49. \begin{cases} 5ax + 4y = 17 \\ ax + 7y = 22 \end{cases} \quad 50. \begin{cases} 4ax + by = 3 \\ 6ax + 5by = 8 \end{cases}$$

51. For the linear function  $f(x) = mx + b$ ,  $f(-2) = 11$  and  $f(3) = -9$ . Find  $m$  and  $b$ .
52. For the linear function  $f(x) = mx + b$ ,  $f(-3) = 23$  and  $f(2) = -7$ . Find  $m$  and  $b$ .

Use the graphs of the linear functions to solve Exercises 53–54.

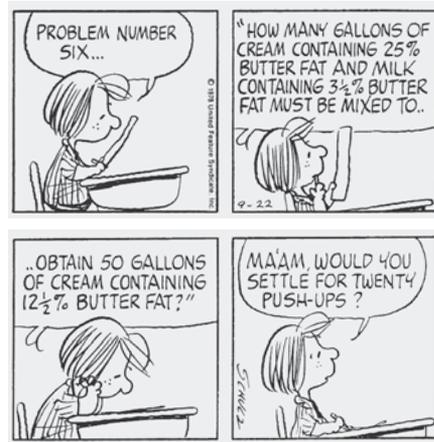

53. Write the linear system whose solution set is  $\{(6, 2)\}$ . Express each equation in the system in slope-intercept form.
54. Write the linear system whose solution set is  $\emptyset$ . Express each equation in the system in slope-intercept form.

### Application Exercises

55. A wine company needs to blend a California wine with a 5% alcohol content and a French wine with a 9% alcohol content to obtain 200 gallons of wine with a 7% alcohol content. How many gallons of each kind of wine must be used?
56. A jeweler needs to mix an alloy with a 16% gold content and an alloy with a 28% gold content to obtain 32 ounces of a new alloy with a 25% gold content. How many ounces of each of the original alloys must be used?
57. For thousands of years, gold has been considered one of Earth's most precious metals. One hundred percent pure gold is 24-karat gold, which is too soft to be made into jewelry. In the United States, most gold jewelry is 14-karat gold, approximately 58% gold. If 18-karat gold is 75% gold and 12-karat gold is 50% gold, how much of each should be used to make a 14-karat gold bracelet weighing 300 grams?

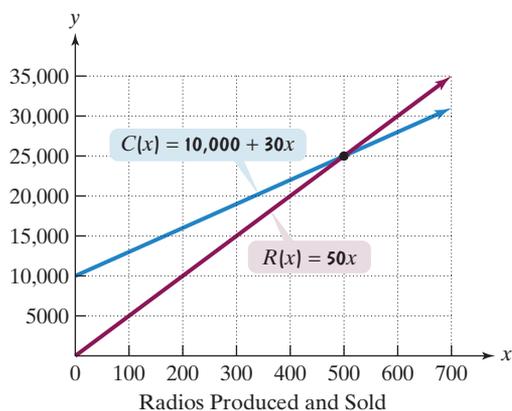

58. In the “Peanuts” cartoon shown, solve the problem that is sending Peppermint Patty into an agitated state. How much cream and how much milk, to the nearest thousandth of a gallon, must be mixed together to obtain 50 gallons of cream that contains 12.5% butterfat?

Peanuts © 1978 Peanuts Worldwide LLC. Used by permission of Universal Uclick. All rights reserved.

59. The manager of a candystand at a large multiplex cinema has a popular candy that sells for \$1.60 per pound. The manager notices a different candy worth \$2.10 per pound that is not selling well. The manager decides to form a mixture of both types of candy to help clear the inventory of the more expensive type. How many pounds of each kind of candy should be used to create a 75-pound mixture selling for \$1.90 per pound?
60. A grocer needs to mix raisins at \$2.00 per pound with granola at \$3.25 per pound to obtain 10 pounds of a mixture that costs \$2.50 per pound. How many pounds of raisins and how many pounds of granola must be used?
61. When a small plane flies with the wind, it can travel 800 miles in 5 hours. When the plane flies in the opposite direction, against the wind, it takes 8 hours to fly the same distance. Find the average velocity of the plane in still air and the average velocity of the wind.
62. When a plane flies with the wind, it can travel 4200 miles in 6 hours. When the plane flies in the opposite direction, against the wind, it takes 7 hours to fly the same distance. Find the average velocity of the plane in still air and the average velocity of the wind.
63. A boat's crew rowed 16 kilometers downstream, with the current, in 2 hours. The return trip upstream, against the current, covered the same distance, but took 4 hours. Find the crew's average rowing velocity in still water and the average velocity of the current.
64. A motorboat traveled 36 miles downstream, with the current, in 1.5 hours. The return trip upstream, against the current, covered the same distance, but took 2 hours. Find the boat's average velocity in still water and the average velocity of the current.
65. With the current, you can canoe 24 miles in 4 hours. Against the same current, you can canoe only  $\frac{3}{4}$  of this distance in 6 hours. Find your average velocity in still water and the average velocity of the current.
66. With the current, you can row 24 miles in 3 hours. Against the same current, you can row only  $\frac{3}{4}$  of this distance in 4 hours. Find your average rowing velocity in still water and the average velocity of the current.

The figure shows the graphs of the cost and revenue functions for a company that manufactures and sells small radios. Use the information in the figure to solve Exercises 67–72.

67. How many radios must be produced and sold for the company to break even?
68. More than how many radios must be produced and sold for the company to have a profit?
69. Use the formulas shown in the voice balloons to find  $R(200) - C(200)$ . Describe what this means for the company.
70. Use the formulas shown in the voice balloons to find  $R(300) - C(300)$ . Describe what this means for the company.
71.
  - a. Use the formulas shown in the voice balloons to write the company's profit function,  $P$ , from producing and selling  $x$  radios.
  - b. Find the company's profit if 10,000 radios are produced and sold.
72.
  - a. Use the formulas shown in the voice balloons to write the company's profit function,  $P$ , from producing and selling  $x$  radios.
  - b. Find the company's profit if 20,000 radios are produced and sold.

Exercises 73–76 describe a number of business ventures. For each exercise,

- a. Write the cost function,  $C$ .
  - b. Write the revenue function,  $R$ .
  - c. Determine the break-even point. Describe what this means.
73. A company that manufactures small canoes has a fixed cost of \$18,000. It costs \$20 to produce each canoe. The selling price is \$80 per canoe. (In solving this exercise, let  $x$  represent the number of canoes produced and sold.)
  74. A company that manufactures bicycles has a fixed cost of \$100,000. It costs \$100 to produce each bicycle. The selling price is \$300 per bike. (In solving this exercise, let  $x$  represent the number of bicycles produced and sold.)
  75. You invest in a new play. The cost includes an overhead of \$30,000, plus production costs of \$2500 per performance. A sold-out performance brings in \$3125. (In solving this exercise, let  $x$  represent the number of sold-out performances.)
  76. You invested \$30,000 and started a business writing greeting cards. Supplies cost 2¢ per card and you are selling each card for 50¢. (In solving this exercise, let  $x$  represent the number of cards produced and sold.)

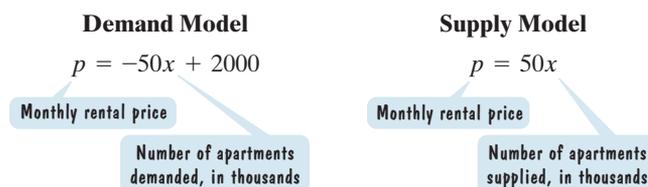

An important application of systems of equations arises in connection with supply and demand. As the price of a product increases, the demand for that product decreases. However, at higher prices, suppliers are willing to produce greater quantities of the product. The price at which supply and demand are equal is called the **equilibrium price**. The quantity supplied and demanded at that price is called the **equilibrium quantity**. Exercises 77–78 involve supply and demand.

77. The following models describe wages for low-skilled labor.

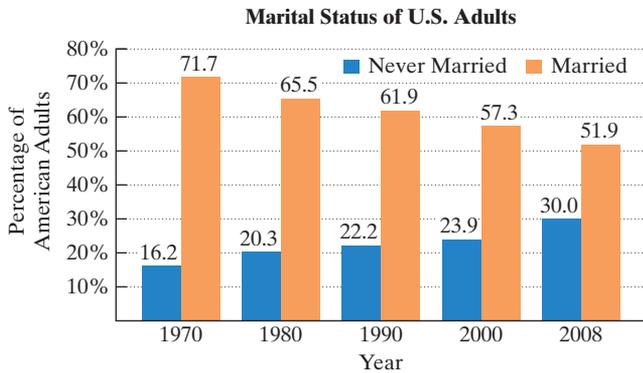

Source: O'Sullivan and Sheffrin, *Economics*, Prentice Hall, 2007.

- a. Solve the system and find the equilibrium number of workers, in millions, and the equilibrium hourly wage.
  - b. Use your answer from part (a) to complete this statement:  
If workers are paid \_\_\_\_\_ per hour, there will be \_\_\_\_\_ million available workers and \_\_\_\_\_ million workers will be hired.
  - c. In 2007, the federal minimum wage was set at \$5.15 per hour. Substitute 5.15 for  $p$  in the demand model,  $p = -0.325x + 5.8$ , and determine the millions of workers employers will hire at this price.
  - d. At a minimum wage of \$5.15 per hour, use the supply model,  $p = 0.375x + 3$ , to determine the millions of available workers. Round to one decimal place.
  - e. At a minimum wage of \$5.15 per hour, use your answers from parts (c) and (d) to determine how many more people are looking for work than employers are willing to hire.
78. The following models describe demand and supply for three-bedroom rental apartments.

- a. Solve the system and find the equilibrium quantity and the equilibrium price.
- b. Use your answer from part (a) to complete this statement:  
When rents are \_\_\_\_\_ per month, consumers will demand \_\_\_\_\_ apartments and suppliers will offer \_\_\_\_\_ apartments for rent.

79. The bar graph indicates that fewer U.S. adults are getting married.

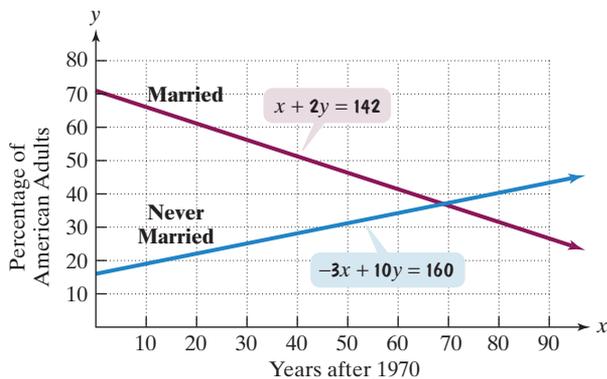

Source: U.S. Census Bureau

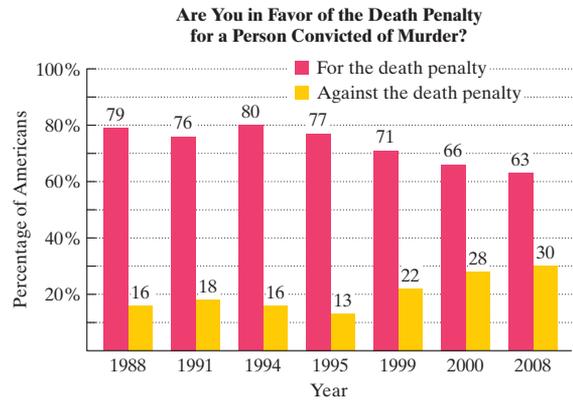

The data can be modeled by the following system of linear equations:

$$\begin{cases} -3x + 10y = 160 & \text{Percentage of never-married American adults, } y, x \text{ years after 1970} \\ x + 2y = 142 & \text{Percentage of married American adults, } y, x \text{ years after 1970} \end{cases}$$

- Use these models to determine the year, rounded to the nearest year, when the percentage of never-married adults will be the same as the percentage of married adults. For that year, approximately what percentage of Americans, rounded to the nearest percent, will belong to each group?
- How is your approximate solution from part (a) shown by the following graphs?

80. The bar graph shows the percentage of Americans for and against the death penalty for a person convicted of murder.

Source: Newsweek poll

The data can be modeled by the following system of equations:

$$\begin{cases} 13x + 12y = 992 & \text{The percent, } y, \text{ in favor of the death penalty } x \text{ years after 1988} \\ -x + y = 16 & \text{The percent, } y, \text{ against the death penalty } x \text{ years after 1988} \end{cases}$$

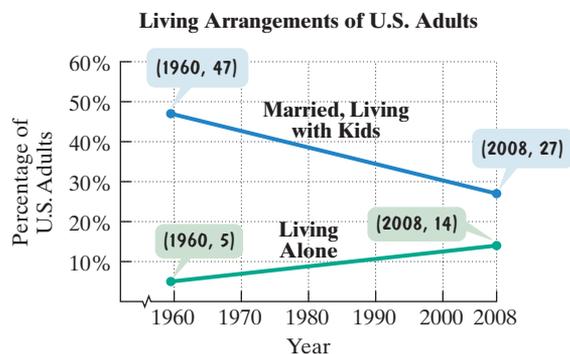

In which year will the percentage of Americans in favor of the death penalty be the same as the percentage of Americans who oppose it? For that year, what percent will be for the death penalty and what percent will be against it?

- We opened this section with a study showing that late in the semester, procrastinating students reported more symptoms of physical illness than their nonprocrastinating peers.
  - At the beginning of the semester, procrastinators reported an average of 0.8 symptoms, increasing at a rate of 0.45 symptoms per week. Write a function that models the average number of symptoms after  $x$  weeks.
  - At the beginning of the semester, nonprocrastinators reported an average of 2.6 symptoms, increasing at a rate of 0.15 symptoms per week. Write a function that models the average number of symptoms after  $x$  weeks.
  - By which week in the semester did both groups report the same number of symptoms of physical illness? For that week, how many symptoms were reported by each group? How is this shown in **Figure 7.1** on page 772?
- Although Social Security is a problem, some projections indicate that there's a much bigger time bomb ticking in the federal budget, and that's Medicare. In 2000, the cost of Social Security was 5.48% of the gross domestic product, increasing by 0.04% of the GDP per year. In 2000, the cost of Medicare was 1.84% of the gross domestic product, increasing by 0.17% of the GDP per year.
 

(Source: Congressional Budget Office)

  - Write a function that models the cost of Social Security as a percentage of the GDP  $x$  years after 2000.
  - Write a function that models the cost of Medicare as a percentage of the GDP  $x$  years after 2000.
  - In which year will the cost of Medicare and Social Security be the same? For that year, what will be the cost of each program as a percentage of the GDP? Which program will have the greater cost after that year?

83. The graphs show the percentage of American adults in two living arrangements from 1960 through 2008.

Source: U.S. Census Bureau

- Write the slope-intercept equation of the line that models the percentage of U.S. adults living alone,  $y$ ,  $x$  years after 1960. Round the value of the slope,  $m$ , to one decimal place.
  - Write the slope-intercept equation of the line that models the percentage of married U.S. adults living with kids,  $y$ ,  $x$  years after 1960. Round the value of the slope,  $m$ , to one decimal place.
  - Use the models from parts (a) and (b) to project the year in which the percentage of adults living alone will be the same as the percentage of adults living with kids. What percentage of U.S. adults will belong to each group during that year?
84. The graphs show that the U.S. public has taken a more conservative stance on gun control for the period from 1999 through 2009.

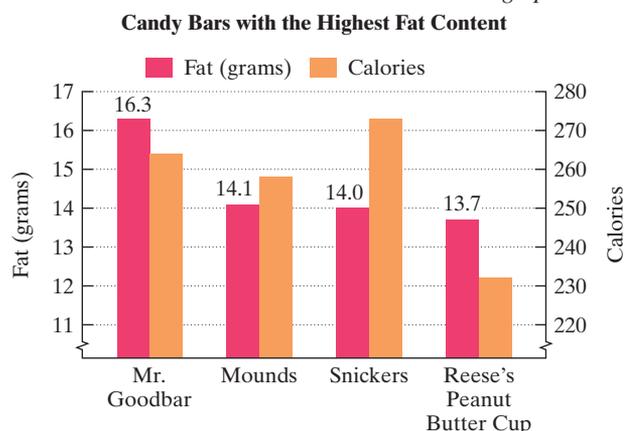

Source: pewresearch.org

- Write the slope-intercept equation of the line that models the percentage of the U.S. public that favors gun control,  $y$ ,  $x$  years after 1999.
- Write the slope-intercept equation of the line that models the percentage of the U.S. public against gun control,  $y$ ,  $x$  years after 1999.
- Use the models from parts (a) and (b) to project the year, to the nearest whole year, during which the percentage in favor of gun control was the same as the percentage against gun control. What percentage of the U.S. public, to the nearest percent, shared each of these opinions during that year?

Use a system of linear equations to solve Exercises 85–92.

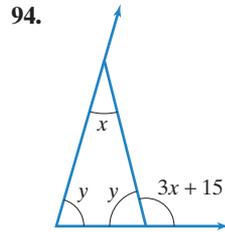

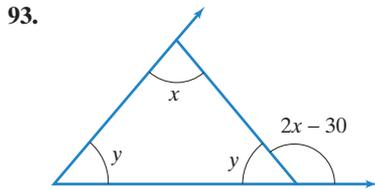

Looking for Mr. Goodbar? It's probably not a good idea if you want to look like Mr. Universe or Julia Roberts. The graph shows the four candy bars with the highest fat content, representing grams of fat and calories in each bar. Exercises 85–88 are based on the graph.

Source: Krantz and Sveum, *The World's Worst*, HarperCollins, 2005

- One Mr. Goodbar and two Mounds bars contain 780 calories. Two Mr. Goodbars and one Mounds bar contain 786 calories. Find the caloric content of each candy bar.
- One Snickers bar and two Reese's Peanut Butter Cups contain 737 calories. Two Snickers bars and one Reese's Peanut Butter Cup contain 778 calories. Find the caloric content of each candy bar.
- A collection of Halloween candy contains a total of five Mr. Goodbars and Mounds bars. Chew on this: The grams of fat in these candy bars exceed the daily maximum desirable fat intake of 70 grams by 7.1 grams. How many bars of each kind of candy are contained in the Halloween collection?
- A collection of Halloween candy contains a total of 12 Snickers bars and Reese's Peanut Butter Cups. Chew on this: The grams of fat in these candy bars exceed twice the daily maximum desirable fat intake of 70 grams by 26.5 grams. How many bars of each kind of candy are contained in the Halloween collection?
- A hotel has 200 rooms. Those with kitchen facilities rent for \$100 per night and those without kitchen facilities rent for \$80 per night. On a night when the hotel was completely occupied, revenues were \$17,000. How many of each type of room does the hotel have?
- A new restaurant is to contain two-seat tables and four-seat tables. Fire codes limit the restaurant's maximum occupancy to 56 customers. If the owners have hired enough servers, how many of each kind of table should they purchase?
- A rectangular lot whose perimeter is 360 feet is fenced along three sides. An expensive fencing along the lot's length costs \$20 per foot and an inexpensive fencing along the two side widths costs only \$8 per foot. The total cost of the fencing along the three sides comes to \$3280. What are the lot's dimensions?
- A rectangular lot whose perimeter is 320 feet is fenced along three sides. An expensive fencing along the lot's length costs \$16 per foot and an inexpensive fencing along the two side widths costs only \$5 per foot. The total cost of the fencing along the three sides comes to \$2140. What are the lot's dimensions?

In Exercises 93–94, an isosceles triangle containing two angles with equal measure is shown. The degree measure of each triangle's three interior angles and an exterior angle is represented with variables. Find the measure of the three interior angles.

**Writing in Mathematics**

- 95. What is a system of linear equations? Provide an example with your description.
- 96. What is the solution of a system of linear equations?
- 97. Explain how to solve a system of equations using the substitution method. Use  $y = 3 - 3x$  and  $3x + 4y = 6$  to illustrate your explanation.
- 98. Explain how to solve a system of equations using the addition method. Use  $3x + 5y = -2$  and  $2x + 3y = 0$  to illustrate your explanation.
- 99. When is it easier to use the addition method rather than the substitution method to solve a system of equations?
- 100. When using the addition or substitution method, how can you tell if a system of linear equations has infinitely many solutions? What is the relationship between the graphs of the two equations?
- 101. When using the addition or substitution method, how can you tell if a system of linear equations has no solution? What is the relationship between the graphs of the two equations?
- 102. Describe the break-even point for a business.

**Technology Exercise**

- 103. Verify your solutions to any five exercises in Exercises 5–42 by using a graphing utility to graph the two equations in the system in the same viewing rectangle. Then use the intersection feature to display the solution.

**Critical Thinking Exercises**

**Make Sense?** In Exercises 104–107, determine whether each statement makes sense or does not make sense, and explain your reasoning.

- 104. Each equation in a system of linear equations has infinitely many ordered-pair solutions.
- 105. Every linear system has infinitely many ordered-pair solutions.
- 106. I should mix 6 liters of a 50% acid solution with 4 liters of a 25% acid solution to obtain 10 liters of a 75% acid solution.

- 107. You told me that you flew against the wind from Miami to Seattle, 2800 miles, in 7 hours and, at the same time, your friend flew with the wind from Seattle to Miami in only 5.6 hours. You have not given me enough information to determine the average velocity of the wind.

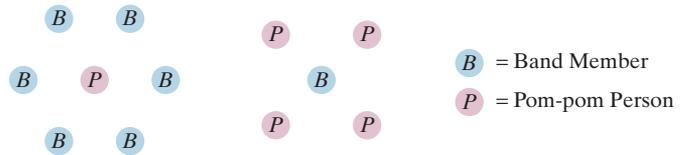

- 108. Write a system of equations having  $\{(-2, 7)\}$  as a solution set. (More than one system is possible.)

- 109. Solve the system for  $x$  and  $y$  in terms of  $a_1, b_1, c_1, a_2, b_2,$  and  $c_2$ :

$$\begin{cases} a_1x + b_1y = c_1 \\ a_2x + b_2y = c_2. \end{cases}$$

- 110. Two identical twins can only be distinguished by the characteristic that one always tells the truth and the other always lies. One twin tells you of a lucky number pair: “When I multiply my first lucky number by 3 and my second lucky number by 6, the addition of the resulting numbers produces a sum of 12. When I add my first lucky number and twice my second lucky number, the sum is 5.” Which twin is talking?

- 111. A marching band has 52 members, and there are 24 in the pom-pom squad. They wish to form several hexagons and squares like those diagrammed below. Can it be done with no people left over?

**Group Exercise**

- 112. The group should write four different word problems that can be solved using a system of linear equations in two variables. All of the problems should be on different topics. The group should turn in the four problems and their algebraic solutions.

**Preview Exercises**

Exercises 113–115 will help you prepare for the material covered in the next section.

- 113. If  $x = 3, y = 2,$  and  $z = -3,$  does the ordered triple  $(x, y, z)$  satisfy the equation  $2x - y + 4z = -8$ ?
- 114. Consider the following equations:

$$\begin{cases} 5x - 2y - 4z = 3 & \text{Equation 1} \\ 3x + 3y + 2z = -3. & \text{Equation 2} \end{cases}$$

Use this process to eliminate  $z$ : Copy Equation 1 and multiply Equation 2 by 2. Then add the equations.

- 115. Write an equation involving  $a, b,$  and  $c$  based on the following description:

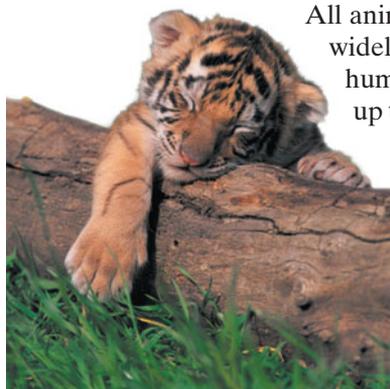

When the value of  $x$  in  $y = ax^2 + bx + c$  is 4, the value of  $y$  is 1682.

## SECTION 7.2

## Systems of Linear Equations in Three Variables

## Objectives

- 1 Verify the solution of a system of linear equations in three variables.
- 2 Solve systems of linear equations in three variables.
- 3 Solve problems using systems in three variables.

All animals sleep, but the length of time they sleep varies widely: Cattle sleep for only a few minutes at a time. We humans seem to need more sleep than other animals, up to eight hours a day. Without enough sleep, we have difficulty concentrating, make mistakes in routine tasks, lose energy, and feel bad-tempered. There is a relationship between hours of sleep and death rate per year per 100,000 people. How many hours of sleep will put you in the group with the minimum death rate? In this section, we will answer this question by solving a system of linear equations with more than two variables.

- 1 Verify the solution of a system of linear equations in three variables.

## Systems of Linear Equations in Three Variables and Their Solutions

An equation such as  $x + 2y - 3z = 9$  is called a *linear equation in three variables*. In general, any equation of the form

$$Ax + By + Cz = D,$$

where  $A$ ,  $B$ ,  $C$ , and  $D$  are real numbers such that  $A$ ,  $B$ , and  $C$  are not all 0, is a **linear equation in three variables:  $x$ ,  $y$ , and  $z$** . The graph of this linear equation in three variables is a plane in three-dimensional space.

The process of solving a system of three linear equations in three variables is geometrically equivalent to finding the point of intersection (assuming that there is one) of three planes in space. (See **Figure 7.9**.) A **solution** of a system of linear equations in three variables is an ordered triple of real numbers that satisfies all equations of the system. The **solution set** of the system is the set of all its solutions.

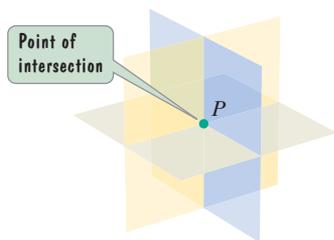

FIGURE 7.9

## EXAMPLE 1 Determining Whether an Ordered Triple Satisfies a System

Show that the ordered triple  $(-1, 2, -2)$  is a solution of the system:

$$\begin{cases} x + 2y - 3z = 9 \\ 2x - y + 2z = -8 \\ -x + 3y - 4z = 15 \end{cases}$$

## SOLUTION

Because  $-1$  is the  $x$ -coordinate,  $2$  is the  $y$ -coordinate, and  $-2$  is the  $z$ -coordinate of  $(-1, 2, -2)$ , we replace  $x$  with  $-1$ ,  $y$  with  $2$ , and  $z$  with  $-2$  in each of the three equations.

$$\begin{array}{lll} x + 2y - 3z = 9 & 2x - y + 2z = -8 & -x + 3y - 4z = 15 \\ -1 + 2(2) - 3(-2) \stackrel{?}{=} 9 & 2(-1) - 2 + 2(-2) \stackrel{?}{=} -8 & -(-1) + 3(2) - 4(-2) \stackrel{?}{=} 15 \\ -1 + 4 + 6 \stackrel{?}{=} 9 & -2 - 2 - 4 \stackrel{?}{=} -8 & 1 + 6 + 8 \stackrel{?}{=} 15 \\ 9 = 9, \text{ true} & -8 = -8, \text{ true} & 15 = 15, \text{ true} \end{array}$$

The ordered triple  $(-1, 2, -2)$  satisfies the three equations: It makes each equation true. Thus, the ordered triple is a solution of the system. ●●●

 **Check Point 1** Show that the ordered triple  $(-1, -4, 5)$  is a solution of the system:

$$\begin{cases} x - 2y + 3z = 22 \\ 2x - 3y - z = 5 \\ 3x + y - 5z = -32. \end{cases}$$

- 2** Solve systems of linear equations in three variables.

## Solving Systems of Linear Equations in Three Variables by Eliminating Variables

The method for solving a system of linear equations in three variables is similar to that used on systems of linear equations in two variables. We use addition to eliminate any variable, reducing the system to two equations in two variables. Once we obtain a system of two equations in two variables, we use addition or substitution to eliminate a variable. The result is a single equation in one variable. We solve this equation to get the value of the remaining variable. Other variable values are found by back-substitution.

### GREAT QUESTION!

**When solving a linear system in three variables, which variable should I eliminate first?**

It does not matter which variable you eliminate first, as long as you eliminate the same variable in two different pairs of equations.

### Solving Linear Systems in Three Variables by Eliminating Variables

1. Reduce the system to two equations in two variables. This is usually accomplished by taking two different pairs of equations and using the addition method to eliminate the same variable from both pairs.
2. Solve the resulting system of two equations in two variables using addition or substitution. The result is an equation in one variable that gives the value of that variable.
3. Back-substitute the value of the variable found in step 2 into either of the equations in two variables to find the value of the second variable.
4. Use the values of the two variables from steps 2 and 3 to find the value of the third variable by back-substituting into one of the original equations.
5. Check the proposed solution in each of the original equations.

### EXAMPLE 2 Solving a System in Three Variables

Solve the system:

$$\begin{cases} 5x - 2y - 4z = 3 & \text{Equation 1} \\ 3x + 3y + 2z = -3 & \text{Equation 2} \\ -2x + 5y + 3z = 3 & \text{Equation 3} \end{cases}$$

### SOLUTION

There are many ways to proceed. Because our initial goal is to reduce the system to two equations in two variables, **the central idea is to take two different pairs of equations and eliminate the same variable from both pairs.**

**Step 1 Reduce the system to two equations in two variables.** We choose any two equations and use the addition method to eliminate a variable. Let's eliminate  $z$  using Equations 1 and 2. We do so by multiplying Equation 2 by 2. Then we add equations.

$$\begin{array}{l} \text{(Equation 1)} \\ \text{(Equation 2)} \end{array} \begin{cases} 5x - 2y - 4z = 3 \\ 3x + 3y + 2z = -3 \end{cases} \begin{array}{l} \xrightarrow{\text{No change}} \\ \xrightarrow{\text{Multiply by 2.}} \\ \text{Add:} \end{array} \begin{cases} 5x - 2y - 4z = 3 \\ 6x + 6y + 4z = -6 \\ \hline 11x + 4y = -3 \end{cases} \text{Equation 4}$$

$$\begin{cases} 5x - 2y - 4z = 3 & \text{Equation 1} \\ 3x + 3y + 2z = -3 & \text{Equation 2} \\ -2x + 5y + 3z = 3 & \text{Equation 3} \end{cases}$$

The given system (repeated)

$$\begin{array}{l} \text{(Equation 2)} \\ \text{(Equation 3)} \end{array} \left\{ \begin{array}{l} 3x + 3y + 2z = -3 \\ -2x + 5y + 3z = 3 \end{array} \right. \begin{array}{l} \xrightarrow{\text{Multiply by } -3.} \\ \xrightarrow{\text{Multiply by } 2.} \\ \text{Add:} \end{array} \left\{ \begin{array}{l} -9x - 9y - 6z = 9 \\ -4x + 10y + 6z = 6 \\ \hline -13x + y = 15 \end{array} \right. \text{Equation 5}$$

Equation 4,  $11x + 4y = -3$ , obtained on the previous page, and Equation 5,  $-13x + y = 15$ , obtained above, give us a system of two equations in two variables:

$$\begin{cases} 11x + 4y = -3 & \text{Equation 4} \\ -13x + y = 15 & \text{Equation 5} \end{cases}$$

**Step 2 Solve the resulting system of two equations in two variables.** We will use the addition method to solve Equations 4 and 5 for  $x$  and  $y$ . To do so, we multiply Equation 5 on both sides by  $-4$  and add this to Equation 4.

$$\begin{array}{l} \text{(Equation 4)} \\ \text{(Equation 5)} \end{array} \left\{ \begin{array}{l} 11x + 4y = -3 \\ -13x + y = 15 \end{array} \right. \begin{array}{l} \xrightarrow{\text{No change}} \\ \xrightarrow{\text{Multiply by } -4.} \\ \text{Add:} \end{array} \left\{ \begin{array}{l} 11x + 4y = -3 \\ 52x - 4y = -60 \\ \hline 63x = -63 \\ x = -1 \end{array} \right. \text{Divide both sides by } 63.$$

**Step 3 Use back-substitution in one of the equations in two variables to find the value of the second variable.** We back-substitute  $-1$  for  $x$  in either Equation 4 or 5 to find the value of  $y$ .

$$\begin{array}{l} -13x + y = 15 & \text{Equation 5} \\ -13(-1) + y = 15 & \text{Substitute } -1 \text{ for } x. \\ 13 + y = 15 & \text{Multiply.} \\ y = 2 & \text{Subtract } 13 \text{ from both sides.} \end{array}$$

**Step 4 Back-substitute the values found for two variables into one of the original equations to find the value of the third variable.** We can now use any one of the original equations and back-substitute the values of  $x$  and  $y$  to find the value for  $z$ . We will use Equation 2.

$$\begin{array}{l} 3x + 3y + 2z = -3 & \text{Equation 2} \\ 3(-1) + 3(2) + 2z = -3 & \text{Substitute } -1 \text{ for } x \text{ and } 2 \text{ for } y. \\ 3 + 2z = -3 & \text{Multiply and then add:} \\ 2z = -6 & \text{Subtract } 3 \text{ from both sides.} \\ z = -3 & \text{Divide both sides by } 2. \end{array}$$

With  $x = -1$ ,  $y = 2$ , and  $z = -3$ , the proposed solution is the ordered triple  $(-1, 2, -3)$ .

**Step 5 Check.** Check the proposed solution,  $(-1, 2, -3)$ , by substituting the values for  $x$ ,  $y$ , and  $z$  into each of the three original equations. These substitutions yield three true statements. Thus, the solution set is  $\{(-1, 2, -3)\}$ . •••

 **Check Point 2** Solve the system:

$$\begin{cases} x + 4y - z = 20 \\ 3x + 2y + z = 8 \\ 2x - 3y + 2z = -16. \end{cases}$$

In some examples, one of the variables is already eliminated from a given equation. In this case, the missing variable should be eliminated from the other two equations, thereby making it possible to omit one of the elimination steps. We illustrate this idea in Example 3.

**EXAMPLE 3** Solving a System of Equations with a Missing Term

Solve the system:

$$\begin{cases} x + z = 8 & \text{Equation 1} \\ x + y + 2z = 17 & \text{Equation 2} \\ x + 2y + z = 16. & \text{Equation 3} \end{cases}$$

**DISCOVERY**

Solve Equation 1 for  $z$  and then replace  $z$  with  $8 - x$  in Equations 2 and 3. Solve the resulting system of two equations in two variables. Compare your solution method with the one shown on the right. Which method do you prefer?

**SOLUTION**

**Step 1 Reduce the system to two equations in two variables.** Because Equation 1 contains only  $x$  and  $z$ , we could omit one of the elimination steps by eliminating  $y$  using Equations 2 and 3. This will give us two equations in  $x$  and  $z$ . To eliminate  $y$  using Equations 2 and 3, we multiply Equation 2 by  $-2$  and add Equation 3.

$$\begin{array}{l} \text{(Equation 2)} \\ \text{(Equation 3)} \end{array} \left\{ \begin{array}{l} x + y + 2z = 17 \\ x + 2y + z = 16 \end{array} \right. \begin{array}{l} \xrightarrow{\text{Multiply by } -2.} \\ \xrightarrow{\text{No change}} \end{array} \left\{ \begin{array}{l} -2x - 2y - 4z = -34 \\ x + 2y + z = 16 \\ \hline -x - 3z = -18 \end{array} \right. \text{Equation 4}$$

Equation 4 and the given Equation 1 provide us with a system of two equations in two variables:

$$\begin{cases} x + z = 8 & \text{Equation 1} \\ -x - 3z = -18. & \text{Equation 4} \end{cases}$$

**Step 2 Solve the resulting system of two equations in two variables.** We will solve Equations 1 and 4 for  $x$  and  $z$ .

$$\begin{array}{l} \\ \text{Add:} \end{array} \left\{ \begin{array}{l} x + z = 8 \\ -x - 3z = -18 \end{array} \right. \begin{array}{l} \text{Equation 1} \\ \text{Equation 4} \end{array} \begin{array}{l} \\ \\ \hline -2z = -10 \\ z = 5 \end{array} \begin{array}{l} \\ \\ \text{Divide both sides by } -2. \end{array}$$

**Step 3 Use back-substitution in one of the equations in two variables to find the value of the second variable.** To find  $x$ , we back-substitute  $5$  for  $z$  in either Equation 1 or 4. We will use Equation 1.

$$\begin{array}{l} x + z = 8 \\ x + 5 = 8 \\ x = 3 \end{array} \begin{array}{l} \text{Equation 1} \\ \text{Substitute 5 for } z. \\ \text{Subtract 5 from both sides.} \end{array}$$

**Step 4 Back-substitute the values found for two variables into one of the original equations to find the value of the third variable.** To find  $y$ , we back-substitute  $3$  for  $x$  and  $5$  for  $z$  into Equation 2 or 3. We cannot use Equation 1 because  $y$  is missing in this equation. We will use Equation 2.

$$\begin{array}{l} x + y + 2z = 17 \\ 3 + y + 2(5) = 17 \\ y + 13 = 17 \\ y = 4 \end{array} \begin{array}{l} \text{Equation 2} \\ \text{Substitute 3 for } x \text{ and } 5 \text{ for } z. \\ \text{Multiply and add.} \\ \text{Subtract 13 from both sides.} \end{array}$$

We found that  $z = 5$ ,  $x = 3$ , and  $y = 4$ . Thus, the proposed solution is the ordered triple  $(3, 4, 5)$ .

**Step 5 Check.** Substituting  $3$  for  $x$ ,  $4$  for  $y$ , and  $5$  for  $z$  into each of the three original equations yields three true statements. Consequently, the solution set is  $\{(3, 4, 5)\}$ . ...

 **Check Point 3** Solve the system:

$$\begin{cases} 2y - z = 7 \\ x + 2y + z = 17 \\ 2x - 3y + 2z = -1. \end{cases}$$

A system of linear equations in three variables represents three planes. The three planes may not always intersect at one point. The planes may have no common point of intersection and represent an inconsistent system with no solution. By contrast, the planes may coincide or intersect along a line. In these cases, the planes have infinitely many points in common and represent systems with infinitely many solutions. Systems of linear equations in three variables that are inconsistent or that contain dependent equations will be discussed in Chapter 6.

- 3 Solve problems using systems in three variables.

### Applications

Systems of equations may allow us to find models for data without using a graphing utility. Three data points that do not lie on or near a line determine the graph of a quadratic function of the form  $y = ax^2 + bx + c$ ,  $a \neq 0$ . Quadratic functions often model situations in which values of  $y$  are decreasing and then increasing, suggesting the bowl-like shape of a parabola.

#### EXAMPLE 4 Modeling Data Relating Sleep and Death Rate

In a study relating sleep and death rate, the following data were obtained. Use the function  $y = ax^2 + bx + c$  to model the data.

$x$ (Average Number of Hours of Sleep)	$y$ (Death Rate per Year per 100,000 Males)
4	1682
7	626
9	967

#### SOLUTION

We need to find values for  $a$ ,  $b$ , and  $c$  in  $y = ax^2 + bx + c$ . We can do so by solving a system of three linear equations in  $a$ ,  $b$ , and  $c$ . We obtain the three equations by using the values of  $x$  and  $y$  from the data as follows:

$$y = ax^2 + bx + c \quad \text{Use the quadratic function to model the data.}$$

$$\begin{array}{l} \text{When } x = 4, y = 1682: \\ \text{When } x = 7, y = 626: \\ \text{When } x = 9, y = 967: \end{array} \left\{ \begin{array}{l} 1682 = a \cdot 4^2 + b \cdot 4 + c \\ 626 = a \cdot 7^2 + b \cdot 7 + c \\ 967 = a \cdot 9^2 + b \cdot 9 + c \end{array} \right. \quad \text{or} \quad \left\{ \begin{array}{l} 16a + 4b + c = 1682 \\ 49a + 7b + c = 626 \\ 81a + 9b + c = 967. \end{array} \right.$$

The easiest way to solve this system is to eliminate  $c$  from two pairs of equations, obtaining two equations in  $a$  and  $b$ . Solving this system gives  $a = 104.5$ ,  $b = -1501.5$ , and  $c = 6016$ . We now substitute the values for  $a$ ,  $b$ , and  $c$  into  $y = ax^2 + bx + c$ . The function that models the given data is

$$y = 104.5x^2 - 1501.5x + 6016. \quad \dots$$

We can use the model that we obtained in Example 4 to find the death rate of males who average, say, 6 hours of sleep. First, write the model in function notation:

$$f(x) = 104.5x^2 - 1501.5x + 6016.$$

Substitute 6 for  $x$ :

$$f(6) = 104.5(6)^2 - 1501.5(6) + 6016 = 769.$$

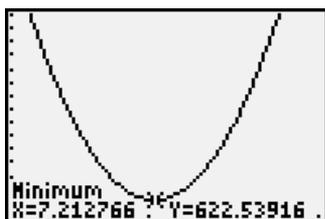

According to the model, the death rate for males who average 6 hours of sleep is 769 deaths per 100,000 males.

### TECHNOLOGY

The graph of

$$y = 104.5x^2 - 1501.5x + 6016$$

is displayed in a  $[3, 12, 1]$  by  $[500, 2000, 100]$  viewing rectangle. The minimum function feature shows that the lowest point on the graph, the vertex, is approximately  $(7.2, 622.5)$ . Men who average 7.2 hours of sleep are in the group with the lowest death rate, approximately 622.5 deaths per 100,000 males.

 **Check Point 4** Find the quadratic function  $y = ax^2 + bx + c$  whose graph passes through the points  $(1, 4)$ ,  $(2, 1)$ , and  $(3, 4)$ .

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

1. A solution of a system of linear equations in three variables is an ordered \_\_\_\_\_ of real numbers that satisfies all/some of the equations in the system.

Circle the correct choice.

2. Consider the following system:

$$\begin{cases} x + y - z = -1 & \text{Equation 1} \\ 2x - 2y - 5z = 7 & \text{Equation 2} \\ 4x + y - 2z = 7 & \text{Equation 3} \end{cases}$$

We can eliminate  $x$  from Equations 1 and 2 by multiplying Equation 1 by \_\_\_\_\_ and adding equations. We can eliminate  $x$  from Equations 1 and 3 by multiplying Equation 1 by \_\_\_\_\_ and adding equations.

3. Consider the following system:

$$\begin{cases} x + y + z = 2 & \text{Equation 1} \\ 2x - 3y = 3 & \text{Equation 2} \\ 10y - z = 12 & \text{Equation 3} \end{cases}$$

Equation 2 does not contain the variable \_\_\_\_\_. To obtain a second equation that does not contain this variable, we can \_\_\_\_\_.

## EXERCISE SET 7.2

## Practice Exercises

In Exercises 1–4, determine if the given ordered triple is a solution of the system.

1.  $(2, -1, 3)$

$$\begin{cases} x + y + z = 4 \\ x - 2y - z = 1 \\ 2x - y - 2z = -1 \end{cases}$$

2.  $(5, -3, -2)$

$$\begin{cases} x + y + z = 0 \\ x + 2y - 3z = 5 \\ 3x + 4y + 2z = -1 \end{cases}$$

3.  $(4, 1, 2)$

$$\begin{cases} x - 2y = 2 \\ 2x + 3y = 11 \\ y - 4z = -7 \end{cases}$$

4.  $(-1, 3, 2)$

$$\begin{cases} x - 2z = -5 \\ y - 3z = -3 \\ 2x - z = -4 \end{cases}$$

Solve each system in Exercises 5–18.

5. 
$$\begin{cases} x + y + 2z = 11 \\ x + y + 3z = 14 \\ x + 2y - z = 5 \end{cases}$$

6. 
$$\begin{cases} 2x + y - 2z = -1 \\ 3x - 3y - z = 5 \\ x - 2y + 3z = 6 \end{cases}$$

7. 
$$\begin{cases} 4x - y + 2z = 11 \\ x + 2y - z = -1 \\ 2x + 2y - 3z = -1 \end{cases}$$

8. 
$$\begin{cases} x - y + 3z = 8 \\ 3x + y - 2z = -2 \\ 2x + 4y + z = 0 \end{cases}$$

9. 
$$\begin{cases} 3x + 2y - 3z = -2 \\ 2x - 5y + 2z = -2 \\ 4x - 3y + 4z = 10 \end{cases}$$

10. 
$$\begin{cases} 2x + 3y + 7z = 13 \\ 3x + 2y - 5z = -22 \\ 5x + 7y - 3z = -28 \end{cases}$$

11. 
$$\begin{cases} 2x - 4y + 3z = 17 \\ x + 2y - z = 0 \\ 4x - y - z = 6 \end{cases}$$

12. 
$$\begin{cases} x + z = 3 \\ x + 2y - z = 1 \\ 2x - y + z = 3 \end{cases}$$

13. 
$$\begin{cases} 2x + y = 2 \\ x + y - z = 4 \\ 3x + 2y + z = 0 \end{cases}$$

14. 
$$\begin{cases} x + 3y + 5z = 20 \\ y - 4z = -16 \\ 3x - 2y + 9z = 36 \end{cases}$$

15. 
$$\begin{cases} x + y = -4 \\ y - z = 1 \\ 2x + y + 3z = -21 \end{cases}$$

16. 
$$\begin{cases} x + y = 4 \\ x + z = 4 \\ y + z = 4 \end{cases}$$

17. 
$$\begin{cases} 3(2x + y) + 5z = -1 \\ 2(x - 3y + 4z) = -9 \\ 4(1 + x) = -3(z - 3y) \end{cases}$$

18. 
$$\begin{cases} 7z - 3 = 2(x - 3y) \\ 5y + 3z - 7 = 4x \\ 4 + 5z = 3(2x - y) \end{cases}$$

In Exercises 19–22, find the quadratic function  $y = ax^2 + bx + c$  whose graph passes through the given points.

19.  $(-1, 6), (1, 4), (2, 9)$

20.  $(-2, 7), (1, -2), (2, 3)$

21.  $(-1, -4), (1, -2), (2, 5)$

22.  $(1, 3), (3, -1), (4, 0)$

In Exercises 23–24, let  $x$  represent the first number,  $y$  the second number, and  $z$  the third number. Use the given conditions to write a system of equations. Solve the system and find the numbers.

23. The sum of three numbers is 16. The sum of twice the first number, 3 times the second number, and 4 times the third number is 46. The difference between 5 times the first number and the second number is 31. Find the three numbers.

24. The following is known about three numbers: Three times the first number plus the second number plus twice the third number is 5. If 3 times the second number is subtracted from the sum of the first number and 3 times the third number, the result is 2. If the third number is subtracted from 2 times the first number and 3 times the second number, the result is 1. Find the numbers.

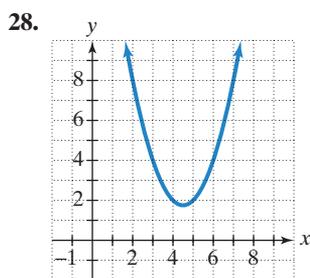

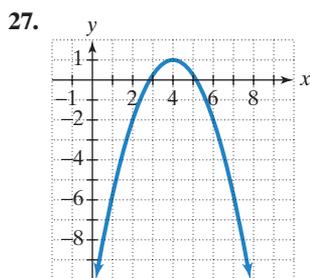

## Practice Plus

Solve each system in Exercises 25–26.

$$25. \begin{cases} \frac{x+2}{6} - \frac{y+4}{3} + \frac{z}{2} = 0 \\ \frac{x+1}{2} + \frac{y-1}{2} - \frac{z}{4} = \frac{9}{2} \\ \frac{x-5}{4} + \frac{y+1}{3} + \frac{z-2}{2} = \frac{19}{4} \end{cases}$$

$$26. \begin{cases} \frac{x+3}{2} - \frac{y-1}{2} + \frac{z+2}{4} = \frac{3}{2} \\ \frac{x-5}{2} + \frac{y+1}{3} - \frac{z}{4} = -\frac{25}{6} \\ \frac{x-3}{4} - \frac{y+1}{2} + \frac{z-3}{2} = -\frac{5}{2} \end{cases}$$

In Exercises 27–28, find the equation of the quadratic function  $y = ax^2 + bx + c$  whose graph is shown. Select three points whose coordinates appear to be integers.

In Exercises 29–30, solve each system for  $(x, y, z)$  in terms of the nonzero constants  $a, b,$  and  $c$ .

$$29. \begin{cases} ax - by - 2cz = 21 \\ ax + by + cz = 0 \\ 2ax - by + cz = 14 \end{cases} \quad 30. \begin{cases} ax - by + 2cz = -4 \\ ax + 3by - cz = 1 \\ 2ax + by + 3cz = 2 \end{cases}$$

## Application Exercises

31. You throw a ball straight up from a rooftop. The ball misses the rooftop on its way down and eventually strikes the ground. A mathematical model can be used to describe the relationship for the ball's height above the ground,  $y$ , after  $x$  seconds. Consider the following data:

$x$ , seconds after the ball is thrown	$y$ , ball's height, in feet, above the ground
1	224
3	176
4	104

- a. Find the quadratic function  $y = ax^2 + bx + c$  whose graph passes through the given points.  
 b. Use the function in part (a) to find the value for  $y$  when  $x = 5$ . Describe what this means.

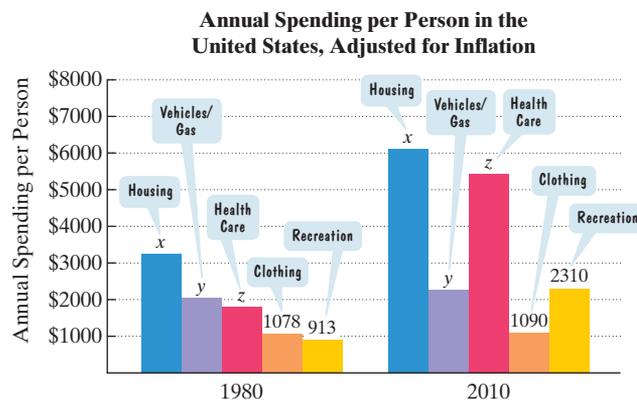

32. A mathematical model can be used to describe the relationship between the number of feet a car travels once the brakes are applied,  $y$ , and the number of seconds the car is in motion after the brakes are applied,  $x$ . A research firm collects the following data:

$x$ , seconds in motion after brakes are applied	$y$ , feet car travels once the brakes are applied
1	46
2	84
3	114

- a. Find the quadratic function  $y = ax^2 + bx + c$  whose graph passes through the given points.  
 b. Use the function in part (a) to find the value for  $y$  when  $x = 6$ . Describe what this means.

Use a system of linear equations in three variables to solve Exercises 33–41.

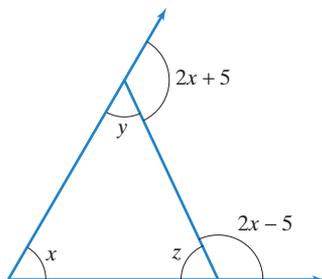

The bar graph shows the average annual spending per person on selected items in 1980 and 2010. All dollar amounts are adjusted for inflation. Use this display to solve Exercises 33–34.

Source: U.S. Bureau of Economic Analysis

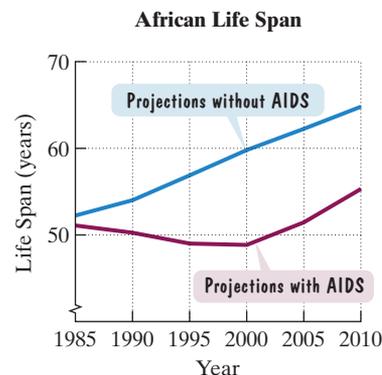

33. In this exercise, we refer to annual spending per person in 2010. The combined spending on housing, vehicles/gas, and health care was \$13,840. The difference between spending on housing and spending on vehicles/gas was \$3864. The difference between spending on housing and spending on health care was \$695. Find the average per-person spending on housing, vehicles/gas, and health care in 2010.
34. In this exercise, we refer to annual spending per person in 1980. The combined spending on housing, vehicles/gas, and health care was \$7073. The difference between spending on housing and spending on vehicles/gas was \$1247. The difference between spending on housing and spending on health care was \$1466. Find the average per-person spending on housing, vehicles/gas, and health care in 1980.

35. On a recent trip to the convenience store, you picked up 2 gallons of milk, 5 bottles of water, and 6 snack-size bags of chips. Your total bill (before tax) was \$19.00. If a bottle of water costs twice as much as a bag of chips, and a gallon of milk costs \$2.00 more than a bottle of water, how much does each item cost?
36. On a recent trip to the convenience store, you picked up 1 gallon of milk, 7 bottles of water, and 4 snack-size bags of chips. Your total bill (before tax) was \$17.00. If a bottle of water costs twice as much as a bag of chips, and a gallon of milk costs \$2.00 more than a bottle of water, how much does each item cost?
37. At a college production of *A Streetcar Named Desire*, 400 tickets were sold. The ticket prices were \$8, \$10, and \$12, and the total income from ticket sales was \$3700. How many tickets of each type were sold if the combined number of \$8 and \$10 tickets sold was 7 times the number of \$12 tickets sold?
38. A certain brand of razor blades comes in packages of 6, 12, and 24 blades, costing \$2, \$3, and \$4 per package, respectively. A store sold 12 packages containing a total of 162 razor blades and took in \$35. How many packages of each type were sold?
39. A person invested \$6700 for one year, part at 8%, part at 10%, and the remainder at 12%. The total annual income from these investments was \$716. The amount of money invested at 12% was \$300 more than the amount invested at 8% and 10% combined. Find the amount invested at each rate.
40. A person invested \$17,000 for one year, part at 10%, part at 12%, and the remainder at 15%. The total annual income from these investments was \$2110. The amount of money invested at 12% was \$1000 less than the amount invested at 10% and 15% combined. Find the amount invested at each rate.
41. In the following triangle, the degree measures of the three interior angles and two of the exterior angles are represented with variables. Find the measure of each interior angle.

### Writing in Mathematics

42. What is a system of linear equations in three variables?
43. How do you determine whether a given ordered triple is a solution of a system in three variables?
44. Describe in general terms how to solve a system in three variables.
45. AIDS is taking a deadly toll on southern Africa. Describe how to use the techniques that you learned in this section to obtain a model for African life span using projections with AIDS, shown by the red graph in the figure. Let  $x$  represent the number of years after 1985 and let  $y$  represent African life span in that year.

### Technology Exercises

46. Does your graphing utility have a feature that allows you to solve linear systems by entering coefficients and constant terms? If so, use this feature to verify the solutions to any five exercises that you worked by hand from Exercises 5–16.
47. Verify your results in Exercises 19–22 by using a graphing utility to graph the resulting parabola. Trace along the curve and convince yourself that the three points given in the exercise lie on the parabola.

### Critical Thinking Exercises

**Make Sense?** In Exercises 48–51, determine whether each statement makes sense or does not make sense, and explain your reasoning.

48. Solving a system in three variables, I found that  $x = 3$  and  $y = -1$ . Because  $z$  represents a third variable,  $z$  cannot equal 3 or  $-1$ .
49. A system of linear equations in three variables,  $x$ ,  $y$ , and  $z$ , cannot contain an equation in the form  $y = mx + b$ .
50. I'm solving a three-variable system in which one of the given equations has a missing term, so it will not be necessary to use any of the original equations twice when I reduce the system to two equations in two variables.
51. Because the percentage of the U.S. population that was foreign-born decreased from 1910 through 1970 and then increased after that, a quadratic function of the form  $f(x) = ax^2 + bx + c$ , rather than a linear function of the form  $f(x) = mx + b$ , should be used to model the data.
52. Describe how the system

$$\begin{cases} x + y - z - 2w = -8 \\ x - 2y + 3z + w = 18 \\ 2x + 2y + 2z - 2w = 10 \\ 2x + y - z + w = 3 \end{cases}$$

could be solved. Is it likely that in the near future a graphing utility will be available to provide a geometric solution (using intersecting graphs) to this system? Explain.

53. A modernistic painting consists of triangles, rectangles, and pentagons, all drawn so as to not overlap or share sides. Within each rectangle are drawn 2 red roses and each pentagon contains 5 carnations. How many triangles, rectangles, and pentagons appear in the painting if the painting contains a total of 40 geometric figures, 153 sides of geometric figures, and 72 flowers?

### Group Exercise

54. Group members should develop appropriate functions that model each of the projections shown in Exercise 45.

### Preview Exercises

Exercises 55–57 will help you prepare for the material covered in the next section.

55. Subtract:  $\frac{3}{x-4} - \frac{2}{x+2}$ .

56. Add:  $\frac{5x-3}{x^2+1} + \frac{2x}{(x^2+1)^2}$ .

57. Solve:

$$\begin{cases} A + B = 3 \\ 2A - 2B + C = 17 \\ 4A - 2C = 14. \end{cases}$$

## SECTION 7.3

### Partial Fractions

#### Objectives

- 1 Decompose  $\frac{P}{Q}$ , where  $Q$  has only distinct linear factors.
- 2 Decompose  $\frac{P}{Q}$ , where  $Q$  has repeated linear factors.
- 3 Decompose  $\frac{P}{Q}$ , where  $Q$  has a nonrepeated prime quadratic factor.
- 4 Decompose  $\frac{P}{Q}$ , where  $Q$  has a prime, repeated quadratic factor.

The rising and setting of the sun suggest the obvious: Things change over time. Calculus is the study of rates of change, allowing the motion of the rising sun to be measured by “freezing the frame” at one instant in time. If you are given a function, calculus reveals its rate of change at any “frozen” instant. In this section, you will learn an algebraic technique used in calculus to find a function if its

rate of change is known. The technique involves expressing a given function in terms of simpler functions.

#### The Idea behind Partial Fraction Decomposition

We know how to use common denominators to write a sum or difference of rational expressions as a single rational expression. For example,

$$\begin{aligned} \frac{3}{x-4} - \frac{2}{x+2} &= \frac{3(x+2) - 2(x-4)}{(x-4)(x+2)} \\ &= \frac{3x+6-2x+8}{(x-4)(x+2)} = \frac{x+14}{(x-4)(x+2)}. \end{aligned}$$

For solving the kind of calculus problem described in the section opener, we must reverse this process:

$$\frac{x+14}{(x-4)(x+2)} \text{ is expressed as the sum of two simpler fractions.}$$

$$\frac{x+14}{(x-4)(x+2)} = \frac{3}{x-4} + \frac{-2}{x+2}.$$

Partial fraction      Partial fraction

This is the partial fraction decomposition of  $\frac{x+14}{(x-4)(x+2)}$ .

Each of the two fractions on the right is called a **partial fraction**. The sum of these fractions is called the **partial fraction decomposition** of the rational expression on the left-hand side.

Partial fraction decompositions can be written for rational expressions of the form  $\frac{P(x)}{Q(x)}$ , where  $P$  and  $Q$  have no common factors and the highest power in the numerator is less than the highest power in the denominator. In this section, we will show you how to write the partial fraction decompositions for each of the following rational expressions:

$$\frac{9x^2 - 9x + 6}{(2x - 1)(x + 2)(x - 2)}$$

$P(x) = 9x^2 - 9x + 6$ ; highest power = 2  
 $Q(x) = (2x - 1)(x + 2)(x - 2)$ ; multiplying factors, highest power = 3.

$$\frac{5x^3 - 3x^2 + 7x - 3}{(x^2 + 1)^2}$$

$P(x) = 5x^3 - 3x^2 + 7x - 3$ ; highest power = 3  
 $Q(x) = (x^2 + 1)^2$ ; squaring the expression, highest power = 4.

The partial fraction decomposition of a rational expression depends on the factors of the denominator. We consider four cases involving different kinds of factors in the denominator:

1. The denominator is a product of distinct linear factors.
2. The denominator is a product of linear factors, some of which are repeated.
3. The denominator has prime quadratic factors, none of which is repeated.
4. The denominator has a repeated prime quadratic factor.

**1** Decompose  $\frac{P}{Q}$ , where  $Q$  has only distinct linear factors.

### The Partial Fraction Decomposition of a Rational Expression with Distinct Linear Factors in the Denominator

If the denominator of a rational expression has a linear factor of the form  $ax + b$ , then the partial fraction decomposition will contain a term of the form

$$\frac{A}{ax + b}$$

$A$ : Constant  
 $ax + b$ : Linear factor

Each distinct linear factor in the denominator produces a partial fraction of the form *constant over linear factor*. For example,

$$\frac{9x^2 - 9x + 6}{(2x - 1)(x + 2)(x - 2)} = \frac{A}{2x - 1} + \frac{B}{x + 2} + \frac{C}{x - 2}$$

We write a constant over each linear factor in the denominator.

### The Partial Fraction Decomposition of $\frac{P(x)}{Q(x)}$ : $Q(x)$ Has Distinct Linear Factors

The form of the partial fraction decomposition for a rational expression with distinct linear factors in the denominator is

$$\frac{P(x)}{(a_1x + b_1)(a_2x + b_2)(a_3x + b_3) \cdots (a_nx + b_n)} = \frac{A_1}{a_1x + b_1} + \frac{A_2}{a_2x + b_2} + \frac{A_3}{a_3x + b_3} + \cdots + \frac{A_n}{a_nx + b_n}$$

**EXAMPLE 1** Partial Fraction Decomposition with Distinct Linear Factors

Find the partial fraction decomposition of

$$\frac{x + 14}{(x - 4)(x + 2)}$$

**SOLUTION**

We begin by setting up the partial fraction decomposition with the unknown constants. Write a constant over each of the two distinct linear factors in the denominator.

$$\frac{x + 14}{(x - 4)(x + 2)} = \frac{A}{x - 4} + \frac{B}{x + 2}$$

Our goal is to find  $A$  and  $B$ . We do this by multiplying both sides of the equation by the least common denominator,  $(x - 4)(x + 2)$ .

$$(x - 4)(x + 2) \frac{x + 14}{(x - 4)(x + 2)} = (x - 4)(x + 2) \left( \frac{A}{x - 4} + \frac{B}{x + 2} \right)$$

We use the distributive property on the right side.

$$\begin{aligned} \cancel{(x - 4)} \cancel{(x + 2)} \frac{x + 14}{\cancel{(x - 4)} \cancel{(x + 2)}} &= \cancel{(x - 4)}(x + 2) \frac{A}{\cancel{(x - 4)}} + (x - 4) \cancel{(x + 2)} \frac{B}{\cancel{(x + 2)}} \\ &= (x + 2)A + (x - 4)B \end{aligned}$$

Dividing out common factors in numerators and denominators, we obtain

$$x + 14 = A(x + 2) + B(x - 4).$$

To find values for  $A$  and  $B$  that make both sides equal, we will express the sides in exactly the same form by writing the variable  $x$ -terms and then writing the constant terms. Apply the distributive property on the right side.

$$\begin{aligned} x + 14 &= Ax + 2A + Bx - 4B && \text{Distribute } A \text{ and } B \text{ over the parentheses.} \\ x + 14 &= Ax + Bx + 2A - 4B && \text{Rearrange terms.} \\ 1x + 14 &= (A + B)x + (2A - 4B) && \text{Rewrite to identify the coefficient of } x \text{ and the constant term.} \end{aligned}$$

As shown by the arrows, if two polynomials are equal, coefficients of like powers of  $x$  must be equal ( $A + B = 1$ ) and their constant terms must be equal ( $2A - 4B = 14$ ). Consequently,  $A$  and  $B$  satisfy the following two equations:

$$\begin{cases} A + B = 1 \\ 2A - 4B = 14. \end{cases}$$

We can use the addition method to solve this linear system in two variables. By multiplying the first equation by  $-2$  and adding equations, we obtain  $A = 3$  and  $B = -2$ . Thus,

$$\frac{x + 14}{(x - 4)(x + 2)} = \frac{A}{x - 4} + \frac{B}{x + 2} = \frac{3}{x - 4} + \frac{-2}{x + 2} \left( \text{or } \frac{3}{x - 4} - \frac{2}{x + 2} \right).$$

### Steps in Partial Fraction Decomposition

1. Set up the partial fraction decomposition with the unknown constants  $A, B, C$ , etc., in the numerators of the decomposition.
2. Multiply both sides of the resulting equation by the least common denominator.
3. Simplify the right side of the equation.
4. Write both sides in descending powers, equate coefficients of like powers of  $x$ , and equate constant terms.
5. Solve the resulting linear system for  $A, B, C$ , etc.
6. Substitute the values for  $A, B, C$ , etc., into the equation in step 1 and write the partial fraction decomposition.

## GREAT QUESTION!

### Is there any way to speed up the process of finding partial fraction decompositions?

Sometimes. In certain situations, you can use the equation in step 2, the identity obtained after clearing fractions, to determine the constants  $A, B, C$ , etc., needed to write the partial fraction decomposition. In Example 1, the identity obtained after fractions were cleared was

$$x + 14 = A(x + 2) + B(x - 4).$$

Using suitable choices for  $x$ , we can quickly find  $A$  and  $B$ .

$$x + 14 = A(x + 2) + B(x - 4)$$

If we let  $x = -2$ , the term containing  $A$  drops out.  
 $12 = -6B$   
 $-2 = B$

$$x + 14 = A(x + 2) + B(x - 4)$$

If we let  $x = 4$ , the term containing  $B$  drops out.  
 $18 = 6A$   
 $3 = A$

As in the solution to Example 1,  $A = 3$  and  $B = -2$ . This shortcut sometimes makes life easier by letting you skip steps 3, 4, and 5 in the box. The downside: Using suitable choices for  $x$  to determine constants does not always work.

 **Check Point 1** Find the partial fraction decomposition of  $\frac{5x - 1}{(x - 3)(x + 4)}$ .

**2** Decompose  $\frac{P}{Q}$ , where  $Q$  has repeated linear factors.

### The Partial Fraction Decomposition of a Rational Expression with Linear Factors in the Denominator, Some of Which Are Repeated

Suppose that  $(ax + b)^n$  is a factor of the denominator. This means that the linear factor  $ax + b$  is repeated  $n$  times. When this occurs, the partial fraction decomposition will contain a sum of  $n$  fractions for this factor of the denominator.

### The Partial Fraction Decomposition of $\frac{P(x)}{Q(x)}$ : $Q(x)$ Has Repeated Linear Factors

The form of the partial fraction decomposition for a rational expression containing the linear factor  $ax + b$  occurring  $n$  times as its denominator is

$$\frac{P(x)}{(ax + b)^n} = \frac{A_1}{ax + b} + \frac{A_2}{(ax + b)^2} + \frac{A_3}{(ax + b)^3} + \cdots + \frac{A_n}{(ax + b)^n}.$$

Include one fraction with a constant numerator for each power of  $ax + b$ .

### EXAMPLE 2 Partial Fraction Decomposition with a Repeated Linear Factor

Find the partial fraction decomposition of  $\frac{x - 18}{x(x - 3)^2}$ .

#### SOLUTION

**Step 1 Set up the partial fraction decomposition with the unknown constants.** Because the linear factor  $x - 3$  occurs twice, we must include one fraction with a constant numerator for each power of  $x - 3$ .

$$\frac{x - 18}{x(x - 3)^2} = \frac{A}{x} + \frac{B}{x - 3} + \frac{C}{(x - 3)^2}$$

**Step 2 Multiply both sides of the resulting equation by the least common denominator.** We clear fractions, multiplying both sides by  $x(x - 3)^2$ , the least common denominator.

$$x(x - 3)^2 \left[ \frac{x - 18}{x(x - 3)^2} \right] = x(x - 3)^2 \left[ \frac{A}{x} + \frac{B}{x - 3} + \frac{C}{(x - 3)^2} \right]$$

We use the distributive property on the right side.

$$\cancel{x(x - 3)^2} \cdot \frac{x - 18}{\cancel{x(x - 3)^2}} = \cancel{x(x - 3)^2} \cdot \frac{A}{\cancel{x}} + x(x - 3)^2 \cdot \frac{B}{(x - 3)} + x(\cancel{x - 3})^2 \cdot \frac{C}{(\cancel{x - 3})^2}$$

Dividing out common factors in numerators and denominators, we obtain

$$x - 18 = A(x - 3)^2 + Bx(x - 3) + Cx.$$

You can use this equation to find  $C$  (let  $x = 3$ ) and to find  $A$  (let  $x = 0$ ).

**Step 3 Simplify the right side of the equation.** Square  $x - 3$ . Then apply the distributive property.

$$x - 18 = A(x^2 - 6x + 9) + Bx(x - 3) + Cx \quad \begin{array}{l} \text{Square } x - 3 \text{ using} \\ (A - B)^2 = A^2 - 2AB + B^2. \end{array}$$

$$x - 18 = Ax^2 - 6Ax + 9A + Bx^2 - 3Bx + Cx \quad \text{Apply the distributive property.}$$

### GREAT QUESTION!

When setting up the partial fraction decomposition for

$$\frac{x - 18}{x(x - 3)^2}$$

can I just use a constant over  $x - 3$  and another constant over  $x - 3$ ? After all,

$$(x - 3)^2 = (x - 3)(x - 3).$$

No. Avoid this common error:

$$\frac{x - 18}{x(x - 3)^2} = \frac{A}{x} + \frac{B}{x - 3} + \frac{C}{x - 3}$$

Listing  $x - 3$  twice does not take into account  $(x - 3)^2$ .

**Step 4 Write both sides in descending powers, equate coefficients of like powers of  $x$ , and equate constant terms.** The left side,  $x - 18$ , is in descending powers of  $x$ :  $x - 18x^0$ . We will write the right side in descending powers of  $x$ .

$$x - 18 = Ax^2 + Bx^2 - 6Ax - 3Bx + Cx + 9A \quad \text{Rearrange terms on the right side.}$$

Express both sides in the same form.

$$0x^2 + 1x - 18 = (A + B)x^2 + (-6A - 3B + C)x + 9A \quad \text{Rewrite to identify coefficients and the constant term.}$$

Equating coefficients of like powers of  $x$  and equating constant terms results in the following system of linear equations:

$$\begin{cases} A + B = 0 \\ -6A - 3B + C = 1 \\ 9A = -18. \end{cases}$$

**Step 5 Solve the resulting system for  $A$ ,  $B$ , and  $C$ .** Dividing both sides of the last equation by 9, we obtain  $A = -2$ . Substituting  $-2$  for  $A$  in the first equation,  $A + B = 0$ , gives  $-2 + B = 0$ , so  $B = 2$ . We find  $C$  by substituting  $-2$  for  $A$  and 2 for  $B$  in the middle equation,  $-6A - 3B + C = 1$ . We obtain  $C = -5$ .

**Step 6 Substitute the values of  $A$ ,  $B$ , and  $C$ , and write the partial fraction decomposition.** With  $A = -2$ ,  $B = 2$ , and  $C = -5$ , the required partial fraction decomposition is

$$\frac{x - 18}{x(x - 3)^2} = \frac{A}{x} + \frac{B}{x - 3} + \frac{C}{(x - 3)^2} = -\frac{2}{x} + \frac{2}{x - 3} - \frac{5}{(x - 3)^2}. \quad \dots$$

 **Check Point 2** Find the partial fraction decomposition of  $\frac{x + 2}{x(x - 1)^2}$ .

### GREAT QUESTION!

**In Examples 1 and 2, the denominators of the given rational expressions were factored. What do I do when I have to determine a partial fraction decomposition in which the denominator of the given rational expression is not already factored?**

Begin by factoring the denominator. Then apply the steps needed to obtain the partial fraction decomposition.

### The Partial Fraction Decomposition of a Rational Expression with Prime, Nonrepeated Quadratic Factors in the Denominator

Our final two cases of partial fraction decomposition involve prime quadratic factors of the form  $ax^2 + bx + c$ . Based on our work with the discriminant, we know that  $ax^2 + bx + c$  is prime and cannot be factored over the integers if  $b^2 - 4ac < 0$  or if  $b^2 - 4ac$  is not a perfect square.

The Partial Fraction Decomposition of  $\frac{P(x)}{Q(x)}$ :  $Q(x)$  Has a Nonrepeated, Prime Quadratic Factor

If  $ax^2 + bx + c$  is a prime quadratic factor of  $Q(x)$ , the partial fraction decomposition will contain a term of the form

$$\frac{Ax + B}{ax^2 + bx + c} \quad \begin{array}{l} \text{Linear numerator} \\ \text{Quadratic factor} \end{array}$$

The voice balloons in the box show that each distinct prime quadratic factor in the denominator produces a partial fraction of the form *linear numerator over quadratic factor*.

- 3 Decompose  $\frac{P}{Q}$ , where  $Q$  has a nonrepeated prime quadratic factor.

Here's an example of a partial fraction decomposition containing a linear numerator over a quadratic factor:

$$\frac{3x^2 + 17x + 14}{(x - 2)(x^2 + 2x + 4)} = \frac{A}{x - 2} + \frac{Bx + C}{x^2 + 2x + 4}$$

We write a constant over the linear factor in the denominator.

We write a linear numerator over the prime quadratic factor in the denominator.

Our next example illustrates how a linear system in three variables is used to determine values for  $A$ ,  $B$ , and  $C$ .

### EXAMPLE 3 Partial Fraction Decomposition

Find the partial fraction decomposition of

$$\frac{3x^2 + 17x + 14}{(x - 2)(x^2 + 2x + 4)}$$

#### SOLUTION

**Step 1 Set up the partial fraction decomposition with the unknown constants.** We put a constant ( $A$ ) over the linear factor and a linear expression ( $Bx + C$ ) over the prime quadratic factor.

$$\frac{3x^2 + 17x + 14}{(x - 2)(x^2 + 2x + 4)} = \frac{A}{x - 2} + \frac{Bx + C}{x^2 + 2x + 4}$$

**Step 2 Multiply both sides of the resulting equation by the least common denominator.** We clear fractions, multiplying both sides by  $(x - 2)(x^2 + 2x + 4)$ , the least common denominator.

$$(x - 2)(x^2 + 2x + 4) \left[ \frac{3x^2 + 17x + 14}{(x - 2)(x^2 + 2x + 4)} \right] = (x - 2)(x^2 + 2x + 4) \left[ \frac{A}{x - 2} + \frac{Bx + C}{x^2 + 2x + 4} \right]$$

We use the distributive property on the right side.

$$\begin{aligned} & \cancel{(x - 2)} \cancel{(x^2 + 2x + 4)} \cdot \frac{3x^2 + 17x + 14}{\cancel{(x - 2)} \cancel{(x^2 + 2x + 4)}} \\ &= \cancel{(x - 2)}(x^2 + 2x + 4) \cdot \frac{A}{\cancel{x - 2}} + (x - 2)\cancel{(x^2 + 2x + 4)} \cdot \frac{Bx + C}{\cancel{x^2 + 2x + 4}} \end{aligned}$$

Dividing out common factors in numerators and denominators, we obtain

$$3x^2 + 17x + 14 = A(x^2 + 2x + 4) + (Bx + C)(x - 2)$$

**Step 3 Simplify the right side of the equation.** We simplify on the right side by distributing  $A$  over each term in parentheses and multiplying  $(Bx + C)(x - 2)$  using the FOIL method.

$$3x^2 + 17x + 14 = Ax^2 + 2Ax + 4A + Bx^2 - 2Bx + Cx - 2C$$

**Step 4 Write both sides in descending powers, equate coefficients of like powers of  $x$ , and equate constant terms.** The left side,  $3x^2 + 17x + 14$ , is in descending powers of  $x$ . We write the right side in descending powers of  $x$

$$3x^2 + 17x + 14 = Ax^2 + Bx^2 + 2Ax - 2Bx + Cx + 4A - 2C$$

and express both sides in the same form.

$$3x^2 + 17x + 14 = (A + B)x^2 + (2A - 2B + C)x + (4A - 2C)$$

Equating coefficients of like powers of  $x$  and equating constant terms results in the following system of linear equations:

$$\begin{cases} A + B = 3 \\ 2A - 2B + C = 17 \\ 4A - 2C = 14. \end{cases}$$

**Step 5 Solve the resulting system for  $A$ ,  $B$ , and  $C$ .** Because the first equation involves  $A$  and  $B$ , we can obtain another equation in  $A$  and  $B$  by eliminating  $C$  from the second and third equations. Multiply the second equation by 2 and add equations. Solving in this manner, we obtain  $A = 5$ ,  $B = -2$ , and  $C = 3$ .

**Step 6 Substitute the values of  $A$ ,  $B$ , and  $C$ , and write the partial fraction decomposition.** With  $A = 5$ ,  $B = -2$ , and  $C = 3$ , the required partial fraction decomposition is

$$\frac{3x^2 + 17x + 14}{(x - 2)(x^2 + 2x + 4)} = \frac{A}{x - 2} + \frac{Bx + C}{x^2 + 2x + 4} = \frac{5}{x - 2} + \frac{-2x + 3}{x^2 + 2x + 4} \dots$$

## TECHNOLOGY

### Numeric Connections

You can use the **TABLE** feature of a graphing utility to check a partial fraction decomposition. To check the result of Example 3, enter the given rational function and its partial fraction decomposition:

$$y_1 = \frac{3x^2 + 17x + 14}{(x - 2)(x^2 + 2x + 4)}$$

$$y_2 = \frac{5}{x - 2} + \frac{-2x + 3}{x^2 + 2x + 4}$$

X	Y <sub>1</sub>	Y <sub>2</sub>
-3	.28571	.28571
-2	.5	.5
-1	0	0
0	-1.75	-1.75
1	-4.857	-4.857
2	ERROR	ERROR
3	4.8421	4.8421

X = -3

No matter how far up or down we scroll,  $y_1 = y_2$ , so the decomposition appears to be correct.

 **Check Point 3** Find the partial fraction decomposition of

$$\frac{8x^2 + 12x - 20}{(x + 3)(x^2 + x + 2)}$$

- 4** Decompose  $\frac{P}{Q}$ , where  $Q$  has a prime, repeated quadratic factor.

### The Partial Fraction Decomposition of a Rational Expression with a Prime, Repeated Quadratic Factor in the Denominator

Suppose that  $(ax^2 + bx + c)^n$  is a factor of the denominator and that  $ax^2 + bx + c$  cannot be factored further. This means that the quadratic factor  $ax^2 + bx + c$  occurs  $n$  times. When this occurs, the partial fraction decomposition will contain a linear numerator for each power of  $ax^2 + bx + c$ .

### The Partial Fraction Decomposition of $\frac{P(x)}{Q(x)}$ : $Q(x)$ Has a Prime, Repeated Quadratic Factor

The form of the partial fraction decomposition for a rational expression containing the prime factor  $ax^2 + bx + c$  occurring  $n$  times as its denominator is

$$\frac{P(x)}{(ax^2 + bx + c)^n} = \frac{A_1x + B_1}{ax^2 + bx + c} + \frac{A_2x + B_2}{(ax^2 + bx + c)^2} + \frac{A_3x + B_3}{(ax^2 + bx + c)^3} + \cdots + \frac{A_nx + B_n}{(ax^2 + bx + c)^n}.$$

Include one fraction with a linear numerator for each power of  $ax^2 + bx + c$ .

## GREAT QUESTION!

**When setting up partial fraction decompositions, when should I use constant numerators and when should I use linear numerators?**

When the denominator of a rational expression contains a **power of a linear factor**, set up the partial fraction decomposition with **constant numerators** ( $A, B, C$ , etc.). When the denominator of a rational expression contains a **power of a prime quadratic factor**, set up the partial fraction decomposition with **linear numerators** ( $Ax + B, Cx + D$ , etc.).

### EXAMPLE 4 Partial Fraction Decomposition with a Repeated Quadratic Factor

Find the partial fraction decomposition of

$$\frac{5x^3 - 3x^2 + 7x - 3}{(x^2 + 1)^2}.$$

#### SOLUTION

**Step 1 Set up the partial fraction decomposition with the unknown constants.** Because the quadratic factor  $x^2 + 1$  occurs twice, we must include one fraction with a linear numerator for each power of  $x^2 + 1$ .

$$\frac{5x^3 - 3x^2 + 7x - 3}{(x^2 + 1)^2} = \frac{Ax + B}{x^2 + 1} + \frac{Cx + D}{(x^2 + 1)^2}$$

**Step 2 Multiply both sides of the resulting equation by the least common denominator.** We clear fractions, multiplying both sides by  $(x^2 + 1)^2$ , the least common denominator.

$$(x^2 + 1)^2 \left[ \frac{5x^3 - 3x^2 + 7x - 3}{(x^2 + 1)^2} \right] = (x^2 + 1)^2 \left[ \frac{Ax + B}{x^2 + 1} + \frac{Cx + D}{(x^2 + 1)^2} \right]$$

Now we multiply and simplify.

$$5x^3 - 3x^2 + 7x - 3 = (x^2 + 1)(Ax + B) + Cx + D$$

**Step 3 Simplify the right side of the equation.** We multiply  $(x^2 + 1)(Ax + B)$  using the FOIL method.

$$5x^3 - 3x^2 + 7x - 3 = Ax^3 + Bx^2 + Ax + B + Cx + D$$

**Step 4 Write both sides in descending powers, equate coefficients of like powers of  $x$ , and equate constant terms.**

$$5x^3 - 3x^2 + 7x - 3 = Ax^3 + Bx^2 + (A + C)x + (B + D)$$

Equating coefficients of like powers of  $x$  and equating constant terms results in the following system of linear equations:

$$\begin{cases} A = 5 \\ B = -3 \\ A + C = 7 \\ B + D = -3. \end{cases} \quad \begin{array}{l} \text{With } A = 5, \text{ we immediately obtain } C = 2. \\ \text{With } B = -3, \text{ we immediately obtain } D = 0. \end{array}$$

**Step 5 Solve the resulting system for  $A$ ,  $B$ ,  $C$ , and  $D$ .** Based on our observations in step 4,  $A = 5$ ,  $B = -3$ ,  $C = 2$ , and  $D = 0$ .

**Step 6 Substitute the values of  $A$ ,  $B$ ,  $C$ , and  $D$ , and write the partial fraction decomposition.**

$$\frac{5x^3 - 3x^2 + 7x - 3}{(x^2 + 1)^2} = \frac{Ax + B}{x^2 + 1} + \frac{Cx + D}{(x^2 + 1)^2} = \frac{5x - 3}{x^2 + 1} + \frac{2x}{(x^2 + 1)^2} \dots$$

 **Check Point 4** Find the partial fraction decomposition of  $\frac{2x^3 + x + 3}{(x^2 + 1)^2}$ .

### GREAT QUESTION!

**When a rational expression contains a power of a factor in the denominator, how many fractions do I have to include in the partial fraction decomposition?**

When a rational expression contains a power of a factor in the denominator, be sure to set up the partial fraction decomposition to allow for every natural-number power of that factor less than or equal to the power. Example:

$$\begin{aligned} & \frac{2x + 1}{(x - 5)^2 x^3} \\ &= \frac{A}{x - 5} + \frac{B}{(x - 5)^2} + \frac{C}{x} + \frac{D}{x^2} + \frac{E}{x^3} \end{aligned}$$

Although  $(x - 5)^2$  and  $x^2$  are quadratic, they are still expressed as powers of linear factors,  $x - 5$  and  $x$ . Thus, the numerators are constant.

### CONCEPT AND VOCABULARY CHECK

Determine whether each partial fraction decomposition is set up correctly. If the setup is incorrect, make the necessary changes to produce the correct decomposition.

1. Correct or incorrect:

$$\frac{7x}{(x + 2)(x - 3)} = \frac{A}{x + 2} + \frac{B}{x - 3} \text{ _____}$$

2. Correct or incorrect:

$$\frac{3x}{(x + 5)(x - 4)^2} = \frac{A}{x + 5} + \frac{B}{x - 4} + \frac{C}{x - 4} \text{ _____}$$

3. Correct or incorrect:

$$\frac{1}{(x + 1)(x^2 + 4)} = \frac{A}{x + 1} + \frac{B}{x^2 + 4} \text{ _____}$$

4. Correct or incorrect:

$$\frac{7x - 5}{(x^2 + x + 1)^2} = \frac{Ax + B}{x^2 + x + 1} + \frac{Cx + D}{(x^2 + x + 1)^2} \text{ _____}$$

### EXERCISE SET 7.3

#### Practice Exercises

In Exercises 1–8, write the form of the partial fraction decomposition of the rational expression. It is not necessary to solve for the constants.

1.  $\frac{11x - 10}{(x - 2)(x + 1)}$

2.  $\frac{5x + 7}{(x - 1)(x + 3)}$

3.  $\frac{6x^2 - 14x - 27}{(x + 2)(x - 3)^2}$

4.  $\frac{3x + 16}{(x + 1)(x - 2)^2}$

5.  $\frac{5x^2 - 6x + 7}{(x - 1)(x^2 + 1)}$

6.  $\frac{5x^2 - 9x + 19}{(x - 4)(x^2 + 5)}$

7.  $\frac{x^3 + x^2}{(x^2 + 4)^2}$

8.  $\frac{7x^2 - 9x + 3}{(x^2 + 7)^2}$

In Exercises 9–42, write the partial fraction decomposition of each rational expression.

9.  $\frac{x}{(x - 3)(x - 2)}$

10.  $\frac{1}{x(x - 1)}$

11.  $\frac{3x + 50}{(x - 9)(x + 2)}$

12.  $\frac{5x - 1}{(x - 2)(x + 1)}$

13.  $\frac{7x - 4}{x^2 - x - 12}$

14.  $\frac{9x + 21}{x^2 + 2x - 15}$

15.  $\frac{4}{2x^2 - 5x - 3}$
17.  $\frac{4x^2 + 13x - 9}{x(x-1)(x+3)}$
19.  $\frac{4x^2 - 7x - 3}{x^3 - x}$
21.  $\frac{6x - 11}{(x-1)^2}$
23.  $\frac{x^2 - 6x + 3}{(x-2)^3}$
25.  $\frac{x^2 + 2x + 7}{x(x-1)^2}$
27.  $\frac{x^2}{(x-1)^2(x+1)}$
29.  $\frac{5x^2 - 6x + 7}{(x-1)(x^2+1)}$
31.  $\frac{5x^2 + 6x + 3}{(x+1)(x^2+2x+2)}$
33.  $\frac{x+4}{x^2(x^2+4)}$
35.  $\frac{6x^2 - x + 1}{x^3 + x^2 + x + 1}$
37.  $\frac{x^3 + x^2 + 2}{(x^2 + 2)^2}$
39.  $\frac{x^3 - 4x^2 + 9x - 5}{(x^2 - 2x + 3)^2}$
41.  $\frac{4x^2 + 3x + 14}{x^3 - 8}$
16.  $\frac{x}{x^2 + 2x - 3}$
18.  $\frac{4x^2 - 5x - 15}{x(x+1)(x-5)}$
20.  $\frac{2x^2 - 18x - 12}{x^3 - 4x}$
22.  $\frac{x}{(x+1)^2}$
24.  $\frac{2x^2 + 8x + 3}{(x+1)^3}$
26.  $\frac{3x^2 + 49}{x(x+7)^2}$
28.  $\frac{x^2}{(x-1)^2(x+1)^2}$
30.  $\frac{5x^2 - 9x + 19}{(x-4)(x^2+5)}$
32.  $\frac{9x+2}{(x-2)(x^2+2x+2)}$
34.  $\frac{10x^2 + 2x}{(x-1)^2(x^2+2)}$
36.  $\frac{3x^2 - 2x + 8}{x^3 + 2x^2 + 4x + 8}$
38.  $\frac{x^2 + 2x + 3}{(x^2 + 4)^2}$
40.  $\frac{3x^3 - 6x^2 + 7x - 2}{(x^2 - 2x + 2)^2}$
42.  $\frac{3x - 5}{x^3 - 1}$

### Practice Plus

In Exercises 43–46, perform each long division and write the partial fraction decomposition of the remainder term.

43.  $\frac{x^5 + 2}{x^2 - 1}$
45.  $\frac{x^4 - x^2 + 2}{x^3 - x^2}$
44.  $\frac{x^5}{x^2 - 4x + 4}$
46.  $\frac{x^4 + 2x^3 - 4x^2 + x - 3}{x^2 - x - 2}$

In Exercises 47–50, write the partial fraction decomposition of each rational expression.

47.  $\frac{1}{x^2 - c^2}$  ( $c \neq 0$ )
49.  $\frac{ax + b}{(x - c)^2}$  ( $c \neq 0$ )
50.  $\frac{1}{x^2 - ax - bx + ab}$  ( $a \neq b$ )
48.  $\frac{ax + b}{x^2 - c^2}$  ( $c \neq 0$ )

### Application Exercises

51. Find the partial fraction decomposition for  $\frac{1}{x(x+1)}$  and use the result to find the following sum:

$$\frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \cdots + \frac{1}{99 \cdot 100}.$$

52. Find the partial fraction decomposition for  $\frac{2}{x(x+2)}$  and use the result to find the following sum:

$$\frac{2}{1 \cdot 3} + \frac{2}{3 \cdot 5} + \frac{2}{5 \cdot 7} + \cdots + \frac{2}{99 \cdot 101}.$$

### Writing in Mathematics

53. Explain what is meant by the partial fraction decomposition of a rational expression.
54. Explain how to find the partial fraction decomposition of a rational expression with distinct linear factors in the denominator.
55. Explain how to find the partial fraction decomposition of a rational expression with a repeated linear factor in the denominator.
56. Explain how to find the partial fraction decomposition of a rational expression with a prime quadratic factor in the denominator.
57. Explain how to find the partial fraction decomposition of a rational expression with a repeated, prime quadratic factor in the denominator.
58. How can you verify your result for the partial fraction decomposition for a given rational expression without using a graphing utility?

### Technology Exercise

59. Use the **TABLE** feature of a graphing utility to verify any three of the decompositions that you obtained in Exercises 9–42.

### Critical Thinking Exercises

**Make Sense?** In Exercises 60–63, determine whether each statement makes sense or does not make sense, and explain your reasoning.

60. Partial fraction decomposition involves finding a single rational expression for a given sum or difference of rational expressions.
61. I apply partial fraction decompositions for rational expressions of the form  $\frac{P(x)}{Q(x)}$ , where  $P$  and  $Q$  have no common factors and the degree of  $P$  is greater than the degree of  $Q$ .
62. Because  $x + 5$  is linear and  $x^2 - 3x + 2$  is quadratic, I set up the following partial fraction decomposition:

$$\frac{7x^2 + 9x + 3}{(x+5)(x^2 - 3x + 2)} = \frac{A}{x+5} + \frac{Bx+C}{x^2 - 3x + 2}.$$

63. Because  $(x+3)^2$  consists of two factors of  $x+3$ , I set up the following partial fraction decomposition:

$$\frac{5x+2}{(x+3)^2} = \frac{A}{x+3} + \frac{B}{x+3}.$$

64. Use an extension of the Great Question! on page 548 to describe how to set up the partial fraction decomposition of a rational expression that contains powers of a prime cubic factor in the denominator. Give an example of such a decomposition.
65. Find the partial fraction decomposition of

$$\frac{4x^2 + 5x - 9}{x^3 - 6x - 9}.$$

## Preview Exercises

Exercises 66–68 will help you prepare for the material covered in the next section.

66. Solve by the substitution method:

$$\begin{cases} 4x + 3y = 4 \\ y = 2x - 7. \end{cases}$$

67. Solve by the addition method:

$$\begin{cases} 2x + 4y = -4 \\ 3x + 5y = -3. \end{cases}$$

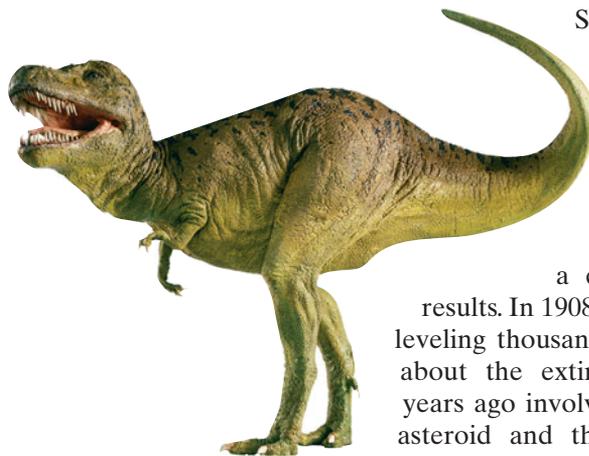

68. Graph  $x - y = 3$  and  $(x - 2)^2 + (y + 3)^2 = 4$  in the same rectangular coordinate system. What are the two intersection points? Show that each of these ordered pairs satisfies both equations.

## SECTION 7.4

## Systems of Nonlinear Equations in Two Variables

## Objectives

- 1 Recognize systems of nonlinear equations in two variables.
- 2 Solve nonlinear systems by substitution.
- 3 Solve nonlinear systems by addition.
- 4 Solve problems using systems of nonlinear equations.

Scientists debate the probability that a “doomsday rock” will collide with Earth. It has been estimated that an asteroid, a tiny planet that revolves around the sun, crashes into Earth about once every 250,000 years, and that such a collision would have disastrous results. In 1908, a small fragment struck Siberia, leveling thousands of acres of trees. One theory about the extinction of dinosaurs 65 million years ago involves Earth’s collision with a large asteroid and the resulting drastic changes in Earth’s climate.

Understanding the path of Earth and the path of a comet is essential to detecting threatening space debris. Orbits about the sun are not described by linear equations in the form  $Ax + By = C$ . The ability to solve systems that contain nonlinear equations provides NASA scientists watching for troublesome asteroids with a way to locate possible collision points with Earth’s orbit.

- 1 Recognize systems of nonlinear equations in two variables.

## Systems of Nonlinear Equations and Their Solutions

A **system of two nonlinear equations** in two variables, also called a **nonlinear system**, contains at least one equation that cannot be expressed in the form  $Ax + By = C$ . Here are two examples:

$$\begin{cases} x^2 = 2y + 10 \\ 3x - y = 9 \end{cases}$$

Not in the form  $Ax + By = C$ .  
The term  $x^2$  is not linear.

$$\begin{cases} y = x^2 + 3 \\ x^2 + y^2 = 9. \end{cases}$$

Neither equation is in the form  $Ax + By = C$ .  
The terms  $x^2$  and  $y^2$  are not linear.

A **solution** of a nonlinear system in two variables is an ordered pair of real numbers that satisfies both equations in the system. The **solution set** of the system is the set of all such ordered pairs. As with linear systems in two variables, the solution of a nonlinear system (if there is one) corresponds to the intersection point(s) of the graphs of the equations in the system. Unlike linear systems, the graphs can be circles, parabolas, or anything other than two lines. We will solve nonlinear systems using the substitution method and the addition method.

- 2 Solve nonlinear systems by substitution.

### Eliminating a Variable Using the Substitution Method

The substitution method involves converting a nonlinear system into one equation in one variable by an appropriate substitution. The steps in the solution process are exactly the same as those used to solve a linear system by substitution. However, when you obtain an equation in one variable, this equation may not be linear. In our first example, this equation is quadratic.

#### EXAMPLE 1 Solving a Nonlinear System by the Substitution Method

Solve by the substitution method:

$$\begin{cases} x^2 = 2y + 10 & \text{(The graph is a parabola.)} \\ 3x - y = 9. & \text{(The graph is a line.)} \end{cases}$$

#### SOLUTION

**Step 1 Solve one of the equations for one variable in terms of the other.** We begin by isolating one of the variables raised to the first power in either of the equations. By solving for  $y$  in the second equation, which has a coefficient of  $-1$ , we can avoid fractions.

$$\begin{aligned} 3x - y &= 9 && \text{This is the second equation in the given system.} \\ 3x &= y + 9 && \text{Add } y \text{ to both sides.} \\ 3x - 9 &= y && \text{Subtract 9 from both sides.} \end{aligned}$$

**Step 2 Substitute the expression from step 1 into the other equation.** We substitute  $3x - 9$  for  $y$  in the first equation.

$$y = \boxed{3x - 9} \quad x^2 = 2\boxed{y} + 10$$

This gives us an equation in one variable, namely,

$$x^2 = 2(3x - 9) + 10.$$

The variable  $y$  has been eliminated.

**Step 3 Solve the resulting equation containing one variable.**

$$\begin{aligned} x^2 &= 2(3x - 9) + 10 && \text{This is the equation containing one variable.} \\ x^2 &= 6x - 18 + 10 && \text{Use the distributive property.} \\ x^2 &= 6x - 8 && \text{Combine numerical terms on the right.} \\ x^2 - 6x + 8 &= 0 && \text{Move all terms to one side and set the} \\ &&& \text{quadratic equation equal to 0.} \\ (x - 4)(x - 2) &= 0 && \text{Factor.} \\ x - 4 = 0 &\text{ or } &x - 2 = 0 && \text{Set each factor equal to 0.} \\ x = 4 &&& &x = 2 && \text{Solve for } x. \end{aligned}$$

**Step 4 Back-substitute the obtained values into the equation from step 1.** Now that we have the  $x$ -coordinates of the solutions, we back-substitute 4 for  $x$  and 2 for  $x$  into the equation  $y = 3x - 9$ .

$$\begin{aligned} \text{If } x \text{ is } 4, & \quad y = 3(4) - 9 = 3, & \text{ so } (4, 3) \text{ is a solution.} \\ \text{If } x \text{ is } 2, & \quad y = 3(2) - 9 = -3, & \text{ so } (2, -3) \text{ is a solution.} \end{aligned}$$

**Step 5 Check the proposed solutions in both of the system's given equations.** We begin by checking (4, 3). Replace  $x$  with 4 and  $y$  with 3.

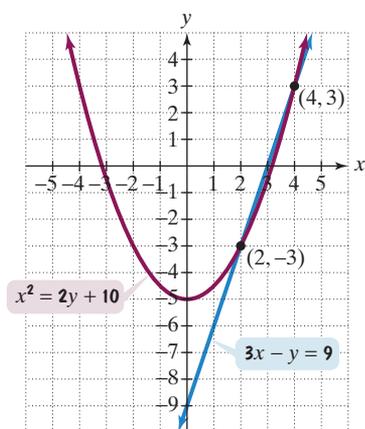

$$\begin{array}{lll} x^2 = 2y + 10 & 3x - y = 9 & \text{These are the given equations.} \\ 4^2 \stackrel{?}{=} 2(3) + 10 & 3(4) - 3 \stackrel{?}{=} 9 & \text{Let } x = 4 \text{ and } y = 3. \\ 16 \stackrel{?}{=} 6 + 10 & 12 - 3 \stackrel{?}{=} 9 & \text{Simplify.} \\ 16 = 16, \text{ true} & 9 = 9, \text{ true} & \text{True statements result.} \end{array}$$

The ordered pair (4, 3) satisfies both equations. Thus, (4, 3) is a solution of the system. Now let's check (2, -3). Replace  $x$  with 2 and  $y$  with -3 in both given equations.

$$\begin{array}{lll} x^2 = 2y + 10 & 3x - y = 9 & \text{These are the given equations.} \\ 2^2 \stackrel{?}{=} 2(-3) + 10 & 3(2) - (-3) \stackrel{?}{=} 9 & \text{Let } x = 2 \text{ and } y = -3. \\ 4 \stackrel{?}{=} -6 + 10 & 6 + 3 \stackrel{?}{=} 9 & \text{Simplify.} \\ 4 = 4, \text{ true} & 9 = 9, \text{ true} & \text{True statements result.} \end{array}$$

The ordered pair (2, -3) also satisfies both equations and is a solution of the system. The solutions are (4, 3) and (2, -3), and the solution set is  $\{(4, 3), (2, -3)\}$ .

**Figure 7.10** shows the graphs of the equations in the system and the solutions as intersection points. ●●●

**FIGURE 7.10** Points of intersection illustrate the nonlinear system's solutions.

**Check Point 1** Solve by the substitution method:

$$\begin{cases} x^2 = y - 1 \\ 4x - y = -1. \end{cases}$$

### EXAMPLE 2 Solving a Nonlinear System by the Substitution Method

Solve by the substitution method:

$$\begin{cases} x - y = 3 & \text{(The graph is a line.)} \\ (x - 2)^2 + (y + 3)^2 = 4. & \text{(The graph is a circle.)} \end{cases}$$

#### SOLUTION

Graphically, we are finding the intersection of a line and a circle with center (2, -3) and radius 2.

**Step 1 Solve one of the equations for one variable in terms of the other.** We will solve for  $x$  in the linear equation—that is, the first equation. (We could also solve for  $y$ .)

$$\begin{array}{ll} x - y = 3 & \text{This is the first equation in the given system.} \\ x = y + 3 & \text{Add } y \text{ to both sides.} \end{array}$$

**Step 2 Substitute the expression from step 1 into the other equation.** We substitute  $y + 3$  for  $x$  in the second equation.

$$x = \boxed{y + 3} \quad \boxed{y + 3} - 2)^2 + (y + 3)^2 = 4$$

This gives an equation in one variable, namely,

$$(y + 3 - 2)^2 + (y + 3)^2 = 4.$$

The variable  $x$  has been eliminated.

### GREAT QUESTION!

**Why is the graph of  $(x - 2)^2 + (y + 3)^2 = 4$  a circle?**

Recall that

$$(x - h)^2 + (y - k)^2 = r^2$$

describes a circle with center  $(h, k)$  and radius  $r$ .

**Step 3 Solve the resulting equation containing one variable.**

$$\begin{aligned} (y + 3 - 2)^2 + (y + 3)^2 &= 4 && \text{This is the equation containing one variable.} \\ (y + 1)^2 + (y + 3)^2 &= 4 && \text{Combine numerical terms in the first parentheses.} \\ y^2 + 2y + 1 + y^2 + 6y + 9 &= 4 && \text{Use the formula } (A + B)^2 = A^2 + 2AB + B^2 \text{ to} \\ &&& \text{square } y + 1 \text{ and } y + 3. \\ 2y^2 + 8y + 10 &= 4 && \text{Combine like terms on the left.} \\ 2y^2 + 8y + 6 &= 0 && \text{Subtract 4 from both sides and set the quadratic} \\ &&& \text{equation equal to 0.} \\ 2(y^2 + 4y + 3) &= 0 && \text{Factor out 2.} \\ 2(y + 3)(y + 1) &= 0 && \text{Factor completely.} \\ y + 3 = 0 \quad \text{or} \quad y + 1 = 0 &&& \text{Set each variable factor equal to 0.} \\ y = -3 \quad \quad \quad y = -1 &&& \text{Solve for } y. \end{aligned}$$

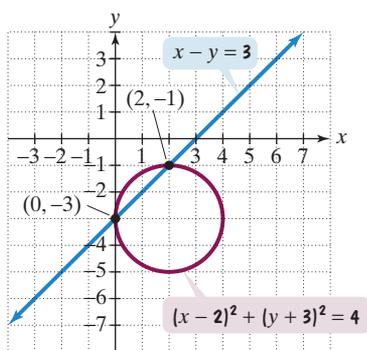

FIGURE 7.11 Points of intersection illustrate the nonlinear system's solutions.

**Step 4 Back-substitute the obtained values into the equation from step 1.** Now that we have the  $y$ -coordinates of the solutions, we back-substitute  $-3$  for  $y$  and  $-1$  for  $y$  in the equation  $x = y + 3$ .

$$\text{If } y = -3: \quad x = -3 + 3 = 0, \quad \text{so } (0, -3) \text{ is a solution.}$$

$$\text{If } y = -1: \quad x = -1 + 3 = 2, \quad \text{so } (2, -1) \text{ is a solution.}$$

**Step 5 Check the proposed solutions in both of the system's given equations.** Take a moment to show that each ordered pair satisfies both given equations,  $x - y = 3$  and  $(x - 2)^2 + (y + 3)^2 = 4$ . The solutions are  $(0, -3)$  and  $(2, -1)$ , and the solution set of the given system is  $\{(0, -3), (2, -1)\}$ .

Figure 7.11 shows the graphs of the equations in the system and the solutions as intersection points. ●●●

 **Check Point 2** Solve by the substitution method:

$$\begin{cases} x + 2y = 0 \\ (x - 1)^2 + (y - 1)^2 = 5. \end{cases}$$

**3** Solve nonlinear systems by addition.

### Eliminating a Variable Using the Addition Method

In solving linear systems with two variables, we learned that the addition method works well when each equation is in the form  $Ax + By = C$ . For nonlinear systems, the addition method can be used when each equation is in the form  $Ax^2 + By^2 = C$ . If necessary, we will multiply either equation or both equations by appropriate numbers so that the coefficients of  $x^2$  or  $y^2$  will have a sum of 0. We then add equations. The sum will be an equation in one variable.

#### EXAMPLE 3 Solving a Nonlinear System by the Addition Method

Solve the system:

$$\begin{cases} 4x^2 + y^2 = 13 & \text{Equation 1} \\ x^2 + y^2 = 10 & \text{Equation 2} \end{cases}$$

#### SOLUTION

We can use the same steps that we did when we solved linear systems by the addition method.

**Step 1** Write both equations in the form  $Ax^2 + By^2 = C$ . Both equations are already in this form, so we can skip this step.

**Step 2** If necessary, multiply either equation or both equations by appropriate numbers so that the sum of the  $x^2$ -coefficients or the sum of the  $y^2$ -coefficients is 0. We can eliminate  $y^2$  by multiplying Equation 2 by  $-1$ .

$$\begin{cases} 4x^2 + y^2 = 13 \\ x^2 + y^2 = 10 \end{cases} \xrightarrow[\text{Multiply by } -1]{\text{No change}} \begin{cases} 4x^2 + y^2 = 13 \\ -x^2 - y^2 = -10 \end{cases}$$

**Steps 3 and 4** Add equations and solve for the remaining variable.

$$\begin{cases} 4x^2 + y^2 = 13 \\ -x^2 - y^2 = -10 \end{cases}$$

$$3x^2 = 3 \quad \text{Add equations.}$$

$$x^2 = 1 \quad \text{Divide both sides by 3.}$$

$$x = \pm 1 \quad \text{Use the square root property:}$$

If  $x^2 = c$ , then  $x = \pm\sqrt{c}$ .

**Step 5** Back-substitute and find the values for the other variable. We must back-substitute each value of  $x$  into either one of the original equations. Let's use  $x^2 + y^2 = 10$ , Equation 2. If  $x = 1$ ,

$$1^2 + y^2 = 10 \quad \text{Replace } x \text{ with } 1 \text{ in Equation 2.}$$

$$y^2 = 9 \quad \text{Subtract 1 from both sides.}$$

$$y = \pm 3. \quad \text{Apply the square root property.}$$

$(1, 3)$  and  $(1, -3)$  are solutions. If  $x = -1$ ,

$$(-1)^2 + y^2 = 10 \quad \text{Replace } x \text{ with } -1 \text{ in Equation 2.}$$

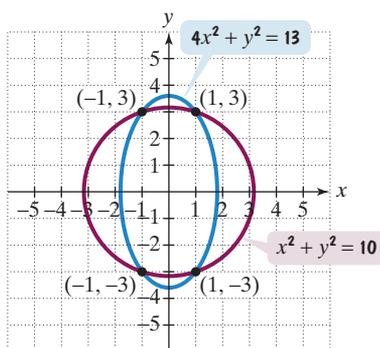

$$y^2 = 9 \quad \text{The steps are the same as before.}$$

$$y = \pm 3.$$

$(-1, 3)$  and  $(-1, -3)$  are solutions.

**Step 6** Check. Take a moment to show that each of the four ordered pairs satisfies the given equations,  $4x^2 + y^2 = 13$  and  $x^2 + y^2 = 10$ . The solution set of the given system is  $\{(1, 3), (1, -3), (-1, 3), (-1, -3)\}$ .

**Figure 7.12** shows the graphs of the equations in the system and the solutions as intersection points. ●●●

**FIGURE 7.12** A system with four solutions

**Check Point 3** Solve the system:

$$\begin{cases} 3x^2 + 2y^2 = 35 \\ 4x^2 + 3y^2 = 48. \end{cases}$$

In solving nonlinear systems, we include only ordered pairs with real numbers in the solution set. We have seen that each of these ordered pairs corresponds to a point of intersection of the system's graphs.

**GREAT QUESTION!**

When solving nonlinear systems, do I really have to go to the hassle of checking my solutions?

Yes. Extra solutions may be introduced that do not satisfy both equations in the system. Therefore, you should get into the habit of checking all proposed pairs in each of the system's two equations.

**EXAMPLE 4** Solving a Nonlinear System by the Addition Method

Solve the system:

$$\begin{cases} y = x^2 + 3 & \text{Equation 1 (The graph is a parabola.)} \\ x^2 + y^2 = 9 & \text{Equation 2 (The graph is a circle.)} \end{cases}$$

**SOLUTION**

We could use substitution because Equation 1,  $y = x^2 + 3$ , has  $y$  expressed in terms of  $x$ , but substituting  $x^2 + 3$  for  $y$  in  $x^2 + y^2 = 9$  would result in a fourth-degree equation. However, we can rewrite Equation 1 by subtracting  $x^2$  from both sides and adding the equations to eliminate the  $x^2$ -terms.

Notice how like terms are arranged in columns.

$$\begin{array}{r} \left\{ \begin{array}{l} -x^2 + y = 3 \\ \underline{-x^2 + y^2 = 9} \\ y + y^2 = 12 \end{array} \right. \begin{array}{l} \text{Subtract } x^2 \text{ from both sides of Equation 1.} \\ \text{This is Equation 2.} \\ \text{Add the equations.} \end{array} \end{array}$$

We now solve this quadratic equation.

$$\begin{array}{r} y + y^2 = 12 \quad \text{This is the equation containing one variable.} \\ y^2 + y - 12 = 0 \quad \text{Subtract 12 from both sides and set the quadratic equation equal to 0.} \\ (y + 4)(y - 3) = 0 \quad \text{Factor.} \\ y + 4 = 0 \quad \text{or} \quad y - 3 = 0 \quad \text{Set each factor equal to 0.} \\ y = -4 \quad \quad \quad y = 3 \quad \text{Solve for } y. \end{array}$$

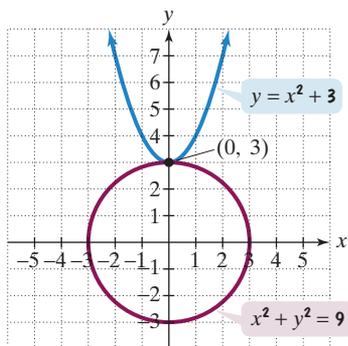

To complete the solution, we must back-substitute each value of  $y$  into either one of the original equations. We will use  $y = x^2 + 3$ , Equation 1. First, we substitute  $-4$  for  $y$ .

$$\begin{array}{r} -4 = x^2 + 3 \\ -7 = x^2 \quad \text{Subtract 3 from both sides.} \end{array}$$

Because the square of a real number cannot be negative, the equation  $x^2 = -7$  does not have real-number solutions. We will not include the imaginary solutions,  $x = \pm\sqrt{-7}$ , or  $i\sqrt{7}$  and  $-i\sqrt{7}$ , in the ordered pairs that make up the solution set. Thus, we move on to our other value for  $y$ , 3, and substitute this value into Equation 1.

$$\begin{array}{r} y = x^2 + 3 \quad \text{This is Equation 1.} \\ 3 = x^2 + 3 \quad \text{Back-substitute 3 for } y. \\ 0 = x^2 \quad \text{Subtract 3 from both sides.} \\ 0 = x \quad \text{Solve for } x. \end{array}$$

We showed that if  $y = 3$ , then  $x = 0$ . Thus,  $(0, 3)$  is the solution with a real ordered pair. Take a moment to show that  $(0, 3)$  satisfies the given equations,  $y = x^2 + 3$  and  $x^2 + y^2 = 9$ . The solution set of the system is  $\{(0, 3)\}$ . **Figure 7.13** shows the system's graphs and the solution as an intersection point. ●●●

**FIGURE 7.13** A system with one real solution

 **Check Point 4** Solve the system:

$$\begin{cases} y = x^2 + 5 \\ x^2 + y^2 = 25. \end{cases}$$

- 4** Solve problems using systems of nonlinear equations.

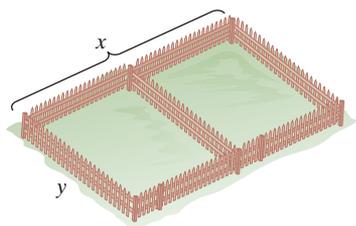

FIGURE 7.14 Building an enclosure

### Applications

Many geometric problems can be modeled and solved by the use of systems of nonlinear equations. We will use our step-by-step strategy for solving problems using mathematical models that are created from verbal conditions.

#### EXAMPLE 5 An Application of a Nonlinear System

You have 36 yards of fencing to build the enclosure in **Figure 7.14**. Some of this fencing is to be used to build an internal divider. If you'd like to enclose 54 square yards, what are the dimensions of the enclosure?

#### SOLUTION

**Step 1 Use variables to represent unknown quantities.** Let  $x$  = the enclosure's length and  $y$  = the enclosure's width. These variables are shown in **Figure 7.14**.

**Step 2 Write a system of equations modeling the problem's conditions.** The first condition is that you have 36 yards of fencing.

Fencing along both lengths	plus	fencing along both widths	plus	fencing for the internal divider	equals	36 yards.
$2x$	+	$2y$	+	$y$	=	$36$

Adding like terms, we can express the equation that models the verbal conditions for the fencing as  $2x + 3y = 36$ .

The second condition is that you'd like to enclose 54 square yards. The rectangle's area, the product of its length and its width, must be 54 square yards.

Length	times	width	is	54 square yards.
$x$	·	$y$	=	$54$

**Step 3 Solve the system and answer the problem's question.** We must solve the system

$$\begin{cases} 2x + 3y = 36 & \text{Equation 1} \\ xy = 54 & \text{Equation 2} \end{cases}$$

We will use substitution. Because Equation 1 has no coefficients of 1 or  $-1$ , we will work with Equation 2 and solve for  $y$ . Dividing both sides of  $xy = 54$  by  $x$ , we obtain

$$y = \frac{54}{x}.$$

Now we substitute  $\frac{54}{x}$  for  $y$  in Equation 1 and solve for  $x$ .

$$\begin{aligned} 2x + 3y &= 36 && \text{This is Equation 1.} \\ 2x + 3 \cdot \frac{54}{x} &= 36 && \text{Substitute } \frac{54}{x} \text{ for } y. \\ 2x + \frac{162}{x} &= 36 && \text{Multiply.} \end{aligned}$$

$$x\left(2x + \frac{162}{x}\right) = 36 \cdot x \quad \text{Clear fractions by multiplying both sides by } x.$$

$$2x^2 + 162 = 36x \quad \text{Use the distributive property on the left side.}$$

$$2x^2 - 36x + 162 = 0 \quad \text{Subtract } 36x \text{ from both sides and set the quadratic equation equal to } 0.$$

$$2(x^2 - 18x + 81) = 0 \quad \text{Factor out } 2.$$

$$2(x - 9)^2 = 0 \quad \text{Factor completely using } A^2 - 2AB + B^2 = (A - B)^2.$$

$$x - 9 = 0 \quad \text{Set the repeated factor equal to zero.}$$

$$x = 9 \quad \text{Solve for } x.$$

We back-substitute this value of  $x$  into  $y = \frac{54}{x}$ .

$$\text{If } x = 9, \quad y = \frac{54}{9} = 6.$$

This means that the dimensions of the enclosure in **Figure 7.14** are 9 yards by 6 yards.

**Step 4 Check the proposed solution in the original wording of the problem.** Take a moment to check that a length of 9 yards and a width of 6 yards results in 36 yards of fencing and an area of 54 square yards. ●●●

 **Check Point 5** Find the length and width of a rectangle whose perimeter is 20 feet and whose area is 21 square feet.

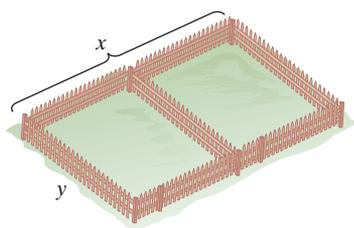

FIGURE 7.14 (repeated)

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- A system of two equations in two variables that contains at least one equation that cannot be expressed in the form  $Ax + By = C$  is called a system of \_\_\_\_\_ equations.
- When solving

$$\begin{cases} x^2 - 4y = 4 \\ x + y = -1 \end{cases}$$

by the substitution method, we obtain  $x = -4$  or  $x = 0$ , so the solution set is \_\_\_\_\_.

- When solving

$$\begin{cases} 3x^2 + 2y^2 = 35 \\ 4x^2 + 3y^2 = 48 \end{cases}$$

by the addition method, we can eliminate  $x^2$  by multiplying the first equation by  $-4$  and the second equation by \_\_\_\_\_ and then adding the equations.

- When solving

$$\begin{cases} x^2 + 4y^2 = 16 \\ x^2 - y^2 = 1 \end{cases}$$

by the addition method, we obtain  $y^2 = 3$ , so the solution set is \_\_\_\_\_.

- When solving

$$\begin{cases} x^2 + y^2 = 13 \\ x^2 - y = 7 \end{cases}$$

by the addition method, we can eliminate  $x^2$  by multiplying the second equation by \_\_\_\_\_ and then adding the equations. We obtain \_\_\_\_\_, a quadratic equation in  $y$ .

- When solving

$$\begin{cases} x^2 + 4y^2 = 20 \\ xy = 4 \end{cases}$$

by the substitution method, we can eliminate  $y$  by solving the second equation for  $y$ . We obtain

$y =$  \_\_\_\_\_. Then we substitute \_\_\_\_\_ for \_\_\_\_\_ in the first equation.

## EXERCISE SET 7.4

## Practice Exercises

In Exercises 1–18, solve each system by the substitution method.

1.  $\begin{cases} x + y = 2 \\ y = x^2 - 4 \end{cases}$
2.  $\begin{cases} x - y = -1 \\ y = x^2 + 1 \end{cases}$
3.  $\begin{cases} x + y = 2 \\ y = x^2 - 4x + 4 \end{cases}$
4.  $\begin{cases} 2x + y = -5 \\ y = x^2 + 6x + 7 \end{cases}$
5.  $\begin{cases} y = x^2 - 4x - 10 \\ y = -x^2 - 2x + 14 \end{cases}$
6.  $\begin{cases} y = x^2 + 4x + 5 \\ y = x^2 + 2x - 1 \end{cases}$
7.  $\begin{cases} x^2 + y^2 = 25 \\ x - y = 1 \end{cases}$
8.  $\begin{cases} x^2 + y^2 = 5 \\ 3x - y = 5 \end{cases}$
9.  $\begin{cases} xy = 6 \\ 2x - y = 1 \end{cases}$
10.  $\begin{cases} xy = -12 \\ x - 2y + 14 = 0 \end{cases}$
11.  $\begin{cases} y^2 = x^2 - 9 \\ 2y = x - 3 \end{cases}$
12.  $\begin{cases} x^2 + y = 4 \\ 2x + y = 1 \end{cases}$
13.  $\begin{cases} xy = 3 \\ x^2 + y^2 = 10 \end{cases}$
14.  $\begin{cases} xy = 4 \\ x^2 + y^2 = 8 \end{cases}$
15.  $\begin{cases} x + y = 1 \\ x^2 + xy - y^2 = -5 \end{cases}$
16.  $\begin{cases} x + y = -3 \\ x^2 + 2y^2 = 12y + 18 \end{cases}$
17.  $\begin{cases} x + y = 1 \\ (x - 1)^2 + (y + 2)^2 = 10 \end{cases}$
18.  $\begin{cases} 2x + y = 4 \\ (x + 1)^2 + (y - 2)^2 = 4 \end{cases}$

In Exercises 19–28, solve each system by the addition method.

19.  $\begin{cases} x^2 + y^2 = 13 \\ x^2 - y^2 = 5 \end{cases}$
20.  $\begin{cases} 4x^2 - y^2 = 4 \\ 4x^2 + y^2 = 4 \end{cases}$
21.  $\begin{cases} x^2 - 4y^2 = -7 \\ 3x^2 + y^2 = 31 \end{cases}$
22.  $\begin{cases} 3x^2 - 2y^2 = -5 \\ 2x^2 - y^2 = -2 \end{cases}$
23.  $\begin{cases} 3x^2 + 4y^2 - 16 = 0 \\ 2x^2 - 3y^2 - 5 = 0 \end{cases}$
24.  $\begin{cases} 16x^2 - 4y^2 - 72 = 0 \\ x^2 - y^2 - 3 = 0 \end{cases}$
25.  $\begin{cases} x^2 + y^2 = 25 \\ (x - 8)^2 + y^2 = 41 \end{cases}$
26.  $\begin{cases} x^2 + y^2 = 5 \\ x^2 + (y - 8)^2 = 41 \end{cases}$
27.  $\begin{cases} y^2 - x = 4 \\ x^2 + y^2 = 4 \end{cases}$
28.  $\begin{cases} x^2 - 2y = 8 \\ x^2 + y^2 = 16 \end{cases}$

In Exercises 29–42, solve each system by the method of your choice.

29.  $\begin{cases} 3x^2 + 4y^2 = 16 \\ 2x^2 - 3y^2 = 5 \end{cases}$
30.  $\begin{cases} x + y^2 = 4 \\ x^2 + y^2 = 16 \end{cases}$
31.  $\begin{cases} 2x^2 + y^2 = 18 \\ xy = 4 \end{cases}$
32.  $\begin{cases} x^2 + 4y^2 = 20 \\ xy = 4 \end{cases}$
33.  $\begin{cases} x^2 + 4y^2 = 20 \\ x + 2y = 6 \end{cases}$
34.  $\begin{cases} 3x^2 - 2y^2 = 1 \\ 4x - y = 3 \end{cases}$
35.  $\begin{cases} x^3 + y = 0 \\ x^2 - y = 0 \end{cases}$
36.  $\begin{cases} x^3 + y = 0 \\ 2x^2 - y = 0 \end{cases}$

37.  $\begin{cases} x^2 + (y - 2)^2 = 4 \\ x^2 - 2y = 0 \end{cases}$
38.  $\begin{cases} x^2 - y^2 - 4x + 6y - 4 = 0 \\ x^2 + y^2 - 4x - 6y + 12 = 0 \end{cases}$
39.  $\begin{cases} y = (x + 3)^2 \\ x + 2y = -2 \end{cases}$
40.  $\begin{cases} (x - 1)^2 + (y + 1)^2 = 5 \\ 2x - y = 3 \end{cases}$
41.  $\begin{cases} x^2 + y^2 + 3y = 22 \\ 2x + y = -1 \end{cases}$
42.  $\begin{cases} x - 3y = -5 \\ x^2 + y^2 - 25 = 0 \end{cases}$

In Exercises 43–46, let  $x$  represent one number and let  $y$  represent the other number. Use the given conditions to write a system of nonlinear equations. Solve the system and find the numbers.

43. The sum of two numbers is 10 and their product is 24. Find the numbers.
44. The sum of two numbers is 20 and their product is 96. Find the numbers.
45. The difference between the squares of two numbers is 3. Twice the square of the first number increased by the square of the second number is 9. Find the numbers.
46. The difference between the squares of two numbers is 5. Twice the square of the second number subtracted from three times the square of the first number is 19. Find the numbers.

## Practice Plus

In Exercises 47–52, solve each system by the method of your choice.

47.  $\begin{cases} 2x^2 + xy = 6 \\ x^2 + 2xy = 0 \end{cases}$
48.  $\begin{cases} 4x^2 + xy = 30 \\ x^2 + 3xy = -9 \end{cases}$
49.  $\begin{cases} -4x + y = 12 \\ y = x^3 + 3x^2 \end{cases}$
50.  $\begin{cases} -9x + y = 45 \\ y = x^3 + 5x^2 \end{cases}$
51.  $\begin{cases} \frac{3}{x^2} + \frac{1}{y^2} = 7 \\ \frac{5}{x^2} - \frac{2}{y^2} = -3 \end{cases}$
52.  $\begin{cases} \frac{2}{x^2} + \frac{1}{y^2} = 11 \\ \frac{4}{x^2} - \frac{2}{y^2} = -14 \end{cases}$

In Exercises 53–54, make a rough sketch in a rectangular coordinate system of the graphs representing the equations in each system.

53. The system, whose graphs are a line with positive slope and a parabola whose equation has a positive leading coefficient, has two solutions.
54. The system, whose graphs are a line with negative slope and a parabola whose equation has a negative leading coefficient, has one solution.

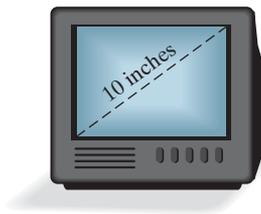

## Application Exercises

55. A planet's orbit follows a path described by  $16x^2 + 4y^2 = 64$ . A comet follows the parabolic path  $y = x^2 - 4$ . Where might the comet intersect the orbiting planet?
56. A system for tracking ships indicates that a ship lies on a path described by  $2y^2 - x^2 = 1$ . The process is repeated and the ship is found to lie on a path described by  $2x^2 - y^2 = 1$ . If it is known that the ship is located in the first quadrant of the coordinate system, determine its exact location.

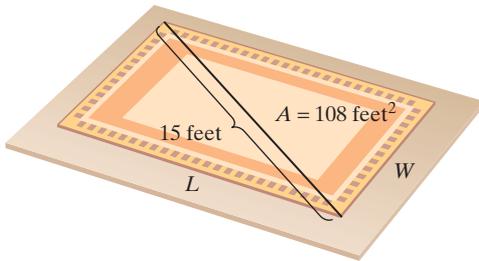

- 57. Find the length and width of a rectangle whose perimeter is 36 feet and whose area is 77 square feet.
- 58. Find the length and width of a rectangle whose perimeter is 40 feet and whose area is 96 square feet.

Use the formula for the area of a rectangle and the Pythagorean Theorem to solve Exercises 59–60.

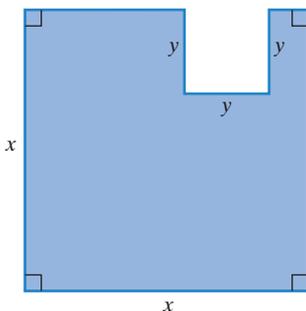

- 59. A small television has a picture with a diagonal measure of 10 inches and a viewing area of 48 square inches. Find the length and width of the screen.

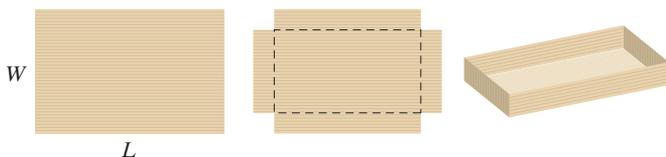

- 60. The area of a rug is 108 square feet and the length of its diagonal is 15 feet. Find the length and width of the rug.

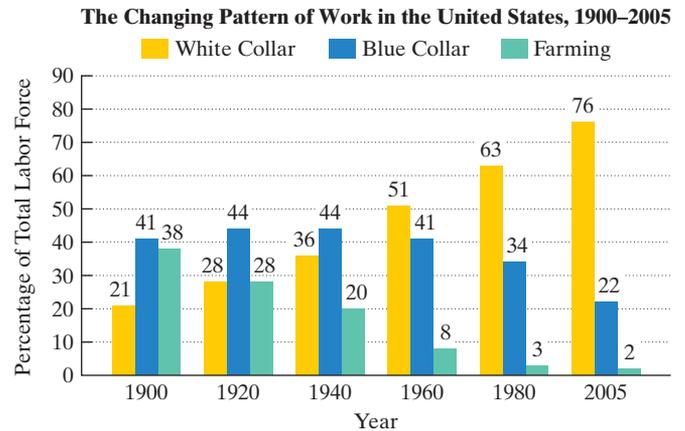

- 61. The figure shows a square floor plan with a smaller square area that will accommodate a combination fountain and pool. The floor with the fountain-pool area removed has an area of 21 square meters and a perimeter of 24 meters. Find the dimensions of the floor and the dimensions of the square that will accommodate the pool.

- 62. The area of the rectangular piece of cardboard shown below is 216 square inches. The cardboard is used to make an open box by cutting a 2-inch square from each corner and turning up the sides. If the box is to have a volume of 224 cubic inches, find the length and width of the cardboard that must be used.

- 63. The bar graph shows that compared to a century ago, work in the United States now involves mostly white-collar service jobs.

Source: U.S. Department of Labor

The data can be modeled by linear and quadratic functions.

White collar  $0.5x - y = -18$

Blue collar  $y = -0.004x^2 + 0.23x + 41$

Farming  $0.4x + y = 35$

In each function,  $x$  represents the number of years after 1900 and  $y$  represents the percentage of the total U.S. labor force.

- a. Based on the information in the graph, it appears that there was a year when the percentage of white-collar workers in the labor force was the same as the percentage of blue-collar workers in the labor force. According to the graph, between which two decades did this occur?
- b. Solve a nonlinear system to determine the year described in part (a). Round to the nearest year. What percentage of the labor force, to the nearest percent, consisted of white-collar workers and what percentage consisted of blue-collar workers?
- c. According to the graph, for which year was the percentage of white-collar workers the same as the percentage of farmers? What percentage of U.S. workers were in each of these groups?
- d. Solve a linear system to determine the year described in part (c). Round to the nearest year. Use the models to find the percentage of the labor force consisting of white-collar workers and the percentage consisting of farmers. How well do your answers model the actual data specified in part (c)?

**Writing in Mathematics**

- 64. What is a system of nonlinear equations? Provide an example with your description.
- 65. Explain how to solve a nonlinear system using the substitution method. Use  $x^2 + y^2 = 9$  and  $2x - y = 3$  to illustrate your explanation.
- 66. Explain how to solve a nonlinear system using the addition method. Use  $x^2 - y^2 = 5$  and  $3x^2 - 2y^2 = 19$  to illustrate your explanation.

**Technology Exercises**

- 67. Verify your solutions to any five exercises from Exercises 1–42 by using a graphing utility to graph the two equations in the system in the same viewing rectangle. Then use the intersection feature to verify the solutions.
- 68. Write a system of equations, one equation whose graph is a line and the other whose graph is a parabola, that has no ordered pairs that are real numbers in its solution set. Graph the equations using a graphing utility and verify that you are correct.

**Critical Thinking Exercises**

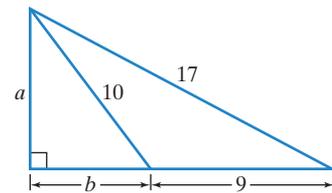

**Make Sense?** In Exercises 69–72, determine whether each statement makes sense or does not make sense, and explain your reasoning.

- 69. I use the same steps to solve nonlinear systems as I did to solve linear systems, although I don't obtain linear equations when a variable is eliminated.
- 70. I graphed a nonlinear system that modeled the orbits of Earth and Mars, and the graphs indicated the system had a solution with a real ordered pair.
- 71. Without using any algebra, it's obvious that the nonlinear system consisting of  $x^2 + y^2 = 4$  and  $x^2 + y^2 = 25$  does not have real-number solutions.
- 72. I think that the nonlinear system consisting of  $x^2 + y^2 = 36$  and  $y = (x - 2)^2 - 3$  is easier to solve graphically than by using the substitution method or the addition method.

In Exercises 73–76, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

- 73. A system of two equations in two variables whose graphs are a circle and a line can have four real ordered-pair solutions.

- 74. A system of two equations in two variables whose graphs are a parabola and a circle can have four real ordered-pair solutions.
- 75. A system of two equations in two variables whose graphs are two circles must have at least two real ordered-pair solutions.
- 76. A system of two equations in two variables whose graphs are a parabola and a circle cannot have only one real ordered-pair solution.
- 77. The points of intersection of the graphs of  $xy = 20$  and  $x^2 + y^2 = 41$  are joined to form a rectangle. Find the area of the rectangle.
- 78. Find  $a$  and  $b$  in this figure.

Solve the systems in Exercises 79–80.

- 79. 
$$\begin{cases} \log_y x = 3 \\ \log_y(4x) = 5 \end{cases}$$
- 80. 
$$\begin{cases} \log x^2 = y + 3 \\ \log x = y - 1 \end{cases}$$

**Preview Exercises**

Exercises 81–83 will help you prepare for the material covered in the next section. In each exercise, graph the linear function.

- 81.  $2x - 3y = 6$
- 82.  $f(x) = -\frac{2}{3}x$
- 83.  $f(x) = -2$

**CHAPTER 7**

**Mid-Chapter Check Point**

**WHAT YOU KNOW:** We learned to solve systems of equations. We solved linear and nonlinear systems in two variables by the substitution method and by the addition method. We solved linear systems in three variables by eliminating a variable, reducing the system to two equations in two variables. We saw that some linear systems, called inconsistent systems, have no solution, whereas other linear systems, called dependent systems, have infinitely many solutions. We applied systems to a variety of situations, including finding the break-even point for a business, finding a quadratic function from three points on its graph, and finding a rational function's partial fraction decomposition.

In Exercises 1–12, solve each system by the method of your choice.

- 1. 
$$\begin{cases} x = 3y - 7 \\ 4x + 3y = 2 \end{cases}$$
- 2. 
$$\begin{cases} 3x + 4y = -5 \\ 2x - 3y = 8 \end{cases}$$

- 3. 
$$\begin{cases} \frac{2x}{3} + \frac{y}{5} = 6 \\ \frac{x}{6} - \frac{y}{2} = -4 \end{cases}$$
- 4. 
$$\begin{cases} y = 4x - 5 \\ 8x - 2y = 10 \end{cases}$$
- 5. 
$$\begin{cases} 2x + 5y = 3 \\ 3x - 2y = 1 \end{cases}$$
- 6. 
$$\begin{cases} \frac{x}{12} - y = \frac{1}{4} \\ 4x - 48y = 16 \end{cases}$$
- 7. 
$$\begin{cases} 2x - y + 2z = -8 \\ x + 2y - 3z = 9 \\ 3x - y - 4z = 3 \end{cases}$$
- 8. 
$$\begin{cases} x - 3z = -5 \\ 2x - y + 2z = 16 \\ 7x - 3y - 5z = 19 \end{cases}$$
- 9. 
$$\begin{cases} x^2 + y^2 = 9 \\ x + 2y - 3 = 0 \end{cases}$$
- 10. 
$$\begin{cases} 3x^2 + 2y^2 = 14 \\ 2x^2 - y^2 = 7 \end{cases}$$
- 11. 
$$\begin{cases} y = x^2 - 6 \\ x^2 + y^2 = 8 \end{cases}$$
- 12. 
$$\begin{cases} x - 2y = 4 \\ 2y^2 + xy = 8 \end{cases}$$

In Exercises 13–16, write the partial fraction decomposition of each rational expression.

13.  $\frac{x^2 - 6x + 3}{(x - 2)^3}$

14.  $\frac{10x^2 + 9x - 7}{(x + 2)(x^2 - 1)}$

15.  $\frac{x^2 + 4x - 23}{(x + 3)(x^2 + 4)}$

16.  $\frac{x^3}{(x^2 + 4)^2}$

17. A company is planning to manufacture PDAs (personal digital assistants). The fixed cost will be \$400,000 and it will cost \$20 to produce each PDA. Each PDA will be sold for \$100.

- Write the cost function,  $C$ , of producing  $x$  PDAs.
- Write the revenue function,  $R$ , from the sale of  $x$  PDAs.
- Write the profit function,  $P$ , from producing and selling  $x$  PDAs.
- Determine the break-even point. Describe what this means.

18. Roses sell for \$3 each and carnations for \$1.50 each. If a mixed bouquet of 20 flowers consisting of roses and carnations costs \$39, how many of each type of flower is in the bouquet?

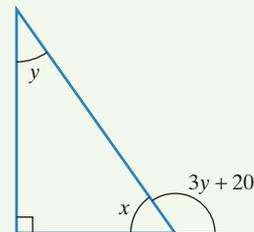

19. At the north campus of a small liberal arts college, 10% of the students are women. At the south campus, 50% of the students are women. The campuses are merged into one east campus. If 40% of the 1200 students at the east campus are women, how many students did the north and south campuses have before the merger?

20. With the current, you can row 9 miles in 2 hours. Against the current, your return trip takes 6 hours. Find your average rowing velocity in still water and the average velocity of the current.

21. Find the measure of each angle whose degree measure is represented with a variable.

22. Find the quadratic function  $y = ax^2 + bx + c$  whose graph passes through the points  $(-1, 0)$ ,  $(1, 4)$ , and  $(2, 3)$ .

23. Find the length and width of a rectangle whose perimeter is 21 meters and whose area is 20 square meters.

## SECTION 7.5

### Systems of Inequalities

#### Objectives

- Graph a linear inequality in two variables.
- Graph a nonlinear inequality in two variables.
- Use mathematical models involving linear inequalities.
- Graph a system of inequalities.

We opened the chapter noting that the modern emphasis on thinness as the ideal body shape has been suggested as a major cause of eating disorders. In this section (Example 5), as well as in the Exercise Set (Exercises 77–80), we use systems of linear inequalities in two variables that will enable you to establish a healthy weight range for your height and age.

#### Linear Inequalities in Two Variables and Their Solutions

We have seen that equations in the form  $Ax + By = C$  are straight lines when graphed. If we change the symbol  $=$  to  $>$ ,  $<$ ,  $\geq$ , or  $\leq$ , we obtain a **linear inequality in two variables**. Some examples of linear inequalities in two variables are  $x + y > 2$ ,  $3x - 5y \leq 15$ , and  $2x - y < 4$ .

A **solution of an inequality in two variables**,  $x$  and  $y$ , is an ordered pair of real numbers with the following property: When the  $x$ -coordinate is substituted for  $x$  and the  $y$ -coordinate is substituted for  $y$  in the inequality, we obtain a true statement. For example,  $(3, 2)$  is a solution of the inequality  $x + y > 1$ . When 3 is substituted for  $x$  and 2 is substituted for  $y$ , we obtain the true statement  $3 + 2 > 1$ , or  $5 > 1$ . Because there are infinitely many pairs of numbers that have a sum greater than 1, the inequality  $x + y > 1$  has infinitely many solutions. Each ordered-pair solution is said to **satisfy** the inequality. Thus,  $(3, 2)$  satisfies the inequality  $x + y > 1$ .

- 1 Graph a linear inequality in two variables.

## The Graph of a Linear Inequality in Two Variables

We know that the graph of an equation in two variables is the set of all points whose coordinates satisfy the equation. Similarly, the **graph of an inequality in two variables** is the set of all points whose coordinates satisfy the inequality.

Let's use **Figure 7.15** to get an idea of what the graph of a linear inequality in two variables looks like. Part of the figure shows the graph of the linear equation  $x + y = 2$ . The line divides the points in the rectangular coordinate system into three sets. First, there is the set of points along the line, satisfying  $x + y = 2$ . Next, there is the set of points in the green region above the line. Points in the green region satisfy the linear inequality  $x + y > 2$ . Finally, there is the set of points in the purple region below the line. Points in the purple region satisfy the linear inequality  $x + y < 2$ .

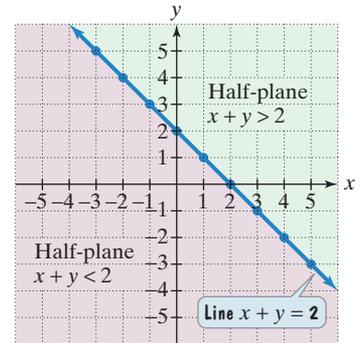

FIGURE 7.15

A **half-plane** is the set of all the points on one side of a line. In **Figure 7.15**, the green region is a half-plane. The purple region is also a half-plane. A half-plane is the graph of a linear inequality that involves  $>$  or  $<$ . The graph of a linear inequality that involves  $\geq$  or  $\leq$  is a half-plane and a line. A solid line is used to show that a line is part of a solution set. A dashed line is used to show that a line is not part of a solution set.

### Graphing a Linear Inequality in Two Variables

1. Replace the inequality symbol with an equal sign and graph the corresponding linear equation. Draw a solid line if the original inequality contains a  $\leq$  or  $\geq$  symbol. Draw a dashed line if the original inequality contains a  $<$  or  $>$  symbol.
2. Choose a test point from one of the half-planes. (Do not choose a point on the line.) Substitute the coordinates of the test point into the inequality.
3. If a true statement results, shade the half-plane containing this test point. If a false statement results, shade the half-plane not containing this test point.

### EXAMPLE 1 Graphing a Linear Inequality in Two Variables

Graph:  $2x - 3y \geq 6$ .

#### SOLUTION

**Step 1** Replace the inequality symbol by  $=$  and graph the linear equation. We need to graph  $2x - 3y = 6$ . We can use intercepts to graph this line.

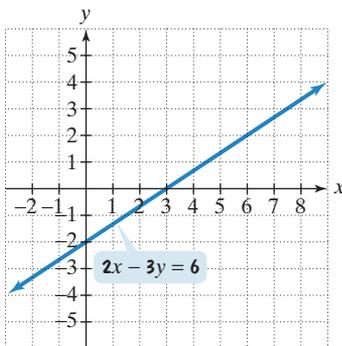

FIGURE 7.16 Preparing to graph  $2x - 3y \geq 6$

We set  $y = 0$  to find the  $x$ -intercept.

$$\begin{aligned} 2x - 3y &= 6 \\ 2x - 3 \cdot 0 &= 6 \\ 2x &= 6 \\ x &= 3 \end{aligned}$$

We set  $x = 0$  to find the  $y$ -intercept.

$$\begin{aligned} 2x - 3y &= 6 \\ 2 \cdot 0 - 3y &= 6 \\ -3y &= 6 \\ y &= -2 \end{aligned}$$

The  $x$ -intercept is 3, so the line passes through  $(3, 0)$ . The  $y$ -intercept is  $-2$ , so the line passes through  $(0, -2)$ . Using the intercepts, the line is shown in **Figure 7.16** as a solid line. This is because the inequality  $2x - 3y \geq 6$  contains a  $\geq$  symbol, in which equality is included.

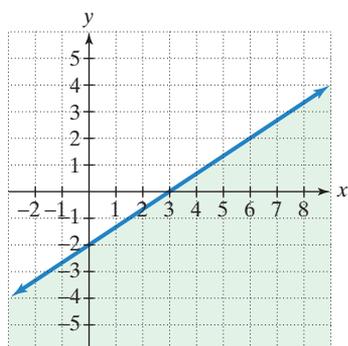

FIGURE 7.17 The graph of  $2x - 3y \geq 6$

**Step 2 Choose a test point from one of the half-planes and not from the line. Substitute its coordinates into the inequality.** The line  $2x - 3y = 6$  divides the plane into three parts—the line itself and two half-planes. The points in one half-plane satisfy  $2x - 3y > 6$ . The points in the other half-plane satisfy  $2x - 3y < 6$ . We need to find which half-plane belongs to the solution of  $2x - 3y \geq 6$ . To do so, we test a point from either half-plane. The origin,  $(0, 0)$ , is the easiest point to test.

$$\begin{aligned} 2x - 3y &\geq 6 && \text{This is the given inequality.} \\ 2 \cdot 0 - 3 \cdot 0 &\stackrel{?}{\geq} 6 && \text{Test } (0, 0) \text{ by substituting } 0 \text{ for } x \text{ and } 0 \text{ for } y. \\ 0 - 0 &\stackrel{?}{\geq} 6 && \text{Multiply.} \\ 0 &\geq 6 && \text{This statement is false.} \end{aligned}$$

**Step 3 If a false statement results, shade the half-plane not containing the test point.** Because 0 is not greater than or equal to 6, the test point,  $(0, 0)$ , is not part of the solution set. Thus, the half-plane below the solid line  $2x - 3y = 6$  is part of the solution set. The solution set is the line and the half-plane that does not contain the point  $(0, 0)$ , indicated by shading this half-plane. The graph is shown using green shading and a blue line in **Figure 7.17**. ●●●

 **Check Point 1** Graph:  $4x - 2y \geq 8$ .

When graphing a linear inequality, choose a test point that lies in one of the half-planes and *not on the line dividing the half-planes*. The test point  $(0, 0)$  is convenient because it is easy to calculate when 0 is substituted for each variable. However, if  $(0, 0)$  lies on the dividing line and not in a half-plane, a different test point must be selected.

### EXAMPLE 2 Graphing a Linear Inequality in Two Variables

Graph:  $y > -\frac{2}{3}x$ .

#### SOLUTION

**Step 1 Replace the inequality symbol by = and graph the linear equation.** Because we are interested in graphing  $y > -\frac{2}{3}x$ , we begin by graphing  $y = -\frac{2}{3}x$ . We can use the slope and the y-intercept to graph this linear function.

$$y = -\frac{2}{3}x + 0$$

Slope =  $-\frac{2}{3} = \frac{\text{rise}}{\text{run}}$       y-intercept = 0

The y-intercept is 0, so the line passes through  $(0, 0)$ . Using the y-intercept and the slope, the line is shown in **Figure 7.18** as a dashed line. This is because the inequality  $y > -\frac{2}{3}x$  contains a  $>$  symbol, in which equality is not included.

**Step 2 Choose a test point from one of the half-planes and not from the line. Substitute its coordinates into the inequality.** We cannot use  $(0, 0)$  as a test point because it lies on the line and not in a half-plane. Let's use  $(1, 1)$ , which lies in the half-plane above the line.

$$\begin{aligned} y &> -\frac{2}{3}x && \text{This is the given inequality.} \\ 1 &\stackrel{?}{>} -\frac{2}{3} \cdot 1 && \text{Test } (1, 1) \text{ by substituting } 1 \text{ for } x \text{ and } 1 \text{ for } y. \\ 1 &> -\frac{2}{3} && \text{This statement is true.} \end{aligned}$$

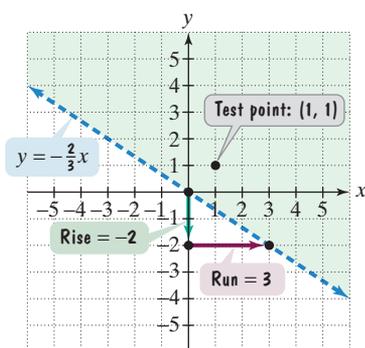

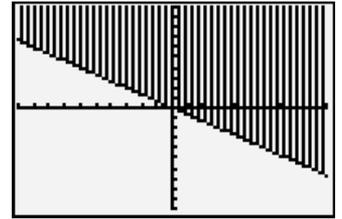

FIGURE 7.18 The graph of  $y > -\frac{2}{3}x$

**Step 3** If a true statement results, shade the half-plane containing the test point. Because 1 is greater than  $-\frac{2}{3}$ , the test point  $(1, 1)$  is part of the solution set. All the points on the same side of the line  $y = -\frac{2}{3}x$  as the point  $(1, 1)$  are members of the solution set. The solution set is the half-plane that contains the point  $(1, 1)$ , indicated by shading this half-plane. The graph is shown using green shading and a dashed blue line in **Figure 7.18**. ●●●

## TECHNOLOGY

Most graphing utilities can graph inequalities in two variables with the **SHADE** feature. The procedure varies by model, so consult your manual. For most graphing utilities, you must first solve for  $y$  if it is not already isolated. The figure shows the graph of  $y > -\frac{2}{3}x$ . Most displays do not distinguish between dashed and solid boundary lines.

 **Check Point 2** Graph:  $y > -\frac{3}{4}x$ .

## Graphing Linear Inequalities without Using Test Points

You can graph inequalities in the form  $y > mx + b$  or  $y < mx + b$  without using test points. The inequality symbol indicates which half-plane to shade.

- If  $y > mx + b$ , shade the half-plane above the line  $y = mx + b$ .
- If  $y < mx + b$ , shade the half-plane below the line  $y = mx + b$ .

Observe how this is illustrated in **Figure 7.18** in the margin on the previous page. The graph of  $y > -\frac{2}{3}x$  is the half-plane above the line  $y = -\frac{2}{3}x$ .

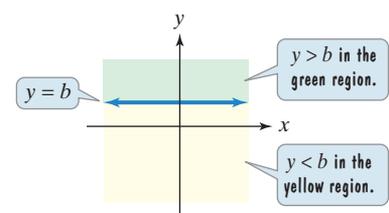

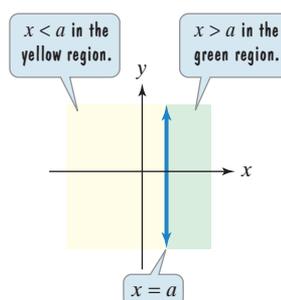

It is also not necessary to use test points when graphing inequalities involving half-planes on one side of a vertical or a horizontal line.

For the Vertical Line $x = a$ :	For the Horizontal Line $y = b$ :
• If $x > a$ , shade the half-plane to the right of $x = a$ .	• If $y > b$ , shade the half-plane above $y = b$ .
• If $x < a$ , shade the half-plane to the left of $x = a$ .	• If $y < b$ , shade the half-plane below $y = b$ .

## GREAT QUESTION!

**When is it important to use test points to graph linear inequalities?**

Continue using test points to graph inequalities in the form  $Ax + By > C$  or  $Ax + By < C$ . The graph of  $Ax + By > C$  can lie above or below the line given by  $Ax + By = C$ , depending on the values of  $A$  and  $B$ . The same comment applies to the graph of  $Ax + By < C$ .

**EXAMPLE 3** Graphing Inequalities without Using Test Points

Graph each inequality in a rectangular coordinate system:

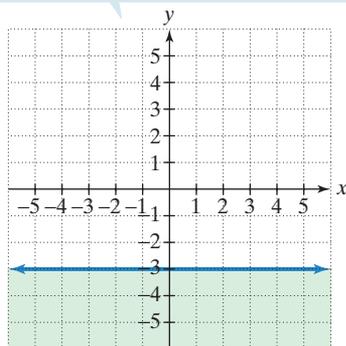

a.  $y \leq -3$

b.  $x > 2$

**SOLUTION**

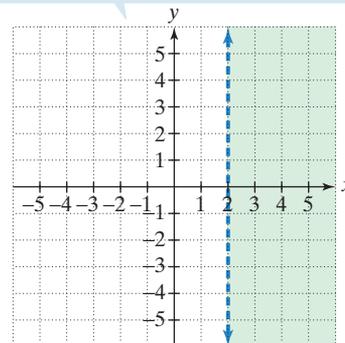

a.  $y \leq -3$

Graph  $y = -3$ , a horizontal line with  $y$ -intercept  $-3$ . The line is solid because equality is included in  $y \leq -3$ . Because of the less than part of  $\leq$ , shade the half-plane below the horizontal line.

b.  $x > 2$

Graph  $x = 2$ , a vertical line with  $x$ -intercept 2. The line is dashed because equality is not included in  $x > 2$ . Because of  $>$ , the greater than symbol, shade the half-plane to the right of the vertical line.

 **Check Point 3** Graph each inequality in a rectangular coordinate system:

a.  $y > 1$

b.  $x \leq -2$

- 2 Graph a nonlinear inequality in two variables.

**Graphing a Nonlinear Inequality in Two Variables**

Example 4 illustrates that a nonlinear inequality in two variables is graphed in the same way that we graph a linear inequality.

**EXAMPLE 4** Graphing a Nonlinear Inequality in Two VariablesGraph:  $x^2 + y^2 \leq 9$ .**SOLUTION**

**Step 1 Replace the inequality symbol with = and graph the nonlinear equation.** We need to graph  $x^2 + y^2 = 9$ . The graph is a circle of radius 3 with its center at the origin. The graph is shown in **Figure 7.19** as a solid circle because equality is included in the  $\leq$  symbol.

**Step 2 Choose a test point from one of the regions and not from the circle. Substitute its coordinates into the inequality.** The circle divides the plane into three parts—the circle itself, the region inside the circle, and the region outside the circle. We need to determine whether the region inside or outside the circle is included in the solution. To do so, we will use the test point  $(0, 0)$  from inside the circle.

$$x^2 + y^2 \leq 9 \quad \text{This is the given inequality.}$$

$$0^2 + 0^2 \stackrel{?}{\leq} 9 \quad \text{Test } (0, 0) \text{ by substituting } 0 \text{ for } x \text{ and } 0 \text{ for } y.$$

$$0 + 0 \stackrel{?}{\leq} 9 \quad \text{Square } 0: 0^2 = 0.$$

$$0 \leq 9 \quad \text{Add. This statement is true.}$$

**Step 3 If a true statement results, shade the region containing the test point.** The true statement tells us that all the points inside the circle satisfy  $x^2 + y^2 \leq 9$ . The graph is shown using green shading and a solid blue circle in **Figure 7.20**.

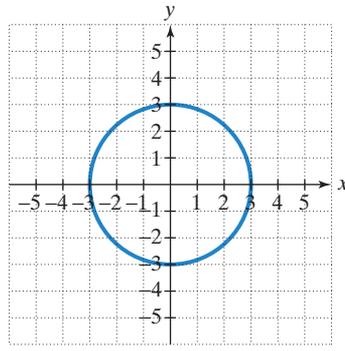

FIGURE 7.19 Preparing to graph  $x^2 + y^2 \leq 9$

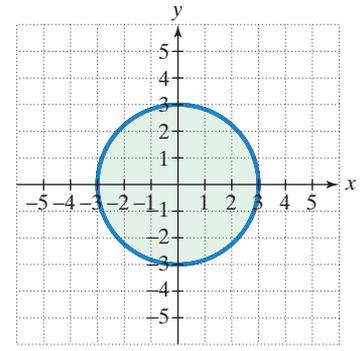

FIGURE 7.20 The graph of  $x^2 + y^2 \leq 9$

 **Check Point 4** Graph:  $x^2 + y^2 \geq 16$ .

**3** Use mathematical models involving linear inequalities.

### Modeling with Systems of Linear Inequalities

Just as two or more linear equations make up a system of linear equations, two or more linear inequalities make up a **system of linear inequalities**. A **solution of a system of linear inequalities** in two variables is an ordered pair that satisfies each inequality in the system.

#### EXAMPLE 5 Does Your Weight Fit You?

The latest guidelines, which apply to both men and women, give healthy weight ranges, rather than specific weights, for your height. **Figure 7.21** shows the healthy weight region for various heights for people between the ages of 19 and 34, inclusive.

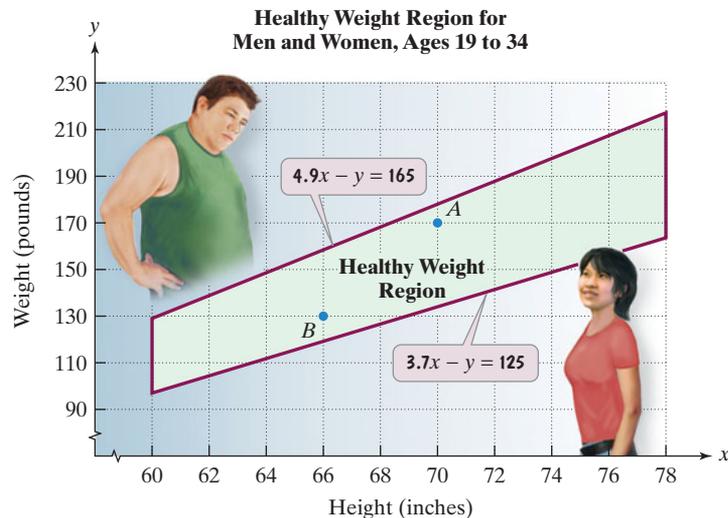

FIGURE 7.21 Source: U.S. Department of Health and Human Services

If  $x$  represents height, in inches, and  $y$  represents weight, in pounds, the healthy weight region in **Figure 7.21** can be modeled by the following system of linear inequalities:

$$\begin{cases} 4.9x - y \geq 165 \\ 3.7x - y \leq 125. \end{cases}$$

Show that point  $A$  in **Figure 7.21** is a solution of the system of inequalities that describes healthy weight.

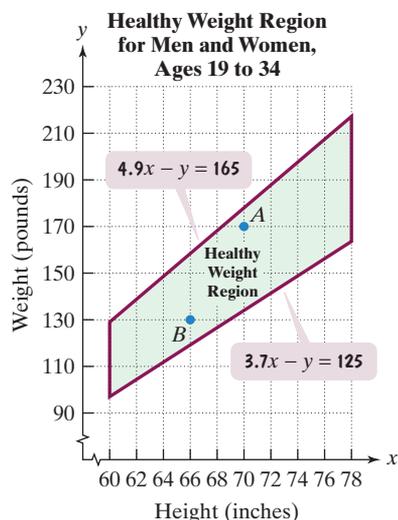

FIGURE 7.21 (repeated)

**SOLUTION**

Point  $A$  has coordinates  $(70, 170)$ . This means that if a person is 70 inches tall, or 5 feet 10 inches, and weighs 170 pounds, then that person's weight is within the healthy weight region. We can show that  $(70, 170)$  satisfies the system of inequalities by substituting  $70$  for  $x$  and  $170$  for  $y$  in each inequality in the system.

$$\begin{array}{rcl}
 4.9x - y & \geq & 165 \\
 4.9(70) - 170 & \stackrel{?}{\geq} & 165 \\
 343 - 170 & \stackrel{?}{\geq} & 165 \\
 173 & \geq & 165, \quad \text{true}
 \end{array}
 \qquad
 \begin{array}{rcl}
 3.7x - y & \leq & 125 \\
 3.7(70) - 170 & \stackrel{?}{\leq} & 125 \\
 259 - 170 & \stackrel{?}{\leq} & 125 \\
 89 & \leq & 125, \quad \text{true}
 \end{array}$$

The coordinates  $(70, 170)$  make each inequality true. Thus,  $(70, 170)$  satisfies the system for the healthy weight region and is a solution of the system. ●●●

**Check Point 5** Show that point  $B$  in **Figure 7.21** is a solution of the system of inequalities that describes healthy weight.

**4** Graph a system of inequalities.

**Graphing Systems of Linear Inequalities**

The **solution set of a system of linear inequalities in two variables** is the set of all ordered pairs that satisfy each inequality in the system. Thus, to graph a system of inequalities in two variables, begin by graphing each individual inequality in the same rectangular coordinate system. Then find the region, if there is one, that is common to every graph in the system. This region of intersection gives a picture of the system's solution set.

**EXAMPLE 6** Graphing a System of Linear Inequalities

Graph the solution set of the system:

$$\begin{cases} x - y < 1 \\ 2x + 3y \geq 12. \end{cases}$$

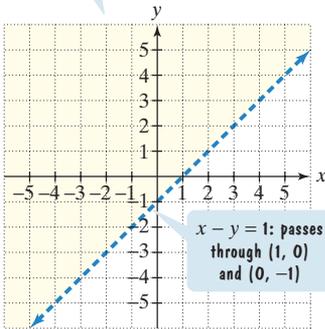

**SOLUTION**

Replacing each inequality symbol with an equal sign indicates that we need to graph  $x - y = 1$  and  $2x + 3y = 12$ . We can use intercepts to graph these lines.

$x - y = 1$		$2x + 3y = 12$
x-intercept: $x - 0 = 1$		x-intercept: $2x + 3 \cdot 0 = 12$
$x = 1$		$2x = 12$
The line passes through $(1, 0)$ .		$x = 6$
		The line passes through $(6, 0)$ .
y-intercept: $0 - y = 1$		y-intercept: $2 \cdot 0 + 3y = 12$
$-y = 1$		$3y = 12$
$y = -1$		$y = 4$
The line passes through $(0, -1)$ .		The line passes through $(0, 4)$ .

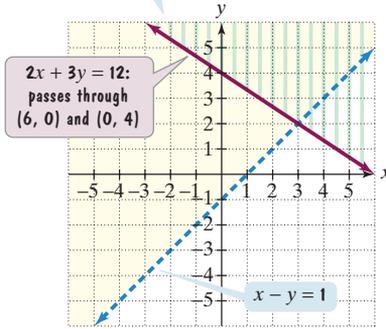

Now we are ready to graph the solution set of the system of linear inequalities.

Graph  $x - y < 1$ . The blue line,  $x - y = 1$ , is dashed: Equality is not included in  $x - y < 1$ . Because  $(0, 0)$  makes the inequality true ( $0 - 0 < 1$ , or  $0 < 1$ , is true), shade the half-plane containing  $(0, 0)$  in yellow.

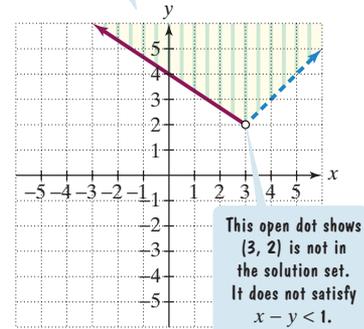

The graph of  $x - y < 1$

Add the graph of  $2x + 3y \geq 12$ . The red line,  $2x + 3y = 12$ , is solid: Equality is included in  $2x + 3y \geq 12$ . Because  $(0, 0)$  makes the inequality false ( $2 \cdot 0 + 3 \cdot 0 \geq 12$ , or  $0 \geq 12$ , is false), shade the half-plane not containing  $(0, 0)$  using green vertical shading.

Adding the graph of  $2x + 3y \geq 12$

The solution set of the system is graphed as the intersection (the overlap) of the two half-planes. This is the region in which the yellow shading and the green vertical shading overlap.

The graph of  $x - y < 1$  and  $2x + 3y \geq 12$

Check Point 6 Graph the solution set of the system:

$$\begin{cases} x - 3y < 6 \\ 2x + 3y \geq -6. \end{cases}$$

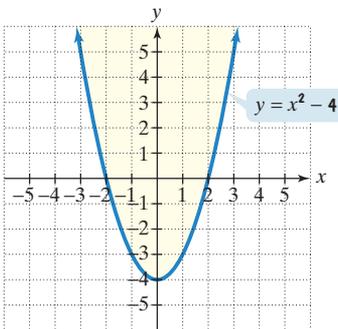

**EXAMPLE 7** Graphing a System of Inequalities

Graph the solution set of the system:

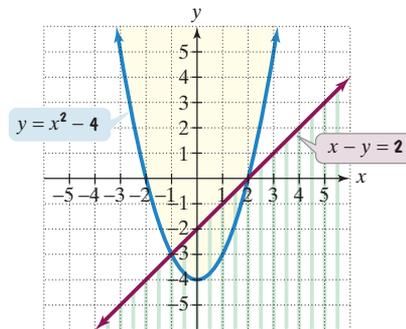

$$\begin{cases} y \geq x^2 - 4 \\ x - y \geq 2. \end{cases}$$

**SOLUTION**

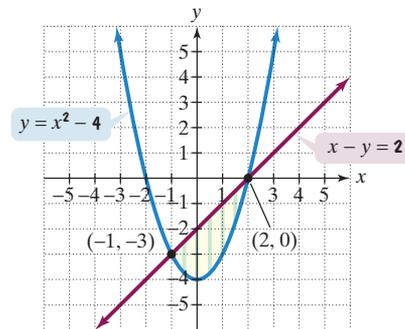

We begin by graphing  $y \geq x^2 - 4$ . Because equality is included in  $\geq$ , we graph  $y = x^2 - 4$  as a solid parabola. Because  $(0, 0)$  makes the inequality  $y \geq x^2 - 4$  true (we obtain  $0 \geq -4$ ), we shade the interior portion of the parabola containing  $(0, 0)$ , shown in yellow in **Figure 7.22**.

**FIGURE 7.22** The graph of  $y \geq x^2 - 4$

**FIGURE 7.23** Adding the graph of  $x - y \geq 2$

**FIGURE 7.24** The graph of  $y \geq x^2 - 4$  and  $x - y \geq 2$

Now we graph  $x - y \geq 2$  in the same rectangular coordinate system. First we graph the line  $x - y = 2$  using its  $x$ -intercept, 2, and its  $y$ -intercept,  $-2$ . Because  $(0, 0)$  makes the inequality  $x - y \geq 2$  false (we obtain  $0 \geq 2$ ), we shade the half-plane below the line. This is shown in **Figure 7.23** using green vertical shading.

The solution of the system is shown in **Figure 7.24** by the intersection (the overlap) of the solid yellow and green vertical shadings. The graph of the system's solution set consists of the region enclosed by the parabola and the line. To find the points of intersection of the parabola and the line, use the substitution method to solve the nonlinear system containing  $y = x^2 - 4$  and  $x - y = 2$ . Take a moment to show that the solutions are  $(-1, -3)$  and  $(2, 0)$ , as shown in **Figure 7.24**.

## GREAT QUESTION!

**In Example 7, how did you graph  $y = x^2 - 4$ ?**

We used the parabola's vertex and its  $x$ -intercepts.

$$y = 1x^2 + 0x - 4$$

a = 1
b = 0
c = -4

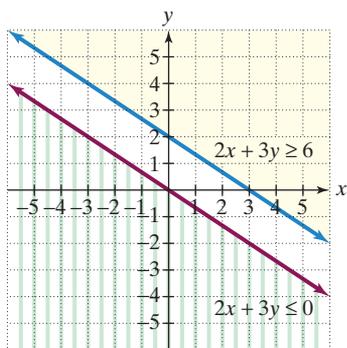

- $a > 0$ : opens upward
- Vertex:

$$\left(-\frac{b}{2a}, f\left(-\frac{b}{2a}\right)\right) = (0, f(0)) = (0, -4)$$

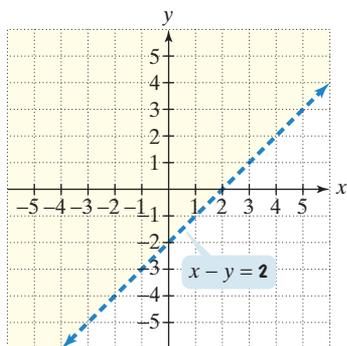

- $x$ -intercepts:

$$\begin{aligned} x^2 - 4 &= 0 \\ x^2 &= 4 \\ x &= \pm 2 \end{aligned}$$

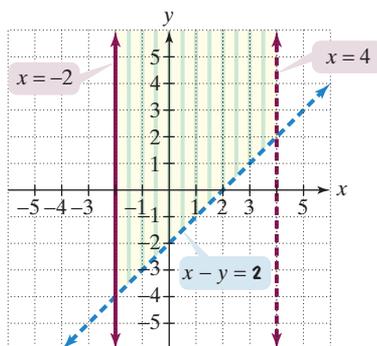

The graph of  $y = x^2 - 4$ , shown in blue in **Figure 7.22** on the previous page, passes through  $(-2, 0)$  and  $(2, 0)$  with a vertex at  $(0, -4)$ .

**FIGURE 7.25** A system of inequalities with no solution

**FIGURE 7.26** The graph of  $x - y < 2$

**FIGURE 7.27** The graph of  $x - y < 2$  and  $-2 \leq x < 4$

**Check Point 7** Graph the solution set of the system:

$$\begin{cases} y \geq x^2 - 4 \\ x + y \leq 2. \end{cases}$$

A system of inequalities has no solution if there are no points in the rectangular coordinate system that simultaneously satisfy each inequality in the system. For example, the system

$$\begin{cases} 2x + 3y \geq 6 \\ 2x + 3y \leq 0, \end{cases}$$

whose separate graphs are shown in **Figure 7.25**, has no overlapping region. Thus, the system has no solution. The solution set is  $\emptyset$ , the empty set.

### EXAMPLE 8 Graphing a System of Inequalities

Graph the solution set of the system:

$$\begin{cases} x - y < 2 \\ -2 \leq x < 4 \\ y < 3. \end{cases}$$

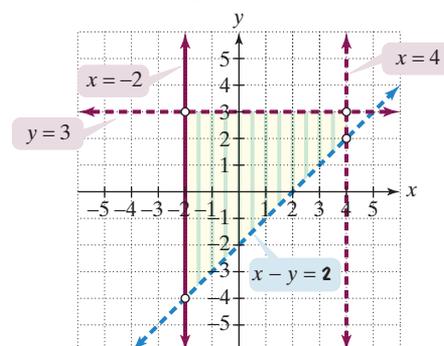

#### SOLUTION

We begin by graphing  $x - y < 2$ , the first given inequality. The line  $x - y = 2$  has an  $x$ -intercept of 2 and a  $y$ -intercept of  $-2$ . The test point  $(0, 0)$  makes the inequality  $x - y < 2$  true, and its graph is shown in **Figure 7.26**.

Now, let's consider the second given inequality,  $-2 \leq x < 4$ . Replacing the inequality symbols by  $=$ , we obtain  $x = -2$  and  $x = 4$ , graphed as red vertical lines in **Figure 7.27**. The line of  $x = 4$  is not included. Because  $x$  is between  $-2$  and  $4$ , we shade the region between the vertical lines. We must intersect this region with the yellow region in **Figure 7.26**. The resulting region is shown in yellow and green vertical shading in **Figure 7.27**.

Finally, let's consider the third given inequality,  $y < 3$ . Replacing the inequality symbol by  $=$ , we obtain  $y = 3$ , which graphs as a horizontal line. Because of the less than symbol in  $y < 3$ , the graph consists of the half-plane below the line  $y = 3$ . We must intersect this half-plane with the region in **Figure 7.27**. The resulting region is shown in yellow and green vertical shading in **Figure 7.28**.

This region represents the graph of the solution set of the given system.

**FIGURE 7.28** The graph of  $x - y < 2$  and  $-2 \leq x < 4$  and  $y < 3$

In **Figure 7.28** it may be difficult to tell where the graph of  $x - y = 2$  intersects the vertical line  $x = 4$ . Using the substitution method, it can be determined that this intersection point is  $(4, 2)$ . Take a moment to verify that the four intersection points in **Figure 7.28** are, clockwise from upper left,  $(-2, 3)$ ,  $(4, 3)$ ,  $(4, 2)$ , and  $(-2, -4)$ . These points are shown as open dots because none satisfies all three of the system's inequalities. ●●●

 **Check Point 8** Graph the solution set of the system:

$$\begin{cases} x + y < 2 \\ -2 \leq x < 1 \\ y > -3. \end{cases}$$

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- The ordered pair  $(3, 2)$  is a/an \_\_\_\_\_ of the inequality  $x + y > 1$  because when 3 is substituted for \_\_\_\_\_ and 2 is substituted for \_\_\_\_\_, the true statement \_\_\_\_\_ is obtained.
- The set of all points that satisfy a linear inequality in two variables is called the \_\_\_\_\_ of the inequality.
- The set of all points on one side of a line is called a/an \_\_\_\_\_.
- True or false: The graph of  $2x - 3y > 6$  includes the line  $2x - 3y = 6$ . \_\_\_\_\_
- True or false: The graph of the linear equation  $2x - 3y = 6$  is used to graph the linear inequality  $2x - 3y > 6$ . \_\_\_\_\_
- True or false: When graphing  $4x - 2y \geq 8$ , to determine which side of the line to shade, choose a test point on  $4x - 2y = 8$ . \_\_\_\_\_
- When graphing  $x^2 + y^2 > 25$ , to determine whether to shade the region inside the circle or the region outside the circle, we can use \_\_\_\_\_ as a test point.
- The solution set of the system
 
$$\begin{cases} x - y < 1 \\ 2x + 3y \geq 12. \end{cases}$$
 is the set of ordered pairs that satisfy \_\_\_\_\_ and \_\_\_\_\_.
- True or false: The graph of the solution set of the system
 
$$\begin{cases} x - 3y < 6 \\ 2x + 3y \geq -6. \end{cases}$$
 includes the intersection point of  $x - 3y = 6$  and  $2x + 3y = -6$ . \_\_\_\_\_

## EXERCISE SET 7.5

### Practice Exercises

In Exercises 1–26, graph each inequality.

- $x + 2y \leq 8$
- $3x - 6y \leq 12$
- $x - 2y > 10$
- $2x - y > 4$
- $y \leq \frac{1}{3}x$
- $y \leq \frac{1}{4}x$
- $y > 2x - 1$
- $y > 3x + 2$
- $x \leq 1$
- $x \leq -3$
- $y > 1$
- $y > -3$
- $x^2 + y^2 \leq 1$
- $x^2 + y^2 \leq 4$
- $x^2 + y^2 > 25$
- $x^2 + y^2 > 36$
- $(x - 2)^2 + (y + 1)^2 < 9$
- $(x + 2)^2 + (y - 1)^2 < 16$
- $y < x^2 - 1$
- $y < x^2 - 9$
- $y \geq x^2 - 9$
- $y \geq x^2 - 1$
- $y > 2^x$
- $y \leq 3^x$
- $y \geq \log_2(x + 1)$
- $y \geq \log_3(x - 1)$

In Exercises 27–62, graph the solution set of each system of inequalities or indicate that the system has no solution.

- $\begin{cases} 3x + 6y \leq 6 \\ 2x + y \leq 8 \end{cases}$
- $\begin{cases} x - y \geq 4 \\ x + y \leq 6 \end{cases}$
- $\begin{cases} 2x - 5y \leq 10 \\ 3x - 2y > 6 \end{cases}$
- $\begin{cases} 2x - y \leq 4 \\ 3x + 2y > -6 \end{cases}$
- $\begin{cases} y > 2x - 3 \\ y < -x + 6 \end{cases}$
- $\begin{cases} y < -2x + 4 \\ y < x - 4 \end{cases}$
- $\begin{cases} x + 2y \leq 4 \\ y \geq x - 3 \end{cases}$
- $\begin{cases} x + y \leq 4 \\ y \geq 2x - 4 \end{cases}$
- $\begin{cases} x \leq 2 \\ y \geq -1 \end{cases}$
- $\begin{cases} x \leq 3 \\ y \leq -1 \end{cases}$
- $-2 \leq x < 5$
- $-2 < y \leq 5$
- $\begin{cases} x - y \leq 1 \\ x \geq 2 \end{cases}$
- $\begin{cases} 4x - 5y \geq -20 \\ x \geq -3 \end{cases}$
- $\begin{cases} x + y > 4 \\ x + y < -1 \end{cases}$
- $\begin{cases} x + y > 3 \\ x + y < -2 \end{cases}$

43. 
$$\begin{cases} x + y > 4 \\ x + y > -1 \end{cases}$$

44. 
$$\begin{cases} x + y > 3 \\ x + y > -2 \end{cases}$$

45. 
$$\begin{cases} y \geq x^2 - 1 \\ x - y \geq -1 \end{cases}$$

46. 
$$\begin{cases} y \geq x^2 - 4 \\ x - y \geq 2 \end{cases}$$

47. 
$$\begin{cases} x^2 + y^2 \leq 16 \\ x + y > 2 \end{cases}$$

48. 
$$\begin{cases} x^2 + y^2 \leq 4 \\ x + y > 1 \end{cases}$$

49. 
$$\begin{cases} x^2 + y^2 > 1 \\ x^2 + y^2 < 16 \end{cases}$$

50. 
$$\begin{cases} x^2 + y^2 > 1 \\ x^2 + y^2 < 9 \end{cases}$$

51. 
$$\begin{cases} (x - 1)^2 + (y + 1)^2 < 25 \\ (x - 1)^2 + (y + 1)^2 \geq 16 \end{cases}$$

52. 
$$\begin{cases} (x + 1)^2 + (y - 1)^2 < 16 \\ (x + 1)^2 + (y - 1)^2 \geq 4 \end{cases}$$

53. 
$$\begin{cases} x^2 + y^2 \leq 1 \\ y - x^2 > 0 \end{cases}$$

54. 
$$\begin{cases} x^2 + y^2 < 4 \\ y - x^2 \geq 0 \end{cases}$$

55. 
$$\begin{cases} x^2 + y^2 < 16 \\ y \geq 2^x \end{cases}$$

56. 
$$\begin{cases} x^2 + y^2 \leq 16 \\ y < 2^x \end{cases}$$

57. 
$$\begin{cases} x - y \leq 2 \\ x > -2 \\ y \leq 3 \end{cases}$$

58. 
$$\begin{cases} 3x + y \leq 6 \\ x > -2 \\ y \leq 4 \end{cases}$$

59. 
$$\begin{cases} x \geq 0 \\ y \geq 0 \\ 2x + 5y < 10 \\ 3x + 4y \leq 12 \end{cases}$$

60. 
$$\begin{cases} x \geq 0 \\ y \geq 0 \\ 2x + y < 4 \\ 2x - 3y \leq 6 \end{cases}$$

61. 
$$\begin{cases} 3x + y \leq 6 \\ 2x - y \leq -1 \\ x > -2 \\ y < 4 \end{cases}$$

62. 
$$\begin{cases} 2x + y \leq 6 \\ x + y > 2 \\ 1 \leq x \leq 2 \\ y < 3 \end{cases}$$

### Practice Plus

In Exercises 63–64, write each sentence as an inequality in two variables. Then graph the inequality.

63. The  $y$ -variable is at least 4 more than the product of  $-2$  and the  $x$ -variable.

64. The  $y$ -variable is at least 2 more than the product of  $-3$  and the  $x$ -variable.

In Exercises 65–68, write the given sentences as a system of inequalities in two variables. Then graph the system.

65. The sum of the  $x$ -variable and the  $y$ -variable is at most 4. The  $y$ -variable added to the product of 3 and the  $x$ -variable does not exceed 6.

66. The sum of the  $x$ -variable and the  $y$ -variable is at most 3. The  $y$ -variable added to the product of 4 and the  $x$ -variable does not exceed 6.

67. The sum of the  $x$ -variable and the  $y$ -variable is no more than 2. The  $y$ -variable is no less than the difference between the square of the  $x$ -variable and 4.

68. The sum of the squares of the  $x$ -variable and the  $y$ -variable is no more than 25. The sum of twice the  $y$ -variable and the  $x$ -variable is no less than 5.

In Exercises 69–70, rewrite each inequality in the system without absolute value bars. Then graph the rewritten system in rectangular coordinates.

69. 
$$\begin{cases} |x| \leq 2 \\ |y| \leq 3 \end{cases}$$

70. 
$$\begin{cases} |x| \leq 1 \\ |y| \leq 2 \end{cases}$$

The graphs of solution sets of systems of inequalities involve finding the intersection of the solution sets of two or more inequalities. By contrast, in Exercises 71–72, you will be graphing the **union** of the solution sets of two inequalities.

71. Graph the union of  $y > \frac{3}{2}x - 2$  and  $y < 4$ .

72. Graph the union of  $x - y \geq -1$  and  $5x - 2y \leq 10$ .

Without graphing, in Exercises 73–76, determine if each system has no solution or infinitely many solutions.

73. 
$$\begin{cases} 3x + y < 9 \\ 3x + y > 9 \end{cases}$$

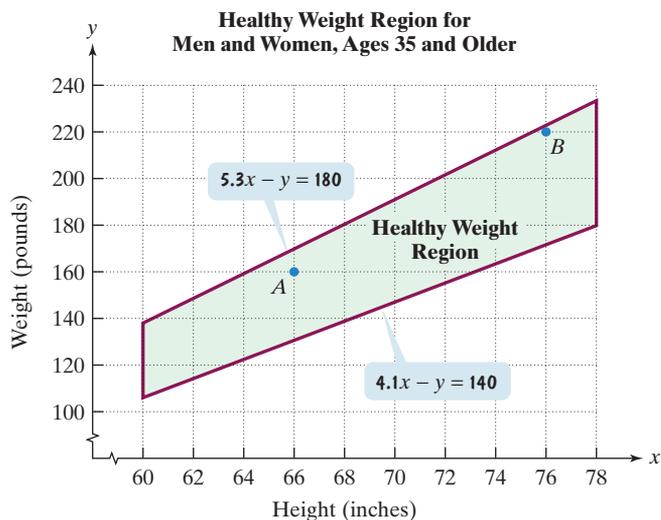

74. 
$$\begin{cases} 6x - y \leq 24 \\ 6x - y > 24 \end{cases}$$

75. 
$$\begin{cases} (x + 4)^2 + (y - 3)^2 \leq 9 \\ (x + 4)^2 + (y - 3)^2 \geq 9 \end{cases}$$

76. 
$$\begin{cases} (x - 4)^2 + (y + 3)^2 \leq 24 \\ (x - 4)^2 + (y + 3)^2 \geq 24 \end{cases}$$

### Application Exercises

The figure shows the healthy weight region for various heights for people ages 35 and older.

Source: U.S. Department of Health and Human Services

If  $x$  represents height, in inches, and  $y$  represents weight, in pounds, the healthy weight region can be modeled by the following system of linear inequalities:

$$\begin{cases} 5.3x - y \geq 180 \\ 4.1x - y \leq 140. \end{cases}$$

Use this information to solve Exercises 77–80.

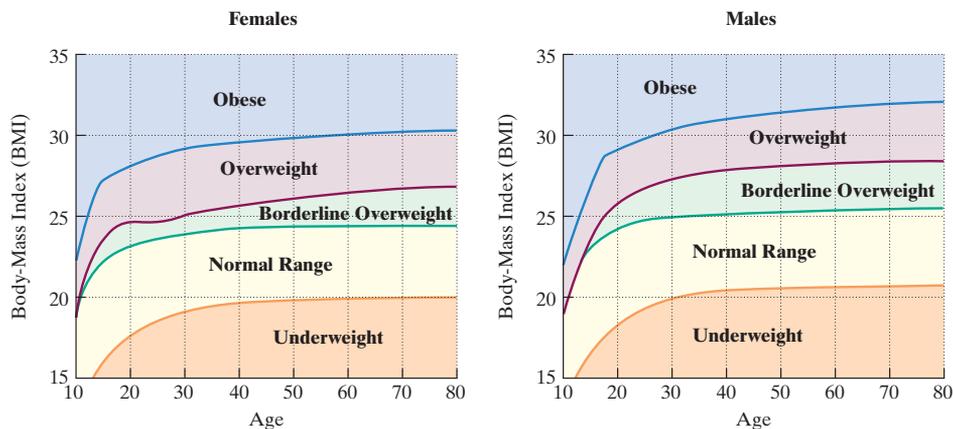

77. Show that point A is a solution of the system of inequalities that describes healthy weight for this age group.

78. Show that point B is a solution of the system of inequalities that describes healthy weight for this age group.

79. Is a person in this age group who is 6 feet tall weighing 205 pounds within the healthy weight region?
80. Is a person in this age group who is 5 feet 8 inches tall weighing 135 pounds within the healthy weight region?
81. Many elevators have a capacity of 2000 pounds.
- If a child averages 50 pounds and an adult 150 pounds, write an inequality that describes when  $x$  children and  $y$  adults will cause the elevator to be overloaded.
  - Graph the inequality. Because  $x$  and  $y$  must be positive, limit the graph to quadrant I only.
  - Select an ordered pair satisfying the inequality. What are its coordinates and what do they represent in this situation?
82. A patient is not allowed to have more than 330 milligrams of cholesterol per day from a diet of eggs and meat. Each egg provides 165 milligrams of cholesterol. Each ounce of meat provides 110 milligrams.
- Write an inequality that describes the patient's dietary restrictions for  $x$  eggs and  $y$  ounces of meat.
  - Graph the inequality. Because  $x$  and  $y$  must be positive, limit the graph to quadrant I only.
  - Select an ordered pair satisfying the inequality. What are its coordinates and what do they represent in this situation?
83. On your next vacation, you will divide lodging between large resorts and small inns. Let  $x$  represent the number of nights spent in large resorts. Let  $y$  represent the number of nights spent in small inns.
- Write a system of inequalities that models the following conditions:  
You want to stay at least 5 nights. At least one night should be spent at a large resort. Large resorts average \$200 per night and small inns average \$100 per night. Your budget permits no more than \$700 for lodging.
  - Graph the solution set of the system of inequalities in part (a).
  - Based on your graph in part (b), what is the greatest number of nights you could spend at a large resort and still stay within your budget?
84. A person with no more than \$15,000 to invest plans to place the money in two investments. One investment is high risk, high yield; the other is low risk, low yield. At least \$2000 is to be placed in the high-risk investment. Furthermore, the amount invested at low risk should be at least three times the amount invested at high risk. Find and graph a system of inequalities that describes all possibilities for placing the money in the high- and low-risk investments.

The graph of an inequality in two variables is a region in the rectangular coordinate system. Regions in coordinate systems have numerous applications. For example, the regions in the following two graphs indicate whether a person is obese, overweight, borderline overweight, normal weight, or underweight.

Source: Centers for Disease Control and Prevention

The horizontal axis shows a person's age. The vertical axis shows that person's body-mass index (BMI), computed using the following formula:

$$\text{BMI} = \frac{703W}{H^2}$$

The variable  $W$  represents weight, in pounds. The variable  $H$  represents height, in inches. Use this information to solve Exercises 85–86.

85. A man is 20 years old, 72 inches (6 feet) tall, and weighs 200 pounds.
- Compute the man's BMI. Round to the nearest tenth.
  - Use the man's age and his BMI to locate this information as a point in the coordinate system for males. Is this person obese, overweight, borderline overweight, normal weight, or underweight?
86. A woman is 25 years old, 66 inches (5 feet, 6 inches) tall, and weighs 105 pounds.
- Compute the woman's BMI. Round to the nearest tenth.
  - Use the woman's age and her BMI to locate this information as a point in the coordinate system for females. Is this person obese, overweight, borderline overweight, normal weight, or underweight?

### Writing in Mathematics

- What is a linear inequality in two variables? Provide an example with your description.
- How do you determine if an ordered pair is a solution of an inequality in two variables,  $x$  and  $y$ ?
- What is a half-plane?
- What does a solid line mean in the graph of an inequality?

91. What does a dashed line mean in the graph of an inequality?
92. Compare the graphs of  $3x - 2y > 6$  and  $3x - 2y \leq 6$ . Discuss similarities and differences between the graphs.
93. What is a system of linear inequalities?
94. What is a solution of a system of linear inequalities?
95. Explain how to graph the solution set of a system of inequalities.
96. What does it mean if a system of linear inequalities has no solution?

### Technology Exercises

Graphing utilities can be used to shade regions in the rectangular coordinate system, thereby graphing an inequality in two variables. Read the section of the user's manual for your graphing utility that describes how to shade a region. Then use your graphing utility to graph the inequalities in Exercises 97–102.

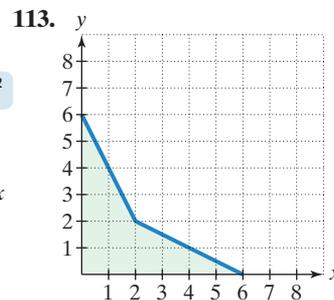

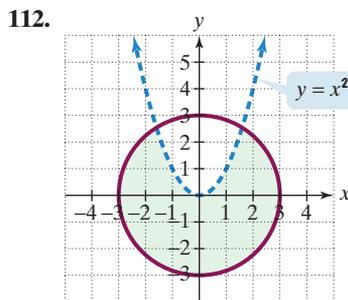

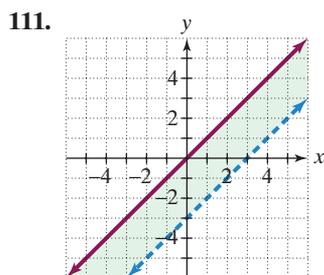

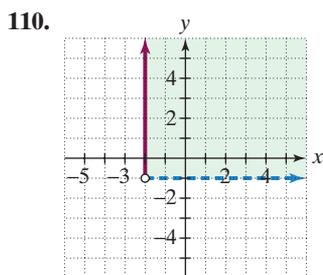

97.  $y \leq 4x + 4$
98.  $y \geq \frac{2}{3}x - 2$
99.  $y \geq x^2 - 4$
100.  $y \geq \frac{1}{2}x^2 - 2$
101.  $2x + y \leq 6$
102.  $3x - 2y \geq 6$
103. Does your graphing utility have any limitations in terms of graphing inequalities? If so, what are they?
104. Use a graphing utility with a **SHADE** feature to verify any five of the graphs that you drew by hand in Exercises 1–26.
105. Use a graphing utility with a **SHADE** feature to verify any five of the graphs that you drew by hand for the systems in Exercises 27–62.

### Critical Thinking Exercises

**Make Sense?** In Exercises 106–109, determine whether each statement makes sense or does not make sense, and explain your reasoning.

106. When graphing a linear inequality, I should always use (0, 0) as a test point because it's easy to perform the calculations when 0 is substituted for each variable.
107. When graphing  $3x - 4y < 12$ , it's not necessary for me to graph the linear equation  $3x - 4y = 12$  because the inequality contains a  $<$  symbol, in which equality is not included.
108. The reason that systems of linear inequalities are appropriate for modeling healthy weight is because guidelines give healthy weight ranges, rather than specific weights, for various heights.
109. I graphed the solution set of  $y \geq x + 2$  and  $x \geq 1$  without using test points.

In Exercises 110–113, write a system of inequalities for each graph.

114. Write a system of inequalities whose solution set includes every point in the rectangular coordinate system.
115. Sketch the graph of the solution set for the following system of inequalities:

$$\begin{cases} y \geq nx + b & (n < 0, b > 0) \\ y \leq mx + b & (m > 0, b > 0) \end{cases}$$

### Preview Exercises

Exercises 116–118 will help you prepare for the material covered in the next section.

116. a. Graph the solution set of the system:

$$\begin{cases} x + y \geq 6 \\ x \leq 8 \\ y \geq 5 \end{cases}$$

- b. List the points that form the corners of the graphed region in part (a).
- c. Evaluate  $3x + 2y$  at each of the points obtained in part (b).

117. a. Graph the solution set of the system:

$$\begin{cases} x \geq 0 \\ y \geq 0 \\ 3x - 2x \leq 6 \\ y \leq -x + 7 \end{cases}$$

- b. List the points that form the corners of the graphed region in part (a).
- c. Evaluate  $2x + 5y$  at each of the points obtained in part (b).

118. Bottled water and medical supplies are to be shipped to survivors of an earthquake by plane. The bottled water weighs 20 pounds per container and medical kits weigh 10 pounds per kit. Each plane can carry no more than 80,000 pounds. If  $x$  represents the number of bottles of water to be shipped per plane and  $y$  represents the number of medical kits per plane, write an inequality that models each plane's 80,000-pound weight restriction.

## SECTION 7.6

## Linear Programming

*Objectives*

- 1 Write an objective function describing a quantity that must be maximized or minimized.
- 2 Use inequalities to describe limitations in a situation.
- 3 Use linear programming to solve problems.

West Berlin children at Tempelhof airport watch fleets of U.S. airplanes bringing in supplies to circumvent the Soviet blockade. The airlift began June 28, 1948, and continued for 15 months.

The Berlin Airlift (1948–1949) was an operation by the United States and Great Britain in response to military action by the former Soviet Union: Soviet troops closed all roads and rail lines between West Germany and Berlin, cutting off supply routes to the city. The Allies used a mathematical technique developed during World War II to maximize the amount of supplies transported. During the 15-month airlift, 278,228 flights provided basic necessities to blockaded Berlin, saving one of the world's great cities.

In this section, we will look at an important application of systems of linear inequalities. Such systems arise in **linear programming**, a method for solving problems in which a particular quantity that must be maximized or minimized is limited by other factors. Linear programming is one of the most widely used tools in management science. It helps businesses allocate resources to manufacture products in a way that will maximize profit. Linear programming accounts for more than 50% and perhaps as much as 90% of all computing time used for management decisions in business. The Allies used linear programming to save Berlin.

- 1 Write an objective function describing a quantity that must be maximized or minimized.

**Objective Functions in Linear Programming**

Many problems involve quantities that must be maximized or minimized. Businesses are interested in maximizing profit. An operation in which bottled water and medical kits are shipped to earthquake survivors needs to maximize the number of survivors helped by this shipment. An **objective function** is an algebraic expression in two or more variables describing a quantity that must be maximized or minimized.

**EXAMPLE 1** Writing an Objective Function

Bottled water and medical supplies are to be shipped to survivors of an earthquake by plane. Each container of bottled water will serve 10 people and each medical kit will aid 6 people. If  $x$  represents the number of bottles of water to be shipped and  $y$  represents the number of medical kits, write the objective function that models the number of people that can be helped.

**SOLUTION**

Because each bottle of water serves 10 people and each medical kit aids 6 people, we have

$$\begin{array}{ccccccc} \text{The number of} & & \text{10 times the number} & & \text{6 times the number} & & \\ \text{people helped} & \text{is} & \text{of bottles of water} & \text{plus} & \text{of medical kits.} & & \\ & = & 10x & + & 6y. & & \end{array}$$

Using  $z$  to represent the number of people helped, the objective function is

$$z = 10x + 6y.$$

Unlike the functions that we have seen so far, the objective function is an equation in three variables. For a value of  $x$  and a value of  $y$ , there is one and only one value of  $z$ . Thus,  $z$  is a function of  $x$  and  $y$ . ...

 **Check Point 1** A company manufactures bookshelves and desks for computers. Let  $x$  represent the number of bookshelves manufactured daily and  $y$  the number of desks manufactured daily. The company's profits are \$25 per bookshelf and \$55 per desk. Write the objective function that models the company's total daily profit,  $z$ , from  $x$  bookshelves and  $y$  desks. (Check Points 2 through 4 are related to this situation, so keep track of your answers.)

**2** Use inequalities to describe limitations in a situation.

**Constraints in Linear Programming**

Ideally, the number of earthquake survivors helped in Example 1 should increase without restriction so that every survivor receives water and medical supplies. However, the planes that ship these supplies are subject to weight and volume restrictions. In linear programming problems, such restrictions are called **constraints**. Each constraint is expressed as a linear inequality. The list of constraints forms a system of linear inequalities.

**EXAMPLE 2** Writing a Constraint

Each plane can carry no more than 80,000 pounds. The bottled water weighs 20 pounds per container and each medical kit weighs 10 pounds. Let  $x$  represent the number of bottles of water to be shipped and  $y$  the number of medical kits. Write an inequality that models this constraint.

**SOLUTION**

Because each plane can carry no more than 80,000 pounds, we have

$$\begin{array}{ccccccc} \text{The total weight of} & & \text{the total weight of} & & \text{must be less than} & & \text{80,000} \\ \text{the water bottles} & \text{plus} & \text{the medical kits} & & \text{or equal to} & & \text{pounds.} \\ & & & & & & \\ & 20x & + & 10y & \leq & & 80,000. \\ & \uparrow & & \uparrow & & & \\ & \text{Each bottle} & & \text{Each kit} & & & \\ & \text{weighs} & & \text{weighs} & & & \\ & \text{20 pounds.} & & \text{10 pounds.} & & & \end{array}$$

The plane's weight constraint is modeled by the inequality

$$20x + 10y \leq 80,000. \quad \dots$$

 **Check Point 2** To maintain high quality, the company in Check Point 1 should not manufacture more than a total of 80 bookshelves and desks per day. Write an inequality that models this constraint.

In addition to a weight constraint on its cargo, each plane has a limited amount of space in which to carry supplies. Example 3 demonstrates how to express this constraint.

### EXAMPLE 3 Writing a Constraint

Each plane can carry a total volume of supplies that does not exceed 6000 cubic feet. Each water bottle is 1 cubic foot and each medical kit also has a volume of 1 cubic foot. With  $x$  still representing the number of water bottles and  $y$  the number of medical kits, write an inequality that models this second constraint.

### SOLUTION

Because each plane can carry a volume of supplies that does not exceed 6000 cubic feet, we have

$$\begin{array}{ccccccc}
 \begin{array}{|c|} \hline \text{The total volume} \\ \text{of the water} \\ \hline \end{array} & & \begin{array}{|c|} \hline \text{plus} \\ \hline \end{array} & & \begin{array}{|c|} \hline \text{the total volume of} \\ \text{the medical kits} \\ \hline \end{array} & & \begin{array}{|c|} \hline \text{must be less than} \\ \text{or equal to} \\ \hline \end{array} & & \begin{array}{|c|} \hline \text{6000} \\ \text{cubic feet.} \\ \hline \end{array} \\
 \uparrow & & + & & \uparrow & & \leq & & 6000. \\
 1x & & & & 1y & & & & \\
 \uparrow & & \text{Each bottle} & & \uparrow & & \text{Each kit} & & \\
 & & \text{is 1 cubic foot.} & & & & \text{is 1 cubic foot.} & & 
 \end{array}$$

The plane's volume constraint is modeled by the inequality  $x + y \leq 6000$ . ●●●

In summary, here's what we have described so far in this aid-to-earthquake-survivors situation:

$$z = 10x + 6y \quad \text{This is the objective function modeling the number of people helped with } x \text{ bottles of water and } y \text{ medical kits.}$$

$$\begin{cases} 20x + 10y \leq 80,000 \\ x + y \leq 6000. \end{cases} \quad \text{These are the constraints based on each plane's weight and volume limitations.}$$

 **Check Point 3** To meet customer demand, the company in Check Point 1 must manufacture between 30 and 80 bookshelves per day, inclusive. Furthermore, the company must manufacture at least 10 and no more than 30 desks per day. Write an inequality that models each of these sentences. Then summarize what you have described about this company by writing the objective function for its profits and the three constraints.

**3** Use linear programming to solve problems.

### Solving Problems with Linear Programming

The problem in the earthquake situation described previously is to maximize the number of survivors who can be helped, subject to each plane's weight and volume constraints. The process of solving this problem is called *linear programming*, based on a theorem that was proven during World War II.

#### Solving a Linear Programming Problem

Let  $z = ax + by$  be an objective function that depends on  $x$  and  $y$ . Furthermore,  $z$  is subject to a number of constraints on  $x$  and  $y$ . If a maximum or minimum value of  $z$  exists, it can be determined as follows:

1. Graph the system of inequalities representing the constraints.
2. Find the value of the objective function at each corner, or **vertex**, of the graphed region. The maximum and minimum of the objective function occur at one or more of the corner points.

**EXAMPLE 4** Solving a Linear Programming Problem

Determine how many bottles of water and how many medical kits should be sent on each plane to maximize the number of earthquake survivors who can be helped.

**SOLUTION**

We must maximize  $z = 10x + 6y$  subject to the following constraints:

$$\begin{cases} 20x + 10y \leq 80,000 \\ x + y \leq 6000. \end{cases}$$

**Step 1 Graph the system of inequalities representing the constraints.** Because  $x$  (the number of bottles of water per plane) and  $y$  (the number of medical kits per plane) must be nonnegative, we need to graph the system of inequalities in quadrant I and its boundary only.

To graph the inequality  $20x + 10y \leq 80,000$ , we graph the equation  $20x + 10y = 80,000$  as a solid blue line (**Figure 7.29**). Setting  $y = 0$ , the  $x$ -intercept is 4000 and setting  $x = 0$ , the  $y$ -intercept is 8000. Using  $(0, 0)$  as a test point, the inequality is satisfied, so we shade below the blue line, as shown in yellow in **Figure 7.29**.

Now we graph  $x + y \leq 6000$  by first graphing  $x + y = 6000$  as a solid red line. Setting  $y = 0$ , the  $x$ -intercept is 6000. Setting  $x = 0$ , the  $y$ -intercept is 6000. Using  $(0, 0)$  as a test point, the inequality is satisfied, so we shade below the red line, as shown using green vertical shading in **Figure 7.29**.

We use the addition method to find where the lines  $20x + 10y = 80,000$  and  $x + y = 6000$  intersect.

$$\begin{cases} 20x + 10y = 80,000 \\ x + y = 6000 \end{cases} \begin{array}{l} \xrightarrow{\text{No change}} \\ \xrightarrow{\text{Multiply by } -10.} \\ \text{Add:} \end{array} \begin{cases} 20x + 10y = 80,000 \\ -10x - 10y = -60,000 \\ \hline 10x = 20,000 \\ x = 2000 \end{cases}$$

Back-substituting 2000 for  $x$  in  $x + y = 6000$ , we find  $y = 4000$ , so the intersection point is  $(2000, 4000)$ .

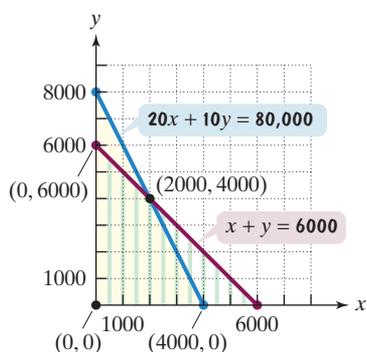

The system of inequalities representing the constraints is shown by the region in which the yellow shading and the green vertical shading overlap in **Figure 7.29**. The graph of the system of inequalities is shown again in **Figure 7.30**. The red and blue line segments are included in the graph.

**Step 2 Find the value of the objective function at each corner of the graphed region. The maximum and minimum of the objective function occur at one or more of the corner points.** We must evaluate the objective function,  $z = 10x + 6y$ , at the four corners, or vertices, of the region in **Figure 7.30**.

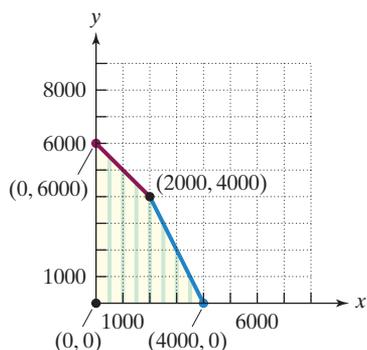

Corner ( $x, y$ )	Objective Function $z = 10x + 6y$
$(0, 0)$	$z = 10(0) + 6(0) = 0$
$(4000, 0)$	$z = 10(4000) + 6(0) = 40,000$
$(2000, 4000)$	$z = 10(2000) + 6(4000) = 44,000 \leftarrow \text{maximum}$
$(0, 6000)$	$z = 10(0) + 6(6000) = 36,000$

Thus, the maximum value of  $z$  is 44,000 and this occurs when  $x = 2000$  and  $y = 4000$ . In practical terms, this means that the maximum number of earthquake survivors who can be helped with each plane shipment is 44,000. This can be accomplished by sending 2000 water bottles and 4000 medical kits per plane. ●●●

 **Check Point 4** For the company in Check Points 1–3, how many bookshelves and how many desks should be manufactured per day to obtain maximum profit? What is the maximum daily profit?

**FIGURE 7.29** The region in quadrant I representing the constraints  $20x + 10y \leq 80,000$  and  $x + y \leq 6000$

**FIGURE 7.30**

**EXAMPLE 5** Solving a Linear Programming Problem

Find the maximum value of the objective function

$$z = 2x + y$$

subject to the following constraints:

$$\begin{cases} x \geq 0, y \geq 0 \\ x + 2y \leq 5 \\ x - y \leq 2. \end{cases}$$

**SOLUTION**

We begin by graphing the region in quadrant I ( $x \geq 0, y \geq 0$ ) formed by the constraints. The graph is shown in **Figure 7.31**.

Now we evaluate the objective function at the four vertices of this region.

**Objective function:**  $z = 2x + y$

At  $(0, 0)$ :  $z = 2 \cdot 0 + 0 = 0$

At  $(2, 0)$ :  $z = 2 \cdot 2 + 0 = 4$

At  $(3, 1)$ :  $z = 2 \cdot 3 + 1 = 7$

At  $(0, 2.5)$ :  $z = 2 \cdot 0 + 2.5 = 2.5$

Maximum  
value of  $z$

Thus, the maximum value of  $z$  is 7, and this occurs when  $x = 3$  and  $y = 1$ . ●●●

We can see why the objective function in Example 5 has a maximum value that occurs at a vertex by solving the equation for  $y$ .

$$z = 2x + y$$

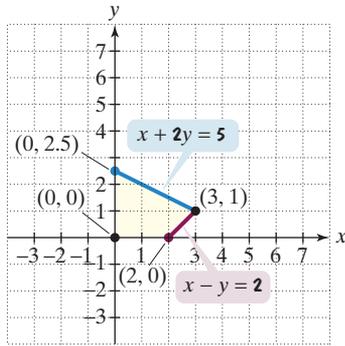

$$y = -2x + z$$

Slope = -2

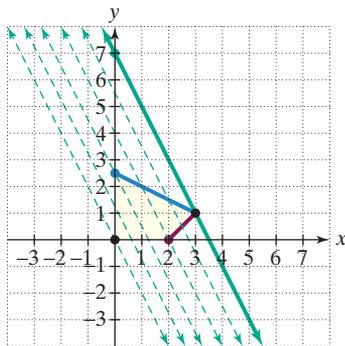

y-intercept =  $z$

This is the objective function of Example 5.

Solve for  $y$ . Recall that the slope-intercept form of a line is  $y = mx + b$ .

**FIGURE 7.31** The graph of  $x + 2y \leq 5$  and  $x - y \leq 2$  in quadrant I

**FIGURE 7.32** The line with slope  $-2$  with the greatest  $y$ -intercept that intersects the shaded region passes through one of its vertices.

In this form,  $z$  represents the  $y$ -intercept of the objective function. The equation describes infinitely many parallel lines, each with slope  $-2$ . The process in linear programming involves finding the maximum  $z$ -value for all lines that intersect the region determined by the constraints. Of all the lines whose slope is  $-2$ , we're looking for the one with the greatest  $y$ -intercept that intersects the given region. As we see in **Figure 7.32**, such a line will pass through one (or possibly more) of the vertices of the region.

 **Check Point 5** Find the maximum value of the objective function  $z = 3x + 5y$  subject to the constraints  $x \geq 0, y \geq 0, x + y \geq 1, x + y \leq 6$ .

**CONCEPT AND VOCABULARY CHECK**

Fill in each blank so that the resulting statement is true.

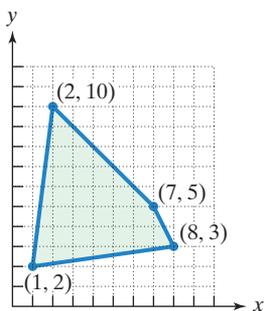

1. A method for finding the maximum or minimum value of a quantity that is subject to various limitations is called \_\_\_\_\_.
2. An algebraic expression in two or more variables describing a quantity that must be maximized or minimized is called a/an \_\_\_\_\_ function.
3. A system of linear inequalities is used to represent restrictions, or \_\_\_\_\_, on a function that must be maximized or minimized. Using the graph of such a system of inequalities, the maximum and minimum values of the function occur at one or more of the \_\_\_\_\_ points.

## EXERCISE SET 7.6

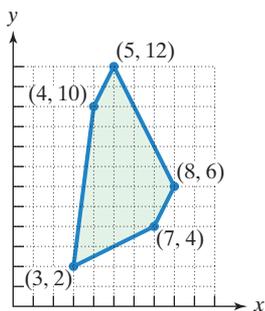

## Practice Exercises

In Exercises 1–4, find the value of the objective function at each corner of the graphed region. What is the maximum value of the objective function? What is the minimum value of the objective function?

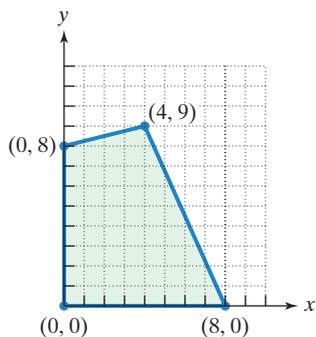

1. Objective Function  
 $z = 5x + 6y$

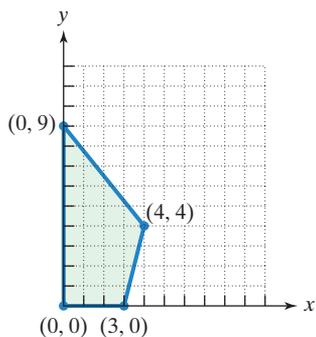

2. Objective Function  
 $z = 3x + 2y$

3. Objective Function  
 $z = 40x + 50y$

4. Objective Function  
 $z = 30x + 45y$

In Exercises 5–14, an objective function and a system of linear inequalities representing constraints are given.

- Graph the system of inequalities representing the constraints.
- Find the value of the objective function at each corner of the graphed region.
- Use the values in part (b) to determine the maximum value of the objective function and the values of  $x$  and  $y$  for which the maximum occurs.

5. Objective Function  
Constraints

$$\begin{cases} z = 3x + 2y \\ x \geq 0, y \geq 0 \\ 2x + y \leq 8 \\ x + y \geq 4 \end{cases}$$

6. Objective Function  
Constraints

$$\begin{cases} z = 2x + 3y \\ x \geq 0, y \geq 0 \\ 2x + y \leq 8 \\ 2x + 3y \leq 12 \end{cases}$$

7. Objective Function  
Constraints

$$\begin{cases} z = 4x + y \\ x \geq 0, y \geq 0 \\ 2x + 3y \leq 12 \\ x + y \geq 3 \end{cases}$$

8. Objective Function  
Constraints

$$\begin{cases} z = x + 6y \\ x \geq 0, y \geq 0 \\ 2x + y \leq 10 \\ x - 2y \geq -10 \end{cases}$$

9. Objective Function  
Constraints

$$\begin{cases} z = 3x - 2y \\ 1 \leq x \leq 5 \\ y \geq 2 \\ x - y \geq -3 \end{cases}$$

10. Objective Function  
Constraints

$$\begin{cases} z = 5x - 2y \\ 0 \leq x \leq 5 \\ 0 \leq y \leq 3 \\ x + y \geq 2 \end{cases}$$

11. Objective Function  
Constraints

$$\begin{cases} z = 4x + 2y \\ x \geq 0, y \geq 0 \\ 2x + 3y \leq 12 \\ 3x + 2y \leq 12 \\ x + y \geq 2 \end{cases}$$

12. Objective Function  
Constraints

$$\begin{cases} z = 2x + 4y \\ x \geq 0, y \geq 0 \\ x + 3y \geq 6 \\ x + y \geq 3 \\ x + y \leq 9 \end{cases}$$

13. Objective Function  
Constraints

$$\begin{cases} z = 10x + 12y \\ x \geq 0, y \geq 0 \\ x + y \leq 7 \\ 2x + y \leq 10 \\ 2x + 3y \leq 18 \end{cases}$$

14. Objective Function  
Constraints

$$\begin{cases} z = 5x + 6y \\ x \geq 0, y \geq 0 \\ 2x + y \geq 10 \\ x + 2y \geq 10 \\ x + y \leq 10 \end{cases}$$

## Application Exercises

15. A television manufacturer makes rear-projection and plasma televisions. The profit per unit is \$125 for the rear-projection televisions and \$200 for the plasma televisions.

a. Let  $x$  = the number of rear-projection televisions manufactured in a month and let  $y$  = the number of plasma televisions manufactured in a month. Write the objective function that models the total monthly profit.

b. The manufacturer is bound by the following constraints:

- Equipment in the factory allows for making at most 450 rear-projection televisions in one month.
- Equipment in the factory allows for making at most 200 plasma televisions in one month.
- The cost to the manufacturer per unit is \$600 for the rear-projection televisions and \$900 for the plasma televisions. Total monthly costs cannot exceed \$360,000.

Write a system of three inequalities that models these constraints.

- c. Graph the system of inequalities in part (b). Use only the first quadrant and its boundary, because  $x$  and  $y$  must both be nonnegative.
- d. Evaluate the objective function for total monthly profit at each of the five vertices of the graphed region. [The vertices should occur at  $(0, 0)$ ,  $(0, 200)$ ,  $(300, 200)$ ,  $(450, 100)$ , and  $(450, 0)$ .]
- e. Complete the missing portions of this statement: The television manufacturer will make the greatest profit by manufacturing \_\_\_\_\_ rear-projection televisions each month and \_\_\_\_\_ plasma televisions each month. The maximum monthly profit is \$ \_\_\_\_\_.
16. a. A student earns \$10 per hour for tutoring and \$7 per hour as a teacher's aide. Let  $x$  = the number of hours each week spent tutoring and let  $y$  = the number of hours each week spent as a teacher's aide. Write the objective function that models total weekly earnings.
- b. The student is bound by the following constraints:
- To have enough time for studies, the student can work no more than 20 hours per week.
  - The tutoring center requires that each tutor spend at least three hours per week tutoring.
  - The tutoring center requires that each tutor spend no more than eight hours per week tutoring.
- Write a system of three inequalities that models these constraints.
- c. Graph the system of inequalities in part (b). Use only the first quadrant and its boundary, because  $x$  and  $y$  are nonnegative.
- d. Evaluate the objective function for total weekly earnings at each of the four vertices of the graphed region. [The vertices should occur at  $(3, 0)$ ,  $(8, 0)$ ,  $(3, 17)$ , and  $(8, 12)$ .]
- e. Complete the missing portions of this statement: The student can earn the maximum amount per week by tutoring for \_\_\_\_\_ hours per week and working as a teacher's aide for \_\_\_\_\_ hours per week. The maximum amount that the student can earn each week is \$ \_\_\_\_\_.

Use the two steps for solving a linear programming problem, given in the box on page 837, to solve the problems in Exercises 17–23.

17. A manufacturer produces two models of mountain bicycles. The times (in hours) required for assembling and painting each model are given in the following table:

	Model A	Model B
Assembling	5	4
Painting	2	3

The maximum total weekly hours available in the assembly department and the paint department are 200 hours and 108 hours, respectively. The profits per unit are \$25 for model A and \$15 for model B. How many of each type should be produced to maximize profit?

18. A large institution is preparing lunch menus containing foods A and B. The specifications for the two foods are given in the following table:

Food	Units of Fat per Ounce	Units of Carbohydrates per Ounce	Units of Protein per Ounce
A	1	2	1
B	1	1	1

Each lunch must provide at least 6 units of fat per serving, no more than 7 units of protein, and at least 10 units of carbohydrates. The institution can purchase food A for \$0.12 per ounce and food B for \$0.08 per ounce. How many ounces of each food should a serving contain to meet the dietary requirements at the least cost?

19. Food and clothing are shipped to survivors of a natural disaster. Each carton of food will feed 12 people, while each carton of clothing will help 5 people. Each 20-cubic-foot box of food weighs 50 pounds and each 10-cubic-foot box of clothing weighs 20 pounds. The commercial carriers transporting food and clothing are bound by the following constraints:
- The total weight per carrier cannot exceed 19,000 pounds.
  - The total volume must be less than 8000 cubic feet.
- How many cartons of food and clothing should be sent with each plane shipment to maximize the number of people who can be helped?
20. On June 24, 1948, the former Soviet Union blocked all land and water routes through East Germany to Berlin. A gigantic airlift was organized using American and British planes to bring food, clothing, and other supplies to the more than 2 million people in West Berlin. The cargo capacity was 30,000 cubic feet for an American plane and 20,000 cubic feet for a British plane. To break the Soviet blockade, the Western Allies had to maximize cargo capacity but were subject to the following restrictions:
- No more than 44 planes could be used.
  - The larger American planes required 16 personnel per flight, double that of the requirement for the British planes. The total number of personnel available could not exceed 512.
  - The cost of an American flight was \$9000 and the cost of a British flight was \$5000. Total weekly costs could not exceed \$300,000.

Find the number of American and British planes that were used to maximize cargo capacity.

21. A theater is presenting a program for students and their parents on drinking and driving. The proceeds will be donated to a local alcohol information center. Admission is \$2.00 for parents and \$1.00 for students. However, the situation has two constraints: The theater can hold no more than 150 people and every two parents must bring at least one student. How many parents and students should attend to raise the maximum amount of money?

22. You are about to take a test that contains computation problems worth 6 points each and word problems worth 10 points each. You can do a computation problem in 2 minutes and a word problem in 4 minutes. You have 40 minutes to take the test and may answer no more than 12 problems. Assuming you answer all the problems attempted correctly, how many of each type of problem must you answer to maximize your score? What is the maximum score?
23. In 1978, a ruling by the Civil Aeronautics Board allowed Federal Express to purchase larger aircraft. Federal Express's options included 20 Boeing 727s that United Airlines was retiring and/or the French-built Dassault Fanjet Falcon 20. To aid in their decision, executives at Federal Express analyzed the following data:

	Boeing 727	Falcon 20
Direct Operating Cost	\$1400 per hour	\$500 per hour
Payload	42,000 pounds	6000 pounds

Federal Express was faced with the following constraints:

- Hourly operating cost was limited to \$35,000.
- Total payload had to be at least 672,000 pounds.
- Only twenty 727s were available.

Given the constraints, how many of each kind of aircraft should Federal Express have purchased to maximize the number of aircraft?

### Writing in Mathematics

24. What kinds of problems are solved using the linear programming method?
25. What is an objective function in a linear programming problem?
26. What is a constraint in a linear programming problem? How is a constraint represented?
27. In your own words, describe how to solve a linear programming problem.
28. Describe a situation in your life in which you would really like to maximize something, but you are limited by at least two constraints. Can linear programming be used in this situation? Explain your answer.

### Critical Thinking Exercises

**Make Sense?** In Exercises 29–32, determine whether each statement makes sense or does not make sense, and explain your reasoning.

29. In order to solve a linear programming problem, I use the graph representing the constraints and the graph of the objective function.
30. I use the coordinates of each vertex from my graph representing the constraints to find the values that maximize or minimize an objective function.
31. I need to be able to graph systems of linear inequalities in order to solve linear programming problems.
32. An important application of linear programming for businesses involves maximizing profit.

33. Suppose that you inherit \$10,000. The will states how you must invest the money. Some (or all) of the money must be invested in stocks and bonds. The requirements are that at least \$3000 be invested in bonds, with expected returns of \$0.08 per dollar, and at least \$2000 be invested in stocks, with expected returns of \$0.12 per dollar. Because the stocks are medium risk, the final stipulation requires that the investment in bonds should never be less than the investment in stocks. How should the money be invested so as to maximize your expected returns?
34. Consider the objective function  $z = Ax + By$  ( $A > 0$  and  $B > 0$ ) subject to the following constraints:  $2x + 3y \leq 9$ ,  $x - y \leq 2$ ,  $x \geq 0$ , and  $y \geq 0$ . Prove that the objective function will have the same maximum value at the vertices  $(3, 1)$  and  $(0, 3)$  if  $A = \frac{2}{3}B$ .

### Group Exercises

35. Group members should choose a particular field of interest. Research how linear programming is used to solve problems in that field. If possible, investigate the solution of a specific practical problem. Present a report on your findings, including the contributions of George Dantzig, Narendra Karmarkar, and L. G. Khachion to linear programming.
36. Members of the group should interview a business executive who is in charge of deciding the product mix for a business. How are production policy decisions made? Are other methods used in conjunction with linear programming? What are these methods? What sort of academic background, particularly in mathematics, does this executive have? Present a group report addressing these questions, emphasizing the role of linear programming for the business.

### Preview Exercises

Exercises 37–39 will help you prepare for the material covered in the first section of the next chapter.

37. Solve the system:

$$\begin{cases} x + y + 2z = 19 \\ y + 2z = 13 \\ z = 5. \end{cases}$$

What makes it fairly easy to find the solution?

38. Solve the system:

$$\begin{cases} w - x + 2y - 2z = -1 \\ x - \frac{1}{3}y + z = \frac{8}{3} \\ y - z = 1 \\ z = 3. \end{cases}$$

Express the solution set in the form  $\{(w, x, y, z)\}$ . What makes it fairly easy to find the solution?

39. Consider the following array of numbers:

$$\begin{bmatrix} 1 & 2 & -1 \\ 4 & -3 & -15 \end{bmatrix}.$$

Rewrite the array as follows: Multiply each number in the top row by  $-4$  and add this product to the corresponding number in the bottom row. Do not change the numbers in the top row.

## CHAPTER 7

## Summary, Review, and Test

## SUMMARY

## DEFINITIONS AND CONCEPTS

## EXAMPLES

## 7.1 Systems of Linear Equations in Two Variables

- a. Two equations in the form  $Ax + By = C$  are called a system of linear equations. A solution of the system is an ordered pair that satisfies both equations in the system. Ex. 1, p. 772
- b. Systems of linear equations in two variables can be solved by eliminating a variable, using the substitution method (see the box on page 774) or the addition method (see the box on page 776). Ex. 2, p. 774;  
Ex. 3, p. 776;  
Ex. 4, p. 777
- c. Some linear systems have no solution and are called inconsistent systems; others have infinitely many solutions. The equations in a linear system with infinitely many solutions are called dependent. For details, see the box on page 778. Ex. 5, p. 778;  
Ex. 6, p. 779
- d. Functions of Business Ex. 9, p. 783;  
Figure 7.8, p. 785
- Revenue Function**

$$R(x) = (\text{price per unit sold})x$$

**Cost Function**

$$C(x) = \text{fixed cost} + (\text{cost per unit produced})x$$

**Profit Function**

$$P(x) = R(x) - C(x)$$

The point of intersection of the graphs of  $R$  and  $C$  is the break-even point. The  $x$ -coordinate of the point reveals the number of units that a company must produce and sell so that the money coming in, the revenue, is equal to the money going out, the cost. The  $y$ -coordinate gives the amount of money coming in and going out.

## 7.2 Systems of Linear Equations in Three Variables

- a. Three equations in the form  $Ax + By + Cz = D$  are called a system of linear equations in three variables. A solution of the system is an ordered triple that satisfies all three equations in the system. Ex. 1, p. 792
- b. A system of linear equations in three variables can be solved by eliminating variables. Use the addition method to eliminate any variable, reducing the system to two equations in two variables. Use substitution or the addition method to solve the resulting system in two variables. Details are found in the box on page 793. Ex. 2, p. 793;  
Ex. 3, p. 795
- c. Three points that do not lie on a line determine the graph of a quadratic function  $y = ax^2 + bx + c$ . Use the three given points to create a system of three equations. Solve the system to find  $a$ ,  $b$ , and  $c$ . Ex. 4, p. 796

## 7.3 Partial Fractions

- a. Partial fraction decomposition is used on rational expressions in which the numerator and denominator have no common factors and the highest power in the numerator is less than the highest power in the denominator. The steps in partial fraction decomposition are given in the box on page 803.
- b. Include one partial fraction with a constant numerator for each distinct linear factor in the denominator. Include one partial fraction with a constant numerator for each power of a repeated linear factor in the denominator. Ex. 1, p. 802;  
Ex. 2, p. 804
- c. Include one partial fraction with a linear numerator for each distinct prime quadratic factor in the denominator. Include one partial fraction with a linear numerator for each power of a prime, repeated quadratic factor in the denominator. Ex. 3, p. 806;  
Ex. 4, p. 808

## 7.4 Systems of Nonlinear Equations in Two Variables

- a. A system of two nonlinear equations in two variables contains at least one equation that cannot be expressed as  $Ax + By = C$ .
- b. Systems of nonlinear equations in two variables can be solved algebraically by eliminating all occurrences of one of the variables by the substitution or addition methods. Ex. 1, p. 812;  
Ex. 2, p. 813;  
Ex. 3, p. 814;  
Ex. 4, p. 816

## DEFINITIONS AND CONCEPTS

## EXAMPLES

## 7.5 Systems of Inequalities

- a. A linear inequality in two variables can be written in the form  $Ax + By > C$ ,  $Ax + By \geq C$ ,  $Ax + By < C$ , or  $Ax + By \leq C$ .
- b. The procedure for graphing a linear inequality in two variables is given in the box on page 823. A nonlinear inequality in two variables is graphed using the same procedure.
- c. To graph the solution set of a system of inequalities, graph each inequality in the system in the same rectangular coordinate system. Then find the region, if there is one, that is common to every graph in the system.

Ex. 1, p. 823;  
Ex. 2, p. 824;  
Ex. 3, p. 826;  
Ex. 4, p. 826  
Ex. 6, p. 828;  
Ex. 7, p. 829;  
Ex. 8, p. 830

## 7.6 Linear Programming

- a. An objective function is an algebraic expression in three variables describing a quantity that must be maximized or minimized.
- b. Constraints are restrictions, expressed as linear inequalities.
- c. Linear programming is a method for solving problems in which an objective function that must be maximized or minimized is limited by constraints. Steps for solving a linear programming problem are given in the box on page 837.

Ex. 1, p. 835  
Ex. 2, p. 836;  
Ex. 3, p. 837  
Ex. 4, p. 838;  
Ex. 5, p. 839

## REVIEW EXERCISES

## 7.1

In Exercises 1–5, solve by the method of your choice. Identify systems with no solution and systems with infinitely many solutions, using set notation to express their solution sets.

$$1. \begin{cases} y = 4x + 1 \\ 3x + 2y = 13 \end{cases} \quad 2. \begin{cases} x + 4y = 14 \\ 2x - y = 1 \end{cases}$$

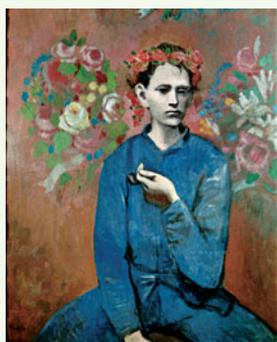

$$3. \begin{cases} 5x + 3y = 1 \\ 3x + 4y = -6 \end{cases} \quad 4. \begin{cases} 2y - 6x = 7 \\ 3x - y = 9 \end{cases}$$

$$5. \begin{cases} 4x - 8y = 16 \\ 3x - 6y = 12 \end{cases}$$

6. A company is planning to manufacture computer desks. The fixed cost will be \$60,000 and it will cost \$200 to produce each desk. Each desk will be sold for \$450.
- a. Write the cost function,  $C$ , of producing  $x$  desks.
- b. Write the revenue function,  $R$ , from the sale of  $x$  desks.
- c. Determine the break-even point. Describe what this means.

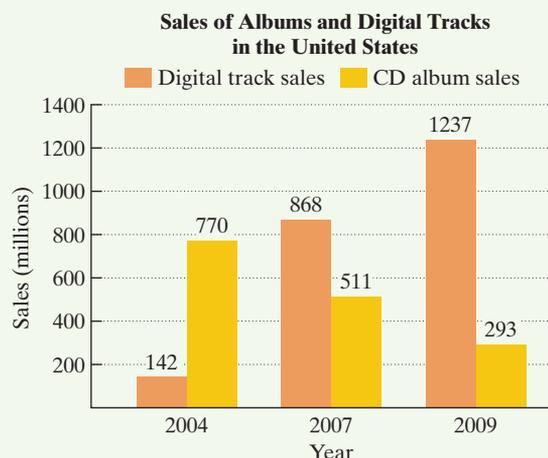

Adele Bloch-Bauer, I (1907),  
Gustav Klimt/Neue Galerie/Art  
Resource, NY

Boy with a Pipe (1905), Pablo  
Picasso. © 2011 Picasso  
Estate/ARS

Talk about paintings by numbers: In 2007, this glittering Klimt set the record for the most ever paid for a painting, a title that had been held by Picasso's *Boy with a Pipe*. Combined, the two paintings sold for \$239 million. The difference between the selling price for Klimt's work and the selling price for Picasso's work was \$31 million. Find the amount paid for each painting.

8. The music business is evolving into a digital marketplace. The bar graph shows that from 2004 through 2009, CD album sales declined, while digital track sales grew.

Source: RIAA

- a. In 2004, 142 million digital tracks were sold. For the period shown by the graph, this has increased at an average rate of 219 million digital tracks per year. Write a function that models the sale of digital tracks,  $y$ , in millions,  $x$  years after 2004.
- b. The function  $95x + y = 770$  models the number of albums sold,  $y$ , in millions,  $x$  years after 2004. Use this model and the model you obtained in part (a) to determine when digital track sales caught up with album sales. How many digital tracks and how many albums were sold in that year?

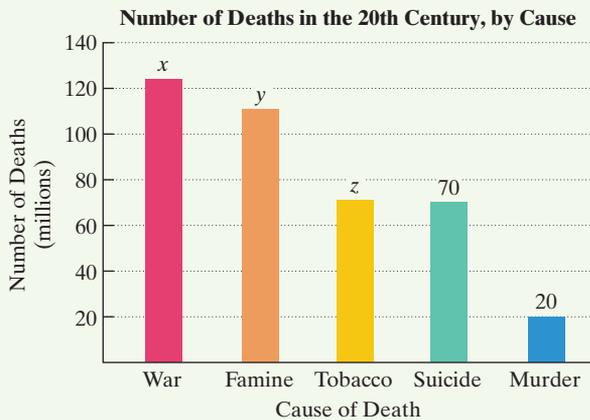

9. A travel agent offers two package vacation plans. The first plan costs \$360 and includes 3 days at a hotel and a rental car for 2 days. The second plan costs \$500 and includes 4 days at a hotel and a rental car for 3 days. The daily charge for the hotel is the same under each plan, as is the daily charge for the car. Find the cost per day for the hotel and for the car.
10. A chemist needs to mix a solution that is 34% silver nitrate with one that is 4% silver nitrate to obtain 100 milliliters of a mixture that is 7% silver nitrate. How many milliliters of each of the solutions must be used?
11. When a plane flies with the wind, it can travel 2160 miles in 3 hours. When the plane flies in the opposite direction, against the wind, it takes 4 hours to fly the same distance. Find the average velocity of the plane in still air and the average velocity of the wind.

### 7.2

Solve each system in Exercises 12–13.

$$12. \begin{cases} 2x - y + z = 1 \\ 3x - 3y + 4z = 5 \\ 4x - 2y + 3z = 4 \end{cases} \quad 13. \begin{cases} x + 2y - z = 5 \\ 2x - y + 3z = 0 \\ 2y + z = 1 \end{cases}$$

14. Find the quadratic function  $y = ax^2 + bx + c$  whose graph passes through the points (1, 4), (3, 20), and (–2, 25).
15. **20th Century Death** The greatest cause of death in the 20th century was disease, killing 1390 million people. The bar graph shows the five leading causes of death in that century, excluding disease.

Source: Wikipedia

War, famine, and tobacco combined resulted in 306 million deaths. The difference between the number of deaths from war and famine was 13 million. The difference between the number of deaths from war and tobacco was 53 million. Find the number of 20th century deaths from war, famine, and tobacco.

### 7.3

In Exercises 16–24, write the partial fraction decomposition of each rational expression.

$$16. \frac{x}{(x-3)(x+2)} \quad 17. \frac{11x-2}{x^2-x-12}$$

$$18. \frac{4x^2 - 3x - 4}{x(x+2)(x-1)} \quad 19. \frac{2x+1}{(x-2)^2}$$

$$20. \frac{2x-6}{(x-1)(x-2)^2} \quad 21. \frac{3x}{(x-2)(x^2+1)}$$

$$22. \frac{7x^2 - 7x + 23}{(x-3)(x^2+4)} \quad 23. \frac{x^3}{(x^2+4)^2}$$

$$24. \frac{4x^3 + 5x^2 + 7x - 1}{(x^2+x+1)^2}$$

### 7.4

In Exercises 25–35, solve each system by the method of your choice.

$$25. \begin{cases} 5y = x^2 - 1 \\ x - y = 1 \end{cases} \quad 26. \begin{cases} y = x^2 + 2x + 1 \\ x + y = 1 \end{cases}$$

$$27. \begin{cases} x^2 + y^2 = 2 \\ x + y = 0 \end{cases} \quad 28. \begin{cases} 2x^2 + y^2 = 24 \\ x^2 + y^2 = 15 \end{cases}$$

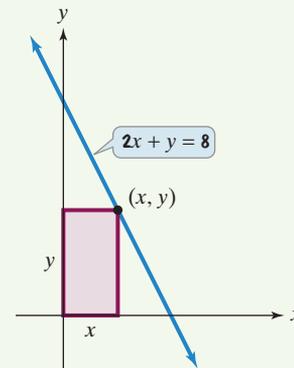

$$29. \begin{cases} xy - 4 = 0 \\ y - x = 0 \end{cases} \quad 30. \begin{cases} y^2 = 4x \\ x - 2y + 3 = 0 \end{cases}$$

$$31. \begin{cases} x^2 + y^2 = 10 \\ y = x + 2 \end{cases} \quad 32. \begin{cases} xy = 1 \\ y = 2x + 1 \end{cases}$$

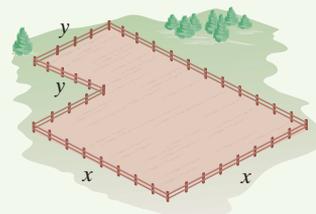

$$33. \begin{cases} x + y + 1 = 0 \\ x^2 + y^2 + 6y - x = -5 \end{cases} \quad 34. \begin{cases} x^2 + y^2 = 13 \\ x^2 - y = 7 \end{cases}$$

$$35. \begin{cases} 2x^2 + 3y^2 = 21 \\ 3x^2 - 4y^2 = 23 \end{cases}$$

36. The perimeter of a rectangle is 26 meters and its area is 40 square meters. Find its dimensions.
37. Find the coordinates of all points  $(x, y)$  that lie on the line whose equation is  $2x + y = 8$ , so that the area of the rectangle shown in the figure is 6 square units.

38. Two adjoining square fields with an area of 2900 square feet are to be enclosed with 240 feet of fencing. The situation is represented in the figure. Find the length of each side where a variable appears.

## 7.5

In Exercises 39–45, graph each inequality.

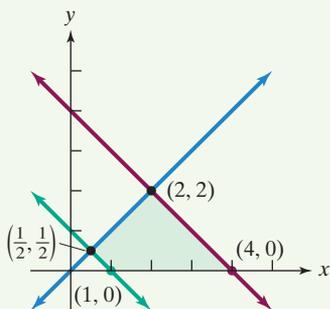

39.  $3x - 4y > 12$       40.  $y \leq -\frac{1}{2}x + 2$   
 41.  $x < -2$       42.  $y \geq 3$   
 43.  $x^2 + y^2 > 4$       44.  $y \leq x^2 - 1$   
 45.  $y \leq 2^x$

In Exercises 46–55, graph the solution set of each system of inequalities or indicate that the system has no solution.

46.  $\begin{cases} 3x + 2y \geq 6 \\ 2x + y \geq 6 \end{cases}$       47.  $\begin{cases} 2x - y \geq 4 \\ x + 2y < 2 \end{cases}$   
 48.  $\begin{cases} y < x \\ y \leq 2 \end{cases}$       49.  $\begin{cases} x + y \leq 6 \\ y \geq 2x - 3 \end{cases}$   
 50.  $\begin{cases} 0 \leq x \leq 3 \\ y > 2 \end{cases}$       51.  $\begin{cases} 2x + y < 4 \\ 2x + y > 6 \end{cases}$   
 52.  $\begin{cases} x^2 + y^2 \leq 16 \\ x + y < 2 \end{cases}$       53.  $\begin{cases} x^2 + y^2 \leq 9 \\ y < -3x + 1 \end{cases}$   
 54.  $\begin{cases} y > x^2 \\ x + y < 6 \\ y < x + 6 \end{cases}$       55.  $\begin{cases} y \geq 0 \\ 3x + 2y \geq 4 \\ x - y \leq 3 \end{cases}$

## 7.6

56. Find the value of the objective function  $z = 2x + 3y$  at each corner of the graphed region shown. What is the maximum value of the objective function? What is the minimum value of the objective function?

In Exercises 57–59, graph the region determined by the constraints. Then find the maximum value of the given objective function, subject to the constraints.

57. Objective Function  $z = 2x + 3y$   
 Constraints  $\begin{cases} x \geq 0, y \geq 0 \\ x + y \leq 8 \\ 3x + 2y \geq 6 \end{cases}$

58. Objective Function  $z = x + 4y$   
 Constraints  $\begin{cases} 0 \leq x \leq 5, 0 \leq y \leq 7 \\ x + y \geq 3 \end{cases}$

59. Objective Function  $z = 5x + 6y$   
 Constraints  $\begin{cases} x \geq 0, y \geq 0 \\ y \leq x \\ 2x + y \leq 12 \\ 2x + 3y \geq 6 \end{cases}$

60. A paper manufacturing company converts wood pulp to writing paper and newsprint. The profit on a unit of writing paper is \$500 and the profit on a unit of newsprint is \$350.

a. Let  $x$  represent the number of units of writing paper produced daily. Let  $y$  represent the number of units of newsprint produced daily. Write the objective function that models total daily profit.

b. The manufacturer is bound by the following constraints:

- Equipment in the factory allows for making at most 200 units of paper (writing paper and newsprint) in a day.
- Regular customers require at least 10 units of writing paper and at least 80 units of newsprint daily.

Write a system of inequalities that models these constraints.

c. Graph the inequalities in part (b). Use only the first quadrant, because  $x$  and  $y$  must both be positive. (*Suggestion:* Let each unit along the  $x$ - and  $y$ -axes represent 20.)

d. Evaluate the objective function at each of the three vertices of the graphed region.

e. Complete the missing portions of this statement: The company will make the greatest profit by producing \_\_\_\_\_ units of writing paper and \_\_\_\_\_ units of newsprint each day. The maximum daily profit is \$\_\_\_\_\_.

61. A manufacturer of lightweight tents makes two models whose specifications are given in the following table:

	Cutting Time per Tent	Assembly Time per Tent
<b>Model A</b>	0.9 hour	0.8 hour
<b>Model B</b>	1.8 hours	1.2 hours

On a monthly basis, the manufacturer has no more than 864 hours of labor available in the cutting department and at most 672 hours in the assembly division. The profits come to \$25 per tent for model A and \$40 per tent for model B. How many of each should be manufactured monthly to maximize the profit?

## CHAPTER 7 TEST

In Exercises 1–5, solve the system.

1.  $\begin{cases} x = y + 4 \\ 3x + 7y = -18 \end{cases}$       2.  $\begin{cases} 2x + 5y = -2 \\ 3x - 4y = 20 \end{cases}$   
 3.  $\begin{cases} x + y + z = 6 \\ 3x + 4y - 7z = 1 \\ 2x - y + 3z = 5 \end{cases}$       4.  $\begin{cases} x^2 + y^2 = 25 \\ x + y = 1 \end{cases}$

5.  $\begin{cases} 2x^2 - 5y^2 = -2 \\ 3x^2 + 2y^2 = 35 \end{cases}$

6. Find the partial fraction decomposition for  $\frac{x}{(x+1)(x^2+9)}$ .

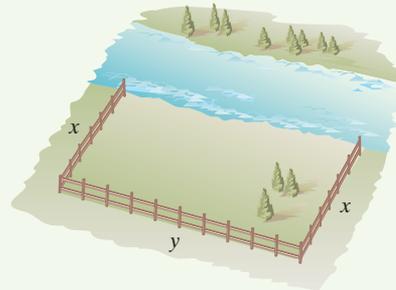

In Exercises 7–10, graph the solution set of each inequality or system of inequalities.

7.  $x - 2y < 8$                       8.  $\begin{cases} x \geq 0, y \geq 0 \\ 3x + y \leq 9 \\ 2x + 3y \geq 6 \end{cases}$

9.  $\begin{cases} x^2 + y^2 > 1 \\ x^2 + y^2 < 4 \end{cases}$                       10.  $\begin{cases} y \leq 1 - x^2 \\ x^2 + y^2 \leq 9 \end{cases}$

11. Find the maximum value of the objective function  $z = 3x + 5y$  subject to the following constraints:  $x \geq 0, y \geq 0, x + y \leq 6, x \geq 2$ .
12. Health experts agree that cholesterol intake should be limited to 300 mg or less each day. Three ounces of shrimp and 2 ounces of scallops contain 156 mg of cholesterol. Five ounces of shrimp and 3 ounces of scallops contain 45 mg of cholesterol less than the suggested maximum daily intake. Determine the cholesterol content in an ounce of each item.
13. A company is planning to produce and sell a new line of computers. The fixed cost will be \$360,000 and it will cost \$850 to produce each computer. Each computer will be sold for \$1150.
- Write the cost function,  $C$ , of producing  $x$  computers.
  - Write the revenue function,  $R$ , from the sale of  $x$  computers.
  - Determine the break-even point. Describe what this means.
14. A chemist needs to mix a 20% acid solution with a 50% acid solution to obtain 60 ounces of a 30% acid solution. How many ounces of each of the solutions must be used?

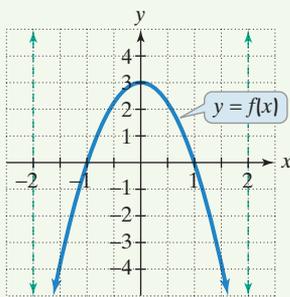

15. When a plane flies with the wind, it can travel 1600 kilometers in 2 hours. When the plane flies in the opposite direction, against the wind, it takes 3 hours to travel 1950 kilometers. Find the average velocity of the plane in still air and the average velocity of the wind.
16. Find the quadratic function whose graph passes through the points  $(-1, -2)$ ,  $(2, 1)$ , and  $(-2, 1)$ .
17. The rectangular plot of land shown in the figure is to be fenced along three sides using 39 feet of fencing. No fencing is to be placed along the river's edge. The area of the plot is 180 square feet. What are its dimensions?

18. A manufacturer makes two types of jet skis, regular and deluxe. The profit on a regular jet ski is \$200 and the profit on the deluxe model is \$250. To meet customer demand, the company must manufacture at least 50 regular jet skis per week and at least 75 deluxe models. To maintain high quality, the total number of both models of jet skis manufactured by the company should not exceed 150 per week. How many jet skis of each type should be manufactured per week to obtain maximum profit? What is the maximum weekly profit?

## CUMULATIVE REVIEW EXERCISES (CHAPTERS P–7)

The figure shows the graph of  $y = f(x)$  and its two vertical asymptotes. Use the graph to solve Exercises 1–10.

- Find the domain and the range of  $f$ .
- Find the zeros.
- What is the relative maximum and where does it occur?
- Find the interval(s) on which  $f$  is decreasing.
- Is  $f(-0.7)$  positive or negative?
- Find  $(f \circ f)(-1)$ .
- Use arrow notation to complete this statement:  
 $f(x) \rightarrow -\infty$  as \_\_\_\_\_ or as \_\_\_\_\_.
- Does  $f$  appear to be even, odd, or neither?
- Graph  $g(x) = f(x + 2) - 1$ .
- Graph  $h(x) = \frac{1}{2}f(\frac{1}{2}x)$ .

In Exercises 11–21, solve each equation, inequality, or system of equations.

11.  $\sqrt{x^2 - 3x} = 2x - 6$                       12.  $4x^2 = 8x - 7$
13.  $\left| \frac{x}{3} + 2 \right| < 4$                       14.  $\frac{x + 5}{x - 1} > 2$
15.  $2x^3 + x^2 - 13x + 6 = 0$                       16.  $6x - 3(5x + 2) = 4(1 - x)$
17.  $\log(x + 3) + \log x = 1$                       18.  $3^{x+2} = 11$
19.  $x^{\frac{1}{2}} - 2x^{\frac{1}{4}} - 15 = 0$                       20.  $\begin{cases} 3x - y = -2 \\ 2x^2 - y = 0 \end{cases}$
21.  $\begin{cases} x + 2y + 3z = -2 \\ 3x + 3y + 10z = -2 \\ 2y - 5z = 6 \end{cases}$

In Exercises 22–28, graph each equation, function, or inequality in a rectangular coordinate system. If two functions are indicated, graph both in the same system.

22.  $f(x) = (x + 2)^2 - 4$                       23.  $2x - 3y \leq 6$
24.  $y = 3^{x-2}$                       25.  $f(x) = \frac{x^2 - x - 6}{x + 1}$
26.  $f(x) = 2x - 4$  and  $f^{-1}$                       27.  $(x - 2)^2 + (y - 4)^2 > 9$
28.  $f(x) = |x|$  and  $g(x) = -|x - 2|$

**848 Chapter 7** Systems of Equations and Inequalities

In Exercises 29–30, let  $f(x) = 2x^2 - x - 1$  and  $g(x) = 1 - x$ .

29. Find  $(f \circ g)(x)$  and  $(g \circ f)(x)$ .

30. Find  $\frac{f(x+h) - f(x)}{h}$  and simplify.

In Exercises 31–32, write the linear function in slope-intercept form satisfying the given conditions.

31. Graph of  $f$  passes through  $(2, 4)$  and  $(4, -2)$ .

32. Graph of  $g$  passes through  $(-1, 0)$  and is perpendicular to the line whose equation is  $x + 3y - 6 = 0$ .

33. You invested \$4000 in two stocks paying 12% and 14% annual interest. At the end of the year, the total interest from these investments was \$508. How much was invested at each rate?

34. The length of a rectangle is 1 meter more than twice the width. If the rectangle's area is 36 square meters, find its dimensions.

35. What interest rate is required for an investment of \$6000 subject to continuous compounding to grow to \$18,000 in 10 years?

In Exercises 36–37, verify each identity.

36.  $\sec \theta - \cos \theta = \tan \theta \sin \theta$

37.  $\tan x + \tan y = \frac{\sin(x+y)}{\cos x \cos y}$

In Exercises 38–39, solve each equation.

38.  $\sin \theta = \tan \theta$ ,  $0 \leq \theta < 2\pi$

39.  $2 + \cos 2\theta = 3 \cos \theta$ ,  $0 \leq \theta < 2\pi$

40. In oblique triangle  $ABC$ ,  $A = 12^\circ$ ,  $B = 75^\circ$ , and  $a = 20$ . Find  $b$  to the nearest tenth.

# MATRICES AND DETERMINANTS

## CHAPTER

# 8

*You are being drawn deeper into cyberspace,* spending more time online each week. With constantly improving high-resolution images, cyberspace is reshaping your life by nourishing shared enthusiasms. The people who built your computer talk of bandwidth that will give you the visual experience, in high-definition 3-D format, of being in the same room with a person who is actually in another city. Rectangular arrays of numbers, called matrices, play a central role in representing computer images and in the forthcoming technology of tele-immersion.

### HERE'S WHERE YOU'LL FIND THESE APPLICATIONS:

The use of rectangular arrays of numbers in the digital representation of images and the manipulation of images on a computer screen is discussed in Examples 8 and 9 in Section 8.3.

## SECTION 8.1

## Matrix Solutions to Linear Systems

## Objectives

- 1 Write the augmented matrix for a linear system.
- 2 Perform matrix row operations.
- 3 Use matrices and Gaussian elimination to solve systems.
- 4 Use matrices and Gauss-Jordan elimination to solve systems.

In Chapter 5, we used systems of inequalities to establish healthy weight ranges for men and women of various ages and heights. Now it's time to step on the scale. The data below show the average weight of American adults, by age.

Average Weight by Age

	Ages 20–29	Ages 30–39	Ages 40–49	Ages 50–59	Ages 60–69	Ages 70–79	Ages 80+
Men	188	194	202	199	198	187	168
Women	156	165	171	172	171	156	142

Source: National Center for Health Statistics

The 14 numbers inside the brackets are arranged in two rows and seven columns. This rectangular array of 14 numbers, arranged in rows and columns and placed in brackets, is an example of a **matrix** (plural: **matrices**). The numbers inside the brackets are called **elements** of the matrix. Matrices are used to display information and to solve systems of linear equations. Because systems involving two equations in two variables can easily be solved by substitution or addition, we will focus on matrix solutions to systems of linear equations in three or more variables.

- 1 Write the augmented matrix for a linear system.

## Augmented Matrices

A matrix gives us a shortened way of writing a system of equations. The first step in solving a system of linear equations using matrices is to write the *augmented matrix*. An **augmented matrix** has a vertical bar separating the columns of the matrix into two groups. The coefficients of each variable are placed to the left of the vertical line and the constants are placed to the right. If any variable is missing, its coefficient is 0. Here are two examples:

## GREAT QUESTION!

**Do linear systems have to be expressed in a special form when writing augmented matrices?**

Yes. Variable terms must be on one side of each equation and constants must be on the other side. Furthermore, the variables must be in the same order in each equation.

## System of Linear Equations

$$\begin{cases} 3x + y + 2z = 31 \\ x + y + 2z = 19 \\ x + 3y + 2z = 25 \end{cases}$$

$$\begin{cases} x + 2y - 5z = -19 \\ y + 3z = 9 \\ z = 4 \end{cases}$$

## Augmented Matrix

$$\left[ \begin{array}{ccc|c} 3 & 1 & 2 & 31 \\ 1 & 1 & 2 & 19 \\ 1 & 3 & 2 & 25 \end{array} \right]$$

$$\left[ \begin{array}{ccc|c} 1 & 2 & -5 & -19 \\ 0 & 1 & 3 & 9 \\ 0 & 0 & 1 & 4 \end{array} \right]$$

Our goal in solving a system of linear equations in three variables using matrices is to produce a matrix with 1s down the diagonal from upper left to lower right on the left side of the vertical bar, called the **main diagonal**, and 0s below the 1s. In general, the matrix will be of the form

$$\left[ \begin{array}{ccc|c} 1 & a & b & c \\ 0 & 1 & d & e \\ 0 & 0 & 1 & f \end{array} \right],$$

where  $a$  through  $f$  represent real numbers. The third row of this matrix gives us the value of one variable. The other variables can then be found by back-substitution.

## 2 Perform matrix row operations.

## Matrix Row Operations

A matrix with 1s down the main diagonal and 0s below the 1s is said to be in **row-echelon form**. How do we produce a matrix in this form? We use **row operations** on the augmented matrix. These row operations are just like what you did when solving a linear system by the addition method. The difference is that we no longer write the variables, usually represented by  $x$ ,  $y$ , and  $z$ .

## Matrix Row Operations

The following row operations produce matrices that represent systems with the same solution set:

1. Two rows of a matrix may be interchanged. This is the same as interchanging two equations in a linear system.
2. The elements in any row may be multiplied by a nonzero number. This is the same as multiplying both sides of an equation by a nonzero number.
3. The elements in any row may be multiplied by a nonzero number, and these products may be added to the corresponding elements in any other row. This is the same as multiplying both sides of an equation by a nonzero number and then adding equations to eliminate a variable.

Two matrices are **row equivalent** if one can be obtained from the other by a sequence of row operations.

Each matrix row operation in the preceding box can be expressed symbolically as follows:

1. Interchange the elements in the  $i$ th and  $j$ th rows:  $R_i \leftrightarrow R_j$ .
2. Multiply each element in the  $i$ th row by  $k$ :  $kR_i$ .
3. Add  $k$  times the elements in row  $i$  to the corresponding elements in row  $j$ :  $kR_i + R_j$ .

## GREAT QUESTION!

Can you clarify what I'm supposed to do to find  $kR_i + R_j$ ? Which row do I work with and which row do I replace?

When performing the row operation

$$kR_i + R_j,$$

you use row  $i$  to find the products. However, **elements in row  $i$  do not change. It is the elements in row  $j$  that change:** Add  $k$  times the elements in row  $i$  to the corresponding elements in row  $j$ . Replace elements in row  $j$  by these sums.

## EXAMPLE 1 Performing Matrix Row Operations

Use the matrix

$$\left[ \begin{array}{ccc|c} 3 & 18 & -12 & 21 \\ 1 & 2 & -3 & 5 \\ -2 & -3 & 4 & -6 \end{array} \right]$$

and perform each indicated row operation:

- a.  $R_1 \leftrightarrow R_2$       b.  $\frac{1}{3}R_1$       c.  $2R_2 + R_3$ .

## SOLUTION

- a. The notation  $R_1 \leftrightarrow R_2$  means to interchange the elements in row 1 and row 2. This results in the row-equivalent matrix

$$\left[ \begin{array}{ccc|c} 1 & 2 & -3 & 5 \\ 3 & 18 & -12 & 21 \\ -2 & -3 & 4 & -6 \end{array} \right].$$

This was row 2; now it's row 1.

This was row 1; now it's row 2.

- b. The notation  $\frac{1}{3}R_1$  means to multiply each element in row 1 by  $\frac{1}{3}$ . This results in the row-equivalent matrix

$$\left[ \begin{array}{ccc|c} \frac{1}{3}(3) & \frac{1}{3}(18) & \frac{1}{3}(-12) & \frac{1}{3}(21) \\ 1 & 2 & -3 & 5 \\ -2 & -3 & 4 & -6 \end{array} \right] = \left[ \begin{array}{ccc|c} 1 & 6 & -4 & 7 \\ 1 & 2 & -3 & 5 \\ -2 & -3 & 4 & -6 \end{array} \right].$$

$$\left[ \begin{array}{ccc|c} 3 & 18 & -12 & 21 \\ 1 & 2 & -3 & 5 \\ -2 & -3 & 4 & -6 \end{array} \right]$$

The given matrix (repeated)

- c. The notation  $2R_2 + R_3$  means to add 2 times the elements in row 2 to the corresponding elements in row 3. Replace the elements in row 3 by these sums. First, we find 2 times the elements in row 2, namely, 1, 2, -3, and 5:

$$2(1) \text{ or } 2, \quad 2(2) \text{ or } 4, \quad 2(-3) \text{ or } -6, \quad 2(5) \text{ or } 10.$$

Now we add these products to the corresponding elements in row 3. Although we use row 2 to find the products, row 2 does not change. It is the elements in row 3 that change, resulting in the row-equivalent matrix

Replace row 3 by the sum of itself and 2 times row 2.

$$\left[ \begin{array}{ccc|c} 3 & 18 & -12 & 21 \\ 1 & 2 & -3 & 5 \\ -2 + 2 = 0 & -3 + 4 = 1 & 4 + (-6) = -2 & -6 + 10 = 4 \end{array} \right] = \left[ \begin{array}{ccc|c} 3 & 18 & -12 & 21 \\ 1 & 2 & -3 & 5 \\ 0 & 1 & -2 & 4 \end{array} \right].$$

 **Check Point 1** Use the matrix

$$\left[ \begin{array}{ccc|c} 4 & 12 & -20 & 8 \\ 1 & 6 & -3 & 7 \\ -3 & -2 & 1 & -9 \end{array} \right]$$

and perform each indicated row operation:

- a.  $R_1 \leftrightarrow R_2$       b.  $\frac{1}{4}R_1$       c.  $3R_2 + R_3$ .

- 3** Use matrices and Gaussian elimination to solve systems.

### Solving Linear Systems Using Gaussian Elimination

The process that we use to solve linear systems using matrix row operations is called **Gaussian elimination**, after the German mathematician Carl Friedrich Gauss (1777–1855). Here are the steps used in Gaussian elimination:

#### Solving Linear Systems of Three Equations with Three Variables Using Gaussian Elimination

- Write the augmented matrix for the system.
- Use matrix row operations to simplify the matrix to a row-equivalent matrix in row-echelon form, with 1s down the main diagonal from upper left to lower right, and 0s below the 1s in the first and second columns.

$$\left[ \begin{array}{ccc|c} 1 & * & * & * \\ * & * & * & * \\ * & * & * & * \end{array} \right] \rightarrow \left[ \begin{array}{ccc|c} 1 & * & * & * \\ 0 & * & * & * \\ 0 & * & * & * \end{array} \right] \rightarrow \left[ \begin{array}{ccc|c} 1 & * & * & * \\ 0 & 1 & * & * \\ 0 & * & * & * \end{array} \right] \rightarrow \left[ \begin{array}{ccc|c} 1 & * & * & * \\ 0 & 1 & * & * \\ 0 & 0 & * & * \end{array} \right] \rightarrow \left[ \begin{array}{ccc|c} 1 & * & * & * \\ 0 & 1 & * & * \\ 0 & 0 & 1 & * \end{array} \right]$$

Get 1 in the upper left-hand corner.

Use the 1 in the first column to get 0s below it.

Get 1 in the second row, second column position.

Use the 1 in the second column to get 0 below it.

Get 1 in the third row, third column position.

- Write the system of linear equations corresponding to the matrix in step 2 and use back-substitution to find the system's solution.

#### EXAMPLE 2 Gaussian Elimination with Back-Substitution

Use matrices to solve the system:

$$\begin{cases} 3x + y + 2z = 31 \\ x + y + 2z = 19 \\ x + 3y + 2z = 25. \end{cases}$$

## SOLUTION

**Step 1** Write the augmented matrix for the system.

Linear System	Augmented Matrix
$\begin{cases} 3x + y + 2z = 31 \\ x + y + 2z = 19 \\ x + 3y + 2z = 25 \end{cases}$	$\left[ \begin{array}{ccc c} 3 & 1 & 2 & 31 \\ 1 & 1 & 2 & 19 \\ 1 & 3 & 2 & 25 \end{array} \right]$

**Step 2** Use matrix row operations to simplify the matrix to row-echelon form, with 1s down the main diagonal from upper left to lower right, and 0s below the 1s in the first and second columns. Our first step in achieving this goal is to get 1 in the top position of the first column.

We want 1 in this position.

$$\left[ \begin{array}{ccc|c} 3 & 1 & 2 & 31 \\ 1 & 1 & 2 & 19 \\ 1 & 3 & 2 & 25 \end{array} \right]$$

To get 1 in this position, we interchange row 1 and row 2:  $R_1 \leftrightarrow R_2$ . (We could also interchange row 1 and row 3 to attain our goal.)

$\left[ \begin{array}{ccc c} 1 & 1 & 2 & 19 \\ 3 & 1 & 2 & 31 \\ 1 & 3 & 2 & 25 \end{array} \right]$	This was row 2; now it's row 1.
	This was row 1; now it's row 2.

Now we want to get 0s below the 1 in the first column.

We want 0 in these positions.

$$\left[ \begin{array}{ccc|c} 1 & 1 & 2 & 19 \\ 3 & 1 & 2 & 31 \\ 1 & 3 & 2 & 25 \end{array} \right]$$

To get a 0 where there is now a 3, multiply the top row of numbers by  $-3$  and add these products to the second row of numbers:  $-3R_1 + R_2$ . To get a 0 where there is now a 1, multiply the top row of numbers by  $-1$  and add these products to the third row of numbers:  $-1R_1 + R_3$ . Although we are using row 1 to find the products, the numbers in row 1 do not change.

Replace row 2 by $-3R_1 + R_2$ .	$\left[ \begin{array}{ccc c} 1 & 1 & 2 & 19 \\ -3(1) + 3 & -3(1) + 1 & -3(2) + 2 & -3(19) + 31 \\ -1(1) + 1 & -1(1) + 3 & -1(2) + 2 & -1(19) + 25 \end{array} \right] = \left[ \begin{array}{ccc c} 1 & 1 & 2 & 19 \\ 0 & -2 & -4 & -26 \\ 0 & 2 & 0 & 6 \end{array} \right]$	We want 1 in this position.
Replace row 3 by $-1R_1 + R_3$ .		

We move on to the second column. To get 1 in the desired position, we multiply  $-2$  by its reciprocal,  $-\frac{1}{2}$ . Therefore, we multiply all the numbers in the second row by  $-\frac{1}{2}$ :  $-\frac{1}{2}R_2$ .

$-\frac{1}{2}R_2$

$$\left[ \begin{array}{ccc|c} 1 & 1 & 2 & 19 \\ -\frac{1}{2}(0) & -\frac{1}{2}(-2) & -\frac{1}{2}(-4) & -\frac{1}{2}(-26) \\ 0 & 2 & 0 & 6 \end{array} \right] = \left[ \begin{array}{ccc|c} 1 & 1 & 2 & 19 \\ 0 & 1 & 2 & 13 \\ 0 & 2 & 0 & 6 \end{array} \right].$$

We want 0 in this position.

$$\left[ \begin{array}{ccc|c} 1 & 1 & 2 & 19 \\ 0 & 1 & 2 & 13 \\ 0 & 2 & 0 & 6 \end{array} \right]$$

We want 0 in this position.

The matrix from the bottom of the previous page (repeated)

So far, our matrix row operations have resulted in the matrix that we repeated in the margin. We are not yet done with the second column. The voice balloon shows that we want to get a 0 where there is now a 2. If we multiply the second row of numbers by  $-2$  and add these products to the third row of numbers, we will get 0 in this position:  $-2R_2 + R_3$ . Although we are using the numbers in row 2 to find the products, the numbers in row 2 do not change.

$$\text{Replace row 3 by } -2R_2 + R_3. \left[ \begin{array}{ccc|c} 1 & 1 & 2 & 19 \\ 0 & 1 & 2 & 13 \\ -2(0) + 0 & -2(1) + 2 & -2(2) + 0 & -2(13) + 6 \end{array} \right] = \left[ \begin{array}{ccc|c} 1 & 1 & 2 & 19 \\ 0 & 1 & 2 & 13 \\ 0 & 0 & -4 & -20 \end{array} \right]$$

We want 1 in this position.

We move on to the third column. To get 1 in the desired position, we multiply  $-4$  by its reciprocal,  $-\frac{1}{4}$ . Therefore, we multiply all the numbers in the third row by  $-\frac{1}{4}$ :  $-\frac{1}{4}R_3$ .

$$-\frac{1}{4}R_3 \left[ \begin{array}{ccc|c} 1 & 1 & 2 & 19 \\ 0 & 1 & 2 & 13 \\ -\frac{1}{4}(0) & -\frac{1}{4}(0) & -\frac{1}{4}(-4) & -\frac{1}{4}(-20) \end{array} \right] = \left[ \begin{array}{ccc|c} 1 & 1 & 2 & 19 \\ 0 & 1 & 2 & 13 \\ 0 & 0 & 1 & 5 \end{array} \right]$$

We now have the desired matrix in row-echelon form, with 1s down the main diagonal and 0s below the 1s in the first and second columns.

**Step 3 Write the system of linear equations corresponding to the matrix in step 2 and use back-substitution to find the system's solution.** The system represented by the matrix in step 2 is

$$\left[ \begin{array}{ccc|c} 1 & 1 & 2 & 19 \\ 0 & 1 & 2 & 13 \\ 0 & 0 & 1 & 5 \end{array} \right] \rightarrow \begin{cases} 1x + 1y + 2z = 19 \\ 0x + 1y + 2z = 13 \\ 0x + 0y + 1z = 5 \end{cases} \text{ or } \begin{cases} x + y + 2z = 19 & (1) \\ y + 2z = 13 & (2) \\ z = 5 & (3) \end{cases}$$

We immediately see from equation (3) that the value for  $z$  is 5. To find  $y$ , we back-substitute 5 for  $z$  in the second equation.

$$\begin{aligned} y + 2z &= 13 && \text{Equation (2)} \\ y + 2(5) &= 13 && \text{Substitute 5 for } z. \\ y + 10 &= 13 && \text{Multiply.} \\ y &= 3 && \text{Subtract 10 from both sides and solve for } y. \end{aligned}$$

Finally, back-substitute 3 for  $y$  and 5 for  $z$  in the first equation.

$$\begin{aligned} x + y + 2z &= 19 && \text{Equation (1)} \\ x + 3 + 2(5) &= 19 && \text{Substitute 3 for } y \text{ and 5 for } z. \\ x + 13 &= 19 && \text{Multiply and add.} \\ x &= 6 && \text{Subtract 13 from both sides and solve for } x. \end{aligned}$$

With  $z = 5$ ,  $y = 3$ , and  $x = 6$ , the solution set of the original system is  $\{(6, 3, 5)\}$ . Check to see that the solution satisfies all three equations in the given system. ●●●

## TECHNOLOGY

Most graphing utilities can convert an augmented matrix to row-echelon form, with 1s down the main diagonal and 0s below the 1s. However, row-echelon form is not unique. Your graphing utility might give a row-echelon form different from the one you obtained by hand. However, all row-echelon forms for a given system's augmented matrix produce the same solution to the system. Enter the augmented matrix and name it  $A$ . Then use the **REF** (row-echelon form) command on matrix  $A$ .

 **Check Point 2** Use matrices to solve the system:

$$\begin{cases} 2x + y + 2z = 18 \\ x - y + 2z = 9 \\ x + 2y - z = 6. \end{cases}$$

Modern supercomputers are capable of solving systems with more than 600,000 variables. The augmented matrices for such systems are huge, but the solution using matrices is exactly like what we did in Example 2. Work with the augmented matrix, one column at a time. Get 1s down the main diagonal from upper left to lower right and 0s below the 1s. Let's see how this works for a linear system involving four equations in four variables.

### EXAMPLE 3 Gaussian Elimination with Back-Substitution

Use matrices to solve the system:

$$\begin{cases} 2w + x + 3y - z = 6 \\ w - x + 2y - 2z = -1 \\ w - x - y + z = -4 \\ -w + 2x - 2y - z = -7. \end{cases}$$

### SOLUTION

**Step 1 Write the augmented matrix for the system.**

Linear System	Augmented Matrix
$\begin{cases} 2w + x + 3y - z = 6 \\ w - x + 2y - 2z = -1 \\ w - x - y + z = -4 \\ -w + 2x - 2y - z = -7 \end{cases}$	$\left[ \begin{array}{cccc c} 2 & 1 & 3 & -1 & 6 \\ 1 & -1 & 2 & -2 & -1 \\ 1 & -1 & -1 & 1 & -4 \\ -1 & 2 & -2 & -1 & -7 \end{array} \right]$

**Step 2 Use matrix row operations to simplify the matrix to row-echelon form, with 1s down the main diagonal from upper left to lower right, and 0s below the 1s in the first, second, and third columns.** Our first step in achieving this goal is to get 1 in the top position of the first column. To do this, we interchange row 1 and row 2:  $R_1 \leftrightarrow R_2$ .

						This was row 2; now it's row 1.	
We want 0s in these positions.	2	1	3	-1	6	This was row 1; now it's row 2.	
	1	-1	-1	1	-4		
	-1	2	-2	-1	-7		

Now we use the 1 at the top of the first column to get 0s below it.

Use the previous matrix and:	1	-1	2	-2	-1	8	We want 1 in this position.
Replace row 2 by $-2R_1 + R_2$ .	0	3	-1	3	8		
Replace row 3 by $-1R_1 + R_3$ .	0	0	-3	3	-3		
Replace row 4 by $1R_1 + R_4$ .	0	1	0	-3	-8		

We move on to the second column. We can obtain 1 in the desired position by multiplying the numbers in the second row by  $\frac{1}{3}$ , the reciprocal of 3.

$\frac{1}{3}(0)$	$\frac{1}{3}(3)$	$\frac{1}{3}(-1)$	$\frac{1}{3}(3)$	$\frac{1}{3}(8)$	=	1	$\frac{1}{3}R_2$
0	0	-3	3	-3	=	0	
0	1	0	-3	-8	=	1	

We want 0s in these positions. The top position already has a 0.

$$\left[ \begin{array}{cccc|c} 1 & -1 & 2 & -2 & -1 \\ 0 & 1 & -\frac{1}{3} & 1 & \frac{8}{3} \\ 0 & 0 & -3 & 3 & -3 \\ 0 & 1 & 0 & -3 & -8 \end{array} \right]$$

We want 0s in these positions.  
The top position already has a 0.

The matrix from the bottom of the previous page (repeated)

So far, our matrix row operations have resulted in the matrix that we repeated in the margin. Now we use the 1 in the second row, second column position to get 0s below it.

$$\left[ \begin{array}{cccc|c} 1 & -1 & 2 & -2 & -1 \\ 0 & 1 & -\frac{1}{3} & 1 & \frac{8}{3} \\ 0 & 0 & -3 & 3 & -3 \\ 0 & 0 & \frac{1}{3} & -4 & -\frac{32}{3} \end{array} \right]$$

Replace row 4 in the previous matrix by  $-1R_2 + R_4$ .

We want 1 in this position.

We move on to the third column. We can obtain 1 in the desired position by multiplying the numbers in the third row by  $-\frac{1}{3}$ , the reciprocal of  $-3$ .

$$\left[ \begin{array}{cccc|c} 1 & -1 & 2 & -2 & -1 \\ 0 & 1 & -\frac{1}{3} & 1 & \frac{8}{3} \\ -\frac{1}{3}(0) & -\frac{1}{3}(0) & -\frac{1}{3}(-3) & -\frac{1}{3}(3) & -\frac{1}{3}(-3) \\ 0 & 0 & \frac{1}{3} & -4 & -\frac{32}{3} \end{array} \right] = \left[ \begin{array}{cccc|c} 1 & -1 & 2 & -2 & -1 \\ 0 & 1 & -\frac{1}{3} & 1 & \frac{8}{3} \\ 0 & 0 & 1 & -1 & 1 \\ 0 & 0 & \frac{1}{3} & -4 & -\frac{32}{3} \end{array} \right]$$

$-\frac{1}{3}R_3$

We want 0 in this position.

Now we use the 1 in the third column to get 0 below it.

$$\left[ \begin{array}{cccc|c} 1 & -1 & 2 & -2 & -1 \\ 0 & 1 & -\frac{1}{3} & 1 & \frac{8}{3} \\ 0 & 0 & 1 & -1 & 1 \\ 0 & 0 & 0 & -\frac{11}{3} & -11 \end{array} \right]$$

Replace row 4 in the previous matrix by  $-\frac{1}{3}R_3 + R_4$ .

We want 1 in this position.

We move on to the fourth column. Because we want 1s down the diagonal from upper left to lower right, we want 1 where there is now  $-\frac{11}{3}$ . We can obtain 1 in this position by multiplying the numbers in the fourth row by  $-\frac{3}{11}$ .

$$\left[ \begin{array}{cccc|c} 1 & -1 & 2 & -2 & -1 \\ 0 & 1 & -\frac{1}{3} & 1 & \frac{8}{3} \\ 0 & 0 & 1 & -1 & 1 \\ -\frac{3}{11}(0) & -\frac{3}{11}(0) & -\frac{3}{11}(0) & -\frac{3}{11}(-\frac{11}{3}) & -\frac{3}{11}(-11) \end{array} \right]$$

$$= \left[ \begin{array}{cccc|c} 1 & -1 & 2 & -2 & -1 \\ 0 & 1 & -\frac{1}{3} & 1 & \frac{8}{3} \\ 0 & 0 & 1 & -1 & 1 \\ 0 & 0 & 0 & 1 & 3 \end{array} \right]$$

$-\frac{3}{11}R_4$

We now have the desired matrix in row-echelon form, with 1s down the main diagonal and 0s below the 1s. An equivalent row-echelon matrix can be obtained using a graphing utility and the **REF** command on the augmented matrix.

**Step 3 Write the system of linear equations corresponding to the matrix in step 2 and use back-substitution to find the system's solution.** The system represented by the matrix in step 2 is

$$\left[ \begin{array}{cccc|c} 1 & -1 & 2 & -2 & -1 \\ 0 & 1 & -\frac{1}{3} & 1 & \frac{8}{3} \\ 0 & 0 & 1 & -1 & 1 \\ 0 & 0 & 0 & 1 & 3 \end{array} \right] \rightarrow \begin{cases} 1w - 1x + 2y - 2z = -1 \\ 0w + 1x - \frac{1}{3}y + 1z = \frac{8}{3} \\ 0w + 0x + 1y - 1z = 1 \\ 0w + 0x + 0y + 1z = 3 \end{cases} \text{ or } \begin{cases} w - x + 2y - 2z = -1 \\ x - \frac{1}{3}y + z = \frac{8}{3} \\ y - z = 1 \\ z = 3. \end{cases}$$

We immediately see that the value for  $z$  is 3. We can now use back-substitution to find the values for  $y$ ,  $x$ , and  $w$ .

These are the four equations from the last column.

$$\begin{array}{l}
 z = 3 \\
 y - z = 1 \\
 y - 3 = 1 \\
 y = 4
 \end{array}
 \left|
 \begin{array}{l}
 x - \frac{1}{3}y + z = \frac{8}{3} \\
 x - \frac{1}{3}(4) + 3 = \frac{8}{3} \\
 x + \frac{5}{3} = \frac{8}{3} \\
 x = 1
 \end{array}
 \right.
 \begin{array}{l}
 w - x + 2y - 2z = -1 \\
 w - 1 + 2(4) - 2(3) = -1 \\
 w - 1 + 8 - 6 = -1 \\
 w + 1 = -1 \\
 w = -2
 \end{array}$$

Let's agree to write the solution for the system in the alphabetical order of the variables from left to right, namely  $(w, x, y, z)$ . Thus, the solution set is  $\{(-2, 1, 4, 3)\}$ . We can verify the solution by substituting the value for each variable into the original system of equations and obtaining four true statements. ●●●

 **Check Point 3** Use matrices to solve the system:

$$\begin{cases}
 w - 3x - 2y + z = -3 \\
 2w - 7x - y + 2z = 1 \\
 3w - 7x - 3y + 3z = -5 \\
 5w + x + 4y - 2z = 18.
 \end{cases}$$

- 4 Use matrices and Gauss-Jordan elimination to solve systems.

### Solving Linear Systems Using Gauss-Jordan Elimination

Using Gaussian elimination, we obtain a matrix in row-echelon form, with 1s down the main diagonal and 0s below the 1s. A second method, called **Gauss-Jordan elimination**, after Carl Friedrich Gauss and Wilhelm Jordan (1842–1899), continues the process until a matrix with 1s down the main diagonal and 0s in every position *above and below* each 1 is found. Such a matrix is said to be in **reduced row-echelon form**. For a system of three linear equations in three variables,  $x, y,$  and  $z$ , we must get the augmented matrix into the form

$$\left[ \begin{array}{ccc|c}
 1 & 0 & 0 & a \\
 0 & 1 & 0 & b \\
 0 & 0 & 1 & c
 \end{array} \right].$$

Based on this matrix, we conclude that  $x = a, y = b,$  and  $z = c$ .

#### Solving Linear Systems Using Gauss-Jordan Elimination

- Write the augmented matrix for the system.
- Use matrix row operations to simplify the matrix to a row-equivalent matrix in reduced row-echelon form, with 1s down the main diagonal from upper left to lower right, and 0s above and below the 1s.
  - Get 1 in the upper left-hand corner.
  - Use the 1 in the first column to get 0s below it.
  - Get 1 in the second row, second column.
  - Use the 1 in the second column to make the remaining entries in the second column 0.
  - Get 1 in the third row, third column.
  - Use the 1 in the third column to make the remaining entries in the third column 0.
  - Continue this procedure as far as possible.
- Use the reduced row-echelon form of the matrix in step 2 to write the system's solution set. (Back-substitution is not necessary.)

## TECHNOLOGY

Most graphing utilities can convert a matrix to reduced row-echelon form. Enter the system's augmented matrix and name it  $A$ . Then use the **RREF** (reduced row-echelon form) command on matrix  $A$ .

$$[A] \left[ \begin{array}{ccc|c} 3 & 1 & 2 & 31 \\ 1 & 1 & 2 & 19 \\ 1 & 3 & 2 & 25 \end{array} \right]$$

This is the augmented matrix for the system in Example 4.

$$\text{rref}([A]) \left[ \begin{array}{ccc|c} 1 & 0 & 0 & 6 \\ 0 & 1 & 0 & 3 \\ 0 & 0 & 1 & 5 \end{array} \right]$$

This is the matrix in reduced row-echelon form we obtained in Example 4.

## EXAMPLE 4 Using Gauss-Jordan Elimination

Use Gauss-Jordan elimination to solve the system:

$$\begin{cases} 3x + y + 2z = 31 \\ x + y + 2z = 19 \\ x + 3y + 2z = 25. \end{cases}$$

### SOLUTION

In Example 2, we used Gaussian elimination to obtain the following matrix:

$$\left[ \begin{array}{ccc|c} 1 & 1 & 2 & 19 \\ 0 & 1 & 2 & 13 \\ 0 & 0 & 1 & 5 \end{array} \right]$$

To use Gauss-Jordan elimination, we need 0s both above and below the 1s in the main diagonal. We use the 1 in the second row, second column to get a 0 above it.

$$\left[ \begin{array}{ccc|c} 1 & 0 & 0 & 6 \\ 0 & 1 & 2 & 13 \\ 0 & 0 & 1 & 5 \end{array} \right]$$

We use the 1 in the third column to get 0s above it.

$$\left[ \begin{array}{ccc|c} 1 & 0 & 0 & 6 \\ 0 & 1 & 0 & 3 \\ 0 & 0 & 1 & 5 \end{array} \right]$$

This last matrix corresponds to

$$x = 6, \quad y = 3, \quad z = 5.$$

As we found in Example 2, the solution set is  $\{(6, 3, 5)\}$ . ...

**Check Point 4** Solve the system in Check Point 2 using Gauss-Jordan elimination. Begin by working with the matrix that you obtained in Check Point 2.

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- A rectangular array of numbers, arranged in rows and columns and placed in brackets, is called a/an \_\_\_\_\_. The numbers inside the brackets are called \_\_\_\_\_.
- Consider the matrix

$$\left[ \begin{array}{ccc|c} 1 & 1 & -1 & -2 \\ -3 & -4 & 2 & 4 \\ 2 & 1 & 1 & 6 \end{array} \right].$$

We can obtain 0 in the position shaded by a rectangle if we multiply the top row of numbers by \_\_\_\_\_ and add these products to the \_\_\_\_\_ row of numbers.

We can obtain 0 in the position shaded by an oval if we multiply the top row of numbers by \_\_\_\_\_ and add these products to the \_\_\_\_\_ row of numbers.

- The augmented matrix for the system

$$\begin{cases} 2x + y + 4z = -4 \\ 3x + z = 1 \\ 4x + 3y + z = 8 \end{cases}$$

$$\text{is } \left[ \begin{array}{ccc|c} - & - & - & - \\ - & - & - & - \\ - & - & - & - \end{array} \right].$$

4. Using Gauss-Jordan elimination to solve the system

$$\begin{cases} x - y + z = -4 \\ 5x + y - 2z = 12, \\ 2x - 3y + 4z = -15 \end{cases}$$

we obtain the matrix

$$\left[ \begin{array}{ccc|c} 1 & 0 & 0 & 1 \\ 0 & 1 & 0 & 3 \\ 0 & 0 & 1 & -2 \end{array} \right].$$

The system's solution set is \_\_\_\_\_.

5. True or false: Back-substitution is required to solve linear systems using Gaussian elimination. \_\_\_\_\_

6. True or false: Back-substitution is required to solve linear systems using Gauss-Jordan elimination. \_\_\_\_\_

## EXERCISE SET 8.1

### Practice Exercises

In Exercises 1–8, write the augmented matrix for each system of linear equations.

$$1. \begin{cases} 2x + y + 2z = 2 \\ 3x - 5y - z = 4 \\ x - 2y - 3z = -6 \end{cases} \quad 2. \begin{cases} 3x - 2y + 5z = 31 \\ x + 3y - 3z = -12 \\ -2x - 5y + 3z = 11 \end{cases}$$

$$3. \begin{cases} x - y + z = 8 \\ y - 12z = -15 \\ z = 1 \end{cases} \quad 4. \begin{cases} x - 2y + 3z = 9 \\ y + 3z = 5 \\ z = 2 \end{cases}$$

$$5. \begin{cases} 5x - 2y - 3z = 0 \\ x + y = 5 \\ 2x - 3z = 4 \end{cases} \quad 6. \begin{cases} x - 2y + z = 10 \\ 3x + y = 5 \\ 7x + 2z = 2 \end{cases}$$

$$7. \begin{cases} 2w + 5x - 3y + z = 2 \\ 3x + y = 4 \\ w - x + 5y = 9 \\ 5w - 5x - 2y = 1 \end{cases}$$

$$8. \begin{cases} 4w + 7x - 8y + z = 3 \\ 5x + y = 5 \\ w - x - y = 17 \\ 2w - 2x + 11y = 4 \end{cases}$$

In Exercises 9–12, write the system of linear equations represented by the augmented matrix. Use  $x$ ,  $y$ , and  $z$ , or, if necessary,  $w$ ,  $x$ ,  $y$ , and  $z$ , for the variables.

$$9. \left[ \begin{array}{ccc|c} 5 & 0 & 3 & -11 \\ 0 & 1 & -4 & 12 \\ 7 & 2 & 0 & 3 \end{array} \right] \quad 10. \left[ \begin{array}{ccc|c} 7 & 0 & 4 & -13 \\ 0 & 1 & -5 & 11 \\ 2 & 7 & 0 & 6 \end{array} \right]$$

$$11. \left[ \begin{array}{cccc|c} 1 & 1 & 4 & 1 & 3 \\ -1 & 1 & -1 & 0 & 7 \\ 2 & 0 & 0 & 5 & 11 \\ 0 & 0 & 12 & 4 & 5 \end{array} \right] \quad 12. \left[ \begin{array}{cccc|c} 4 & 1 & 5 & 1 & 6 \\ 1 & -1 & 0 & -1 & 8 \\ 3 & 0 & 0 & 7 & 4 \\ 0 & 0 & 11 & 5 & 3 \end{array} \right]$$

In Exercises 13–18, perform each matrix row operation and write the new matrix.

$$13. \left[ \begin{array}{ccc|c} 2 & -6 & 4 & 10 \\ 1 & 5 & -5 & 0 \\ 3 & 0 & 4 & 7 \end{array} \right] \quad \frac{1}{2}R_1$$

$$14. \left[ \begin{array}{ccc|c} 3 & -12 & 6 & 9 \\ 1 & -4 & 4 & 0 \\ 2 & 0 & 7 & 4 \end{array} \right] \quad \frac{1}{3}R_1$$

$$15. \left[ \begin{array}{ccc|c} 1 & -3 & 2 & 0 \\ 3 & 1 & -1 & 7 \\ 2 & -2 & 1 & 3 \end{array} \right] \quad -3R_1 + R_2$$

$$16. \left[ \begin{array}{ccc|c} 1 & -1 & 5 & -6 \\ 3 & 3 & -1 & 10 \\ 1 & 3 & 2 & 5 \end{array} \right] \quad -3R_1 + R_2$$

$$17. \left[ \begin{array}{cccc|c} 1 & -1 & 1 & 1 & 3 \\ 0 & 1 & -2 & -1 & 0 \\ 2 & 0 & 3 & 4 & 11 \\ 5 & 1 & 2 & 4 & 6 \end{array} \right] \quad \begin{array}{l} -2R_1 + R_3 \\ -5R_1 + R_4 \end{array}$$

$$18. \left[ \begin{array}{cccc|c} 1 & -5 & 2 & -2 & 4 \\ 0 & 1 & -3 & -1 & 0 \\ 3 & 0 & 2 & -1 & 6 \\ -4 & 1 & 4 & 2 & -3 \end{array} \right] \quad \begin{array}{l} -3R_1 + R_3 \\ 4R_1 + R_4 \end{array}$$

In Exercises 19–20, a few steps in the process of simplifying the given matrix to row-echelon form, with 1s down the diagonal from upper left to lower right, and 0s below the 1s, are shown. Fill in the missing numbers in the steps that are shown.

$$19. \left[ \begin{array}{ccc|c} 1 & -1 & 1 & 8 \\ 2 & 3 & -1 & -2 \\ 3 & -2 & -9 & 9 \end{array} \right] \rightarrow \left[ \begin{array}{ccc|c} 1 & -1 & 1 & 8 \\ 0 & 5 & \square & \square \\ 0 & 1 & \square & \square \end{array} \right] \\ \rightarrow \left[ \begin{array}{ccc|c} 1 & -1 & 1 & 8 \\ 0 & 1 & \square & \square \\ 0 & 1 & \square & \square \end{array} \right]$$

$$20. \left[ \begin{array}{ccc|c} 1 & -2 & 3 & 4 \\ 2 & 1 & -4 & 3 \\ -3 & 4 & -1 & -2 \end{array} \right] \rightarrow \left[ \begin{array}{ccc|c} 1 & -2 & 3 & 4 \\ 0 & 5 & \square & \square \\ 0 & -2 & \square & \square \end{array} \right] \\ \rightarrow \left[ \begin{array}{ccc|c} 1 & -2 & 3 & 4 \\ 0 & 1 & \square & \square \\ 0 & -2 & \square & \square \end{array} \right]$$

In Exercises 21–38, solve each system of equations using matrices. Use Gaussian elimination with back-substitution or Gauss-Jordan elimination.

$$21. \begin{cases} x + y - z = -2 \\ 2x - y + z = 5 \\ -x + 2y + 2z = 1 \end{cases} \quad 22. \begin{cases} x - 2y - z = 2 \\ 2x - y + z = 4 \\ -x + y - 2z = -4 \end{cases}$$

$$23. \begin{cases} x + 3y = 0 \\ x + y + z = 1 \\ 3x - y - z = 11 \end{cases} \quad 24. \begin{cases} 3y - z = -1 \\ x + 5y - z = -4 \\ -3x + 6y + 2z = 11 \end{cases}$$

$$25. \begin{cases} 2x - y - z = 4 \\ x + y - 5z = -4 \\ x - 2y = 4 \end{cases} \quad 26. \begin{cases} x - 3z = -2 \\ 2x + 2y + z = 4 \\ 3x + y - 2z = 5 \end{cases}$$

$$27. \begin{cases} x + y + z = 4 \\ x - y - z = 0 \\ x - y + z = 2 \end{cases} \quad 28. \begin{cases} 3x + y - z = 0 \\ x + y + 2z = 6 \\ 2x + 2y + 3z = 10 \end{cases}$$

$$29. \begin{cases} x + 2y = z - 1 \\ x = 4 + y - z \\ x + y - 3z = -2 \end{cases} \quad 30. \begin{cases} 2x + y = z + 1 \\ 2x = 1 + 3y - z \\ x + y + z = 4 \end{cases}$$

$$31. \begin{cases} 3a - b - 4c = 3 \\ 2a - b + 2c = -8 \\ a + 2b - 3c = 9 \end{cases} \quad 32. \begin{cases} 3a + b - c = 0 \\ 2a + 3b - 5c = 1 \\ a - 2b + 3c = -4 \end{cases}$$

$$33. \begin{cases} 2x + 2y + 7z = -1 \\ 2x + y + 2z = 2 \\ 4x + 6y + z = 15 \end{cases} \quad 34. \begin{cases} 3x + 2y + 3z = 3 \\ 4x - 5y + 7z = 1 \\ 2x + 3y - 2z = 6 \end{cases}$$

$$35. \begin{cases} w + x + y + z = 4 \\ 2w + x - 2y - z = 0 \\ w - 2x - y - 2z = -2 \\ 3w + 2x + y + 3z = 4 \end{cases}$$

$$36. \begin{cases} w + x + y + z = 5 \\ w + 2x - y - 2z = -1 \\ w - 3x - 3y - z = -1 \\ 2w - x + 2y - z = -2 \end{cases}$$

$$37. \begin{cases} 3w - 4x + y + z = 9 \\ w + x - y - z = 0 \\ 2w + x + 4y - 2z = 3 \\ -w + 2x + y - 3z = 3 \end{cases}$$

$$38. \begin{cases} 2w + y - 3z = 8 \\ w - x + 4z = -10 \\ 3w + 5x - y - z = 20 \\ w + x - y - z = 6 \end{cases}$$

### Practice Plus

39. Find the quadratic function  $f(x) = ax^2 + bx + c$  for which  $f(-2) = -4$ ,  $f(1) = 2$ , and  $f(2) = 0$ .
40. Find the quadratic function  $f(x) = ax^2 + bx + c$  for which  $f(-1) = 5$ ,  $f(1) = 3$ , and  $f(2) = 5$ .
41. Find the cubic function  $f(x) = ax^3 + bx^2 + cx + d$  for which  $f(-1) = 0$ ,  $f(1) = 2$ ,  $f(2) = 3$ , and  $f(3) = 12$ .
42. Find the cubic function  $f(x) = ax^3 + bx^2 + cx + d$  for which  $f(-1) = 3$ ,  $f(1) = 1$ ,  $f(2) = 6$ , and  $f(3) = 7$ .
43. Solve the system:

$$\begin{cases} 2 \ln w + \ln x + 3 \ln y - 2 \ln z = -6 \\ 4 \ln w + 3 \ln x + \ln y - \ln z = -2 \\ \ln w + \ln x + \ln y + \ln z = -5 \\ \ln w + \ln x - \ln y - \ln z = 5 \end{cases}$$

(Hint: Let  $A = \ln w$ ,  $B = \ln x$ ,  $C = \ln y$ , and  $D = \ln z$ . Solve the system for  $A$ ,  $B$ ,  $C$ , and  $D$ . Then use the logarithmic equations to find  $w$ ,  $x$ ,  $y$ , and  $z$ .)

44. Solve the system:

$$\begin{cases} \ln w + \ln x + \ln y + \ln z = -1 \\ -\ln w + 4 \ln x + \ln y - \ln z = 0 \\ \ln w - 2 \ln x + \ln y - 2 \ln z = 11 \\ -\ln w - 2 \ln x + \ln y + 2 \ln z = -3 \end{cases}$$

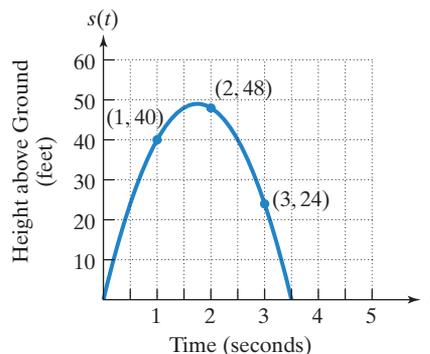

(Hint: Let  $A = \ln w$ ,  $B = \ln x$ ,  $C = \ln y$ , and  $D = \ln z$ . Solve the system for  $A$ ,  $B$ ,  $C$ , and  $D$ . Then use the logarithmic equations to find  $w$ ,  $x$ ,  $y$ , and  $z$ .)

### Application Exercises

45. A ball is thrown straight upward. A position function

$$s(t) = \frac{1}{2}at^2 + v_0t + s_0$$

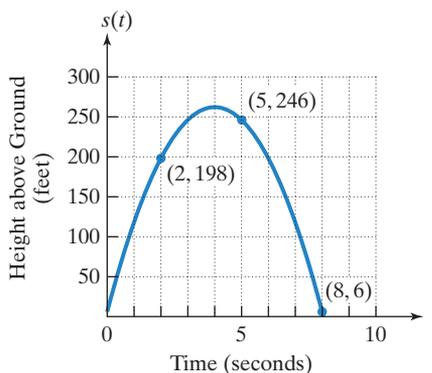

can be used to describe the ball's height,  $s(t)$ , in feet, after  $t$  seconds.

- a. Use the points labeled in the graph to find the values of  $a$ ,  $v_0$ , and  $s_0$ . Solve the system of linear equations involving  $a$ ,  $v_0$ , and  $s_0$  using matrices.
- b. Find and interpret  $s(3.5)$ . Identify your solution as a point on the graph shown.
- c. After how many seconds does the ball reach its maximum height? What is its maximum height?
46. A football is kicked straight upward. A position function

$$s(t) = \frac{1}{2}at^2 + v_0t + s_0$$

can be used to describe the ball's height,  $s(t)$ , in feet, after  $t$  seconds.

- a. Use the points labeled in the graph to find the values of  $a$ ,  $v_0$ , and  $s_0$ . Solve the system of linear equations involving  $a$ ,  $v_0$ , and  $s_0$  using matrices.
- b. Find and interpret  $s(7)$ . Identify your solution as a point on the graph shown.
- c. After how many seconds does the ball reach its maximum height? What is its maximum height?

Write a system of linear equations in three or four variables to solve Exercises 47–50. Then use matrices to solve the system.

47. Three foods have the following nutritional content per ounce.

	Calories	Protein (in grams)	Vitamin C (in milligrams)
<b>Food A</b>	40	5	30
<b>Food B</b>	200	2	10
<b>Food C</b>	400	4	300

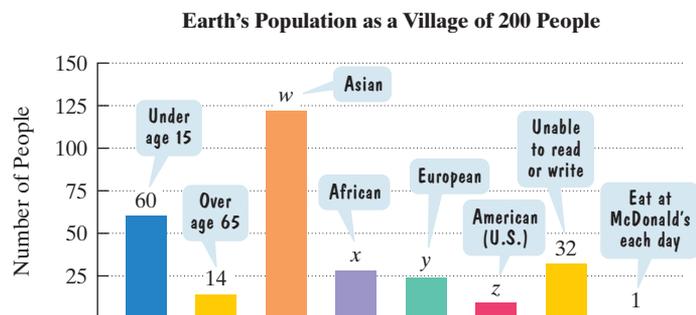

If a meal consisting of the three foods allows exactly 660 calories, 25 grams of protein, and 425 milligrams of vitamin C, how many ounces of each kind of food should be used?

48. A furniture company produces three types of desks: a children's model, an office model, and a deluxe model. Each desk is manufactured in three stages: cutting, construction, and finishing. The time requirements for each model and manufacturing stage are given in the following table.

	Children's Model	Office Model	Deluxe Model
<b>Cutting</b>	2 hr	3 hr	2 hr
<b>Construction</b>	2 hr	1 hr	3 hr
<b>Finishing</b>	1 hr	1 hr	2 hr

Each week the company has available a maximum of 100 hours for cutting, 100 hours for construction, and 65 hours for finishing. If all available time must be used, how many of each type of desk should be produced each week?

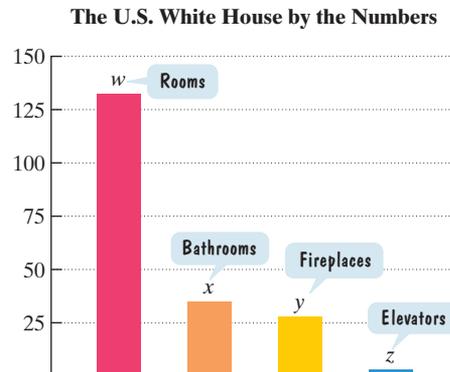

49. Imagine the entire global population as a village of precisely 200 people. The bar graph shows some numeric observations based on this scenario.

Source: Gary Rimmer, *Number Freaking*, The Disinformation Company Ltd., 2006

Combined, there are 183 Asians, Africans, Europeans, and Americans in the village. The number of Asians exceeds the number of Africans and Europeans by 70. The difference between the number of Europeans and Americans is 15. If the number of Africans is doubled, their population exceeds the number of Europeans and Americans by 23. Determine the number of Asians, Africans, Europeans, and Americans in the global village.

50. The bar graph shows the number of rooms, bathrooms, fireplaces, and elevators in the U.S. White House.

Source: The White House

Combined, there are 198 rooms, bathrooms, fireplaces, and elevators. The number of rooms exceeds the number of bathrooms and fireplaces by 69. The difference between the number of fireplaces and elevators is 25. If the number of bathrooms is doubled, it exceeds the number of fireplaces and elevators by 39. Determine the number of rooms, bathrooms, fireplaces, and elevators in the U.S. White House.

### Writing in Mathematics

- What is a matrix?
- Describe what is meant by the augmented matrix of a system of linear equations.
- In your own words, describe each of the three matrix row operations. Give an example with each of the operations.
- Describe how to use row operations and matrices to solve a system of linear equations.
- What is the difference between Gaussian elimination and Gauss-Jordan elimination?

### Technology Exercises

- Most graphing utilities can perform row operations on matrices. Consult the owner's manual for your graphing utility to learn proper keystrokes for performing these operations. Then duplicate the row operations of any three exercises that you solved from Exercises 13–18.
- If your graphing utility has a **REF** (row-echelon form) command or a **RREF** (reduced row-echelon form) command, use this feature to verify your work with any five systems that you solved from Exercises 21–38.
- Solve using a graphing utility's **REF** or **RREF** command:

$$\begin{cases} 2x_1 - 2x_2 + 3x_3 - x_4 &= 12 \\ x_1 + 2x_2 - x_3 + 2x_4 - x_5 &= -7 \\ x_1 + x_3 + x_4 - 5x_5 &= 1 \\ -x_1 + x_2 - x_3 - 2x_4 - 3x_5 &= 0 \\ x_1 - x_2 - x_4 + x_5 &= 4. \end{cases}$$

## Critical Thinking Exercises

**Make Sense?** In Exercises 59–62, determine whether each statement makes sense or does not make sense, and explain your reasoning.

59. Matrix row operations remind me of what I did when solving a linear system by the addition method, although I no longer write the variables.
60. When I use matrices to solve linear systems, the only arithmetic involves multiplication or a combination of multiplication and addition.
61. When I use matrices to solve linear systems, I spend most of my time using row operations to express the system's augmented matrix in row-echelon form.
62. Using row operations on an augmented matrix, I obtain a row in which 0s appear to the left of the vertical bar, but 6 appears on the right, so the system I'm working with has no solution.

In Exercises 63–66, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

63. A matrix row operation such as  $-\frac{4}{5}R_1 + R_2$  is not permitted because of the negative fraction.
64. The augmented matrix for the system

$$\begin{cases} x - 3y = 5 \\ y - 2z = 7 \\ 2x + z = 4 \end{cases} \text{ is } \left[ \begin{array}{cc|c} 1 & -3 & 5 \\ 1 & -2 & 7 \\ 2 & 1 & 4 \end{array} \right].$$

65. In solving a linear system of three equations in three variables, we begin with the augmented matrix and use row operations to obtain a row-equivalent matrix with 0s down the diagonal from left to right and 1s below each 0.

66. The row operation  $kR_i + R_j$  indicates that it is the elements in row  $i$  that change.
67. The table shows the daily production level and profit for a business.

<b>x (Number of Units Produced Daily)</b>	30	50	100
<b>y (Daily Profit)</b>	\$5900	\$7500	\$4500

Use the quadratic function  $y = ax^2 + bx + c$  to determine the number of units that should be produced each day for maximum profit. What is the maximum daily profit?

## Preview Exercises

Exercises 68–70 will help you prepare for the material covered in the next section. In each exercise, refer to the following system:

$$\begin{cases} 3x - 4y + 4z = 7 \\ x - y - 2z = 2 \\ 2x - 3y + 6z = 5. \end{cases}$$

68. Show that  $(12z + 1, 10z - 1, z)$  satisfies the system for  $z = 0$ .
69. Show that  $(12z + 1, 10z - 1, z)$  satisfies the system for  $z = 1$ .
70. a. Select a value for  $z$  other than 0 or 1 and show that  $(12z + 1, 10z - 1, z)$  satisfies the system.  
b. Based on your work in Exercises 68–70(a), how does this system differ from those in Exercises 21–34?

## SECTION 8.2

## Inconsistent and Dependent Systems and Their Applications

## Objectives

- 1 Apply Gaussian elimination to systems without unique solutions.
- 2 Apply Gaussian elimination to systems with more variables than equations.
- 3 Solve problems involving systems without unique solutions.

- 1 Apply Gaussian elimination to systems without unique solutions.

Traffic jams getting you down? Powerful computers, able to solve systems with hundreds of thousands of variables in a single bound, may promise a gridlock-free future. The computer in your car could be linked to a central computer that manages traffic flow by controlling traffic lights, rerouting you away from traffic congestion, issuing weather reports, and selecting the best route to your destination. New technologies could eventually drive your car at a steady 75 miles per hour along automated highways as you comfortably nap. In this section, we look at the role of linear systems without unique solutions in a future free of traffic jams.

Linear systems can have one solution, no solution, or infinitely many solutions. We can use Gaussian elimination on systems with three or more variables to determine how many solutions such systems may have. In the case of systems with no solution or infinitely many solutions, it is impossible to rewrite the augmented matrix in the desired form with 1s down the main diagonal from upper left to lower right, and 0s below the 1s. Let's see what this means by looking at a system that has no solution.

**EXAMPLE 1** A System with No Solution

Use Gaussian elimination to solve the system:

$$\begin{cases} x - y - 2z = 2 \\ 2x - 3y + 6z = 5 \\ 3x - 4y + 4z = 12. \end{cases}$$

**SOLUTION****Step 1** Write the augmented matrix for the system.

Linear System	Augmented Matrix
$\begin{cases} x - y - 2z = 2 \\ 2x - 3y + 6z = 5 \\ 3x - 4y + 4z = 12 \end{cases}$	$\left[ \begin{array}{ccc c} 1 & -1 & -2 & 2 \\ 2 & -3 & 6 & 5 \\ 3 & -4 & 4 & 12 \end{array} \right]$

**Step 2** Attempt to simplify the matrix to row-echelon form, with 1s down the main diagonal and 0s below the 1s. Notice that the augmented matrix already has a 1 in the top position of the first column. Now we want 0s below the 1. To get the first 0, multiply row 1 by  $-2$  and add these products to row 2. To get the second 0, multiply row 1 by  $-3$  and add these products to row 3. Performing these operations, we obtain the following matrix:

We want 1 in this position.	$\left[ \begin{array}{ccc c} 1 & -1 & -2 & 2 \\ 0 & -1 & 10 & 1 \\ 0 & -1 & 10 & 6 \end{array} \right]$	Use the augmented matrix and: Replace row 2 by $-2R_1 + R_2$ . Replace row 3 by $-3R_1 + R_3$ .
-----------------------------	---	---

Moving on to the second column, we obtain 1 in the desired position by multiplying row 2 by  $-1$ .

$$\left[ \begin{array}{ccc|c} 1 & -1 & -2 & 2 \\ -1(0) & -1(-1) & -1(10) & -1(1) \\ 0 & -1 & 10 & 6 \end{array} \right] = \left[ \begin{array}{ccc|c} 1 & -1 & -2 & 2 \\ 0 & 1 & -10 & -1 \\ 0 & -1 & 10 & 6 \end{array} \right] \quad -1R_2$$

We want 0 in this position.

Now we want a 0 below the 1 in column 2. To get the 0, multiply row 2 by 1 and add these products to row 3. (Equivalently, add row 2 to row 3.) We obtain the following matrix:

$$\left[ \begin{array}{ccc|c} 1 & -1 & -2 & 2 \\ 0 & 1 & -10 & -1 \\ 0 & 0 & 0 & 5 \end{array} \right]. \quad \text{Replace row 3 in the previous matrix by } 1R_2 + R_3.$$

It is impossible to convert this last matrix to the desired form of 1s down the main diagonal. If we translate the last row back into equation form, we get

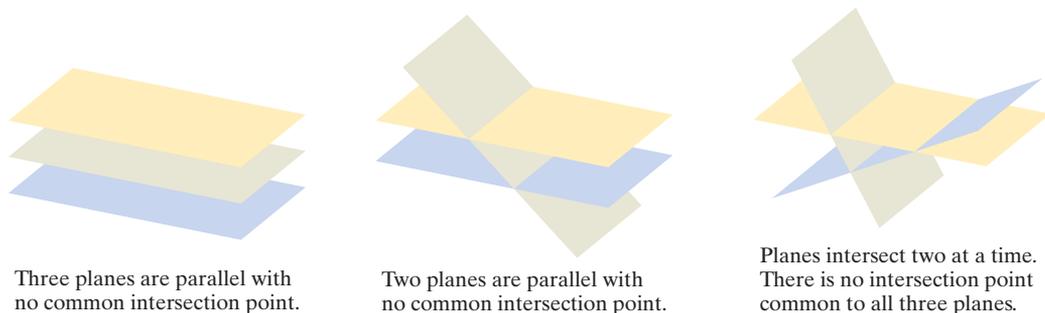

$$0x + 0y + 0z = 5, \quad \text{There are no values of } x, y, \text{ and } z \text{ for which } 0 = 5.$$

which is false. Regardless of which values we select for  $x$ ,  $y$ , and  $z$ , the last equation can never be a true statement. Consequently, the system has no solution. The solution set is  $\emptyset$ , the empty set. ...

**Check Point 1** Use Gaussian elimination to solve the system:

$$\begin{cases} x - 2y - z = -5 \\ 2x - 3y - z = 0 \\ 3x - 4y - z = 1. \end{cases}$$

Recall that the graph of a system of three linear equations in three variables consists of three planes. When these planes intersect in a single point, the system has precisely one ordered-triple solution. When the planes have no point in common, the system has no solution, like the one in Example 1. **Figure 8.1** illustrates some of the geometric possibilities for these inconsistent systems.

**FIGURE 8.1** Three planes may have no common point of intersection.

Now let's see what happens when we apply Gaussian elimination to a system with infinitely many solutions. Representing the solution set for these systems can be a bit tricky.

### EXAMPLE 2 A System with an Infinite Number of Solutions

Use Gaussian elimination to solve the following system:

$$\begin{cases} 3x - 4y + 4z = 7 \\ x - y - 2z = 2 \\ 2x - 3y + 6z = 5. \end{cases}$$

#### SOLUTION

As always, we start with the augmented matrix.

$$\begin{array}{l} \left[ \begin{array}{ccc|c} 3 & -4 & 4 & 7 \\ 1 & -1 & -2 & 2 \\ 2 & -3 & 6 & 5 \end{array} \right] \xrightarrow[\text{Interchange rows 1 and 2.}]{R_1 \leftrightarrow R_2} \left[ \begin{array}{ccc|c} 1 & -1 & -2 & 2 \\ 3 & -4 & 4 & 7 \\ 2 & -3 & 6 & 5 \end{array} \right] \xrightarrow[\text{Replace row 3 by } -2R_1 + R_3.]{\text{Replace row 2 by } -3R_1 + R_2.} \\ \left[ \begin{array}{ccc|c} 1 & -1 & -2 & 2 \\ 0 & -1 & 10 & 1 \\ 0 & -1 & 10 & 1 \end{array} \right] \xrightarrow[\text{Multiply row 2 by } -1.]{-1R_2} \left[ \begin{array}{ccc|c} 1 & -1 & -2 & 2 \\ 0 & 1 & -10 & -1 \\ 0 & -1 & 10 & 1 \end{array} \right] \xrightarrow[\text{Replace row 3 by } 1R_2 + R_3.]{\text{Replace row 3 by } -3R_1 + R_2.} \\ \left[ \begin{array}{ccc|c} 1 & -1 & -2 & 2 \\ 0 & 1 & -10 & -1 \\ 0 & 0 & 0 & 0 \end{array} \right] \end{array}$$

If we translate row 3 of the matrix into equation form, we obtain

$$0x + 0y + 0z = 0$$

or

$$0 = 0.$$

This equation results in a true statement regardless of which values we select for  $x$ ,  $y$ , and  $z$ . Consequently, the equation  $0x + 0y + 0z = 0$  is *dependent* on the other two equations in the system in the sense that it adds no new information about the variables. Thus, we can drop it from the system, which can now be expressed in the form

$$\left[ \begin{array}{ccc|c} 1 & -1 & -2 & 2 \\ 0 & 1 & -10 & -1 \end{array} \right]. \quad \text{This is the last matrix from above with row 3 omitted.}$$

The original system is equivalent to the system

$$\begin{cases} x - y - 2z = 2 & \text{This is the system represented} \\ y - 10z = -1. & \text{by the matrix at the bottom of the previous page.} \end{cases}$$

Although neither of these equations gives a value for  $z$ , we can use them to express  $x$  and  $y$  in terms of  $z$ . From the last equation, we obtain

$$y = 10z - 1. \quad \text{Add } 10z \text{ to both sides and isolate } y.$$

Back-substituting for  $y$  into the first equation obtained from the final matrix, we can find  $x$  in terms of  $z$ .

$$\begin{aligned} x - y - 2z &= 2 && \text{This is the first equation} \\ x - (10z - 1) - 2z &= 2 && \text{obtained from the final matrix.} \\ x - 10z + 1 - 2z &= 2 && \text{Because } y = 10z - 1, \\ x - 12z + 1 &= 2 && \text{substitute } 10z - 1 \text{ for } y. \\ x - 12z + 1 &= 2 && \text{Apply the distributive property.} \\ x - 12z + 1 &= 2 && \text{Combine like terms.} \\ x &= 12z + 1 && \text{Solve for } x \text{ in terms of } z. \end{aligned}$$

We have now found two equations expressing  $x$  and  $y$  in terms of  $z$ :

$$\begin{aligned} x &= 12z + 1 \\ y &= 10z - 1. \end{aligned}$$

Because no value is determined for  $z$ , we can find a solution of the system by letting  $z$  equal any real number and then using these equations to obtain  $x$  and  $y$ . For example, if  $z = 1$ , then

$$\begin{aligned} x &= 12z + 1 = 12(1) + 1 = 13 \text{ and} \\ y &= 10z - 1 = 10(1) - 1 = 9. \end{aligned}$$

Consequently,  $(13, 9, 1)$  is a solution of the system. On the other hand, if we let  $z = -1$ , then

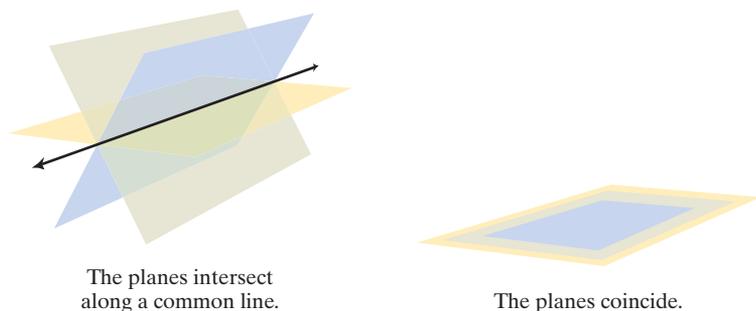

$$\begin{aligned} x &= 12z + 1 = 12(-1) + 1 = -11 \text{ and} \\ y &= 10z - 1 = 10(-1) - 1 = -11. \end{aligned}$$

Thus,  $(-11, -11, -1)$  is another solution of the system.

We see that for any arbitrary choice of  $z$ , every ordered triple of the form  $(12z + 1, 10z - 1, z)$  is a solution of the system. The solution set of this system with dependent equations is

$$\{(12z + 1, 10z - 1, z)\}. \quad \dots$$

We have seen that when three planes have no point in common, the corresponding system has no solution. When the system has infinitely many solutions, like the one in Example 2, the three planes intersect in more than one point. **Figure 8.2** illustrates geometric possibilities for systems with dependent equations.

**FIGURE 8.2** Three planes may intersect at infinitely many points.

 **Check Point 2** Use Gaussian elimination to solve the following system:

$$\begin{cases} x - 2y - z = 5 \\ 2x - 5y + 3z = 6 \\ x - 3y + 4z = 1. \end{cases}$$

- 2 Apply Gaussian elimination to systems with more variables than equations.

### Nonsquare Systems

Up to this point, we have encountered only *square* systems in which the number of equations is equal to the number of variables. In a **nonsquare system**, the number of variables differs from the number of equations. In Example 3, we have two equations and three variables.

#### EXAMPLE 3 A System with Fewer Equations Than Variables

Use Gaussian elimination to solve the system:

$$\begin{cases} 3x + 7y + 6z = 26 \\ x + 2y + z = 8. \end{cases}$$

#### SOLUTION

We begin with the augmented matrix.

$$\left[ \begin{array}{ccc|c} 3 & 7 & 6 & 26 \\ 1 & 2 & 1 & 8 \end{array} \right] \xrightarrow{R_1 \leftrightarrow R_2} \left[ \begin{array}{ccc|c} 1 & 2 & 1 & 8 \\ 3 & 7 & 6 & 26 \end{array} \right] \xrightarrow{\substack{\text{Replace row 2} \\ \text{by } -3R_1 + R_2.}} \left[ \begin{array}{ccc|c} 1 & 2 & 1 & 8 \\ 0 & 1 & 3 & 2 \end{array} \right]$$

Because the matrix  $\left[ \begin{array}{ccc|c} 1 & 2 & 1 & 8 \\ 0 & 1 & 3 & 2 \end{array} \right]$  has 1s down the diagonal that begins with the upper-left entry and a 0 below the leading 1, we translate this matrix back into equation form.

$$\begin{cases} x + 2y + z = 8 & \text{Equation 1} \\ y + 3z = 2 & \text{Equation 2} \end{cases}$$

We can let  $z$  equal any real number and use back-substitution to express  $x$  and  $y$  in terms of  $z$ .

#### DISCOVERY

Let  $z = 1$  for the solution

$$(5z + 4, -3z + 2, z).$$

What solution do you obtain? Substitute these three values in the two original equations:

$$\begin{cases} 3x + 7y + 6z = 26 \\ x + 2y + z = 8. \end{cases}$$

Show that each equation is satisfied. Repeat this process for two other values of  $z$ .

#### Equation 2

$$\begin{aligned} y + 3z &= 2 \\ y &= -3z + 2 \end{aligned}$$

#### Equation 1

$$\begin{aligned} x + 2y + z &= 8 \\ x + 2(-3z + 2) + z &= 8 \\ x - 6z + 4 + z &= 8 \\ x - 5z + 4 &= 8 \\ x &= 5z + 4 \end{aligned}$$

For any arbitrary choice of  $z$ , every ordered triple of the form  $(5z + 4, -3z + 2, z)$  is a solution of the system. We can express the system's solution set as

$$\{(5z + 4, -3z + 2, z)\}. \quad \dots$$

 **Check Point 3** Use Gaussian elimination to solve the system:

$$\begin{cases} x + 2y + 3z = 70 \\ x + y + z = 60. \end{cases}$$

- 3 Solve problems involving systems without unique solutions.

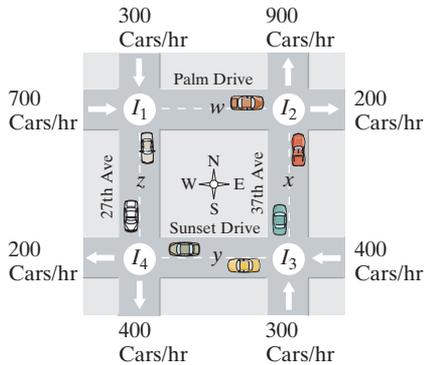

FIGURE 8.3 The intersections of four one-way streets

## Applications

How will computers be programmed to control traffic flow and avoid congestion? They will be required to solve systems continually based on the following premise: If traffic is to keep moving, during any period of time the number of cars entering an intersection must equal the number of cars leaving that intersection. Let's see what this means by looking at the intersections of four one-way city streets.

### EXAMPLE 4 Traffic Control

Figure 8.3 shows the intersections of four one-way streets. As you study the figure, notice that 300 cars per hour want to enter intersection  $I_1$  from the north on 27th Avenue. Also, 200 cars per hour want to head east from intersection  $I_2$  on Palm Drive. The letters  $w$ ,  $x$ ,  $y$ , and  $z$  stand for the number of cars passing between the intersections.

- If the traffic is to keep moving, at each intersection the number of cars entering per hour must equal the number of cars leaving per hour. Use this idea to set up a linear system of equations involving  $w$ ,  $x$ ,  $y$ , and  $z$ .
- Use Gaussian elimination to solve the system.
- If construction on 27th Avenue limits  $z$  to 50 cars per hour, how many cars per hour must pass between the other intersections to keep traffic flowing?

## SOLUTION

- Set up the system by considering one intersection at a time, referring to Figure 8.3.

For Intersection  $I_1$ : Because  $300 + 700 = 1000$  cars enter  $I_1$  and  $w + z$  cars leave the intersection, then  $w + z = 1000$ .

For Intersection  $I_2$ : Because  $w + x$  cars enter the intersection and  $200 + 900 = 1100$  cars leave  $I_2$ , then  $w + x = 1100$ .

For Intersection  $I_3$ : Figure 8.3 indicates that  $300 + 400 = 700$  cars enter and  $x + y$  leave, so  $x + y = 700$ .

For Intersection  $I_4$ : With  $y + z$  cars entering and  $200 + 400 = 600$  cars exiting, traffic will keep flowing if  $y + z = 600$ .

The system of equations that models this situation is given by

$$\begin{cases} w + z = 1000 \\ w + x = 1100 \\ x + y = 700 \\ y + z = 600. \end{cases}$$

- To solve this system using Gaussian elimination, we begin with the augmented matrix.

**System of Linear Equations**  
(showing missing variables  
with 0 coefficients)

$$\begin{cases} 1w + 0x + 0y + 1z = 1000 \\ 1w + 1x + 0y + 0z = 1100 \\ 0w + 1x + 1y + 0z = 700 \\ 0w + 0x + 1y + 1z = 600 \end{cases}$$

**Augmented Matrix**

$$\left[ \begin{array}{cccc|c} 1 & 0 & 0 & 1 & 1000 \\ 1 & 1 & 0 & 0 & 1100 \\ 0 & 1 & 1 & 0 & 700 \\ 0 & 0 & 1 & 1 & 600 \end{array} \right]$$

We can now use row operations to obtain the following matrix:

$$\left[ \begin{array}{cccc|c} 1 & 0 & 0 & 1 & 1000 \\ 0 & 1 & 0 & -1 & 100 \\ 0 & 0 & 1 & 1 & 600 \\ 0 & 0 & 0 & 0 & 0 \end{array} \right]$$

w + z = 1000  
x - z = 100  
y + z = 600

The last row of the matrix shows that the system in the voice balloons has dependent equations and infinitely many solutions. To write the solution set containing these infinitely many solutions, let  $z$  equal any real number. Use the three equations in the voice balloons to express  $w$ ,  $x$ , and  $y$  in terms of  $z$ :

$$w = 1000 - z, \quad x = 100 + z, \quad \text{and} \quad y = 600 - z.$$

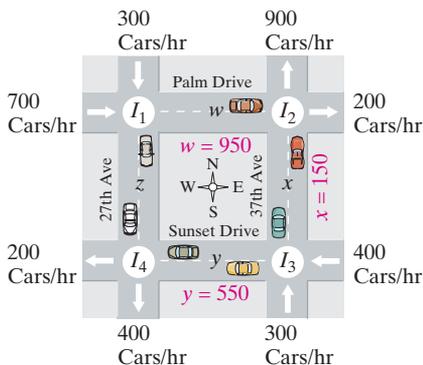

With  $z$  arbitrary, the alphabetically ordered solution  $(w, x, y, z)$  enables us to express the system's solution set as

$$\{(1000 - z, 100 + z, 600 - z, z)\}.$$

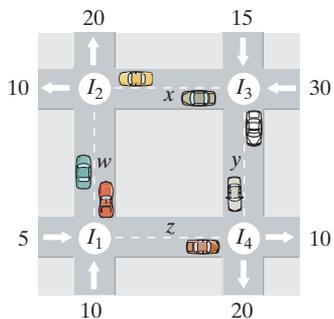

- c. We are given that construction limits  $z$  to 50 cars per hour. Because  $z = 50$ , we substitute 50 for  $z$  in the system's ordered solution:

$$\begin{aligned} &(1000 - z, 100 + z, 600 - z, z) && \text{Use the system's solution.} \\ &= (1000 - 50, 100 + 50, 600 - 50, 50) && z = 50 \\ &= (950, 150, 550, 50). \end{aligned}$$

Thus,  $w = 950$ ,  $x = 150$ , and  $y = 550$ . (See **Figure 8.4**.) With construction on 27th Avenue, this means that to keep traffic flowing, 950 cars per hour must be routed between  $I_1$  and  $I_2$ , 150 per hour between  $I_3$  and  $I_2$ , and 550 per hour between  $I_3$  and  $I_4$ . ...

**FIGURE 8.4** With  $z$  limited to 50 cars per hour, values for  $w$ ,  $x$ , and  $y$  are determined.

**FIGURE 8.5**

**Check Point 4** **Figure 8.5** shows a system of four one-way streets. The numbers in the figure denote the number of cars per minute that travel in the direction shown.

- Use the requirement that the number of cars entering each of the intersections per minute must equal the number of cars leaving per minute to set up a system of equations in  $w$ ,  $x$ ,  $y$ , and  $z$ .
- Use Gaussian elimination to solve the system.
- If construction limits  $z$  to 10 cars per minute, how many cars per minute must pass between the other intersections to keep traffic flowing?

### CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

Using Gaussian elimination on linear systems in three variables, we obtained each of the matrices shown in Exercises 1 through 3. State whether the linear system has one solution, no solution, or infinitely many solutions.

1.  $\left[ \begin{array}{ccc|c} 1 & 1 & 1 & 6 \\ 0 & 1 & 1 & -6 \\ 0 & 0 & 0 & -27 \end{array} \right]$  \_\_\_\_\_

2.  $\left[ \begin{array}{ccc|c} 1 & 1 & 2 & 19 \\ 0 & 1 & 2 & 13 \\ 0 & 0 & 1 & 5 \end{array} \right]$  \_\_\_\_\_

3.  $\left[ \begin{array}{ccc|c} 1 & -1 & -2 & 2 \\ 0 & 1 & -10 & -1 \\ 0 & 0 & 0 & 0 \end{array} \right]$  \_\_\_\_\_

4. True or false: If  $\{(2z + 3, 5z - 1, z)\}$  is the solution set of a system with dependent equations, then  $(5, 4, 1)$  is a solution of this system. \_\_\_\_\_

5. Using Gaussian elimination to solve

$$\begin{cases} 3x + 2y - 2z = 0 \\ x - y + z = 5, \end{cases}$$

we obtain the matrix

$$\left[ \begin{array}{ccc|c} 1 & -1 & 1 & 5 \\ 0 & 1 & -1 & -3 \end{array} \right].$$

Translating this matrix back into equation form gives

$$\begin{cases} \text{_____} & \text{Equation 1} \\ \text{_____} & \text{Equation 2} \end{cases}$$

Solving Equation 2 for  $y$  in terms of  $z$  results in  $y = \text{_____}$ . Substituting this expression for  $y$  in Equation 1 gives  $x = \text{_____}$ . The system's solution set is \_\_\_\_\_.

### EXERCISE SET 8.2

#### Practice Exercises

In Exercises 1–24, use Gaussian elimination to find the complete solution to each system of equations, or show that none exists.

1. 
$$\begin{cases} 5x + 12y + z = 10 \\ 2x + 5y + 2z = -1 \\ x + 2y - 3z = 5 \end{cases}$$
2. 
$$\begin{cases} 2x - 4y + z = 3 \\ x - 3y + z = 5 \\ 3x - 7y + 2z = 12 \end{cases}$$
3. 
$$\begin{cases} 5x + 8y - 6z = 14 \\ 3x + 4y - 2z = 8 \\ x + 2y - 2z = 3 \end{cases}$$
4. 
$$\begin{cases} 5x - 11y + 6z = 12 \\ -x + 3y - 2z = -4 \\ 3x - 5y + 2z = 4 \end{cases}$$
5. 
$$\begin{cases} 3x + 4y + 2z = 3 \\ 4x - 2y - 8z = -4 \\ x + y - z = 3 \end{cases}$$
6. 
$$\begin{cases} 2x - y - z = 0 \\ x + 2y + z = 3 \\ 3x + 4y + 2z = 8 \end{cases}$$
7. 
$$\begin{cases} 8x + 5y + 11z = 30 \\ -x - 4y + 2z = 3 \\ 2x - y + 5z = 12 \end{cases}$$
8. 
$$\begin{cases} x + y - 10z = -4 \\ x - 7z = -5 \\ 3x + 5y - 36z = -10 \end{cases}$$
9. 
$$\begin{cases} w - 2x - y - 3z = -9 \\ w + x - y = 0 \\ 3w + 4x + z = 6 \\ 2x - 2y + z = 3 \end{cases}$$
10. 
$$\begin{cases} 2w + x - 2y - z = 3 \\ w - 2x + y + z = 4 \\ -w - 8x + 7y + 5z = 13 \\ 3w + x - 2y + 2z = 6 \end{cases}$$
11. 
$$\begin{cases} 2w + x - y = 3 \\ w - 3x + 2y = -4 \\ 3w + x - 3y + z = 1 \\ w + 2x - 4y - z = -2 \end{cases}$$
12. 
$$\begin{cases} 2w - x + 3y + z = 0 \\ 3w + 2x + 4y - z = 0 \\ 5w - 2x - 2y - z = 0 \\ 2w + 3x - 7y - 5z = 0 \end{cases}$$
13. 
$$\begin{cases} w - 3x + y - 4z = 4 \\ -2w + x + 2y = -2 \\ 3w - 2x + y - 6z = 2 \\ -w + 3x + 2y - z = -6 \end{cases}$$
14. 
$$\begin{cases} 3w + 2x - y + 2z = -12 \\ 4w - x + y + 2z = 1 \\ w + x + y + z = -2 \\ -2w + 3x + 2y - 3z = 10 \end{cases}$$

15. 
$$\begin{cases} 2x + y - z = 2 \\ 3x + 3y - 2z = 3 \end{cases}$$
16. 
$$\begin{cases} 3x + 2y - z = 5 \\ x + 2y - z = 1 \end{cases}$$
17. 
$$\begin{cases} x + 2y + 3z = 5 \\ y - 5z = 0 \end{cases}$$
18. 
$$\begin{cases} 3x - y + 4z = 8 \\ y + 2z = 1 \end{cases}$$
19. 
$$\begin{cases} x + y - 2z = 2 \\ 3x - y - 6z = -7 \end{cases}$$
20. 
$$\begin{cases} -2x - 5y + 10z = 19 \\ x + 2y - 4z = 12 \end{cases}$$
21. 
$$\begin{cases} w + x - y + z = -2 \\ 2w - x + 2y - z = 7 \\ -w + 2x + y + 2z = -1 \end{cases}$$
22. 
$$\begin{cases} 2w - 3x + 4y + z = 7 \\ w - x + 3y - 5z = 10 \\ 3w + x - 2y - 2z = 6 \end{cases}$$
23. 
$$\begin{cases} w + 2x + 3y - z = 7 \\ 2x - 3y + z = 4 \\ w - 4x + y = 3 \end{cases}$$
24. 
$$\begin{cases} w - x + z = 0 \\ w - 4x + y + 2z = 0 \\ 3w - y + 2z = 0 \end{cases}$$

#### Practice Plus

In Exercises 25–28, the first screen shows the augmented matrix,  $A$ , for a nonsquare linear system of three equations in four variables,  $w, x, y$ , and  $z$ . The second screen shows the reduced row-echelon form of matrix  $A$ . For each exercise,

- a. Write the system represented by  $A$ .
- b. Use the reduced row-echelon form of  $A$  to find the system's complete solution.

25.

$$[A] \begin{bmatrix} 4 & -2 & 2 & -3 & 0 \\ 7 & -1 & -1 & -3 & 0 \\ 1 & 1 & 1 & -1 & 0 \end{bmatrix}$$

$$\text{rref}([A]) \begin{bmatrix} 1 & 0 & 0 & -0.5 & 0 \\ 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & -0.5 & 0 \end{bmatrix}$$

26.

```
[A]
[[2 17 -23 40 0]
 [2 5 1 3 0]
 [0 1 -2 3 0]]
```

```
rref([A])

```

**Application Exercises**

The figure for Exercises 29–32 shows the intersections of three one-way streets. To keep traffic moving, the number of cars per minute entering an intersection must equal the number exiting that intersection. For intersection  $I_1$ ,  $x + 10$  cars enter and  $y + 14$  cars exit per minute. Thus,  $x + 10 = y + 14$ .

29. Write an equation for intersection  $I_2$  that keeps traffic moving.
30. Write an equation for intersection  $I_3$  that keeps traffic moving.
31. Use Gaussian elimination to solve the system formed by the equation given prior to Exercise 29 and the two equations that you obtained in Exercises 29–30.
32. Use your ordered solution obtained in Exercise 31 to solve this exercise. If construction limits  $z$  to 4 cars per minute, how many cars per minute must pass between the other intersections to keep traffic flowing?

33. The figure shows the intersections of four one-way streets.

- a. Set up a system of equations that keeps traffic moving.
  - b. Use Gaussian elimination to solve the system.
  - c. If construction limits  $z$  to 50 cars per hour, how many cars per hour must pass between the other intersections to keep traffic moving?
34. The vitamin content per ounce for three foods is given in the following table.

	Milligrams per Ounce		
	Thiamin	Riboflavin	Niacin
Food A	3	7	1
Food B	1	5	3
Food C	3	8	2

- a. Use matrices to show that no combination of these foods can provide exactly 14 mg of thiamin, 32 mg of riboflavin, and 9 mg of niacin.
  - b. Use matrices to describe in practical terms what happens if the riboflavin requirement is increased by 5 mg and the other requirements stay the same.
35. Three foods have the following nutritional content per ounce.

	Units per Ounce		
	Vitamin A	Iron	Calcium
Food 1	20	20	10
Food 2	30	10	10
Food 3	10	10	30

- a. A diet must consist precisely of 220 units of vitamin A, 180 units of iron, and 340 units of calcium. However, the dietician runs out of Food 1. Use a matrix approach to show that under these conditions the dietary requirements cannot be met.
- b. Now suppose that all three foods are available. Use matrices to give two possible ways to meet the iron and calcium requirements with the three foods.

36. A company that manufactures products *A*, *B*, and *C* does both manufacturing and testing. The hours needed to manufacture and test each product are shown in the table.

	Hours Needed Weekly to Manufacture	Hours Needed Weekly to Test
Product A	7	2
Product B	6	2
Product C	3	1

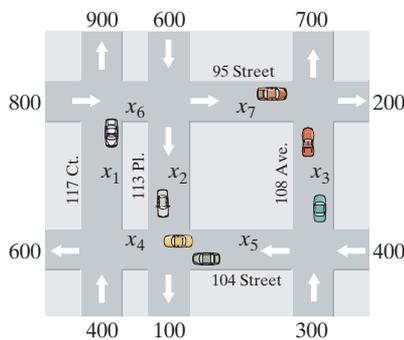

The company has exactly 67 hours per week available for manufacturing and 20 hours per week available for testing. Give two different combinations for the number of products that can be manufactured and tested weekly.

### Writing in Mathematics

37. Describe what happens when Gaussian elimination is used to solve an inconsistent system.
38. Describe what happens when Gaussian elimination is used to solve a system with dependent equations.
39. In solving a system of dependent equations in three variables, one student simply said that there are infinitely many solutions. A second student expressed the solution set as  $\{(4z + 3, 5z - 1, z)\}$ . Which is the better form of expressing the solution set and why?

### Technology Exercise

40. a. The figure shows the intersections of a number of one-way streets. The numbers given represent traffic flow at a peak period (from 4 P.M. to 5:30 P.M.). Use the figure to write a linear system of six equations in seven variables based on the idea that at each intersection the number of cars entering must equal the number of cars leaving.
- b. Use a graphing utility with a **REF** or **RREF** command to find the complete solution to the system.

### Critical Thinking Exercises

**Make Sense?** In Exercises 41–44, determine whether each statement makes sense or does not make sense, and explain your reasoning.

41. I omitted row 3 from  $\left[ \begin{array}{ccc|c} 1 & -1 & -2 & 2 \\ 0 & 1 & -10 & -1 \\ 0 & 0 & 0 & 5 \end{array} \right]$  and expressed the system in the form  $\left[ \begin{array}{ccc|c} 1 & -1 & -2 & 2 \\ 0 & 1 & -10 & -1 \end{array} \right]$ .

42. I omitted row 3 from  $\left[ \begin{array}{ccc|c} 1 & -1 & -2 & 2 \\ 0 & 1 & -10 & -1 \\ 0 & 0 & 0 & 0 \end{array} \right]$  and expressed the system in the form  $\left[ \begin{array}{ccc|c} 1 & -1 & -2 & 2 \\ 0 & 1 & -10 & -1 \end{array} \right]$ .

43. I solved a nonsquare system in which the number of equations was the same as the number of variables.
44. Models for controlling traffic flow are based on an equal number of cars entering an intersection and leaving that intersection.
45. Consider the linear system

$$\begin{cases} x + 3y + z = a^2 \\ 2x + 5y + 2az = 0 \\ x + y + a^2z = -9. \end{cases}$$

For which values of *a* will the system be inconsistent?

### Group Exercise

46. Before beginning this exercise, the group needs to read and solve Exercise 40.
- a. A political group is planning a demonstration on 95th Street between 113th Place and 117th Court for 5 P.M. Wednesday. The problem becomes one of minimizing traffic flow on 95th Street (between 113th and 117th) without causing traffic tie-ups on other streets. One possible solution is to close off traffic on 95th Street between 113th and 117th (let  $x_6 = 0$ ). What can group members conclude about  $x_7$  under these conditions?
- b. Working with a matrix allows us to simplify the problem caused by the political demonstration, but it did not actually solve the problem. There are an infinite number of solutions; each value of  $x_7$  we choose gives us a new picture. We also assumed  $x_6$  was equal to 0; changing that assumption would also lead to different solutions. With your group, design another solution to the traffic flow problem caused by the political demonstration.

### Preview Exercises

Exercises 47–49 will help you prepare for the material covered in the next section. In each exercise, perform the indicated operation or operations.

47.  $-6 - (-5)$
48.  $1(-4) + 2(5) + 3(-6)$
49.  $\frac{1}{2}[8 - (-8)]$

## SECTION 8.3

## Matrix Operations and Their Applications

## Objectives

- 1 Use matrix notation.
- 2 Understand what is meant by equal matrices.
- 3 Add and subtract matrices.
- 4 Perform scalar multiplication.
- 5 Solve matrix equations.
- 6 Multiply matrices.
- 7 Model applied situations with matrix operations.

- 1 Use matrix notation.

Use your smartphone to read your e-mail.

Turn on your computer to write

a paper. When you need to do research, use the Internet to browse through art museums and photography exhibits. When you need a break, load a flight simulator program and fly through a photorealistic computer world.

As different as these experiences may be, they all share one thing—you're looking at images based on

matrices. Matrices have applications in numerous fields, including the technology of digital photography in which pictures are represented by numbers rather than film. In this section, we turn our attention to matrix algebra and some of its applications.

## Notations for Matrices

We have seen that an array of numbers, arranged in rows and columns and placed in brackets, is called a matrix. We can represent a matrix in two different ways.

- A capital letter, such as  $A$ ,  $B$ , or  $C$ , can denote a matrix.
- A lowercase letter enclosed in brackets, such as that shown below, can denote a matrix.

$$A = [a_{ij}]$$

Matrix  $A$  with elements  $a_{ij}$

A general element in matrix  $A$  is denoted by  $a_{ij}$ . This refers to the element in the  $i$ th row and  $j$ th column. For example,  $a_{32}$  is the element of  $A$  located in the third row, second column.

A matrix of **order**  $m \times n$  has  $m$  rows and  $n$  columns. If  $m = n$ , a matrix has the same number of rows as columns and is called a **square matrix**.

## EXAMPLE 1 Matrix Notation

Let

$$A = \begin{bmatrix} 3 & 2 & 0 \\ -4 & -5 & -\frac{1}{5} \end{bmatrix}.$$

- a. What is the order of  $A$ ?
- b. If  $A = [a_{ij}]$ , identify  $a_{23}$  and  $a_{12}$ .

## SOLUTION

a. The matrix has 2 rows and 3 columns, so it is of order  $2 \times 3$ .

b. The element  $a_{23}$  is in the second row and third column. Thus,  $a_{23} = -\frac{1}{5}$ . The element  $a_{12}$  is in the first row and second column. Consequently,  $a_{12} = 2$ .

 Check Point 1 Let

$$A = \begin{bmatrix} 5 & -2 \\ -3 & \pi \\ 1 & 6 \end{bmatrix}.$$

- a. What is the order of  $A$ ?      b. Identify  $a_{12}$  and  $a_{31}$ .

- 2 Understand what is meant by equal matrices.

### Equality of Matrices

Two matrices are **equal** if and only if they have the same order and corresponding elements are equal.

#### Definition of Equality of Matrices

Two matrices  $A$  and  $B$  are **equal** if and only if they have the same order  $m \times n$  and  $a_{ij} = b_{ij}$  for  $i = 1, 2, \dots, m$  and  $j = 1, 2, \dots, n$ .

For example, if  $A = \begin{bmatrix} x & y + 1 \\ z & 6 \end{bmatrix}$  and  $B = \begin{bmatrix} 1 & 5 \\ 3 & 6 \end{bmatrix}$ , then  $A = B$  if and only if  $x = 1$ ,  $y + 1 = 5$  (so  $y = 4$ ), and  $z = 3$ .

- 3 Add and subtract matrices.

### Matrix Addition and Subtraction

**Table 8.1** shows that matrices of the same order can be added or subtracted by simply adding or subtracting corresponding elements.

**Table 8.1** Adding and Subtracting Matrices

Let  $A = [a_{ij}]$  and  $B = [b_{ij}]$  be matrices of order  $m \times n$ .

Definition	The Definition in Words	Example
<p><i>Matrix Addition</i></p> $A + B = [a_{ij} + b_{ij}]$	Matrices of the same order are added by adding the elements in corresponding positions.	$\begin{bmatrix} 1 & -2 \\ 3 & 5 \end{bmatrix} + \begin{bmatrix} -1 & 6 \\ 0 & 4 \end{bmatrix}$ $= \begin{bmatrix} 1 + (-1) & -2 + 6 \\ 3 + 0 & 5 + 4 \end{bmatrix} = \begin{bmatrix} 0 & 4 \\ 3 & 9 \end{bmatrix}$
<p><i>Matrix Subtraction</i></p> $A - B = [a_{ij} - b_{ij}]$	Matrices of the same order are subtracted by subtracting the elements in corresponding positions.	$\begin{bmatrix} 1 & -2 \\ 3 & 5 \end{bmatrix} - \begin{bmatrix} -1 & 6 \\ 0 & 4 \end{bmatrix}$ $= \begin{bmatrix} 1 - (-1) & -2 - 6 \\ 3 - 0 & 5 - 4 \end{bmatrix} = \begin{bmatrix} 2 & -8 \\ 3 & 1 \end{bmatrix}$

The sum or difference of two matrices of different orders is undefined. For example, consider the matrices

$$A = \begin{bmatrix} 0 & 3 \\ 4 & 3 \end{bmatrix} \quad \text{and} \quad B = \begin{bmatrix} 1 & 9 \\ 4 & 5 \\ 2 & 3 \end{bmatrix}.$$

The order of  $A$  is  $2 \times 2$ ; the order of  $B$  is  $3 \times 2$ . These matrices are of different orders and cannot be added or subtracted.

**TECHNOLOGY**

Graphing utilities can add and subtract matrices. Enter the matrices and name them  $[A]$  and  $[B]$ . Then use a keystroke sequence similar to

$$[A] + [B] \text{ ENTER}$$

$$[A] - [B] \text{ ENTER}$$

Consult your manual and verify the results in Example 2.

**EXAMPLE 2** Adding and Subtracting Matrices

Perform the indicated matrix operations:

$$\text{a. } \begin{bmatrix} 0 & 5 & 3 \\ -2 & 6 & -8 \end{bmatrix} + \begin{bmatrix} -2 & 3 & 5 \\ 7 & -9 & 6 \end{bmatrix}$$

$$\text{b. } \begin{bmatrix} -6 & 7 \\ 2 & -3 \end{bmatrix} - \begin{bmatrix} -5 & 6 \\ 0 & -4 \end{bmatrix}$$

**SOLUTION**

$$\text{a. } \begin{bmatrix} 0 & 5 & 3 \\ -2 & 6 & -8 \end{bmatrix} + \begin{bmatrix} -2 & 3 & 5 \\ 7 & -9 & 6 \end{bmatrix}$$

$$= \begin{bmatrix} 0 + (-2) & 5 + 3 & 3 + 5 \\ -2 + 7 & 6 + (-9) & -8 + 6 \end{bmatrix} \quad \begin{array}{l} \text{Add the corresponding elements} \\ \text{in the } 2 \times 3 \text{ matrices.} \end{array}$$

$$= \begin{bmatrix} -2 & 8 & 8 \\ 5 & -3 & -2 \end{bmatrix} \quad \text{Simplify.}$$

$$\text{b. } \begin{bmatrix} -6 & 7 \\ 2 & -3 \end{bmatrix} - \begin{bmatrix} -5 & 6 \\ 0 & -4 \end{bmatrix}$$

$$= \begin{bmatrix} -6 - (-5) & 7 - 6 \\ 2 - 0 & -3 - (-4) \end{bmatrix} \quad \begin{array}{l} \text{Subtract the corresponding elements} \\ \text{in the } 2 \times 2 \text{ matrices.} \end{array}$$

$$= \begin{bmatrix} -1 & 1 \\ 2 & 1 \end{bmatrix} \quad \text{Simplify.} \quad \dots$$

 **Check Point 2** Perform the indicated matrix operations:

$$\text{a. } \begin{bmatrix} -4 & 3 \\ 7 & -6 \end{bmatrix} + \begin{bmatrix} 6 & -3 \\ 2 & -4 \end{bmatrix} \quad \text{b. } \begin{bmatrix} 5 & 4 \\ -3 & 7 \\ 0 & 1 \end{bmatrix} - \begin{bmatrix} -4 & 8 \\ 6 & 0 \\ -5 & 3 \end{bmatrix}$$

A matrix whose elements are all equal to 0 is called a **zero matrix**. If  $A$  is an  $m \times n$  matrix and  $0$  is the  $m \times n$  zero matrix, then  $A + 0 = A$ . For example,

$$\begin{bmatrix} -5 & 2 \\ 3 & 6 \end{bmatrix} + \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} = \begin{bmatrix} -5 & 2 \\ 3 & 6 \end{bmatrix}$$

The  $m \times n$  zero matrix is called the **additive identity** for  $m \times n$  matrices.

For any matrix  $A$ , the **additive inverse** of  $A$ , written  $-A$ , is the matrix with the same order as  $A$  such that every element of  $-A$  is the opposite of the corresponding element of  $A$ . Because corresponding elements are added in matrix addition,  $A + (-A)$  is a zero matrix. For example,

$$\begin{bmatrix} -5 & 2 \\ 3 & 6 \end{bmatrix} + \begin{bmatrix} 5 & -2 \\ -3 & -6 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$$

Properties of matrix addition are similar to properties for adding real numbers.

**Properties of Matrix Addition**

If  $A$ ,  $B$ , and  $C$  are  $m \times n$  matrices and  $0$  is the  $m \times n$  zero matrix, then the following properties are true.

1.  $A + B = B + A$  Commutative property of addition
2.  $(A + B) + C = A + (B + C)$  Associative property of addition
3.  $A + 0 = 0 + A = A$  Additive identity property
4.  $A + (-A) = (-A) + A = 0$  Additive inverse property

## 4 Perform scalar multiplication.

## Scalar Multiplication

A matrix of order  $1 \times 1$ , such as  $[6]$ , contains only one entry. To distinguish this matrix from the number 6, we refer to 6 as a **scalar**. In general, in our work with matrices, we will refer to real numbers as scalars.

To multiply a matrix  $A$  by a scalar  $c$ , we multiply each entry in  $A$  by  $c$ . For example,

$$4 \begin{bmatrix} 2 & 5 \\ -3 & 0 \end{bmatrix} = \begin{bmatrix} 4(2) & 4(5) \\ 4(-3) & 4(0) \end{bmatrix} = \begin{bmatrix} 8 & 20 \\ -12 & 0 \end{bmatrix}.$$

Scalar      Matrix

## Definition of Scalar Multiplication

If  $A = [a_{ij}]$  is a matrix of order  $m \times n$  and  $c$  is a scalar, then the matrix  $cA$  is the  $m \times n$  matrix given by

$$cA = [ca_{ij}].$$

This matrix is obtained by multiplying each element of  $A$  by the real number  $c$ . We call  $cA$  a **scalar multiple** of  $A$ .

## EXAMPLE 3 Scalar Multiplication

If  $A = \begin{bmatrix} -1 & 4 \\ 3 & 0 \end{bmatrix}$  and  $B = \begin{bmatrix} 2 & -3 \\ 5 & -6 \end{bmatrix}$ , find the following matrices:

- a.  $-5B$       b.  $2A + 3B$ .

## SOLUTION

$$\text{a. } -5B = -5 \begin{bmatrix} 2 & -3 \\ 5 & -6 \end{bmatrix} = \begin{bmatrix} -5(2) & -5(-3) \\ -5(5) & -5(-6) \end{bmatrix} = \begin{bmatrix} -10 & 15 \\ -25 & 30 \end{bmatrix}$$

Multiply each element by  $-5$ .

$$\begin{aligned} \text{b. } 2A + 3B &= 2 \begin{bmatrix} -1 & 4 \\ 3 & 0 \end{bmatrix} + 3 \begin{bmatrix} 2 & -3 \\ 5 & -6 \end{bmatrix} \\ &= \begin{bmatrix} 2(-1) & 2(4) \\ 2(3) & 2(0) \end{bmatrix} + \begin{bmatrix} 3(2) & 3(-3) \\ 3(5) & 3(-6) \end{bmatrix} \end{aligned}$$

Multiply each element in  $A$  by 2.

Multiply each element in  $B$  by 3.

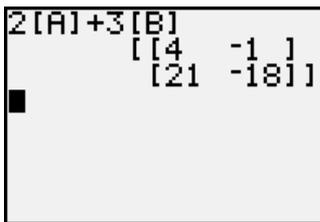

$$= \begin{bmatrix} -2 & 8 \\ 6 & 0 \end{bmatrix} + \begin{bmatrix} 6 & -9 \\ 15 & -18 \end{bmatrix} = \begin{bmatrix} -2 + 6 & 8 + (-9) \\ 6 + 15 & 0 + (-18) \end{bmatrix}$$

Perform the addition of these  $2 \times 2$  matrices by adding corresponding elements.

$$= \begin{bmatrix} 4 & -1 \\ 21 & -18 \end{bmatrix} \quad \dots$$

## TECHNOLOGY

You can verify the algebraic solution in Example 3(b) by first entering the matrices  $[A]$  and  $[B]$  into your graphing utility. The screen below shows the required computation.

**Check Point 3** If  $A = \begin{bmatrix} -4 & 1 \\ 3 & 0 \end{bmatrix}$  and  $B = \begin{bmatrix} -1 & -2 \\ 8 & 5 \end{bmatrix}$ , find the following matrices:

- a.  $-6B$       b.  $3A + 2B$ .

**DISCOVERY**

Verify each of the four properties listed in the box using

$$A = \begin{bmatrix} 2 & -4 \\ -5 & 3 \end{bmatrix},$$

$$B = \begin{bmatrix} 4 & 0 \\ 1 & -6 \end{bmatrix},$$

$c = 4$ , and  $d = 2$ .

Properties of scalar multiplication are similar to properties for multiplying real numbers.

**Properties of Scalar Multiplication**

If  $A$  and  $B$  are  $m \times n$  matrices, and  $c$  and  $d$  are scalars, then the following properties are true.

1.  $(cd)A = c(dA)$  Associative property of scalar multiplication
2.  $1A = A$  Scalar identity property
3.  $c(A + B) = cA + cB$  Distributive property
4.  $(c + d)A = cA + dA$  Distributive property

**5** Solve matrix equations.

Have you noticed the many similarities between addition of real numbers and matrix addition, subtraction of real numbers and matrix subtraction, and multiplication of real numbers and scalar multiplication? Example 4 shows how these similarities can be used to solve matrix equations involving matrix addition, matrix subtraction, and scalar multiplication.

**EXAMPLE 4** Solving a Matrix Equation

Solve for  $X$  in the matrix equation

$$2X + A = B,$$

where  $A = \begin{bmatrix} 1 & -5 \\ 0 & 2 \end{bmatrix}$  and  $B = \begin{bmatrix} -6 & 5 \\ 9 & 1 \end{bmatrix}$ .

**SOLUTION**

We begin by solving the matrix equation for  $X$ .

$$2X + A = B \quad \text{This is the given matrix equation.}$$

$$2X = B - A \quad \text{Subtract matrix } A \text{ from both sides.}$$

We multiply both sides by  $\frac{1}{2}$  rather than divide both sides by 2. This is in anticipation of performing scalar multiplication.

$$X = \frac{1}{2}(B - A) \quad \text{Multiply both sides by } \frac{1}{2} \text{ and solve for matrix } X.$$

Now we use the matrices  $A$  and  $B$  to find the matrix  $X$ .

$$X = \frac{1}{2} \left( \begin{bmatrix} -6 & 5 \\ 9 & 1 \end{bmatrix} - \begin{bmatrix} 1 & -5 \\ 0 & 2 \end{bmatrix} \right) \quad \text{Substitute the matrices into } X = \frac{1}{2}(B - A).$$

$$= \frac{1}{2} \begin{bmatrix} -7 & 10 \\ 9 & -1 \end{bmatrix} \quad \text{Subtract matrices by subtracting corresponding elements.}$$

$$= \begin{bmatrix} -\frac{7}{2} & 5 \\ \frac{9}{2} & -\frac{1}{2} \end{bmatrix} \quad \text{Perform the scalar multiplication by multiplying each element by } \frac{1}{2}.$$

Take a few minutes to show that this matrix satisfies the given equation  $2X + A = B$ . Substitute the matrix for  $X$  and the given matrices for  $A$  and  $B$  into the equation. The matrices on each side of the equal sign,  $2X + A$  and  $B$ , should be equal. ●●●

 **Check Point 4** Solve for  $X$  in the matrix equation  $3X + A = B$ , where

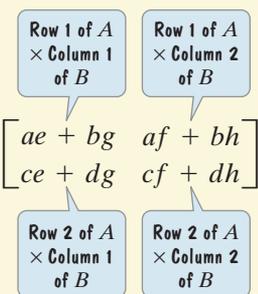

$$A = \begin{bmatrix} 2 & -8 \\ 0 & 4 \end{bmatrix} \quad \text{and} \quad B = \begin{bmatrix} -10 & 1 \\ -9 & 17 \end{bmatrix}.$$

**6** Multiply matrices.

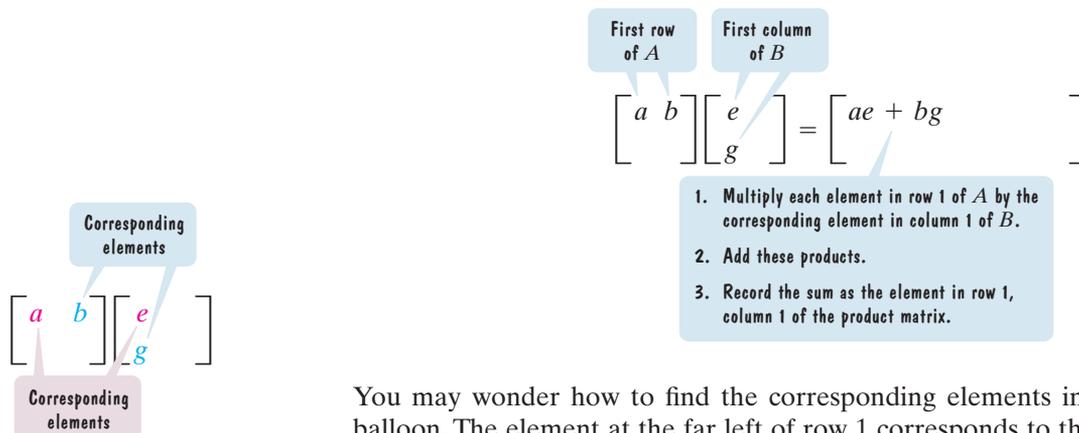

### Matrix Multiplication

We do not multiply two matrices by multiplying the corresponding entries of the matrices. Instead, we must think of matrix multiplication as *row-by-column multiplication*. To better understand how this works, let's begin with the definition of matrix multiplication for matrices of order  $2 \times 2$ .

#### Definition of Matrix Multiplication: $2 \times 2$ Matrices

$$AB = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} e & f \\ g & h \end{bmatrix} = \begin{bmatrix} ae + bg & af + bh \\ ce + dg & cf + dh \end{bmatrix}$$

Notice that we obtain the element in the  $i$ th row and  $j$ th column in  $AB$  by performing computations with elements in the  $i$ th row of  $A$  and the  $j$ th column of  $B$ . For example, we obtain the element in the first row and first column of  $AB$  by performing computations with elements in the first row of  $A$  and the first column of  $B$ .

**FIGURE 8.6** Finding corresponding elements when multiplying matrices

You may wonder how to find the corresponding elements in step 1 in the voice balloon. The element at the far left of row 1 corresponds to the element at the top of column 1. The second element from the left of row 1 corresponds to the second element from the top of column 1. This is illustrated in **Figure 8.6**.

#### EXAMPLE 5 Multiplying Matrices

Find  $AB$ , given

$$A = \begin{bmatrix} 2 & 3 \\ 4 & 7 \end{bmatrix} \quad \text{and} \quad B = \begin{bmatrix} 0 & 1 \\ 5 & 6 \end{bmatrix}.$$

## SOLUTION

We will perform a row-by-column computation.

$$\begin{aligned}
 AB &= \begin{bmatrix} 2 & 3 \\ 4 & 7 \end{bmatrix} \begin{bmatrix} 0 & 1 \\ 5 & 6 \end{bmatrix} \\
 &= \begin{bmatrix} 2(0) + 3(5) & 2(1) + 3(6) \\ 4(0) + 7(5) & 4(1) + 7(6) \end{bmatrix} = \begin{bmatrix} 15 & 20 \\ 35 & 46 \end{bmatrix}
 \end{aligned}$$

Row 1 of  $A \times$  Column 1 of  $B$ 
Row 1 of  $A \times$  Column 2 of  $B$

Row 2 of  $A \times$  Column 1 of  $B$ 
Row 2 of  $A \times$  Column 2 of  $B$

**Check Point 5** Find  $AB$ , given  $A = \begin{bmatrix} 1 & 3 \\ 2 & 5 \end{bmatrix}$  and  $B = \begin{bmatrix} 4 & 6 \\ 1 & 0 \end{bmatrix}$ .

We can generalize the process of Example 5 to multiply an  $m \times n$  matrix and an  $n \times p$  matrix. **For the product of two matrices to be defined, the number of columns of the first matrix must equal the number of rows of the second matrix.**

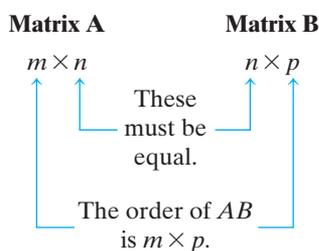

**First Matrix**      **Second Matrix**  
 $m \times n$                $n \times p$

The number of columns in the first matrix must be the same as the number of rows in the second matrix.

## GREAT QUESTION!

**Is there a diagram I can use to determine the order of the matrix product  $AB$ ?**

Yes. The following diagram illustrates the first sentence in the box defining matrix multiplication.

## Definition of Matrix Multiplication

The **product** of an  $m \times n$  matrix,  $A$ , and an  $n \times p$  matrix,  $B$ , is an  $m \times p$  matrix,  $AB$ , whose elements are found as follows: The element in the  $i$ th row and  $j$ th column of  $AB$  is found by multiplying each element in the  $i$ th row of  $A$  by the corresponding element in the  $j$ th column of  $B$  and adding the products.

To find a product  $AB$ , each row of  $A$  must have the same number of elements as each column of  $B$ . We obtain  $p_{ij}$ , the element in the  $i$ th row and  $j$ th column in  $AB$ , by performing computations with elements in the  $i$ th row of  $A$  and the  $j$ th column of  $B$ :

$\begin{bmatrix} \text{ith row of } A \end{bmatrix} \begin{bmatrix} \text{jth column of } B \end{bmatrix} = \begin{bmatrix} \text{Element in the } i\text{th row and } j\text{th column of } AB \end{bmatrix}$

When multiplying corresponding elements, keep in mind that the element at the far left of row  $i$  corresponds to the element at the top of column  $j$ . The element second from the left in row  $i$  corresponds to the element second from the top in column  $j$ . Likewise, the element third from the left in row  $i$  corresponds to the element third from the top in column  $j$ , and so on.

## EXAMPLE 6 Multiplying Matrices

Matrices  $A$  and  $B$  are defined as follows:

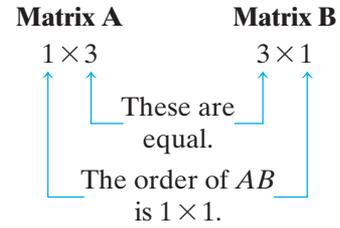

$$A = [1 \quad 2 \quad 3] \quad B = \begin{bmatrix} 4 \\ 5 \\ 6 \end{bmatrix}.$$

Find each product:    **a.**  $AB$       **b.**  $BA$ .

**SOLUTION**

- a. Matrix  $A$  is a  $1 \times 3$  matrix and matrix  $B$  is a  $3 \times 1$  matrix. Thus, the product  $AB$  is a  $1 \times 1$  matrix.

$$A = [1 \ 2 \ 3] \quad B = \begin{bmatrix} 4 \\ 5 \\ 6 \end{bmatrix}$$

$$\begin{aligned} AB &= [1 \ 2 \ 3] \begin{bmatrix} 4 \\ 5 \\ 6 \end{bmatrix} \\ &= [(1)(4) + (2)(5) + (3)(6)] \\ &= [4 + 10 + 18] \\ &= [32] \end{aligned}$$

We will perform a row-by-column computation.

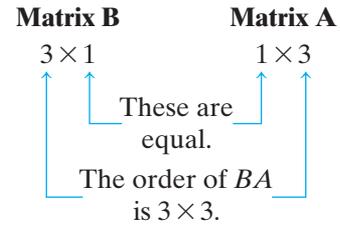

Multiply elements in row 1 of  $A$  by corresponding elements in column 1 of  $B$  and add the products.

Perform the multiplications.

Add.

- b. Matrix  $B$  is a  $3 \times 1$  matrix and matrix  $A$  is a  $1 \times 3$  matrix. Thus, the product  $BA$  is a  $3 \times 3$  matrix.

$$B = \begin{bmatrix} 4 \\ 5 \\ 6 \end{bmatrix} \quad A = [1 \ 2 \ 3]$$

$$BA = \begin{bmatrix} 4 \\ 5 \\ 6 \end{bmatrix} [1 \ 2 \ 3]$$

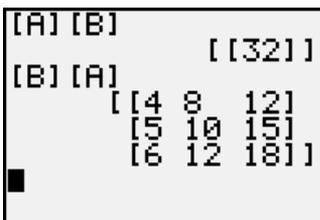

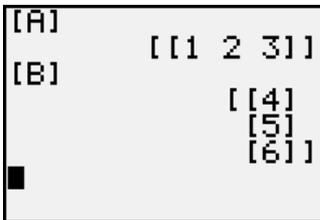

We perform a row-by-column computation.

$$\begin{aligned} &= \begin{matrix} \text{Row 1 of } B \times \text{Column 1 of } A & \text{Row 1 of } B \times \text{Column 2 of } A & \text{Row 1 of } B \times \text{Column 3 of } A \\ \text{Row 2 of } B \times \text{Column 1 of } A & \text{Row 2 of } B \times \text{Column 2 of } A & \text{Row 2 of } B \times \text{Column 3 of } A \\ \text{Row 3 of } B \times \text{Column 1 of } A & \text{Row 3 of } B \times \text{Column 2 of } A & \text{Row 3 of } B \times \text{Column 3 of } A \end{matrix} \begin{bmatrix} (4)(1) & (4)(2) & (4)(3) \\ (5)(1) & (5)(2) & (5)(3) \\ (6)(1) & (6)(2) & (6)(3) \end{bmatrix} \\ &= \begin{bmatrix} 4 & 8 & 12 \\ 5 & 10 & 15 \\ 6 & 12 & 18 \end{bmatrix} \end{aligned}$$

Simplify.

**TECHNOLOGY**

The screens illustrate the solution of Example 6 using a graphing utility.

In Example 6, did you notice that  $AB$  and  $BA$  are different matrices? For most matrices  $A$  and  $B$ ,  $AB \neq BA$ . Because **matrix multiplication is not commutative**, be careful about the order in which matrices appear when performing this operation.

**Check Point 6** If  $A = [2 \ 0 \ 4]$  and  $B = \begin{bmatrix} 1 \\ 3 \\ 7 \end{bmatrix}$ , find  $AB$  and  $BA$ .

*Blitzer Bonus*  
Arthur Cayley

Matrices were first studied intensively by the English mathematician Arthur Cayley (1821–1895). Before reaching the age of 25, he published 25 papers, setting a pattern of prolific creativity that lasted throughout his life. Cayley was a lawyer, painter, mountaineer, and Cambridge professor whose greatest invention was that of matrices and matrix theory. Cayley's matrix algebra, especially the noncommutativity of multiplication ( $AB \neq BA$ ), opened up a new area of mathematics called abstract algebra.

### EXAMPLE 7 Multiplying Matrices

Where possible, find each product:

a.  $\begin{bmatrix} 4 & 2 \\ 1 & 3 \end{bmatrix} \begin{bmatrix} 1 & 2 & 3 & 4 \\ 0 & 2 & -1 & 6 \end{bmatrix}$       b.  $\begin{bmatrix} 1 & 2 & 3 & 4 \\ 0 & 2 & -1 & 6 \end{bmatrix} \begin{bmatrix} 4 & 2 \\ 1 & 3 \end{bmatrix}$ .

### SOLUTION

- a. The first matrix is a  $2 \times 2$  matrix and the second is a  $2 \times 4$  matrix. The product will be a  $2 \times 4$  matrix.

**First Matrix**      **Second Matrix**  
 $2 \times 2$                    $2 \times 4$   
 These are equal.  
 The order of the product is  $2 \times 4$ .

$\begin{bmatrix} 4 & 2 \\ 1 & 3 \end{bmatrix} \begin{bmatrix} 1 & 2 & 3 & 4 \\ 0 & 2 & -1 & 6 \end{bmatrix}$       We perform a row-by-column computation.

$$= \begin{bmatrix} \text{Row 1} \times \text{Column 1} & \text{Row 1} \times \text{Column 2} & \text{Row 1} \times \text{Column 3} & \text{Row 1} \times \text{Column 4} \\ 4(1) + 2(0) & 4(2) + 2(2) & 4(3) + 2(-1) & 4(4) + 2(6) \\ \text{Row 2} \times \text{Column 1} & \text{Row 2} \times \text{Column 2} & \text{Row 2} \times \text{Column 3} & \text{Row 2} \times \text{Column 4} \\ 1(1) + 3(0) & 1(2) + 3(2) & 1(3) + 3(-1) & 1(4) + 3(6) \end{bmatrix}$$

$$= \begin{bmatrix} 4 + 0 & 8 + 4 & 12 - 2 & 16 + 12 \\ 1 + 0 & 2 + 6 & 3 - 3 & 4 + 18 \end{bmatrix}$$

$$= \begin{bmatrix} 4 & 12 & 10 & 28 \\ 1 & 8 & 0 & 22 \end{bmatrix}$$

b.  $\begin{bmatrix} 1 & 2 & 3 & 4 \\ 0 & 2 & -1 & 6 \end{bmatrix} \begin{bmatrix} 4 & 2 \\ 1 & 3 \end{bmatrix}$       **First matrix**      **Second matrix**  
 $2 \times 4$                    $2 \times 2$

These numbers must be the same to multiply the matrices.

The number of columns in the first matrix does not equal the number of rows in the second matrix. Thus, the product of these two matrices is undefined. ●●●

### Check Point 7 Where possible, find each product:

a.  $\begin{bmatrix} 1 & 3 \\ 0 & 2 \end{bmatrix} \begin{bmatrix} 2 & 3 & -1 & 6 \\ 0 & 5 & 4 & 1 \end{bmatrix}$       b.  $\begin{bmatrix} 2 & 3 & -1 & 6 \\ 0 & 5 & 4 & 1 \end{bmatrix} \begin{bmatrix} 1 & 3 \\ 0 & 2 \end{bmatrix}$ .

Although matrix multiplication is not commutative, it does obey many of the properties of real numbers.

## DISCOVERY

Verify the properties listed in the box using

$$A = \begin{bmatrix} 3 & 2 \\ -1 & 4 \end{bmatrix},$$

$$B = \begin{bmatrix} 1 & 0 \\ 3 & 2 \end{bmatrix},$$

$$C = \begin{bmatrix} 1 & 2 \\ -1 & 1 \end{bmatrix},$$

and  $c = 3$ .

- 7 Model applied situations with matrix operations.

## Properties of Matrix Multiplication

If  $A$ ,  $B$ , and  $C$  are matrices and  $c$  is a scalar, then the following properties are true. (Assume the order of each matrix is such that all operations in these properties are defined.)

- $(AB)C = A(BC)$  *Associative property of matrix multiplication*
- $A(B + C) = AB + AC$  *Distributive properties of matrix multiplication*  
 $(A + B)C = AC + BC$
- $c(AB) = (cA)B$  *Associative property of scalar multiplication*

## Applications

All of the still images that you see on the Web have been created or manipulated on a computer in a digital format—made up of hundreds of thousands, or even millions, of tiny squares called **pixels**. Pixels are created by dividing an image into a grid. The computer can change the brightness of every square or pixel in this grid. A digital camera captures photos in this digital format. Also, you can scan pictures to convert them into digital format. Example 8 illustrates the role that matrices play in this technology.

### EXAMPLE 8 Matrices and Digital Photography

The letter L in **Figure 8.7** is shown using 9 pixels in a  $3 \times 3$  grid. The colors possible in the grid are shown in **Figure 8.8**. Each color is represented by a specific number: 0, 1, 2, or 3.

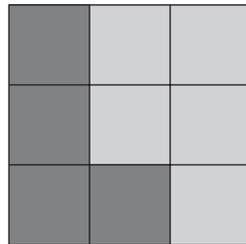

FIGURE 8.7 The letter L

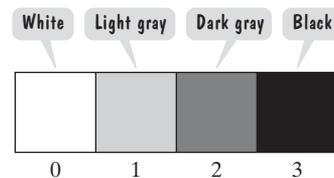

FIGURE 8.8 Color levels

- Find a matrix that represents a digital photograph of this letter L.
- Increase the contrast of the letter L by changing the dark gray to black and the light gray to white. Use matrix addition to accomplish this.

## SOLUTION

- Look at the L and the background in **Figure 8.7**. Because the L is dark gray, color level 2, and the background is light gray, color level 1, a digital photograph of **Figure 8.7** can be represented by the matrix

$$\begin{bmatrix} 2 & 1 & 1 \\ 2 & 1 & 1 \\ 2 & 2 & 1 \end{bmatrix}.$$

- We can make the L black, color level 3, by increasing each 2 in the above matrix to 3. We can make the background white, color level 0, by decreasing each 1 in the above matrix to 0. This is accomplished using the following matrix addition:

$$\begin{bmatrix} 2 & 1 & 1 \\ 2 & 1 & 1 \\ 2 & 2 & 1 \end{bmatrix} + \begin{bmatrix} 1 & -1 & -1 \\ 1 & -1 & -1 \\ 1 & 1 & -1 \end{bmatrix} = \begin{bmatrix} 3 & 0 & 0 \\ 3 & 0 & 0 \\ 3 & 3 & 0 \end{bmatrix}.$$

The picture corresponding to the matrix sum to the right of the equal sign is shown in **Figure 8.9**.

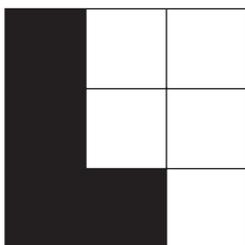

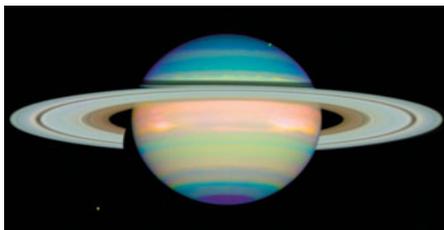

FIGURE 8.9 Changing contrast: the letter L

 **Check Point 8** Change the contrast of the letter L in **Figure 8.7** on the previous page by making the L light gray and the background black. Use matrix addition to accomplish this.

*Blitzer Bonus* || Images of Space

Photographs sent back from space use matrices with thousands of pixels. Each pixel is assigned a number from 0 to 63 representing its color—0 for pure white and 63 for pure black. In the image of Saturn shown here, matrix operations provide false colors that emphasize the banding of the planet's upper atmosphere.

We have seen how functions can be transformed using translations, reflections, stretching, and shrinking. In a similar way, matrix operations are used to transform and manipulate computer graphics.

**EXAMPLE 9** Transformations of an Image

The quadrilateral in **Figure 8.10** can be represented by the matrix

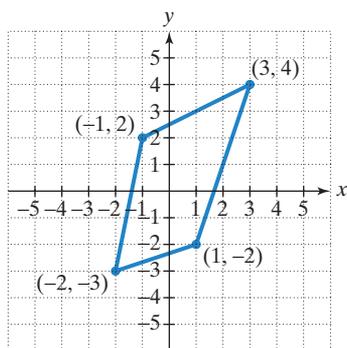

FIGURE 8.10

$$A = \begin{bmatrix} -2 & -1 & 3 & 1 \\ -3 & 2 & 4 & -2 \end{bmatrix}$$

Coordinates of vertices

x-coordinates  
y-coordinates

Each column in the matrix gives the coordinates of a vertex, or corner, of the quadrilateral. Use matrix operations to perform the following transformations:

- Move the quadrilateral 4 units to the right and 1 unit down.
- Shrink the quadrilateral to half its perimeter.
- Let  $B = \begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix}$ . Find  $BA$ . What effect does this have on the quadrilateral in **Figure 8.10**?

**SOLUTION**

- We translate the quadrilateral 4 units right and 1 unit down by adding 4 to each  $x$ -coordinate and subtracting 1 from each  $y$ -coordinate. This is accomplished using the following matrix addition:

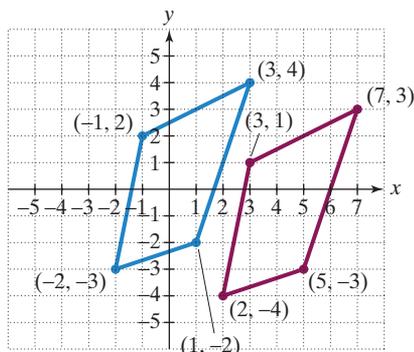

FIGURE 8.11 Shifting the quadrilateral 4 units right and 1 unit down

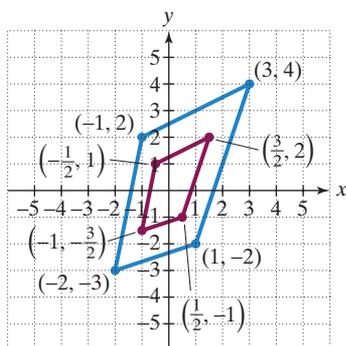

$$\begin{bmatrix} -2 & -1 & 3 & 1 \\ -3 & 2 & 4 & -2 \end{bmatrix} + \begin{bmatrix} 4 & 4 & 4 & 4 \\ -1 & -1 & -1 & -1 \end{bmatrix} = \begin{bmatrix} 2 & 3 & 7 & 5 \\ -4 & 1 & 3 & -3 \end{bmatrix}$$

This matrix represents the original quadrilateral.

Shift 4 units to the right and 1 unit down.

This matrix represents the translated quadrilateral.

Each column in the matrix on the right gives the coordinates of a vertex of the translated quadrilateral. The original quadrilateral and the translated image are shown in **Figure 8.11**.

**FIGURE 8.12** Shrinking the quadrilateral to half the original perimeter

- b. We shrink the quadrilateral in **Figure 8.10**, shown in blue in **Figure 8.12**, to half its perimeter by multiplying each  $x$ -coordinate and each  $y$ -coordinate by  $\frac{1}{2}$ . This is accomplished using the following scalar multiplication:

$$\frac{1}{2} \begin{bmatrix} -2 & -1 & 3 & 1 \\ -3 & 2 & 4 & -2 \end{bmatrix} = \begin{bmatrix} -1 & -\frac{1}{2} & \frac{3}{2} & \frac{1}{2} \\ -\frac{3}{2} & 1 & 2 & -1 \end{bmatrix}.$$

This matrix represents the original quadrilateral.

This matrix represents the quadrilateral with half the original perimeter.

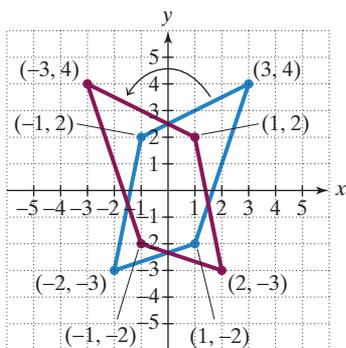

Each column in the matrix on the right gives the coordinates of a vertex of the reduced quadrilateral. The original quadrilateral and the reduced image are shown in **Figure 8.12**.

- c. We begin by finding  $BA$ . Keep in mind that  $A$  represents the original quadrilateral, shown in blue in **Figure 8.13**.

$$\begin{aligned} BA &= \begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} -2 & -1 & 3 & 1 \\ -3 & 2 & 4 & -2 \end{bmatrix} \\ &= \begin{bmatrix} (-1)(-2) + 0(-3) & (-1)(-1) + 0(2) & (-1)(3) + 0(4) & (-1)(1) + 0(-2) \\ 0(-2) + 1(-3) & 0(-1) + 1(2) & 0(3) + 1(4) & 0(1) + 1(-2) \end{bmatrix} \\ &= \begin{bmatrix} 2 & 1 & -3 & -1 \\ -3 & 2 & 4 & -2 \end{bmatrix} \end{aligned}$$

Each column in the matrix multiplication gives the coordinates of a vertex of the transformed image. The original quadrilateral and this transformed image are shown in **Figure 8.13**. Notice that each  $x$ -coordinate on the original blue image is replaced with its opposite on the transformed red image.

We can conclude that multiplication by  $\begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix}$  reflected the blue quadrilateral about the  $y$ -axis. ●●●

**FIGURE 8.13**

- Check Point 9** Consider the triangle represented by the matrix

$$A = \begin{bmatrix} 0 & 3 & 4 \\ 0 & 5 & 2 \end{bmatrix}.$$

Use matrix operations to perform the following transformations:

- Move the triangle 3 units to the left and 1 unit down.
- Enlarge the triangle to twice its original perimeter.

Illustrate your results in parts (a) and (b) by showing the original triangle and the transformed image in a rectangular coordinate system.

- Let  $B = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$ . Find  $BA$ . What effect does this have on the original triangle?

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- The notation  $a_{34}$  refers to the element in the \_\_\_\_\_ row and \_\_\_\_\_ column of a matrix.
- The order of  $A = \begin{bmatrix} 2 & 3 & 7 \end{bmatrix}$  is \_\_\_\_\_.
- A matrix that has the same number of rows as columns is called a/an \_\_\_\_\_ matrix.
- If  $\begin{bmatrix} 3 & x \\ y & -7 \end{bmatrix} = \begin{bmatrix} 3 & -10 \\ 6 & -7 \end{bmatrix}$ , then  $x =$  \_\_\_\_\_ and  $y =$  \_\_\_\_\_.
- True or false: Matrix addition is commutative. \_\_\_\_\_

6. True or false: Matrices of different orders can be added. \_\_\_\_\_
7. True or false: The scalar multiple  $-4A$  is obtained by multiplying each element of  $A$  by  $-4$ . \_\_\_\_\_
8. If  $A$  is an  $m \times n$  matrix and  $B$  is an  $n \times p$  matrix, then  $AB$  is defined as an  $\_\_\_ \times \_\_\_$  matrix. To find the product  $AB$ , the number of  $\_\_\_\_\_\_$  in matrix  $A$  must equal the number of  $\_\_\_\_\_\_$  in matrix  $B$ .
9. True or false: Matrices of different orders can sometimes be multiplied. \_\_\_\_\_
10. True or false: Matrix multiplication is commutative. \_\_\_\_\_

## EXERCISE SET 8.3

## Practice Exercises

In Exercises 1–4,

- a. Give the order of each matrix.
- b. If  $A = [a_{ij}]$ , identify  $a_{32}$  and  $a_{23}$ , or explain why identification is not possible.

$$1. \begin{bmatrix} 4 & -7 & 5 \\ -6 & 8 & -1 \end{bmatrix} \quad 2. \begin{bmatrix} -6 & 4 & -1 \\ -9 & 0 & \frac{1}{2} \end{bmatrix}$$

$$3. \begin{bmatrix} 1 & -5 & \pi & e \\ 0 & 7 & -6 & -\pi \\ -2 & \frac{1}{2} & 11 & -\frac{1}{5} \end{bmatrix} \quad 4. \begin{bmatrix} -4 & 1 & 3 & -5 \\ 2 & -1 & \pi & 0 \\ 1 & 0 & -e & \frac{1}{5} \end{bmatrix}$$

In Exercises 5–8, find values for the variables so that the matrices in each exercise are equal.

$$5. \begin{bmatrix} x \\ 4 \end{bmatrix} = \begin{bmatrix} 6 \\ y \end{bmatrix} \quad 6. \begin{bmatrix} x \\ 7 \end{bmatrix} = \begin{bmatrix} 11 \\ y \end{bmatrix}$$

$$7. \begin{bmatrix} x & 2y \\ z & 9 \end{bmatrix} = \begin{bmatrix} 4 & 12 \\ 3 & 9 \end{bmatrix} \quad 8. \begin{bmatrix} x & y+3 \\ 2z & 8 \end{bmatrix} = \begin{bmatrix} 12 & 5 \\ 6 & 8 \end{bmatrix}$$

In Exercises 9–16, find the following matrices:

a.  $A + B$                       b.  $A - B$   
c.  $-4A$                          d.  $3A + 2B$ .

9.  $A = \begin{bmatrix} 4 & 1 \\ 3 & 2 \end{bmatrix}$ ,  $B = \begin{bmatrix} 5 & 9 \\ 0 & 7 \end{bmatrix}$

10.  $A = \begin{bmatrix} -2 & 3 \\ 0 & 1 \end{bmatrix}$ ,  $B = \begin{bmatrix} 8 & 1 \\ 5 & 4 \end{bmatrix}$

11.  $A = \begin{bmatrix} 1 & 3 \\ 3 & 4 \\ 5 & 6 \end{bmatrix}$ ,  $B = \begin{bmatrix} 2 & -1 \\ 3 & -2 \\ 0 & 1 \end{bmatrix}$

12.  $A = \begin{bmatrix} 3 & 1 & 1 \\ -1 & 2 & 5 \end{bmatrix}$ ,  $B = \begin{bmatrix} 2 & -3 & 6 \\ -3 & 1 & -4 \end{bmatrix}$

13.  $A = \begin{bmatrix} 2 \\ -4 \\ 1 \end{bmatrix}$ ,  $B = \begin{bmatrix} -5 \\ 3 \\ -1 \end{bmatrix}$

14.  $A = [6 \ 2 \ -3]$ ,  $B = [4 \ -2 \ 3]$

15.  $A = \begin{bmatrix} 2 & -10 & -2 \\ 14 & 12 & 10 \\ 4 & -2 & 2 \end{bmatrix}$ ,  $B = \begin{bmatrix} 6 & 10 & -2 \\ 0 & -12 & -4 \\ -5 & 2 & -2 \end{bmatrix}$

16.  $A = \begin{bmatrix} 6 & -3 & 5 \\ 6 & 0 & -2 \\ -4 & 2 & -1 \end{bmatrix}$ ,  $B = \begin{bmatrix} -3 & 5 & 1 \\ -1 & 2 & -6 \\ 2 & 0 & 4 \end{bmatrix}$

In Exercises 17–26, let

$$A = \begin{bmatrix} -3 & -7 \\ 2 & -9 \\ 5 & 0 \end{bmatrix} \quad \text{and} \quad B = \begin{bmatrix} -5 & -1 \\ 0 & 0 \\ 3 & -4 \end{bmatrix}.$$

Solve each matrix equation for  $X$ .

17.  $X - A = B$                       18.  $X - B = A$

19.  $2X + A = B$                      20.  $3X + A = B$

21.  $3X + 2A = B$                     22.  $2X + 5A = B$

23.  $B - X = 4A$                      24.  $A - X = 4B$

25.  $4A + 3B = -2X$                 26.  $4B + 3A = -2X$

In Exercises 27–36, find (if possible) the following matrices:

a.  $AB$                       b.  $BA$ .

27.  $A = \begin{bmatrix} 1 & 3 \\ 5 & 3 \end{bmatrix}$ ,  $B = \begin{bmatrix} 3 & -2 \\ -1 & 6 \end{bmatrix}$

28.  $A = \begin{bmatrix} 3 & -2 \\ 1 & 5 \end{bmatrix}$ ,  $B = \begin{bmatrix} 0 & 0 \\ 5 & -6 \end{bmatrix}$

29.  $A = [1 \ 2 \ 3 \ 4]$ ,  $B = \begin{bmatrix} 1 \\ 2 \\ 3 \\ 4 \end{bmatrix}$

30.  $A = \begin{bmatrix} -1 \\ -2 \\ -3 \end{bmatrix}$ ,  $B = [1 \ 2 \ 3]$

31.  $A = \begin{bmatrix} 1 & -1 & 4 \\ 4 & -1 & 3 \\ 2 & 0 & -2 \end{bmatrix}$ ,  $B = \begin{bmatrix} 1 & 1 & 0 \\ 1 & 2 & 4 \\ 1 & -1 & 3 \end{bmatrix}$

32.  $A = \begin{bmatrix} 1 & -1 & 1 \\ 5 & 0 & -2 \\ 3 & -2 & 2 \end{bmatrix}$ ,  $B = \begin{bmatrix} 1 & 1 & 0 \\ 1 & -4 & 5 \\ 3 & -1 & 2 \end{bmatrix}$

33.  $A = \begin{bmatrix} 4 & 2 \\ 6 & 1 \\ 3 & 5 \end{bmatrix}$ ,  $B = \begin{bmatrix} 2 & 3 & 4 \\ -1 & -2 & 0 \end{bmatrix}$

34.  $A = \begin{bmatrix} 2 & 4 \\ 3 & 1 \\ 4 & 2 \end{bmatrix}$ ,  $B = \begin{bmatrix} 3 & 2 & 0 \\ -1 & -3 & 5 \end{bmatrix}$

$$35. A = \begin{bmatrix} 2 & -3 & 1 & -1 \\ 1 & 1 & -2 & 1 \end{bmatrix}, B = \begin{bmatrix} 1 & 2 \\ -1 & 1 \\ 5 & 4 \\ 10 & 5 \end{bmatrix}$$

$$36. A = \begin{bmatrix} 2 & -1 & 3 & 2 \\ 1 & 0 & -2 & 1 \end{bmatrix}, B = \begin{bmatrix} -1 & 2 \\ 1 & 1 \\ 3 & -4 \\ 6 & 5 \end{bmatrix}$$

In Exercises 37–44, perform the indicated matrix operations given that  $A$ ,  $B$ , and  $C$  are defined as follows. If an operation is not defined, state the reason.

$$A = \begin{bmatrix} 4 & 0 \\ -3 & 5 \\ 0 & 1 \end{bmatrix} \quad B = \begin{bmatrix} 5 & 1 \\ -2 & -2 \end{bmatrix} \quad C = \begin{bmatrix} 1 & -1 \\ -1 & 1 \end{bmatrix}$$

$$37. 4B - 3C$$

$$38. 5C - 2B$$

$$39. BC + CB$$

$$40. A(B + C)$$

$$41. A - C$$

$$42. B - A$$

$$43. A(BC)$$

$$44. A(CB)$$

### Practice Plus

In Exercises 45–50, let

$$A = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}, B = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}, C = \begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix},$$

$$D = \begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix}.$$

45. Find the product of the sum of  $A$  and  $B$  and the difference between  $C$  and  $D$ .

46. Find the product of the difference between  $A$  and  $B$  and the sum of  $C$  and  $D$ .

47. Use any three of the matrices to verify a distributive property.

48. Use any three of the matrices to verify an associative property.

In Exercises 49–50, suppose that the vertices of a computer graphic are points,  $(x, y)$ , represented by the matrix

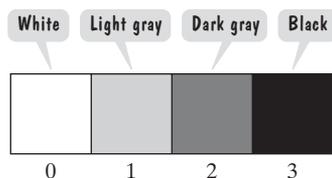

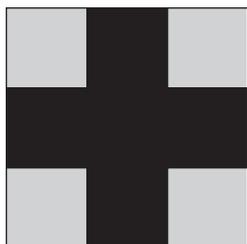

$$Z = \begin{bmatrix} x \\ y \end{bmatrix}.$$

49. Find  $BZ$  and explain why this reflects the graphic about the  $x$ -axis.

50. Find  $CZ$  and explain why this reflects the graphic about the  $y$ -axis.

### Application Exercises

The  $+$  sign in the figure is shown using 9 pixels in a  $3 \times 3$  grid. The color levels are given to the right of the figure. Each color is represented by a specific number: 0, 1, 2, or 3. Use this information to solve Exercises 51–52.

51. a. Find a matrix that represents a digital photograph of the  $+$  sign.

b. Adjust the contrast by changing the black to dark gray and the light gray to white. Use matrix addition to accomplish this.

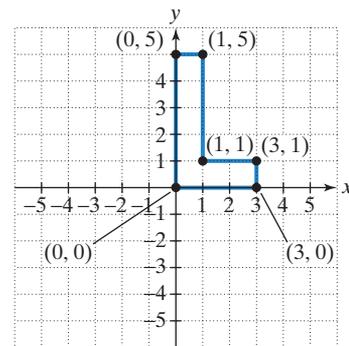

c. Adjust the contrast by changing the black to light gray and the light gray to dark gray. Use matrix addition to accomplish this.

52. a. Find a matrix that represents a digital photograph of the  $+$  sign.

b. Adjust the contrast by changing the black to dark gray and the light gray to black. Use matrix addition to accomplish this.

c. Adjust the contrast by leaving the black alone and changing the light gray to white. Use matrix addition to accomplish this.

The figure shows the letter  $L$  in a rectangular coordinate system.

The figure can be represented by the matrix

$$B = \begin{bmatrix} 0 & 3 & 3 & 1 & 1 & 0 \\ 0 & 0 & 1 & 1 & 5 & 5 \end{bmatrix}.$$

Each column in the matrix describes a point on the letter. The order of the columns shows the direction in which a pencil must move to draw the letter. The  $L$  is completed by connecting the last point in the matrix,  $(0, 5)$ , to the starting point,  $(0, 0)$ . Use these ideas to solve Exercises 53–60.

53. Use matrix operations to move the  $L$  2 units to the left and 3 units down. Then graph the letter and its transformation in a rectangular coordinate system.

54. Use matrix operations to move the  $L$  2 units to the right and 3 units down. Then graph the letter and its transformation in a rectangular coordinate system.

55. Reduce the  $L$  to half its perimeter and move the reduced image 1 unit up. Then graph the letter and its transformation.

56. Reduce the  $L$  to half its perimeter and move the reduced image 2 units up. Then graph the letter and its transformation.

57. a. If  $A = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$ , find  $AB$ .

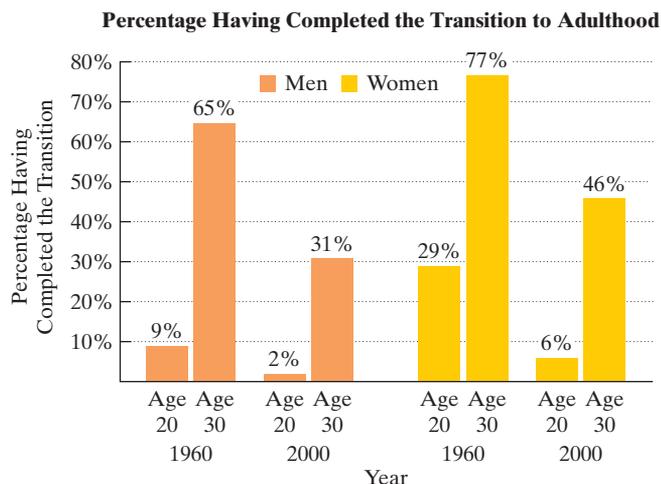

b. Graph the object represented by matrix  $AB$ . What effect does the matrix multiplication have on the letter  $L$  represented by matrix  $B$ ?

58. a. If  $A = \begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix}$ , find  $AB$ .

b. Graph the object represented by matrix  $AB$ . What effect does the matrix multiplication have on the letter  $L$  represented by matrix  $B$ ?

(In Exercises 59–60, be sure to refer to matrix  $B$  described in the second column on the previous page.)

59. a. If  $A = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix}$ , find  $AB$ .  
 b. Graph the object represented by matrix  $AB$ . What effect does the matrix multiplication have on the letter L represented by matrix  $B$ ?
60. a. If  $A = \begin{bmatrix} 2 & 0 \\ 0 & 1 \end{bmatrix}$ , find  $AB$ .  
 b. Graph the object represented by matrix  $AB$ . What effect does the matrix multiplication have on the letter L represented by matrix  $B$ ?
61. Completing the transition to adulthood is measured by one or more of the following: leaving home, finishing school, getting married, having a child, or being financially independent. The bar graph shows the percentage of Americans, ages 20 and 30, who had completed the transition to adulthood in 1960 and in 2000.

Source: James M. Henslin, *Sociology*, Eleventh Edition, Pearson, 2012.

- a. Use a  $2 \times 2$  matrix to represent the data for 2000. Entries in the matrix should be percents that are organized as follows:
- $$\begin{matrix} & \text{Men} & \text{Women} \\ \text{Age 20} & \begin{bmatrix} & \end{bmatrix} \\ \text{Age 30} & \begin{bmatrix} & \end{bmatrix} \end{matrix}$$
- Call this matrix  $A$ .
- b. Use a  $2 \times 2$  matrix to represent the data for 1960. Call this matrix  $B$ .
- c. Find  $B - A$ . What does this matrix represent?
62. The table gives an estimate of basic caloric needs for different age groups and activity levels.

Age Range	Sedentary		Moderately Active		Active	
19–30	2400	2000	2700	2100	3000	2400
31–50	2200	1800	2500	2000	2900	2200
51+	2000	1600	2300	1800	2600	2100

Men Women
Men Women
Men Women

Source: *USA Today*

- a. Use a  $3 \times 3$  matrix to represent the daily caloric needs, by age and activity level, for men. Call this matrix  $M$ .  
 b. Use a  $3 \times 3$  matrix to represent the daily caloric needs, by age and activity level, for women. Call this matrix  $W$ .  
 c. Find  $M - W$ . What does this matrix represent?
63. The final grade in a particular course is determined by grades on the midterm and final. The grades for five students and the two grading systems are modeled by the following matrices. Call the first matrix  $A$  and the second  $B$ .

	Midterm	Final	System 1	System 2
Student 1	76	92	Midterm	0.5
Student 2	74	84	Final	0.3
Student 3	94	86		0.7
Student 4	84	62		
Student 5	58	80		

- a. Describe the grading system that is represented by matrix  $B$ .  
 b. Compute the matrix  $AB$  and assign each of the five students a final course grade first using system 1 and then using system 2. ( $89.5 - 100 = A$ ,  $79.5 - 89.4 = B$ ,  $69.5 - 79.4 = C$ ,  $59.5 - 69.4 = D$ , below  $59.5 = F$ )
64. In a certain county, the proportion of voters in each age group registered as Republicans, Democrats, or Independents is given by the following matrix, which we'll call  $A$ .

	Age		
	18–30	31–50	Over 50
Republicans	0.40	0.30	0.70
Democrats	0.30	0.60	0.25
Independents	0.30	0.10	0.05

The distribution, by age and gender, of this county's voting population is given by the following matrix, which we'll call  $B$ .

	Male	Female
18–30	6000	8000
Age 31–50	12,000	14,000
Over 50	14,000	16,000

- a. Calculate the product  $AB$ .  
 b. How many female Democrats are there?  
 c. How many male Republicans are there?

### Writing in Mathematics

65. What is meant by the order of a matrix? Give an example with your explanation.  
 66. What does  $a_{ij}$  mean?  
 67. What are equal matrices?  
 68. How are matrices added?  
 69. Describe how to subtract matrices.  
 70. Describe matrices that cannot be added or subtracted.  
 71. Describe how to perform scalar multiplication. Provide an example with your description.  
 72. Describe how to multiply matrices.

73. Describe when the multiplication of two matrices is not defined.
74. If two matrices can be multiplied, describe how to determine the order of the product.
75. Low-resolution digital photographs use 262,144 pixels in a  $512 \times 512$  grid. If you enlarge a low-resolution digital photograph enough, describe what will happen.

### Technology Exercise

76. Use the matrix feature of a graphing utility to verify each of your answers to Exercises 37–44.

### Critical Thinking Exercises

**Make Sense?** In Exercises 77–80, determine whether each statement makes sense or does not make sense, and explain your reasoning.

77. I added matrices of the same order by adding corresponding elements.
78. I multiplied an  $m \times n$  matrix and an  $n \times p$  matrix by multiplying corresponding elements.
79. I'm working with two matrices that can be added but not multiplied.
80. I'm working with two matrices that can be multiplied but not added.
81. Find two matrices  $A$  and  $B$  such that  $AB = BA$ .
82. Consider a square matrix such that each element that is not on the diagonal from upper left to lower right is zero. Experiment with such matrices (call each matrix  $A$ ) by finding  $AA$ . Then write a sentence or two describing a method for multiplying this kind of matrix by itself.
83. If  $AB = -BA$ , then  $A$  and  $B$  are said to be anticommutative. Are  $A = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix}$  and  $B = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$  anticommutative?

### Group Exercise

84. The interesting and useful applications of matrix theory are nearly unlimited. Applications of matrices range from representing digital photographs to predicting long-range trends in the stock market. Members of the group should research an application of matrices that they find intriguing. The group should then present a seminar to the class about this application.

### Preview Exercises

Exercises 85–87 will help you prepare for the material covered in the next section.

85. Multiply:

$$\begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}.$$

After performing the multiplication, describe what happens to the elements in the first matrix.

86. Use Gauss-Jordan elimination to solve the system:

$$\begin{cases} -x - y - z = 1 \\ 4x + 5y = 0 \\ y - 3z = 0. \end{cases}$$

87. Multiply and write the linear system represented by the following matrix multiplication:

$$\begin{bmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} d_1 \\ d_2 \\ d_3 \end{bmatrix}.$$

## CHAPTER 8

## Mid-Chapter Check Point

**WHAT YOU KNOW:** We learned to use matrices to solve systems of linear equations. Gaussian elimination required simplifying the augmented matrix to one with 1s down the main diagonal and 0s below the 1s. Gauss-Jordan elimination simplified the augmented matrix to one with 1s down the main diagonal and 0s above and below each 1. Such a matrix, in reduced row-echelon form, did not require back-substitution to solve the system. We applied Gaussian elimination to systems with no solution, as well as to represent the solution set for systems with infinitely many solutions, including nonsquare systems. We learned how to perform operations with matrices, including matrix addition, matrix subtraction, scalar multiplication, and matrix multiplication.

In Exercises 1–5, use matrices to find the complete solution to each system of equations, or show that none exists.

$$1. \begin{cases} x + 2y - 3z = -7 \\ 3x - y + 2z = 8 \\ 2x - y + z = 5 \end{cases} \quad 2. \begin{cases} 2x + 4y + 5z = 2 \\ x + y + 2z = 1 \\ 3x + 5y + 7z = 4 \end{cases}$$

$$3. \begin{cases} x - 2y + 2z = -2 \\ 2x + 3y - z = 1 \end{cases} \quad 4. \begin{cases} w + x + y + z = 6 \\ w - x + 3y + z = -14 \\ w + 2x - 3z = 12 \\ 2w + 3x + 6y + z = 1 \end{cases}$$

$$5. \begin{cases} 2x - 2y + 2z = 5 \\ x - y + z = 2 \\ 2x + y - z = 1 \end{cases}$$

In Exercises 6–10, perform the indicated matrix operations or solve the matrix equation for  $X$  given that  $A$ ,  $B$ , and  $C$  are defined as follows. If an operation is not defined, state the reason.

$$A = \begin{bmatrix} 0 & 2 \\ -1 & 3 \\ 1 & 0 \end{bmatrix} \quad B = \begin{bmatrix} 4 & 1 \\ -6 & -2 \end{bmatrix} \quad C = \begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix}$$

6.  $2C - \frac{1}{2}B$       7.  $A(B + C)$       8.  $A(BC)$   
9.  $A + C$       10.  $2X - 3C = B$

## SECTION 8.4

## Multiplicative Inverses of Matrices and Matrix Equations

## Objectives

- 1 Find the multiplicative inverse of a square matrix.
- 2 Use inverses to solve matrix equations.
- 3 Encode and decode messages.

In 1939, Britain's secret service hired top chess players, mathematicians, and other masters of logic to break the code used by the Nazis in communications between headquarters and troops. The project, which employed over 10,000 people, broke the code less than a year later, providing the Allies with information about Nazi troop movements throughout World War II.

Messages must often be sent in such a way that the real meaning is hidden from everyone but the sender and the recipient. In this section, we will look at the role that matrices and their inverses play in this process.

## The Multiplicative Identity Matrix

For the real numbers, we know that 1 is the multiplicative identity because  $a \cdot 1 = 1 \cdot a = a$ . Is there a similar property for matrix multiplication? That is, is there a matrix  $I$  such that  $AI = A$  and  $IA = A$ ? The answer is yes. A square matrix with 1s down the main diagonal from upper left to lower right and 0s elsewhere does not change the elements in a matrix in products with that matrix. In the case of  $2 \times 2$  matrices,

$$\begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}$$

The elements in the matrix do not change.

$$\text{and } \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix} = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}.$$

The elements in the matrix do not change.

The  $n \times n$  square matrix with 1s down the main diagonal from upper left to lower right and 0s elsewhere is called the **multiplicative identity matrix of order  $n$** . This matrix is designated by  $I_n$ . For example,

$$I_2 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}, \quad I_3 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix},$$

and so on.

- 1 Find the multiplicative inverse of a square matrix.

## The Multiplicative Inverse of a Matrix

The multiplicative identity matrix,  $I_n$ , will help us to define a new concept: the multiplicative inverse of a matrix. To do so, let's consider a similar concept, the multiplicative inverse of a nonzero number,  $a$ . Recall that the multiplicative inverse of  $a$  is  $\frac{1}{a}$ . The multiplicative inverse has the following property:

$$a \cdot \frac{1}{a} = 1 \quad \text{and} \quad \frac{1}{a} \cdot a = 1.$$

We can define the multiplicative inverse of a square matrix in a similar manner.

### Definition of the Multiplicative Inverse of a Square Matrix

Let  $A$  be an  $n \times n$  matrix. If there exists an  $n \times n$  matrix  $A^{-1}$  (read: “ $A$  inverse”) such that

$$AA^{-1} = I_n \quad \text{and} \quad A^{-1}A = I_n,$$

then  $A^{-1}$  is the **multiplicative inverse** of  $A$ .

We have seen that matrix multiplication is not commutative. Thus, to show that a matrix  $B$  is the multiplicative inverse of the matrix  $A$ , find both  $AB$  and  $BA$ . If  $B$  is the multiplicative inverse of  $A$ , both products ( $AB$  and  $BA$ ) will be the multiplicative identity matrix,  $I_n$ .

### EXAMPLE 1 The Multiplicative Inverse of a Matrix

Show that  $B$  is the multiplicative inverse of  $A$ , where

$$A = \begin{bmatrix} -1 & 3 \\ 2 & -5 \end{bmatrix} \quad \text{and} \quad B = \begin{bmatrix} 5 & 3 \\ 2 & 1 \end{bmatrix}.$$

### SOLUTION

To show that  $B$  is the multiplicative inverse of  $A$ , we must find the products  $AB$  and  $BA$ . If  $B$  is the multiplicative inverse of  $A$ , then  $AB$  will be the multiplicative identity matrix and  $BA$  will be the multiplicative identity matrix. Because  $A$  and  $B$  are  $2 \times 2$  matrices,  $n = 2$ . Thus, we denote the multiplicative identity matrix as  $I_2$ ; it is also a  $2 \times 2$  matrix. We must show that

- $AB = I_2 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$  and
- $BA = I_2 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ .

Let's first show  $AB = I_2$ .

$$\begin{aligned} AB &= \begin{bmatrix} -1 & 3 \\ 2 & -5 \end{bmatrix} \begin{bmatrix} 5 & 3 \\ 2 & 1 \end{bmatrix} \\ &= \begin{bmatrix} -1(5) + 3(2) & -1(3) + 3(1) \\ 2(5) + (-5)(2) & 2(3) + (-5)(1) \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \end{aligned}$$

Let's now show  $BA = I_2$ .

$$\begin{aligned} BA &= \begin{bmatrix} 5 & 3 \\ 2 & 1 \end{bmatrix} \begin{bmatrix} -1 & 3 \\ 2 & -5 \end{bmatrix} \\ &= \begin{bmatrix} 5(-1) + 3(2) & 5(3) + 3(-5) \\ 2(-1) + 1(2) & 2(3) + 1(-5) \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \end{aligned}$$

Both products give the multiplicative identity matrix. Thus,  $B$  is the multiplicative inverse of  $A$  and we can designate  $B$  as  $A^{-1} = \begin{bmatrix} 5 & 3 \\ 2 & 1 \end{bmatrix}$ . ...

 **Check Point 1** Show that  $B$  is the multiplicative inverse of  $A$ , where

$$A = \begin{bmatrix} 2 & 1 \\ 1 & 1 \end{bmatrix} \quad \text{and} \quad B = \begin{bmatrix} 1 & -1 \\ -1 & 2 \end{bmatrix}.$$

One method for finding the multiplicative inverse of a matrix  $A$  is to begin by denoting the elements in  $A^{-1}$  with variables. Using the equation  $AA^{-1} = I_n$ , we can find a value for each element in the multiplicative inverse that is represented by a variable. Example 2 shows how this is done.

### EXAMPLE 2 Finding the Multiplicative Inverse of a Matrix

Find the multiplicative inverse of

$$A = \begin{bmatrix} 2 & 1 \\ 5 & 3 \end{bmatrix}.$$

#### SOLUTION

Let us denote the multiplicative inverse by

$$A^{-1} = \begin{bmatrix} w & x \\ y & z \end{bmatrix}.$$

Because  $A$  is a  $2 \times 2$  matrix, we use the equation  $AA^{-1} = I_2$  to find values for  $w$ ,  $x$ ,  $y$ , and  $z$ .

$$\begin{matrix} A & A^{-1} & I_2 \\ \begin{bmatrix} 2 & 1 \\ 5 & 3 \end{bmatrix} & \begin{bmatrix} w & x \\ y & z \end{bmatrix} & = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \end{matrix}$$

$$\begin{bmatrix} 2w + y & 2x + z \\ 5w + 3y & 5x + 3z \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \quad \begin{array}{l} \text{Use row-by-column matrix multiplication on the} \\ \text{left side of } \begin{bmatrix} 2 & 1 \\ 5 & 3 \end{bmatrix} \begin{bmatrix} w & x \\ y & z \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}. \end{array}$$

We now equate corresponding elements to obtain the following two systems of linear equations:

$$\begin{cases} 2w + y = 1 \\ 5w + 3y = 0 \end{cases} \quad \text{and} \quad \begin{cases} 2x + z = 0 \\ 5x + 3z = 1. \end{cases}$$

#### TECHNOLOGY

You can use a graphing utility to find the inverse of the matrix in Example 2. Enter the matrix and name it  $A$ . The screens show  $A$  and  $A^{-1}$ . Verify that this is correct by showing that

$$AA^{-1} = I_2 \quad \text{and} \quad A^{-1}A = I_2.$$

A graphing utility screen showing the matrix  $A$  as  $\begin{bmatrix} 2 & 1 \\ 5 & 3 \end{bmatrix}$ .

A graphing utility screen showing the inverse matrix  $A^{-1}$  as  $\begin{bmatrix} 3 & -1 \\ -5 & 2 \end{bmatrix}$ .

Each of these systems can be solved using the addition method.

$$\begin{cases} 2w + y = 1 \\ 5w + 3y = 0 \end{cases} \quad \begin{array}{l} \xrightarrow{\text{Multiply by } -3.} \\ \xrightarrow{\text{No change}} \\ \text{Add:} \end{array} \quad \begin{array}{r} -6w - 3y = -3 \\ 5w + 3y = 0 \\ \hline -w = -3 \\ w = 3 \\ \text{Use back-substitution.} \\ y = -5 \end{array}$$

$$\begin{cases} 2x + z = 0 \\ 5x + 3z = 1 \end{cases} \quad \begin{array}{l} \xrightarrow{\text{Multiply by } -3.} \\ \xrightarrow{\text{No change}} \\ \text{Add:} \end{array} \quad \begin{array}{r} -6x - 3z = 0 \\ 5x + 3z = 1 \\ \hline -x = 1 \\ x = -1 \\ \text{Use back-substitution.} \\ z = 2 \end{array}$$

Using these values, we have

$$A^{-1} = \begin{bmatrix} w & x \\ y & z \end{bmatrix} = \begin{bmatrix} 3 & -1 \\ -5 & 2 \end{bmatrix}.$$

**Check Point 2** Find the multiplicative inverse of  $A = \begin{bmatrix} 5 & 7 \\ 2 & 3 \end{bmatrix}$ .

Only square matrices of order  $n \times n$  have multiplicative inverses, but not every square matrix possesses a multiplicative inverse. For example, suppose that you apply the procedure of Example 2 to  $A = \begin{bmatrix} -6 & 4 \\ -3 & 2 \end{bmatrix}$ :

$$\begin{array}{c} \text{This is } A. \\ \text{This represents } A^{-1}. \\ \text{This is the multiplicative identity matrix.} \end{array} \begin{bmatrix} -6 & 4 \\ -3 & 2 \end{bmatrix} \begin{bmatrix} w & x \\ y & z \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}.$$

Multiplying matrices on the left and equating corresponding elements results in inconsistent systems with no solutions. There are no values for  $w, x, y,$  and  $z$ . This shows that matrix  $A$  does not have a multiplicative inverse.

A nonsquare matrix, one with a different number of rows than columns, cannot have a multiplicative inverse. If  $A$  is an  $m \times n$  matrix and  $B$  is an  $n \times m$  matrix ( $n \neq m$ ), then the products  $AB$  and  $BA$  are of different orders. This means that they could not be equal to each other, so that  $AB$  and  $BA$  could not both equal the multiplicative identity matrix.

If a square matrix has a multiplicative inverse, that inverse is unique. This means that the square matrix has no more than one inverse. If a square matrix has a multiplicative inverse, it is said to be **invertible** or **nonsingular**. If a square matrix has no multiplicative inverse, it is called **singular**.

### A Quick Method for Finding the Multiplicative Inverse of a $2 \times 2$ Matrix

The same method used in Example 2 can be used to develop the general form of the multiplicative inverse of a  $2 \times 2$  matrix. The following rule enables us to calculate the multiplicative inverse, if there is one:

#### Multiplicative Inverse of a $2 \times 2$ Matrix

$$\text{If } A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}, \text{ then } A^{-1} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}.$$

The matrix  $A$  is invertible if and only if  $ad - bc \neq 0$ . If  $ad - bc = 0$ , then  $A$  does not have a multiplicative inverse.

### GREAT QUESTION!

Can you provide any suggestions that will help me remember the formula for the multiplicative inverse of a  $2 \times 2$  matrix?

Yes. To find the matrix that appears as the second factor for the inverse of

$$A = \begin{bmatrix} a & b \\ c & d \end{bmatrix};$$

- Reverse  $a$  and  $d$ , the numbers in the diagonal from upper left to lower right.
- Negate  $b$  and  $c$ , the numbers in the other diagonal.

### GREAT QUESTION!

When using the formula to find the multiplicative inverse of

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix},$$

what should I do first?

Start by computing  $ad - bc$ . If the computed value is 0, there is no need to continue. The given matrix is singular—that is, it does not have a multiplicative inverse.

### EXAMPLE 3 Using the Quick Method to Find a Multiplicative Inverse

Find the multiplicative inverse of

$$A = \begin{bmatrix} -1 & -2 \\ 3 & 4 \end{bmatrix}.$$

#### SOLUTION

$$A = \begin{bmatrix} a & b \\ c & d \end{bmatrix} = \begin{bmatrix} -1 & -2 \\ 3 & 4 \end{bmatrix}$$

This is the given matrix. We've designated the elements  $a, b, c,$  and  $d$ .

$$A = \begin{bmatrix} a & b \\ -1 & -2 \\ 3 & 4 \\ c & d \end{bmatrix}$$

The given matrix (repeated)

$$A^{-1} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$$

This is the formula for the inverse of  $\begin{bmatrix} a & b \\ c & d \end{bmatrix}$ .

$$= \frac{1}{(-1)(4) - (-2)(3)} \begin{bmatrix} 4 & -(-2) \\ -3 & -1 \end{bmatrix}$$

Apply the formula with  $a = -1$ ,  $b = -2$ ,  $c = 3$ , and  $d = 4$ .

$$= \frac{1}{2} \begin{bmatrix} 4 & 2 \\ -3 & -1 \end{bmatrix}$$

Simplify.

$$= \begin{bmatrix} 2 & 1 \\ -\frac{3}{2} & -\frac{1}{2} \end{bmatrix}$$

Perform the scalar multiplication by multiplying each element in the matrix by  $\frac{1}{2}$ .

The inverse of  $A = \begin{bmatrix} -1 & -2 \\ 3 & 4 \end{bmatrix}$  is  $A^{-1} = \begin{bmatrix} 2 & 1 \\ -\frac{3}{2} & -\frac{1}{2} \end{bmatrix}$ .

We can verify this result by showing that  $AA^{-1} = I_2$  and  $A^{-1}A = I_2$ . ...

 **Check Point 3** Find the multiplicative inverse of

$$A = \begin{bmatrix} 3 & -2 \\ -1 & 1 \end{bmatrix}.$$

### Finding Multiplicative Inverses of $n \times n$ Matrices with $n$ Greater Than 2

To find the multiplicative inverse of a  $3 \times 3$  invertible matrix, we begin by denoting the elements in the multiplicative inverse with variables. Here is an example:

$$\begin{bmatrix} -1 & -1 & -1 \\ 4 & 5 & 0 \\ 0 & 1 & -3 \end{bmatrix} \begin{bmatrix} x_1 & x_2 & x_3 \\ y_1 & y_2 & y_3 \\ z_1 & z_2 & z_3 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}.$$

This is matrix  $A$  whose inverse we wish to find.

This represents  $A^{-1}$ .

This is the multiplicative identity matrix,  $I_3$ .

We multiply the matrices on the left, using the row-by-column definition of matrix multiplication.

$$\begin{bmatrix} -x_1 - y_1 - z_1 & -x_2 - y_2 - z_2 & -x_3 - y_3 - z_3 \\ 4x_1 + 5y_1 + 0z_1 & 4x_2 + 5y_2 + 0z_2 & 4x_3 + 5y_3 + 0z_3 \\ 0x_1 + 1y_1 - 3z_1 & 0x_2 + 1y_2 - 3z_2 & 0x_3 + 1y_3 - 3z_3 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

We now equate corresponding entries to obtain the following three systems of linear equations:

$$\begin{cases} -x_1 - y_1 - z_1 = 1 \\ 4x_1 + 5y_1 + 0z_1 = 0 \\ 0x_1 + y_1 - 3z_1 = 0 \end{cases} \quad \begin{cases} -x_2 - y_2 - z_2 = 0 \\ 4x_2 + 5y_2 + 0z_2 = 1 \\ 0x_2 + y_2 - 3z_2 = 0 \end{cases} \quad \begin{cases} -x_3 - y_3 - z_3 = 0 \\ 4x_3 + 5y_3 + 0z_3 = 0 \\ 0x_3 + y_3 - 3z_3 = 1. \end{cases}$$

Notice that the variables on the left of the equal signs have the same coefficients in each system. We can use Gauss-Jordan elimination to solve all three systems at once. Form an augmented matrix that contains the coefficients of the three systems to the left of the vertical line and the constants for the systems to the right.

$$\left[ \begin{array}{ccc|ccc} -1 & -1 & -1 & 1 & 0 & 0 \\ 4 & 5 & 0 & 0 & 1 & 0 \\ 0 & 1 & -3 & 0 & 0 & 1 \end{array} \right]$$

Coefficients of the three systems

Constants on the right in each of the three systems

To solve all three systems using Gauss-Jordan elimination, we must obtain  $\left[ \begin{array}{ccc|ccc} 1 & 0 & 0 & 1 & 0 & 0 \\ 0 & 1 & 0 & 0 & 1 & 0 \\ 0 & 0 & 1 & 0 & 0 & 1 \end{array} \right]$

to the left of the vertical line. Use matrix row operations, working one column at a time. Obtain 1 in the required position. Then obtain 0s in the other two positions. Using these operations, we obtain the matrix

$$\left[ \begin{array}{ccc|ccc} 1 & 0 & 0 & 15 & 4 & -5 \\ 0 & 1 & 0 & -12 & -3 & 4 \\ 0 & 0 & 1 & -4 & -1 & 1 \end{array} \right].$$

This augmented matrix provides the solutions to the three systems of equations. They are given by

$$\left[ \begin{array}{ccc|c} 1 & 0 & 0 & 15 \\ 0 & 1 & 0 & -12 \\ 0 & 0 & 1 & -4 \end{array} \right] \quad \begin{array}{l} x_1 = 15 \\ y_1 = -12 \\ z_1 = -4 \end{array}$$

$$\text{and } \left[ \begin{array}{ccc|c} 1 & 0 & 0 & 4 \\ 0 & 1 & 0 & -3 \\ 0 & 0 & 1 & -1 \end{array} \right] \quad \begin{array}{l} x_2 = 4 \\ y_2 = -3 \\ z_2 = -1 \end{array} \quad \text{and} \quad \left[ \begin{array}{ccc|c} 1 & 0 & 0 & -5 \\ 0 & 1 & 0 & 4 \\ 0 & 0 & 1 & 1 \end{array} \right] \quad \begin{array}{l} x_3 = -5 \\ y_3 = 4 \\ z_3 = 1. \end{array}$$

Using the preceding nine values, the inverse matrix is

$$\begin{bmatrix} x_1 & x_2 & x_3 \\ y_1 & y_2 & y_3 \\ z_1 & z_2 & z_3 \end{bmatrix} = \begin{bmatrix} 15 & 4 & -5 \\ -12 & -3 & 4 \\ -4 & -1 & 1 \end{bmatrix}.$$

Take a second look at the matrix obtained at the point where Gauss-Jordan elimination was completed. This matrix is shown, again, below. Notice that the  $3 \times 3$  matrix to the right of the vertical bar is the multiplicative inverse of  $A$ . Also notice that the multiplicative identity matrix,  $I_3$  is the matrix that appears to the left of the vertical bar.

$$\left[ \begin{array}{ccc|ccc} 1 & 0 & 0 & 15 & 4 & -5 \\ 0 & 1 & 0 & -12 & -3 & 4 \\ 0 & 0 & 1 & -4 & -1 & 1 \end{array} \right]$$

This is the multiplicative identity,  $I_3$ .

This is the multiplicative inverse of  $A$ .

The observations in the voice balloons and the procedures followed above give us a general method for finding the multiplicative inverse of an invertible matrix. This method is given at the top of the next page.

**GREAT QUESTION!**

Should I use the procedure in the box for finding the multiplicative inverse of a  $2 \times 2$  matrix?

No. Because we have a quick method for finding the multiplicative inverse of a  $2 \times 2$  matrix, the procedure on the right is recommended for matrices of order  $3 \times 3$  or greater when a graphing utility is not being used.

**Procedure for Finding the Multiplicative Inverse of an Invertible Matrix**

To find  $A^{-1}$  for any  $n \times n$  matrix  $A$  for which  $A^{-1}$  exists,

1. Form the augmented matrix  $[A|I_n]$ , where  $I_n$  is the multiplicative identity matrix of the same order as the given matrix  $A$ .
2. Perform row operations on  $[A|I_n]$  to obtain a matrix of the form  $[I_n|B]$ . This is equivalent to using Gauss-Jordan elimination to change  $A$  into the identity matrix.
3. Matrix  $B$  is  $A^{-1}$ .
4. Verify the result by showing that  $AA^{-1} = I_n$  and  $A^{-1}A = I_n$ .

**EXAMPLE 4** Finding the Multiplicative Inverse of a  $3 \times 3$  Matrix

Find the multiplicative inverse of

$$A = \begin{bmatrix} 1 & -1 & 1 \\ 0 & -2 & 1 \\ -2 & -3 & 0 \end{bmatrix}.$$

**SOLUTION**

**Step 1** Form the augmented matrix  $[A|I_3]$ .

$$\left[ \begin{array}{ccc|ccc} 1 & -1 & 1 & 1 & 0 & 0 \\ 0 & -2 & 1 & 0 & 1 & 0 \\ -2 & -3 & 0 & 0 & 0 & 1 \end{array} \right]$$

This is matrix  $A$ .

This is  $I_3$ , the multiplicative identity matrix, with 1s down the main diagonal and 0s elsewhere.

**Step 2** Perform row operations on  $[A|I_3]$  to obtain a matrix of the form  $[I_3|B]$ .

To the left of the vertical dividing line, we want 1s down the diagonal from upper left to lower right and 0s elsewhere.

$$\left[ \begin{array}{ccc|ccc} 1 & -1 & 1 & 1 & 0 & 0 \\ 0 & -2 & 1 & 0 & 1 & 0 \\ -2 & -3 & 0 & 0 & 0 & 1 \end{array} \right] \xrightarrow{\text{Replace row 3 by } 2R_1 + R_3.} \left[ \begin{array}{ccc|ccc} 1 & -1 & 1 & 1 & 0 & 0 \\ 0 & -2 & 1 & 0 & 1 & 0 \\ 0 & -5 & 2 & 2 & 0 & 1 \end{array} \right] \xrightarrow{-\frac{1}{2}R_2}$$

$$\left[ \begin{array}{ccc|ccc} 1 & -1 & 1 & 1 & 0 & 0 \\ 0 & 1 & -\frac{1}{2} & 0 & -\frac{1}{2} & 0 \\ 0 & -5 & 2 & 2 & 0 & 1 \end{array} \right] \xrightarrow{\text{Replace row 1 by } 1R_2 + R_1. \text{ Replace row 3 by } 5R_2 + R_3.} \left[ \begin{array}{ccc|ccc} 1 & 0 & \frac{1}{2} & 1 & -\frac{1}{2} & 0 \\ 0 & 1 & -\frac{1}{2} & 0 & -\frac{1}{2} & 0 \\ 0 & 0 & -\frac{1}{2} & 2 & -\frac{5}{2} & 1 \end{array} \right] \xrightarrow{-2R_3}$$

$$\left[ \begin{array}{ccc|ccc} 1 & 0 & \frac{1}{2} & 1 & -\frac{1}{2} & 0 \\ 0 & 1 & -\frac{1}{2} & 0 & -\frac{1}{2} & 0 \\ 0 & 0 & 1 & -4 & 5 & -2 \end{array} \right] \xrightarrow{\text{Replace row 1 by } -\frac{1}{2}R_3 + R_1. \text{ Replace row 2 by } \frac{1}{2}R_3 + R_2.} \left[ \begin{array}{ccc|ccc} 1 & 0 & 0 & 3 & -3 & 1 \\ 0 & 1 & 0 & -2 & 2 & -1 \\ 0 & 0 & 1 & -4 & 5 & -2 \end{array} \right]$$

This is the multiplicative identity,  $I_3$ .

This is the multiplicative inverse of  $A$ .

## TECHNOLOGY

We can use a graphing utility to verify the inverse matrix we found in Example 4. Enter the elements in matrix  $A$  and press  $\boxed{x^{-1}}$  to display  $A^{-1}$ .

Calculator screen showing matrix  $A$  and its inverse  $A^{-1}$ .

$$[A] \begin{bmatrix} 1 & -1 & 1 \\ 0 & -2 & 1 \\ -2 & -3 & 0 \end{bmatrix}$$

$$[A]^{-1} \begin{bmatrix} 3 & -3 & 1 \\ -2 & 2 & -1 \\ -4 & 5 & -2 \end{bmatrix}$$

## TECHNOLOGY

The matrix

$$A = \begin{bmatrix} 4 & 6 \\ 2 & 3 \end{bmatrix} = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$$

has no multiplicative inverse because

$$\begin{aligned} ad - bc &= 4 \cdot 3 - 6 \cdot 2 \\ &= 12 - 12 = 0. \end{aligned}$$

When we try to find the inverse with a graphing utility, an ERROR message occurs, indicating the matrix is singular.

Calculator screen showing matrix  $A$  and an error message.

$$[A] \begin{bmatrix} 4 & 6 \\ 2 & 3 \end{bmatrix}$$

$$[A]^{-1}$$

ERR: SINGULAR MAT  
Quit  
2: Goto

**Step 3 Matrix  $B$  is  $A^{-1}$ .** The last matrix shown at the bottom of the previous page is in the form  $[I_3|B]$ . The multiplicative identity matrix is on the left of the vertical bar. Matrix  $B$ , the multiplicative inverse of  $A$ , is on the right. Thus, the multiplicative inverse of  $A$  is

$$A^{-1} = \begin{bmatrix} 3 & -3 & 1 \\ -2 & 2 & -1 \\ -4 & 5 & -2 \end{bmatrix}.$$

**Step 4 Verify the result by showing that  $AA^{-1} = I_3$  and  $A^{-1}A = I_3$ .** Try confirming the result by multiplying  $A$  and  $A^{-1}$  to obtain  $I_3$ . Do you obtain  $I_3$  if you reverse the order of the multiplication? ●●●

We have seen that not all square matrices have multiplicative inverses. If the row operations in step 2 result in all zeros in a row or column to the left of the vertical line, the given matrix does not have a multiplicative inverse.

**Check Point 4** Find the multiplicative inverse of

$$A = \begin{bmatrix} 1 & 0 & 2 \\ -1 & 2 & 3 \\ 1 & -1 & 0 \end{bmatrix}.$$

### Summary: Finding Multiplicative Inverses for Invertible Matrices

Use a graphing utility with matrix capabilities, or

**a.** If the matrix is  $2 \times 2$ : The inverse of  $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$  is

$$A^{-1} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}.$$

**b.** If the matrix  $A$  is  $n \times n$  where  $n > 2$ : Use the procedure on page 894. Form  $[A|I_n]$  and use row transformations to obtain  $[I_n|B]$ . Then  $A^{-1} = B$ .

## Solving Systems of Equations Using Multiplicative Inverses of Matrices

Matrix multiplication can be used to represent a system of linear equations.

### Linear System

$$\begin{cases} a_1x + b_1y + c_1z = d_1 \\ a_2x + b_2y + c_2z = d_2 \\ a_3x + b_3y + c_3z = d_3 \end{cases}$$

### Matrix Form of the System

$$\begin{bmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} d_1 \\ d_2 \\ d_3 \end{bmatrix}$$

The matrix contains the system's coefficients.

The matrix contains the system's variables.

The matrix contains the system's constants.

You can work with the matrix form of the system and obtain the form of the linear system on the left. To do so, perform the matrix multiplication on the left side of the matrix equation. Then equate the corresponding elements.

The matrix equation

$$\begin{bmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} d_1 \\ d_2 \\ d_3 \end{bmatrix}$$

$$\begin{matrix} \downarrow & \downarrow & \downarrow & \downarrow \\ A & X & = & B \end{matrix}$$

is abbreviated as  $AX = B$ , where  $A$  is the **coefficient matrix** of the system, and  $X$  and  $B$  are matrices containing one column, called **column matrices**. The matrix  $B$  is called the **constant matrix**.

Here is a specific example of a linear system and its matrix form:

### Linear System

$$\begin{cases} x - y + z = 2 \\ -2y + z = 2 \\ -2x - 3y = \frac{1}{2} \end{cases}$$

### Matrix Form

$$\begin{array}{c} \text{Coefficients} \\ \left[ \begin{array}{ccc} 1 & -1 & 1 \\ 0 & -2 & 1 \\ -2 & -3 & 0 \end{array} \right] \end{array} \begin{array}{c} \left[ \begin{array}{c} x \\ y \\ z \end{array} \right] \\ X \end{array} = \begin{array}{c} \left[ \begin{array}{c} 2 \\ 2 \\ \frac{1}{2} \end{array} \right] \\ \text{Constants} \\ B, \text{ the} \\ \text{constant} \\ \text{matrix} \end{array}$$

$A$ , the coefficient matrix
 $X$ 
 $B$ , the constant matrix

The matrix equation  $AX = B$  can be solved using  $A^{-1}$  if it exists.

$$AX = B \quad \text{This is the matrix equation.}$$

$$A^{-1}AX = A^{-1}B \quad \text{Multiply both sides by } A^{-1}. \text{ Because matrix multiplication is not commutative, put } A^{-1} \text{ in the same left position on both sides.}$$

$$I_n X = A^{-1}B \quad \text{The multiplicative inverse property tells us that } A^{-1}A = I_n.$$

$$X = A^{-1}B \quad \text{Because } I_n \text{ is the multiplicative identity, } I_n X = X.$$

We see that if  $AX = B$ , then  $X = A^{-1}B$ .

- 2 Use inverses to solve matrix equations.

### Solving a System Using $A^{-1}$

If  $AX = B$  has a unique solution, then  $X = A^{-1}B$ . To solve a linear system of equations, multiply  $A^{-1}$  and  $B$  to find  $X$ .

### EXAMPLE 5 Using the Inverse of a Matrix to Solve a System

Solve the system by using  $A^{-1}$ , the inverse of the coefficient matrix:

$$\begin{cases} x - y + z = 2 \\ -2y + z = 2 \\ -2x - 3y = \frac{1}{2} \end{cases}$$

### SOLUTION

The linear system can be written as

$$\begin{array}{c} \left[ \begin{array}{ccc} 1 & -1 & 1 \\ 0 & -2 & 1 \\ -2 & -3 & 0 \end{array} \right] \\ A \end{array} \begin{array}{c} \left[ \begin{array}{c} x \\ y \\ z \end{array} \right] \\ X \end{array} = \begin{array}{c} \left[ \begin{array}{c} 2 \\ 2 \\ \frac{1}{2} \end{array} \right] \\ B \end{array}$$

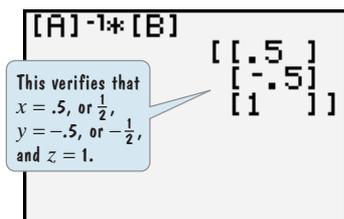

The solution is given by  $X = A^{-1}B$ . Consequently, we must find  $A^{-1}$ . We found the inverse of matrix  $A$  in Example 4. Using this result,

$$X = A^{-1}B = \begin{bmatrix} 3 & -3 & 1 \\ -2 & 2 & -1 \\ -4 & 5 & -2 \end{bmatrix} \begin{bmatrix} 2 \\ 2 \\ \frac{1}{2} \end{bmatrix} = \begin{bmatrix} 3 \cdot 2 + (-3) \cdot 2 + 1 \cdot \frac{1}{2} \\ -2 \cdot 2 + 2 \cdot 2 + (-1) \cdot \frac{1}{2} \\ -4 \cdot 2 + 5 \cdot 2 + (-2) \cdot \frac{1}{2} \end{bmatrix} = \begin{bmatrix} \frac{1}{2} \\ -\frac{1}{2} \\ 1 \end{bmatrix}$$

Thus,  $x = \frac{1}{2}$ ,  $y = -\frac{1}{2}$ , and  $z = 1$ . The solution set is  $\left\{\left(\frac{1}{2}, -\frac{1}{2}, 1\right)\right\}$ . ...

### TECHNOLOGY

We can use a graphing utility to solve a linear system with a unique solution by entering the elements in  $A$ , the coefficient matrix, and  $B$ , the column matrix. Then find the product of  $A^{-1}$  and  $B$ . The screen below verifies our solution in Example 5.

 **Check Point 5** Solve the system by using  $A^{-1}$ , the inverse of the coefficient matrix that you found in Check Point 4:

$$\begin{cases} x + 2z = 6 \\ -x + 2y + 3z = -5 \\ x - y = 6. \end{cases}$$

**3** Encode and decode messages.

### Applications of Matrix Inverses to Coding

A **cryptogram** is a message written so that no one other than the intended recipient can understand it. To encode a message, we begin by assigning a number to each letter in the alphabet:  $A = 1, B = 2, C = 3, \dots, Z = 26$ , and a space = 0. For example, the numerical equivalent of the word MATH is 13, 1, 20, 8. The numerical equivalent of the message is then converted into a matrix. Finally, an invertible matrix can be used to convert the message into code. The multiplicative inverse of this matrix can be used to decode the message.

#### Encoding a Word or Message

- Express the word or message numerically.
- List the numbers in step 1 by columns and form a square matrix. If you do not have enough numbers to form a square matrix, put zeros in any remaining spaces in the last column.
- Select any square invertible matrix, called the **coding matrix**, the same size as the matrix in step 2. Multiply the coding matrix by the square matrix that expresses the message numerically. The resulting matrix is the **coded matrix**.
- Use the numbers, by columns, from the coded matrix in step 3 to write the encoded message.

#### EXAMPLE 6 Encoding a Word

Use matrices to encode the word MATH.

#### SOLUTION

**Step 1 Express the word numerically.** As shown previously, the numerical equivalent of MATH is 13, 1, 20, 8.

**Step 2 List the numbers in step 1 by columns and form a square matrix.** The  $2 \times 2$  matrix for the numerical equivalent of MATH, 13, 1, 20, 8, is

$$\begin{bmatrix} 13 & 20 \\ 1 & 8 \end{bmatrix}.$$

**Step 3 Multiply the matrix in step 2 by a square invertible matrix.** We will use  $\begin{bmatrix} -2 & -3 \\ 3 & 4 \end{bmatrix}$  as the coding matrix.

$$\begin{bmatrix} -2 & -3 \\ 3 & 4 \end{bmatrix} \begin{bmatrix} 13 & 20 \\ 1 & 8 \end{bmatrix} = \begin{bmatrix} -2(13) - 3(1) & -2(20) - 3(8) \\ 3(13) + 4(1) & 3(20) + 4(8) \end{bmatrix}$$

$$\begin{matrix} \text{Coding} & \text{Numerical} & \\ \text{matrix} & \text{representation of} & \\ & \text{MATH} & \\ & & \text{Coded} \\ & & \text{matrix} \end{matrix} = \begin{bmatrix} -29 & -64 \\ 43 & 92 \end{bmatrix}$$

**Step 4 Use the numbers, by columns, from the coded matrix in step 3 to write the encoded message.** The encoded message is  $-29, 43, -64, 92$ . ...

 **Check Point 6** Use the coding matrix in Example 6,  $\begin{bmatrix} -2 & -3 \\ 3 & 4 \end{bmatrix}$ , to encode the word BASE.

The inverse of a coding matrix can be used to decode a word or message that was encoded.

### Decoding a Word or Message That Was Encoded

1. Find the multiplicative inverse of the coding matrix.
2. Multiply the multiplicative inverse of the coding matrix and the coded matrix.
3. Express the numbers, by columns, from the matrix in step 2 as letters.

### EXAMPLE 7 Decoding a Word

Decode  $-29, 43, -64, 92$  from Example 6.

#### SOLUTION

**Step 1 Find the inverse of the coding matrix.** The coding matrix in Example 6 was  $\begin{bmatrix} -2 & -3 \\ 3 & 4 \end{bmatrix}$ . We use the formula for the multiplicative inverse of a  $2 \times 2$  matrix to find the multiplicative inverse of this matrix. It is  $\begin{bmatrix} 4 & 3 \\ -3 & -2 \end{bmatrix}$ .

**Step 2 Multiply the multiplicative inverse of the coding matrix and the coded matrix.**

$$\begin{bmatrix} 4 & 3 \\ -3 & -2 \end{bmatrix} \begin{bmatrix} -29 & -64 \\ 43 & 92 \end{bmatrix} = \begin{bmatrix} 4(-29) + 3(43) & 4(-64) + 3(92) \\ -3(-29) - 2(43) & -3(-64) - 2(92) \end{bmatrix}$$

Multiplicative inverse  
of the coding matrix

Coded  
matrix

$= \begin{bmatrix} 13 & 20 \\ 1 & 8 \end{bmatrix}$

**Step 3 Express the numbers, by columns, from the matrix in step 2 as letters.** The numbers are 13, 1, 20, and 8. Using letters, the decoded message is MATH. ●●●

**Check Point 7** Decode the word that you encoded in Check Point 6.

Decoding is simple for an authorized receiver who knows the coding matrix. Because any invertible matrix can be used for the coding matrix, decoding a cryptogram for an unauthorized receiver who does not know this matrix is extremely difficult.

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

1. The multiplicative identity matrix of order 2 is

$$I_2 = \underline{\hspace{2cm}}$$

2. The multiplicative identity matrix of order 3 is

$$I_3 = \underline{\hspace{2cm}}$$

3. For  $n \times n$  matrices  $A$  and  $B$ , if  $AB = I_n$  and  $BA = I_n$ , then  $B$  is called the \_\_\_\_\_ of  $A$ .
4. True or false: Only square matrices have multiplicative inverses. \_\_\_\_\_

5. If  $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ , the matrix  $A$  is invertible if and only if \_\_\_\_\_.

6. If a square matrix does not have a multiplicative inverse, it is called \_\_\_\_\_.

7. True or false:  $A = \begin{bmatrix} 3 & 2 \\ 9 & 6 \end{bmatrix}$  is invertible. \_\_\_\_\_

8. To find the multiplicative inverse of an invertible matrix  $A$ , we perform row operations on  $[A | I_n]$  to obtain a matrix of the form  $[I_n | B]$ , where  $B = \underline{\hspace{2cm}}$ .

9. If the matrix equation  $AX = B$  has a unique solution, then we can solve the equation using  $X = \underline{\hspace{2cm}}$ .

## EXERCISE SET 8.4

## Practice Exercises

In Exercises 1–12, find the products  $AB$  and  $BA$  to determine whether  $B$  is the multiplicative inverse of  $A$ .

1.  $A = \begin{bmatrix} 4 & -3 \\ -5 & 4 \end{bmatrix}, B = \begin{bmatrix} 4 & 3 \\ 5 & 4 \end{bmatrix}$

2.  $A = \begin{bmatrix} -2 & -1 \\ -1 & 1 \end{bmatrix}, B = \begin{bmatrix} 1 & 1 \\ 1 & 2 \end{bmatrix}$

3.  $A = \begin{bmatrix} -4 & 0 \\ 1 & 3 \end{bmatrix}, B = \begin{bmatrix} -2 & 4 \\ 0 & 1 \end{bmatrix}$

4.  $A = \begin{bmatrix} -2 & 4 \\ 1 & -2 \end{bmatrix}, B = \begin{bmatrix} 1 & 2 \\ -1 & -2 \end{bmatrix}$

5.  $A = \begin{bmatrix} -2 & 1 \\ \frac{3}{2} & -\frac{1}{2} \end{bmatrix}, B = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$

6.  $A = \begin{bmatrix} 4 & 5 \\ 2 & 3 \end{bmatrix}, B = \begin{bmatrix} \frac{3}{2} & -\frac{5}{2} \\ -1 & 2 \end{bmatrix}$

7.  $A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 0 & 0 \end{bmatrix}, B = \begin{bmatrix} 0 & 0 & 1 \\ 1 & 0 & 0 \\ 0 & 1 & 0 \end{bmatrix}$

8.  $A = \begin{bmatrix} -2 & 1 & -1 \\ -5 & 2 & -1 \\ 3 & -1 & 1 \end{bmatrix}, B = \begin{bmatrix} 1 & 0 & 1 \\ 2 & 1 & 3 \\ -1 & 1 & 1 \end{bmatrix}$

9.  $A = \begin{bmatrix} 1 & 2 & 3 \\ 1 & 3 & 4 \\ 1 & 4 & 3 \end{bmatrix}, B = \begin{bmatrix} \frac{7}{2} & -3 & \frac{1}{2} \\ -\frac{1}{2} & 0 & \frac{1}{2} \\ -\frac{1}{2} & 1 & -\frac{1}{2} \end{bmatrix}$

10.  $A = \begin{bmatrix} 0 & 2 & 0 \\ 3 & 3 & 2 \\ 2 & 5 & 1 \end{bmatrix}, B = \begin{bmatrix} -3.5 & -1 & 2 \\ 0.5 & 0 & 0 \\ 4.5 & 2 & -3 \end{bmatrix}$

11.  $A = \begin{bmatrix} 0 & 0 & -2 & 1 \\ -1 & 0 & 1 & 1 \\ 0 & 1 & -1 & 0 \\ 1 & 0 & 0 & -1 \end{bmatrix}, B = \begin{bmatrix} 1 & 2 & 0 & 3 \\ 0 & 1 & 1 & 1 \\ 0 & 1 & 0 & 1 \\ 1 & 2 & 0 & 2 \end{bmatrix}$

12.  $A = \begin{bmatrix} 1 & -2 & 1 & 0 \\ 0 & 1 & -2 & 1 \\ 0 & 0 & 1 & -2 \\ 0 & 0 & 0 & 1 \end{bmatrix}, B = \begin{bmatrix} 1 & 2 & 3 & 4 \\ 0 & 1 & 2 & 3 \\ 0 & 0 & 1 & 2 \\ 0 & 0 & 0 & 1 \end{bmatrix}$

In Exercises 13–18, use the fact that if  $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ , then

$$A^{-1} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$$

to find the inverse of each matrix, if possible. Check that  $AA^{-1} = I_2$  and  $A^{-1}A = I_2$ .

13.  $A = \begin{bmatrix} 2 & 3 \\ -1 & 2 \end{bmatrix}$

14.  $A = \begin{bmatrix} 0 & 3 \\ 4 & -2 \end{bmatrix}$

15.  $A = \begin{bmatrix} 3 & -1 \\ -4 & 2 \end{bmatrix}$

16.  $A = \begin{bmatrix} 2 & -6 \\ 1 & -2 \end{bmatrix}$

17.  $A = \begin{bmatrix} 10 & -2 \\ -5 & 1 \end{bmatrix}$

18.  $A = \begin{bmatrix} 6 & -3 \\ -2 & 1 \end{bmatrix}$

In Exercises 19–28, find  $A^{-1}$  by forming  $[A|I]$  and then using row operations to obtain  $[I|B]$ , where  $A^{-1} = [B]$ . Check that  $AA^{-1} = I$  and  $A^{-1}A = I$ .

19.  $A = \begin{bmatrix} 2 & 0 & 0 \\ 0 & 4 & 0 \\ 0 & 0 & 6 \end{bmatrix}$

20.  $A = \begin{bmatrix} 3 & 0 & 0 \\ 0 & 6 & 0 \\ 0 & 0 & 9 \end{bmatrix}$

21.  $A = \begin{bmatrix} 1 & 2 & -1 \\ -2 & 0 & 1 \\ 1 & -1 & 0 \end{bmatrix}$

22.  $A = \begin{bmatrix} 1 & -1 & 1 \\ 0 & 2 & -1 \\ 2 & 3 & 0 \end{bmatrix}$

23.  $A = \begin{bmatrix} 2 & 2 & -1 \\ 0 & 3 & -1 \\ -1 & -2 & 1 \end{bmatrix}$

24.  $A = \begin{bmatrix} 2 & 4 & -4 \\ 1 & 3 & -4 \\ 2 & 4 & -3 \end{bmatrix}$

25.  $A = \begin{bmatrix} 5 & 0 & 2 \\ 2 & 2 & 1 \\ -3 & 1 & -1 \end{bmatrix}$

26.  $A = \begin{bmatrix} 3 & 2 & 6 \\ 1 & 1 & 2 \\ 2 & 2 & 5 \end{bmatrix}$

27.  $A = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & -1 & 0 & 0 \\ 0 & 0 & 3 & 0 \\ 1 & 0 & 0 & 1 \end{bmatrix}$

28.  $A = \begin{bmatrix} 2 & 0 & 0 & 1 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & 2 \end{bmatrix}$

In Exercises 29–32, write each linear system as a matrix equation in the form  $AX = B$ , where  $A$  is the coefficient matrix and  $B$  is the constant matrix.

29. 
$$\begin{cases} 6x + 5y = 13 \\ 5x + 4y = 10 \end{cases}$$

30. 
$$\begin{cases} 7x + 5y = 23 \\ 3x + 2y = 10 \end{cases}$$

31. 
$$\begin{cases} x + 3y + 4z = -3 \\ x + 2y + 3z = -2 \\ x + 4y + 3z = -6 \end{cases}$$

32. 
$$\begin{cases} x + 4y - z = 3 \\ x + 3y - 2z = 5 \\ 2x + 7y - 5z = 12 \end{cases}$$

In Exercises 33–36, write each matrix equation as a system of linear equations without matrices.

33. 
$$\begin{bmatrix} 4 & -7 \\ 2 & -3 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} -3 \\ 1 \end{bmatrix}$$

34. 
$$\begin{bmatrix} 3 & 0 \\ -3 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 6 \\ -7 \end{bmatrix}$$

35. 
$$\begin{bmatrix} 2 & 0 & -1 \\ 0 & 3 & 0 \\ 1 & 1 & 0 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 6 \\ 9 \\ 5 \end{bmatrix}$$

36. 
$$\begin{bmatrix} -1 & 0 & 1 \\ 0 & -1 & 0 \\ 0 & 1 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} -4 \\ 2 \\ 4 \end{bmatrix}$$

In Exercises 37–42,

a. Write each linear system as a matrix equation in the form  $AX = B$ .

b. Solve the system using the inverse that is given for the coefficient matrix.

37. 
$$\begin{cases} 2x + 6y + 6z = 8 \\ 2x + 7y + 6z = 10 \\ 2x + 7y + 7z = 9 \end{cases}$$
 The inverse of  $\begin{bmatrix} 2 & 6 & 6 \\ 2 & 7 & 6 \\ 2 & 7 & 7 \end{bmatrix}$  is  $\begin{bmatrix} \frac{7}{2} & 0 & -3 \\ -1 & 1 & 0 \\ 0 & -1 & 1 \end{bmatrix}$ .

38. 
$$\begin{cases} x + 2y + 5z = 2 \\ 2x + 3y + 8z = 3 \\ -x + y + 2z = 3 \end{cases}$$
 The inverse of  $\begin{bmatrix} 1 & 2 & 5 \\ 2 & 3 & 8 \\ -1 & 1 & 2 \end{bmatrix}$  is  $\begin{bmatrix} 2 & -1 & -1 \\ 12 & -7 & -2 \\ -5 & 3 & 1 \end{bmatrix}$ .

39. 
$$\begin{cases} x - y + z = 8 \\ 2y - z = -7 \\ 2x + 3y = 1 \end{cases}$$
 The inverse of  $\begin{bmatrix} 1 & -1 & 1 \\ 0 & 2 & -1 \\ 2 & 3 & 0 \end{bmatrix}$  is  $\begin{bmatrix} 3 & 3 & -1 \\ -2 & -2 & 1 \\ -4 & -5 & 2 \end{bmatrix}$ .

40. 
$$\begin{cases} x - 6y + 3z = 11 \\ 2x - 7y + 3z = 14 \\ 4x - 12y + 5z = 25 \end{cases}$$
 The inverse of  $\begin{bmatrix} 1 & -6 & 3 \\ 2 & -7 & 3 \\ 4 & -12 & 5 \end{bmatrix}$  is  $\begin{bmatrix} 1 & -6 & 3 \\ 2 & -7 & 3 \\ 4 & -12 & 5 \end{bmatrix}$ .

41. 
$$\begin{cases} w - x + 2y = -3 \\ x - y + z = 4 \\ -w + x - y + 2z = 2 \\ -x + y - 2z = -4 \end{cases}$$

The inverse of  $\begin{bmatrix} 1 & -1 & 2 & 0 \\ 0 & 1 & -1 & 1 \\ -1 & 1 & -1 & 2 \\ 0 & -1 & 1 & -2 \end{bmatrix}$  is  $\begin{bmatrix} 0 & 0 & -1 & -1 \\ 1 & 4 & 1 & 3 \\ 1 & 2 & 1 & 2 \\ 0 & -1 & 0 & -1 \end{bmatrix}$ .

42. 
$$\begin{cases} 2w + y + z = 6 \\ 3w + z = 9 \\ -w + x - 2y + z = 4 \\ 4w - x + y = 6 \end{cases}$$

The inverse of  $\begin{bmatrix} 2 & 0 & 1 & 1 \\ 3 & 0 & 0 & 1 \\ -1 & 1 & -2 & 1 \\ 4 & -1 & 1 & 0 \end{bmatrix}$  is  $\begin{bmatrix} -1 & 2 & -1 & -1 \\ -4 & 9 & -5 & -6 \\ 0 & 1 & -1 & -1 \\ 3 & -5 & 3 & 3 \end{bmatrix}$ .

### Practice Plus

In Exercises 43–44, find  $A^{-1}$  and check.

43.  $A = \begin{bmatrix} e^x & e^{3x} \\ -e^{3x} & e^{5x} \end{bmatrix}$       44.  $A = \begin{bmatrix} e^{2x} & -e^x \\ e^{3x} & e^{2x} \end{bmatrix}$

In Exercises 45–46, if  $I$  is the multiplicative identity matrix of order 2, find  $(I - A)^{-1}$  for the given matrix  $A$ .

45.  $\begin{bmatrix} 8 & -5 \\ -3 & 2 \end{bmatrix}$       46.  $\begin{bmatrix} 7 & -5 \\ -4 & 3 \end{bmatrix}$

In Exercises 47–48, find  $(AB)^{-1}$ ,  $A^{-1}B^{-1}$ , and  $B^{-1}A^{-1}$ . What do you observe?

47.  $A = \begin{bmatrix} 2 & 1 \\ 3 & 1 \end{bmatrix}$        $B = \begin{bmatrix} 4 & 7 \\ 1 & 2 \end{bmatrix}$

48.  $A = \begin{bmatrix} 2 & -9 \\ 1 & -4 \end{bmatrix}$        $B = \begin{bmatrix} 9 & 5 \\ 7 & 4 \end{bmatrix}$

49. Prove the following statement:

If  $A = \begin{bmatrix} a & 0 & 0 \\ 0 & b & 0 \\ 0 & 0 & c \end{bmatrix}$ ,  $a \neq 0$ ,  $b \neq 0$ ,  $c \neq 0$ ,

then  $A^{-1} = \begin{bmatrix} \frac{1}{a} & 0 & 0 \\ 0 & \frac{1}{b} & 0 \\ 0 & 0 & \frac{1}{c} \end{bmatrix}$ .

50. Prove the following statement:

If  $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$  and  $ad - bc \neq 0$ ,

then  $A^{-1} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$ .

(Hint: Use the method of Example 2 on page 630.)

### Application Exercises

In Exercises 51–52, use the coding matrix

$$A = \begin{bmatrix} 4 & -1 \\ -3 & 1 \end{bmatrix} \text{ and its inverse } A^{-1} = \begin{bmatrix} 1 & 1 \\ 3 & 4 \end{bmatrix}$$

to encode and then decode the given message.

51. HELP

52. LOVE

In Exercises 53–54, use the coding matrix

$$A = \begin{bmatrix} 1 & -1 & 0 \\ 3 & 0 & 2 \\ -1 & 0 & -1 \end{bmatrix} \text{ and its inverse}$$

$$A^{-1} = \begin{bmatrix} 0 & 1 & 2 \\ -1 & 1 & 2 \\ 0 & -1 & -3 \end{bmatrix} \text{ to write a cryptogram for each}$$

message. Check your result by decoding the cryptogram.

53. S E N D \_ C A S H  
19 5 14 4 0 3 1 19 8

$$\text{Use } \begin{bmatrix} 19 & 4 & 1 \\ 5 & 0 & 19 \\ 14 & 3 & 8 \end{bmatrix}.$$

54. S T A Y \_ W E L L  
19 20 1 25 0 23 5 12 12

$$\text{Use } \begin{bmatrix} 19 & 25 & 5 \\ 20 & 0 & 12 \\ 1 & 23 & 12 \end{bmatrix}.$$

### Writing in Mathematics

- What is the multiplicative identity matrix?
- If you are given two matrices,  $A$  and  $B$ , explain how to determine if  $B$  is the multiplicative inverse of  $A$ .
- Explain why a matrix that does not have the same number of rows and columns cannot have a multiplicative inverse.
- Explain how to find the multiplicative inverse for a  $2 \times 2$  invertible matrix.
- Explain how to find the multiplicative inverse for a  $3 \times 3$  invertible matrix.
- Explain how to write a linear system of three equations in three variables as a matrix equation.
- Explain how to solve the matrix equation  $AX = B$ .
- What is a cryptogram?
- It's January 1, and you've written down your major goal for the year. You do not want those closest to you to see what you've written in case you do not accomplish your objective. Consequently, you decide to use a coding matrix to encode your goal. Explain how this can be accomplished.

64. A year has passed since Exercise 63. (Time flies when you're solving exercises in precalculus books.) It's been a terrific year and so many wonderful things have happened that you can't remember your goal from a year ago. You consult your personal journal and you find the encoded message and the coding matrix. How can you use these to find your original goal?

### Technology Exercises

In Exercises 65–70, use a graphing utility to find the multiplicative inverse of each matrix. Check that the displayed inverse is correct.

$$65. \begin{bmatrix} 3 & -1 \\ -2 & 1 \end{bmatrix}$$

$$66. \begin{bmatrix} -4 & 1 \\ 6 & -2 \end{bmatrix}$$

$$67. \begin{bmatrix} -2 & 1 & -1 \\ -5 & 2 & -1 \\ 3 & -1 & 1 \end{bmatrix}$$

$$68. \begin{bmatrix} 1 & 1 & -1 \\ -3 & 2 & -1 \\ 3 & -3 & 2 \end{bmatrix}$$

$$69. \begin{bmatrix} 7 & -3 & 0 & 2 \\ -2 & 1 & 0 & -1 \\ 4 & 0 & 1 & -2 \\ -1 & 1 & 0 & -1 \end{bmatrix}$$

$$70. \begin{bmatrix} 1 & 2 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 1 & 3 & 0 & 1 \\ 4 & 0 & 0 & 2 \end{bmatrix}$$

In Exercises 71–76, write each system in the form  $AX = B$ . Then solve the system by entering  $A$  and  $B$  into your graphing utility and computing  $A^{-1}B$ .

$$71. \begin{cases} x - y + z = -6 \\ 4x + 2y + z = 9 \\ 4x - 2y + z = -3 \end{cases}$$

$$72. \begin{cases} y + 2z = 0 \\ -x + y = 1 \\ 2x - y + z = -1 \end{cases}$$

$$73. \begin{cases} 3x - 2y + z = -2 \\ 4x - 5y + 3z = -9 \\ 2x - y + 5z = -5 \end{cases}$$

$$74. \begin{cases} x - y = 1 \\ 6x + y + 20z = 14 \\ y + 3z = 1 \end{cases}$$

$$75. \begin{cases} v - 3x + z = -3 \\ w + y = -1 \\ x + z = 7 \\ v + w - x + 4y = -8 \\ v + w + x + y + z = 8 \end{cases}$$

$$76. \begin{cases} w + x + y + z = 4 \\ w + 3x - 2y + 2z = 7 \\ 2w + 2x + y + z = 3 \\ w - x + 2y + 3z = 5 \end{cases}$$

In Exercises 77–78, use a coding matrix  $A$  of your choice. Use a graphing utility to find the multiplicative inverse of your coding matrix. Write a cryptogram for each message. Check your result by decoding the cryptogram. Use your graphing utility to perform all necessary matrix multiplications.

$$77. \begin{matrix} A & R & R & I & V & E & D & \_ & S & A & F & E & L & Y \\ 1 & 18 & 18 & 9 & 22 & 5 & 4 & 0 & 19 & 1 & 6 & 5 & 12 & 25 \end{matrix}$$

$$78. \begin{matrix} A & R & T & \_ & E & N & R & I & C & H & E & S \\ 1 & 18 & 20 & 0 & 5 & 14 & 18 & 9 & 3 & 8 & 5 & 19 \end{matrix}$$

### Critical Thinking Exercises

**Make Sense?** In Exercises 79–82, determine whether each statement makes sense or does not make sense, and explain your reasoning.

79. I found the multiplicative inverse of a  $2 \times 3$  matrix.  
 80. I used Gauss-Jordan elimination to find the multiplicative inverse of a  $3 \times 3$  matrix.  
 81. I used matrix multiplication to represent a system of linear equations.  
 82. I made an encoding error by selecting the wrong square invertible matrix.

In Exercises 83–88, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

83. All square  $2 \times 2$  matrices have inverses because there is a formula for finding these inverses.  
 84. Two  $2 \times 2$  invertible matrices can have a matrix sum that is not invertible.  
 85. To solve the matrix equation  $AX = B$  for  $X$ , multiply  $A$  and the inverse of  $B$ .  
 86.  $(AB)^{-1} = A^{-1}B^{-1}$ , assuming  $A$ ,  $B$ , and  $AB$  are invertible.  
 87.  $(A + B)^{-1} = A^{-1} + B^{-1}$ , assuming  $A$ ,  $B$ , and  $A + B$  are invertible.  
 88.  $\begin{bmatrix} 1 & -3 \\ -1 & 3 \end{bmatrix}$  is an invertible matrix.  
 89. Give an example of a  $2 \times 2$  matrix that is its own inverse.  
 90. If  $A = \begin{bmatrix} 3 & 5 \\ 2 & 4 \end{bmatrix}$ , find  $(A^{-1})^{-1}$ .  
 91. Find values of  $a$  for which the following matrix is not invertible:

$$\begin{bmatrix} 1 & a + 1 \\ a - 2 & 4 \end{bmatrix}$$

### Group Exercise

92. Each person in the group should work with one partner. Send a coded word or message to each other by giving your partner the coded matrix and the coding matrix that you selected. Once messages are sent, each person should decode the message received.

### Preview Exercises

Exercises 93–95 will help you prepare for the material covered in the next section. Simplify the expression in each exercise.

$$93. 2(-5) - (-3)(4)$$

$$94. \frac{2(-5) - 1(-4)}{5(-5) - 6(-4)}$$

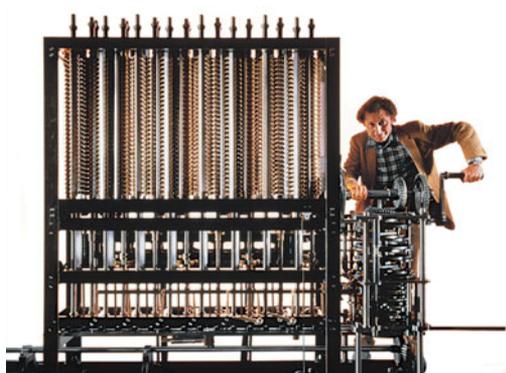

$$95. 2(-30 - (-3)) - 3(6 - 9) + (-1)(1 - 15)$$

## SECTION 8.5

## Determinants and Cramer's Rule

*Objectives*

- 1 Evaluate a second-order determinant.
- 2 Solve a system of linear equations in two variables using Cramer's Rule.
- 3 Evaluate a third-order determinant.
- 4 Solve a system of linear equations in three variables using Cramer's Rule.
- 5 Evaluate higher-order determinants.

A portion of Charles Babbage's unrealized difference engine

As cyberspace absorbs more and more of our work, play, shopping, and socializing, where will it all end? Which activities will still be offline in 2025?

Our technologically transformed lives can be traced back to the English inventor Charles Babbage

(1792–1871). Babbage knew of a method for solving linear systems called *Cramer's Rule*, in honor of the Swiss geometer Gabriel Cramer (1704–1752). Cramer's Rule was simple but involved numerous multiplications for large systems. Babbage designed a machine, called the “difference engine” that consisted of toothed wheels on shafts for performing these multiplications. Despite the fact that only one-seventh of the functions ever worked, Babbage's invention demonstrated how complex calculations could be handled mechanically. In 1944, scientists at IBM used the lessons of the difference engine to create the world's first computer.

Those who invented computers hoped to relegate the drudgery of repeated computation to a machine. In this section, we look at a method for solving linear systems that played a critical role in this process. The method uses real numbers, called *determinants*, that are associated with arrays of numbers. As with matrix methods, solutions are obtained by writing down the coefficients and constants of a linear system and performing operations with them.

- 1 Evaluate a second-order determinant.

**GREAT QUESTION!**

**What does the definition of a determinant mean? What am I supposed to do?**

To evaluate a second-order determinant, find the difference of the product of the two diagonals.

$$\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix} = a_1b_2 - a_2b_1$$

**The Determinant of a  $2 \times 2$  Matrix**

Associated with every square matrix is a real number, called its **determinant**. The determinant for a  $2 \times 2$  square matrix is defined as follows:

**Definition of the Determinant of a  $2 \times 2$  Matrix**

The determinant of the matrix  $\begin{bmatrix} a_1 & b_1 \\ a_2 & b_2 \end{bmatrix}$  is denoted by  $\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}$  and is defined by

$$\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix} = a_1b_2 - a_2b_1.$$

We also say that the **value** of the **second-order determinant**  $\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}$  is  $a_1b_2 - a_2b_1$ .

Example 1 illustrates that the determinant of a matrix may be positive or negative. A determinant can also have 0 as its value.

**EXAMPLE 1** Evaluating the Determinant of a  $2 \times 2$  Matrix

Evaluate the determinant of each of the following matrices:

a.  $\begin{bmatrix} 5 & 6 \\ 7 & 3 \end{bmatrix}$

b.  $\begin{bmatrix} 2 & 4 \\ -3 & -5 \end{bmatrix}$ .

**DISCOVERY**

Write and then evaluate three determinants, one whose value is positive, one whose value is negative, and one whose value is 0.

**SOLUTION**

We multiply and subtract as indicated.

a.  $\begin{vmatrix} 5 & 6 \\ 7 & 3 \end{vmatrix} = 5 \cdot 3 - 7 \cdot 6 = 15 - 42 = -27$

The value of the second-order determinant is  $-27$ .

b.  $\begin{vmatrix} 2 & 4 \\ -3 & -5 \end{vmatrix} = 2(-5) - (-3)(4) = -10 + 12 = 2$

The value of the second-order determinant is 2. ●●●

 **Check Point 1** Evaluate the determinant of each of the following matrices:

a.  $\begin{bmatrix} 10 & 9 \\ 6 & 5 \end{bmatrix}$

b.  $\begin{bmatrix} 4 & 3 \\ -5 & -8 \end{bmatrix}$ .

- 2 Solve a system of linear equations in two variables using Cramer's Rule.

**Solving Systems of Linear Equations in Two Variables Using Determinants**

Determinants can be used to solve a linear system in two variables. In general, such a system appears as

$$\begin{cases} a_1x + b_1y = c_1 \\ a_2x + b_2y = c_2. \end{cases}$$

Let's first solve this system for  $x$  using the addition method. We can solve for  $x$  by eliminating  $y$  from the equations. Multiply the first equation by  $b_2$  and the second equation by  $-b_1$ . Then add the two equations:

$$\begin{cases} a_1x + b_1y = c_1 \\ a_2x + b_2y = c_2 \end{cases} \xrightarrow[\text{Add:}]{\begin{array}{l} \text{Multiply by } b_2. \\ \text{Multiply by } -b_1. \end{array}} \begin{cases} a_1b_2x + b_1b_2y = c_1b_2 \\ -a_2b_1x - b_1b_2y = -c_2b_1 \end{cases}$$

$$(a_1b_2 - a_2b_1)x = c_1b_2 - c_2b_1$$

$$x = \frac{c_1b_2 - c_2b_1}{a_1b_2 - a_2b_1}.$$

Because

$$\begin{vmatrix} c_1 & b_1 \\ c_2 & b_2 \end{vmatrix} = c_1b_2 - c_2b_1 \quad \text{and} \quad \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix} = a_1b_2 - a_2b_1,$$

we can express our answer for  $x$  as the quotient of two determinants:

$$x = \frac{c_1b_2 - c_2b_1}{a_1b_2 - a_2b_1} = \frac{\begin{vmatrix} c_1 & b_1 \\ c_2 & b_2 \end{vmatrix}}{\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}}.$$

Similarly, we could use the addition method to solve our system for  $y$ , again expressing  $y$  as the quotient of two determinants. This method of using determinants to solve the linear system, called **Cramer's Rule**, is summarized in the box at the top of the next page.

### Solving a Linear System in Two Variables Using Determinants Cramer's Rule

If

$$\begin{cases} a_1x + b_1y = c_1 \\ a_2x + b_2y = c_2, \end{cases}$$

then

$$x = \frac{\begin{vmatrix} c_1 & b_1 \\ c_2 & b_2 \end{vmatrix}}{\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}} \quad \text{and} \quad y = \frac{\begin{vmatrix} a_1 & c_1 \\ a_2 & c_2 \end{vmatrix}}{\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}},$$

where

$$\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix} \neq 0.$$

Here are some helpful tips when solving

$$\begin{cases} a_1x + b_1y = c_1 \\ a_2x + b_2y = c_2 \end{cases}$$

using determinants:

1. Three different determinants are used to find  $x$  and  $y$ . The determinants in the denominators for  $x$  and  $y$  are identical. The determinants in the numerators for  $x$  and  $y$  differ. In abbreviated notation, we write

$$x = \frac{D_x}{D} \quad \text{and} \quad y = \frac{D_y}{D}, \quad \text{where } D \neq 0.$$

2. The elements of  $D$ , the determinant in the denominator, are the coefficients of the variables in the system.

$$D = \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}$$

3.  $D_x$ , the determinant in the numerator of  $x$ , is obtained by replacing the  $x$ -coefficients, in  $D$ ,  $a_1$  and  $a_2$ , with the constants on the right sides of the equations,  $c_1$  and  $c_2$ .

$$D = \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix} \quad \text{and} \quad D_x = \begin{vmatrix} c_1 & b_1 \\ c_2 & b_2 \end{vmatrix} \quad \text{Replace the column with } a_1 \text{ and } a_2 \text{ with the constants } c_1 \text{ and } c_2 \text{ to get } D_x.$$

4.  $D_y$ , the determinant in the numerator for  $y$ , is obtained by replacing the  $y$ -coefficients, in  $D$ ,  $b_1$  and  $b_2$ , with the constants on the right sides of the equations,  $c_1$  and  $c_2$ .

$$D = \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix} \quad \text{and} \quad D_y = \begin{vmatrix} a_1 & c_1 \\ a_2 & c_2 \end{vmatrix} \quad \text{Replace the column with } b_1 \text{ and } b_2 \text{ with the constants } c_1 \text{ and } c_2 \text{ to get } D_y.$$

**EXAMPLE 2** Using Cramer's Rule to Solve a Linear System

Use Cramer's Rule to solve the system:

$$\begin{cases} 5x - 4y = 2 \\ 6x - 5y = 1. \end{cases}$$

**SOLUTION**

Because

$$x = \frac{D_x}{D} \quad \text{and} \quad y = \frac{D_y}{D},$$

we will set up and evaluate the three determinants  $D$ ,  $D_x$ , and  $D_y$ .

1.  $D$ , the determinant in both denominators, consists of the  $x$ - and  $y$ -coefficients.

$$D = \begin{vmatrix} 5 & -4 \\ 6 & -5 \end{vmatrix} = (5)(-5) - (6)(-4) = -25 + 24 = -1$$

Because this determinant is not zero, we continue to use Cramer's Rule to solve the system.

2.  $D_x$ , the determinant in the numerator for  $x$ , is obtained by replacing the  $x$ -coefficients in  $D$ , 5 and 6, by the constants on the right sides of the equations, 2 and 1.

$$D_x = \begin{vmatrix} 2 & -4 \\ 1 & -5 \end{vmatrix} = (2)(-5) - (1)(-4) = -10 + 4 = -6$$

3.  $D_y$ , the determinant in the numerator for  $y$ , is obtained by replacing the  $y$ -coefficients in  $D$ ,  $-4$  and  $-5$ , by the constants on the right sides of the equations, 2 and 1.

$$D_y = \begin{vmatrix} 5 & 2 \\ 6 & 1 \end{vmatrix} = (5)(1) - (6)(2) = 5 - 12 = -7$$

4. Thus,

$$x = \frac{D_x}{D} = \frac{-6}{-1} = 6 \quad \text{and} \quad y = \frac{D_y}{D} = \frac{-7}{-1} = 7.$$

As always, the solution  $(6, 7)$  can be checked by substituting these values into the original equations. The solution set is  $\{(6, 7)\}$ . ... **Check Point 2** Use Cramer's Rule to solve the system:

$$\begin{cases} 5x + 4y = 12 \\ 3x - 6y = 24. \end{cases}$$

- 3** Evaluate a third-order determinant.

**The Determinant of a  $3 \times 3$  Matrix**Associated with every square matrix is a real number called its determinant. The determinant for a  $3 \times 3$  matrix is defined as follows:**Definition of a Third-Order Determinant**

$$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = a_1b_2c_3 + b_1c_2a_3 + c_1a_2b_3 - a_3b_2c_1 - b_3c_2a_1 - c_3a_2b_1$$

The six terms and the three factors in each term in this complicated evaluation formula,  $a_1b_2c_3 + b_1c_2a_3 + c_1a_2b_3 - a_3b_2c_1 - b_3c_2a_1 - c_3a_2b_1$ , can be rearranged, and then we can apply the distributive property. We obtain

$$\begin{aligned} & a_1b_2c_3 - a_1b_3c_2 - a_2b_1c_3 + a_2b_3c_1 + a_3b_1c_2 - a_3b_2c_1 \\ &= a_1(b_2c_3 - b_3c_2) - a_2(b_1c_3 - b_3c_1) + a_3(b_1c_2 - b_2c_1) \\ &= a_1 \begin{vmatrix} b_2 & c_2 \\ b_3 & c_3 \end{vmatrix} - a_2 \begin{vmatrix} b_1 & c_1 \\ b_3 & c_3 \end{vmatrix} + a_3 \begin{vmatrix} b_1 & c_1 \\ b_2 & c_2 \end{vmatrix}. \end{aligned}$$

You can evaluate each of the second-order determinants and obtain the three expressions in parentheses in the second step.

In summary, we now have arranged the definition of a third-order determinant as follows:

### Definition of the Determinant of a $3 \times 3$ Matrix

A third-order determinant is defined by

$$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = a_1 \begin{vmatrix} b_2 & c_2 \\ b_3 & c_3 \end{vmatrix} - a_2 \begin{vmatrix} b_1 & c_1 \\ b_3 & c_3 \end{vmatrix} + a_3 \begin{vmatrix} b_1 & c_1 \\ b_2 & c_2 \end{vmatrix}.$$

Subtract.      Add.

Each  $a$  on the right comes from the first column.

Here are some tips that may be helpful when evaluating the determinant of a  $3 \times 3$  matrix:

### Evaluating the Determinant of a $3 \times 3$ Matrix

1. Each of the three terms in the definition contains two factors—a numerical factor and a second-order determinant.
2. The numerical factor in each term is an element from the first column of the third-order determinant.
3. The minus sign precedes the second term.
4. The second-order determinant that appears in each term is obtained by crossing out the row and the column containing the numerical factor.

$$\begin{aligned} & a_1 \begin{vmatrix} b_2 & c_2 \\ b_3 & c_3 \end{vmatrix} - a_2 \begin{vmatrix} b_1 & c_1 \\ b_3 & c_3 \end{vmatrix} + a_3 \begin{vmatrix} b_1 & c_1 \\ b_2 & c_2 \end{vmatrix} \\ & \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} \end{aligned}$$

The **minor** of an element is the determinant that remains after deleting the row and column of that element. For this reason, we call this method **expansion by minors**.

### EXAMPLE 3 Evaluating the Determinant of a $3 \times 3$ Matrix

Evaluate the determinant of the following matrix:

$$\begin{bmatrix} 4 & 1 & 0 \\ -9 & 3 & 4 \\ -3 & 8 & 1 \end{bmatrix}.$$

## SOLUTION

We know that each of the three terms in the determinant contains a numerical factor and a second-order determinant. The numerical factors are from the first column of the given matrix. They are highlighted in red in the following matrix:

$$\begin{bmatrix} 4 & 1 & 0 \\ -9 & 3 & 4 \\ -3 & 8 & 1 \end{bmatrix}.$$

We find the minor for each numerical factor by deleting the row and column of that element:

$$\begin{bmatrix} \cancel{4} & 1 & 0 \\ -9 & 3 & 4 \\ -3 & 8 & 1 \end{bmatrix}$$

The minor for 4 is  $\begin{vmatrix} 3 & 4 \\ 8 & 1 \end{vmatrix}$ .

$$\begin{bmatrix} 4 & 1 & 0 \\ \cancel{-9} & 3 & 4 \\ -3 & 8 & 1 \end{bmatrix}$$

The minor for -9 is  $\begin{vmatrix} 1 & 0 \\ 8 & 1 \end{vmatrix}$ .

$$\begin{bmatrix} 4 & 1 & 0 \\ -9 & 3 & 4 \\ \cancel{-3} & 8 & 1 \end{bmatrix}$$

The minor for -3 is  $\begin{vmatrix} 1 & 0 \\ 3 & 4 \end{vmatrix}$ .

Now we have three numerical factors, 4, -9, and -3, and three second-order determinants. We multiply each numerical factor by its second-order determinant to find the three terms of the third-order determinant:

$$4 \begin{vmatrix} 3 & 4 \\ 8 & 1 \end{vmatrix}, \quad -9 \begin{vmatrix} 1 & 0 \\ 8 & 1 \end{vmatrix}, \quad -3 \begin{vmatrix} 1 & 0 \\ 3 & 4 \end{vmatrix}.$$

Based on the preceding definition, we subtract the second term from the first term and add the third term:

## TECHNOLOGY

A graphing utility can be used to evaluate the determinant of a matrix. Enter the matrix and call it  $A$ . Then use the determinant command. The screen below verifies our result in Example 3.

Don't forget to supply the minus sign.

$$\begin{aligned} \begin{vmatrix} 4 & 1 & 0 \\ -9 & 3 & 4 \\ -3 & 8 & 1 \end{vmatrix} &= 4 \begin{vmatrix} 3 & 4 \\ 8 & 1 \end{vmatrix} - (-9) \begin{vmatrix} 1 & 0 \\ 8 & 1 \end{vmatrix} - 3 \begin{vmatrix} 1 & 0 \\ 3 & 4 \end{vmatrix} && \text{Begin by evaluating the three second-order determinants.} \\ &= 4(3 \cdot 1 - 8 \cdot 4) + 9(1 \cdot 1 - 8 \cdot 0) - 3(1 \cdot 4 - 3 \cdot 0) && \\ &= 4(3 - 32) + 9(1 - 0) - 3(4 - 0) && \text{Multiply within parentheses.} \\ &= 4(-29) + 9(1) - 3(4) && \text{Subtract within parentheses.} \\ &= -116 + 9 - 12 && \text{Multiply.} \\ &= -119 && \text{Add and subtract as indicated.} \end{aligned}$$

**Check Point 3** Evaluate the determinant of the following matrix:

$$\begin{bmatrix} 2 & 1 & 7 \\ -5 & 6 & 0 \\ -4 & 3 & 1 \end{bmatrix}.$$

The six terms in the definition of a third-order determinant can be rearranged and factored in a variety of ways. Thus, it is possible to expand a determinant by minors about any row or any column. *Minus signs must be supplied preceding any element appearing in a position where the sum of its row and its column is an odd number.* For example, expanding about the elements in column 2 gives us

$$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = -b_1 \begin{vmatrix} a_2 & c_2 \\ a_3 & c_3 \end{vmatrix} + b_2 \begin{vmatrix} a_1 & c_1 \\ a_3 & c_3 \end{vmatrix} - b_3 \begin{vmatrix} a_1 & c_1 \\ a_2 & c_2 \end{vmatrix}.$$

Minus sign is supplied because  $b_1$  appears in row 1 and column 2;  $1 + 2 = 3$ , an odd number.

Minus sign is supplied because  $b_3$  appears in row 3 and column 2;  $3 + 2 = 5$ , an odd number.

**GREAT QUESTION!**

Is there a way I can remember the signs for the numerical factors of the minors?

Yes. Keep in mind that you can expand a determinant by minors about any row or column. Use alternating plus and minus signs to precede the numerical factors of the minors according to the following sign array:

$$\begin{vmatrix} + & - & + \\ - & + & - \\ + & - & + \end{vmatrix}.$$

Expanding by minors about column 3, we obtain

$$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = c_1 \begin{vmatrix} a_2 & b_2 \\ a_3 & b_3 \end{vmatrix} - c_2 \begin{vmatrix} a_1 & b_1 \\ a_3 & b_3 \end{vmatrix} + c_3 \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}.$$

Minus sign must be supplied because  $c_2$  appears in row 2 and column 3;  $2 + 3 = 5$ , an odd number.

When evaluating a  $3 \times 3$  determinant using expansion by minors, you can expand about any row or column. To simplify the arithmetic, if a row or column contains one or more 0s, expand about that row or column.

**EXAMPLE 4** Evaluating a Third-Order Determinant

Evaluate:

$$\begin{vmatrix} 9 & 5 & 0 \\ -2 & -3 & 0 \\ 1 & 4 & 2 \end{vmatrix}.$$

**SOLUTION**

Note that the last column has two 0s. We will expand the determinant about the elements in that column.

$$\begin{aligned} \begin{vmatrix} 9 & 5 & 0 \\ -2 & -3 & 0 \\ 1 & 4 & 2 \end{vmatrix} &= 0 \begin{vmatrix} -2 & -3 \\ 1 & 4 \end{vmatrix} - 0 \begin{vmatrix} 9 & 5 \\ 1 & 4 \end{vmatrix} + 2 \begin{vmatrix} 9 & 5 \\ -2 & -3 \end{vmatrix} \\ &= 0 - 0 + 2[9(-3) - (-2)5] && \text{Evaluate the second-order} \\ &= 2(-27 + 10) && \text{determinant whose numerical} \\ &= 2(-17) && \text{factor is not 0.} \\ &= -34 \end{aligned}$$

 **Check Point 4** Evaluate:

$$\begin{vmatrix} 6 & 4 & 0 \\ -3 & -5 & 3 \\ 1 & 2 & 0 \end{vmatrix}.$$

- 4** Solve a system of linear equations in three variables using Cramer's Rule.

**Solving Systems of Linear Equations in Three Variables Using Determinants**

Cramer's Rule can be applied to solving systems of linear equations in three variables. The determinants in the numerator and denominator of all variables are third-order determinants.

**Solving Three Equations in Three Variables Using Determinants**  
Cramer's Rule

If

$$\begin{cases} a_1x + b_1y + c_1z = d_1 \\ a_2x + b_2y + c_2z = d_2 \\ a_3x + b_3y + c_3z = d_3 \end{cases}$$

then

$$x = \frac{D_x}{D}, y = \frac{D_y}{D}, \text{ and } z = \frac{D_z}{D}, \text{ where } D \neq 0.$$

These four third-order determinants are given by

$$D = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} \quad \text{These are the coefficients of the variables } x, y, \text{ and } z.$$

$$D_x = \begin{vmatrix} d_1 & b_1 & c_1 \\ d_2 & b_2 & c_2 \\ d_3 & b_3 & c_3 \end{vmatrix} \quad \text{Replace } x\text{-coefficients in } D \text{ with the constants on the right of the three equations.}$$

$$D_y = \begin{vmatrix} a_1 & d_1 & c_1 \\ a_2 & d_2 & c_2 \\ a_3 & d_3 & c_3 \end{vmatrix} \quad \text{Replace } y\text{-coefficients in } D \text{ with the constants on the right of the three equations.}$$

$$D_z = \begin{vmatrix} a_1 & b_1 & d_1 \\ a_2 & b_2 & d_2 \\ a_3 & b_3 & d_3 \end{vmatrix} \quad \text{Replace } z\text{-coefficients in } D \text{ with the constants on the right of the three equations.}$$

### EXAMPLE 5 Using Cramer's Rule to Solve a Linear System in Three Variables

Use Cramer's Rule to solve:

$$\begin{cases} x + 2y - z = -4 \\ x + 4y - 2z = -6 \\ 2x + 3y + z = 3. \end{cases}$$

#### SOLUTION

Because

$$x = \frac{D_x}{D}, \quad y = \frac{D_y}{D}, \quad \text{and} \quad z = \frac{D_z}{D},$$

we need to set up and evaluate four determinants.

#### Step 1 Set up the determinants.

1.  $D$ , the determinant in all three denominators, consists of the  $x$ -,  $y$ -, and  $z$ -coefficients.

$$D = \begin{vmatrix} 1 & 2 & -1 \\ 1 & 4 & -2 \\ 2 & 3 & 1 \end{vmatrix}$$

2.  $D_x$ , the determinant in the numerator for  $x$ , is obtained by replacing the  $x$ -coefficients in  $D$ , 1, 1, and 2, with the constants on the right sides of the equations,  $-4$ ,  $-6$ , and 3.

$$D_x = \begin{vmatrix} -4 & 2 & -1 \\ -6 & 4 & -2 \\ 3 & 3 & 1 \end{vmatrix}$$

3.  $D_y$ , the determinant in the numerator for  $y$ , is obtained by replacing the  $y$ -coefficients in  $D$ , 2, 4, and 3, with the constants on the right sides of the equations,  $-4$ ,  $-6$ , and 3.

$$D_y = \begin{vmatrix} 1 & -4 & -1 \\ 1 & -6 & -2 \\ 2 & 3 & 1 \end{vmatrix}$$

4.  $D_z$ , the determinant in the numerator for  $z$ , is obtained by replacing the  $z$ -coefficients in  $D$ ,  $-1$ ,  $-2$ , and 1, with the constants on the right sides of the equations,  $-4$ ,  $-6$ , and 3.

$$D_z = \begin{vmatrix} 1 & 2 & -4 \\ 1 & 4 & -6 \\ 2 & 3 & 3 \end{vmatrix}$$

**Step 2 Evaluate the four determinants.**

$$\begin{aligned}
 D &= \begin{vmatrix} 1 & 2 & -1 \\ 1 & 4 & -2 \\ 2 & 3 & 1 \end{vmatrix} = 1 \begin{vmatrix} 4 & -2 \\ 3 & 1 \end{vmatrix} - 1 \begin{vmatrix} 2 & -1 \\ 3 & 1 \end{vmatrix} + 2 \begin{vmatrix} 2 & -1 \\ 4 & -2 \end{vmatrix} \\
 &= 1(4 + 6) - 1(2 + 3) + 2(-4 + 4) \\
 &= 1(10) - 1(5) + 2(0) = 5
 \end{aligned}$$

**GREAT QUESTION!**

**Can I use  $D$ , the determinant in each denominator, to find the determinants in the numerators?**

No. To find  $D_x$ ,  $D_y$ , and  $D_z$ , you'll need to apply the evaluation process for a  $3 \times 3$  determinant three more times. The values of  $D_x$ ,  $D_y$ , and  $D_z$  cannot be obtained from the number that occurs in the computation of  $D$ .

Using the same technique to evaluate each determinant, we obtain

$$D_x = -10, \quad D_y = 5, \quad \text{and} \quad D_z = 20.$$

**Step 3 Substitute these four values and solve the system.**

$$\begin{aligned}
 x &= \frac{D_x}{D} = \frac{-10}{5} = -2 \\
 y &= \frac{D_y}{D} = \frac{5}{5} = 1 \\
 z &= \frac{D_z}{D} = \frac{20}{5} = 4
 \end{aligned}$$

The solution  $(-2, 1, 4)$  can be checked by substitution into the original three equations. The solution set is  $\{(-2, 1, 4)\}$ . ...

 **Check Point 5** Use Cramer's Rule to solve the system:

$$\begin{cases} 3x - 2y + z = 16 \\ 2x + 3y - z = -9 \\ x + 4y + 3z = 2. \end{cases}$$

**GREAT QUESTION!**

**What should I do if  $D$ , the determinant in the denominator of Cramer's Rule, is zero?**

If  $D = 0$ , the system is inconsistent or contains dependent equations. Use a method other than Cramer's Rule to determine the solution set. For systems in two variables, use the substitution method or the addition method. For systems in three variables, use Gaussian elimination.

Speaking of Cramer meltdown, there's another situation in which Cramer's Rule is useless. This involves nonsquare systems such as

$$\begin{cases} 3x + 7y + 6z = 26 \\ x + 2y + z = 8. \end{cases}$$

Determinants are only associated with square matrices. Gaussian elimination must be used to solve systems with fewer equations than variables. (This system is solved in Example 3 on page 866.)

In essence, the use of Cramer's Rule to determine solution sets is only an alternative to Gaussian elimination in some situations.

**5** Evaluate higher-order determinants.

**The Determinant of Any  $n \times n$  Matrix**

The determinant of a matrix with  $n$  rows and  $n$  columns is said to be an  **$n$ th-order determinant**. The value of an  $n$ th-order determinant ( $n > 2$ ) can be found in terms of determinants of order  $n - 1$ . For example, we found the value of a third-order determinant in terms of determinants of order 2.

We can generalize this idea for fourth-order determinants and higher. We have seen that the **minor** of the element  $a_{ij}$  is the determinant obtained by deleting the  $i$ th row and the  $j$ th column in the given array of numbers. The **cofactor** of the element  $a_{ij}$  is  $(-1)^{i+j}$  times the minor of  $a_{ij}$ . If the sum of the row and column ( $i + j$ ) is even, the cofactor is the same as the minor. If the sum of the row and column ( $i + j$ ) is odd, the cofactor is the opposite of the minor.

Let's see what this means in the case of a fourth-order determinant.

### EXAMPLE 6 Evaluating the Determinant of a $4 \times 4$ Matrix

Evaluate the determinant of the following matrix:

$$A = \begin{bmatrix} 1 & -2 & 3 & 0 \\ -1 & 1 & 0 & 2 \\ 0 & 2 & 0 & -3 \\ 2 & 3 & -4 & 1 \end{bmatrix}.$$

#### SOLUTION

$$|A| = \begin{vmatrix} 1 & -2 & 3 & 0 \\ -1 & 1 & 0 & 2 \\ 0 & 2 & 0 & -3 \\ 2 & 3 & -4 & 1 \end{vmatrix}$$

With two 0s in the third column, we will expand along the third column.

$$= (-1)^{1+3}(3) \begin{vmatrix} -1 & 1 & 2 \\ 0 & 2 & -3 \\ 2 & 3 & 1 \end{vmatrix} + (-1)^{4+3}(-4) \begin{vmatrix} 1 & -2 & 0 \\ -1 & 1 & 2 \\ 0 & 2 & -3 \end{vmatrix}$$

3 is in row 1,  
column 3.

-4 is in row 4,  
column 3.

$$= 3 \begin{vmatrix} -1 & 1 & 2 \\ 0 & 2 & -3 \\ 2 & 3 & 1 \end{vmatrix} + 4 \begin{vmatrix} 1 & -2 & 0 \\ -1 & 1 & 2 \\ 0 & 2 & -3 \end{vmatrix}$$

The determinant that follows 3 is obtained by crossing out the row and the column (row 1, column 3) in the original determinant. The minor for -4 is obtained in a similar manner.

Evaluate the two third-order determinants to get

$$|A| = 3(-25) + 4(-1) = -79.$$

...

 **Check Point 6** Evaluate the determinant of the following matrix:

$$A = \begin{bmatrix} 0 & 4 & 0 & -3 \\ -1 & 1 & 5 & 2 \\ 1 & -2 & 0 & 6 \\ 3 & 0 & 0 & 1 \end{bmatrix}.$$

If a linear system has  $n$  equations, Cramer's Rule requires you to compute  $n + 1$  determinants of  $n$ th order. The excessive number of calculations required to perform Cramer's Rule for systems with four or more equations makes it an inefficient method for solving large systems.

### CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

1.  $\begin{vmatrix} 5 & 4 \\ 2 & 3 \end{vmatrix} = \_ \cdot \_ - \_ \cdot \_ = \_ - \_ = \_$   
 The value of this second-order \_\_\_\_\_  
 is \_\_\_\_\_.

2. Using Cramer's Rule to solve

$$\begin{cases} x + y = 8 \\ x - y = -2 \end{cases}$$

we obtain

$$x = \frac{\begin{vmatrix} \_ & \_ \\ \_ & \_ \end{vmatrix}}{\begin{vmatrix} \_ & \_ \\ \_ & \_ \end{vmatrix}} \quad \text{and} \quad y = \frac{\begin{vmatrix} \_ & \_ \\ \_ & \_ \end{vmatrix}}{\begin{vmatrix} \_ & \_ \\ \_ & \_ \end{vmatrix}}$$

3.  $\begin{vmatrix} 3 & 2 & 1 \\ 4 & 3 & 1 \\ 5 & 1 & 1 \end{vmatrix} = 3 \begin{vmatrix} \_ & \_ \\ \_ & \_ \end{vmatrix} - 4 \begin{vmatrix} \_ & \_ \\ \_ & \_ \end{vmatrix} + 5 \begin{vmatrix} \_ & \_ \\ \_ & \_ \end{vmatrix}$

4. Using Cramer's Rule to solve

$$\begin{cases} 3x + y + 4z = -8 \\ 2x + 3y - 2z = 11 \\ x - 3y - 2z = 4 \end{cases}$$

for y, we obtain

$$y = \frac{\begin{vmatrix} \_ & \_ & \_ \\ \_ & \_ & \_ \\ \_ & \_ & \_ \end{vmatrix}}{\begin{vmatrix} \_ & \_ & \_ \\ \_ & \_ & \_ \\ \_ & \_ & \_ \end{vmatrix}}$$

5. The easiest way to evaluate

$$\begin{vmatrix} 3 & 2 & 8 \\ 5 & -4 & 0 \\ -6 & 7 & 0 \end{vmatrix}$$

is to expand about the elements in \_\_\_\_\_.

### EXERCISE SET 8.5

#### Practice Exercises

Evaluate each determinant in Exercises 1–10.

1.  $\begin{vmatrix} 5 & 7 \\ 2 & 3 \end{vmatrix}$

2.  $\begin{vmatrix} 4 & 8 \\ 5 & 6 \end{vmatrix}$

3.  $\begin{vmatrix} -4 & 1 \\ 5 & 6 \end{vmatrix}$

4.  $\begin{vmatrix} 7 & 9 \\ -2 & -5 \end{vmatrix}$

5.  $\begin{vmatrix} -7 & 14 \\ 2 & -4 \end{vmatrix}$

6.  $\begin{vmatrix} 1 & -3 \\ -8 & 2 \end{vmatrix}$

7.  $\begin{vmatrix} -5 & -1 \\ -2 & -7 \end{vmatrix}$

8.  $\begin{vmatrix} \frac{1}{5} & \frac{1}{6} \\ -6 & 5 \end{vmatrix}$

9.  $\begin{vmatrix} \frac{1}{2} & \frac{1}{2} \\ \frac{1}{8} & -\frac{3}{4} \end{vmatrix}$

10.  $\begin{vmatrix} \frac{2}{3} & \frac{1}{3} \\ -\frac{1}{2} & \frac{3}{4} \end{vmatrix}$

For Exercises 11–22, use Cramer's Rule to solve each system.

11.  $\begin{cases} x + y = 7 \\ x - y = 3 \end{cases}$

12.  $\begin{cases} 2x + y = 3 \\ x - y = 3 \end{cases}$

13.  $\begin{cases} 12x + 3y = 15 \\ 2x - 3y = 13 \end{cases}$

14.  $\begin{cases} x - 2y = 5 \\ 5x - y = -2 \end{cases}$

15.  $\begin{cases} 4x - 5y = 17 \\ 2x + 3y = 3 \end{cases}$

16.  $\begin{cases} 3x + 2y = 2 \\ 2x + 2y = 3 \end{cases}$

17.  $\begin{cases} x + 2y = 3 \\ 3x - 4y = 4 \end{cases}$

18.  $\begin{cases} 2x - 9y = 5 \\ 3x - 3y = 11 \end{cases}$

19.  $\begin{cases} 3x - 4y = 4 \\ 2x + 2y = 12 \end{cases}$

20.  $\begin{cases} 3x = 7y + 1 \\ 2x = 3y - 1 \end{cases}$

21.  $\begin{cases} 2x = 3y + 2 \\ 5x = 51 - 4y \end{cases}$

22.  $\begin{cases} y = -4x + 2 \\ 2x = 3y + 8 \end{cases}$

Evaluate each determinant in Exercises 23–28.

23.  $\begin{vmatrix} 3 & 0 & 0 \\ 2 & 1 & -5 \\ 2 & 5 & -1 \end{vmatrix}$

24.  $\begin{vmatrix} 4 & 0 & 0 \\ 3 & -1 & 4 \\ 2 & -3 & 5 \end{vmatrix}$

25.  $\begin{vmatrix} 3 & 1 & 0 \\ -3 & 4 & 0 \\ -1 & 3 & -5 \end{vmatrix}$

26.  $\begin{vmatrix} 2 & -4 & 2 \\ -1 & 0 & 5 \\ 3 & 0 & 4 \end{vmatrix}$

27.  $\begin{vmatrix} 1 & 1 & 1 \\ 2 & 2 & 2 \\ -3 & 4 & -5 \end{vmatrix}$

28.  $\begin{vmatrix} 1 & 2 & 3 \\ 2 & 2 & -3 \\ 3 & 2 & 1 \end{vmatrix}$

In Exercises 29–36, use Cramer's Rule to solve each system.

29.  $\begin{cases} x + y + z = 0 \\ 2x - y + z = -1 \\ -x + 3y - z = -8 \end{cases}$

30.  $\begin{cases} x - y + 2z = 3 \\ 2x + 3y + z = 9 \\ -x - y + 3z = 11 \end{cases}$

31.  $\begin{cases} 4x - 5y - 6z = -1 \\ x - 2y - 5z = -12 \\ 2x - y = 7 \end{cases}$

32.  $\begin{cases} x - 3y + z = -2 \\ x + 2y = 8 \\ 2x - y = 1 \end{cases}$

33.  $\begin{cases} x + y + z = 4 \\ x - 2y + z = 7 \\ x + 3y + 2z = 4 \end{cases}$

34.  $\begin{cases} 2x + 2y + 3z = 10 \\ 4x - y + z = -5 \\ 5x - 2y + 6z = 1 \end{cases}$

35.  $\begin{cases} x + 2z = 4 \\ 2y - z = 5 \\ 2x + 3y = 13 \end{cases}$

36.  $\begin{cases} 3x + 2z = 4 \\ 5x - y = -4 \\ 4y + 3z = 22 \end{cases}$

Evaluate each determinant in Exercises 37–40.

37.  $\begin{vmatrix} 4 & 2 & 8 & -7 \\ -2 & 0 & 4 & 1 \\ 5 & 0 & 0 & 5 \\ 4 & 0 & 0 & -1 \end{vmatrix}$

38.  $\begin{vmatrix} 3 & -1 & 1 & 2 \\ -2 & 0 & 0 & 0 \\ 2 & -1 & -2 & 3 \\ 1 & 4 & 2 & 3 \end{vmatrix}$

$$39. \begin{vmatrix} -2 & -3 & 3 & 5 \\ 1 & -4 & 0 & 0 \\ 1 & 2 & 2 & -3 \\ 2 & 0 & 1 & 1 \end{vmatrix} \quad 40. \begin{vmatrix} 1 & -3 & 2 & 0 \\ -3 & -1 & 0 & -2 \\ 2 & 1 & 3 & 1 \\ 2 & 0 & -2 & 0 \end{vmatrix}$$

### Practice Plus

In Exercises 41–42, evaluate each determinant.

$$41. \begin{vmatrix} 3 & 1 \\ -2 & 3 \\ 3 & 0 \\ 0 & 7 \end{vmatrix} \begin{vmatrix} 7 & 0 \\ 1 & 5 \\ 9 & -6 \\ 3 & 5 \end{vmatrix} \quad 42. \begin{vmatrix} 5 & 0 \\ 4 & -3 \\ 7 & -5 \\ 4 & 6 \end{vmatrix} \begin{vmatrix} -1 & 0 \\ 0 & -1 \\ 4 & 1 \\ -3 & 5 \end{vmatrix}$$

In Exercises 43–44, write the system of linear equations for which Cramer's Rule yields the given determinants.

$$43. D = \begin{vmatrix} 2 & -4 \\ 3 & 5 \end{vmatrix}, \quad D_x = \begin{vmatrix} 8 & -4 \\ -10 & 5 \end{vmatrix}$$

$$44. D = \begin{vmatrix} 2 & -3 \\ 5 & 6 \end{vmatrix}, \quad D_x = \begin{vmatrix} 8 & -3 \\ 11 & 6 \end{vmatrix}$$

In Exercises 45–48, solve each equation for  $x$ .

$$45. \begin{vmatrix} -2 & x \\ 4 & 6 \end{vmatrix} = 32 \quad 46. \begin{vmatrix} x+3 & -6 \\ x-2 & -4 \end{vmatrix} = 28$$

$$47. \begin{vmatrix} 1 & x & -2 \\ 3 & 1 & 1 \\ 0 & -2 & 2 \end{vmatrix} = -8 \quad 48. \begin{vmatrix} 2 & x & 1 \\ -3 & 1 & 0 \\ 2 & 1 & 4 \end{vmatrix} = 39$$

### Application Exercises

Determinants are used to find the area of a triangle whose vertices are given by three points in a rectangular coordinate system. The area of a triangle with vertices  $(x_1, y_1)$ ,  $(x_2, y_2)$ , and  $(x_3, y_3)$  is

$$\text{Area} = \pm \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix},$$

where the  $\pm$  symbol indicates that the appropriate sign should be chosen to yield a positive area. Use this information to work Exercises 49–50.

49. Use determinants to find the area of the triangle whose vertices are  $(3, -5)$ ,  $(2, 6)$ , and  $(-3, 5)$ .  
 50. Use determinants to find the area of the triangle whose vertices are  $(1, 1)$ ,  $(-2, -3)$ , and  $(11, -3)$ .

Determinants are used to show that three points lie on the same line (are collinear). If

$$\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0,$$

then the points  $(x_1, y_1)$ ,  $(x_2, y_2)$ , and  $(x_3, y_3)$  are collinear. If the determinant does not equal 0, then the points are not collinear. Use this information to work Exercises 51–52.

51. Are the points  $(3, -1)$ ,  $(0, -3)$ , and  $(12, 5)$  collinear?  
 52. Are the points  $(-4, -6)$ ,  $(1, 0)$ , and  $(11, 12)$  collinear?

Determinants are used to write an equation of a line passing through two points. An equation of the line passing through the distinct points  $(x_1, y_1)$  and  $(x_2, y_2)$  is given by

$$\begin{vmatrix} x & y & 1 \\ x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \end{vmatrix} = 0.$$

Use this information to work Exercises 53–54.

53. Use the determinant to write an equation of the line passing through  $(3, -5)$  and  $(-2, 6)$ . Then expand the determinant, expressing the line's equation in slope-intercept form.  
 54. Use the determinant to write an equation of the line passing through  $(-1, 3)$  and  $(2, 4)$ . Then expand the determinant, expressing the line's equation in slope-intercept form.

### Writing in Mathematics

55. Explain how to evaluate a second-order determinant.  
 56. Describe the determinants  $D_x$  and  $D_y$  in terms of the coefficients and constants in a system of two equations in two variables.  
 57. Explain how to evaluate a third-order determinant.  
 58. When expanding a determinant by minors, when is it necessary to supply minus signs?  
 59. Without going into too much detail, describe how to solve a linear system in three variables using Cramer's Rule.  
 60. In applying Cramer's Rule, what should you do if  $D = 0$ ?  
 61. The process of solving a linear system in three variables using Cramer's Rule can involve tedious computation. Is there a way of speeding up this process, perhaps using Cramer's Rule to find the value for only one of the variables? Describe how this process might work, presenting a specific example with your description. Remember that your goal is still to find the value for each variable in the system.  
 62. If you could use only one method to solve linear systems in three variables, which method would you select? Explain why this is so.

### Technology Exercises

63. Use the feature of your graphing utility that evaluates the determinant of a square matrix to verify any five of the determinants that you evaluated by hand in Exercises 1–10, 23–28, or 37–40.

In Exercises 64–65, use a graphing utility to evaluate the determinant for the given matrix.

$$64. \begin{bmatrix} 3 & -2 & -1 & 4 \\ -5 & 1 & 2 & 7 \\ 2 & 4 & 5 & 0 \\ -1 & 3 & -6 & 5 \end{bmatrix} \quad 65. \begin{bmatrix} 8 & 2 & 6 & -1 & 0 \\ 2 & 0 & -3 & 4 & 7 \\ 2 & 1 & -3 & 6 & -5 \\ -1 & 2 & 1 & 5 & -1 \\ 4 & 5 & -2 & 3 & -8 \end{bmatrix}$$

66. What is the fastest method for solving a linear system with your graphing utility?

## Critical Thinking Exercises

**Make Sense?** In Exercises 67–70, determine whether each statement makes sense or does not make sense, and explain your reasoning.

67. I'm solving a linear system using a determinant that contains two rows and three columns.
68. I can speed up the tedious computations required by Cramer's Rule by using the value of  $D$  to determine the value of  $D_x$ .
69. When using Cramer's Rule to solve a linear system, the number of determinants that I set up and evaluate is the same as the number of variables in the system.
70. Using Cramer's Rule to solve a linear system, I found the value of  $D$  to be zero, so the value of each variable is zero.

71. a. Evaluate:  $\begin{vmatrix} a & a \\ 0 & a \end{vmatrix}$ .

b. Evaluate:  $\begin{vmatrix} a & a & a \\ 0 & a & a \\ 0 & 0 & a \end{vmatrix}$ .

c. Evaluate:  $\begin{vmatrix} a & a & a & a \\ 0 & a & a & a \\ 0 & 0 & a & a \\ 0 & 0 & 0 & a \end{vmatrix}$ .

- d. Describe the pattern in the given determinants.  
e. Describe the pattern in the evaluations.

72. Evaluate:  $\begin{vmatrix} 2 & 0 & 0 & 0 & 0 \\ 0 & 3 & 0 & 0 & 0 \\ 0 & 0 & 2 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 4 \end{vmatrix}$ .

73. What happens to the value of a second-order determinant if the two columns are interchanged?

74. Consider the system

$$\begin{cases} a_1x + b_1y = c_1 \\ a_2x + b_2y = c_2. \end{cases}$$

Use Cramer's Rule to prove that if the first equation of the system is replaced by the sum of the two equations, the resulting system has the same solution as the original system.

75. Show that the equation of a line through  $(x_1, y_1)$  and  $(x_2, y_2)$  is given by the determinant equation in Exercises 53–54.

## Group Exercise

76. We have seen that determinants can be used to solve linear equations, give areas of triangles in rectangular coordinates, and determine equations of lines. Not impressed with these applications? Members of the group should research an application of determinants that they find intriguing. The group should then present a seminar to the class about this application.

## Preview Exercises

Exercises 77–79 will help you prepare for the material covered in the first section of the next chapter.

77. Consider the equation  $\frac{x^2}{9} + \frac{y^2}{4} = 1$ .

- a. Set  $y = 0$  and find the  $x$ -intercepts.  
b. Set  $x = 0$  and find the  $y$ -intercepts.

78. Divide both sides of  $25x^2 + 16y^2 = 400$  by 400 and simplify.

79. Complete the square and write the circle's equation in standard form:

$$x^2 + y^2 - 2x + 4y = 4.$$

Then give the center and radius of the circle and graph the equation.

## CHAPTER 8

## Summary, Review, and Test

## SUMMARY

## DEFINITIONS AND CONCEPTS

## 8.1 Matrix Solutions to Linear Systems

- a. Matrix row operations are described in the box on page 851.
- b. To solve a linear system using Gaussian elimination, begin with the system's augmented matrix. Use matrix row operations to get 1s down the main diagonal from upper left to lower right, and 0s below the 1s. Such a matrix is in row-echelon form. Details are in the box on page 852.
- c. To solve a linear system using Gauss-Jordan elimination, use the procedure of Gaussian elimination, but obtain 0s above and below the 1s in the main diagonal from upper left to lower right. Such a matrix is in reduced row-echelon form. Details are in the box on page 857.

## EXAMPLES

Ex. 1, p. 851

Ex. 2, p. 852;  
Ex. 3, p. 855

Ex. 4, p. 858

## 8.2 Inconsistent and Dependent Systems and Their Applications

- a. If Gaussian elimination results in a matrix with a row containing all 0s to the left of the vertical line and a nonzero number to the right, the system has no solution (is inconsistent). Ex. 1, p. 863
- b. In a square system, if Gaussian elimination results in a matrix with a row with all 0s, but not a row like the one in part (a), the system has an infinite number of solutions (contains dependent equations). Ex. 2, p. 864
- c. In nonsquare systems, the number of variables differs from the number of equations. Ex. 3, p. 866

## 8.3 Matrix Operations and Their Applications

- a. A matrix of order  $m \times n$  has  $m$  rows and  $n$  columns. Two matrices are equal if and only if they have the same order and corresponding elements are equal. Ex. 1, p. 872
- b. Matrix Addition and Subtraction: Matrices of the same order are added or subtracted by adding or subtracting corresponding elements. Properties of matrix addition are given in the box on page 874. Ex. 2, p. 874
- c. Scalar Multiplication: If  $A$  is a matrix and  $c$  is a scalar, then  $cA$  is the matrix formed by multiplying each element in  $A$  by  $c$ . Properties of scalar multiplication are given in the box on page 876. Ex. 3, p. 875; Ex. 4, p. 876
- d. Matrix Multiplication: The product of an  $m \times n$  matrix  $A$  and an  $n \times p$  matrix  $B$  is an  $m \times p$  matrix  $AB$ . The element in the  $i$ th row and  $j$ th column of  $AB$  is found by multiplying each element in the  $i$ th row of  $A$  by the corresponding element in the  $j$ th column of  $B$  and adding the products. Matrix multiplication is not commutative:  $AB \neq BA$ . Properties of matrix multiplication are given in the box on page 881. Ex. 5, p. 877; Ex. 6, p. 878; Ex. 7, p. 880

## 8.4 Multiplicative Inverses of Matrices and Matrix Equations

- a. The multiplicative identity matrix  $I_n$  is an  $n \times n$  matrix with 1s down the main diagonal from upper left to lower right and 0s elsewhere.
- b. Let  $A$  be an  $n \times n$  square matrix. If there is a square matrix  $A^{-1}$  such that  $AA^{-1} = I_n$  and  $A^{-1}A = I_n$ , then  $A^{-1}$  is the multiplicative inverse of  $A$ . Ex. 1, p. 889
- c. If a square matrix has a multiplicative inverse, it is invertible or nonsingular. Methods for finding multiplicative inverses for invertible matrices, including a formula for  $2 \times 2$  matrices, are given in the box on page 895. Ex. 2, p. 890; Ex. 3, p. 891; Ex. 4, p. 894
- d. Linear systems can be represented by matrix equations of the form  $AX = B$  in which  $A$  is the coefficient matrix and  $B$  is the constant matrix. If  $AX = B$  has a unique solution, then  $X = A^{-1}B$ . Ex. 5, p. 896

## 8.5 Determinants and Cramer's Rule

- a. Value of a second-order determinant: Ex. 1, p. 903
- $$\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix} = a_1b_2 - a_2b_1$$
- b. Cramer's Rule for solving systems of linear equations in two variables uses three second-order determinants and is stated in the box on page 904. Ex. 2, p. 905
- c. To evaluate an  $n$ th-order determinant, where  $n > 2$ , Ex. 3, p. 906; Ex. 4, p. 908; Ex. 6, p. 911
1. Select a row or column about which to expand.
  2. Multiply each element  $a_{ij}$  in the row or column by  $(-1)^{i+j}$  times the determinant obtained by deleting the  $i$ th row and the  $j$ th column in the given array of numbers.
  3. The value of the determinant is the sum of the products found in step 2.
- d. Cramer's Rule for solving systems of linear equations in three variables uses four third-order determinants and is stated in the box beginning on page 908. Ex. 5, p. 909
- e. Cramer's Rule cannot be used to determine solution sets with inconsistent or dependent systems.

## REVIEW EXERCISES

### 8.1

In Exercises 1–2, perform each matrix row operation and write the new matrix.

$$1. \left[ \begin{array}{ccc|c} 1 & 2 & 2 & 2 \\ 0 & 1 & -1 & 2 \\ 0 & 5 & 4 & 1 \end{array} \right] \quad -5R_2 + R_3$$

$$2. \left[ \begin{array}{ccc|c} 2 & -2 & 1 & -1 \\ 1 & 2 & -1 & 2 \\ 6 & 4 & 3 & 5 \end{array} \right] \quad \frac{1}{2}R_1$$

In Exercises 3–5, solve each system of equations using matrices. Use Gaussian elimination with back-substitution or Gauss-Jordan elimination.

$$3. \begin{cases} x + 2y + 3z = -5 \\ 2x + y + z = 1 \\ x + y - z = 8 \end{cases} \quad 4. \begin{cases} x - 2y + z = 0 \\ y - 3z = -1 \\ 2y + 5z = -2 \end{cases}$$

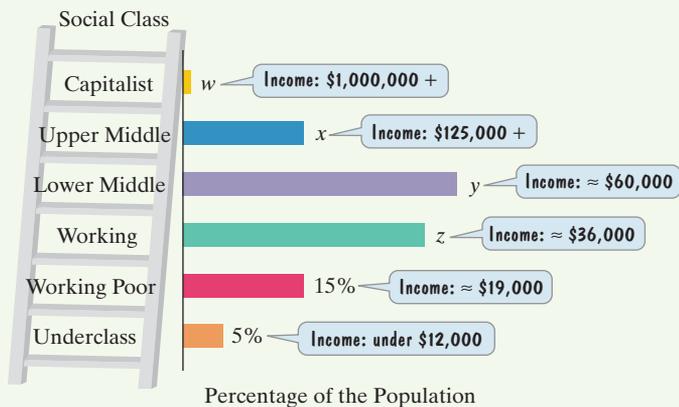

$$5. \begin{cases} 3x_1 + 5x_2 - 8x_3 + 5x_4 = -8 \\ x_1 + 2x_2 - 3x_3 + x_4 = -7 \\ 2x_1 + 3x_2 - 7x_3 + 3x_4 = -11 \\ 4x_1 + 8x_2 - 10x_3 + 7x_4 = -10 \end{cases}$$

6. The table shows the pollutants in the air in a city on a typical summer day.

$x$ (Hours after 6 A.M.)	$y$ (Amount of Pollutants in the Air, in parts per million)
2	98
4	138
10	162

- a. Use the function  $y = ax^2 + bx + c$  to model the data. Use either Gaussian elimination with back-substitution or Gauss-Jordan elimination to find the values for  $a$ ,  $b$ , and  $c$ .
- b. Use the function to find the time of day at which the city's air pollution level is at a maximum. What is the maximum level?
7. Sociologists Joseph Kahl and Dennis Gilbert developed a six-tier model to portray the class structure of the United States. The bar graph represents the percentage of Americans who are members of each of the six social classes.

The United States Social Class Ladder

Source: James Henslin, *Sociology*, Ninth Edition, Allyn and Bacon, 2011.

Combined, members of the capitalist class, the upper-middle class, the lower-middle class, and the working class make up 80% of the U.S. population. The percentage of the population belonging to the lower-middle class exceeds the percentage belonging to capitalist and upper-middle classes by 18%. The difference between the percentage belonging to the lower-middle class and the working class is 4%. If the percentage belonging to the upper-middle class is tripled, it exceeds the percentage belonging to the capitalist and lower-middle classes by 10%. Determine the percentage of the U.S. population who are members of the capitalist class, the upper-middle class, the lower-middle class, and the working class.

### 8.2

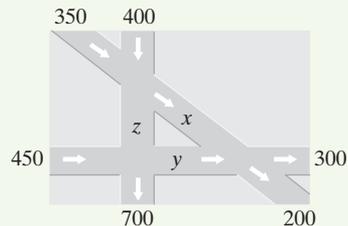

In Exercises 8–11, use Gaussian elimination to find the complete solution to each system, or show that none exists.

$$8. \begin{cases} 2x - 3y + z = 1 \\ x - 2y + 3z = 2 \\ 3x - 4y - z = 1 \end{cases} \quad 9. \begin{cases} x - 3y + z = 1 \\ -2x + y + 3z = -7 \\ x - 4y + 2z = 0 \end{cases}$$

$$10. \begin{cases} x_1 + 4x_2 + 3x_3 - 6x_4 = 5 \\ x_1 + 3x_2 + x_3 - 4x_4 = 3 \\ 2x_1 + 8x_2 + 7x_3 - 5x_4 = 11 \\ 2x_1 + 5x_2 - 6x_4 = 4 \end{cases}$$

$$11. \begin{cases} 2x + 3y - 5z = 15 \\ x + 2y - z = 4 \end{cases}$$

12. The figure shows the intersections of three one-way streets. The numbers given represent traffic flow, in cars per hour, at a peak period (from 4 P.M. to 6 P.M.).

- a. Use the idea that the number of cars entering each intersection per hour must equal the number of cars leaving per hour to set up a system of linear equations involving  $x$ ,  $y$ , and  $z$ .
- b. Use Gaussian elimination to solve the system.
- c. If construction limits the value of  $z$  to 400, how many cars per hour must pass between the other intersections to keep traffic flowing?

### 8.3

13. Find values for  $x$ ,  $y$ , and  $z$  so that the following matrices are equal:

$$\begin{bmatrix} 2x & y + 7 \\ z & 4 \end{bmatrix} = \begin{bmatrix} -10 & 13 \\ 6 & 4 \end{bmatrix}$$

In Exercises 14–27, perform the indicated matrix operations given that  $A$ ,  $B$ ,  $C$ , and  $D$  are defined as follows. If an operation is not defined, state the reason.

$$A = \begin{bmatrix} 2 & -1 & 2 \\ 5 & 3 & -1 \end{bmatrix} \quad B = \begin{bmatrix} 0 & -2 \\ 3 & 2 \\ 1 & -5 \end{bmatrix}$$

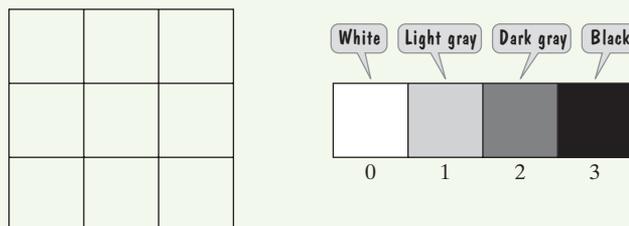

$$C = \begin{bmatrix} 1 & 2 & 3 \\ -1 & 1 & 2 \\ -1 & 2 & 1 \end{bmatrix} \quad D = \begin{bmatrix} -2 & 3 & 1 \\ 3 & -2 & 4 \end{bmatrix}$$

14.  $A + D$       15.  $2B$       16.  $D - A$   
 17.  $B + C$       18.  $3A + 2D$       19.  $-2A + 4D$   
 20.  $-5(A + D)$       21.  $AB$       22.  $BA$   
 23.  $BD$       24.  $DB$       25.  $AB - BA$   
 26.  $(A - D)C$       27.  $B(AC)$   
 28. Solve for  $X$  in the matrix equation

$$3X + A = B,$$

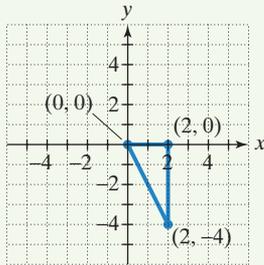

where  $A = \begin{bmatrix} 4 & 6 \\ -5 & 0 \end{bmatrix}$  and  $B = \begin{bmatrix} -2 & -12 \\ 4 & 1 \end{bmatrix}$ .

In Exercises 29–30, use nine pixels in a  $3 \times 3$  grid and the color levels shown.

29. Write a  $3 \times 3$  matrix that represents a digital photograph of the letter T in dark gray on a light gray background.
30. Find a matrix  $B$  so that  $A + B$  increases the contrast of the letter T by changing the dark gray to black and the light gray to white.

The figure shows a right triangle in a rectangular coordinate system.

The figure can be represented by the matrix

$$B = \begin{bmatrix} 0 & 2 & 2 \\ 0 & 0 & -4 \end{bmatrix}.$$

Use the triangle and the matrix that represents it to solve Exercises 31–36.

31. Use matrix operations to move the triangle 2 units to the left and 1 unit up. Then graph the triangle and its transformation in a rectangular coordinate system.
32. Use matrix operations to reduce the triangle to half its perimeter and move the reduced image 2 units down. Then graph the triangle and its transformation in a rectangular coordinate system.

In Exercises 33–36, find  $AB$  and graph the resulting image. What effect does the multiplication have on the triangle represented by matrix  $B$ ?

33.  $A = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$       34.  $A = \begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix}$

35.  $A = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix}$       36.  $A = \begin{bmatrix} 2 & 0 \\ 0 & 1 \end{bmatrix}$

### 8.4

In Exercises 37–38, find the products  $AB$  and  $BA$  to determine whether  $B$  is the multiplicative inverse of  $A$ .

37.  $A = \begin{bmatrix} 2 & 7 \\ 1 & 4 \end{bmatrix}$ ,  $B = \begin{bmatrix} 4 & -7 \\ -1 & 3 \end{bmatrix}$

38.  $A = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 2 & -7 \\ 0 & -1 & 4 \end{bmatrix}$ ,  $B = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 4 & 7 \\ 0 & 1 & 2 \end{bmatrix}$

In Exercises 39–42, find  $A^{-1}$ . Check that  $AA^{-1} = I$  and  $A^{-1}A = I$ .

39.  $A = \begin{bmatrix} 1 & -1 \\ -2 & 3 \end{bmatrix}$       40.  $A = \begin{bmatrix} 0 & 1 \\ 5 & 3 \end{bmatrix}$

41.  $A = \begin{bmatrix} 1 & 0 & -2 \\ 2 & 1 & 0 \\ 1 & 0 & -3 \end{bmatrix}$       42.  $A = \begin{bmatrix} 1 & 3 & -2 \\ 4 & 13 & -7 \\ 5 & 16 & -8 \end{bmatrix}$

In Exercises 43–44,

- a. Write each linear system as a matrix equation in the form  $AX = B$ .
- b. Solve the system using the inverse that is given for the coefficient matrix.

43. 
$$\begin{cases} x + y + 2z = 7 \\ y + 3z = -2 \\ 3x - 2z = 0 \end{cases} \quad \begin{array}{l} \text{The inverse of} \\ \begin{bmatrix} 1 & 1 & 2 \\ 0 & 1 & 3 \\ 3 & 0 & -2 \end{bmatrix} \text{ is } \begin{bmatrix} -2 & 2 & 1 \\ 9 & -8 & -3 \\ -3 & 3 & 1 \end{bmatrix}. \end{array}$$

44. 
$$\begin{cases} x - y + 2z = 12 \\ y - z = -5 \\ x + 2z = 10 \end{cases} \quad \begin{array}{l} \text{The inverse of} \\ \begin{bmatrix} 1 & -1 & 2 \\ 0 & 1 & -1 \\ 1 & 0 & 2 \end{bmatrix} \text{ is } \begin{bmatrix} 2 & 2 & -1 \\ -1 & 0 & 1 \\ -1 & -1 & 1 \end{bmatrix}. \end{array}$$

45. Use the coding matrix  $A = \begin{bmatrix} 3 & 2 \\ 4 & 3 \end{bmatrix}$  and its inverse  $A^{-1} = \begin{bmatrix} 3 & -2 \\ -4 & 3 \end{bmatrix}$  to encode and then decode the word RULE.

### 8.5

In Exercises 46–51, evaluate each determinant.

46.  $\begin{vmatrix} 3 & 2 \\ -1 & 5 \end{vmatrix}$       47.  $\begin{vmatrix} -2 & -3 \\ -4 & -8 \end{vmatrix}$

48.  $\begin{vmatrix} 2 & 4 & -3 \\ 1 & -1 & 5 \\ -2 & 4 & 0 \end{vmatrix}$       49.  $\begin{vmatrix} 4 & 7 & 0 \\ -5 & 6 & 0 \\ 3 & 2 & -4 \end{vmatrix}$

50.  $\begin{vmatrix} 1 & 1 & 0 & 2 \\ 0 & 3 & 2 & 1 \\ 0 & -2 & 4 & 0 \\ 0 & 3 & 0 & 1 \end{vmatrix}$       51.  $\begin{vmatrix} 2 & 2 & 2 & 2 \\ 0 & 2 & 2 & 2 \\ 0 & 0 & 2 & 2 \\ 0 & 0 & 0 & 2 \end{vmatrix}$

In Exercises 52–55, use Cramer's Rule to solve each system.

52. 
$$\begin{cases} x - 2y = 8 \\ 3x + 2y = -1 \end{cases}$$
      53. 
$$\begin{cases} 7x + 2y = 0 \\ 2x + y = -3 \end{cases}$$

54. 
$$\begin{cases} x + 2y + 2z = 5 \\ 2x + 4y + 7z = 19 \\ -2x - 5y - 2z = 8 \end{cases}$$
      55. 
$$\begin{cases} 2x + y = -4 \\ y - 2z = 0 \\ 3x - 2z = -11 \end{cases}$$

56. Use the quadratic function  $y = ax^2 + bx + c$  to model the following data:

$x$ (Age of a Driver)	$y$ (Average Number of Automobile Accidents per Day in the United States)
20	400
40	150
60	400

Use Cramer's Rule to determine values for  $a$ ,  $b$ , and  $c$ . Then use the model to write a statement about the average number of automobile accidents in which 30-year-olds and 50-year-olds are involved daily.

## CHAPTER 8 TEST

In Exercises 1–2, solve each system of equations using matrices.

$$1. \begin{cases} x + 2y - z = -3 \\ 2x - 4y + z = -7 \\ -2x + 2y - 3z = 4 \end{cases}$$

$$2. \begin{cases} x - 2y + z = 2 \\ 2x - y - z = 1 \end{cases}$$

In Exercises 3–6, let

$$A = \begin{bmatrix} 3 & 1 \\ 1 & 0 \\ 2 & 1 \end{bmatrix}, \quad B = \begin{bmatrix} 1 & -1 \\ 2 & 1 \end{bmatrix}, \quad \text{and} \quad C = \begin{bmatrix} 1 & 2 \\ -1 & 3 \end{bmatrix}.$$

Carry out the indicated operations.

3.  $2B + 3C$

4.  $AB$

5.  $C^{-1}$

6.  $BC - 3B$

7. If  $A = \begin{bmatrix} 1 & 2 & 2 \\ 2 & 3 & 3 \\ 1 & -1 & -2 \end{bmatrix}$  and  $B = \begin{bmatrix} -3 & 2 & 0 \\ 7 & -4 & 1 \\ -5 & 3 & -1 \end{bmatrix}$ , show that  $B$  is the inverse of  $A$ .

8. Consider the system

$$\begin{cases} 3x + 5y = 9 \\ 2x - 3y = -13. \end{cases}$$

a. Express the system in the form  $AX = B$ , where  $A$ ,  $X$ , and  $B$  are appropriate matrices.

b. Find  $A^{-1}$ , the inverse of the coefficient matrix.

c. Use  $A^{-1}$  to solve the given system.

9. Evaluate:  $\begin{vmatrix} 4 & -1 & 3 \\ 0 & 5 & -1 \\ 5 & 2 & 4 \end{vmatrix}$ .

10. Solve for  $x$  only using Cramer's Rule:

$$\begin{cases} 3x + y - 2z = -3 \\ 2x + 7y + 3z = 9 \\ 4x - 3y - z = 7. \end{cases}$$

## CUMULATIVE REVIEW EXERCISES (CHAPTERS P–8)

Solve each equation or inequality in Exercises 1–6.

1.  $2x^2 = 4 - x$

2.  $5x + 8 \leq 7(1 + x)$

3.  $\sqrt{2x + 4} - \sqrt{x + 3} - 1 = 0$

4.  $3x^3 + 8x^2 - 15x + 4 = 0$

5.  $e^{2x} - 14e^x + 45 = 0$

6.  $\log_3 x + \log_3(x + 2) = 1$

7. Use matrices to solve this system:

$$\begin{cases} x - y + z = 17 \\ 2x + 3y + z = 8 \\ -4x + y + 5z = -2. \end{cases}$$

8. Solve for  $y$  using Cramer's Rule:

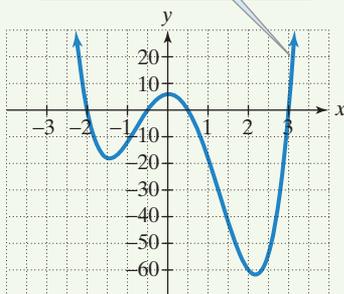

$$\begin{cases} x - 2y + z = 7 \\ 2x + y - z = 0 \\ 3x + 2y - 2z = -2. \end{cases}$$

9. If  $f(x) = \sqrt{4x - 7}$ , find  $f^{-1}(x)$ .

10. Graph:  $f(x) = \frac{x}{x^2 - 16}$ .

11. Use the graph of  $f(x) = 4x^4 - 4x^3 - 25x^2 + x + 6$  shown in the figure to factor the polynomial completely.

$$f(x) = 4x^4 - 4x^3 - 25x^2 + x + 6$$

12. Graph  $y = \log_2 x$  and  $y = \log_2(x + 1)$  in the same rectangular coordinate system.

13. Use the exponential decay model  $A = A_0 e^{kt}$  to solve this problem. A radioactive substance has a half-life of 40 days. There are initially 900 grams of the substance.

a. Find the decay model for this substance. Round  $k$  to the nearest thousandth.

b. How much of the substance will remain after 10 days? Round to the nearest hundredth of a gram.

14. Multiply the matrices:  $\begin{bmatrix} 1 & -1 & 0 \\ 2 & 1 & 3 \end{bmatrix} \begin{bmatrix} 4 & -1 \\ 2 & 0 \\ 1 & 1 \end{bmatrix}$ .

15. Find the partial fraction decomposition of

$$\frac{3x^2 + 17x - 38}{(x - 3)(x - 2)(x + 2)}.$$

In Exercises 16–19, graph each equation, function, or inequality in a rectangular coordinate system.

16.  $y = -\frac{2}{3}x - 1$

17.  $3x - 5y < 15$

18.  $f(x) = x^2 - 2x - 3$

19.  $(x - 1)^2 + (y + 1)^2 = 9$

20. Use synthetic division to divide  $x^3 - 6x + 4$  by  $x - 2$ .

21. Graph:  $y = 2 \sin 2\pi x$ ,  $0 \leq x \leq 2$ .

22. Find the exact value of  $\cos \left[ \tan^{-1} \left( -\frac{4}{3} \right) \right]$ .

23. Verify the identity:  $\frac{\cos 2x}{\cos x - \sin x} = \cos x + \sin x$ .

24. Solve on the interval  $[0, 2\pi)$ :  $\cos^2 x + \sin x + 1 = 0$ .

25. If  $\mathbf{v} = -6\mathbf{i} + 5\mathbf{j}$  and  $\mathbf{w} = -7\mathbf{i} + 3\mathbf{j}$ , find  $4\mathbf{w} - 5\mathbf{v}$ .

# CONIC SECTIONS AND ANALYTIC GEOMETRY

## CHAPTER

# 9

*From ripples in water* to the path on which humanity journeys through space, certain curves occur naturally throughout the universe. Over two thousand years ago, the ancient Greeks studied these curves, called *conic sections*, without regard to their immediate usefulness simply because studying them elicited ideas that were exciting, challenging, and interesting. The ancient Greeks could not have imagined the applications of these curves in the twenty-first century. They enable the Hubble Space Telescope, a large satellite about the size of a school bus orbiting 375 miles above Earth, to gather distant rays of light and focus them into spectacular images of our evolving universe. They provide doctors with a procedure for dissolving kidney stones painlessly without invasive surgery. In this chapter, we use the rectangular coordinate system to study the conic sections and the mathematics behind their surprising applications.

### HERE'S WHERE YOU'LL FIND THESE APPLICATIONS THAT MOVE BEYOND PLANET EARTH:

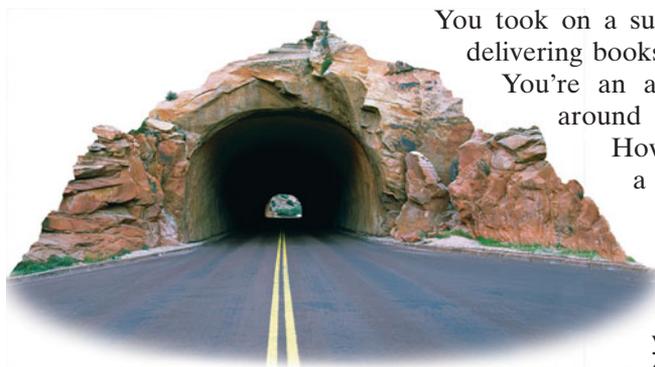

- Planetary orbits: Section 9.1, page 928; Exercise Set 9.1, Exercise 78
  - Halley's Comet: Blitzzer Bonus on page 929
  - Hubble Space Telescope: Section 9.3, pages 948 and 956.
- For a kidney stone here on Earth, see Section 9.1, page 928.

## SECTION 9.1

## The Ellipse

## Objectives

- 1 Graph ellipses centered at the origin.
- 2 Write equations of ellipses in standard form.
- 3 Graph ellipses not centered at the origin.
- 4 Solve applied problems involving ellipses.

You took on a summer job driving a truck, delivering books that were ordered online.

You're an avid reader, so just being around books sounded appealing.

However, now you're feeling a bit shaky driving the truck for the first time. It's

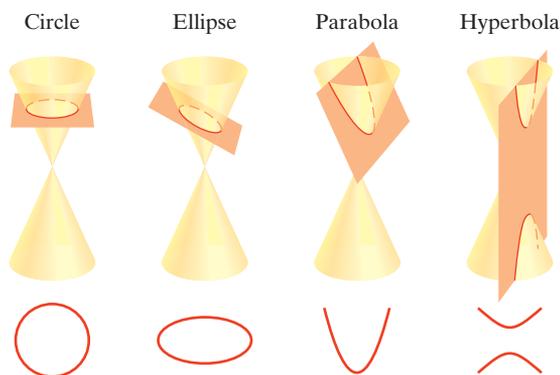

10 feet wide and 9 feet high; compared to your compact car, it feels like

you're behind the wheel of a tank. Up ahead you see a

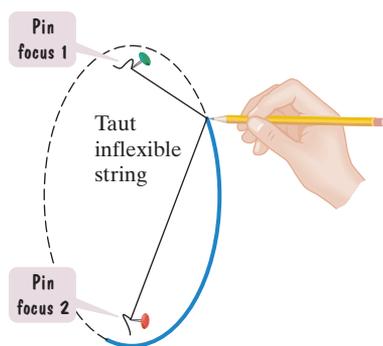

sign at the semielliptical entrance to a tunnel: Caution! Tunnel is 10 Feet High at Center Peak.

Then you see another sign: Caution! Tunnel Is 40 Feet Wide. Will your truck clear the opening of the tunnel's archway?

Mathematics is present in the movements of planets, bridge and tunnel construction, navigational systems used to keep track of a ship's location, manufacture of lenses for telescopes, and even in a procedure for disintegrating kidney stones. The mathematics behind these applications involves conic sections. Conic sections are curves that result from the intersection of a right circular cone and a plane. **Figure 9.1** illustrates the four conic sections: the circle, the ellipse, the parabola, and the hyperbola.

**FIGURE 9.1** Obtaining the conic sections by intersecting a plane and a cone

**FIGURE 9.2** Drawing an ellipse

In this section, we study the symmetric oval-shaped curve known as the ellipse. We will use a geometric definition for an ellipse to derive its equation. With this equation, we will determine if your delivery truck will clear the tunnel's entrance.

### Definition of an Ellipse

**Figure 9.2** illustrates how to draw an ellipse. Place pins at two fixed points, each of which is called a *focus* (plural: *foci*). If the ends of a fixed length of string are fastened to the pins and we draw the string taut with a pencil, the path traced by the pencil will be an ellipse. Notice that the sum of the distances of the pencil point from the foci remains constant because the length of the string is fixed. This procedure for drawing an ellipse illustrates its geometric definition.

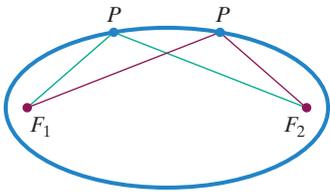

FIGURE 9.3

### Definition of an Ellipse

An **ellipse** is the set of all points,  $P$ , in a plane the sum of whose distances from two fixed points,  $F_1$  and  $F_2$ , is constant (see **Figure 9.3**). These two fixed points are called the **foci** (plural of **focus**). The midpoint of the segment connecting the foci is the **center** of the ellipse.

**Figure 9.4** illustrates that an ellipse can be elongated in any direction. In this section, we will limit our discussion to ellipses that are elongated horizontally or vertically. The line through the foci intersects the ellipse at two points, called the **vertices** (singular: **vertex**). The line segment that joins the vertices is the **major axis**. Notice that the midpoint of the major axis is the center of the ellipse. The line segment whose endpoints are on the ellipse and that is perpendicular to the major axis at the center is called the **minor axis** of the ellipse.

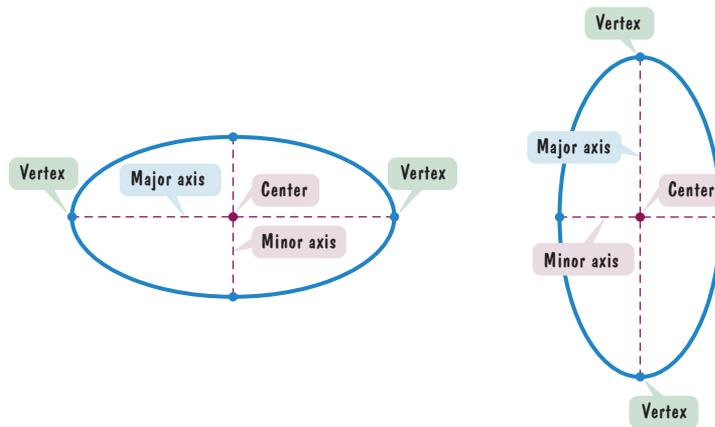

FIGURE 9.4 Horizontal and vertical elongations of an ellipse

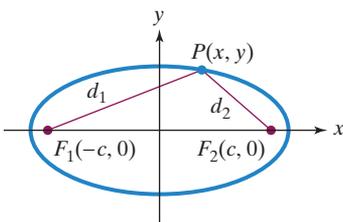

FIGURE 9.5

### GREAT QUESTION!

How did you go from

$$\sqrt{(x+c)^2 + y^2} + \sqrt{(x-c)^2 + y^2} = 2a$$

to  $(a^2 - c^2)x^2 + a^2y^2 = a^2(a^2 - c^2)$ ?

The algebraic details behind eliminating the radicals can be found in the appendix. There you will find a step-by-step derivation of the ellipse's equation.

### Standard Form of the Equation of an Ellipse

The rectangular coordinate system gives us a unique way of describing an ellipse. It enables us to translate an ellipse's geometric definition into an algebraic equation.

We start with **Figure 9.5** to obtain an ellipse's equation. We've placed an ellipse that is elongated horizontally into a rectangular coordinate system. The foci are on the  $x$ -axis at  $(-c, 0)$  and  $(c, 0)$ , as in **Figure 9.5**. In this way, the center of the ellipse is at the origin. We let  $(x, y)$  represent the coordinates of any point on the ellipse.

What does the definition of an ellipse tell us about the point  $(x, y)$  in **Figure 9.5**? For any point  $(x, y)$  on the ellipse, the sum of the distances to the two foci,  $d_1 + d_2$ , must be constant. As we shall see, it is convenient to denote this constant by  $2a$ . Thus, the point  $(x, y)$  is on the ellipse if and only if

$$d_1 + d_2 = 2a.$$

$$\sqrt{(x+c)^2 + y^2} + \sqrt{(x-c)^2 + y^2} = 2a \quad \text{Use the distance formula.}$$

After eliminating radicals and simplifying, we obtain

$$(a^2 - c^2)x^2 + a^2y^2 = a^2(a^2 - c^2).$$

Look at the triangle in **Figure 9.5**. Notice that the distance from  $F_1$  to  $F_2$  is  $2c$ . Because the length of any side of a triangle is less than the sum of the lengths of the other two sides,  $2c < d_1 + d_2$ . Equivalently,  $2c < 2a$  and  $c < a$ . Consequently,

$a^2 - c^2 > 0$ . For convenience, let  $b^2 = a^2 - c^2$ . Substituting  $b^2$  for  $a^2 - c^2$  in the preceding equation,  $(a^2 - c^2)x^2 + a^2y^2 = a^2(a^2 - c^2)$ , we obtain

$$b^2x^2 + a^2y^2 = a^2b^2$$

$$\frac{b^2x^2}{a^2b^2} + \frac{a^2y^2}{a^2b^2} = \frac{a^2b^2}{a^2b^2} \quad \text{Divide both sides by } a^2b^2.$$

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1. \quad \text{Simplify.}$$

This last equation is the **standard form of the equation of an ellipse centered at the origin**. There are two such equations, one for a horizontal major axis and one for a vertical major axis.

### GREAT QUESTION!

**Which equation do I need to use for locating the foci of an ellipse?**

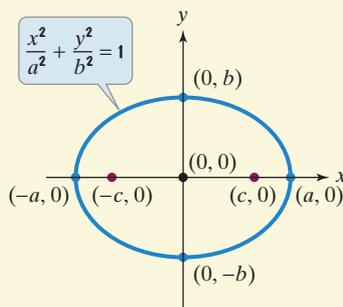

The form  $c^2 = a^2 - b^2$  is the one you should remember. When finding the foci, this form is easy to manipulate.

### Standard Forms of the Equations of an Ellipse

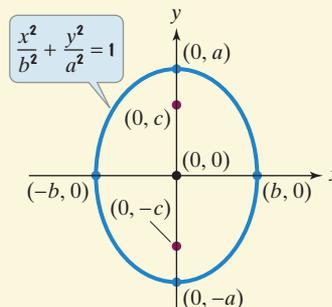

The **standard form of the equation of an ellipse** with center at the origin, and major and minor axes of lengths  $2a$  and  $2b$  (where  $a$  and  $b$  are positive, and  $a^2 > b^2$ ) is

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \quad \text{or} \quad \frac{x^2}{b^2} + \frac{y^2}{a^2} = 1.$$

**Figure 9.6** illustrates that the vertices are on the major axis,  $a$  units from the center. The foci are on the major axis,  $c$  units from the center. For both equations,  $b^2 = a^2 - c^2$ . Equivalently,  $c^2 = a^2 - b^2$ .

**FIGURE 9.6(a)** Major axis is horizontal with length  $2a$ .

**FIGURE 9.6(b)** Major axis is vertical with length  $2a$ .

The intercepts shown in **Figure 9.6(a)** can be obtained algebraically. Let's do this for

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1.$$

**x-intercepts: Set  $y = 0$ .**

$$\begin{aligned} \frac{x^2}{a^2} &= 1 \\ x^2 &= a^2 \\ x &= \pm a \end{aligned}$$

x-intercepts are  $-a$  and  $a$ .  
The graph passes through  $(-a, 0)$  and  $(a, 0)$ , which are the vertices.

**y-intercepts: Set  $x = 0$ .**

$$\begin{aligned} \frac{y^2}{b^2} &= 1 \\ y^2 &= b^2 \\ y &= \pm b \end{aligned}$$

y-intercepts are  $-b$  and  $b$ .  
The graph passes through  $(0, -b)$  and  $(0, b)$ .

## Using the Standard Form of the Equation of an Ellipse

We can use the standard form of an ellipse's equation to graph the ellipse. Although the definition of the ellipse is given in terms of its foci, the foci are not part of the graph. A complete graph of an ellipse can be obtained without graphing the foci.

- 1 Graph ellipses centered at the origin.

## EXAMPLE 1 Graphing an Ellipse Centered at the Origin

Graph and locate the foci:  $\frac{x^2}{9} + \frac{y^2}{4} = 1$ .

## SOLUTION

The given equation is the standard form of an ellipse's equation with  $a^2 = 9$  and  $b^2 = 4$ .

$$\frac{x^2}{9} + \frac{y^2}{4} = 1$$

$a^2 = 9$ . This is the larger of the two denominators.

$b^2 = 4$ . This is the smaller of the two denominators.

## TECHNOLOGY

We graph  $\frac{x^2}{9} + \frac{y^2}{4} = 1$  with a graphing utility by solving for  $y$ .

$$\begin{aligned}\frac{y^2}{4} &= 1 - \frac{x^2}{9} \\ y^2 &= 4\left(1 - \frac{x^2}{9}\right) \\ y &= \pm 2\sqrt{1 - \frac{x^2}{9}}\end{aligned}$$

Notice that the square root property requires us to define two functions. Enter

$$y_1 = 2 \sqrt{1 - \frac{x^2}{9}}$$

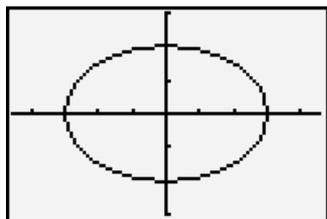

and

$$y_2 = -y_1.$$

To see the true shape of the ellipse, use the

ZOOM SQUARE

feature so that one unit on the  $y$ -axis is the same length as one unit on the  $x$ -axis.

$[-4.5, 4.5, 1]$  by  $[-3, 3, 1]$

Because the denominator of the  $x^2$ -term is greater than the denominator of the  $y^2$ -term, the major axis is horizontal. Based on the standard form of the equation, we know the vertices are  $(-a, 0)$  and  $(a, 0)$ . Because  $a^2 = 9$ ,  $a = 3$ . Thus, the vertices are  $(-3, 0)$  and  $(3, 0)$ , shown in **Figure 9.7**.

Now let us find the endpoints of the vertical minor axis. According to the standard form of the equation, these endpoints are  $(0, -b)$  and  $(0, b)$ . Because  $b^2 = 4$ ,  $b = 2$ . Thus, the endpoints of the minor axis are  $(0, -2)$  and  $(0, 2)$ . They are shown in **Figure 9.7**.

Finally, we find the foci, which are located at  $(-c, 0)$  and  $(c, 0)$ . We can use the formula  $c^2 = a^2 - b^2$  to do so. We know that  $a^2 = 9$  and  $b^2 = 4$ . Thus,

$$c^2 = a^2 - b^2 = 9 - 4 = 5.$$

Because  $c^2 = 5$ ,  $c = \sqrt{5}$ . The foci,  $(-c, 0)$  and  $(c, 0)$ , are located at  $(-\sqrt{5}, 0)$  and  $(\sqrt{5}, 0)$ . They are shown in **Figure 9.7**.

You can sketch the ellipse in **Figure 9.7** by locating endpoints on the major and minor axes.

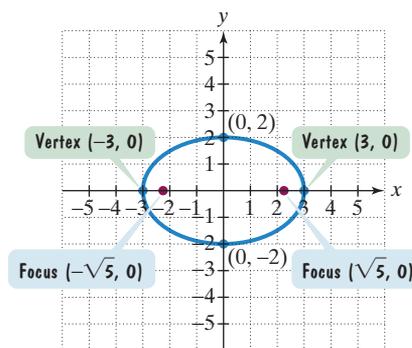

FIGURE 9.7 The graph of  $\frac{x^2}{9} + \frac{y^2}{4} = 1$

$$\frac{x^2}{3^2} + \frac{y^2}{2^2} = 1$$

Endpoints of the major axis are 3 units to the right and left of the center.

Endpoints of the minor axis are 2 units up and down from the center.

Check Point 1 Graph and locate the foci:  $\frac{x^2}{36} + \frac{y^2}{9} = 1$ .

**EXAMPLE 2** Graphing an Ellipse Centered at the OriginGraph and locate the foci:  $25x^2 + 16y^2 = 400$ .**SOLUTION**

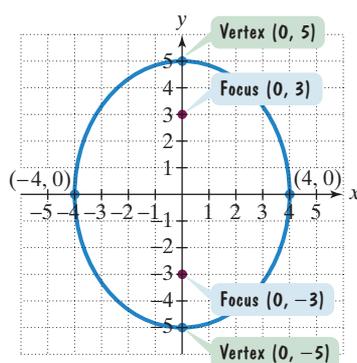

We begin by expressing the equation in standard form. Because we want 1 on the right side, we divide both sides by 400.

$$\frac{25x^2}{400} + \frac{16y^2}{400} = \frac{400}{400}$$

$$\frac{x^2}{16} + \frac{y^2}{25} = 1$$

$b^2 = 16$ . This is the smaller of the two denominators.

$a^2 = 25$ . This is the larger of the two denominators.

**FIGURE 9.8** The graph of  $25x^2 + 16y^2 = 400$ , or  $\frac{x^2}{16} + \frac{y^2}{25} = 1$

The equation is the standard form of an ellipse's equation with  $a^2 = 25$  and  $b^2 = 16$ . Because the denominator of the  $y^2$ -term is greater than the denominator of the  $x^2$ -term, the major axis is vertical. Based on the standard form of the equation, we know the vertices are  $(0, -a)$  and  $(0, a)$ . Because  $a^2 = 25$ ,  $a = 5$ . Thus, the vertices are  $(0, -5)$  and  $(0, 5)$ , shown in **Figure 9.8**.

Now let us find the endpoints of the horizontal minor axis. According to the standard form of the equation, these endpoints are  $(-b, 0)$  and  $(b, 0)$ . Because  $b^2 = 16$ ,  $b = 4$ . Thus, the endpoints of the minor axis are  $(-4, 0)$  and  $(4, 0)$ . They are shown in **Figure 9.8**.

Finally, we find the foci, which are located at  $(0, -c)$  and  $(0, c)$ . We can use the formula  $c^2 = a^2 - b^2$  to do so. We know that  $a^2 = 25$  and  $b^2 = 16$ . Thus,

$$c^2 = a^2 - b^2 = 25 - 16 = 9.$$

Because  $c^2 = 9$ ,  $c = 3$ . The foci,  $(0, -c)$  and  $(0, c)$ , are located at  $(0, -3)$  and  $(0, 3)$ . They are shown in **Figure 9.8**.

You can sketch the ellipse in **Figure 9.8** by locating endpoints on the major and minor axes.

$$\frac{x^2}{4^2} + \frac{y^2}{5^2} = 1$$

Endpoints of the minor axis are 4 units to the right and left of the center.

Endpoints of the major axis are 5 units up and down from the center.

...

**Check Point 2** Graph and locate the foci:  $16x^2 + 9y^2 = 144$ .

- 2** Write equations of ellipses in standard form.

In Examples 1 and 2, we used the equation of an ellipse to find its foci and vertices. In the next example, we reverse this procedure.

**EXAMPLE 3** Finding the Equation of an Ellipse from Its Foci and Vertices

Find the standard form of the equation of an ellipse with foci at  $(-1, 0)$  and  $(1, 0)$  and vertices  $(-2, 0)$  and  $(2, 0)$ .

## SOLUTION

Because the foci are located at  $(-1, 0)$  and  $(1, 0)$ , on the  $x$ -axis, the major axis is horizontal. The center of the ellipse is midway between the foci, located at  $(0, 0)$ . Thus, the form of the equation is

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1.$$

We need to determine the values for  $a^2$  and  $b^2$ . The distance from the center,  $(0, 0)$ , to either vertex,  $(-2, 0)$  or  $(2, 0)$ , is 2. Thus,  $a = 2$ .

$$\frac{x^2}{2^2} + \frac{y^2}{b^2} = 1 \quad \text{or} \quad \frac{x^2}{4} + \frac{y^2}{b^2} = 1$$

We must still find  $b^2$ . The distance from the center,  $(0, 0)$ , to either focus,  $(-1, 0)$  or  $(1, 0)$ , is 1, so  $c = 1$ . Using  $c^2 = a^2 - b^2$ , we have

$$1^2 = 2^2 - b^2$$

and

$$b^2 = 2^2 - 1^2 = 4 - 1 = 3.$$

Substituting 3 for  $b^2$  in  $\frac{x^2}{4} + \frac{y^2}{b^2} = 1$  gives us the standard form of the ellipse's equation. The equation is

$$\frac{x^2}{4} + \frac{y^2}{3} = 1. \quad \dots$$

 **Check Point 3** Find the standard form of the equation of an ellipse with foci at  $(-2, 0)$  and  $(2, 0)$  and vertices  $(-3, 0)$  and  $(3, 0)$ .

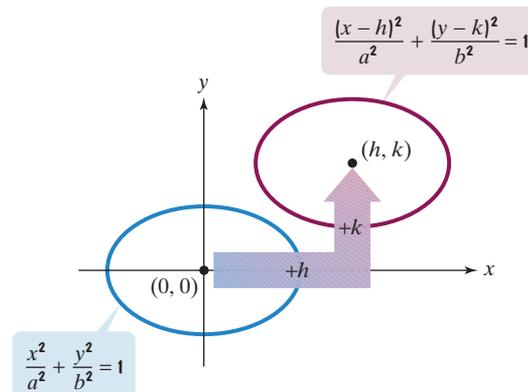

**3** Graph ellipses not centered at the origin.

## Translations of Ellipses

Horizontal and vertical translations can be used to graph ellipses that are not centered at the origin. **Figure 9.9** illustrates that the graphs of

$$\frac{(x - h)^2}{a^2} + \frac{(y - k)^2}{b^2} = 1 \quad \text{and} \quad \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

have the same size and shape. However, the graph of the first equation is centered at  $(h, k)$  rather than at the origin.

**FIGURE 9.9** Translating an ellipse's graph

**Table 9.1** gives the standard forms of equations of ellipses centered at  $(h, k)$  and shows their graphs.

**Table 9.1** Standard Forms of Equations of Ellipses Centered at  $(h, k)$

Equation	Center	Major Axis	Vertices	Graph
$\frac{(x-h)^2}{a^2} + \frac{(y-k)^2}{b^2} = 1$ <p>Endpoints of major axis are <math>a</math> units right and <math>a</math> units left of center.</p> <p><math>a^2 &gt; b^2</math></p> <p>Foci are <math>c</math> units right and <math>c</math> units left of center, where <math>c^2 = a^2 - b^2</math>.</p>	$(h, k)$	Parallel to the $x$ -axis, horizontal	$(h - a, k)$ $(h + a, k)$	
$\frac{(x-h)^2}{b^2} + \frac{(y-k)^2}{a^2} = 1$ <p><math>a^2 &gt; b^2</math></p> <p>Endpoints of the major axis are <math>a</math> units above and <math>a</math> units below the center.</p> <p>Foci are <math>c</math> units above and <math>c</math> units below the center, where <math>c^2 = a^2 - b^2</math>.</p>	$(h, k)$	Parallel to the $y$ -axis, vertical	$(h, k - a)$ $(h, k + a)$	

#### EXAMPLE 4 Graphing an Ellipse Centered at $(h, k)$

Graph:  $\frac{(x-1)^2}{4} + \frac{(y+2)^2}{9} = 1$ . Where are the foci located?

#### SOLUTION

To graph the ellipse, we need to know its center,  $(h, k)$ . In the standard forms of equations centered at  $(h, k)$ ,  $h$  is the number subtracted from  $x$  and  $k$  is the number subtracted from  $y$ .

This is  $(x-h)^2$ ,  
with  $h=1$ .

This is  $(y-k)^2$ ,  
with  $k=-2$ .

$$\frac{(x-1)^2}{4} + \frac{(y-(-2))^2}{9} = 1$$

We see that  $h = 1$  and  $k = -2$ . Thus, the center of the ellipse,  $(h, k)$ , is  $(1, -2)$ . We can graph the ellipse by locating endpoints on the major and minor axes. To do this, we must identify  $a^2$  and  $b^2$ .

$$\frac{(x-1)^2}{4} + \frac{(y+2)^2}{9} = 1$$

$b^2 = 4$ . This is the  
smaller of the two  
denominators.

$a^2 = 9$ . This is the  
larger of the two  
denominators.

The larger number is under the expression involving  $y$ . This means that the major axis is vertical and parallel to the  $y$ -axis.

We can sketch the ellipse by locating endpoints on the major and minor axes.

$$\frac{(x - 1)^2}{2^2} + \frac{(y + 2)^2}{3^2} = 1$$

Endpoints of the minor axis are 2 units to the right and left of the center.

Endpoints of the major axis (the vertices) are 3 units up and down from the center.

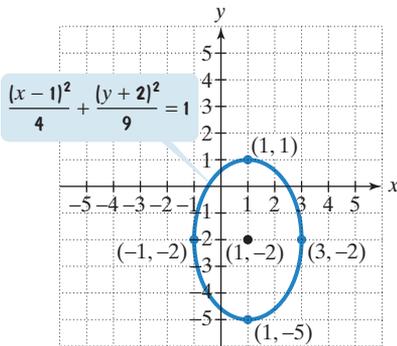

FIGURE 9.10 The graph of an ellipse centered at (1, -2)

We categorize the observations in the voice balloons as follows:

For a Vertical Major Axis with Center (1, -2)		
	Vertices	Endpoints of Minor Axis
3 units above and below center	$(1, -2 + 3) = (1, 1)$	$(1 + 2, -2) = (3, -2)$
	$(1, -2 - 3) = (1, -5)$	$(1 - 2, -2) = (-1, -2)$
		2 units right and left of center

Using the center and these four points, we can sketch the ellipse shown in Figure 9.10.

With  $c^2 = a^2 - b^2$ , we have  $c^2 = 9 - 4 = 5$ . So the foci are located  $\sqrt{5}$  units above and below the center, at  $(1, -2 + \sqrt{5})$  and  $(1, -2 - \sqrt{5})$ . ●●●

**Check Point 4** Graph:  $\frac{(x + 1)^2}{9} + \frac{(y - 2)^2}{4} = 1$ . Where are the foci located?

In some cases, it is necessary to convert the equation of an ellipse to standard form by completing the square on  $x$  and  $y$ . For example, suppose that we wish to graph the ellipse whose equation is

$$9x^2 + 4y^2 - 18x + 16y - 11 = 0.$$

Because we plan to complete the square on both  $x$  and  $y$ , we need to rearrange terms so that

- $x$ -terms are arranged in descending order.
- $y$ -terms are arranged in descending order.
- the constant term appears on the right.

$$9x^2 + 4y^2 - 18x + 16y - 11 = 0$$

$$(9x^2 - 18x) + (4y^2 + 16y) = 11$$

$$9(x^2 - 2x + \square) + 4(y^2 + 4y + \square) = 11$$

We added  $9 \cdot 1$ , or 9, to the left side.

We also added  $4 \cdot 4$ , or 16, to the left side.

$$9(x^2 - 2x + 1) + 4(y^2 + 4y + 4) = 11 + 9 + 16$$

9 and 16, added on the left side, must also be added on the right side.

$$9(x - 1)^2 + 4(y + 2)^2 = 36$$

$$\frac{9(x - 1)^2}{36} + \frac{4(y + 2)^2}{36} = \frac{36}{36}$$

$$\frac{(x - 1)^2}{4} + \frac{(y + 2)^2}{9} = 1$$

This is the given equation.

Group terms and add 11 to both sides.

To complete the square, coefficients of  $x^2$  and  $y^2$  must be 1. Factor out 9 and 4, respectively.

Complete each square by adding the square of half the coefficient of  $x$  and  $y$ , respectively.

Factor.

Divide both sides by 36.

Simplify.

The equation is now in standard form. This is precisely the form of the equation that we graphed in Example 4.

## GREAT QUESTION!

Can you remind me how to complete the square?

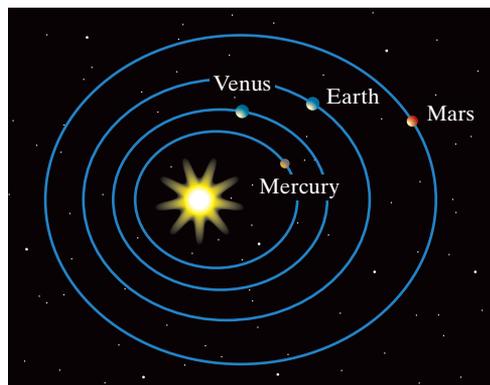

To complete the square on  $x^2 + bx$ , take half the coefficient of  $x$ . Then square this number.

By adding the square of half the coefficient of  $x$ , a perfect square trinomial will result. Once you've completed the square, remember that changes made on the left side of the equation must also be made on the right side of the equation.

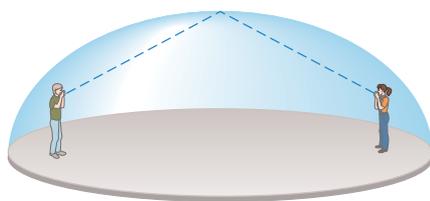

- 4 Solve applied problems involving ellipses.

### Applications

Ellipses have many applications. German scientist Johannes Kepler (1571–1630) showed that the planets in our solar system move in elliptical orbits, with the sun at a focus. Earth satellites also travel in elliptical orbits, with Earth at a focus.

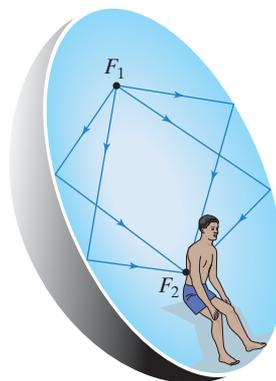

Planets move in elliptical orbits.

Whispering in an elliptical dome

One intriguing aspect of the ellipse is that a ray of light or a sound wave emanating from one focus will be reflected from the ellipse to exactly the other focus. A whispering gallery is an elliptical room with an elliptical, dome-shaped ceiling. People standing at the foci can whisper and hear each other quite clearly, while persons in other locations in the room cannot hear them. Statuary Hall in the U.S. Capitol Building is elliptical. President John Quincy Adams, while a member of the House of Representatives, was aware of this acoustical phenomenon. He situated his desk at a focal point of the elliptical ceiling, easily eavesdropping on the private conversations of other House members located near the other focus.

The elliptical reflection principle is used in a procedure for disintegrating kidney stones. The patient is placed within a device that is elliptical in shape. The patient is placed so the kidney is centered at one focus, while ultrasound waves from the other focus hit the walls and are reflected to the kidney stone. The convergence of the ultrasound waves at the kidney stone causes vibrations that shatter it into fragments. The small pieces can then be passed painlessly through the patient's system. The patient recovers in days, as opposed to up to six weeks if surgery is used instead.

Disintegrating kidney stones

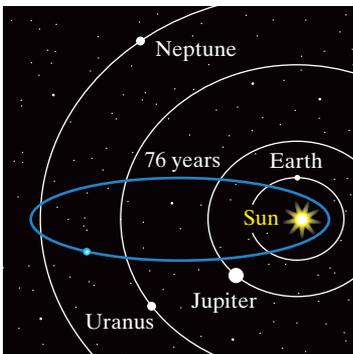

Ellipses are often used for supporting arches of bridges and in tunnel construction. This application forms the basis of our next example.

## Blitzer Bonus Halley's Comet

Halley's Comet has an elliptical orbit with the sun at one focus. The comet returns every 76.3 years. The first recorded sighting was in 239 B.C. It was last seen in 1986. At that time, spacecraft went close to the comet, measuring its nucleus to be 7 miles long and 4 miles wide. By 2024, Halley's Comet will have reached the farthest point in its elliptical orbit before returning to be next visible from Earth in 2062.

The elliptical orbit of Halley's Comet

### EXAMPLE 5 An Application Involving an Ellipse

A semielliptical archway over a one-way road has a height of 10 feet and a width of 40 feet (see **Figure 9.11**). Your truck has a width of 10 feet and a height of 9 feet. Will your truck clear the opening of the archway?

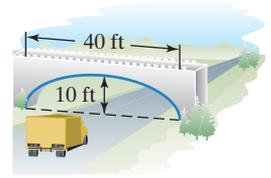

FIGURE 9.11  
A semielliptical archway

### SOLUTION

Because your truck's width is 10 feet, to determine the clearance, we must find the height of the archway 5 feet from the center. If that height is 9 feet or less, the truck will not clear the opening.

In **Figure 9.12**, we've constructed a coordinate system with the  $x$ -axis on the ground and the origin at the center of the archway. Also shown is the truck, whose height is 9 feet.

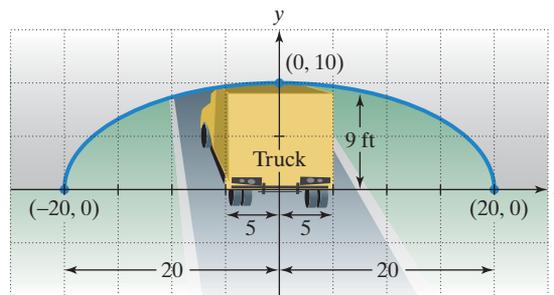

FIGURE 9.12

Using the equation  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ , we can express the equation of the blue archway in **Figure 9.12** as  $\frac{x^2}{20^2} + \frac{y^2}{10^2} = 1$ , or  $\frac{x^2}{400} + \frac{y^2}{100} = 1$ .

As shown in **Figure 9.12**, the edge of the 10-foot-wide truck corresponds to  $x = 5$ . We find the height of the archway 5 feet from the center by substituting 5 for  $x$  and solving for  $y$ .

$$\frac{5^2}{400} + \frac{y^2}{100} = 1 \quad \text{Substitute 5 for } x \text{ in } \frac{x^2}{400} + \frac{y^2}{100} = 1.$$

$$\frac{25}{400} + \frac{y^2}{100} = 1 \quad \text{Square 5.}$$

$$400\left(\frac{25}{400} + \frac{y^2}{100}\right) = 400(1) \quad \text{Clear fractions by multiplying both sides by 400.}$$

$$25 + 4y^2 = 400 \quad \text{Use the distributive property and simplify.}$$

$$4y^2 = 375 \quad \text{Subtract 25 from both sides.}$$

$$y^2 = \frac{375}{4} \quad \text{Divide both sides by 4.}$$

$$y = \sqrt{\frac{375}{4}} \quad \text{Take only the positive square root. The archway is above the } x\text{-axis, so } y \text{ is nonnegative.}$$

$$\approx 9.68 \quad \text{Use a calculator.}$$

Thus, the height of the archway 5 feet from the center is approximately 9.68 feet. Because your truck's height is 9 feet, there is enough room for the truck to clear the archway. ...

**Check Point 5** Will a truck that is 12 feet wide and has a height of 9 feet clear the opening of the archway described in Example 5?

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- The set of all points in a plane the sum of whose distances from two fixed points is constant is a/an \_\_\_\_\_. The two fixed points are called the \_\_\_\_\_. The midpoint of the line segment connecting the two fixed points is the \_\_\_\_\_.
- Consider the following equation in standard form:

$$\frac{x^2}{25} + \frac{y^2}{9} = 1.$$

The value of  $a^2$  is \_\_\_\_\_, so the  $x$ -intercepts are \_\_\_\_\_ and \_\_\_\_\_. The graph passes through \_\_\_\_\_ and \_\_\_\_\_, which are the vertices.

The value of  $b^2$  is \_\_\_\_\_, so the  $y$ -intercepts are \_\_\_\_\_ and \_\_\_\_\_. The graph passes through \_\_\_\_\_ and \_\_\_\_\_.

- Consider the following equation in standard form:

$$\frac{x^2}{9} + \frac{y^2}{25} = 1.$$

The value of  $a^2$  is \_\_\_\_\_, so the  $y$ -intercepts are \_\_\_\_\_ and \_\_\_\_\_. The graph passes through \_\_\_\_\_ and \_\_\_\_\_, which are the vertices.

The value of  $b^2$  is \_\_\_\_\_, so the  $x$ -intercepts are \_\_\_\_\_ and \_\_\_\_\_. The graph passes through \_\_\_\_\_ and \_\_\_\_\_.

- Consider an ellipse centered at the origin whose major axis is vertical. The equation of this ellipse in standard form indicates that  $a^2 = 9$  and  $b^2 = 4$ . Thus,  $c^2 =$  \_\_\_\_\_. The foci are located at \_\_\_\_\_ and \_\_\_\_\_.
- The graph of  $\frac{(x+1)^2}{25} + \frac{(y-4)^2}{9} = 1$  has its center at \_\_\_\_\_.
- If the center of an ellipse is  $(3, -2)$ , the major axis is horizontal and parallel to the  $x$ -axis, and the distance from the center of the ellipse to its vertices is  $a = 5$  units, then the coordinates of the vertices are \_\_\_\_\_ and \_\_\_\_\_.
- If the foci of an ellipse are located at  $(-8, 6)$  and  $(10, 12)$ , then the coordinates of the center of the ellipse are \_\_\_\_\_.
- In the equation  $3(x^2 + 4x) + 4(y^2 - 2y) = 32$ , we complete the square on  $x$  by adding \_\_\_\_\_ within the first parentheses. We complete the square on  $y$  by adding \_\_\_\_\_ within the second parentheses. Thus, we must add \_\_\_\_\_ to the right side of the equation.

32. Major axis horizontal with length 12; length of minor axis = 6; center:  $(0, 0)$
33. Major axis vertical with length 10; length of minor axis = 4; center:  $(-2, 3)$
34. Major axis vertical with length 20; length of minor axis = 10; center:  $(2, -3)$
35. Endpoints of major axis:  $(7, 9)$  and  $(7, 3)$   
Endpoints of minor axis:  $(5, 6)$  and  $(9, 6)$
36. Endpoints of major axis:  $(2, 2)$  and  $(8, 2)$   
Endpoints of minor axis:  $(5, 3)$  and  $(5, 1)$

In Exercises 37–50, graph each ellipse and give the location of its foci.

37.  $\frac{(x-2)^2}{9} + \frac{(y-1)^2}{4} = 1$

38.  $\frac{(x-1)^2}{16} + \frac{(y+2)^2}{9} = 1$

39.  $(x+3)^2 + 4(y-2)^2 = 16$

40.  $(x-3)^2 + 9(y+2)^2 = 18$

41.  $\frac{(x-4)^2}{9} + \frac{(y+2)^2}{25} = 1$

42.  $\frac{(x-3)^2}{9} + \frac{(y+1)^2}{16} = 1$

43.  $\frac{x^2}{25} + \frac{(y-2)^2}{36} = 1$

44.  $\frac{(x-4)^2}{4} + \frac{y^2}{25} = 1$

45.  $\frac{(x+3)^2}{9} + (y-2)^2 = 1$

46.  $\frac{(x+2)^2}{16} + (y-3)^2 = 1$

47.  $\frac{(x-1)^2}{2} + \frac{(y+3)^2}{5} = 1$

48.  $\frac{(x+1)^2}{2} + \frac{(y-3)^2}{5} = 1$

49.  $9(x-1)^2 + 4(y+3)^2 = 36$

50.  $36(x+4)^2 + (y+3)^2 = 36$

In Exercises 51–56, convert each equation to standard form by completing the square on  $x$  and  $y$ . Then graph the ellipse and give the location of its foci.

51.  $9x^2 + 25y^2 - 36x + 50y - 164 = 0$

52.  $4x^2 + 9y^2 - 32x + 36y + 64 = 0$

53.  $9x^2 + 16y^2 - 18x + 64y - 71 = 0$

54.  $x^2 + 4y^2 + 10x - 8y + 13 = 0$

55.  $4x^2 + y^2 + 16x - 6y - 39 = 0$

56.  $4x^2 + 25y^2 - 24x + 100y + 36 = 0$

### Practice Plus

In Exercises 57–62, find the solution set for each system by graphing both of the system's equations in the same rectangular coordinate system and finding points of intersection. Check all solutions in both equations.

57.  $\begin{cases} x^2 + y^2 = 1 \\ x^2 + 9y^2 = 9 \end{cases}$

58.  $\begin{cases} x^2 + y^2 = 25 \\ 25x^2 + y^2 = 25 \end{cases}$

59.  $\begin{cases} \frac{x^2}{25} + \frac{y^2}{9} = 1 \\ y = 3 \end{cases}$

60.  $\begin{cases} \frac{x^2}{4} + \frac{y^2}{36} = 1 \\ x = -2 \end{cases}$

61.  $\begin{cases} 4x^2 + y^2 = 4 \\ 2x - y = 2 \end{cases}$

62.  $\begin{cases} 4x^2 + y^2 = 4 \\ x + y = 3 \end{cases}$

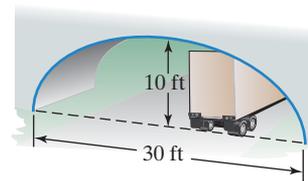

In Exercises 63–64, graph each semiellipse.

63.  $y = -\sqrt{16 - 4x^2}$

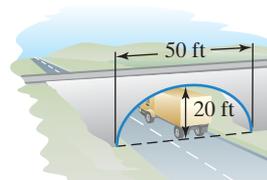

64.  $y = -\sqrt{4 - 4x^2}$

### Application Exercises

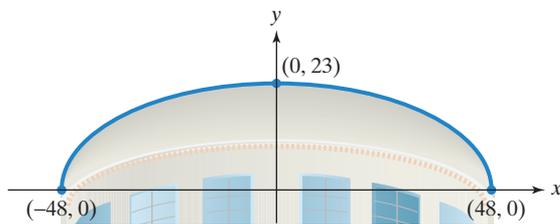

65. Will a truck that is 8 feet wide carrying a load that reaches 7 feet above the ground clear the semielliptical arch on the one-way road that passes under the bridge shown in the figure?

66. A semielliptical archway has a height of 20 feet and a width of 50 feet, as shown in the figure. Can a truck 14 feet high and 10 feet wide drive under the archway without going into the other lane?

67. The elliptical ceiling in Statuary Hall in the U.S. Capitol Building is 96 feet long and 23 feet tall.

- a. Using the rectangular coordinate system in the figure shown, write the standard form of the equation of the elliptical ceiling.
- b. John Quincy Adams discovered that he could overhear the conversations of opposing party leaders near the left side of the chamber if he situated his desk at the focus at the right side of the chamber. How far from the center of the ellipse along the major axis did Adams situate his desk? (Round to the nearest foot.)
68. If an elliptical whispering room has a height of 30 feet and a width of 100 feet, where should two people stand if they would like to whisper back and forth and be heard?

### Writing in Mathematics

69. What is an ellipse?
70. Describe how to graph  $\frac{x^2}{25} + \frac{y^2}{16} = 1$ .
71. Describe how to locate the foci for  $\frac{x^2}{25} + \frac{y^2}{16} = 1$ .
72. Describe one similarity and one difference between the graphs of  $\frac{x^2}{25} + \frac{y^2}{16} = 1$  and  $\frac{x^2}{16} + \frac{y^2}{25} = 1$ .
73. Describe one similarity and one difference between the graphs of  $\frac{x^2}{25} + \frac{y^2}{16} = 1$  and  $\frac{(x-1)^2}{25} + \frac{(y-1)^2}{16} = 1$ .
74. An elliptipool is an elliptical pool table with only one pocket. A pool shark places a ball on the table, hits it in what appears to be a random direction, and yet it bounces off the edge, falling directly into the pocket. Explain why this happens.

### Technology Exercises

75. Use a graphing utility to graph any five of the ellipses that you graphed by hand in Exercises 1–18.
76. Use a graphing utility to graph any three of the ellipses that you graphed by hand in Exercises 37–50. First solve the given equation for  $y$  by using the square root property. Enter each of the two resulting equations to produce each half of the ellipse.

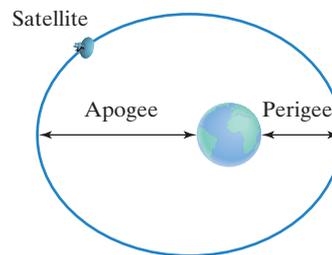

77. Use a graphing utility to graph any one of the ellipses that you graphed by hand in Exercises 51–56. Write the equation as a quadratic equation in  $y$  and use the quadratic formula to solve for  $y$ . Enter each of the two resulting equations to produce each half of the ellipse.
78. Write an equation for the path of each of the following elliptical orbits. Then use a graphing utility to graph the two ellipses in the same viewing rectangle. Can you see why early astronomers had difficulty detecting that these orbits are ellipses rather than circles?
- Earth's orbit: Length of major axis: 186 million miles  
Length of minor axis: 185.8 million miles
  - Mars's orbit: Length of major axis: 283.5 million miles  
Length of minor axis: 278.5 million miles

### Critical Thinking Exercises

**Make Sense?** In Exercises 79–82, determine whether each statement makes sense or does not make sense, and explain your reasoning.

79. I graphed an ellipse with a horizontal major axis and foci on the  $y$ -axis.
80. I graphed an ellipse that was symmetric about its major axis but not symmetric about its minor axis.
81. You told me that an ellipse centered at the origin has vertices at  $(-5, 0)$  and  $(5, 0)$ , so I was able to graph the ellipse.
82. In a whispering gallery at our science museum, I stood at one focus, my friend stood at the other focus, and we had a clear conversation, very little of which was heard by the 25 museum visitors standing between us.
83. Find the standard form of the equation of an ellipse with vertices at  $(0, -6)$  and  $(0, 6)$ , passing through  $(2, -4)$ .
84. An Earth satellite has an elliptical orbit described by

$$\frac{x^2}{(5000)^2} + \frac{y^2}{(4750)^2} = 1.$$

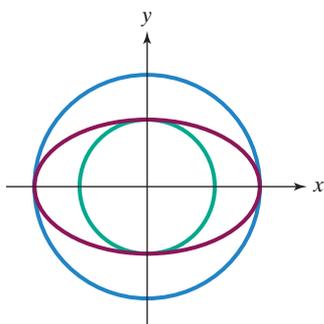

(All units are in miles.) The coordinates of the center of Earth are  $(16, 0)$ .

- a. The perigee of the satellite's orbit is the point that is nearest Earth's center. If the radius of Earth is approximately 4000 miles, find the distance of the perigee above Earth's surface.
- b. The apogee of the satellite's orbit is the point that is the greatest distance from Earth's center. Find the distance of the apogee above Earth's surface.

85. The equation of the red ellipse in the figure shown is

$$\frac{x^2}{25} + \frac{y^2}{9} = 1.$$

Write the equation for each circle shown in the figure.

86. What happens to the shape of the graph of  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$  as  $\frac{c}{a} \rightarrow 0$ , where  $c^2 = a^2 - b^2$ ?

### Preview Exercises

Exercises 87–89 will help you prepare for the material covered in the next section.

87. Divide both sides of  $4x^2 - 9y^2 = 36$  by 36 and simplify. How does the simplified equation differ from that of an ellipse?
88. Consider the equation  $\frac{x^2}{16} - \frac{y^2}{9} = 1$ .
- Find the  $x$ -intercepts.
  - Explain why there are no  $y$ -intercepts.
89. Consider the equation  $\frac{y^2}{9} - \frac{x^2}{16} = 1$ .
- Find the  $y$ -intercepts.
  - Explain why there are no  $x$ -intercepts.

## SECTION 9.2

### The Hyperbola

#### Objectives

- Locate a hyperbola's vertices and foci.
- Write equations of hyperbolas in standard form.
- Graph hyperbolas centered at the origin.
- Graph hyperbolas not centered at the origin.
- Solve applied problems involving hyperbolas.

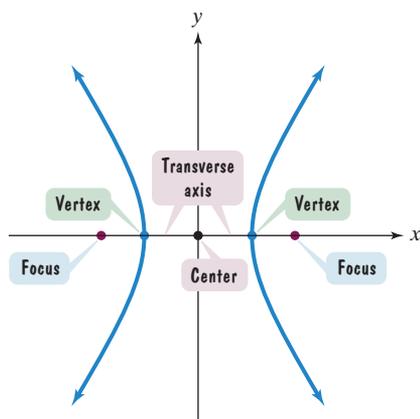

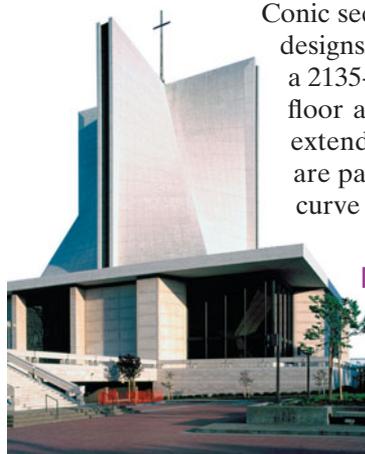

FIGURE 9.14 The two branches of a hyperbola

St. Mary's Cathedral

Conic sections are often used to create unusual architectural designs. The top of St. Mary's Cathedral in San Francisco is a 2135-cubic-foot dome with walls rising 200 feet above the floor and supported by four massive concrete pylons that extend 94 feet into the ground. Cross sections of the roof are parabolas and hyperbolas. In this section, we study the curve with two parts known as the hyperbola.

#### Definition of a Hyperbola

Figure 9.13 shows a cylindrical lampshade casting two shadows on a wall. These shadows indicate the distinguishing feature of hyperbolas: Their graphs contain two disjoint parts, called **branches**. Although each branch might look like a parabola, its shape is actually quite different.

FIGURE 9.13 Casting hyperbolic shadows

The definition of a hyperbola is similar to that of an ellipse. For an ellipse, the *sum* of the distances to the foci is a constant. By contrast, for a hyperbola the *difference* of the distances to the foci is a constant.

The definition of a hyperbola is similar to that of an ellipse. For an ellipse, the *sum* of the distances to the foci is a constant. By contrast, for a hyperbola the *difference* of the distances to the foci is a constant.

#### Definition of a Hyperbola

A **hyperbola** is the set of points in a plane the difference of whose distances from two fixed points, called foci, is constant.

Figure 9.14 illustrates the two branches of a hyperbola. The line through the foci intersects the hyperbola at two points, called the **vertices**. The line segment that joins the vertices is the **transverse axis**. The midpoint of the transverse axis is the **center** of the hyperbola. Notice that the center lies midway between the vertices, as well as midway between the foci.

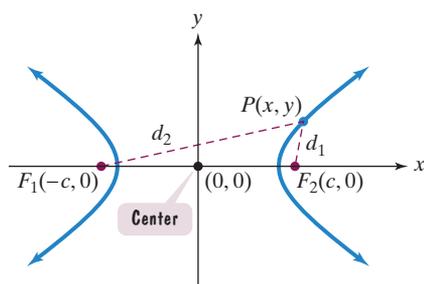

FIGURE 9.15

### Standard Form of the Equation of a Hyperbola

The rectangular coordinate system enables us to translate a hyperbola's geometric definition into an algebraic equation. **Figure 9.15** is our starting point for obtaining an equation. We place the foci,  $F_1$  and  $F_2$ , on the  $x$ -axis at the points  $(-c, 0)$  and  $(c, 0)$ . Note that the center of this hyperbola is at the origin. We let  $(x, y)$  represent the coordinates of any point,  $P$ , on the hyperbola.

What does the definition of a hyperbola tell us about the point  $(x, y)$  in **Figure 9.15**? For any point  $(x, y)$  on the hyperbola, the absolute value of the difference of the distances from the two foci,  $|d_2 - d_1|$ , must be constant. We denote this constant by  $2a$ , just as we did for the ellipse. Thus, the point  $(x, y)$  is on the hyperbola if and only if

$$|d_2 - d_1| = 2a.$$

$$\left| \sqrt{(x+c)^2 + (y-0)^2} - \sqrt{(x-c)^2 + (y-0)^2} \right| = 2a \quad \text{Use the distance formula.}$$

After eliminating radicals and simplifying, we obtain

$$(c^2 - a^2)x^2 - a^2y^2 = a^2(c^2 - a^2).$$

For convenience, let  $b^2 = c^2 - a^2$ . Substituting  $b^2$  for  $c^2 - a^2$  in the preceding equation, we obtain

$$\begin{aligned} b^2x^2 - a^2y^2 &= a^2b^2 \\ \frac{b^2x^2}{a^2b^2} - \frac{a^2y^2}{a^2b^2} &= \frac{a^2b^2}{a^2b^2} && \text{Divide both sides by } a^2b^2. \\ \frac{x^2}{a^2} - \frac{y^2}{b^2} &= 1 && \text{Simplify.} \end{aligned}$$

This last equation is called the **standard form of the equation of a hyperbola centered at the origin**. There are two such equations. The first is for a hyperbola in which the transverse axis lies on the  $x$ -axis. The second is for a hyperbola in which the transverse axis lies on the  $y$ -axis.

### GREAT QUESTION!

**Which equation do I need to use for locating the foci of a hyperbola?**

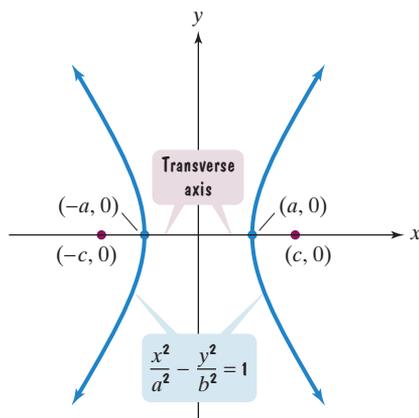

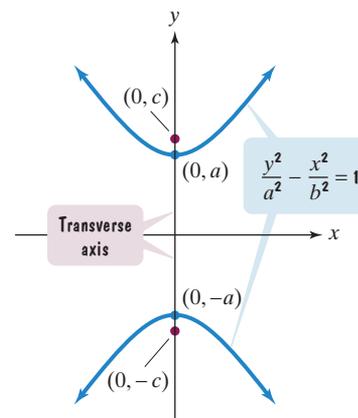

The form  $c^2 = a^2 + b^2$  is the one you should remember. When finding the foci, this form is easy to manipulate.

### Standard Forms of the Equations of a Hyperbola

The **standard form of the equation of a hyperbola** with center at the origin is

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \quad \text{or} \quad \frac{y^2}{a^2} - \frac{x^2}{b^2} = 1.$$

**Figure 9.16(a)** illustrates that for the equation on the left, the transverse axis lies on the  $x$ -axis. **Figure 9.16(b)** illustrates that for the equation on the right, the transverse axis lies on the  $y$ -axis. The vertices are  $a$  units from the center and the foci are  $c$  units from the center. For both equations,  $b^2 = c^2 - a^2$ . Equivalently,  $c^2 = a^2 + b^2$ .

 FIGURE 9.16(a) Transverse axis lies on the  $x$ -axis.

 FIGURE 9.16(b) Transverse axis lies on the  $y$ -axis.

- 1 Locate a hyperbola's vertices and foci.

## GREAT QUESTION!

What's the difference between the equations for locating an ellipse's foci and locating a hyperbola's foci?

Notice the sign difference between the following equations:

Finding an ellipse's foci:

$$c^2 = a^2 - b^2$$

Finding a hyperbola's foci:

$$c^2 = a^2 + b^2.$$

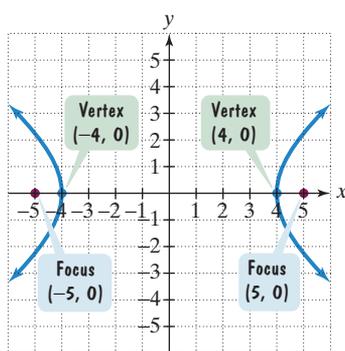

FIGURE 9.17 The graph of

$$\frac{x^2}{16} - \frac{y^2}{9} = 1$$

## GREAT QUESTION!

How can I tell from a hyperbola's equation whether the transverse axis is horizontal or vertical?

When the  $x^2$ -term is preceded by a plus sign, the transverse axis is horizontal. When the  $y^2$ -term is preceded by a plus sign, the transverse axis is vertical.

## Using the Standard Form of the Equation of a Hyperbola

We can use the standard form of the equation of a hyperbola to find its vertices and locate its foci. Because the vertices are  $a$  units from the center, begin by identifying  $a^2$  in the equation. In the standard form of a hyperbola's equation,  **$a^2$  is the number under the variable whose term is preceded by a plus sign (+)**. If the  $x^2$ -term is preceded by a plus sign, the transverse axis lies along the  $x$ -axis. Thus, the vertices are  $a$  units to the left and right of the origin. If the  $y^2$ -term is preceded by a plus sign, the transverse axis lies along the  $y$ -axis. Thus, the vertices are  $a$  units above and below the origin.

We know that the foci are  $c$  units from the center. The substitution that is used to derive the hyperbola's equation,  $c^2 = a^2 + b^2$ , is needed to locate the foci when  $a^2$  and  $b^2$  are known.

### EXAMPLE 1 Finding Vertices and Foci from a Hyperbola's Equation

Find the vertices and locate the foci for each of the following hyperbolas with the given equation:

a.  $\frac{x^2}{16} - \frac{y^2}{9} = 1$       b.  $\frac{y^2}{9} - \frac{x^2}{16} = 1.$

## SOLUTION

Both equations are in standard form. We begin by identifying  $a^2$  and  $b^2$  in each equation.

a. The first equation is in the form  $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1.$

$$\frac{x^2}{16} - \frac{y^2}{9} = 1$$

$a^2 = 16.$  This is the denominator of the term preceded by a plus sign.

$b^2 = 9.$  This is the denominator of the term preceded by a minus sign.

Because the  $x^2$ -term is preceded by a plus sign, the transverse axis lies along the  $x$ -axis. Thus, the vertices are  $a$  units to the *left* and *right* of the origin. Based on the standard form of the equation, we know the vertices are  $(-a, 0)$  and  $(a, 0)$ . Because  $a^2 = 16$ ,  $a = 4$ . Thus, the vertices are  $(-4, 0)$  and  $(4, 0)$ , shown in **Figure 9.17**.

We use  $c^2 = a^2 + b^2$  to find the foci, which are located at  $(-c, 0)$  and  $(c, 0)$ . We know that  $a^2 = 16$  and  $b^2 = 9$ ; we need to find  $c^2$  in order to find  $c$ .

$$c^2 = a^2 + b^2 = 16 + 9 = 25$$

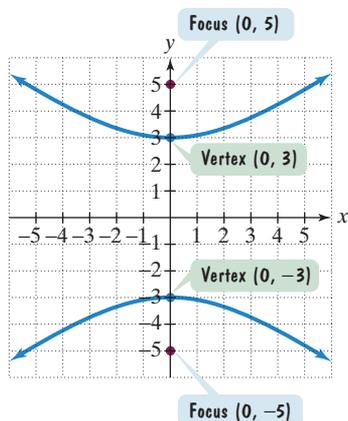

Because  $c^2 = 25$ ,  $c = 5$ . The foci are located at  $(-5, 0)$  and  $(5, 0)$ . They are shown in **Figure 9.17**.

b. The second given equation is in the form  $\frac{y^2}{a^2} - \frac{x^2}{b^2} = 1.$

$$\frac{y^2}{9} - \frac{x^2}{16} = 1$$

$a^2 = 9.$  This is the denominator of the term preceded by a plus sign.

$b^2 = 16.$  This is the denominator of the term preceded by a minus sign.

**FIGURE 9.18** The graph of  $\frac{y^2}{9} - \frac{x^2}{16} = 1$

Because the  $y^2$ -term in  $\frac{y^2}{9} - \frac{x^2}{16} = 1$  is preceded by a plus sign, the transverse axis lies along the  $y$ -axis. Thus, the vertices are  $a$  units *above* and *below* the origin. Based on the standard form of the equation, we know the vertices are  $(0, -a)$  and  $(0, a)$ . Because  $a^2 = 9$ ,  $a = 3$ . Thus, the vertices are  $(0, -3)$  and  $(0, 3)$ , shown in **Figure 9.18**.

We use  $c^2 = a^2 + b^2$  to find the foci, which are located at  $(0, -c)$  and  $(0, c)$ .

$$c^2 = a^2 + b^2 = 9 + 16 = 25$$

Because  $c^2 = 25$ ,  $c = 5$ . The foci are located at  $(0, -5)$  and  $(0, 5)$ . They are shown in **Figure 9.18**. ...

**Check Point 1** Find the vertices and locate the foci for each of the following hyperbolas with the given equation:

a.  $\frac{x^2}{25} - \frac{y^2}{16} = 1$       b.  $\frac{y^2}{25} - \frac{x^2}{16} = 1$ .

In Example 1, we used equations of hyperbolas to find their foci and vertices. In the next example, we reverse this procedure.

### EXAMPLE 2 Finding the Equation of a Hyperbola from Its Foci and Vertices

Find the standard form of the equation of a hyperbola with foci at  $(0, -3)$  and  $(0, 3)$  and vertices  $(0, -2)$  and  $(0, 2)$ , shown in **Figure 9.19**.

#### SOLUTION

Because the foci are located at  $(0, -3)$  and  $(0, 3)$ , on the  $y$ -axis, the transverse axis lies on the  $y$ -axis. The center of the hyperbola is midway between the foci, located at  $(0, 0)$ . Thus, the form of the equation is

$$\frac{y^2}{a^2} - \frac{x^2}{b^2} = 1.$$

We need to determine the values for  $a^2$  and  $b^2$ . The distance from the center,  $(0, 0)$ , to either vertex,  $(0, -2)$  or  $(0, 2)$ , is 2, so  $a = 2$ .

$$\frac{y^2}{2^2} - \frac{x^2}{b^2} = 1 \quad \text{or} \quad \frac{y^2}{4} - \frac{x^2}{b^2} = 1$$

We must still find  $b^2$ . The distance from the center,  $(0, 0)$ , to either focus,  $(0, -3)$  or  $(0, 3)$ , is 3. Thus,  $c = 3$ . Using  $c^2 = a^2 + b^2$ , we have

$$3^2 = 2^2 + b^2$$

and

$$b^2 = 3^2 - 2^2 = 9 - 4 = 5.$$

Substituting 5 for  $b^2$  in  $\frac{y^2}{4} - \frac{x^2}{b^2} = 1$  gives us the standard form of the hyperbola's equation. The equation is

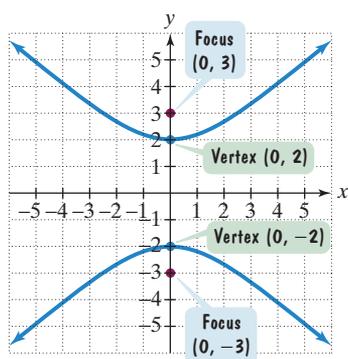

$$\frac{y^2}{4} - \frac{x^2}{5} = 1. \quad \dots$$

**Check Point 2** Find the standard form of the equation of a hyperbola with foci at  $(0, -5)$  and  $(0, 5)$  and vertices  $(0, -3)$  and  $(0, 3)$ .

### The Asymptotes of a Hyperbola

As  $x$  and  $y$  get larger, the two branches of the graph of a hyperbola approach a pair of intersecting straight lines, called **asymptotes**. The asymptotes pass through the center of the hyperbola and are helpful in graphing hyperbolas.

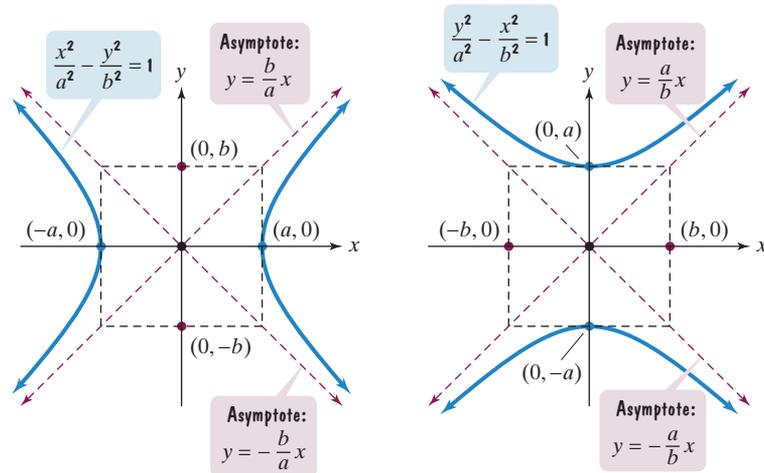

## 2 Write equations of hyperbolas in standard form.

**FIGURE 9.19**

**Figure 9.20** shows the asymptotes for the graphs of hyperbolas centered at the origin. The asymptotes pass through the corners of a rectangle. Note that the dimensions of this rectangle are  $2a$  by  $2b$ . The line segment of length  $2b$  is the **conjugate axis** of the hyperbola and is perpendicular to the transverse axis through the center of the hyperbola.

**FIGURE 9.20** Asymptotes of a hyperbola

### The Asymptotes of a Hyperbola Centered at the Origin

The hyperbola  $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$  has a horizontal transverse axis and two asymptotes

$$y = \frac{b}{a}x \quad \text{and} \quad y = -\frac{b}{a}x.$$

The hyperbola  $\frac{y^2}{a^2} - \frac{x^2}{b^2} = 1$  has a vertical transverse axis and two asymptotes

$$y = \frac{a}{b}x \quad \text{and} \quad y = -\frac{a}{b}x.$$

Why are  $y = \pm \frac{b}{a}x$  the asymptotes for a hyperbola whose transverse axis is horizontal? The proof can be found in the appendix.

- 3** Graph hyperbolas centered at the origin.

### Graphing Hyperbolas Centered at the Origin

Hyperbolas are graphed using vertices and asymptotes.

#### Graphing Hyperbolas

1. Locate the vertices.
2. Use dashed lines to draw the rectangle centered at the origin with sides parallel to the axes, crossing one axis at  $\pm a$  and the other at  $\pm b$ .
3. Use dashed lines to draw the diagonals of this rectangle and extend them to obtain the asymptotes.
4. Draw the two branches of the hyperbola by starting at each vertex and approaching the asymptotes.

**EXAMPLE 3** Graphing a Hyperbola

Graph and locate the foci:  $\frac{x^2}{25} - \frac{y^2}{16} = 1$ . What are the equations of the asymptotes?

**SOLUTION**

**Step 1 Locate the vertices.** The given equation is in the form  $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ , with  $a^2 = 25$  and  $b^2 = 16$ .

$$\frac{x^2}{25} - \frac{y^2}{16} = 1$$

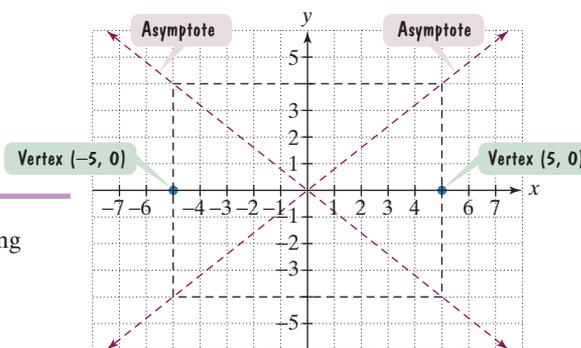

$a^2 = 25$        $b^2 = 16$

Based on the standard form of the equation with the transverse axis on the  $x$ -axis, we know that the vertices are  $(-a, 0)$  and  $(a, 0)$ . Because  $a^2 = 25$ ,  $a = 5$ . Thus, the vertices are  $(-5, 0)$  and  $(5, 0)$ , shown in **Figure 9.21**.

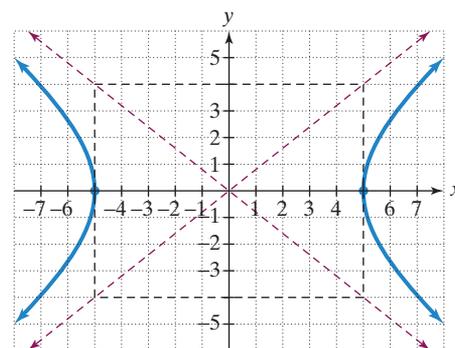

**Step 2 Draw a rectangle.** Because  $a^2 = 25$  and  $b^2 = 16$ ,  $a = 5$  and  $b = 4$ . We construct a rectangle to find the asymptotes, using  $-5$  and  $5$  on the  $x$ -axis (the vertices are located here) and  $-4$  and  $4$  on the  $y$ -axis. The rectangle passes through these four points, shown using dashed lines in **Figure 9.21**.

**Step 3 Draw extended diagonals for the rectangle to obtain the asymptotes.** We draw dashed lines through the opposite corners of the rectangle, shown in **Figure 9.21**, to obtain the graph of the asymptotes. Based on the standard form of the hyperbola's equation, the equations for these asymptotes are

$$y = \pm \frac{b}{a}x \quad \text{or} \quad y = \pm \frac{4}{5}x.$$

**FIGURE 9.21** Preparing to graph  $\frac{x^2}{25} - \frac{y^2}{16} = 1$

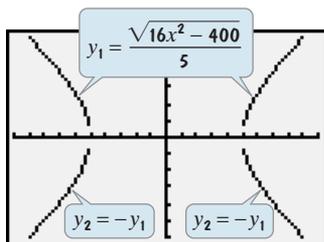

**FIGURE 9.22** The graph of  $\frac{x^2}{25} - \frac{y^2}{16} = 1$

**TECHNOLOGY**

Graph  $\frac{x^2}{25} - \frac{y^2}{16} = 1$  by solving for  $y$ :

$$y_1 = \frac{\sqrt{16x^2 - 400}}{5}$$

$$y_2 = -\frac{\sqrt{16x^2 - 400}}{5} = -y_1.$$

$[-10, 10, 1]$  by  $[-6, 6, 1]$

**Step 4 Draw the two branches of the hyperbola by starting at each vertex and approaching the asymptotes.** The hyperbola is shown in **Figure 9.22**.

We now consider the foci, located at  $(-c, 0)$  and  $(c, 0)$ . We find  $c$  using  $c^2 = a^2 + b^2$ .

$$c^2 = 25 + 16 = 41$$

Because  $c^2 = 41$ ,  $c = \sqrt{41}$ . The foci are located at  $(-\sqrt{41}, 0)$  and  $(\sqrt{41}, 0)$ , approximately  $(-6.4, 0)$  and  $(6.4, 0)$ . ●●●

**Check Point 3** Graph and locate the foci:  $\frac{x^2}{36} - \frac{y^2}{9} = 1$ . What are the equations of the asymptotes?

**EXAMPLE 4** Graphing a Hyperbola

Graph and locate the foci:  $9y^2 - 4x^2 = 36$ . What are the equations of the asymptotes?

**SOLUTION**

We begin by writing the equation in standard form. The right side should be 1, so we divide both sides by 36.

$$\frac{9y^2}{36} - \frac{4x^2}{36} = \frac{36}{36}$$

$$\frac{y^2}{4} - \frac{x^2}{9} = 1 \quad \text{Simplify. The right side is now 1.}$$

Now we are ready to use our four-step procedure for graphing hyperbolas.

**Step 1 Locate the vertices.** The equation that we obtained is in the form  $\frac{y^2}{a^2} - \frac{x^2}{b^2} = 1$ , with  $a^2 = 4$  and  $b^2 = 9$ .

$$\frac{y^2}{4} - \frac{x^2}{9} = 1$$

$a^2 = 4$                        $b^2 = 9$

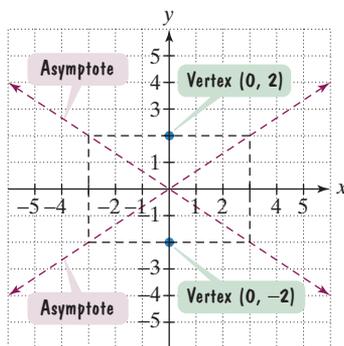

Based on the standard form of the equation with the transverse axis on the  $y$ -axis, we know that the vertices are  $(0, -a)$  and  $(0, a)$ . Because  $a^2 = 4$ ,  $a = 2$ . Thus, the vertices are  $(0, -2)$  and  $(0, 2)$ , shown in **Figure 9.23**.

**Step 2 Draw a rectangle.** Because  $a^2 = 4$  and  $b^2 = 9$ ,  $a = 2$  and  $b = 3$ . We construct a rectangle to find the asymptotes, using  $-2$  and  $2$  on the  $y$ -axis (the vertices are located here) and  $-3$  and  $3$  on the  $x$ -axis. The rectangle passes through these four points, shown using dashed lines in **Figure 9.23**.

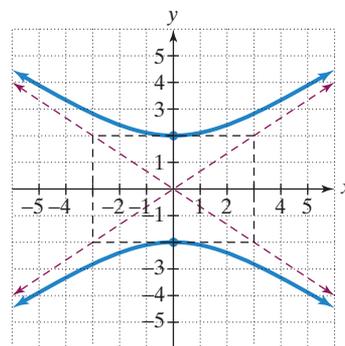

**Step 3 Draw extended diagonals of the rectangle to obtain the asymptotes.** We draw dashed lines through the opposite corners of the rectangle, shown in **Figure 9.23**, to obtain the graph of the asymptotes. Based on the standard form of the hyperbola's equation, the equations of these asymptotes are

$$y = \pm \frac{a}{b}x \quad \text{or} \quad y = \pm \frac{2}{3}x.$$

**Step 4 Draw the two branches of the hyperbola by starting at each vertex and approaching the asymptotes.** The hyperbola is shown in **Figure 9.24**.

**FIGURE 9.23** Preparing to graph  $\frac{y^2}{4} - \frac{x^2}{9} = 1$

**FIGURE 9.24** The graph of  $\frac{y^2}{4} - \frac{x^2}{9} = 1$

We now consider the foci, located at  $(0, -c)$  and  $(0, c)$ . We find  $c$  using  $c^2 = a^2 + b^2$ .

$$c^2 = 4 + 9 = 13$$

Because  $c^2 = 13$ ,  $c = \sqrt{13}$ . The foci are located at  $(0, -\sqrt{13})$  and  $(0, \sqrt{13})$ , approximately  $(0, -3.6)$  and  $(0, 3.6)$ . ●●●

 **Check Point 4** Graph and locate the foci:  $y^2 - 4x^2 = 4$ . What are the equations of the asymptotes?

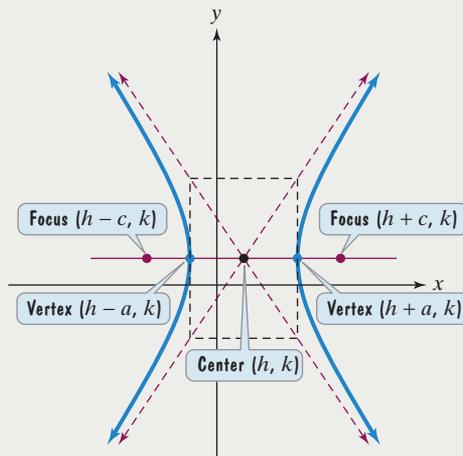

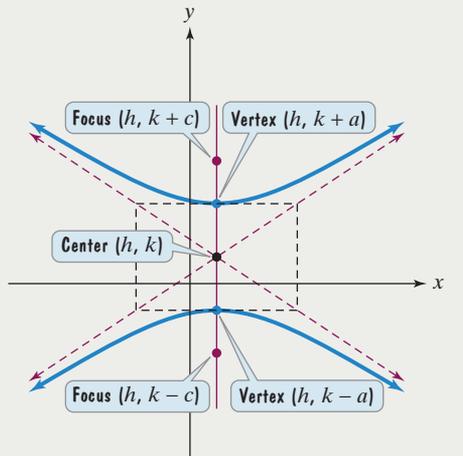

- 4** Graph hyperbolas not centered at the origin.

### Translations of Hyperbolas

The graph of a hyperbola can be centered at  $(h, k)$ , rather than at the origin. Horizontal and vertical translations are accomplished by replacing  $x$  with  $x - h$  and  $y$  with  $y - k$  in the standard form of the hyperbola's equation.

**Table 9.2** gives the standard forms of equations of hyperbolas centered at  $(h, k)$  and shows their graphs.

**Table 9.2** Standard Forms of Equations of Hyperbolas Centered at  $(h, k)$

Equation	Center	Transverse Axis	Vertices	Graph
$\frac{(x - h)^2}{a^2} - \frac{(y - k)^2}{b^2} = 1$ <p>Vertices are <math>a</math> units right and <math>a</math> units left of center.</p> <p>Foci are <math>c</math> units right and <math>c</math> units left of center, where <math>c^2 = a^2 + b^2</math>.</p>	$(h, k)$	Parallel to the $x$ -axis; horizontal	$(h - a, k)$ $(h + a, k)$	
$\frac{(y - k)^2}{a^2} - \frac{(x - h)^2}{b^2} = 1$ <p>Vertices are <math>a</math> units above and <math>a</math> units below the center.</p> <p>Foci are <math>c</math> units above and <math>c</math> units below the center, where <math>c^2 = a^2 + b^2</math>.</p>	$(h, k)$	Parallel to the $y$ -axis; vertical	$(h, k - a)$ $(h, k + a)$	

### EXAMPLE 5 Graphing a Hyperbola Centered at $(h, k)$

Graph:  $\frac{(x - 2)^2}{16} - \frac{(y - 3)^2}{9} = 1$ . Where are the foci located? What are the equations of the asymptotes?

## SOLUTION

In order to graph the hyperbola, we need to know its center,  $(h, k)$ . In the standard forms of equations centered at  $(h, k)$ ,  $h$  is the number subtracted from  $x$  and  $k$  is the number subtracted from  $y$ .

$$\frac{(x - 2)^2}{16} - \frac{(y - 3)^2}{9} = 1$$

This is  $(x - h)^2$ , with  $h = 2$ .      This is  $(y - k)^2$ , with  $k = 3$ .

We see that  $h = 2$  and  $k = 3$ . Thus, the center of the hyperbola,  $(h, k)$ , is  $(2, 3)$ . We can graph the hyperbola by using vertices, asymptotes, and our four-step graphing procedure.

**Step 1 Locate the vertices.** To do this, we must identify  $a^2$ .

$$\frac{(x - 2)^2}{16} - \frac{(y - 3)^2}{9} = 1 \quad \text{The form of this equation is } \frac{(x - h)^2}{a^2} - \frac{(y - k)^2}{b^2} = 1.$$

$a^2 = 16$        $b^2 = 9$

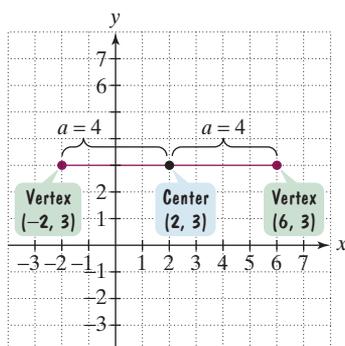

FIGURE 9.25 Locating a hyperbola's center and vertices

Based on the standard form of the equation with a horizontal transverse axis, the vertices are  $a$  units to the left and right of the center. Because  $a^2 = 16$ ,  $a = 4$ . This means that the vertices are 4 units to the left and right of the center,  $(2, 3)$ . Four units to the left of  $(2, 3)$  puts one vertex at  $(2 - 4, 3)$ , or  $(-2, 3)$ . Four units to the right of  $(2, 3)$  puts the other vertex at  $(2 + 4, 3)$ , or  $(6, 3)$ . The vertices are shown in **Figure 9.25**.

**Step 2 Draw a rectangle.** Because  $a^2 = 16$  and  $b^2 = 9$ ,  $a = 4$  and  $b = 3$ . The rectangle passes through points that are 4 units to the right and left of the center (the vertices are located here) and 3 units above and below the center. The rectangle is shown using dashed lines in **Figure 9.26**.

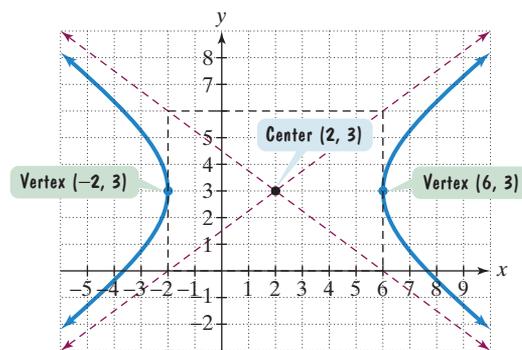

FIGURE 9.26 The graph of  $\frac{(x - 2)^2}{16} - \frac{(y - 3)^2}{9} = 1$

**Step 3 Draw extended diagonals of the rectangle to obtain the asymptotes.** We draw dashed lines through the opposite corners of the rectangle, shown in **Figure 9.26**, to obtain the graph of the asymptotes. The equations of the asymptotes of the unshifted hyperbola  $\frac{x^2}{16} - \frac{y^2}{9} = 1$  are  $y = \pm \frac{b}{a}x$ , or  $y = \pm \frac{3}{4}x$ . Thus, the asymptotes for the hyperbola that is shifted two units to the right and three units up, namely,

$$\frac{(x - 2)^2}{16} - \frac{(y - 3)^2}{9} = 1$$

have equations that can be expressed as

$$y - 3 = \pm \frac{3}{4}(x - 2).$$

**Step 4 Draw the two branches of the hyperbola by starting at each vertex and approaching the asymptotes.** The hyperbola is shown in **Figure 9.26**.

We now consider the foci, located  $c$  units to the right and left of the center. We find  $c$  using  $c^2 = a^2 + b^2$ .

$$c^2 = 16 + 9 = 25$$

Because  $c^2 = 25$ ,  $c = 5$ . This means that the foci are 5 units to the left and right of the center,  $(2, 3)$ . Five units to the left of  $(2, 3)$  puts one focus at  $(2 - 5, 3)$ , or  $(-3, 3)$ . Five units to the right of  $(2, 3)$  puts the other focus at  $(2 + 5, 3)$ , or  $(7, 3)$ . ●●●

## GREAT QUESTION!

**Do I have to use the equations for the asymptotes of a hyperbola centered at the origin,**

**$y = \pm \frac{b}{a}x$  or  $y = \pm \frac{a}{b}x$ , to determine the equations of the asymptotes when the hyperbola's center is  $(h, k)$ ?**

No. You can also use the point-slope form of a line's equation

$$y - y_1 = m(x - x_1)$$

to find the equations of the asymptotes. The center of the hyperbola,  $(h, k)$ , is a point on each asymptote, so  $x_1 = h$  and

$y_1 = k$ . The slopes,  $m$ , are  $\pm \frac{b}{a}$  for a horizontal transverse axis and  $\pm \frac{a}{b}$  for a vertical transverse axis.

 **Check Point 5** Graph:  $\frac{(x - 3)^2}{4} - \frac{(y - 1)^2}{1} = 1$ . Where are the foci located? What are the equations of the asymptotes?

In our next example, it is necessary to convert the equation of a hyperbola to standard form by completing the square on  $x$  and  $y$ .

**EXAMPLE 6** Graphing a Hyperbola Centered at  $(h, k)$

Graph:  $4x^2 - 24x - 25y^2 + 250y - 489 = 0$ . Where are the foci located? What are the equations of the asymptotes?

**SOLUTION**

We begin by completing the square on  $x$  and  $y$ .

$$4x^2 - 24x - 25y^2 + 250y - 489 = 0$$

$$(4x^2 - 24x) + (-25y^2 + 250y) = 489$$

$$4(x^2 - 6x + \square) - 25(y^2 - 10y + \square) = 489$$

$$4(x^2 - 6x + 9) - 25(y^2 - 10y + 25) = 489 + 36 + (-625)$$

We added  $4 \cdot 9$ , or 36, to the left side.

We added  $-25 \cdot 25$ , or  $-625$ , to the left side.

Add  $36 + (-625)$  to the right side.

$$4(x - 3)^2 - 25(y - 5)^2 = -100$$

$$\frac{4(x - 3)^2}{-100} - \frac{25(y - 5)^2}{-100} = \frac{-100}{-100}$$

$$\frac{(x - 3)^2}{-25} + \frac{(y - 5)^2}{4} = 1$$

This is  $(y - k)^2$ , with  $k = 5$ .

$$\frac{(y - 5)^2}{4} - \frac{(x - 3)^2}{25} = 1$$

This is  $(x - h)^2$ , with  $h = 3$ .

This is the given equation.

Group terms and add 489 to both sides.

Factor out 4 and  $-25$ , respectively, so coefficients of  $x^2$  and  $y^2$  are 1.

Complete each square by adding the square of half the coefficient of  $x$  and  $y$ , respectively.

Factor.

Divide both sides by  $-100$ .

Simplify.

Write the equation in standard form,  $\frac{(y - k)^2}{a^2} - \frac{(x - h)^2}{b^2} = 1$ .

**GREAT QUESTION!**

Shouldn't the center of  $\frac{(y - 5)^2}{4} - \frac{(x - 3)^2}{25} = 1$  be  $(5, 3)$ ?

No. The hyperbola's center is  $(3, 5)$  because the equation shows that 3 is subtracted from  $x$  and 5 is subtracted from  $y$ . Many students tend to read the equation from left to right and get the center backward. The hyperbola's center is *not*  $(5, 3)$ .

We see that  $h = 3$  and  $k = 5$ . Thus, the center of the hyperbola,  $(h, k)$ , is  $(3, 5)$ . Because the  $x^2$ -term is being subtracted, the transverse axis is vertical and the hyperbola opens upward and downward.

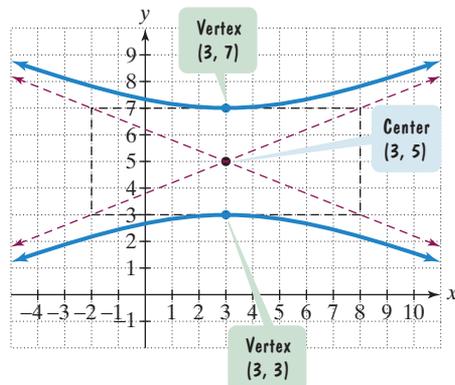

We use our four-step procedure to obtain the graph of

$$\frac{(y - 5)^2}{4} - \frac{(x - 3)^2}{25} = 1.$$

$a^2 = 4$        $b^2 = 25$

**Step 1 Locate the vertices.** Based on the standard form of the equation with a vertical transverse axis, the vertices are  $a$  units above and below the center. Because  $a^2 = 4$ ,  $a = 2$ . This means that the vertices are 2 units above and below the center,  $(3, 5)$ . This puts the vertices at  $(3, 7)$  and  $(3, 3)$ , shown in **Figure 9.27**.

**Step 2 Draw a rectangle.** Because  $a^2 = 4$  and  $b^2 = 25$ ,  $a = 2$  and  $b = 5$ . The rectangle passes through points that are 2 units above and below the center (the vertices are located here) and 5 units to the right and left of the center. The rectangle is shown using dashed lines in **Figure 9.27**.

**FIGURE 9.27** The graph of  $\frac{(y - 5)^2}{4} - \frac{(x - 3)^2}{25} = 1$

**Step 3 Draw extended diagonals of the rectangle to obtain the asymptotes.** We draw dashed lines through the opposite corners of the rectangle, shown in **Figure 9.27**, to obtain the graph of the asymptotes. The equations of the asymptotes of the unshifted hyperbola  $\frac{y^2}{4} - \frac{x^2}{25} = 1$  are  $y = \pm \frac{a}{b}x$ , or  $y = \pm \frac{2}{5}x$ . Thus, the asymptotes for the hyperbola that is shifted three units to the right and five units up, namely,

$$\frac{(y - 5)^2}{4} - \frac{(x - 3)^2}{25} = 1$$

have equations that can be expressed as

$$y - 5 = \pm \frac{2}{5}(x - 3).$$

**Step 4 Draw the two branches of the hyperbola by starting at each vertex and approaching the asymptotes.** The hyperbola is shown in **Figure 9.27**.

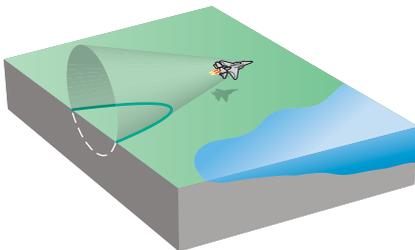

We now consider the foci, located  $c$  units above and below the center,  $(3, 5)$ . We find  $c$  using  $c^2 = a^2 + b^2$ .

$$c^2 = 4 + 25 = 29$$

Because  $c^2 = 29$ ,  $c = \sqrt{29}$ . The foci are located at  $(3, 5 + \sqrt{29})$  and  $(3, 5 - \sqrt{29})$ . ...

 **Check Point 6** Graph:  $4x^2 - 24x - 9y^2 - 90y - 153 = 0$ . Where are the foci located? What are the equations of the asymptotes?

- 5** Solve applied problems involving hyperbolas.

The hyperbolic shape of a sonic boom

### Applications

Hyperbolas have many applications. When a jet flies at a speed greater than the speed of sound, the shock wave that is created is heard as a sonic boom. The wave has the shape of a cone. The shape formed as the cone hits the ground is one branch of a hyperbola.

Halley's Comet, a permanent part of our solar system, travels around the sun in an elliptical orbit. Other comets pass through the solar system only once, following a hyperbolic path with the sun as a focus.

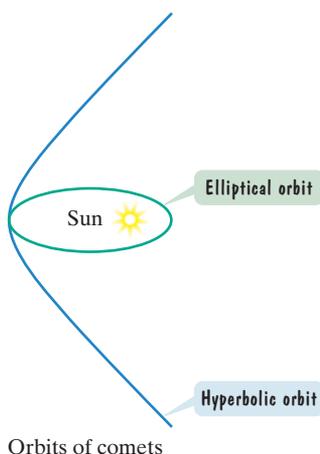

Hyperbolas are of practical importance in fields ranging from architecture to navigation. Cooling towers used in the design for nuclear power plants have cross sections that are both ellipses and hyperbolas. Three-dimensional solids whose cross sections are hyperbolas are used in some rather unique architectural creations, including the TWA building at Kennedy Airport in New York City and the St. Louis Science Center Planetarium.

### EXAMPLE 7 An Application Involving Hyperbolas

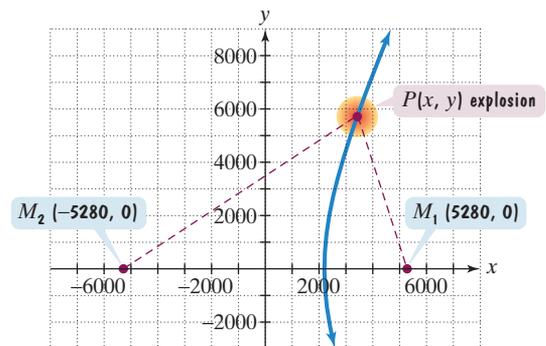

An explosion is recorded by two microphones that are 2 miles apart. Microphone  $M_1$  received the sound 4 seconds before microphone  $M_2$ . Assuming sound travels at 1100 feet per second, determine the possible locations of the explosion relative to the location of the microphones.

#### SOLUTION

We begin by putting the microphones in a coordinate system. Because 1 mile = 5280 feet, we place  $M_1$  5280 feet on a horizontal axis to the right of the origin and  $M_2$  5280 feet on a horizontal axis to the left of the origin. **Figure 9.28** illustrates that the two microphones are 2 miles apart.

Orbits of comets

**FIGURE 9.28** Locating an explosion on the branch of a hyperbola

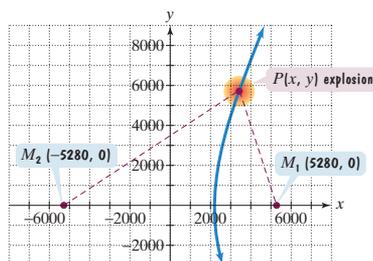

FIGURE 9.28 (repeated) Locating an explosion on the branch of a hyperbola

We know that  $M_2$  received the sound 4 seconds after  $M_1$ . Because sound travels at 1100 feet per second, the difference between the distance from  $P$  to  $M_1$  and the distance from  $P$  to  $M_2$  is 4400 feet. The set of all points  $P$  (or locations of the explosion) satisfying these conditions fits the definition of a hyperbola, with microphones  $M_1$  and  $M_2$  at the foci.

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \quad \text{Use the standard form of the hyperbola's equation. } P(x, y), \text{ the explosion point, lies on this hyperbola. We must find } a^2 \text{ and } b^2.$$

The difference between the distances, represented by  $2a$  in the derivation of the hyperbola's equation, is 4400 feet. Thus,  $2a = 4400$  and  $a = 2200$ .

$$\frac{x^2}{(2200)^2} - \frac{y^2}{b^2} = 1 \quad \text{Substitute 2200 for } a.$$

$$\frac{x^2}{4,840,000} - \frac{y^2}{b^2} = 1 \quad \text{Square 2200.}$$

We must still find  $b^2$ . We know that  $a = 2200$ . The distance from the center,  $(0, 0)$ , to either focus,  $(-5280, 0)$  or  $(5280, 0)$ , is 5280. Thus,  $c = 5280$ . Using  $c^2 = a^2 + b^2$ , we have

$$5280^2 = 2200^2 + b^2$$

and

$$b^2 = 5280^2 - 2200^2 = 23,038,400.$$

The equation of the hyperbola with a microphone at each focus is

$$\frac{x^2}{4,840,000} - \frac{y^2}{23,038,400} = 1. \quad \text{Substitute 23,038,400 for } b^2.$$

We can conclude that the explosion occurred somewhere on the right branch (the branch closer to  $M_1$ ) of the hyperbola given by this equation. ●●●

In Example 7, we determined that the explosion occurred somewhere along one branch of a hyperbola, but not exactly where on the hyperbola. If, however, we had received the sound from another pair of microphones, we could locate the sound along a branch of another hyperbola. The exact location of the explosion would be the point where the two hyperbolas intersect.

**Check Point 7** Rework Example 7 assuming microphone  $M_1$  receives the sound 3 seconds before microphone  $M_2$ .

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- The set of all points in a plane the difference of whose distances from two fixed points is constant is a/an \_\_\_\_\_. The two fixed points are called the \_\_\_\_\_. The line through these points intersects the graph at two points, called the \_\_\_\_\_, which are joined by the \_\_\_\_\_ axis.
- The vertices of  $\frac{x^2}{25} - \frac{y^2}{9} = 1$  are \_\_\_\_\_ and \_\_\_\_\_. The foci are located at \_\_\_\_\_ and \_\_\_\_\_.
- The vertices of  $\frac{y^2}{25} - \frac{x^2}{9} = 1$  are \_\_\_\_\_ and \_\_\_\_\_. The foci are located at \_\_\_\_\_ and \_\_\_\_\_.
- The two branches of the graph of a hyperbola approach a pair of intersecting lines, called \_\_\_\_\_. These intersecting lines pass through the \_\_\_\_\_ of the hyperbola.
- The equation  $9x^2 - 4y^2 = 36$  can be written in standard form by \_\_\_\_\_ both sides by \_\_\_\_\_.
- The equations for the asymptotes of  $\frac{x^2}{4} - \frac{y^2}{9} = 1$  are \_\_\_\_\_ and \_\_\_\_\_.
- The equations for the asymptotes of  $\frac{y^2}{4} - x^2 = 1$  are \_\_\_\_\_ and \_\_\_\_\_.

8. If the center of a hyperbola with a horizontal transverse axis is  $(2, 3)$  and  $a^2 = 25$ , then the coordinates of the vertices are \_\_\_\_\_ and \_\_\_\_\_.
9. The center of  $\frac{(y + 2)^2}{4} - \frac{(x - 7)^2}{36} = 1$  is \_\_\_\_\_.

10. In the equation  $9(x^2 - 8x) - 16(y^2 + 2y) = 16$ , we complete the square on  $x$  by adding \_\_\_\_\_ within the first parentheses. We complete the square on  $y$  by adding \_\_\_\_\_ within the second parentheses. Thus, we must add \_\_\_\_\_ to the right side of the equation.

### EXERCISE SET 9.2

#### Practice Exercises

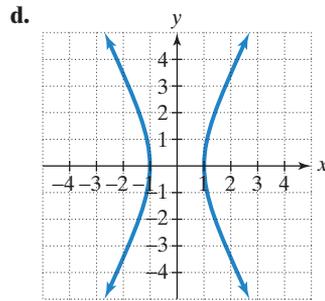

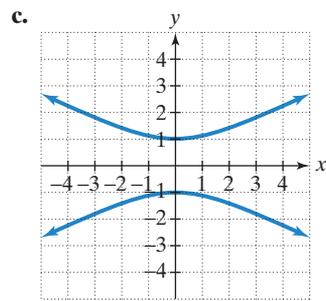

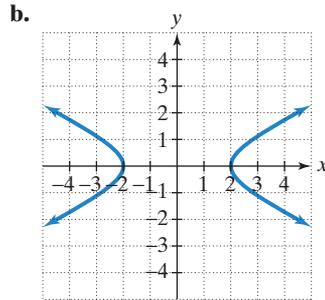

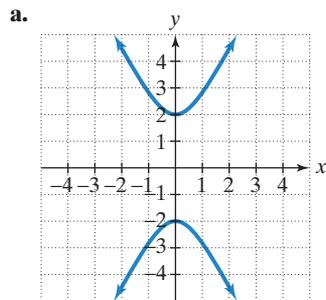

In Exercises 1–4, find the vertices and locate the foci of each hyperbola with the given equation. Then match each equation to one of the graphs that are shown and labeled (a)–(d).

1.  $\frac{x^2}{4} - \frac{y^2}{1} = 1$

2.  $\frac{x^2}{1} - \frac{y^2}{4} = 1$

3.  $\frac{y^2}{4} - \frac{x^2}{1} = 1$

4.  $\frac{y^2}{1} - \frac{x^2}{4} = 1$

In Exercises 5–12, find the standard form of the equation of each hyperbola satisfying the given conditions.

5. Foci:  $(0, -3), (0, 3)$ ; vertices:  $(0, -1), (0, 1)$
6. Foci:  $(0, -6), (0, 6)$ ; vertices:  $(0, -2), (0, 2)$
7. Foci:  $(-4, 0), (4, 0)$ ; vertices:  $(-3, 0), (3, 0)$
8. Foci:  $(-7, 0), (7, 0)$ ; vertices:  $(-5, 0), (5, 0)$
9. Endpoints of transverse axis:  $(0, -6), (0, 6)$ ; asymptote:  $y = 2x$
10. Endpoints of transverse axis:  $(-4, 0), (4, 0)$ ; asymptote:  $y = 2x$
11. Center:  $(4, -2)$ ; Focus:  $(7, -2)$ ; vertex:  $(6, -2)$
12. Center:  $(-2, 1)$ ; Focus:  $(-2, 6)$ ; vertex:  $(-2, 4)$

In Exercises 13–26, use vertices and asymptotes to graph each hyperbola. Locate the foci and find the equations of the asymptotes.

13.  $\frac{x^2}{9} - \frac{y^2}{25} = 1$

14.  $\frac{x^2}{16} - \frac{y^2}{25} = 1$

15.  $\frac{x^2}{100} - \frac{y^2}{64} = 1$

16.  $\frac{x^2}{144} - \frac{y^2}{81} = 1$

17.  $\frac{y^2}{16} - \frac{x^2}{36} = 1$

18.  $\frac{y^2}{25} - \frac{x^2}{64} = 1$

19.  $4y^2 - x^2 = 1$

20.  $9y^2 - x^2 = 1$

21.  $9x^2 - 4y^2 = 36$

22.  $4x^2 - 25y^2 = 100$

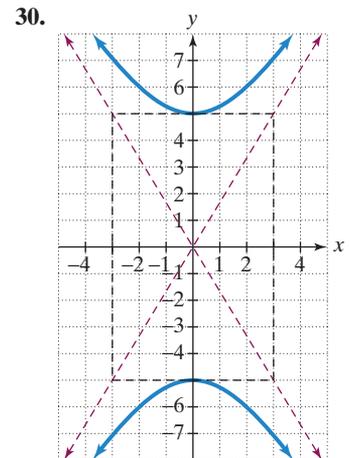

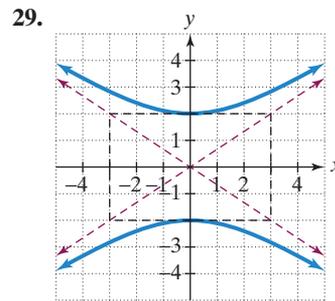

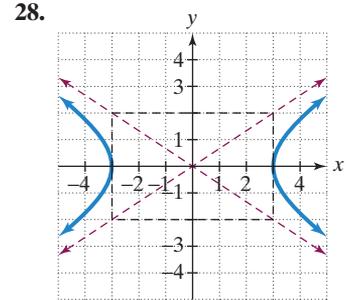

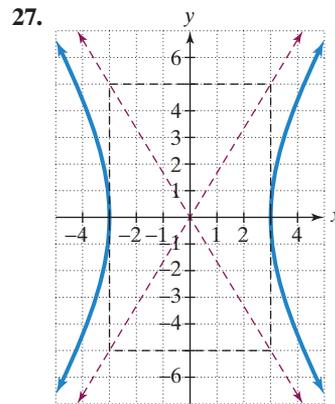

23.  $9y^2 - 25x^2 = 225$

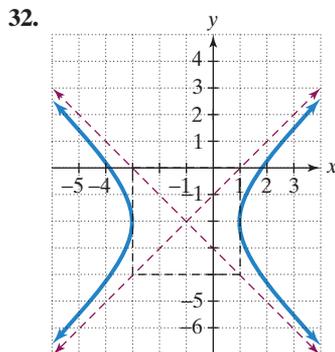

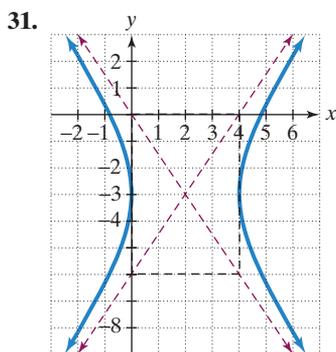

24.  $16y^2 - 9x^2 = 144$

25.  $y = \pm \sqrt{x^2 - 2}$

26.  $y = \pm \sqrt{x^2 - 3}$

In Exercises 27–32, find the standard form of the equation of each hyperbola.

In Exercises 33–42, use the center, vertices, and asymptotes to graph each hyperbola. Locate the foci and find the equations of the asymptotes.

33.  $\frac{(x + 4)^2}{9} - \frac{(y + 3)^2}{16} = 1$       34.  $\frac{(x + 2)^2}{9} - \frac{(y - 1)^2}{25} = 1$

35.  $\frac{(x + 3)^2}{25} - \frac{y^2}{16} = 1$       36.  $\frac{(x + 2)^2}{9} - \frac{y^2}{25} = 1$

37.  $\frac{(y + 2)^2}{4} - \frac{(x - 1)^2}{16} = 1$

38.  $\frac{(y - 2)^2}{36} - \frac{(x + 1)^2}{49} = 1$

39.  $(x - 3)^2 - 4(y + 3)^2 = 4$

40.  $(x + 3)^2 - 9(y - 4)^2 = 9$

41.  $(x - 1)^2 - (y - 2)^2 = 3$

42.  $(y - 2)^2 - (x + 3)^2 = 5$

In Exercises 43–50, convert each equation to standard form by completing the square on  $x$  and  $y$ . Then graph the hyperbola. Locate the foci and find the equations of the asymptotes.

43.  $x^2 - y^2 - 2x - 4y - 4 = 0$

44.  $4x^2 - y^2 + 32x + 6y + 39 = 0$

45.  $16x^2 - y^2 + 64x - 2y + 67 = 0$

46.  $9y^2 - 4x^2 - 18y + 24x - 63 = 0$

47.  $4x^2 - 9y^2 - 16x + 54y - 101 = 0$

48.  $4x^2 - 9y^2 + 8x - 18y - 6 = 0$

49.  $4x^2 - 25y^2 - 32x + 164 = 0$

50.  $9x^2 - 16y^2 - 36x - 64y + 116 = 0$

**Practice Plus**

In Exercises 51–56, graph each relation. Use the relation's graph to determine its domain and range.

51.  $\frac{x^2}{9} - \frac{y^2}{16} = 1$

52.  $\frac{x^2}{25} - \frac{y^2}{4} = 1$

53.  $\frac{x^2}{9} + \frac{y^2}{16} = 1$

54.  $\frac{x^2}{25} + \frac{y^2}{4} = 1$

55.  $\frac{y^2}{16} - \frac{x^2}{9} = 1$

56.  $\frac{y^2}{4} - \frac{x^2}{25} = 1$

In Exercises 57–60, find the solution set for each system by graphing both of the system's equations in the same rectangular coordinate system and finding points of intersection. Check all solutions in both equations.

57.  $\begin{cases} x^2 - y^2 = 4 \\ x^2 + y^2 = 4 \end{cases}$

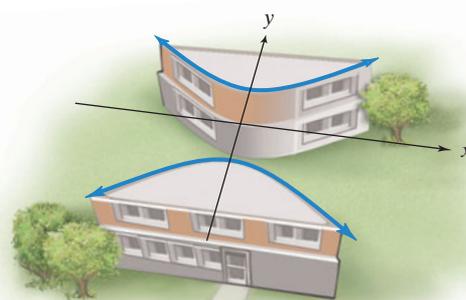

58.  $\begin{cases} x^2 - y^2 = 9 \\ x^2 + y^2 = 9 \end{cases}$

59.  $\begin{cases} 9x^2 + y^2 = 9 \\ y^2 - 9x^2 = 9 \end{cases}$

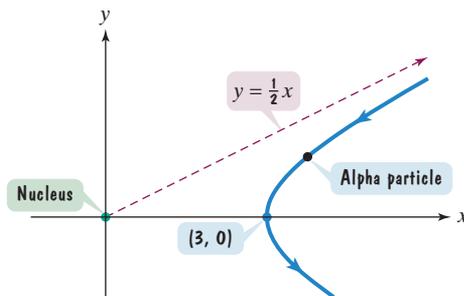

60.  $\begin{cases} 4x^2 + y^2 = 4 \\ y^2 - 4x^2 = 4 \end{cases}$

**Application Exercises**

- An explosion is recorded by two microphones that are 1 mile apart. Microphone  $M_1$  received the sound 2 seconds before microphone  $M_2$ . Assuming sound travels at 1100 feet per second, determine the possible locations of the explosion relative to the location of the microphones.
- Radio towers  $A$  and  $B$ , 200 kilometers apart, are situated along the coast, with  $A$  located due west of  $B$ . Simultaneous radio signals are sent from each tower to a ship, with the signal from  $B$  received 500 microseconds before the signal from  $A$ .
  - Assuming that the radio signals travel 300 meters per microsecond, determine the equation of the hyperbola on which the ship is located.
  - If the ship lies due north of tower  $B$ , how far out at sea is it?
- An architect designs two houses that are shaped and positioned like a part of the branches of the hyperbola whose equation is  $625y^2 - 400x^2 = 250,000$ , where  $x$  and  $y$  are in yards. How far apart are the houses at their closest point?

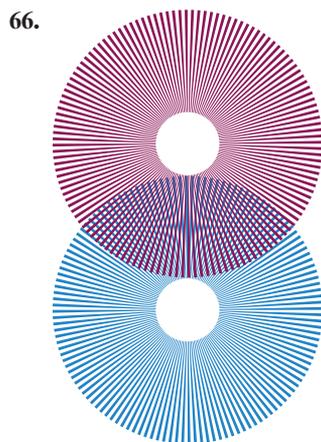

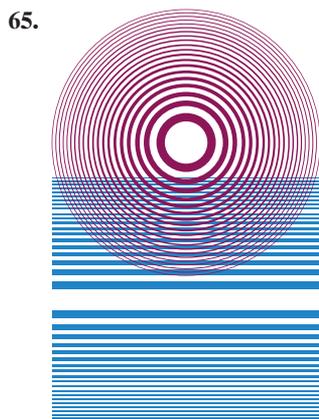

- Scattering experiments, in which moving particles are deflected by various forces, led to the concept of the nucleus of an atom. In 1911, the physicist Ernest Rutherford (1871–1937) discovered that when alpha particles are directed toward the nuclei of gold atoms, they are eventually deflected along hyperbolic paths, illustrated in the figure. If a particle gets as close as 3 units to the nucleus along a hyperbolic path with an asymptote given by  $y = \frac{1}{2}x$ , what is the equation of its path?

Moiré patterns, such as those shown in Exercises 65–66, can appear when two repetitive patterns overlap to produce a third, sometimes unintended, pattern.

- a. In each exercise, use the name of a conic section to describe the moiré pattern.  
 b. Select one of the following equations that can possibly describe a conic section within the moiré pattern:

$$x^2 + y^2 = 1; \quad x^2 - y^2 = 1; \quad x^2 + 4y^2 = 4.$$

### Writing in Mathematics

67. What is a hyperbola?  
 68. Describe how to graph  $\frac{x^2}{9} - \frac{y^2}{1} = 1$ .  
 69. Describe how to locate the foci of the graph of  $\frac{x^2}{9} - \frac{y^2}{1} = 1$ .  
 70. Describe one similarity and one difference between the graphs of  $\frac{x^2}{9} - \frac{y^2}{1} = 1$  and  $\frac{y^2}{9} - \frac{x^2}{1} = 1$ .  
 71. Describe one similarity and one difference between the graphs of  $\frac{x^2}{9} - \frac{y^2}{1} = 1$  and  $\frac{(x-3)^2}{9} - \frac{(y+3)^2}{1} = 1$ .  
 72. How can you distinguish an ellipse from a hyperbola by looking at their equations?  
 73. In 1992, a NASA team began a project called Spaceguard Survey, calling for an international watch for comets that might collide with Earth. Why is it more difficult to detect a possible “doomsday comet” with a hyperbolic orbit than one with an elliptical orbit?

### Technology Exercises

74. Use a graphing utility to graph any five of the hyperbolas that you graphed by hand in Exercises 13–26.  
 75. Use a graphing utility to graph any three of the hyperbolas that you graphed by hand in Exercises 33–42. First solve the given equation for  $y$  by using the square root property. Enter each of the two resulting equations to produce each branch of the hyperbola.  
 76. Use a graphing utility to graph any one of the hyperbolas that you graphed by hand in Exercises 43–50. Write the equation as a quadratic equation in  $y$  and use the quadratic formula to solve for  $y$ . Enter each of the two resulting equations to produce each branch of the hyperbola.

77. Use a graphing utility to graph  $\frac{x^2}{4} - \frac{y^2}{9} = 0$ . Is the graph a hyperbola? In general, what is the graph of  $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 0$ ?  
 78. Graph  $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$  and  $\frac{x^2}{a^2} - \frac{y^2}{b^2} = -1$  in the same viewing rectangle for values of  $a^2$  and  $b^2$  of your choice. Describe the relationship between the two graphs.  
 79. Write  $4x^2 - 6xy + 2y^2 - 3x + 10y - 6 = 0$  as a quadratic equation in  $y$  and then use the quadratic formula to express  $y$  in terms of  $x$ . Graph the resulting two equations using a graphing utility in a  $[-50, 70, 10]$  by  $[-30, 50, 10]$  viewing rectangle. What effect does the  $xy$ -term have on the graph of the resulting hyperbola? What problems would you encounter if you attempted to write the given equation in standard form by completing the square?  
 80. Graph  $\frac{x^2}{16} - \frac{y^2}{9} = 1$  and  $\frac{x|x|}{16} - \frac{y|y|}{9} = 1$  in the same viewing rectangle. Explain why the graphs are not the same.

### Critical Thinking Exercises

**Make Sense?** In Exercises 81–84, determine whether each statement makes sense or does not make sense, and explain your reasoning.

81. I changed the addition in an ellipse’s equation to subtraction and this changed its elongation from horizontal to vertical.  
 82. I noticed that the definition of a hyperbola closely resembles that of an ellipse in that it depends on the distances between a set of points in a plane to two fixed points, the foci.  
 83. I graphed a hyperbola centered at the origin that had  $y$ -intercepts but no  $x$ -intercepts.  
 84. I graphed a hyperbola centered at the origin that was symmetric with respect to the  $x$ -axis and also symmetric with respect to the  $y$ -axis.

In Exercises 85–88, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

85. If one branch of a hyperbola is removed from a graph, then the branch that remains must define  $y$  as a function of  $x$ .  
 86. All points on the asymptotes of a hyperbola also satisfy the hyperbola’s equation.  
 87. The graph of  $\frac{x^2}{9} - \frac{y^2}{4} = 1$  does not intersect the line  $y = -\frac{2}{3}x$ .  
 88. Two different hyperbolas can never share the same asymptotes.  
 89. What happens to the shape of the graph of  $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$  as  $\frac{c}{a} \rightarrow \infty$ , where  $c^2 = a^2 + b^2$ ?  
 90. Find the standard form of the equation of the hyperbola with vertices  $(5, -6)$  and  $(5, 6)$ , passing through  $(0, 9)$ .  
 91. Find the equation of a hyperbola whose asymptotes are perpendicular.

## Preview Exercises

Exercises 92–94 will help you prepare for the material covered in the next section.

In Exercises 92–93, graph each parabola with the given equation.

92.  $y = x^2 + 4x - 5$

93.  $y = -3(x - 1)^2 + 2$

94. Isolate the terms involving  $y$  on the left side of the equation:

$$y^2 + 2y + 12x - 23 = 0.$$

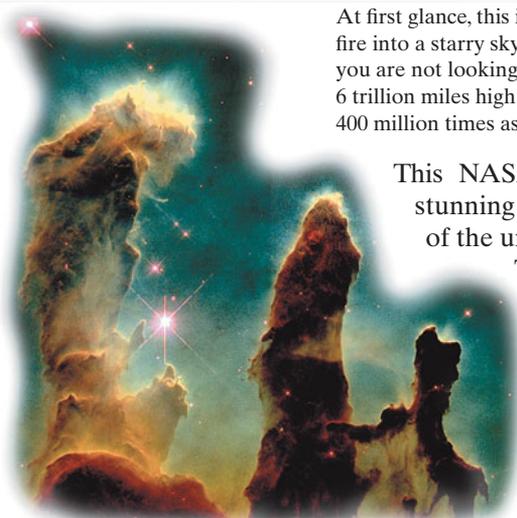

Then write the equation in an equivalent form by completing the square on the left side.

## SECTION 9.3

## The Parabola

## Objectives

- 1 Graph parabolas with vertices at the origin.
- 2 Write equations of parabolas in standard form.
- 3 Graph parabolas with vertices not at the origin.
- 4 Solve applied problems involving parabolas.

At first glance, this image looks like columns of smoke rising from a fire into a starry sky. Those are, indeed, stars in the background, but you are not looking at ordinary smoke columns. These stand almost 6 trillion miles high and are 7000 light-years from Earth—more than 400 million times as far away as the sun.

This NASA photograph is one of a series of stunning images captured from the ends of the universe by the Hubble Space Telescope.

The image shows infant star systems the size of our solar system emerging from the gas and dust that shrouded their creation. Using a parabolic mirror that is 94.5 inches in diameter, the Hubble has provided answers to many of the profound mysteries of the cosmos: How big and how old is the universe? How did the galaxies

come to exist? Do other Earth-like planets orbit other sun-like stars? In this section, we study parabolas and their applications, including parabolic shapes that gather distant rays of light and focus them into spectacular images.

## Definition of a Parabola

In Chapter 2, we studied parabolas, viewing them as graphs of quadratic functions in the form

$$y = a(x - h)^2 + k \quad \text{or} \quad y = ax^2 + bx + c.$$

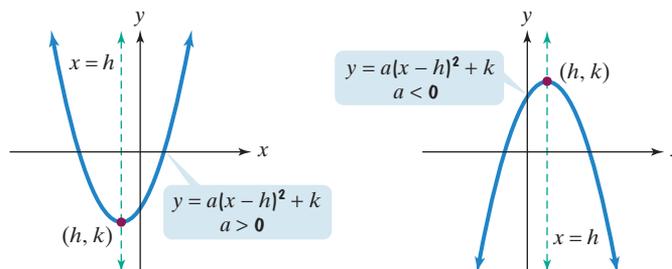

## GREAT QUESTION!

What should I already know about graphing parabolas?

Here's a brief summary:

**Graphing  $y = a(x - h)^2 + k$  and  $y = ax^2 + bx + c$**

1. If  $a > 0$ , the graph opens upward. If  $a < 0$ , the graph opens downward.
2. The vertex of  $y = a(x - h)^2 + k$  is  $(h, k)$ .

3. The  $x$ -coordinate of the vertex of  $y = ax^2 + bx + c$  is  $x = -\frac{b}{2a}$ .

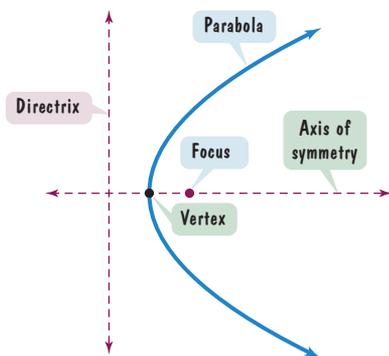

FIGURE 9.29

Parabolas can be given a geometric definition that enables us to include graphs that open to the left or to the right, as well as those that open obliquely. The definitions of ellipses and hyperbolas involved two fixed points, the foci. By contrast, the definition of a parabola is based on one point and a line.

### Definition of a Parabola

A **parabola** is the set of all points in a plane that are equidistant from a fixed line, the **directrix**, and a fixed point, the **focus**, that is not on the line (see **Figure 9.29**).

In **Figure 9.29**, find the line passing through the focus and perpendicular to the directrix. This is the **axis of symmetry** of the parabola. The point of intersection of the parabola with its axis of symmetry is called the **vertex**. Notice that the vertex is midway between the focus and the directrix.

### Standard Form of the Equation of a Parabola

The rectangular coordinate system enables us to translate a parabola's geometric definition into an algebraic equation. **Figure 9.30** is our starting point for obtaining an equation. We place the focus on the  $x$ -axis at the point  $(p, 0)$ . The directrix has an equation given by  $x = -p$ . The vertex, located midway between the focus and the directrix, is at the origin.

What does the definition of a parabola tell us about the point  $(x, y)$  in **Figure 9.30**? For any point  $(x, y)$  on the parabola, the distance  $d_1$  to the directrix is equal to the distance  $d_2$  to the focus. Thus, the point  $(x, y)$  is on the parabola if and only if

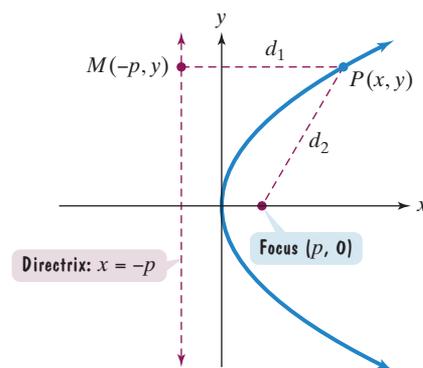

FIGURE 9.30

$$\begin{aligned}
 d_1 &= d_2. \\
 \sqrt{(x + p)^2 + (y - y)^2} &= \sqrt{(x - p)^2 + (y - 0)^2} \\
 (x + p)^2 &= (x - p)^2 + y^2 \\
 x^2 + 2px + p^2 &= x^2 - 2px + p^2 + y^2 \\
 2px &= -2px + y^2 \\
 y^2 &= 4px
 \end{aligned}$$

Use the distance formula.

Square both sides of the equation.

Square  $x + p$  and  $x - p$ .

Subtract  $x^2 + p^2$  from both sides of the equation.

Solve for  $y^2$ .

This last equation is called the **standard form of the equation of a parabola with its vertex at the origin**. There are two such equations, one for a focus on the  $x$ -axis and one for a focus on the  $y$ -axis.

### Standard Forms of the Equations of a Parabola

The **standard form of the equation of a parabola** with vertex at the origin is

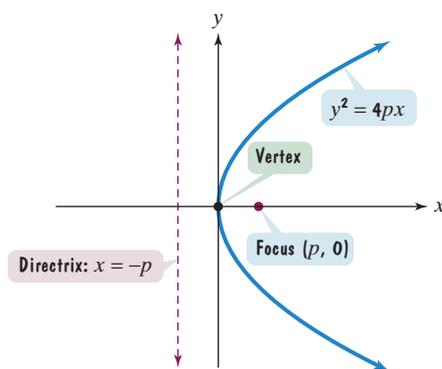

$$y^2 = 4px \quad \text{or} \quad x^2 = 4py.$$

**Figure 9.31(a)** at the top of the next page illustrates that for the equation on the left, the focus is on the  $x$ -axis, which is the axis of symmetry. **Figure 9.31(b)** illustrates that for the equation on the right, the focus is on the  $y$ -axis, which is the axis of symmetry.

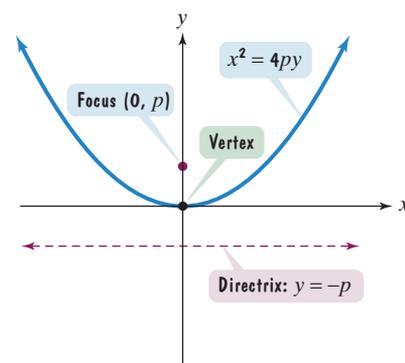

## GREAT QUESTION!

**What is the relationship between the sign of  $p$  and the position of the focus from the vertex?**

It is helpful to think of  $p$  as the *directed distance* from the vertex to the focus. If  $p > 0$ , the focus lies  $p$  units to the right of the vertex or  $p$  units above the vertex. If  $p < 0$ , the focus lies  $|p|$  units to the left of the vertex or  $|p|$  units below the vertex.

**FIGURE 9.31(a)** Parabola with the  $x$ -axis as the axis of symmetry. If  $p > 0$ , the graph opens to the right. If  $p < 0$ , the graph opens to the left.

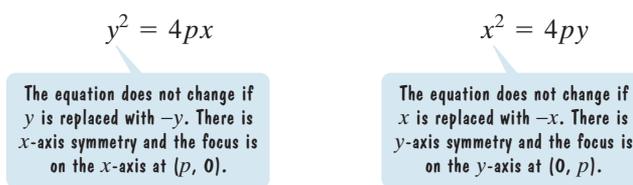

**FIGURE 9.31(b)** Parabola with the  $y$ -axis as the axis of symmetry. If  $p > 0$ , the graph opens upward. If  $p < 0$ , the graph opens downward.

- Graph parabolas with vertices at the origin.

## Using the Standard Form of the Equation of a Parabola

We can use the standard form of the equation of a parabola to find its focus and directrix. Observing the graph's symmetry from its equation is helpful in locating the focus.

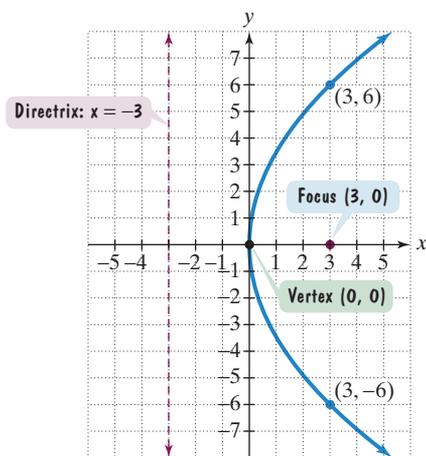

Although the definition of a parabola is given in terms of its focus and its directrix, the focus and directrix are not part of the graph. The vertex, located at the origin, is a point on the graph of  $y^2 = 4px$  and  $x^2 = 4py$ . Example 1 illustrates how you can find two additional points on the parabola.

### EXAMPLE 1 Finding the Focus and Directrix of a Parabola

Find the focus and directrix of the parabola given by  $y^2 = 12x$ . Then graph the parabola.

#### SOLUTION

The given equation,  $y^2 = 12x$ , is in the standard form  $y^2 = 4px$ , so  $4p = 12$ .

**FIGURE 9.32** The graph of  $y^2 = 12x$

No change if  $y$  is replaced with  $-y$ . The parabola has  $x$ -axis symmetry.

$y^2 = 12x$

This is  $4p$ .

We can find both the focus and the directrix by finding  $p$ .

$$4p = 12$$

$$p = 3 \quad \text{Divide both sides by 4.}$$

Because  $p$  is positive, the parabola, with its  $x$ -axis symmetry, opens to the right. The focus is 3 units to the right of the vertex,  $(0, 0)$ .

Focus:  $(p, 0) = (3, 0)$

Directrix:  $x = -p; x = -3$

The focus,  $(3, 0)$ , and directrix,  $x = -3$ , are shown in **Figure 9.32**.

To graph the parabola, we will use two points on the graph that lie directly above and below the focus. Because the focus is at  $(3, 0)$ , substitute 3 for  $x$  in the parabola's equation,  $y^2 = 12x$ .

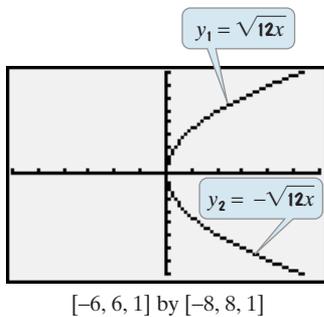

$$\begin{aligned} y^2 &= 12 \cdot 3 && \text{Replace } x \text{ with } 3 \text{ in } y^2 = 12x. \\ y^2 &= 36 && \text{Simplify.} \\ y &= \pm\sqrt{36} = \pm 6 && \text{Apply the square root property.} \end{aligned}$$

The points on the parabola above and below the focus are  $(3, 6)$  and  $(3, -6)$ . The graph is sketched in **Figure 9.32**. •••

 **Check Point 1** Find the focus and directrix of the parabola given by  $y^2 = 8x$ . Then graph the parabola.

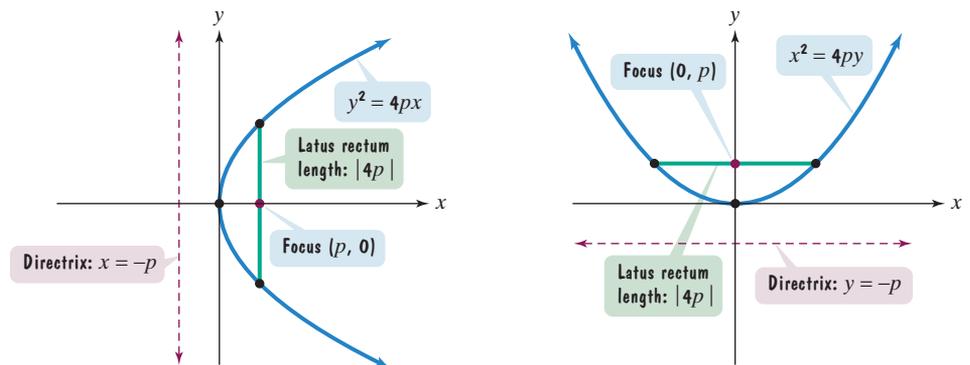

## TECHNOLOGY

We graph  $y^2 = 12x$  with a graphing utility by first solving for  $y$ . The screen shows the graphs of  $y = \sqrt{12x}$  and  $y = -\sqrt{12x}$ . The graph fails the vertical line test. Because  $y^2 = 12x$  is not a function, you were not familiar with this form of the parabola's equation in Chapter 2.

## The Latus Rectum and Graphing Parabolas

The **latus rectum** of a parabola is a line segment that passes through its focus, is parallel to its directrix, and has its endpoints on the parabola. **Figure 9.33** shows that the length of the latus rectum for the graphs of  $y^2 = 4px$  and  $x^2 = 4py$  is  $|4p|$ .

**FIGURE 9.33** Endpoints of the latus rectum are helpful in determining a parabola's "width," or how it opens.

## EXAMPLE 2 Finding the Focus and Directrix of a Parabola

Find the focus and directrix of the parabola given by  $x^2 = -8y$ . Then graph the parabola.

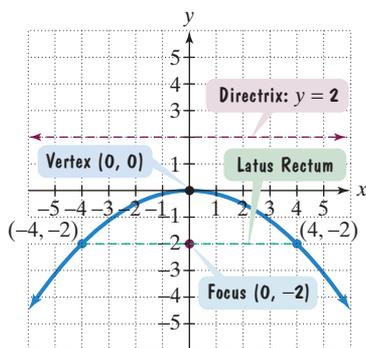

### SOLUTION

The given equation,  $x^2 = -8y$ , is in the standard form  $x^2 = 4py$ , so  $4p = -8$ .

No change if  $x$  is replaced with  $-x$ . The parabola has  $y$ -axis symmetry.

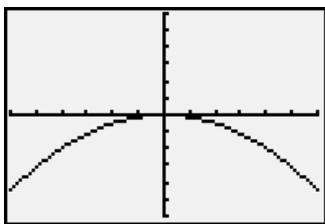

$$x^2 = -8y$$

This is  $4p$ .

 FIGURE 9.34 The graph of  $x^2 = -8y$ 

### TECHNOLOGY

Graph  $x^2 = -8y$  by first solving for  $y$ :  $y = -\frac{x^2}{8}$ . The graph passes the vertical line test. Because  $x^2 = -8y$  is a function, you were familiar with the parabola's alternate algebraic form,  $y = -\frac{1}{8}x^2$ , in Chapter 3. The form is  $y = ax^2 + bx + c$ , with  $a = -\frac{1}{8}$ ,  $b = 0$ , and  $c = 0$ .

$[-6, 6, 1]$  by  $[-6, 6, 1]$

- 2 Write equations of parabolas in standard form.

- 3 Graph parabolas with vertices not at the origin.

We can find both the focus and the directrix by finding  $p$ .

$$\begin{aligned} 4p &= -8 \\ p &= -2 \quad \text{Divide both sides by 4.} \end{aligned}$$

Because  $p$  is negative, the parabola, with its  $y$ -axis symmetry, opens downward. The focus is 2 units below the vertex,  $(0, 0)$ .

$$\begin{aligned} \text{Focus:} & \quad (0, p) = (0, -2) \\ \text{Directrix:} & \quad y = -p; y = 2 \end{aligned}$$

The focus and directrix are shown in **Figure 9.34**.

To graph the parabola, we will use the vertex,  $(0, 0)$ , and the two endpoints of the latus rectum. The length of the latus rectum is

$$|4p| = |4(-2)| = |-8| = 8.$$

Because the graph has  $y$ -axis symmetry, the latus rectum extends 4 units to the left and 4 units to the right of the focus,  $(0, -2)$ . The endpoints of the latus rectum are  $(-4, -2)$  and  $(4, -2)$ . Passing a smooth curve through the vertex and these two points, we sketch the parabola, shown in **Figure 9.34**. ●●●

- Check Point 2** Find the focus and directrix of the parabola given by  $x^2 = -12y$ . Then graph the parabola.

In Examples 1 and 2, we used the equation of a parabola to find its focus and directrix. In the next example, we reverse this procedure.

### EXAMPLE 3 Finding the Equation of a Parabola from Its Focus and Directrix

Find the standard form of the equation of a parabola with focus  $(5, 0)$  and directrix  $x = -5$ , shown in **Figure 9.35**.

#### SOLUTION

The focus is  $(5, 0)$ . Thus, the focus is on the  $x$ -axis. We use the standard form of the equation in which there is  $x$ -axis symmetry, namely,  $y^2 = 4px$ .

We need to determine the value of  $p$ . **Figure 9.35** shows that the focus is 5 units to the right of the vertex,  $(0, 0)$ . Thus,  $p$  is positive and  $p = 5$ . We substitute 5 for  $p$  in  $y^2 = 4px$  to obtain the standard form of the equation of the parabola. The equation is

$$y^2 = 4 \cdot 5x \quad \text{or} \quad y^2 = 20x.$$

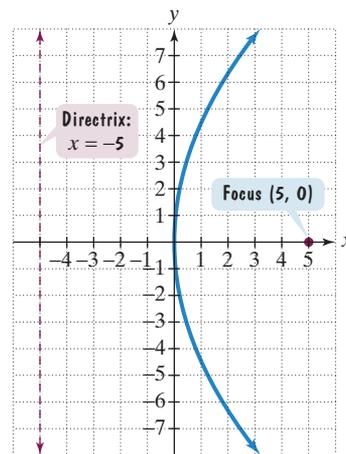

FIGURE 9.35

- Check Point 3** Find the standard form of the equation of a parabola with focus  $(8, 0)$  and directrix  $x = -8$ .

### Translations of Parabolas

The graph of a parabola can have its vertex at  $(h, k)$ , rather than at the origin. Horizontal and vertical translations are accomplished by replacing  $x$  with  $x - h$  and  $y$  with  $y - k$  in the standard form of the parabola's equation.

**Table 9.3** gives the standard forms of equations of parabolas with vertex at  $(h, k)$ . **Figure 9.36** shows their graphs.

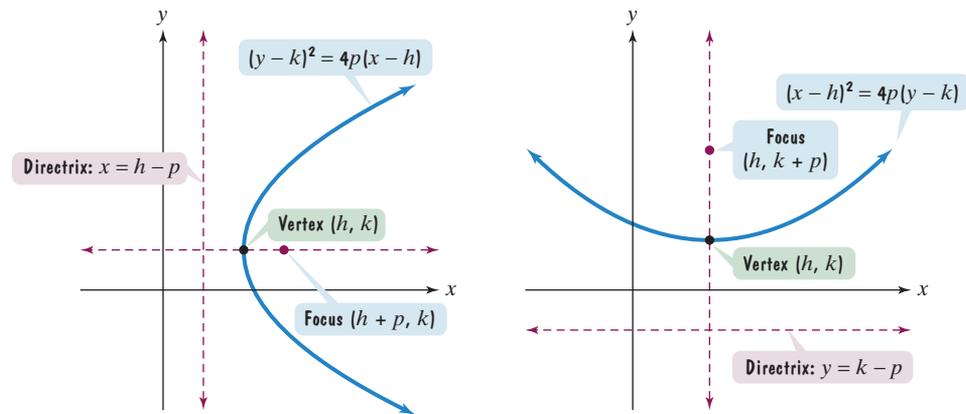

**Table 9.3** Standard Forms of Equations of Parabolas with Vertex at  $(h, k)$

Equation	Vertex	Axis of Symmetry	Focus	Directrix	Description
$(y - k)^2 = 4p(x - h)$	$(h, k)$	Horizontal	$(h + p, k)$	$x = h - p$	If $p > 0$ , opens to the right. If $p < 0$ , opens to the left.
$(x - h)^2 = 4p(y - k)$	$(h, k)$	Vertical	$(h, k + p)$	$y = k - p$	If $p > 0$ , opens upward. If $p < 0$ , opens downward.

## GREAT QUESTION!

What are the main differences between parabolas whose equations contain  $y^2$  and parabolas whose equations contain  $x^2$ ?

If  $y$  is the squared term, there is horizontal symmetry and the parabola's equation is not a function. If  $x$  is the squared term, there is vertical symmetry and the parabola's equation is a function. Continue to think of  $p$  as the directed distance from the vertex,  $(h, k)$ , to the focus.

**FIGURE 9.36** Graphs of parabolas with vertex at  $(h, k)$  and  $p > 0$

The two parabolas shown in **Figure 9.36** illustrate standard forms of equations for  $p > 0$ . If  $p < 0$ , a parabola with a horizontal axis of symmetry will open to the left and the focus will lie to the left of the directrix. If  $p < 0$ , a parabola with a vertical axis of symmetry will open downward and the focus will lie below the directrix.

### EXAMPLE 4 Graphing a Parabola with Vertex at $(h, k)$

Find the vertex, focus, and directrix of the parabola given by

$$(x - 3)^2 = 8(y + 1).$$

Then graph the parabola.

### SOLUTION

In order to find the focus and directrix, we need to know the vertex. In the standard forms of equations with vertex at  $(h, k)$ ,  $h$  is the number subtracted from  $x$  and  $k$  is the number subtracted from  $y$ .

$$(x - 3)^2 = 8(y - (-1))$$

This is  $(x - h)^2$ ,  
with  $h = 3$ .

This is  $y - k$ ,  
with  $k = -1$ .

We see that  $h = 3$  and  $k = -1$ . Thus, the vertex of the parabola is  $(h, k) = (3, -1)$ .

Now that we have the vertex, we can find both the focus and directrix by finding  $p$ .

$$(x - 3)^2 = 8(y + 1) \quad \text{The equation is in the standard form } (x - h)^2 = 4p(y - k). \text{ Because } x \text{ is the squared term, there is vertical symmetry and the parabola's equation is a function.}$$

This is  $4p$ .

Because  $4p = 8$ ,  $p = 2$ . Based on the standard form of the equation, the axis of symmetry is vertical. With a positive value for  $p$  and a vertical axis of symmetry,

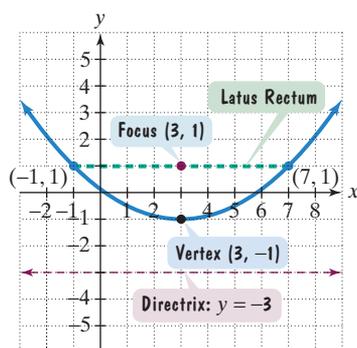

FIGURE 9.37 The graph of  $(x - 3)^2 = 8(y + 1)$

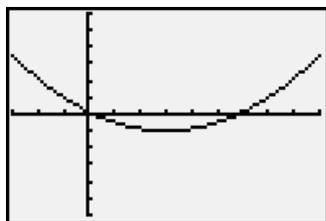

## TECHNOLOGY

Graph  $(x - 3)^2 = 8(y + 1)$  by first solving for  $y$ :

$$\frac{1}{8}(x - 3)^2 = y + 1$$

$$y = \frac{1}{8}(x - 3)^2 - 1.$$

The graph passes the vertical line test. Because  $(x - 3)^2 = 8(y + 1)$  is a function, you were familiar with the parabola's alternate algebraic form,  $y = \frac{1}{8}(x - 3)^2 - 1$ , in Chapter 3. The form is  $y = a(x - h)^2 + k$  with  $a = \frac{1}{8}$ ,  $h = 3$ , and  $k = -1$ .

$[-3, 9, 1]$  by  $[-6, 6, 1]$

the parabola opens upward. Because  $p = 2$ , the focus is located 2 units above the vertex,  $(3, -1)$ . Likewise, the directrix is located 2 units below the vertex.

Focus:  $(h, k + p) = (3, -1 + 2) = (3, 1)$

The vertex,  $(h, k)$ , is  $(3, -1)$ .

The focus is 2 units above the vertex,  $(3, -1)$ .

Directrix:  $y = k - p$   
 $y = -1 - 2 = -3$

The directrix is 2 units below the vertex,  $(3, -1)$ .

Thus, the focus is  $(3, 1)$  and the directrix is  $y = -3$ . They are shown in **Figure 9.37**. To graph the parabola, we will use the vertex,  $(3, -1)$ , and the two endpoints of the latus rectum. The length of the latus rectum is

$$|4p| = |4 \cdot 2| = |8| = 8.$$

Because the graph has vertical symmetry, the latus rectum extends 4 units to the left and 4 units to the right of the focus,  $(3, 1)$ . The endpoints of the latus rectum are  $(3 - 4, 1)$ , or  $(-1, 1)$ , and  $(3 + 4, 1)$ , or  $(7, 1)$ . Passing a smooth curve through the vertex and these two points, we sketch the parabola, shown in **Figure 9.37**. ●●●

 **Check Point 4** Find the vertex, focus, and directrix of the parabola given by  $(x - 2)^2 = 4(y + 1)$ . Then graph the parabola.

In some cases, we need to convert the equation of a parabola to standard form by completing the square on  $x$  or  $y$ , whichever variable is squared. Let's see how this is done.

### EXAMPLE 5 Graphing a Parabola with Vertex at $(h, k)$

Find the vertex, focus, and directrix of the parabola given by

$$y^2 + 2y + 12x - 23 = 0.$$

Then graph the parabola.

### SOLUTION

We convert the given equation to standard form by completing the square on the variable  $y$ . We isolate the terms involving  $y$  on the left side.

$$y^2 + 2y + 12x - 23 = 0$$

This is the given equation.

$$y^2 + 2y = -12x + 23$$

Isolate the terms involving  $y$ .

$$y^2 + 2y + 1 = -12x + 23 + 1$$

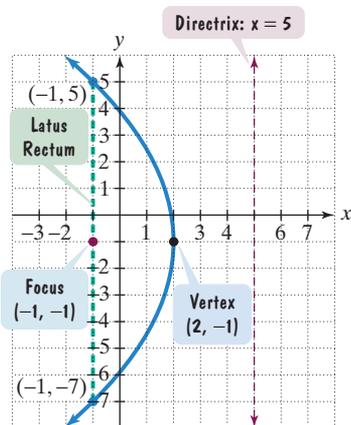

Complete the square by adding the square of half the coefficient of  $y$ .

$$(y + 1)^2 = -12x + 24$$

Factor.

To express the equation  $(y + 1)^2 = -12x + 24$  in the standard form  $(y - k)^2 = 4p(x - h)$ , we factor out  $-12$  on the right. The standard form of the parabola's equation is

$$(y + 1)^2 = -12(x - 2).$$

**FIGURE 9.38** The graph of  $y^2 + 2y + 12x - 23 = 0$ , or  $(y + 1)^2 = -12(x - 2)$

## TECHNOLOGY

Graph  $y^2 + 2y + 12x - 23 = 0$  by solving the equation for  $y$ .

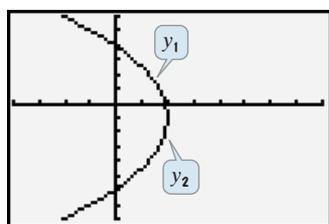

$$y^2 + 2y + (12x - 23) = 0$$

$$a = 1 \quad b = 2 \quad c = 12x - 23$$

Use the quadratic formula to solve for  $y$  and enter the resulting equations.

$$y_1 = \frac{-2 + \sqrt{4 - 4(12x - 23)}}{2}$$

$$y_2 = \frac{-2 - \sqrt{4 - 4(12x - 23)}}{2}$$

$[-4, 8, 1]$  by  $[-8, 6, 1]$

- 4** Solve applied problems involving parabolas.

We use  $(y + 1)^2 = -12(x - 2)$  to identify the vertex,  $(h, k)$ , and the value for  $p$  needed to locate the focus and the directrix.

$$[y - (-1)]^2 = -12(x - 2)$$

This is  $(y - k)^2$ ,  
with  $k = -1$ .

This is  $4p$ .

This is  $x - h$ ,  
with  $h = 2$ .

The equation is in the standard form  $(y - k)^2 = 4p(x - h)$ . Because  $y$  is the squared term, there is horizontal symmetry and the parabola's equation is not a function.

We see that  $h = 2$  and  $k = -1$ . Thus, the vertex of the parabola is  $(h, k) = (2, -1)$ . Because  $4p = -12$ ,  $p = -3$ . Based on the standard form of the equation, the axis of symmetry is horizontal. With a negative value for  $p$  and a horizontal axis of symmetry, the parabola opens to the left. Because  $p = -3$ , the focus is located 3 units to the left of the vertex,  $(2, -1)$ . Likewise, the directrix is located 3 units to the right of the vertex.

$$\text{Focus:} \quad (h + p, k) = (2 + (-3), -1) = (-1, -1)$$

The vertex,  $(h, k)$ ,  
is  $(2, -1)$ .

The focus is 3 units  
to the left of the  
vertex,  $(2, -1)$ .

$$\begin{aligned} \text{Directrix:} \quad x &= h - p \\ x &= 2 - (-3) = 5 \end{aligned}$$

The directrix is 3 units  
to the right of the  
vertex,  $(2, -1)$ .

Thus, the focus is  $(-1, -1)$  and the directrix is  $x = 5$ . They are shown in **Figure 9.38**.

To graph the parabola, we will use the vertex,  $(2, -1)$ , and the two endpoints of the latus rectum. The length of the latus rectum is

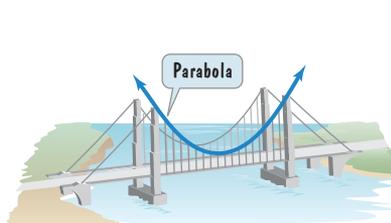

$$|4p| = |4(-3)| = |-12| = 12.$$

Because the graph has horizontal symmetry, the latus rectum extends 6 units above and 6 units below the focus,  $(-1, -1)$ . The endpoints of the latus rectum are  $(-1, -1 + 6)$ , or  $(-1, 5)$ , and  $(-1, -1 - 6)$ , or  $(-1, -7)$ . Passing a smooth curve through the vertex and these two points, we sketch the parabola shown in **Figure 9.38**.

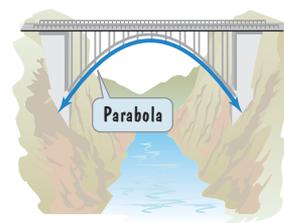

**Check Point 5** Find the vertex, focus, and directrix of the parabola given by  $y^2 + 2y + 4x - 7 = 0$ . Then graph the parabola.

## Applications

Parabolas have many applications. Cables hung between structures to form suspension bridges form parabolas. Arches constructed of steel and concrete, whose main purpose is strength, are usually parabolic in shape.

Suspension bridge

Arch bridge

We have seen that comets in our solar system travel in orbits that are ellipses and hyperbolas. Some comets follow parabolic paths. Only comets with elliptical orbits, such as Halley's Comet, return to our part of the galaxy.

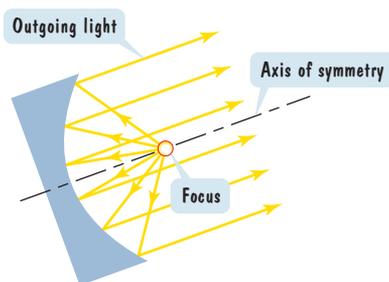

*Blitzer Bonus*  
The Hubble Space Telescope

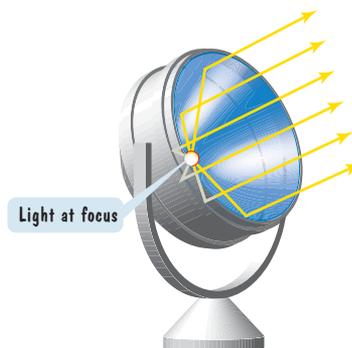

The Hubble Space Telescope

For decades, astronomers hoped to create an observatory above the atmosphere that would provide an unobscured view of the universe. This vision was realized with the 1990 launching of the Hubble Space Telescope. The telescope initially had blurred vision due to problems with its parabolic mirror. The mirror had been ground two millionths of a meter smaller than design specifications. In 1993, astronauts from the Space Shuttle *Endeavor* equipped the telescope with optics to correct the blurred vision. “A small change for a mirror, a giant leap for astronomy,” Christopher J. Burrows of the Space Telescope Science Institute said when clear images from the ends of the universe were presented to the public after the repair mission.

If a parabola is rotated about its axis of symmetry, a parabolic surface is formed. **Figure 9.39(a)** shows how a parabolic surface can be used to reflect light. Light originates at the focus. Note how the light is reflected by the parabolic surface, so that the outgoing light is parallel to the axis of symmetry. The reflective properties of parabolic surfaces are used in the design of searchlights [see **Figure 9.39(b)**] and automobile headlights.

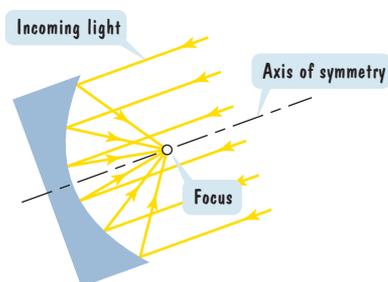

**FIGURE 9.39(a)** Parabolic surface reflecting light

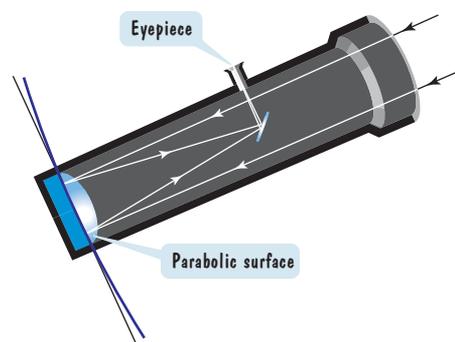

**FIGURE 9.39(b)** Light from the focus is reflected parallel to the axis of symmetry.

**Figure 9.40(a)** shows how a parabolic surface can be used to reflect *incoming* light. Note that light rays strike the surface and are reflected *to the focus*. This principle is used in the design of reflecting telescopes, radar, and television satellite dishes. Reflecting telescopes magnify the light from distant stars by reflecting the light from these bodies to the focus of a parabolic mirror [see **Figure 9.40(b)**].

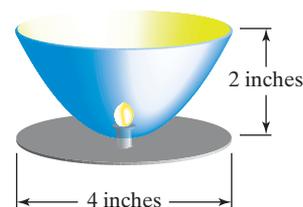

**FIGURE 9.40(a)** Parabolic surface reflecting incoming light

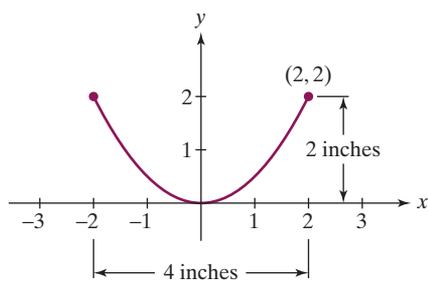

**FIGURE 9.40(b)** Incoming light rays are reflected to the focus.

**EXAMPLE 6** Using the Reflection Property of Parabolas

An engineer is designing a flashlight using a parabolic reflecting mirror and a light source, shown in **Figure 9.41**. The casting has a diameter of 4 inches and a depth of 2 inches. What is the equation of the parabola used to shape the mirror? At what point should the light source be placed relative to the mirror’s vertex?

**FIGURE 9.41** Designing a flashlight

**FIGURE 9.42**

**SOLUTION**

We position the parabola with its vertex at the origin and opening upward (**Figure 9.42**). Thus, the focus is on the  $y$ -axis, located at  $(0, p)$ . We use the standard

form of the equation in which there is  $y$ -axis symmetry, namely,  $x^2 = 4py$ . We need to find  $p$ . Because  $(2, 2)$  lies on the parabola, we let  $x = 2$  and  $y = 2$  in  $x^2 = 4py$ .

$$2^2 = 4p \cdot 2 \quad \text{Substitute 2 for } x \text{ and 2 for } y \text{ in } x^2 = 4py.$$

$$4 = 8p \quad \text{Simplify.}$$

$$p = \frac{1}{2} \quad \text{Divide both sides of the equation by 8 and reduce the resulting fraction.}$$

We substitute  $\frac{1}{2}$  for  $p$  in  $x^2 = 4py$  to obtain the standard form of the equation of the parabola. The equation of the parabola used to shape the mirror is

$$x^2 = 4 \cdot \frac{1}{2}y \quad \text{or} \quad x^2 = 2y.$$

The light source should be placed at the focus,  $(0, p)$ . Because  $p = \frac{1}{2}$ , the light should be placed at  $(0, \frac{1}{2})$ , or  $\frac{1}{2}$  inch above the vertex. ●●●

### Blitzer Bonus

#### Five Things Scientists Learned from the Hubble Space Telescope

- The universe is approximately 13.7 billion years old.
- There is a high probability that the universe is expanding at ever-accelerating rates.
- New stars are created from clouds of gas and dust when giant galaxies collide.
- Dust rings around stars transform into planets.
- Planets are far more common than previously thought.

Source: *Listomania*, Harper Design, 2011

 **Check Point 6** In Example 6, suppose that the casting has a diameter of 6 inches and a depth of 4 inches. What is the equation of the parabola used to shape the mirror? At what point should the light source be placed relative to the mirror's vertex?

### Degenerate Conic Sections

We opened the chapter by noting that conic sections are curves that result from the intersection of a cone and a plane. However, these intersections might not result in a conic section. Three degenerate cases occur when the cutting plane passes through the vertex. These **degenerate conic sections** are a point, a line, and a pair of intersecting lines, illustrated in **Figure 9.43**.

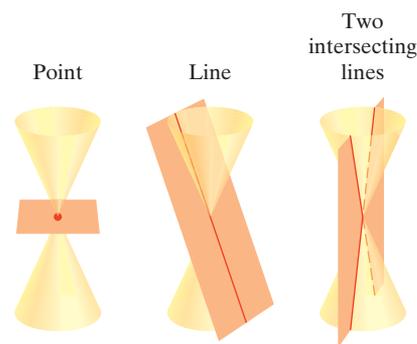

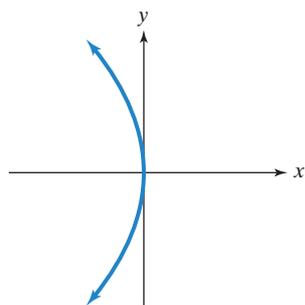

FIGURE 9.43 Degenerate conics

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

1. The set of all points in a plane that are equidistant from a fixed line and a fixed point is a/an \_\_\_\_\_. The fixed line is called the \_\_\_\_\_ and the fixed point is called the \_\_\_\_\_.

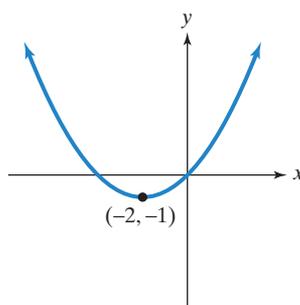

Use the graph shown to answer Exercises 2–5.

2. The equation of the parabola is of the form
  - a.  $y^2 = 4px$
  - b.  $x^2 = 4py$ . \_\_\_\_\_
3. If  $4p = -28$ , then the coordinates of the focus are \_\_\_\_\_.
4. If  $4p = -28$ , then the equation of the directrix is \_\_\_\_\_.

5. If  $4p = -28$ , then the length of the latus rectum is \_\_\_\_\_. The endpoints of the latus rectum are \_\_\_\_\_ and \_\_\_\_\_.

Use the graph shown to answer Exercises 6–9.

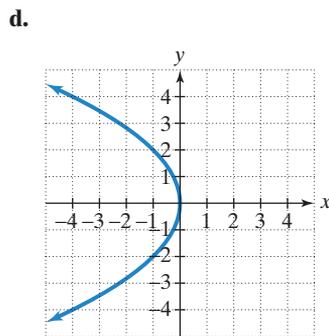

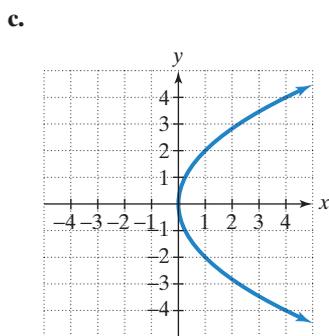

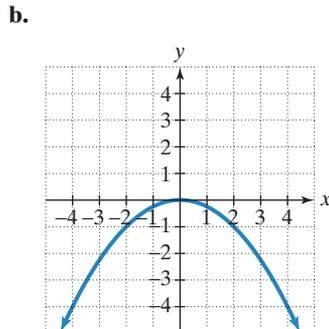

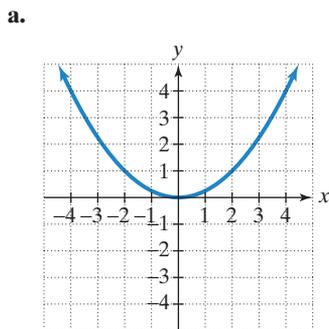

6. The equation of the parabola is of the form
  - a.  $(y - 1)^2 = 4p(x + 2)$
  - b.  $(y + 1)^2 = 4p(x + 2)$
  - c.  $(x - 2)^2 = 4p(y - 1)$
  - d.  $(x + 2)^2 = 4p(y + 1)$ . \_\_\_\_\_
7. If  $4p = 4$ , then the coordinates of the focus are \_\_\_\_\_.
8. If  $4p = 4$ , then the equation of the directrix is \_\_\_\_\_.
9. If  $4p = 4$ , then the length of the latus rectum is \_\_\_\_\_. The endpoints of the latus rectum are \_\_\_\_\_ and \_\_\_\_\_.

**EXERCISE SET 9.3**

**Practice Exercises**

In Exercises 1–4, find the focus and directrix of each parabola with the given equation. Then match each equation to one of the graphs that are shown and labeled (a)–(d).

- 1.  $y^2 = 4x$
- 2.  $x^2 = 4y$
- 3.  $x^2 = -4y$
- 4.  $y^2 = -4x$

In Exercises 5–16, find the focus and directrix of the parabola with the given equation. Then graph the parabola.

- 5.  $y^2 = 16x$
- 6.  $y^2 = 4x$
- 7.  $y^2 = -8x$
- 8.  $y^2 = -12x$
- 9.  $x^2 = 12y$
- 10.  $x^2 = 8y$
- 11.  $x^2 = -16y$
- 12.  $x^2 = -20y$
- 13.  $y^2 - 6x = 0$
- 14.  $x^2 - 6y = 0$
- 15.  $8x^2 + 4y = 0$
- 16.  $8y^2 + 4x = 0$

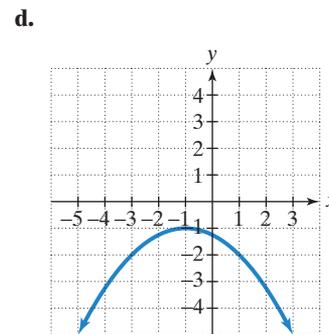

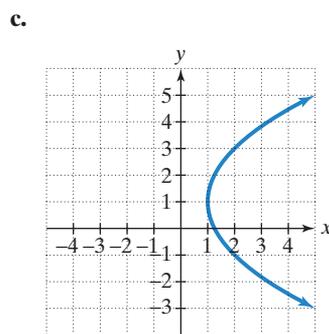

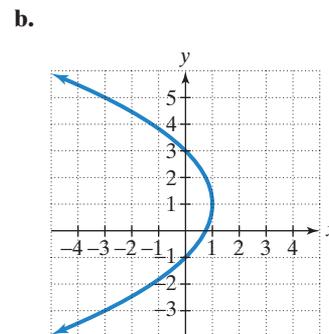

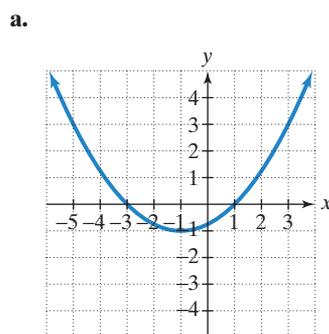

In Exercises 17–30, find the standard form of the equation of each parabola satisfying the given conditions.

- 17. Focus: (7, 0); Directrix:  $x = -7$
- 18. Focus: (9, 0); Directrix:  $x = -9$
- 19. Focus: (-5, 0); Directrix:  $x = 5$
- 20. Focus: (-10, 0); Directrix:  $x = 10$
- 21. Focus: (0, 15); Directrix:  $y = -15$
- 22. Focus: (0, 20); Directrix:  $y = -20$
- 23. Focus: (0, -25); Directrix:  $y = 25$
- 24. Focus: (0, -15); Directrix:  $y = 15$

- 25. Vertex: (2, -3); Focus: (2, -5)
- 26. Vertex: (5, -2); Focus: (7, -2)
- 27. Focus: (3, 2); Directrix:  $x = -1$
- 28. Focus: (2, 4); Directrix:  $x = -4$
- 29. Focus: (-3, 4); Directrix:  $y = 2$
- 30. Focus: (7, -1); Directrix:  $y = -9$

In Exercises 31–34, find the vertex, focus, and directrix of each parabola with the given equation. Then match each equation to one of the graphs that are shown and labeled (a)–(d).

- 31.  $(y - 1)^2 = 4(x - 1)$
- 32.  $(x + 1)^2 = 4(y + 1)$
- 33.  $(x + 1)^2 = -4(y + 1)$
- 34.  $(y - 1)^2 = -4(x - 1)$

In Exercises 35–42, find the vertex, focus, and directrix of each parabola with the given equation. Then graph the parabola.

- 35.  $(x - 2)^2 = 8(y - 1)$
- 36.  $(x + 2)^2 = 4(y + 1)$
- 37.  $(x + 1)^2 = -8(y + 1)$
- 38.  $(x + 2)^2 = -8(y + 2)$
- 39.  $(y + 3)^2 = 12(x + 1)$
- 40.  $(y + 4)^2 = 12(x + 2)$
- 41.  $(y + 1)^2 = -8x$
- 42.  $(y - 1)^2 = -8x$

In Exercises 43–48, convert each equation to standard form by completing the square on  $x$  or  $y$ . Then find the vertex, focus, and directrix of the parabola. Finally, graph the parabola.

- 43.  $x^2 - 2x - 4y + 9 = 0$
- 44.  $x^2 + 6x + 8y + 1 = 0$
- 45.  $y^2 - 2y + 12x - 35 = 0$
- 46.  $y^2 - 2y - 8x + 1 = 0$
- 47.  $x^2 + 6x - 4y + 1 = 0$
- 48.  $x^2 + 8x - 4y + 8 = 0$

## Practice Plus

In Exercises 49–54, use the vertex and the direction in which the parabola opens to determine the relation's domain and range. Is the relation a function?

49.  $y^2 + 6y - x + 5 = 0$

50.  $y^2 - 2y - x - 5 = 0$

51.  $y = -x^2 + 4x - 3$

52.  $y = -x^2 - 4x + 4$

53.  $x = -4(y - 1)^2 + 3$

54.  $x = -3(y - 1)^2 - 2$

In Exercises 55–60, find the solution set for each system by graphing both of the system's equations in the same rectangular coordinate system and finding points of intersection. Check all solutions in both equations.

55. 
$$\begin{cases} (y - 2)^2 = x + 4 \\ y = -\frac{1}{2}x \end{cases}$$

56. 
$$\begin{cases} (y - 3)^2 = x - 2 \\ x + y = 5 \end{cases}$$

57. 
$$\begin{cases} x = y^2 - 3 \\ x = y^2 - 3y \end{cases}$$

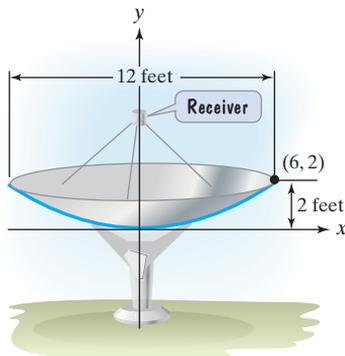

58. 
$$\begin{cases} x = y^2 - 5 \\ x^2 + y^2 = 25 \end{cases}$$

59. 
$$\begin{cases} x = (y + 2)^2 - 1 \\ (x - 2)^2 + (y + 2)^2 = 1 \end{cases}$$

60. 
$$\begin{cases} x = 2y^2 + 4y + 5 \\ (x + 1)^2 + (y - 2)^2 = 1 \end{cases}$$

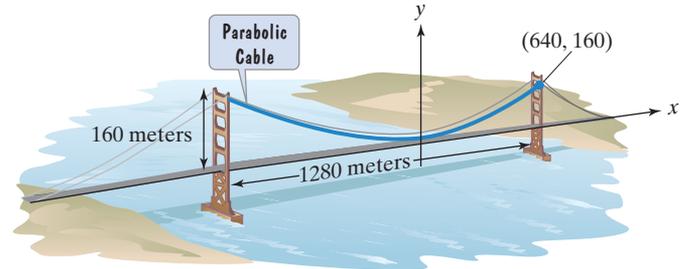

## Application Exercises

61. The reflector of a flashlight is in the shape of a parabolic surface. The casting has a diameter of 4 inches and a depth of 1 inch. How far from the vertex should the light bulb be placed?
62. The reflector of a flashlight is in the shape of a parabolic surface. The casting has a diameter of 8 inches and a depth of 1 inch. How far from the vertex should the light bulb be placed?
63. A satellite dish, like the one shown below, is in the shape of a parabolic surface. Signals coming from a satellite strike the surface of the dish and are reflected to the focus, where the receiver is located. The satellite dish shown has a diameter of 12 feet and a depth of 2 feet. How far from the base of the dish should the receiver be placed?

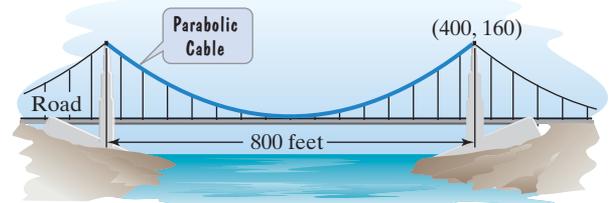

64. In Exercise 63, if the diameter of the dish is halved and the depth stays the same, how far from the base of the smaller dish should the receiver be placed?

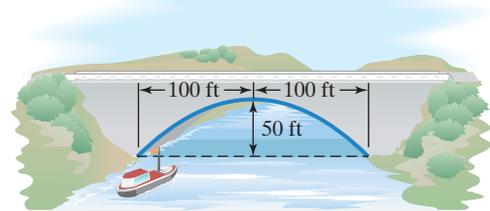

65. The towers of the Golden Gate Bridge connecting San Francisco to Marin County are 1280 meters apart and rise 160 meters above the road. The cable between the towers has the shape of a parabola and the cable just touches the sides of the road midway between the towers. What is the height of the cable 200 meters from a tower? Round to the nearest meter.

66. The towers of a suspension bridge are 800 feet apart and rise 160 feet above the road. The cable between the towers has the shape of a parabola and the cable just touches the sides of the road midway between the towers. What is the height of the cable 100 feet from a tower?

67. The parabolic arch shown in the figure is 50 feet above the water at the center and 200 feet wide at the base. Will a boat that is 30 feet tall clear the arch 30 feet from the center?

68. A satellite dish in the shape of a parabolic surface has a diameter of 20 feet. If the receiver is to be placed 6 feet from the base, how deep should the dish be?

## Writing in Mathematics

69. What is a parabola?
70. Explain how to use  $y^2 = 8x$  to find the parabola's focus and directrix.
71. If you are given the standard form of the equation of a parabola with vertex at the origin, explain how to determine if the parabola opens to the right, left, upward, or downward.
72. Describe one similarity and one difference between the graphs of  $y^2 = 4x$  and  $(y - 1)^2 = 4(x - 1)$ .
73. How can you distinguish parabolas from other conic sections by looking at their equations?
74. Look at the satellite dish shown in Exercise 63. Why must the receiver for a shallow dish be farther from the base of the dish than for a deeper dish of the same diameter?

### Technology Exercises

75. Use a graphing utility to graph any five of the parabolas that you graphed by hand in Exercises 5–16.
76. Use a graphing utility to graph any three of the parabolas that you graphed by hand in Exercises 35–42. First solve the given equation for  $y$ , possibly using the square root property. Enter each of the two resulting equations to produce the complete graph.

Use a graphing utility to graph the parabolas in Exercises 77–78. Write the given equation as a quadratic equation in  $y$  and use the quadratic formula to solve for  $y$ . Enter each of the equations to produce the complete graph.

77.  $y^2 + 2y - 6x + 13 = 0$

78.  $y^2 + 10y - x + 25 = 0$

In Exercises 79–80, write each equation as a quadratic equation in  $y$  and then use the quadratic formula to express  $y$  in terms of  $x$ . Graph the resulting two equations using a graphing utility. What effect does the  $xy$ -term have on the graph of the resulting parabola?

79.  $16x^2 - 24xy + 9y^2 - 60x - 80y + 100 = 0$

80.  $x^2 + 2\sqrt{3}xy + 3y^2 + 8\sqrt{3}x - 8y + 32 = 0$

### Critical Thinking Exercises

**Make Sense?** In Exercises 81–84, determine whether each statement makes sense or does not make sense, and explain your reasoning.

81. I graphed a parabola that opened to the right and contained a maximum point.
82. Knowing that a parabola opening to the right has a vertex at  $(-1, 1)$  gives me enough information to determine its graph.
83. I noticed that depending on the values for  $A$  and  $B$ , assuming that they are both not zero, the graph of  $Ax^2 + By^2 = C$  can represent any of the conic sections other than a parabola.
84. I'm using a telescope in which light from distant stars is reflected to the focus of a parabolic mirror.

In Exercises 85–88, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

85. The parabola whose equation is  $x = 2y - y^2 + 5$  opens to the right.

86. If the parabola whose equation is  $x = ay^2 + by + c$  has its vertex at  $(3, 2)$  and  $a > 0$ , then it has no  $y$ -intercepts.
87. Some parabolas that open to the right have equations that define  $y$  as a function of  $x$ .
88. The graph of  $x = a(y - k) + h$  is a parabola with vertex at  $(h, k)$ .
89. Find the focus and directrix of a parabola whose equation is of the form  $Ax^2 + Ey = 0$ ,  $A \neq 0$ ,  $E \neq 0$ .
90. Write the standard form of the equation of a parabola whose points are equidistant from  $y = 4$  and  $(-1, 0)$ .

### Group Exercise

91. Consult the research department of your library or the Internet to find an example of architecture that incorporates one or more conic sections in its design. Share this example with other group members. Explain precisely how conic sections are used. Do conic sections enhance the appeal of the architecture? In what ways?

### Preview Exercises

Exercises 92–94 will help you prepare for the material covered in the next section.

92. Simplify and write the equation in standard form in terms of  $x'$  and  $y'$ :

$$\left[ \frac{\sqrt{2}}{2}(x' - y') \right] \left[ \frac{\sqrt{2}}{2}(x' + y') \right] = 1.$$

93. a. Make a sketch of an angle  $\theta$  in standard position for which  $\cot 2\theta = -\frac{7}{24}$  and  $90^\circ < 2\theta < 180^\circ$ .

- b. Use your sketch from part (a) to determine the value of  $\cos 2\theta$ .

- c. Use the value of  $\cos 2\theta$  from part (b) and the identities

$$\sin \theta = \sqrt{\frac{1 - \cos 2\theta}{2}} \quad \text{and} \quad \cos \theta = \sqrt{\frac{1 + \cos 2\theta}{2}}$$

to determine the values of  $\sin \theta$  and  $\cos \theta$ .

- d. In part (c), why did we not write  $\pm$  before the radical in each formula?

94. The equation  $3x^2 - 2\sqrt{3}xy + y^2 + 2x + 2\sqrt{3}y = 0$  is in the form  $Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$ . Use the equation to determine the value of  $B^2 - 4AC$ .

## CHAPTER 9

### Mid-Chapter Check Point

**WHAT YOU KNOW:** We learned that the four conic sections are the circle, the ellipse, the hyperbola, and the parabola. Prior to this chapter, we graphed circles with center  $(h, k)$  and radius  $r$ :

$$(x - h)^2 + (y - k)^2 = r^2.$$

In this chapter, you learned to graph ellipses centered at the origin and ellipses centered at  $(h, k)$ :

$$\frac{(x - h)^2}{a^2} + \frac{(y - k)^2}{b^2} = 1 \quad \text{or} \quad \frac{(x - h)^2}{b^2} + \frac{(y - k)^2}{a^2} = 1, a^2 > b^2.$$

We saw that the larger denominator ( $a^2$ ) determines whether the major axis is horizontal or vertical. We used vertices and asymptotes to graph hyperbolas centered at the origin and hyperbolas centered at  $(h, k)$ :

$$\frac{(x-h)^2}{a^2} - \frac{(y-k)^2}{b^2} = 1 \quad \text{or} \quad \frac{(y-k)^2}{a^2} - \frac{(x-h)^2}{b^2} = 1.$$

We used  $c^2 = a^2 - b^2$  to locate the foci of an ellipse. We used  $c^2 = a^2 + b^2$  to locate the foci of a hyperbola. Finally, we used the vertex and the latus rectum to graph parabolas with vertices at the origin and parabolas with vertices at  $(h, k)$ :

$$(y-k)^2 = 4p(x-h) \quad \text{or} \quad (x-h)^2 = 4p(y-k).$$

In Exercises 1–5, graph each ellipse. Give the location of the foci.

1.  $\frac{x^2}{25} + \frac{y^2}{4} = 1$

2.  $9x^2 + 4y^2 = 36$

3.  $\frac{(x-2)^2}{16} + \frac{(y+1)^2}{25} = 1$

4.  $\frac{(x+2)^2}{25} + \frac{(y-1)^2}{16} = 1$

5.  $x^2 + 9y^2 - 4x + 54y + 49 = 0$

In Exercises 6–11, graph each hyperbola. Give the location of the foci and the equations of the asymptotes.

6.  $\frac{x^2}{9} - y^2 = 1$

7.  $\frac{y^2}{9} - x^2 = 1$

8.  $y^2 - 4x^2 = 16$

9.  $4x^2 - 49y^2 = 196$

10.  $\frac{(x-2)^2}{9} - \frac{(y+2)^2}{16} = 1$

11.  $4x^2 - y^2 + 8x + 6y + 11 = 0$

In Exercises 12–13, graph each parabola. Give the location of the focus and the directrix.

12.  $(x-2)^2 = -12(y+1)$

13.  $y^2 - 2x - 2y - 5 = 0$

In Exercises 14–21, graph each equation.

14.  $x^2 + y^2 = 4$

15.  $x + y = 4$

16.  $x^2 - y^2 = 4$

17.  $x^2 + 4y^2 = 4$

18.  $(x+1)^2 + (y-1)^2 = 4$

19.  $x^2 + 4(y-1)^2 = 4$

20.  $(x-1)^2 - (y-1)^2 = 4$

21.  $(y+1)^2 = 4(x-1)$

In Exercises 22–27, find the standard form of the equation of the conic section satisfying the given conditions.

22. Ellipse; Foci:  $(-4, 0)$ ,  $(4, 0)$ ; Vertices:  $(-5, 0)$ ,  $(5, 0)$

23. Ellipse; Endpoints of major axis:  $(-8, 2)$ ,  $(10, 2)$ ; Foci:  $(-4, 2)$ ,  $(6, 2)$

24. Hyperbola; Foci:  $(0, -3)$ ,  $(0, 3)$ ; Vertices:  $(0, -2)$ ,  $(0, 2)$

25. Hyperbola; Foci:  $(-4, 5)$ ,  $(2, 5)$ ; Vertices:  $(-3, 5)$ ,  $(1, 5)$

26. Parabola; Focus:  $(4, 5)$ ; Directrix:  $y = -1$

27. Parabola; Focus:  $(-2, 6)$ ; Directrix:  $x = 8$

28. A semielliptical archway over a one-way road has a height of 10 feet and a width of 30 feet. A truck has a width of 10 feet and a height of 9.5 feet. Will this truck clear the opening of the archway?

29. A lithotriper is used to disintegrate kidney stones. The patient is placed within an elliptical device with the kidney centered at one focus, while ultrasound waves from the other focus hit the walls and are reflected to the kidney stone, shattering the stone. Suppose that the length of the major axis of the ellipse is 40 centimeters and the length of the minor axis is 20 centimeters. How far from the kidney stone should the electrode that sends the ultrasound waves be placed in order to shatter the stone?

30. An explosion is recorded by two forest rangers, one at a primary station and the other at an outpost 6 kilometers away. The ranger at the primary station hears the explosion 6 seconds before the ranger at the outpost.

a. Assuming sound travels at 0.35 kilometer per second, write an equation in standard form that gives all the possible locations of the explosion. Use a coordinate system with the two ranger stations on the  $x$ -axis and the midpoint between the stations at the origin.

b. Graph the equation that gives the possible locations of the explosion. Show the locations of the ranger stations in your drawing.

31. A domed ceiling is a parabolic surface. Ten meters down from the top of the dome, the ceiling is 15 meters wide. For the best lighting on the floor, a light source should be placed at the focus of the parabolic surface. How far from the top of the dome, to the nearest tenth of a meter, should the light source be placed?

## SECTION 9.4

## Rotation of Axes

*Objectives*

- 1 Identify conics without completing the square.
- 2 Use rotation of axes formulas.
- 3 Write equations of rotated conics in standard form.
- 4 Identify conics without rotating axes.

Richard E. Prince “The Cone of Apollonius” (detail), fiberglass, steel, paint, graphite,  $51 \times 18 \times 14$  in. Collection: Vancouver Art Gallery, Vancouver, Canada. Photo courtesy of Equinox Gallery, Vancouver, Canada.

To recognize a conic section, you often need to pay close attention to its graph. Graphs powerfully enhance our understanding of algebra and trigonometry. However, it is not possible for people who are blind—or sometimes, visually impaired—to see a graph. Creating informative materials for the blind and visually impaired is a challenge for instructors and mathematicians. Many people who are

visually impaired “see” a graph by touching a three-dimensional representation of that graph, perhaps while it is described verbally.

Is it possible to identify conic sections in nonvisual ways? The answer is yes, and the methods for doing so are related to the coefficients in their equations. As we present these methods, think about how you learn them. How would your approach to studying mathematics change if we removed all graphs and replaced them with verbal descriptions?

- 1 Identify conics without completing the square.

**Identifying Conic Sections without Completing the Square**

Conic sections can be represented both geometrically (as intersecting planes and cones) and algebraically. The equations of the conic sections we have considered in the first three sections of this chapter can be expressed in the form

$$Ax^2 + Cy^2 + Dx + Ey + F = 0,$$

in which  $A$  and  $C$  are not both zero. You can use  $A$  and  $C$ , the coefficients of  $x^2$  and  $y^2$ , respectively, to identify a conic section without completing the square.

**Identifying a Conic Section without Completing the Square**

A nondegenerate conic section of the form

$$Ax^2 + Cy^2 + Dx + Ey + F = 0,$$

in which  $A$  and  $C$  are not both zero, is

- a circle if  $A = C$ ,
- a parabola if  $AC = 0$ ,
- an ellipse if  $A \neq C$  and  $AC > 0$ , and
- a hyperbola if  $AC < 0$ .

**EXAMPLE 1** Identifying a Conic Section without Completing the Square

Identify the graph of each of the following nondegenerate conic sections:

- a.  $4x^2 - 25y^2 - 24x + 250y - 489 = 0$
- b.  $x^2 + y^2 + 6x - 2y + 6 = 0$
- c.  $y^2 + 12x + 2y - 23 = 0$
- d.  $9x^2 + 25y^2 - 54x + 50y - 119 = 0$ .

## SOLUTION

We use  $A$ , the coefficient of  $x^2$ , and  $C$ , the coefficient of  $y^2$ , to identify each conic section.

a.  $4x^2 - 25y^2 - 24x + 250y - 489 = 0$

$A = 4$      $C = -25$

$$AC = 4(-25) = -100 < 0.$$

Because  $AC < 0$ , the graph of the equation is a hyperbola.

b.  $x^2 + y^2 + 6x - 2y + 6 = 0$

$A = 1$      $C = 1$

Because  $A = C$ , the graph of the equation is a circle.

c. We can write  $y^2 + 12x + 2y - 23 = 0$  as

$$0x^2 + y^2 + 12x + 2y - 23 = 0.$$

$A = 0$      $C = 1$

$$AC = 0(1) = 0.$$

Because  $AC = 0$ , the graph of the equation is a parabola.

d.  $9x^2 + 25y^2 - 54x + 50y - 119 = 0$

$A = 9$      $C = 25$

$$AC = 9(25) = 225 > 0.$$

Because  $AC > 0$  and  $A \neq C$ , the graph of the equation is an ellipse. ●●●

 **Check Point 1** Identify the graph of each of the following nondegenerate conic sections:

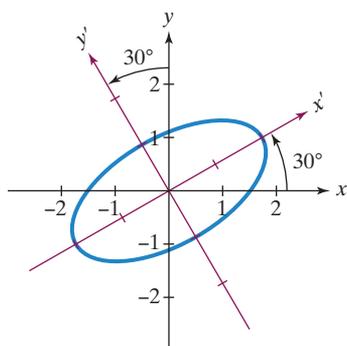

a.  $3x^2 + 2y^2 + 12x - 4y + 2 = 0$

b.  $x^2 + y^2 - 6x + y + 3 = 0$

c.  $y^2 - 12x - 4y + 52 = 0$

d.  $9x^2 - 16y^2 - 90x + 64y + 17 = 0.$

**2** Use rotation of axes formulas.

**FIGURE 9.44** The graph of  $7x^2 - 6\sqrt{3}xy + 13y^2 - 16 = 0$ , a rotated ellipse

### Rotation of Axes

**Figure 9.44** shows the graph of

$$7x^2 - 6\sqrt{3}xy + 13y^2 - 16 = 0.$$

The graph looks like an ellipse, although its major axis neither lies along the  $x$ -axis or  $y$ -axis nor is parallel to the  $x$ -axis or  $y$ -axis. Do you notice anything unusual about the equation? It contains an  $xy$ -term. However, look at what happens if we rotate the  $x$ - and  $y$ -axes through an angle of  $30^\circ$ . In the rotated  $x'y'$ -system, the major axis of the ellipse lies along the  $x'$ -axis. We can write the equation of the ellipse in this rotated  $x'y'$ -system as

$$\frac{x'^2}{4} + \frac{y'^2}{1} = 1.$$

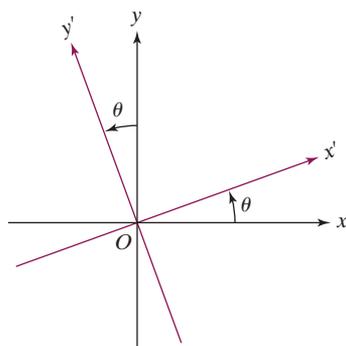

Observe that there is no  $x'y'$ -term in the equation.

Except for degenerate cases, the **general second-degree equation**

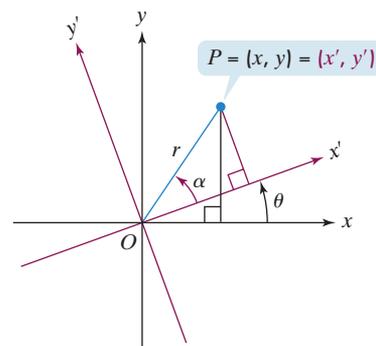

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$$

represents one of the conic sections. However, due to the  $xy$ -term in the equation, these conic sections are rotated in such a way that their axes are no longer parallel to the  $x$ - and  $y$ -axes. To reduce these equations to forms of the conic sections with which you are already familiar, we use a procedure called **rotation of axes**.

Suppose that the  $x$ - and  $y$ -axes are rotated through a positive angle  $\theta$ , resulting in a new  $x'y'$ -coordinate system. This system is shown in **Figure 9.45(a)**. The origin in the  $x'y'$ -system is the same as the origin in the  $xy$ -system. Point  $P$  in **Figure 9.45(b)** has coordinates  $(x, y)$  relative to the  $xy$ -system and coordinates  $(x', y')$  relative to the  $x'y'$ -system. Our goal is to obtain formulas relating the old and new coordinates. Thus, we need to express  $x$  and  $y$  in terms of  $x'$ ,  $y'$ , and  $\theta$ .

(a) Rotating the  $x$ - and  $y$ -axes through a positive angle  $\theta$

(b) Describing point  $P$  relative to the  $xy$ -system and the rotated  $x'y'$ -system

**FIGURE 9.45** Rotating axes

Look at **Figure 9.45(b)**. Notice that

$r$  = the distance from the origin  $O$  to point  $P$ .

$\alpha$  = the angle from the positive  $x'$ -axis to the ray from  $O$  through  $P$ .

Using the definitions of sine and cosine, we obtain

$$\cos \alpha = \frac{x'}{r} : x' = r \cos \alpha$$

$$\sin \alpha = \frac{y'}{r} : y' = r \sin \alpha$$

This is from the right triangle with a leg along the  $x'$ -axis.

$$\cos(\theta + \alpha) = \frac{x}{r} : x = r \cos(\theta + \alpha)$$

$$\sin(\theta + \alpha) = \frac{y}{r} : y = r \sin(\theta + \alpha)$$

This is from the taller right triangle with a leg along the  $x$ -axis.

Thus,

$$x = r \cos(\theta + \alpha)$$

$$= r(\cos \theta \cos \alpha - \sin \theta \sin \alpha)$$

$$= (r \cos \alpha) \cos \theta - (r \sin \alpha) \sin \theta$$

$$= x' \cos \theta - y' \sin \theta.$$

This is the third of the preceding equations.

Use the formula for the cosine of the sum of two angles.

Apply the distributive property and rearrange factors.

Use the first and second of the preceding equations:  $x' = r \cos \alpha$  and  $y' = r \sin \alpha$ .

Similarly,

$$y = r \sin(\theta + \alpha) = r(\sin \theta \cos \alpha + \cos \theta \sin \alpha) = x' \sin \theta + y' \cos \theta.$$

## Rotation of Axes Formulas

Suppose an  $xy$ -coordinate system and an  $x'y'$ -coordinate system have the same origin and  $\theta$  is the angle from the positive  $x$ -axis to the positive  $x'$ -axis. If the coordinates of point  $P$  are  $(x, y)$  in the  $xy$ -system and  $(x', y')$  in the rotated  $x'y'$ -system, then

$$x = x' \cos \theta - y' \sin \theta$$

$$y = x' \sin \theta + y' \cos \theta.$$

## EXAMPLE 2 Rotating Axes

Write the equation  $xy = 1$  in terms of a rotated  $x'y'$ -system if the angle of rotation from the  $x$ -axis to the  $x'$ -axis is  $45^\circ$ . Express the equation in standard form. Use the rotated system to graph  $xy = 1$ .

## SOLUTION

With  $\theta = 45^\circ$ , the rotation formulas for  $x$  and  $y$  are

$$x = x' \cos \theta - y' \sin \theta = x' \cos 45^\circ - y' \sin 45^\circ$$

$$= x' \left( \frac{\sqrt{2}}{2} \right) - y' \left( \frac{\sqrt{2}}{2} \right) = \frac{\sqrt{2}}{2} (x' - y')$$

$$y = x' \sin \theta + y' \cos \theta = x' \sin 45^\circ + y' \cos 45^\circ$$

$$= x' \left( \frac{\sqrt{2}}{2} \right) + y' \left( \frac{\sqrt{2}}{2} \right) = \frac{\sqrt{2}}{2} (x' + y').$$

Now substitute these expressions for  $x$  and  $y$  in the given equation,  $xy = 1$ .

$$xy = 1 \quad \text{This is the given equation.}$$

$$\left[ \frac{\sqrt{2}}{2} (x' - y') \right] \left[ \frac{\sqrt{2}}{2} (x' + y') \right] = 1 \quad \text{Substitute the expressions for } x \text{ and } y \text{ from the rotation formulas.}$$

$$\frac{2}{4} (x' - y')(x' + y') = 1 \quad \text{Multiply: } \frac{\sqrt{2}}{2} \cdot \frac{\sqrt{2}}{2} = \frac{2}{4}.$$

$$\frac{1}{2} (x'^2 - y'^2) = 1 \quad \text{Reduce } \frac{2}{4} \text{ and multiply the binomials.}$$

$$\frac{x'^2}{2} - \frac{y'^2}{2} = 1 \quad \text{Write the equation in standard form:}$$

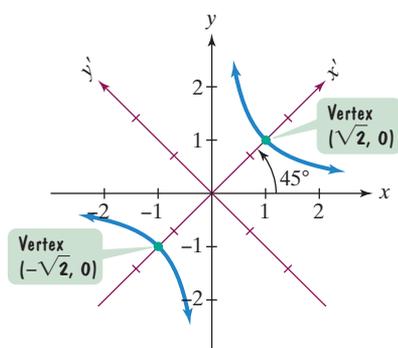

$$\frac{x'^2}{a^2} - \frac{y'^2}{b^2} = 1.$$

$$a^2 = 2 \quad b^2 = 2$$

This equation expresses  $xy = 1$  in terms of the rotated  $x'y'$ -system. Can you see that this is the standard form of the equation of a hyperbola? The hyperbola's center is at  $(0, 0)$ , with the transverse axis on the  $x'$ -axis. The vertices are  $(-a, 0)$  and  $(a, 0)$ . Because  $a^2 = 2$ , the vertices are  $(-\sqrt{2}, 0)$  and  $(\sqrt{2}, 0)$ , located on the  $x'$ -axis. Based on the standard form of the hyperbola's equation, the equations for the asymptotes are

$$y' = \pm \frac{b}{a} x' \quad \text{or} \quad y' = \pm \frac{\sqrt{2}}{\sqrt{2}} x'.$$

The equations of the asymptotes can be simplified to  $y' = x'$  and  $y' = -x'$ , which correspond to the original  $x$ - and  $y$ -axes. The graph of the hyperbola is shown in **Figure 9.46**.

**FIGURE 9.46** The graph of  $xy = 1$  or  $\frac{x'^2}{2} - \frac{y'^2}{2} = 1$

**Check Point 2** Write the equation  $xy = 2$  in terms of a rotated  $x'y'$ -system if the angle of rotation from the  $x$ -axis to the  $x'$ -axis is  $45^\circ$ . Express the equation in standard form. Use the rotated system to graph  $xy = 2$ .

- 3 Write equations of rotated conics in standard form.

### Using Rotations to Transform Equations with $xy$ -Terms to Standard Equations of Conic Sections

We have noted that the appearance of the term  $Bxy$  ( $B \neq 0$ ) in the general second-degree equation indicates that the graph of the conic section has been rotated. A rotation of axes through an appropriate angle can transform the equation to one of the standard forms of the conic sections in  $x'$  and  $y'$  in which no  $x'y'$ -term appears.

#### Amount of Rotation Formula

The general second-degree equation

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0, B \neq 0$$

can be rewritten as an equation in  $x'$  and  $y'$  without an  $x'y'$ -term by rotating the axes through angle  $\theta$ , where

$$\cot 2\theta = \frac{A - C}{B}.$$

Before we learn to apply this formula, let's see how it can be derived. We begin with the general second-degree equation

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0, B \neq 0.$$

Then we rotate the axes through an angle  $\theta$ . In terms of the rotated  $x'y'$ -system, the general second-degree equation can be written as

$$\begin{aligned} A(x' \cos \theta - y' \sin \theta)^2 + B(x' \cos \theta - y' \sin \theta)(x' \sin \theta + y' \cos \theta) \\ + C(x' \sin \theta + y' \cos \theta)^2 + D(x' \cos \theta - y' \sin \theta) \\ + E(x' \sin \theta + y' \cos \theta) + F = 0. \end{aligned}$$

After a lot of simplifying that involves expanding and collecting like terms, you will obtain the following equation:

We want a rotation that results in no  $x'y'$ -term.

$$\begin{aligned} (A \cos^2 \theta + B \sin \theta \cos \theta + C \sin^2 \theta)x'^2 + [B(\cos^2 \theta - \sin^2 \theta) + 2(C - A)(\sin \theta \cos \theta)]x'y' \\ + (A \sin^2 \theta - B \sin \theta \cos \theta + C \cos^2 \theta)y'^2 \\ + (D \cos \theta + E \sin \theta)x' \\ + (-D \sin \theta + E \cos \theta)y' + F = 0. \end{aligned}$$

If this looks somewhat ghastly, take a deep breath and focus only on the  $x'y'$ -term. We want to choose  $\theta$  so that the coefficient of this term is zero. This will give the required rotation that results in no  $x'y'$ -term.

$$B(\cos^2 \theta - \sin^2 \theta) + 2(C - A) \sin \theta \cos \theta = 0$$

$$B \cos 2\theta + (C - A) \sin 2\theta = 0$$

Set the coefficient of the  $x'y'$ -term equal to 0.

Use the double-angle formulas:

$$\cos 2\theta = \cos^2 \theta - \sin^2 \theta \text{ and}$$

$$\sin 2\theta = 2 \sin \theta \cos \theta.$$

$$B \cos 2\theta = -(C - A) \sin 2\theta$$

Subtract  $(C - A) \sin 2\theta$  from both sides.

$$B \cos 2\theta = (A - C) \sin 2\theta$$

Simplify.

$$\frac{B \cos 2\theta}{B \sin 2\theta} = \frac{(A - C) \sin 2\theta}{B \sin 2\theta}$$

Divide both sides by  $B \sin 2\theta$ .

$$\frac{\cos 2\theta}{\sin 2\theta} = \frac{A - C}{B}$$

Simplify.

$$\cot 2\theta = \frac{A - C}{B}$$

Apply a quotient identity:

$$\cot 2\theta = \frac{\cos 2\theta}{\sin 2\theta}.$$

If  $\cot 2\theta$  is positive, we will select  $\theta$  so that  $0^\circ < \theta < 45^\circ$ . If  $\cot 2\theta$  is negative, we will select  $\theta$  so that  $45^\circ < \theta < 90^\circ$ . Thus  $\theta$ , the angle of rotation, is always an acute angle.

**GREAT QUESTION!**

**What do I do after substituting the expressions for  $x$  and  $y$  from the rotation formulas into the given equation?**

You must simplify the resulting equation by expanding and collecting like terms. Work through this process slowly and carefully, allowing lots of room on your paper.

If your rotation equations are correct but you obtain an equation that has an  $x'y'$ -term, you have made an error in the algebraic simplification.

Here is a step-by-step procedure for writing the equation of a rotated conic section in standard form:

**Writing the Equation of a Rotated Conic in Standard Form**

1. Use the given equation

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0, B \neq 0$$

to find  $\cot 2\theta$ .

$$\cot 2\theta = \frac{A - C}{B}$$

2. Use the expression for  $\cot 2\theta$  to determine  $\theta$ , the angle of rotation.
3. Substitute  $\theta$  in the rotation formulas

$$x = x' \cos \theta - y' \sin \theta \quad \text{and} \quad y = x' \sin \theta + y' \cos \theta$$

and simplify.

4. Substitute the expressions for  $x$  and  $y$  from the rotation formulas in the given equation and simplify. The resulting equation should have no  $x'y'$ -term.
5. Write the equation involving  $x'$  and  $y'$  in standard form.

Using the equation in step 5, you can graph the conic section in the rotated  $x'y'$ -system.

**EXAMPLE 3** Writing the Equation of a Rotated Conic Section in Standard Form

Rewrite the equation

$$7x^2 - 6\sqrt{3}xy + 13y^2 - 16 = 0$$

in a rotated  $x'y'$ -system without an  $x'y'$ -term. Express the equation in the standard form of a conic section. Graph the conic section in the rotated system.

**SOLUTION**

**Step 1** Use the given equation to find  $\cot 2\theta$ . We need to identify the constants  $A$ ,  $B$ , and  $C$  in the given equation.

$$7x^2 - 6\sqrt{3}xy + 13y^2 - 16 = 0$$

$A$  is the coefficient of the  $x^2$ -term:  
 $A = 7$ .

$B$  is the coefficient of the  $xy$ -term:  
 $B = -6\sqrt{3}$ .

$C$  is the coefficient of the  $y^2$ -term:  
 $C = 13$ .

The appropriate angle  $\theta$  through which to rotate the axes satisfies the equation

$$\cot 2\theta = \frac{A - C}{B} = \frac{7 - 13}{-6\sqrt{3}} = \frac{-6}{-6\sqrt{3}} = \frac{1}{\sqrt{3}} \text{ or } \frac{\sqrt{3}}{3}.$$

**Step 2** Use the expression for  $\cot 2\theta$  to determine the angle of rotation. We have  $\cot 2\theta = \frac{\sqrt{3}}{3}$ . Based on our knowledge of exact values for trigonometric functions, we conclude that  $2\theta = 60^\circ$ . Thus,  $\theta = 30^\circ$ .

**Step 3 Substitute  $\theta$  in the rotation formulas  $x = x' \cos \theta - y' \sin \theta$  and  $y = x' \sin \theta + y' \cos \theta$  and simplify.** Substituting  $30^\circ$  for  $\theta$ ,

$$x = x' \cos 30^\circ - y' \sin 30^\circ = x' \left( \frac{\sqrt{3}}{2} \right) - y' \left( \frac{1}{2} \right) = \frac{\sqrt{3}x' - y'}{2}$$

$$y = x' \sin 30^\circ + y' \cos 30^\circ = x' \left( \frac{1}{2} \right) + y' \left( \frac{\sqrt{3}}{2} \right) = \frac{x' + \sqrt{3}y'}{2}$$

**Step 4 Substitute the expressions for  $x$  and  $y$  from the rotation formulas in the given equation and simplify.**

$$7x^2 - 6\sqrt{3}xy + 13y^2 - 16 = 0 \quad \text{This is the given equation.}$$

$$7 \left( \frac{\sqrt{3}x' - y'}{2} \right)^2 - 6\sqrt{3} \left( \frac{\sqrt{3}x' - y'}{2} \right) \left( \frac{x' + \sqrt{3}y'}{2} \right) + 13 \left( \frac{x' + \sqrt{3}y'}{2} \right)^2 - 16 = 0$$

Substitute the expressions for  $x$  and  $y$  from the rotation formulas.

$$7 \left( \frac{3x'^2 - 2\sqrt{3}x'y' + y'^2}{4} \right) - 6\sqrt{3} \left( \frac{\sqrt{3}x'^2 + 3x'y' - x'y' - \sqrt{3}y'^2}{4} \right) + 13 \left( \frac{x'^2 + 2\sqrt{3}x'y' + 3y'^2}{4} \right) - 16 = 0$$

Square and multiply.

$$7(3x'^2 - 2\sqrt{3}x'y' + y'^2) - 6\sqrt{3}(\sqrt{3}x'^2 + 2x'y' - \sqrt{3}y'^2) + 13(x'^2 + 2\sqrt{3}x'y' + 3y'^2) - 64 = 0$$

Multiply both sides by 4.

$$21x'^2 - 14\sqrt{3}x'y' + 7y'^2 - 18x'^2 - 12\sqrt{3}x'y' + 18y'^2 + 13x'^2 + 26\sqrt{3}x'y' + 39y'^2 - 64 = 0$$

Distribute throughout parentheses.

$$21x'^2 - 18x'^2 + 13x'^2 - 14\sqrt{3}x'y' - 12\sqrt{3}x'y' + 26\sqrt{3}x'y' + 7y'^2 + 18y'^2 + 39y'^2 - 64 = 0$$

Rearrange terms.

$$16x'^2 + 64y'^2 - 64 = 0 \quad \text{Combine like terms.}$$

Do you see how we “lost” the  $x'y'$ -term in the last equation?

$$-14\sqrt{3}x'y' - 12\sqrt{3}x'y' + 26\sqrt{3}x'y' = -26\sqrt{3}x'y' + 26\sqrt{3}x'y' = 0x'y' = 0$$

**Step 5 Write the equation involving  $x'$  and  $y'$  in standard form.** We can express  $16x'^2 + 64y'^2 - 64 = 0$ , an equation of an ellipse, in the standard form  $\frac{x'^2}{a^2} + \frac{y'^2}{b^2} = 1$ .

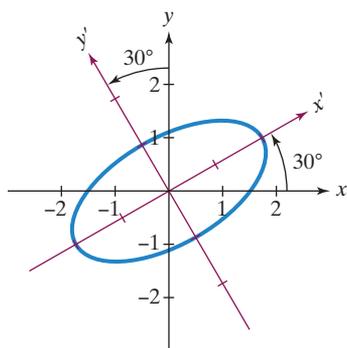

$$16x'^2 + 64y'^2 - 64 = 0 \quad \text{This equation describes the ellipse relative to a system rotated through } 30^\circ.$$

$$16x'^2 + 64y'^2 = 64 \quad \text{Add 64 to both sides.}$$

$$\frac{16x'^2}{64} + \frac{64y'^2}{64} = \frac{64}{64} \quad \text{Divide both sides by 64.}$$

$$\frac{x'^2}{4} + \frac{y'^2}{1} = 1 \quad \text{Simplify.}$$

**FIGURE 9.44** (repeated) The graph of  $7x^2 - 6\sqrt{3}xy + 13y^2 - 16 = 0$  or  $\frac{x'^2}{4} - \frac{y'^2}{1} = 1$ , a rotated ellipse

The equation  $\frac{x'^2}{4} + \frac{y'^2}{1} = 1$  is the standard form of the equation of an ellipse. The major axis is on the  $x'$ -axis and the vertices are  $(-2, 0)$  and  $(2, 0)$ . The minor axis is on the  $y'$ -axis with endpoints  $(0, -1)$  and  $(0, 1)$ . The graph of the ellipse is shown in **Figure 9.44**. Does this graph look familiar? It should—you saw it earlier in this section on page 963. ●●●

 **Check Point 3** Rewrite the equation

$$2x^2 + \sqrt{3}xy + y^2 - 2 = 0$$

in a rotated  $x'y'$ -system without an  $x'y'$ -term. Express the equation in the standard form of a conic section. Graph the conic section in the rotated system.

## TECHNOLOGY

In order to graph a general second-degree equation in the form

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$$

using a graphing utility, it is necessary to solve for  $y$ . Rewrite the equation as a quadratic equation in  $y$ .

$$Cy^2 + (Bx + E)y + (Ax^2 + Dx + F) = 0$$

By applying the quadratic formula, the graph of this equation can be obtained by entering

$$y_1 = \frac{-(Bx + E) + \sqrt{(Bx + E)^2 - 4C(Ax^2 + Dx + F)}}{2C}$$

and

$$y_2 = \frac{-(Bx + E) - \sqrt{(Bx + E)^2 - 4C(Ax^2 + Dx + F)}}{2C}.$$

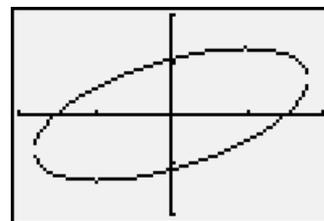

The graph of

$$7x^2 - 6\sqrt{3}xy + 13y^2 - 16 = 0$$

is shown on the right in a  $[-2, 2, 1]$  by  $[-2, 2, 1]$  viewing rectangle. The graph was obtained by entering the equations for  $y_1$  and  $y_2$  shown above with

$$A = 7, B = -6\sqrt{3}, C = 13, D = 0, E = 0,$$

and  $F = -16$ .

In Example 3 and Check Point 3, we found  $\theta$ , the angle of rotation, directly because we recognized  $\frac{\sqrt{3}}{3}$  as the value of  $\cot 60^\circ$ . What do we do if  $\cot 2\theta$  is not the cotangent of one of the familiar angles? We use  $\cot 2\theta$  to find  $\sin \theta$  and  $\cos \theta$  as follows:

- Use a sketch of  $\cot 2\theta$  to find  $\cos 2\theta$ .
- Find  $\sin \theta$  and  $\cos \theta$  using the identities

$$\sin \theta = \sqrt{\frac{1 - \cos 2\theta}{2}} \quad \text{and} \quad \cos \theta = \sqrt{\frac{1 + \cos 2\theta}{2}}.$$

Because  $\theta$  is an acute angle, the positive square roots are appropriate.

The resulting values for  $\sin \theta$  and  $\cos \theta$  are used to write the rotation formulas that give an equation with no  $x'y'$ -term.

**EXAMPLE 4** Graphing the Equation of a Rotated ConicGraph relative to a rotated  $x'y'$ -system in which the equation has no  $x'y'$ -term:

$$16x^2 - 24xy + 9y^2 + 110x - 20y + 100 = 0.$$

**SOLUTION****Step 1** Use the given equation to find  $\cot 2\theta$ . With  $A = 16$ ,  $B = -24$ , and  $C = 9$ , we have

$$\cot 2\theta = \frac{A - C}{B} = \frac{16 - 9}{-24} = -\frac{7}{24}.$$

**Step 2** Use the expression for  $\cot 2\theta$  to determine  $\sin \theta$  and  $\cos \theta$ . A rough sketch showing  $\cot 2\theta$  is given in **Figure 9.47**. Because  $\theta$  is always acute and  $\cot 2\theta$  is negative,  $2\theta$  is in quadrant II. The third side of the triangle is found using  $r = \sqrt{x^2 + y^2}$ . Thus,  $r = \sqrt{(-7)^2 + 24^2} = \sqrt{625} = 25$ . By the definition of the cosine function,

$$\cos 2\theta = \frac{x}{r} = \frac{-7}{25} = -\frac{7}{25}.$$

Now we use identities to find values for  $\sin \theta$  and  $\cos \theta$ .

$$\begin{aligned} \sin \theta &= \sqrt{\frac{1 - \cos 2\theta}{2}} = \sqrt{\frac{1 - \left(-\frac{7}{25}\right)}{2}} \\ &= \sqrt{\frac{\frac{25}{25} + \frac{7}{25}}{2}} = \sqrt{\frac{\frac{32}{25}}{2}} = \sqrt{\frac{32}{50}} = \sqrt{\frac{16}{25}} = \frac{4}{5} \\ \cos \theta &= \sqrt{\frac{1 + \cos 2\theta}{2}} = \sqrt{\frac{1 + \left(-\frac{7}{25}\right)}{2}} \\ &= \sqrt{\frac{\frac{25}{25} - \frac{7}{25}}{2}} = \sqrt{\frac{\frac{18}{25}}{2}} = \sqrt{\frac{18}{50}} = \sqrt{\frac{9}{25}} = \frac{3}{5} \end{aligned}$$

**Step 3** Substitute  $\sin \theta$  and  $\cos \theta$  in the rotation formulas

$$x = x' \cos \theta - y' \sin \theta \quad \text{and} \quad y = x' \sin \theta + y' \cos \theta$$

**and simplify.** Substituting  $\frac{4}{5}$  for  $\sin \theta$  and  $\frac{3}{5}$  for  $\cos \theta$ ,

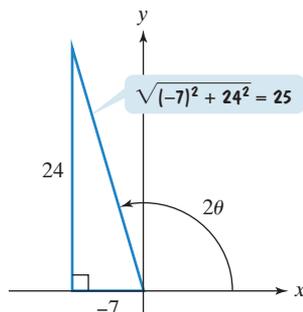

$$\begin{aligned} x &= x' \left(\frac{3}{5}\right) - y' \left(\frac{4}{5}\right) = \frac{3x' - 4y'}{5} \\ y &= x' \left(\frac{4}{5}\right) + y' \left(\frac{3}{5}\right) = \frac{4x' + 3y'}{5}. \end{aligned}$$

**Step 4** Substitute the expressions for  $x$  and  $y$  from the rotation formulas in the given equation and simplify.

$$16x^2 - 24xy + 9y^2 + 110x - 20y + 100 = 0$$

This is the given equation.

$$\begin{aligned} 16\left(\frac{3x' - 4y'}{5}\right)^2 - 24\left(\frac{3x' - 4y'}{5}\right)\left(\frac{4x' + 3y'}{5}\right) + 9\left(\frac{4x' + 3y'}{5}\right)^2 \\ + 110\left(\frac{3x' - 4y'}{5}\right) - 20\left(\frac{4x' + 3y'}{5}\right) + 100 = 0 \end{aligned}$$

Substitute the expressions for  $x$  and  $y$  from the rotation formulas.**FIGURE 9.47** Using  $\cot 2\theta$  to find  $\cos 2\theta$

Work with the preceding equation. Take a few minutes to expand, multiply both sides of the equation by 25, and combine like terms. You should obtain

$$y'^2 + 2x' - 4y' + 4 = 0,$$

an equation that has no  $x'y'$ -term.

**Step 5 Write the equation involving  $x'$  and  $y'$  in standard form.** With only one variable that is squared, we have the equation of a parabola. We need to write the equation in the standard form  $(y - k)^2 = 4p(x - h)$ .

$$y'^2 + 2x' - 4y' + 4 = 0$$

This is the equation without an  $x'y'$ -term.

$$y'^2 - 4y' = -2x' - 4$$

Isolate the terms involving  $y'$ .

$$y'^2 - 4y' + 4 = -2x' - 4 + 4$$

Complete the square by adding the square of half the coefficient of  $y'$ .

$$(y' - 2)^2 = -2x'$$

Factor.

The standard form of the parabola's equation in the rotated  $x'y'$ -system is

$$(y' - 2)^2 = -2x'.$$

This is  $(y' - k)^2$ ,  
with  $k = 2$ .

This is  
 $4p$ .

This is  $x' - h$ ,  
with  $h = 0$ .

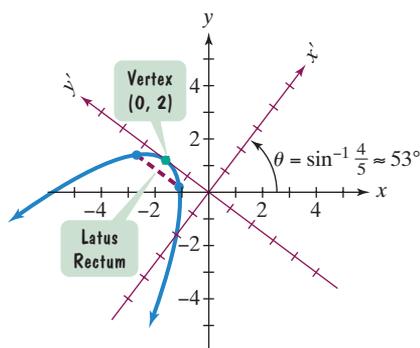

We see that  $h = 0$  and  $k = 2$ . Thus, the vertex of the parabola in the  $x'y'$ -system is  $(h, k) = (0, 2)$ .

We can use the  $x'y'$ -system to graph the parabola. Using a calculator to solve  $\sin \theta = \frac{4}{5}$ , we find that  $\theta = \sin^{-1} \frac{4}{5} \approx 53^\circ$ . Rotate the axes through approximately  $53^\circ$ . With  $4p = -2$  and  $p = -\frac{1}{2}$ , the parabola's focus is  $\frac{1}{2}$  unit to the left of the vertex,  $(0, 2)$ . Thus, the focus in the  $x'y'$ -system is  $(-\frac{1}{2}, 2)$ .

To graph the parabola, we use the vertex,  $(0, 2)$ , and the two endpoints of the latus rectum.

$$\text{length of latus rectum} = |4p| = |-2| = 2$$

The latus rectum extends 1 unit above and 1 unit below the focus,  $(-\frac{1}{2}, 2)$ . Thus, the endpoints of the latus rectum in the  $x'y'$ -system are  $(-\frac{1}{2}, 3)$  and  $(-\frac{1}{2}, 1)$ . Using the rotated system, pass a smooth curve through the vertex and the two endpoints of the latus rectum. The graph of the parabola is shown in **Figure 9.48**. ●●●

**FIGURE 9.48** The graph of  $(y' - 2)^2 = -2x'$  in a rotated  $x'y'$ -system

**Check Point 4** Graph relative to a rotated  $x'y'$ -system in which the equation has no  $x'y'$ -term:

$$4x^2 - 4xy + y^2 - 8\sqrt{5}x - 16\sqrt{5}y = 0.$$

**4** Identify conics without rotating axes.

### Identifying Conic Sections without Rotating Axes

We now know that the general second-degree equation

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0, B \neq 0$$

can be rewritten as

$$A'x'^2 + C'y'^2 + D'x' + E'y' + F' = 0$$

in a rotated  $x'y'$ -system. A relationship between the coefficients of the two equations is given by

$$B^2 - 4AC = -4A'C'.$$

We also know that  $A'$  and  $C'$  can be used to identify the graph of the rotated equation. Because  $B^2 - 4AC = -4A'C'$ , we can also use  $B^2 - 4AC$  to identify the graph of the general second-degree equation.

### Identifying a Conic Section without a Rotation of Axes

A nondegenerate conic section of the form

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$$

is

- a parabola if  $B^2 - 4AC = 0$ ,
- an ellipse or a circle if  $B^2 - 4AC < 0$ , and
- a hyperbola if  $B^2 - 4AC > 0$ .

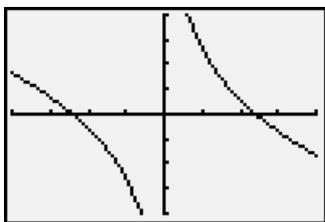

## TECHNOLOGY

### Graphic Connections

The graph of

$$11x^2 + 10\sqrt{3}xy + y^2 - 4 = 0$$

is shown in a  $[-1, 1, \frac{1}{4}]$  by  $[-1, 1, \frac{1}{4}]$  viewing rectangle. The graph verifies that the equation represents a rotated hyperbola.

### EXAMPLE 5 Identifying a Conic Section without Rotating Axes

Identify the graph of

$$11x^2 + 10\sqrt{3}xy + y^2 - 4 = 0.$$

### SOLUTION

We use  $A$ ,  $B$ , and  $C$  to identify the conic section.

$$11x^2 + 10\sqrt{3}xy + y^2 - 4 = 0$$

$$A = 11 \quad B = 10\sqrt{3} \quad C = 1$$

$$B^2 - 4AC = (10\sqrt{3})^2 - 4(11)(1) = 100 \cdot 3 - 44 = 256 > 0$$

Because  $B^2 - 4AC > 0$ , the graph of the equation is a hyperbola. ...

**Check Point 5** Identify the graph of  $3x^2 - 2\sqrt{3}xy + y^2 + 2x + 2\sqrt{3}y = 0$ .

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

1. A nondegenerate conic section in the form

$$Ax^2 + Cy^2 + Dx + Ey + F = 0,$$

in which  $A$  and  $C$  are not both zero is a/an \_\_\_\_\_

if  $A = C$ , a/an \_\_\_\_\_ if  $AC = 0$ , a/an \_\_\_\_\_

if  $A \neq C$  and  $AC > 0$ , and a/an \_\_\_\_\_ if  $AC < 0$ .

2. The general second-degree equation

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0, B \neq 0$$

can be rewritten as an equation in  $x'$  and  $y'$  without an  $x'y'$ -term by rotating the axes through an acute angle  $\theta$  that satisfies the equation \_\_\_\_\_.

3. A nondegenerate conic section of the form

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$$

is a/an \_\_\_\_\_ if  $B^2 - 4AC = 0$ , a/an \_\_\_\_\_

or a/an \_\_\_\_\_ if  $B^2 - 4AC < 0$ , and

a/an \_\_\_\_\_ if  $B^2 - 4AC > 0$ .

## EXERCISE SET 9.4

## Practice Exercises

In Exercises 1–8, identify each equation without completing the square.

- $y^2 - 4x + 2y + 21 = 0$
- $y^2 - 4x - 4y = 0$
- $4x^2 - 9y^2 - 8x - 36y - 68 = 0$
- $9x^2 + 25y^2 - 54x - 200y + 256 = 0$
- $4x^2 + 4y^2 + 12x + 4y + 1 = 0$
- $9x^2 + 4y^2 - 36x + 8y + 31 = 0$
- $100x^2 - 7y^2 + 90y - 368 = 0$
- $y^2 + 8x + 6y + 25 = 0$

In Exercises 9–14, write each equation in terms of a rotated  $x'y'$ -system using  $\theta$ , the angle of rotation. Write the equation involving  $x'$  and  $y'$  in standard form.

- $xy = -1; \theta = 45^\circ$
- $xy = -4; \theta = 45^\circ$
- $x^2 - 4xy + y^2 - 3 = 0; \theta = 45^\circ$
- $13x^2 - 10xy + 13y^2 - 72 = 0; \theta = 45^\circ$
- $23x^2 + 26\sqrt{3}xy - 3y^2 - 144 = 0; \theta = 30^\circ$
- $13x^2 - 6\sqrt{3}xy + 7y^2 - 16 = 0; \theta = 60^\circ$

In Exercises 15–26, write the appropriate rotation formulas so that in a rotated system the equation has no  $x'y'$ -term.

- $x^2 + xy + y^2 - 10 = 0$
- $x^2 + 4xy + y^2 - 3 = 0$
- $3x^2 - 10xy + 3y^2 - 32 = 0$
- $5x^2 - 8xy + 5y^2 - 9 = 0$
- $11x^2 + 10\sqrt{3}xy + y^2 - 4 = 0$
- $7x^2 - 6\sqrt{3}xy + 13y^2 - 16 = 0$
- $10x^2 + 24xy + 17y^2 - 9 = 0$
- $32x^2 - 48xy + 18y^2 - 15x - 20y = 0$
- $x^2 + 4xy - 2y^2 - 1 = 0$
- $3xy - 4y^2 + 18 = 0$
- $34x^2 - 24xy + 41y^2 - 25 = 0$
- $6x^2 - 6xy + 14y^2 - 45 = 0$

In Exercises 27–38,

- Rewrite the equation in a rotated  $x'y'$ -system without an  $x'y'$ -term. Use the appropriate rotation formulas from Exercises 15–26.
  - Express the equation involving  $x'$  and  $y'$  in the standard form of a conic section.
  - Use the rotated system to graph the equation.
- $x^2 + xy + y^2 - 10 = 0$
  - $x^2 + 4xy + y^2 - 3 = 0$
  - $3x^2 - 10xy + 3y^2 - 32 = 0$
  - $5x^2 - 8xy + 5y^2 - 9 = 0$

- $11x^2 + 10\sqrt{3}xy + y^2 - 4 = 0$
- $7x^2 - 6\sqrt{3}xy + 13y^2 - 16 = 0$
- $10x^2 + 24xy + 17y^2 - 9 = 0$
- $32x^2 - 48xy + 18y^2 - 15x - 20y = 0$
- $x^2 + 4xy - 2y^2 - 1 = 0$
- $3xy - 4y^2 + 18 = 0$
- $34x^2 - 24xy + 41y^2 - 25 = 0$
- $6x^2 - 6xy + 14y^2 - 45 = 0$

In Exercises 39–44, identify each equation without applying a rotation of axes.

- $5x^2 - 2xy + 5y^2 - 12 = 0$
- $10x^2 + 24xy + 17y^2 - 9 = 0$
- $24x^2 + 16\sqrt{3}xy + 8y^2 - x + \sqrt{3}y - 8 = 0$
- $3x^2 - 2\sqrt{3}xy + y^2 + 2x + 2\sqrt{3}y = 0$
- $23x^2 + 26\sqrt{3}xy - 3y^2 - 144 = 0$
- $4xy + 3y^2 + 4x + 6y - 1 = 0$

## Practice Plus

In Exercises 45–48,

- If the graph of the equation is an ellipse, find the coordinates of the vertices on the minor axis.
- If the graph of the equation is a hyperbola, find the equations of the asymptotes.
- If the graph of the equation is a parabola, find the coordinates of the vertex.

Express answers relative to an  $x'y'$ -system in which the given equation has no  $x'y'$ -term. Assume that the  $x'y'$ -system has the same origin as the  $xy$ -system.

- $5x^2 - 6xy + 5y^2 - 8 = 0$
- $2x^2 - 4xy + 5y^2 - 36 = 0$
- $x^2 - 4xy + 4y^2 + 5\sqrt{5}y - 10 = 0$
- $x^2 + 4xy - 2y^2 - 6 = 0$

## Writing in Mathematics

49. Explain how to identify the graph of

$$Ax^2 + Cy^2 + Dx + Ey + F = 0.$$

- If there is a  $60^\circ$  angle from the positive  $x$ -axis to the positive  $x'$ -axis, explain how to obtain the rotation formulas for  $x$  and  $y$ .
- How do you obtain the angle of rotation so that a general second-degree equation has no  $x'y'$ -term in a rotated  $x'y'$ -system?
- What is the most time-consuming part in using a graphing utility to graph a general second-degree equation with an  $xy$ -term?
- Explain how to identify the graph of

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0.$$

## Technology Exercises

In Exercises 54–60, use a graphing utility to graph each equation.

54.  $x^2 + 4xy + y^2 - 3 = 0$   
 55.  $7x^2 + 8xy + y^2 - 1 = 0$   
 56.  $3x^2 + 4xy + 6y^2 - 7 = 0$   
 57.  $3x^2 - 6xy + 3y^2 + 10x - 8y - 2 = 0$   
 58.  $9x^2 + 24xy + 16y^2 + 90x - 130y = 0$   
 59.  $x^2 + 4xy + 4y^2 + 10\sqrt{5}x - 9 = 0$   
 60.  $7x^2 + 6xy + 2.5y^2 - 14x + 4y + 9 = 0$

## Critical Thinking Exercises

**Make Sense?** In Exercises 61–64, determine whether each statement makes sense or does not make sense, and explain your reasoning.

61. I graphed  $2x^2 - 3y^2 + 6y + 4 = 0$  by using the procedure for writing the equation of a rotated conic in standard form.  
 62. In order to graph an ellipse whose equation contained an  $xy$ -term, I used a rotated coordinate system that placed the ellipse's center at the origin.  
 63. Although the algebra of rotations can get ugly, the main idea is that rotation through an appropriate angle will transform a general second-degree equation into an equation in  $x'$  and  $y'$  without an  $x'y'$ -term.  
 64. I can verify that  $2xy - 9 = 0$  is the equation of a hyperbola by rotating the axes through  $45^\circ$  or by showing that  $B^2 - 4AC > 0$ .  
 65. Explain the relationship between the graph of  $3x^2 - 2xy + 3y^2 + 2 = 0$  and the sound made by one hand clapping. Begin by following the directions for Exercises 27–38. (You will first need to write rotation formulas that eliminate the  $x'y'$ -term.)  
 66. What happens to the equation  $x^2 + y^2 = r^2$  in a rotated  $x'y'$ -system?

In Exercises 67–68, let

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$$

be an equation of a conic section in an  $xy$ -coordinate system. Let  $A'x'^2 + B'x'y' + C'y'^2 + D'x' + E'y' + F' = 0$  be the equation of the conic section in the rotated  $x'y'$ -coordinate system. Use the coefficients  $A'$ ,  $B'$ , and  $C'$ , shown in the equation with the voice balloon pointing to  $B'$  on page 966, to prove the following relationships.

67.  $A' + C' = A + C$   
 68.  $B'^2 - 4A'C' = B^2 - 4AC$

## Group Exercise

69. Many public and private organizations and schools provide educational materials and information for the blind and visually impaired. Using your library, resources on the World Wide Web, or local organizations, investigate how your group or college could make a contribution to enhance the study of mathematics for the blind and visually impaired. In relation to conic sections, group members should discuss how to create graphs in tactile, or touchable, form that show blind students the visual structure of the conics, including asymptotes, intercepts, end behavior, and rotations.

## Preview Exercises

Exercises 70–72 will help you prepare for the material covered in the next section. In each exercise, graph the equation in a rectangular coordinate system.

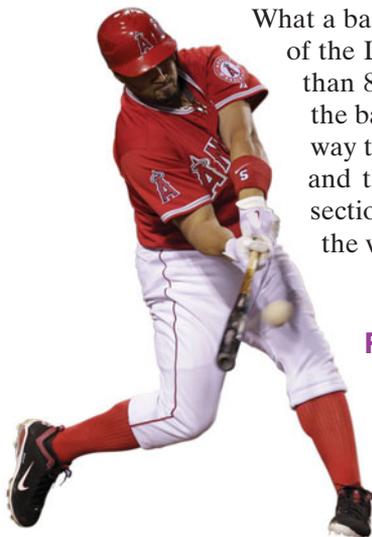

70.  $y^2 = 4(x + 1)$   
 71.  $y = \frac{1}{2}x^2 + 1, \quad x \geq 0$   
 72.  $\frac{x^2}{25} + \frac{y^2}{4} = 1$

## SECTION 9.5

## Parametric Equations

## Objectives

- 1 Use point plotting to graph plane curves described by parametric equations.
- 2 Eliminate the parameter.
- 3 Find parametric equations for functions.
- 4 Understand the advantages of parametric representations.

What a baseball game! You got to see the great Albert Pujols of the Los Angeles Angels blast a powerful homer. In less than 8 seconds, the parabolic path of his home run took the ball a horizontal distance of over 1000 feet. Is there a way to model this path that gives both the ball's location and the time that it is in each of its positions? In this section, we look at ways of describing curves that reveal the where and the when of motion.

## Plane Curves and Parametric Equations

You throw a ball from a height of 6 feet, with an initial velocity of 90 feet per second and at an angle of  $40^\circ$  with the horizontal. After  $t$  seconds, the location of the ball can be described by

$$x = (90 \cos 40^\circ)t \quad \text{and} \quad y = 6 + (90 \sin 40^\circ)t - 16t^2.$$

This is the ball's horizontal distance, in feet.

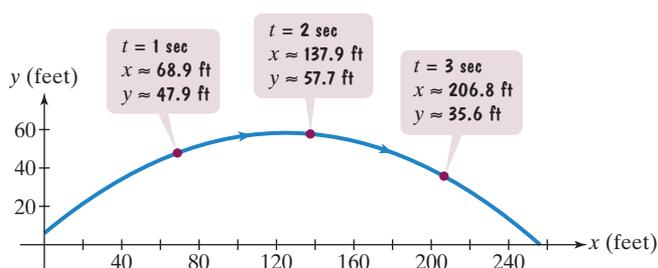

This is the ball's vertical height, in feet.

Because we can use these equations to calculate the location of the ball at any time  $t$ , we can describe the path of the ball. For example, to determine the location when  $t = 1$  second, substitute **1** for  $t$  in each equation:

$$x = (90 \cos 40^\circ)t = (90 \cos 40^\circ)(1) \approx 68.9 \text{ feet}$$

$$y = 6 + (90 \sin 40^\circ)t - 16t^2 = 6 + (90 \sin 40^\circ)(1) - 16(1)^2 \approx 47.9 \text{ feet.}$$

This tells us that after one second, the ball has traveled a horizontal distance of approximately 68.9 feet, and the height of the ball is approximately 47.9 feet. **Figure 9.49** displays this information and the results for calculations corresponding to  $t = 2$  seconds and  $t = 3$  seconds.

**FIGURE 9.49** The location of a thrown ball after 1, 2, and 3 seconds

The voice balloons in **Figure 9.49** tell where the ball is located and when the ball is at a given point  $(x, y)$  on its path. The variable  $t$ , called a **parameter**, gives the various times for the ball's location. The equations that describe where the ball is located express both  $x$  and  $y$  as functions of  $t$  and are called **parametric equations**.

$$x = (90 \cos 40^\circ)t \quad y = 6 + (90 \sin 40^\circ)t - 16t^2$$

This is the parametric equation for  $x$ .

This is the parametric equation for  $y$ .

The collection of points  $(x, y)$  in **Figure 9.49** is called a **plane curve**.

### Plane Curves and Parametric Equations

Suppose that  $t$  is a number in an interval  $I$ . A **plane curve** is the set of ordered pairs  $(x, y)$ , where

$$x = f(t), \quad y = g(t) \quad \text{for } t \text{ in interval } I.$$

The variable  $t$  is called a **parameter**, and the equations  $x = f(t)$  and  $y = g(t)$  are called **parametric equations** for the curve.

**1** Use point plotting to graph plane curves described by parametric equations.

### Graphing Plane Curves

Graphing a plane curve represented by parametric equations involves plotting points in the rectangular coordinate system and connecting them with a smooth curve.

#### Graphing a Plane Curve Described by Parametric Equations

1. Select some values of  $t$  on the given interval.
2. For each value of  $t$ , use the given parametric equations to compute  $x$  and  $y$ .
3. Plot the points  $(x, y)$  in the order of increasing  $t$  and connect them with a smooth curve.

Turn back a page and take a second look at **Figure 9.49**. Do you notice arrows along the curve? These arrows show the direction, or **orientation**, along the curve as  $t$  increases. After graphing a plane curve defined by parametric equations, use arrows between the points to show the orientation of the curve corresponding to increasing values of  $t$ .

### EXAMPLE 1 Graphing a Curve Defined by Parametric Equations

Graph the plane curve defined by the parametric equations:

$$x = t^2 - 1, \quad y = 2t, \quad -2 \leq t \leq 2.$$

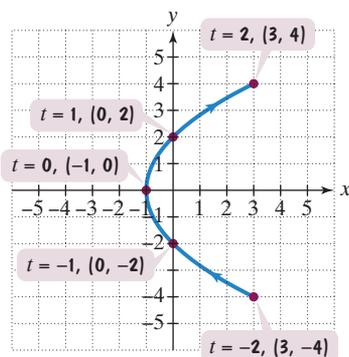

#### SOLUTION

**Step 1** Select some values of  $t$  on the given interval. We will select integral values of  $t$  on the interval  $-2 \leq t \leq 2$ . Let  $t = -2, -1, 0, 1,$  and  $2$ .

**Step 2** For each value of  $t$ , use the given parametric equations to compute  $x$  and  $y$ . We organize our work in a table. The first column lists the choices for the parameter  $t$ . The next two columns show the corresponding values for  $x$  and  $y$ . The last column lists the ordered pair  $(x, y)$ .

$t$	$x = t^2 - 1$	$y = 2t$	$(x, y)$
-2	$(-2)^2 - 1 = 4 - 1 = 3$	$2(-2) = -4$	$(3, -4)$
-1	$(-1)^2 - 1 = 1 - 1 = 0$	$2(-1) = -2$	$(0, -2)$
0	$0^2 - 1 = -1$	$2(0) = 0$	$(-1, 0)$
1	$1^2 - 1 = 0$	$2(1) = 2$	$(0, 2)$
2	$2^2 - 1 = 4 - 1 = 3$	$2(2) = 4$	$(3, 4)$

**Step 3** Plot the points  $(x, y)$  in the order of increasing  $t$  and connect them with a smooth curve. The plane curve defined by the parametric equations on the given interval is shown in **Figure 9.50**. The arrows show the direction, or orientation, along the curve as  $t$  varies from  $-2$  to  $2$ .

**FIGURE 9.50** The plane curve defined by  $x = t^2 - 1$ ,  $y = 2t$ ,  $-2 \leq t \leq 2$

## 2 Eliminate the parameter.

### TECHNOLOGY

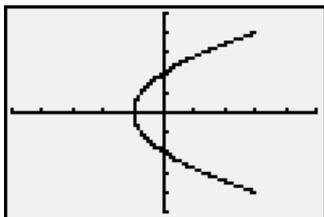

A graphing utility can be used to obtain a plane curve represented by parametric equations. Set the mode to parametric and enter the equations. You must enter the minimum and maximum values for  $t$  and an increment setting for  $t$  ( $t$ step). The setting  $t$ step determines the number of points the graphing utility will plot.

Shown below is the plane curve for

$$x = t^2 - 1$$

$$y = 2t$$

in a  $[-5, 5, 1]$  by  $[-5, 5, 1]$  viewing rectangle with  $t$ min =  $-2$ ,  $t$ max =  $2$ , and  $t$ step =  $0.01$ .

**Check Point 1** Graph the plane curve defined by the parametric equations:

$$x = t^2 + 1, \quad y = 3t, \quad -2 \leq t \leq 2.$$

### Eliminating the Parameter

The graph in **Figure 9.50** shows the plane curve for  $x = t^2 - 1$ ,  $y = 2t$ ,  $-2 \leq t \leq 2$ . Even if we examine the parametric equations carefully, we may not be able to tell that the corresponding plane curve is a portion of a parabola. By **eliminating the parameter**, we can write one equation in  $x$  and  $y$  that is equivalent to the two parametric equations. The voice balloons illustrate this process.

Begin with the parametric equations.

$$x = t^2 - 1$$

$$y = 2t$$

Solve for  $t$  in one of the equations.

Using  $y = 2t$ ,

$$t = \frac{y}{2}.$$

Substitute the expression for  $t$  in the other parametric equation.

Using  $t = \frac{y}{2}$  and  $x = t^2 - 1$ ,

$$x = \left(\frac{y}{2}\right)^2 - 1.$$

The rectangular equation (the equation in  $x$  and  $y$ ),  $x = \frac{y^2}{4} - 1$ , can be written as  $y^2 = 4(x + 1)$ . This is the standard form of the equation of a parabola with vertex at  $(-1, 0)$  and axis of symmetry along the  $x$ -axis. Because the parameter  $t$  is restricted to the interval  $[-2, 2]$ , the plane curve in the technology box on the left shows only a part of the parabola.

Our discussion illustrates a second method for graphing a plane curve described by parametric equations. Eliminate the parameter  $t$  and graph the resulting rectangular equation in  $x$  and  $y$ . However, **you may need to change the domain of the rectangular equation to be consistent with the domain for the parametric equation in  $x$** . This situation is illustrated in Example 2.

### EXAMPLE 2 Finding and Graphing the Rectangular Equation of a Curve Defined Parametrically

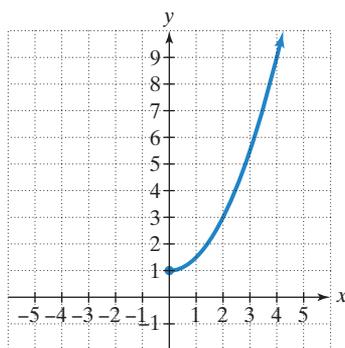

Sketch the plane curve represented by the parametric equations

$$x = \sqrt{t} \quad \text{and} \quad y = \frac{1}{2}t + 1$$

by eliminating the parameter.

#### SOLUTION

We eliminate the parameter  $t$  and then graph the resulting rectangular equation.

**FIGURE 9.51** The plane curve for  $x = \sqrt{t}$  and  $y = \frac{1}{2}t + 1$ , or  $y = \frac{1}{2}x^2 + 1, x \geq 0$

Begin with the parametric equations.

$$x = \sqrt{t} \\ y = \frac{1}{2}t + 1$$

Solve for  $t$  in one of the equations.

Using  $x = \sqrt{t}$  and squaring both sides,  $t = x^2$ .

Substitute the expression for  $t$  in the other parametric equation.

$$\text{Using } t = x^2 \text{ and } y = \frac{1}{2}t + 1, \\ y = \frac{1}{2}x^2 + 1.$$

Because  $t$  is not limited to a closed interval, you might be tempted to graph the entire bowl-shaped parabola whose equation is  $y = \frac{1}{2}x^2 + 1$ . However, take a second look at the parametric equation for  $x$ :

$$x = \sqrt{t}.$$

This equation is defined only when  $t \geq 0$ . Thus,  $x$  is nonnegative. The plane curve is the parabola given by  $y = \frac{1}{2}x^2 + 1$  with the domain restricted to  $x \geq 0$ . The plane curve is shown in **Figure 9.51**. ●●●

**Check Point 2** Sketch the plane curve represented by the parametric equations

$$x = \sqrt{t} \quad \text{and} \quad y = 2t - 1$$

by eliminating the parameter.

Eliminating the parameter is not always a simple matter. In some cases, it may not be possible. When this occurs, you can use point plotting to obtain a plane curve.

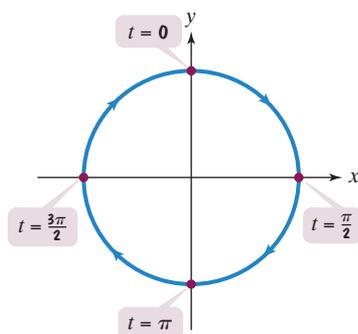

Trigonometric identities can be helpful in eliminating the parameter. For example, consider the plane curve defined by the parametric equations

$$x = \sin t, \quad y = \cos t, \quad 0 \leq t < 2\pi.$$

We use the trigonometric identity  $\sin^2 t + \cos^2 t = 1$  to eliminate the parameter. Square each side of each parametric equation and then add.

$$\begin{array}{r} x^2 = \sin^2 t \\ y^2 = \cos^2 t \\ \hline x^2 + y^2 = \sin^2 t + \cos^2 t \end{array}$$

This is the sum of the two equations above the horizontal lines.

**FIGURE 9.52** The plane curve defined by  $x = \sin t, y = \cos t, 0 \leq t < 2\pi$

Using a Pythagorean identity, we write this equation as  $x^2 + y^2 = 1$ . The plane curve is a circle with center  $(0, 0)$  and radius 1. It is shown in **Figure 9.52**.

**EXAMPLE 3** Finding and Graphing the Rectangular Equation of a Curve Defined Parametrically

Sketch the plane curve represented by the parametric equations

$$x = 5 \cos t, \quad y = 2 \sin t, \quad 0 \leq t \leq \pi$$

by eliminating the parameter.

**SOLUTION**

We eliminate the parameter using the identity  $\cos^2 t + \sin^2 t = 1$ . To apply the identity, divide the parametric equation for  $x$  by 5 and the parametric equation for  $y$  by 2.

$$\frac{x}{5} = \cos t \quad \text{and} \quad \frac{y}{2} = \sin t$$

Square and add these two equations.

$$\begin{array}{r} \frac{x^2}{25} = \cos^2 t \\ \frac{y^2}{4} = \sin^2 t \\ \hline \frac{x^2}{25} + \frac{y^2}{4} = \cos^2 t + \sin^2 t \end{array}$$

This is the sum of the two equations above the horizontal lines.

Using a Pythagorean identity, we write this equation as

$$\frac{x^2}{25} + \frac{y^2}{4} = 1.$$

This rectangular equation is the standard form of the equation for an ellipse centered at  $(0, 0)$ .

$$\frac{x^2}{25} + \frac{y^2}{4} = 1$$

$a^2 = 25$ : Endpoints of major axis are 5 units left and right of center.

$b^2 = 4$ : Endpoints of minor axis are 2 units above and below center.

The ellipse is shown in **Figure 9.53(a)** at the top of the next page. However, this is not the plane curve. Because  $t$  is restricted to the interval  $[0, \pi]$ , the plane curve is only a portion of the ellipse. Use the starting and ending values for  $t$ , 0 and  $\pi$ , respectively, and a value of  $t$  in the interval  $(0, \pi)$  to find which portion to include.

<b>Begin at <math>t = 0</math>.</b>	<b>Increase to <math>t = \frac{\pi}{2}</math>.</b>	<b>End at <math>t = \pi</math>.</b>
$x = 5 \cos t = 5 \cos 0 = 5 \cdot 1 = 5$	$x = 5 \cos t = 5 \cos \frac{\pi}{2} = 5 \cdot 0 = 0$	$x = 5 \cos t = 5 \cos \pi = 5(-1) = -5$
$y = 2 \sin t = 2 \sin 0 = 2 \cdot 0 = 0$	$y = 2 \sin t = 2 \sin \frac{\pi}{2} = 2 \cdot 1 = 2$	$y = 2 \sin t = 2 \sin \pi = 2(0) = 0$

Points on the plane curve include  $(5, 0)$ , which is the starting point,  $(0, 2)$ , and  $(-5, 0)$ , which is the ending point. The plane curve is the top half of the ellipse, shown in **Figure 9.53(b)** on the next page.

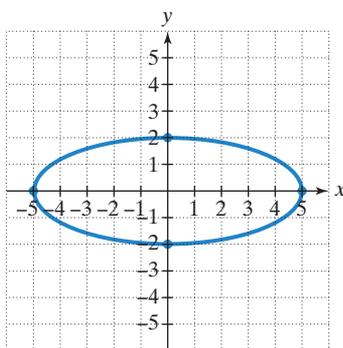

FIGURE 9.53(a) The graph of  $\frac{x^2}{25} + \frac{y^2}{4} = 1$

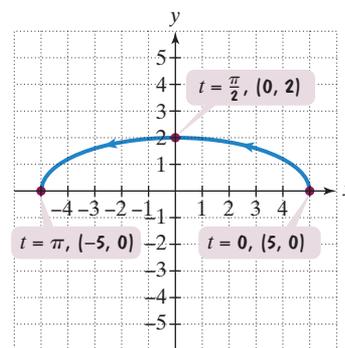

FIGURE 9.53(b) The plane curve for  $x = 5 \cos t$ ,  $y = 2 \sin t$ ,  $0 \leq t \leq \pi$

 **Check Point 3** Sketch the plane curve represented by the parametric equations

$$x = 6 \cos t, y = 4 \sin t, \pi \leq t \leq 2\pi$$

by eliminating the parameter.

**3** Find parametric equations for functions.

### Finding Parametric Equations

Infinitely many pairs of parametric equations can represent the same plane curve. If the plane curve is defined by the function  $y = f(x)$ , here is a procedure for finding a set of parametric equations:

#### Parametric Equations for the Function $y = f(x)$

One set of parametric equations for the plane curve defined by  $y = f(x)$  is

$$x = t \quad \text{and} \quad y = f(t),$$

in which  $t$  is in the domain of  $f$ .

#### EXAMPLE 4 Finding Parametric Equations

Find a set of parametric equations for the parabola whose equation is  $y = 9 - x^2$ .

#### SOLUTION

Let  $x = t$ . Parametric equations for  $y = f(x)$  are  $x = t$  and  $y = f(t)$ . Thus, parametric equations for  $y = 9 - x^2$  are

$$x = t \quad \text{and} \quad y = 9 - t^2.$$

 **Check Point 4** Find a set of parametric equations for the parabola whose equation is  $y = x^2 - 25$ .

You can write other sets of parametric equations for  $y = 9 - x^2$  by starting with a different parametric equation for  $x$ . Here are three more sets of parametric equations for

$$y = 9 - x^2:$$

- If  $x = t^3$ ,  $y = 9 - (t^3)^2 = 9 - t^6$ .  
Parametric equations are  $x = t^3$  and  $y = 9 - t^6$ .
- If  $x = t + 1$ ,  $y = 9 - (t + 1)^2 = 9 - (t^2 + 2t + 1) = 8 - t^2 - 2t$ .  
Parametric equations are  $x = t + 1$  and  $y = 8 - t^2 - 2t$ .
- If  $x = \frac{t}{2}$ ,  $y = 9 - \left(\frac{t}{2}\right)^2 = 9 - \frac{t^2}{4}$ .  
Parametric equations are  $x = \frac{t}{2}$  and  $y = 9 - \frac{t^2}{4}$ .

When finding parametric equations for  $y = 9 - x^2$ , can we start with any choice for the parametric equation for  $x$ ? The answer is no. **The substitution for  $x$  must be a function that allows  $x$  to take on all the values in the domain of the given rectangular equation.** For example, the domain of the function  $y = 9 - x^2$  is the set of all real numbers. If you incorrectly let  $x = t^2$ , these values of  $x$  exclude negative numbers that are included in  $y = 9 - x^2$ . The parametric equations

$$x = t^2 \quad \text{and} \quad y = 9 - (t^2)^2 = 9 - t^4$$

do not represent  $y = 9 - x^2$  because only points for which  $x \geq 0$  are obtained.

- 4 Understand the advantages of parametric representations.

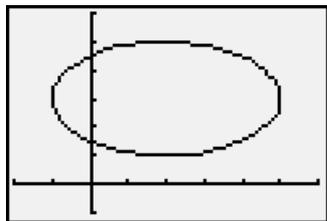

### TECHNOLOGY

The ellipse shown was obtained using the parametric mode and the radian mode of a graphing utility.

$$x(t) = 2 + 3 \cos t$$

$$y(t) = 3 + 2 \sin t$$

We used a  $[-2, 6, 1]$  by  $[-1, 6, 1]$  viewing rectangle with  $t_{\min} = 0$ ,  $t_{\max} = 6.2$ , and  $t_{\text{step}} = 0.1$ .

### Advantages of Parametric Equations over Rectangular Equations

We opened this section with parametric equations that described the horizontal distance and the vertical height of your thrown baseball after  $t$  seconds. Parametric equations are frequently used to represent the path of a moving object. If  $t$  represents time, parametric equations give the location of a moving object and tell when the object is located at each of its positions. Rectangular equations tell where the moving object is located but do not reveal when the object is in a particular position.

When using technology to obtain graphs, parametric equations that represent relations that are not functions are often easier to use than their corresponding rectangular equations. It is far easier to enter the equation of an ellipse given by the parametric equations

$$x = 2 + 3 \cos t \quad \text{and} \quad y = 3 + 2 \sin t$$

than to use the rectangular equivalent

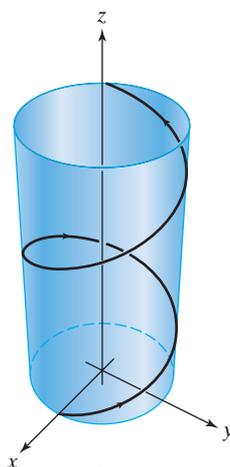

$$\frac{(x - 2)^2}{9} + \frac{(y - 3)^2}{4} = 1.$$

The rectangular equation must first be solved for  $y$  and then entered as two separate equations before a graphing utility reveals the ellipse.

### Blitzer Bonus || The Parametrization of DNA

The DNA molecule, structured like a spiraled ladder, consists of two parallel helices (singular: helix) that are intertwined.

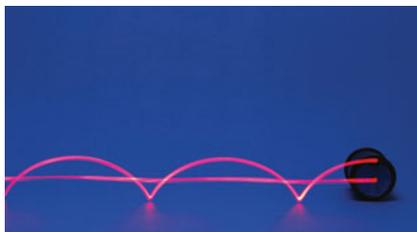

Each helix can be described by a curve in three dimensions represented by parametric equations in  $x$ ,  $y$ , and  $z$ :  
 $x = a \cos t$ ,  $y = a \sin t$ ,  $z = bt$ ,  
 where  $a$  and  $b$  are positive constants.

DNA, the molecule of biological inheritance, is hip. At least that's what a new breed of marketers would like you to believe. For \$2500, you can spit into a test tube and a Web-based company will tell you your risks for heart attack and other conditions.

It's been more than 55 years since James Watson and Francis Crick defined the structure, or shape, of DNA. A knowledge of how a molecule is structured does not always lead to an understanding of how it works, but it did in the case of DNA. The structure, which Watson and Crick announced in *Nature* in 1953, immediately suggested how the molecule could be reproduced and how it could contain biological information.

The structure of the DNA molecule reveals the vital role that trigonometric functions play in the genetic information and instruction codes necessary for the maintenance and continuation of life.

Linear functions and cycloids are used to describe rolling motion. The light at the rolling circle's center shows that it moves linearly. By contrast, the light at the circle's edge has rotational motion and traces out a cycloid.

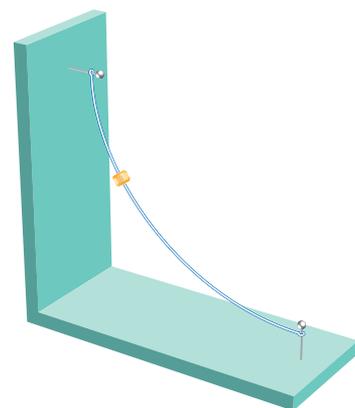

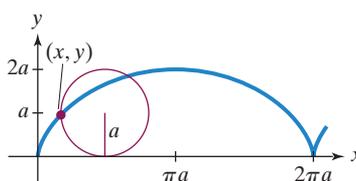

A curve that is used in physics for much of the theory of light is called a **cycloid**. The path of a fixed point on the circumference of a circle as it rolls along a line is a cycloid. A point on the rim of a bicycle wheel traces out a cycloid curve, shown in **Figure 9.54**. If the radius of the circle is  $a$ , the parametric equations of the cycloid are

$$x = a(t - \sin t) \quad \text{and} \quad y = a(1 - \cos t).$$

It is an extremely complicated task to represent the cycloid in rectangular form.

Cycloids are used to solve problems that involve the “shortest time.” For example, **Figure 9.55** shows a bead sliding down a wire. For the bead to travel along the wire in the shortest possible time, the shape of the wire should be that of an inverted cycloid.

**FIGURE 9.54** The curve traced by a fixed point on the circumference of a circle rolling along a straight line is a cycloid.

**FIGURE 9.55**

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- The pair of equations  $x = \sqrt{t}$  and  $y = 2t - 1$  are called \_\_\_\_\_ equations and the common variable  $t$  is called the \_\_\_\_\_. The graph for this pair of equations is called a/an \_\_\_\_\_.
- Eliminating the parameter from  $x = f(t)$  and  $y = g(t)$  means eliminating \_\_\_\_\_ from the pair of equations to obtain one equation in \_\_\_\_\_ and \_\_\_\_\_ only.
- In order to eliminate the parameter from  $x = 3 \sin t$  and  $y = 2 \cos t$ , isolate \_\_\_\_\_ and \_\_\_\_\_, square the two equations, and then use the identity \_\_\_\_\_.
- True or false: There is more than one way for pairs of parametric equations to represent the same plane curve. \_\_\_\_\_

## EXERCISE SET 9.5

### Practice Exercises

In Exercises 1–8, parametric equations and a value for the parameter  $t$  are given. Find the coordinates of the point on the plane curve described by the parametric equations corresponding to the given value of  $t$ .

- $x = 3 - 5t, y = 4 + 2t; t = 1$
- $x = 7 - 4t, y = 5 + 6t; t = 1$
- $x = t^2 + 1, y = 5 - t^3; t = 2$
- $x = t^2 + 3, y = 6 - t^3; t = 2$
- $x = 4 + 2 \cos t, y = 3 + 5 \sin t; t = \frac{\pi}{2}$
- $x = 2 + 3 \cos t, y = 4 + 2 \sin t; t = \pi$
- $x = (60 \cos 30^\circ)t, y = 5 + (60 \sin 30^\circ)t - 16t^2; t = 2$
- $x = (80 \cos 45^\circ)t, y = 6 + (80 \sin 45^\circ)t - 16t^2; t = 2$

In Exercises 9–20, use point plotting to graph the plane curve described by the given parametric equations. Use arrows to show the orientation of the curve corresponding to increasing values of  $t$ .

- $x = t + 2, y = t^2; -2 \leq t \leq 2$
- $x = t - 1, y = t^2; -2 \leq t \leq 2$
- $x = t - 2, y = 2t + 1; -2 \leq t \leq 3$
- $x = t - 3, y = 2t + 2; -2 \leq t \leq 3$
- $x = t + 1, y = \sqrt{t}; t \geq 0$
- $x = \sqrt{t}, y = t - 1; t \geq 0$
- $x = \cos t, y = \sin t; 0 \leq t < 2\pi$
- $x = -\sin t, y = -\cos t; 0 \leq t < 2\pi$
- $x = t^2, y = t^3; -\infty < t < \infty$
- $x = t^2 + 1, y = t^3 - 1; -\infty < t < \infty$
- $x = 2t, y = |t - 1|; -\infty < t < \infty$
- $x = |t + 1|, y = t - 2; -\infty < t < \infty$

In Exercises 21–40, eliminate the parameter  $t$ . Then use the rectangular equation to sketch the plane curve represented by the given parametric equations. Use arrows to show the orientation of the curve corresponding to increasing values of  $t$ . (If an interval for  $t$  is not specified, assume that  $-\infty < t < \infty$ .)

21.  $x = t, y = 2t$
22.  $x = t, y = -2t$
23.  $x = 2t - 4, y = 4t^2$
24.  $x = t - 2, y = t^2$
25.  $x = \sqrt{t}, y = t - 1$
26.  $x = \sqrt{t}, y = t + 1$
27.  $x = 2 \sin t, y = 2 \cos t; 0 \leq t < 2\pi$
28.  $x = 3 \sin t, y = 3 \cos t; 0 \leq t < 2\pi$
29.  $x = 1 + 3 \cos t, y = 2 + 3 \sin t; 0 \leq t < 2\pi$
30.  $x = -1 + 2 \cos t, y = 1 + 2 \sin t; 0 \leq t < 2\pi$
31.  $x = 2 \cos t, y = 3 \sin t; 0 \leq t < 2\pi$
32.  $x = 3 \cos t, y = 5 \sin t; 0 \leq t < 2\pi$
33.  $x = 1 + 3 \cos t, y = -1 + 2 \sin t; 0 \leq t \leq \pi$
34.  $x = 2 + 4 \cos t, y = -1 + 3 \sin t; 0 \leq t \leq \pi$
35.  $x = \sec t, y = \tan t$
36.  $x = 5 \sec t, y = 3 \tan t$
37.  $x = t^2 + 2, y = t^2 - 2$
38.  $x = \sqrt{t} + 2, y = \sqrt{t} - 2$
39.  $x = 2^t, y = 2^{-t}; t \geq 0$
40.  $x = e^t, y = e^{-t}; t \geq 0$

In Exercises 41–43, eliminate the parameter. Write the resulting equation in standard form.

41. A circle:  $x = h + r \cos t, y = k + r \sin t$
42. An ellipse:  $x = h + a \cos t, y = k + b \sin t$
43. A hyperbola:  $x = h + a \sec t, y = k + b \tan t$
44. The following are parametric equations of the line through  $(x_1, y_1)$  and  $(x_2, y_2)$ :  

$$x = x_1 + t(x_2 - x_1) \quad \text{and} \quad y = y_1 + t(y_2 - y_1).$$

Eliminate the parameter and write the resulting equation in point-slope form.

In Exercises 45–52, use your answers from Exercises 41–44 and the parametric equations given in Exercises 41–44 to find a set of parametric equations for the conic section or the line.

45. Circle: Center: (3, 5); Radius: 6
46. Circle: Center: (4, 6); Radius: 9
47. Ellipse: Center: (-2, 3); Vertices: 5 units to the left and right of the center; Endpoints of Minor Axis: 2 units above and below the center
48. Ellipse: Center: (4, -1); Vertices: 5 units above and below the center; Endpoints of Minor Axis: 3 units to the left and right of the center
49. Hyperbola: Vertices: (4, 0) and (-4, 0); Foci: (6, 0) and (-6, 0)

50. Hyperbola: Vertices: (0, 4) and (0, -4); Foci: (0, 5) and (0, -5)

51. Line: Passes through (-2, 4) and (1, 7)

52. Line: Passes through (3, -1) and (9, 12)

In Exercises 53–56, find two different sets of parametric equations for each rectangular equation.

53.  $y = 4x - 3$

54.  $y = 2x - 5$

55.  $y = x^2 + 4$

56.  $y = x^2 - 3$

In Exercises 57–58, the parametric equations of four plane curves are given. Graph each plane curve and determine how they differ from each other.

57. a.  $x = t$  and  $y = t^2 - 4$

- b.  $x = t^2$  and  $y = t^4 - 4$

- c.  $x = \cos t$  and  $y = \cos^2 t - 4$

- d.  $x = e^t$  and  $y = e^{2t} - 4$

58. a.  $x = t, y = \sqrt{4 - t^2}; -2 \leq t \leq 2$

- b.  $x = \sqrt{4 - t^2}, y = t; -2 \leq t \leq 2$

- c.  $x = 2 \sin t, y = 2 \cos t; 0 \leq t < 2\pi$

- d.  $x = 2 \cos t, y = 2 \sin t; 0 \leq t < 2\pi$

### Practice Plus

In Exercises 59–62, sketch the plane curve represented by the given parametric equations. Then use interval notation to give each relation's domain and range.

59.  $x = 4 \cos t + 2, y = 4 \cos t - 1$

60.  $x = 2 \sin t - 3, y = 2 \sin t + 1$

61.  $x = t^2 + t + 1, y = 2t$

62.  $x = t^2 - t + 6, y = 3t$

In Exercises 63–68, sketch the function represented by the given parametric equations. Then use the graph to determine each of the following:

- a. intervals, if any, on which the function is increasing and intervals, if any, on which the function is decreasing.

- b. the number, if any, at which the function has a maximum and this maximum value, or the number, if any, at which the function has a minimum and this minimum value.

63.  $x = 2^t, y = t$

64.  $x = e^t, y = t$

65.  $x = \frac{t}{2}, y = 2t^2 - 8t + 3$

66.  $x = \frac{t}{2}, y = -2t^2 + 8t - 1$

67.  $x = 2(t - \sin t), y = 2(1 - \cos t); 0 \leq t \leq 2\pi$

68.  $x = 3(t - \sin t), y = 3(1 - \cos t); 0 \leq t \leq 2\pi$

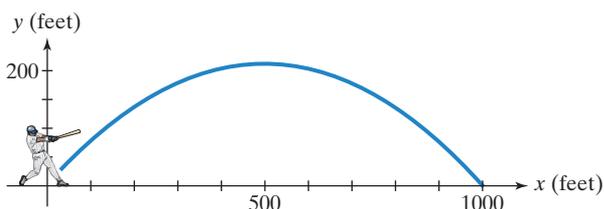

## Application Exercises

The path of a projectile that is launched  $h$  feet above the ground with an initial velocity of  $v_0$  feet per second and at an angle  $\theta$  with the horizontal is given by the parametric equations

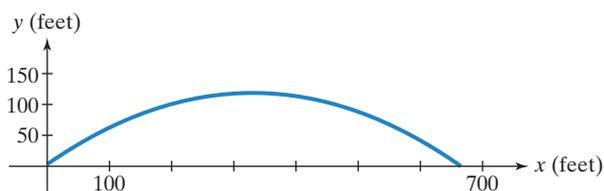

$$x = (v_0 \cos \theta)t \quad \text{and} \quad y = h + (v_0 \sin \theta)t - 16t^2,$$

where  $t$  is the time, in seconds, after the projectile was launched. The parametric equation for  $x$  gives the projectile's horizontal distance, in feet. The parametric equation for  $y$  gives the projectile's height, in feet. Use these parametric equations to solve Exercises 69–70.

69. The figure shows the path for a baseball hit by Albert Pujols. The ball was hit with an initial velocity of 180 feet per second at an angle of  $40^\circ$  to the horizontal. The ball was hit at a height 3 feet off the ground.

- a. Find the parametric equations that describe the position of the ball as a function of time.
- b. Describe the ball's position after 1, 2, and 3 seconds. Round to the nearest tenth of a foot. Locate your solutions on the plane curve.
- c. How long, to the nearest tenth of a second, is the ball in flight? What is the total horizontal distance that it travels before it lands? Is your answer consistent with the figure shown?
- d. You meet Albert Pujols and he asks you to tell him something interesting about the path of the baseball that he hit. Use the graph to respond to his request. Then verify your observation algebraically.
70. The figure shows the path for a baseball that was hit with an initial velocity of 150 feet per second at an angle of  $35^\circ$  to the horizontal. The ball was hit at a height of 3 feet off the ground.

- a. Find the parametric equations that describe the position of the ball as a function of time.
- b. Describe the ball's position after 1, 2, and 3 seconds. Round to the nearest tenth of a foot. Locate your solutions on the plane curve.
- c. How long is the ball in flight? (Round to the nearest tenth of a second.) What is the total horizontal distance that it travels, to the nearest tenth of a foot, before it lands? Is your answer consistent with the figure shown?
- d. Use the graph to describe something about the path of the baseball that might be of interest to the player who hit the ball. Then verify your observation algebraically.

## Writing in Mathematics

71. What are plane curves and parametric equations?
72. How is point plotting used to graph a plane curve described by parametric equations? Give an example with your description.
73. What is the significance of arrows along a plane curve?
74. What does it mean to eliminate the parameter? What useful information can be obtained by doing this?
75. Explain how the rectangular equation  $y = 5x$  can have infinitely many sets of parametric equations.
76. Discuss how the parametric equations for the path of a projectile (see Exercises 69–70) and the ability to obtain plane curves with a graphing utility can be used by a baseball coach to analyze performances of team players.

## Technology Exercises

77. Use a graphing utility in a parametric mode to verify any five of your hand-drawn graphs in Exercises 9–40.

In Exercises 78–82, use a graphing utility to obtain the plane curve represented by the given parametric equations.

78. Cycloid:  $x = 3(t - \sin t)$ ,  $y = 3(1 - \cos t)$ ;  
 $[0, 60, 5] \times [0, 8, 1]$ ,  $0 \leq t < 6\pi$
79. Cycloid:  $x = 2(t - \sin t)$ ,  $y = 2(1 - \cos t)$ ;  
 $[0, 60, 5] \times [0, 8, 1]$ ,  $0 \leq t < 6\pi$
80. Witch of Agnesi:  $x = 2 \cot t$ ,  $y = 2 \sin^2 t$ ;  
 $[-6, 6, 1] \times [-4, 4, 1]$ ,  $0 \leq t < 2\pi$
81. Hypocycloid:  $x = 4 \cos^3 t$ ,  $y = 4 \sin^3 t$ ;  
 $[-5, 5, 1] \times [-5, 5, 1]$ ,  $0 \leq t < 2\pi$
82. Lissajous Curve:  $x = 2 \cos t$ ,  $y = \sin 2t$ ;  
 $[-3, 3, 1] \times [-2, 2, 1]$ ,  $0 \leq t < 2\pi$

Use the equations for the path of a projectile given prior to Exercises 69–70 to solve Exercises 83–85.

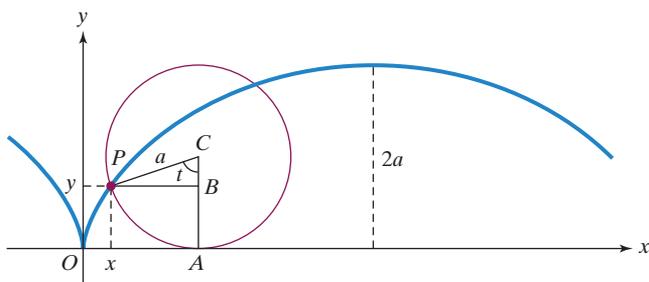

In Exercises 83–84, use a graphing utility to obtain the path of a projectile launched from the ground ( $h = 0$ ) at the specified values of  $\theta$  and  $v_0$ . In each exercise, use the graph to determine the maximum height and the time at which the projectile reaches its maximum height. Also use the graph to determine the range of the projectile and the time it hits the ground. Round all answers to the nearest tenth.

83.  $\theta = 55^\circ$ ,  $v_0 = 200$  feet per second
84.  $\theta = 35^\circ$ ,  $v_0 = 300$  feet per second
85. A baseball player throws a ball with an initial velocity of 140 feet per second at an angle of  $22^\circ$  to the horizontal. The ball leaves the player's hand at a height of 5 feet.
- Write the parametric equations that describe the ball's position as a function of time.
  - Use a graphing utility to obtain the path of the baseball.
  - Find the ball's maximum height and the time at which it reaches this height. Round all answers to the nearest tenth.
  - How long is the ball in the air?
  - How far does the ball travel?

## Critical Thinking Exercises

**Make Sense?** In Exercises 86–89, determine whether each statement makes sense or does not make sense, and explain your reasoning.

86. Parametric equations allow me to use functions to describe curves that are not graphs of functions.
87. Parametric equations let me think of a curve as a path traced out by a moving point.
88. I represented  $y = x^2 - 9$  with the parametric equations  $x = t^2$  and  $y = t^4 - 9$ .
89. I found alternate pairs of parametric equations for the same rectangular equation.
90. Eliminate the parameter:  $x = \cos^3 t$  and  $y = \sin^3 t$ .
91. The plane curve described by the parametric equations  $x = 3 \cos t$  and  $y = 3 \sin t$ ,  $0 \leq t < 2\pi$ , has a counterclockwise orientation. Alter one or both parametric equations so that you obtain the same plane curve with the opposite orientation.
92. The figure shows a circle of radius  $a$  rolling along a horizontal line. Point  $P$  traces out a cycloid. Angle  $t$ , in radians, is the angle through which the circle has rolled.  $C$  is the center of the circle.

Use the suggestions in parts (a) and (b) to prove that the parametric equations of the cycloid are  $x = a(t - \sin t)$  and  $y = a(1 - \cos t)$ .

- a. Derive the parametric equation for  $x$  using the figure and  $x = OA - xA$ .
- b. Derive the parametric equation for  $y$  using the figure and  $y = AC - BC$ .

## Preview Exercises

Exercises 93–95 will help you prepare for the material covered in the next section.

93. Rewrite  $r = \frac{4}{2 + \cos \theta}$  by dividing the numerator and the denominator by 2.
94. Complete the table of coordinates below. Where necessary, round to two decimal places. Then plot the resulting points,  $(r, \theta)$ , using a polar coordinate system.

$\theta$	0	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	$\pi$
$r = \frac{4}{2 + \cos \theta}$						

95. a. Showing all steps, rewrite  $r = \frac{1}{3 - 3 \cos \theta}$  as  $9r^2 = (1 + 3r \cos \theta)^2$ .
- b. Express  $9r^2 = (1 + 3r \cos \theta)^2$  in rectangular coordinates. Which conic section is represented by the rectangular equation?

## SECTION 9.6

## Conic Sections in Polar Coordinates

## Objectives

- 1 Define conics in terms of a focus and a directrix.
- 2 Graph the polar equations of conics.

John Glenn made the first U.S.-manned flight around Earth on *Friendship 7*.

On the morning of February 20, 1962, millions of Americans collectively held their breath as the world's newest pioneer swept across the threshold of one of our last frontiers. Roughly one hundred miles above Earth, astronaut John Glenn sat comfortably in the weightless environment of a

$9\frac{1}{2}$ -by-6-foot space capsule that offered the leg room of a Volkswagen “Beetle” and the aesthetics of a garbage can. Glenn became the first American to orbit Earth in a three-orbit mission that lasted slightly under 5 hours.

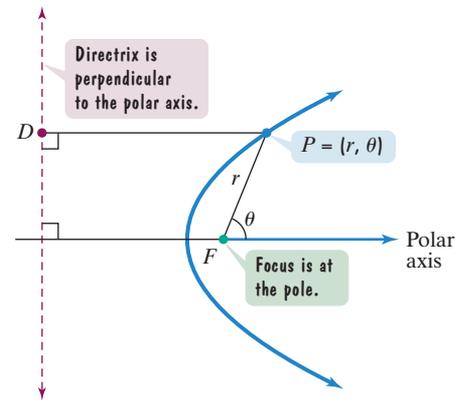

In this section’s Exercise Set, you will see how John Glenn’s historic orbit can be described using conic sections in polar coordinates. To obtain this model, we begin with a definition that permits a unified approach to the conic sections.

- 1 Define conics in terms of a focus and a directrix.

### The Focus-Directrix Definitions of the Conic Sections

The definition of a parabola is given in terms of a fixed point, the focus, and a fixed line, the directrix. By contrast, the definitions of an ellipse and a hyperbola are given in terms of two fixed points, the foci. It is possible to define each of these conic sections in terms of a point and a line. **Figure 9.56** shows a conic section in the polar coordinate system. The fixed point, the focus, is at the pole. The fixed line, the directrix, is perpendicular to the polar axis.

**FIGURE 9.56** A conic in the polar coordinate system

#### Focus-Directrix Definitions of the Conic Sections

Let  $F$  be a fixed point, the focus, and let  $D$  be a fixed line, the directrix, in a plane (**Figure 9.56**). A **conic section**, or **conic**, is the set of all points  $P$  in the plane such that

$$\frac{PF}{PD} = e,$$

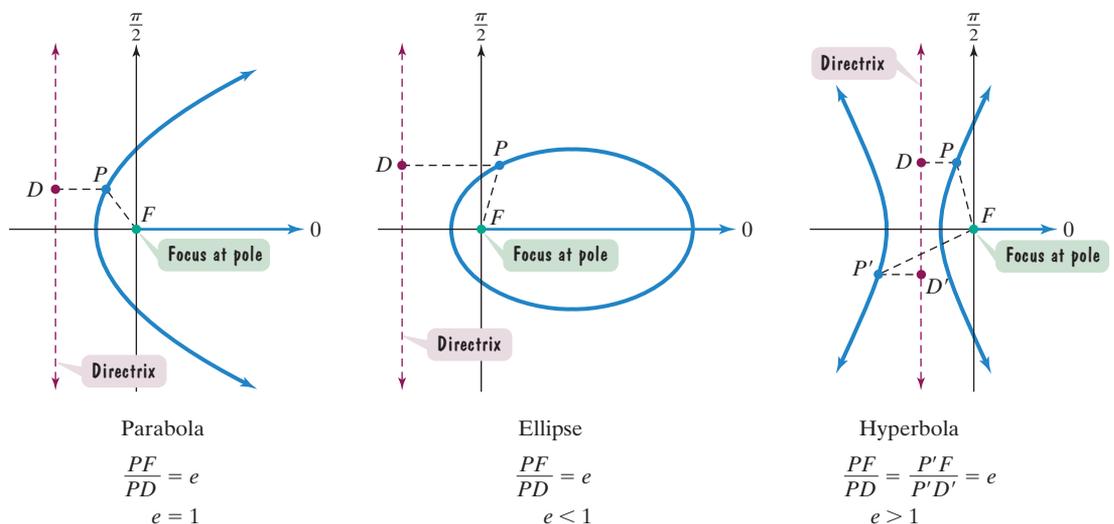

where  $e$  is a fixed positive number, called the **eccentricity**.

If  $e = 1$ , the conic is a parabola.

If  $e < 1$ , the conic is an ellipse.

If  $e > 1$ , the conic is a hyperbola.

**Figure 9.57** illustrates the eccentricity for each type of conic. Notice that if  $e = 1$ , the definition of the parabola is the same as the focus-directrix definition with which you are familiar.

**FIGURE 9.57** The eccentricity for each conic

- 2 Graph the polar equations of conics.

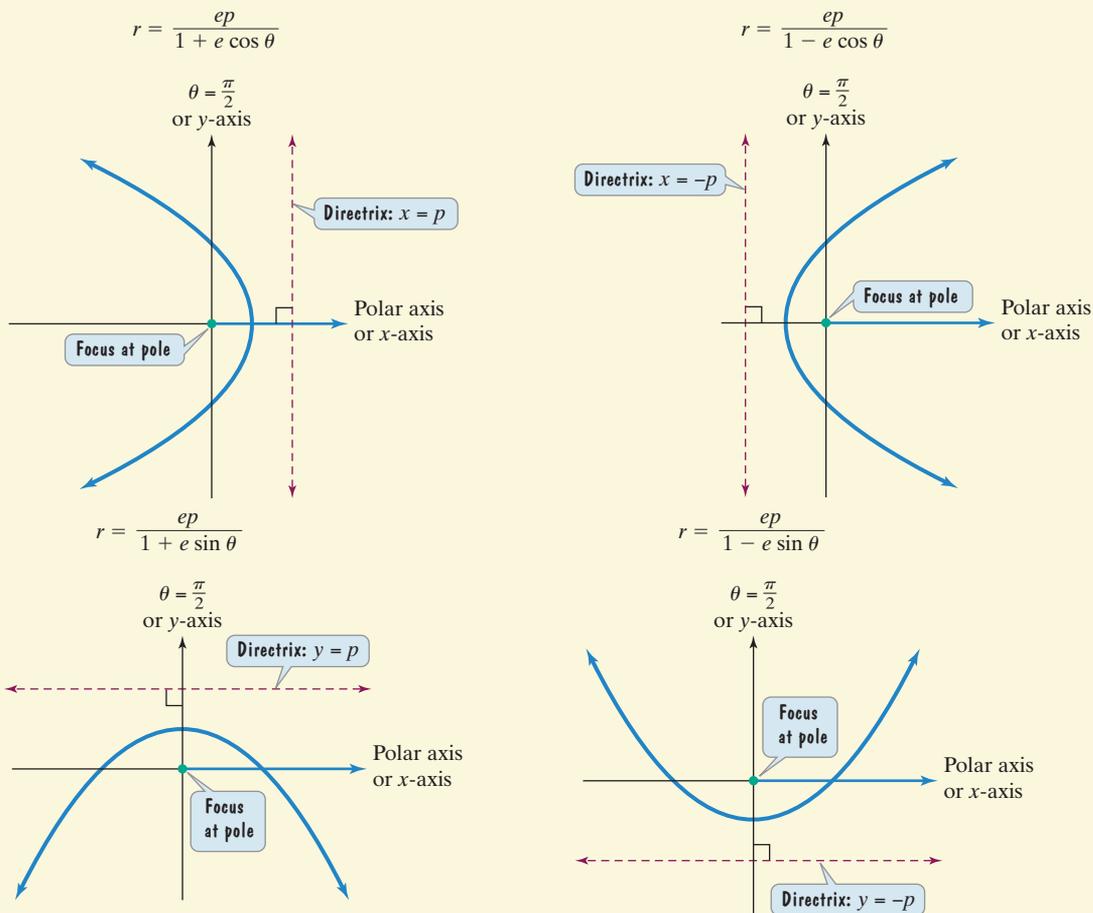

### Polar Equations of Conics

By locating a focus at the pole, all conics can be represented by similar equations in the polar coordinate system. In each of these equations,

- $(r, \theta)$  is a point on the graph of the conic.
- $e$  is the eccentricity. (Remember that  $e > 0$ .)
- $p$  is the distance between the focus (located at the pole) and the directrix.

### Standard Forms of the Polar Equations of Conics

Let the pole be a focus of a conic section of eccentricity  $e$  with the directrix  $p$  units from the focus. The equation of the conic is given by one of the four equations listed.

The graphs in the box illustrate two kinds of symmetry—symmetry with respect to the polar axis and symmetry with respect to the  $y$ -axis. If the equation contains  $\cos \theta$ , the polar axis is an axis of symmetry. If the equation contains  $\sin \theta$ , the line  $\theta = \frac{\pi}{2}$ , or the  $y$ -axis, is an axis of symmetry. Take a moment to verify these observations.

We will derive one of the equations displayed in the box. The other three equations are obtained in a similar manner. In **Figure 9.58**, let  $P = (r, \theta)$  be any point on a conic section.

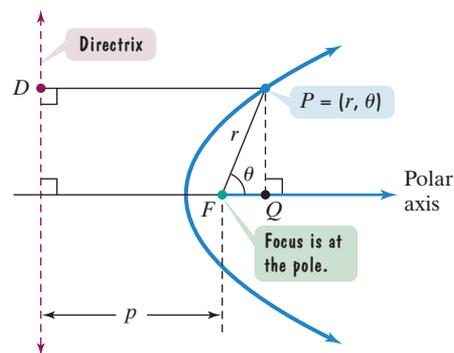

FIGURE 9.58

$$\frac{PF}{PD} = e \quad \text{By definition, the ratio of the distance between } P \text{ and the focus to the distance between } P \text{ and the directrix equals the positive constant } e.$$

$$\frac{r}{PD} = e \quad \text{Figure 9.58 shows that the distance from } P \text{ to the focus, located at the pole, is } r: PF = r.$$

$$\frac{r}{p + FQ} = e \quad \text{Figure 9.58 shows that the distance from } P \text{ to the directrix is } p + FQ: PD = p + FQ.$$

$$\frac{r}{p + r \cos \theta} = e \quad \text{Using the triangle in the figure, } \cos \theta = \frac{FQ}{r} \text{ and } FQ = r \cos \theta.$$

By solving this equation for  $r$ , we will obtain the desired equation. Clear fractions by multiplying both sides by the least common denominator.

$$\begin{aligned}
 r &= e(p + r \cos \theta) && \text{Multiply both sides by } p + r \cos \theta. \\
 r &= ep + er \cos \theta && \text{Apply the distributive property.} \\
 r - er \cos \theta &= ep && \text{Subtract } er \cos \theta \text{ from both sides to collect terms} \\
 &&& \text{involving } r \text{ on the same side.} \\
 r(1 - e \cos \theta) &= ep && \text{Factor out } r \text{ from the two terms on the left.} \\
 r &= \frac{ep}{1 - e \cos \theta} && \text{Divide both sides by } 1 - e \cos \theta \text{ and solve for } r.
 \end{aligned}$$

In summary, the standard forms of the polar equations of conics are

$$r = \frac{ep}{1 \pm e \cos \theta} \quad \text{and} \quad r = \frac{ep}{1 \pm e \sin \theta}.$$

In all forms, the constant term in the denominator is 1.

### Graphing the Polar Equation of a Conic

1. If necessary, write the equation in one of the standard forms.
2. Use the standard form to determine values for  $e$  and  $p$ . Use the value of  $e$  to identify the conic.
3. Use the appropriate figure for the standard form of the equation shown in the box on page 986 to help guide the graphing process.

### EXAMPLE 1 Graphing the Polar Equation of a Conic

Graph the polar equation:

$$r = \frac{4}{2 + \cos \theta}.$$

#### SOLUTION

**Step 1 Write the equation in one of the standard forms.** The equation is not in standard form because the constant term in the denominator is not 1.

$$r = \frac{4}{2 + \cos \theta}$$

To obtain 1 in this position, divide the numerator and denominator by 2.

The equation in standard form is

$$r = \frac{2}{1 + \frac{1}{2} \cos \theta}.$$

$ep = 2$

$e = \frac{1}{2}$

This equation is in the form  $r = \frac{ep}{1 + e \cos \theta}$ .

**Step 2 Use the standard form to find  $e$  and  $p$ , and identify the conic.** The voice balloons show that

$$e = \frac{1}{2} \quad \text{and} \quad ep = \frac{1}{2}p = 2.$$

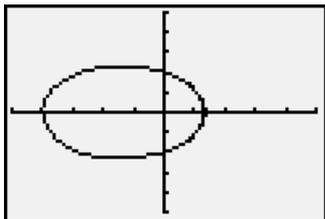

Thus,  $e = \frac{1}{2}$  and  $p = 4$ . Because  $e = \frac{1}{2} < 1$ , the conic is an ellipse.

### TECHNOLOGY

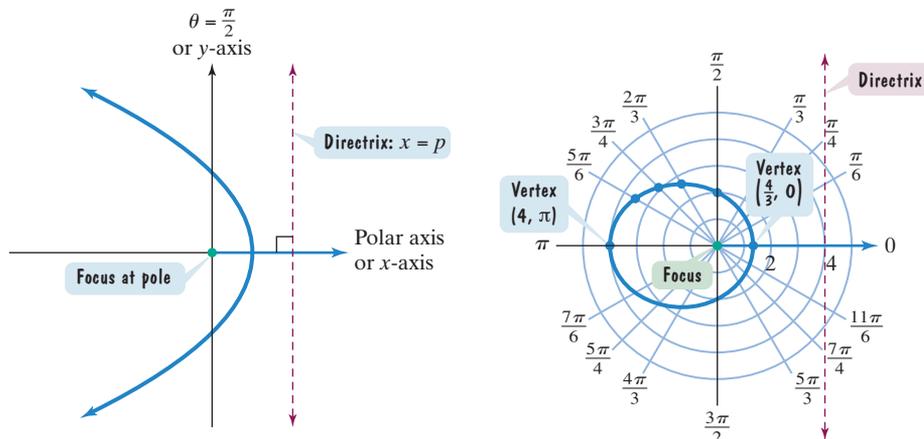

The graph of

$$r = \frac{4}{2 + \cos \theta}$$

is obtained using the polar mode with angle measure in radians. To verify the hand-drawn graph in **Figure 9.59(b)**, we used a  $[-5, 5, 1]$  by  $[-5, 5, 1]$  viewing rectangle with  $\theta_{\min} = 0$ ,  $\theta_{\max} = 2\pi$ , and  $\theta_{\text{step}} = \frac{\pi}{48}$ .

**Step 3 Use the figure for the equation's standard form to guide the graphing process.** The figure for the conic's standard form is shown in **Figure 9.59(a)**. We have symmetry with respect to the polar axis. One focus is at the pole and the corresponding directrix is  $x = 4$ , located four units to the right of the pole.

(a) Using  $r = \frac{ep}{1 + e \cos \theta}$  to graph  $r = \frac{2}{1 + \frac{1}{2} \cos \theta}$

(b) The graph of  $r = \frac{4}{2 + \cos \theta}$  or  $r = \frac{2}{1 + \frac{1}{2} \cos \theta}$

FIGURE 9.59

**Figure 9.59(a)** indicates that the major axis is on the polar axis. Thus, we find the vertices by selecting 0 and  $\pi$  for  $\theta$ . The corresponding values for  $r$  are  $\frac{4}{3}$  and 4, respectively. **Figure 9.59(b)** shows the vertices,  $(\frac{4}{3}, 0)$  and  $(4, \pi)$ .

You can sketch the upper half of the ellipse by plotting some points from  $\theta = 0$  to  $\theta = \pi$ .

$$r = \frac{4}{2 + \cos \theta}$$

$\theta$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$
$r$	2	2.7	3.1	3.5

Using symmetry with respect to the polar axis, you can sketch the lower half. The graph of the given equation is shown in **Figure 9.59(b)**. ...

**Check Point 1** Use the three steps shown in the preceding box on page 987 to graph the polar equation:

$$r = \frac{4}{2 - \cos \theta}$$

### EXAMPLE 2 Graphing the Polar Equation of a Conic

Graph the polar equation:

$$r = \frac{12}{3 + 3 \sin \theta}$$

#### SOLUTION

**Step 1 Write the equation in one of the standard forms.** The equation is not in standard form because the constant term in the denominator is not 1. Divide the numerator and denominator by 3 to write the standard form.

$$r = \frac{4}{1 + 1 \sin \theta}$$

$e = 1$

This equation is in the form  $r = \frac{ep}{1 + e \sin \theta}$ .

**Step 2 Use the standard form to find  $e$  and  $p$ , and identify the conic.** The voice balloons show that

$$e = 1 \quad \text{and} \quad ep = 1p = 4.$$

Thus,  $e = 1$  and  $p = 4$ . Because  $e = 1$ , the conic is a parabola.

**Step 3 Use the figure for the equation's standard form to guide the graphing process.** Figure 9.60(a) indicates that we have symmetry with respect to  $\theta = \frac{\pi}{2}$ . The focus is at the pole and, with  $p = 4$ , the directrix is  $y = 4$ , located four units above the pole.

Figure 9.60(a) indicates that the vertex is on the line  $\theta = \frac{\pi}{2}$ , or the  $y$ -axis. Thus, we find the vertex by selecting  $\frac{\pi}{2}$  for  $\theta$ . The corresponding value for  $r$  is 2.

Figure 9.60(b) shows the vertex,  $(2, \frac{\pi}{2})$ .

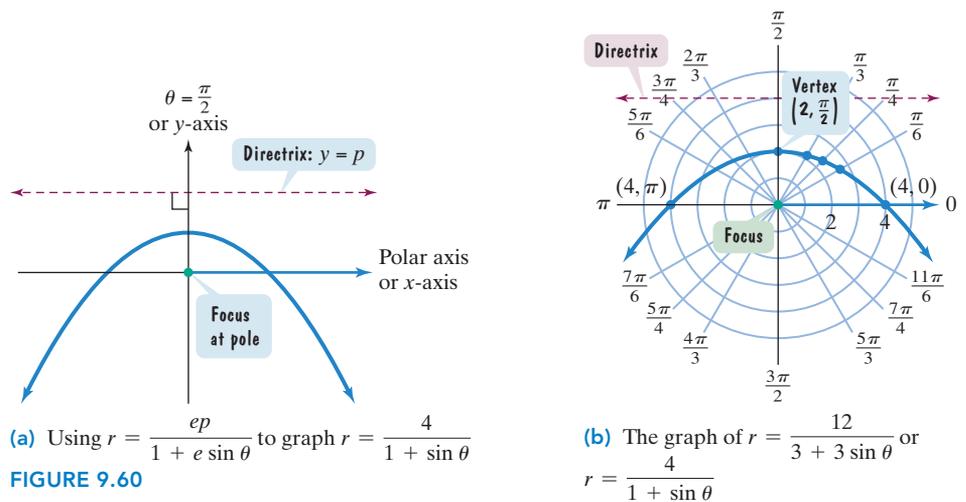

FIGURE 9.60

### TECHNOLOGY

The graph of

$$r = \frac{12}{3 + 3 \sin \theta}$$

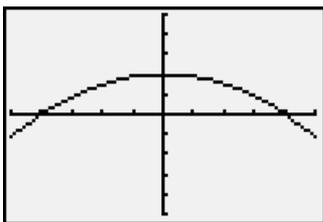

was obtained using a

$$[-5, 5, 1] \text{ by } [-5, 5, 1]$$

viewing rectangle with

$$\theta_{\min} = 0, \quad \theta_{\max} = 2\pi,$$

$$\theta_{\text{step}} = \frac{\pi}{48}.$$

To find where the parabola crosses the polar axis, select  $\theta = 0$  and  $\theta = \pi$ . The corresponding values for  $r$  are 4 and 4, respectively. Figure 9.60(b) shows the points  $(4, 0)$  and  $(4, \pi)$  on the polar axis.

You can sketch the right half of the parabola by plotting some points from  $\theta = 0$  to  $\theta = \frac{\pi}{2}$ .

$$r = \frac{12}{3 + 3 \sin \theta}$$

$\theta$	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$
$r$	2.7	2.3	2.1

Using symmetry with respect to  $\theta = \frac{\pi}{2}$ , you can sketch the left half. The graph of the given equation is shown in Figure 9.60(b). ...

**Check Point 2** Use the three steps shown in the preceding box on page 987 to graph the polar equation:

$$r = \frac{8}{4 + 4 \sin \theta}.$$

**EXAMPLE 3** Graphing the Polar Equation of a Conic

Graph the polar equation:

$$r = \frac{9}{3 - 6 \cos \theta}$$

**SOLUTION**

**Step 1 Write the equation in one of the standard forms.** We can obtain a constant term of 1 in the denominator by dividing each term by 3.

$ep = 3$

$r = \frac{3}{1 - 2 \cos \theta}$

This equation is in the form

$$r = \frac{ep}{1 - e \cos \theta}$$

$e = 2$

**Step 2 Use the standard form to find  $e$  and  $p$ , and identify the conic.** The voice balloons show that

$$e = 2 \quad \text{and} \quad ep = 2p = 3.$$

Thus,  $e = 2$  and  $p = \frac{3}{2}$ . Because  $e = 2 > 1$ , the conic is a hyperbola.

**Step 3 Use the figure for the equation's standard form to guide the graphing process.** Figure 9.61(a) indicates that we have symmetry with respect to the polar axis. One focus is at the pole and, with  $p = \frac{3}{2}$ , the corresponding directrix is  $x = -\frac{3}{2}$ , located 1.5 units to the left of the pole.

Figure 9.61(a) indicates that the transverse axis is horizontal and the vertices lie on the polar axis. Thus, we find the vertices by selecting 0 and  $\pi$  for  $\theta$ . Figure 9.61(b) shows the vertices,  $(-3, 0)$  and  $(1, \pi)$ .

To find where the hyperbola crosses the line  $\theta = \frac{\pi}{2}$ , select  $\frac{\pi}{2}$  and  $\frac{3\pi}{2}$  for  $\theta$ .

Figure 9.61(b) shows the points  $(3, \frac{\pi}{2})$  and  $(3, \frac{3\pi}{2})$  on the graph.

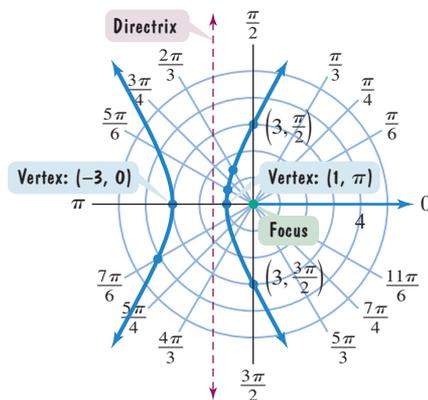

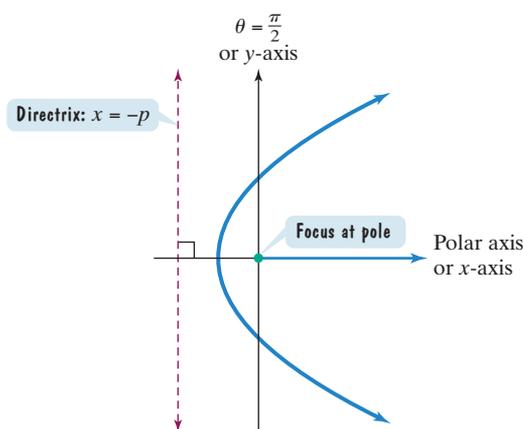

FIGURE 9.61 (a) Using  $r = \frac{ep}{1 - e \cos \theta}$  to graph  $r = \frac{3}{1 - 2 \cos \theta}$

(b) The graph of  $r = \frac{9}{3 - 6 \cos \theta}$  or  $r = \frac{3}{1 - 2 \cos \theta}$

We sketch the hyperbola by plotting some points from  $\theta = 0$  to  $\theta = \pi$ .

$$r = \frac{3}{1 - 2 \cos \theta}$$

$\theta$	$\frac{\pi}{6}$	$\frac{2\pi}{3}$	$\frac{5\pi}{6}$
$r$	-4.1	1.5	1.1

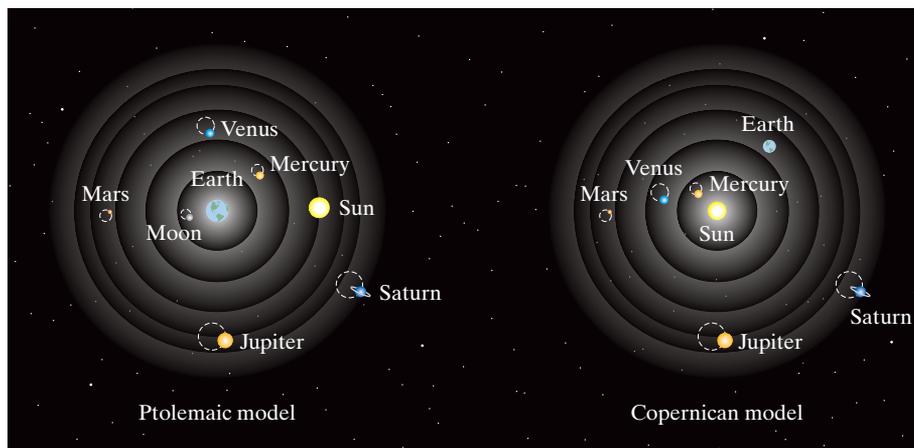

**Figure 9.61(b)** shows the points  $\left(\frac{\pi}{6}, -4.1\right)$ ,  $\left(\frac{2\pi}{3}, 1.5\right)$ , and  $\left(\frac{5\pi}{6}, 1.1\right)$  on the graph. Observe that  $\left(\frac{\pi}{6}, -4.1\right)$  is on the lower half of the hyperbola. Using symmetry with respect to the polar axis, we sketch the entire hyperbola. The graph of the given equation is shown in **Figure 9.61(b)**. ●●●

 **Check Point 3** Use the three steps shown in the preceding box on page 987 to graph the polar equation:

$$r = \frac{9}{3 - 9 \cos \theta}.$$

### Blitzer Bonus || Modeling Planetary Motion

Polish astronomer Nicolaus Copernicus (1473–1543) was correct in stating that planets in our solar system revolve around the sun and not Earth. However, he incorrectly believed that celestial orbits move in perfect circles, calling his system “the ballet of the planets.”

**Table 9.4** indicates that the planets in our solar system have orbits with eccentricities that are much closer to 0 than to 1. Most of these orbits are almost circular, which made it difficult for early astronomers to detect that they are actually ellipses.

German scientist and mathematician Johannes Kepler (1571–1630) discovered that planets move in elliptical orbits with the sun at one focus. The polar equation for these orbits is

$$r = \frac{(1 - e^2)a}{1 - e \cos \theta},$$

where the length of the orbit’s major axis is  $2a$ . Describing planetary orbits, Kepler wrote, “The heavenly motions are nothing but a continuous song for several voices, to be perceived by the intellect, not by the ear.”

**Table 9.4** Eccentricities of Planetary Orbits

Mercury	0.2056	Jupiter	0.0484
Venus	0.0068	Saturn	0.0543
Earth	0.0167	Uranus	0.0460
Mars	0.0934	Neptune	0.0082

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

1. A conic section is the set of all points in the plane such that the ratio of the distance from a fixed point, called the \_\_\_\_\_, to the distance from a fixed line, called the \_\_\_\_\_, equals a constant  $e$ , called the \_\_\_\_\_. If  $e = 1$ , the conic is a/an \_\_\_\_\_. If  $e < 1$ , the conic is a/an \_\_\_\_\_. If  $e > 1$ , the conic is a/an \_\_\_\_\_.

### Standard Forms of the Polar Equations of Conics

- a.  $r = \frac{ep}{1 + e \cos \theta}$  Directrix is perpendicular to the polar axis at a distance  $p$  units to the right of the pole.
- b.  $r = \frac{ep}{1 - e \cos \theta}$  Directrix is perpendicular to the polar axis at a distance  $p$  units to the left of the pole.
- c.  $r = \frac{ep}{1 + e \sin \theta}$  Directrix is parallel to the polar axis at a distance  $p$  units above the pole.
- d.  $r = \frac{ep}{1 - e \sin \theta}$  Directrix is parallel to the polar axis at a distance  $p$  units below the pole.

Use the four equations in the previous column to solve Exercises 2–4.

2. For all four equations shown in the previous column, the focus is at the \_\_\_\_\_ and  $e$  represents the conic's \_\_\_\_\_.

3. Consider the equation

$$r = \frac{3}{1 + 3 \cos \theta}$$

$e = \underline{\hspace{2cm}}$ , so this is the equation of a/an \_\_\_\_\_.

$p = \underline{\hspace{2cm}}$ , so the directrix is \_\_\_\_\_ to the polar axis at a distance \_\_\_\_\_ unit(s) to the \_\_\_\_\_ of the pole.

4. Consider the equation

$$r = \frac{2}{1 - \sin \theta}$$

$e = \underline{\hspace{2cm}}$ , so this is the equation of a/an \_\_\_\_\_.

$p = \underline{\hspace{2cm}}$ , so the directrix is \_\_\_\_\_ to the polar axis at a distance \_\_\_\_\_ unit(s) \_\_\_\_\_ the pole.

5. The equation  $r = \frac{12}{4 - 4 \cos \theta}$  is not in standard form because the constant term in the denominator is not \_\_\_\_\_. The equation can be written in standard form by \_\_\_\_\_.

## EXERCISE SET 9.6

### Practice Exercises

In Exercises 1–8,

- a. Identify the conic section that each polar equation represents.
- b. Describe the location of a directrix from the focus located at the pole.

- |  |  |
|--|--|
| <p>1. <math>r = \frac{3}{1 + \sin \theta}</math></p> <p>3. <math>r = \frac{6}{3 - 2 \cos \theta}</math></p> <p>5. <math>r = \frac{8}{2 + 2 \sin \theta}</math></p> <p>7. <math>r = \frac{12}{2 - 4 \cos \theta}</math></p> | <p>2. <math>r = \frac{3}{1 + \cos \theta}</math></p> <p>4. <math>r = \frac{6}{3 + 2 \cos \theta}</math></p> <p>6. <math>r = \frac{8}{2 - 2 \sin \theta}</math></p> <p>8. <math>r = \frac{12}{2 + 4 \cos \theta}</math></p> |
|--|--|

In Exercises 9–20, use the three steps shown in the box on page 0000 to graph each polar equation.

### Application Exercises

Halley's Comet has an elliptical orbit with the sun at one focus. Its orbit, shown in the figure below, is given approximately by

$$r = \frac{1.069}{1 + 0.967 \sin \theta}$$

In the formula,  $r$  is measured in astronomical units. (One astronomical unit is the average distance from Earth to the sun, approximately 93 million miles.) Use the given formula and the figure to solve Exercises 29–30. Round to the nearest hundredth of an astronomical unit and the nearest million miles.

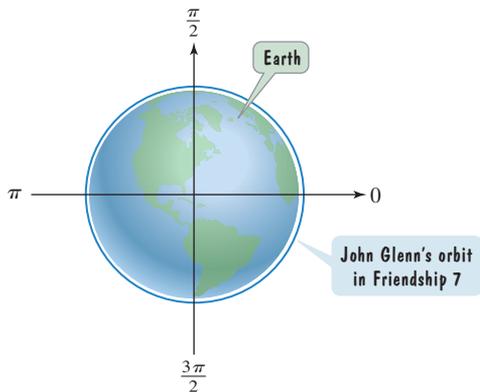

29. Find the distance from Halley's Comet to the sun at its shortest distance from the sun.  
 30. Find the distance from Halley's Comet to the sun at its greatest distance from the sun.

On February 20, 1962, John Glenn made the first U.S.-manned flight around the Earth for three orbits on Friendship 7. With Earth at one focus, the orbit of Friendship 7 is given approximately by

$$r = \frac{4090.76}{1 - 0.0076 \cos \theta}$$

where  $r$  is measured in miles from Earth's center. Use the formula and the figure shown to solve Exercises 31–32.

31. How far from Earth's center was John Glenn at his greatest distance from the planet? Round to the nearest mile. If the radius of Earth is 3960 miles, how far was he from Earth's surface at this point on the flight?  
 32. How far from Earth's center was John Glenn at his closest distance from the planet? Round to the nearest mile. If the radius of Earth is 3960 miles, how far was he from Earth's surface at this point on the flight?

### Writing in Mathematics

33. How are the conics described in terms of a fixed point and a fixed line?  
 34. If all conics are defined in terms of a fixed point and a fixed line, how can you tell one kind of conic from another?  
 35. If you are given the standard form of the polar equation of a conic, how do you determine its eccentricity?  
 36. If you are given the standard form of the polar equation of a conic, how do you determine the location of a directrix from the focus at the pole?  
 37. Describe a strategy for graphing  $r = \frac{1}{1 + \sin \theta}$ .  
 38. You meet an astronaut and she asks you to tell her something of interest about the elliptical orbit of John Glenn's first space voyage in 1962. Describe how to use the polar equation for orbits in the Blitzer Bonus on page 991, the equation for John Glenn's 1962 journey in Exercises 31–32, and a graphing utility to provide an interesting visual analysis.

### Technology Exercises

Use the polar mode of a graphing utility with angle measure in radians to solve Exercises 39–42. Unless otherwise indicated, use  $\theta_{\min} = 0$ ,  $\theta_{\max} = 2\pi$ , and  $\theta$  step  $= \frac{\pi}{48}$ . If you are not satisfied with the quality of the graph, experiment with smaller values for  $\theta$  step.

39. Use a graphing utility to verify any five of your hand-drawn graphs in Exercises 9–20.

In Exercises 40–42, identify the conic that each polar equation represents. Then use a graphing utility to graph the equation.

40.  $r = \frac{16}{4 - 3 \cos \theta}$       41.  $r = \frac{12}{4 + 5 \sin \theta}$

42.  $r = \frac{18}{6 - 6 \cos \theta}$

In Exercises 43–44, use a graphing utility to graph the equation. Then answer the given question.

43.  $r = \frac{4}{1 - \sin\left(\theta - \frac{\pi}{4}\right)}$ ; How does the graph differ from the graph of  $r = \frac{4}{1 - \sin \theta}$ ?

44.  $r = \frac{3}{2 + 6 \cos\left(\theta + \frac{\pi}{3}\right)}$ ; How does the graph differ from the graph of  $r = \frac{3}{2 + 6 \cos \theta}$ ?

45. Use the polar equation for planetary orbits,

$$r = \frac{(1 - e^2)a}{1 - e \cos \theta}$$

to find the polar equation of the orbit for Mercury and Earth.

Mercury:  $e = 0.2056$  and  $a = 36.0 \times 10^6$  miles

Earth:  $e = 0.0167$  and  $a = 92.96 \times 10^6$  miles

Use a graphing utility to graph both orbits in the same viewing rectangle. What do you see about the orbits from their graphs that is not obvious from their equations?

## Critical Thinking Exercises

**Make Sense?** In Exercises 46–49, determine whether each statement makes sense or does not make sense, and explain your reasoning.

46. Eccentricity and polar coordinates enable me to see that ellipses, hyperbolas, and parabolas are a unified group of interrelated curves.
47. I graphed a conic in the form  $r = \frac{ep}{1 - e \cos \theta}$  that was symmetric with respect to the  $y$ -axis.
48. Given the focus is at the pole, I can write the polar equation of a conic section if I know its eccentricity and the rectangular equation of the directrix.
49. As long as I know how to graph in polar coordinates, a knowledge of conic sections is not necessary to graph the equations in Exercises 9–20.
50. Identify the conic and graph the equation:

$$r = \frac{4 \sec \theta}{2 \sec \theta - 1}$$

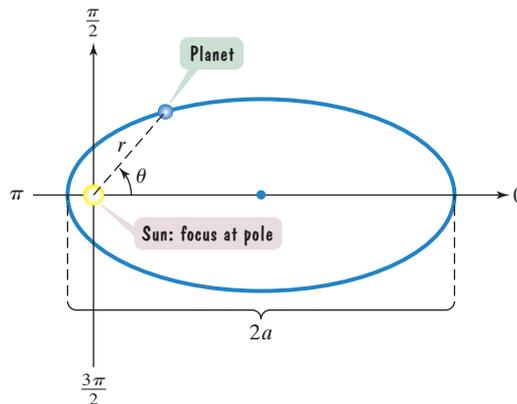

In Exercises 51–52, write a polar equation of the conic that is named and described.

51. Ellipse: a focus at the pole; vertex:  $(4, 0)$ ;  $e = \frac{1}{2}$
52. Hyperbola: a focus at the pole; directrix:  $x = -1$ ;  $e = \frac{3}{2}$
53. Identify the conic and write its equation in rectangular coordinates:  $r = \frac{1}{2 - 2 \cos \theta}$ .

54. Prove that the polar equation of a planet's elliptical orbit is

$$r = \frac{(1 - e^2)a}{1 - e \cos \theta},$$

where  $e$  is the eccentricity and  $2a$  is the length of the major axis.

## Preview Exercises

Exercises 55–57 will help you prepare for the material covered in the first section of the next chapter.

55. Evaluate  $\frac{(-1)^n}{3^n - 1}$  for  $n = 1, 2, 3$ , and 4.
56. Find the product of all positive integers from  $n$  down through 1 for  $n = 5$ .
57. Evaluate  $j^2 + 1$  for all consecutive integers from 1 to 6, inclusive. Then find the sum of the six evaluations.

## CHAPTER 9

## Summary, Review, and Test

## SUMMARY

## DEFINITIONS AND CONCEPTS

## 9.1 The Ellipse

- a. An ellipse is the set of all points in a plane the sum of whose distances from two fixed points, the foci, is constant.

- b. Standard forms of the equations of an ellipse with center at the origin are  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$  [foci:  $(-c, 0)$ ,  $(c, 0)$ ] and  $\frac{x^2}{b^2} + \frac{y^2}{a^2} = 1$  [foci:  $(0, -c)$ ,  $(0, c)$ ], where  $c^2 = a^2 - b^2$  and  $a^2 > b^2$ . See the box on page 922 and Figure 9.6.

- c. Standard forms of the equations of an ellipse centered at  $(h, k)$  are  $\frac{(x - h)^2}{a^2} + \frac{(y - k)^2}{b^2} = 1$  and  $\frac{(x - h)^2}{b^2} + \frac{(y - k)^2}{a^2} = 1$ ,  $a^2 > b^2$ . See Table 9.1 on page 926.

## 9.2 The Hyperbola

- a. A hyperbola is the set of all points in a plane the difference of whose distances from two fixed points, the foci, is constant.

- b. Standard forms of the equations of a hyperbola with center at the origin are  $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$  [foci:  $(-c, 0)$ ,  $(c, 0)$ ] and  $\frac{y^2}{a^2} - \frac{x^2}{b^2} = 1$  [foci:  $(0, -c)$ ,  $(0, c)$ ], where  $c^2 = a^2 + b^2$ . See the box on page 934 and Figure 9.16.

## EXAMPLES

Ex. 1, p. 923;  
Ex. 2, p. 924;  
Ex. 3, p. 924

Ex. 4, p. 926

Ex. 1, p. 935;  
Ex. 2, p. 936

## DEFINITIONS AND CONCEPTS

## EXAMPLES

c. Asymptotes for  $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$  are  $y = \pm \frac{b}{a}x$ . Asymptotes for  $\frac{y^2}{a^2} - \frac{x^2}{b^2} = 1$  are  $y = \pm \frac{a}{b}x$ .

d. A procedure for graphing hyperbolas is given in the box on page 937.

Ex. 3, p. 938;

Ex. 4, p. 939

e. Standard forms of the equations of a hyperbola centered at  $(h, k)$  are  $\frac{(x-h)^2}{a^2} - \frac{(y-k)^2}{b^2} = 1$  and  $\frac{(y-k)^2}{a^2} - \frac{(x-h)^2}{b^2} = 1$ . See Table 9.2 on page 940.

Ex. 5, p. 940;

Ex. 6, p. 942

## 9.3 The Parabola

a. A parabola is the set of all points in a plane that are equidistant from a fixed line, the directrix, and a fixed point, the focus.

b. Standard forms of the equations of parabolas with vertex at the origin are  $y^2 = 4px$  [focus:  $(p, 0)$ ] and  $x^2 = 4py$  [focus:  $(0, p)$ ]. See the box on page 949 and Figure 9.31 on page 950.

Ex. 1, p. 950;

Ex. 3, p. 952

c. A parabola's latus rectum is a line segment that passes through its focus, is parallel to its directrix, and has its endpoints on the parabola. The length of the latus rectum for  $y^2 = 4px$  and  $x^2 = 4py$  is  $|4p|$ . A parabola can be graphed using the vertex and endpoints of the latus rectum.

Ex. 2, p. 951

d. Standard forms of the equations of a parabola with vertex at  $(h, k)$  are  $(y-k)^2 = 4p(x-h)$  and  $(x-h)^2 = 4p(y-k)$ . See Table 9.3 on page 953 and Figure 9.36.

Ex. 4, p. 953;

Ex. 5, p. 954

## 9.4 Rotation of Axes

a. A nondegenerate conic section of the form  $Ax^2 + Cy^2 + Dx + Ey + F = 0$  in which  $A$  and  $C$  are not both zero is **1.** a circle if  $A = C$ ; **2.** a parabola if  $AC = 0$ ; **3.** an ellipse if  $A \neq C$  and  $AC > 0$ ; **4.** a hyperbola if  $AC < 0$ .

Ex. 1, p. 962

b. Rotation of Axes Formulas

Ex. 2, p. 965

$\theta$  is the angle from the positive  $x$ -axis to the positive  $x'$ -axis.

$$x = x' \cos \theta - y' \sin \theta \quad \text{and} \quad y = x' \sin \theta + y' \cos \theta$$

c. Amount of Rotation Formula

The general second-degree equation

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$$

can be rewritten in  $x'$  and  $y'$  without an  $x'y'$ -term by rotating the axes through angle  $\theta$ , where  $\cot 2\theta = \frac{A-C}{B}$  and  $\theta$  is an acute angle.

d. If  $2\theta$  in  $\cot 2\theta$  is one of the familiar angles such as  $30^\circ$ ,  $45^\circ$ , or  $60^\circ$ , write the equation of a rotated conic in standard form using the five-step procedure in the box on page 967.

Ex. 3, p. 967

e. If  $\cot 2\theta$  is not the cotangent of one of the more familiar angles, use a sketch of  $\cot 2\theta$  to find  $\cos 2\theta$ . Then use

Ex. 4, p. 970

$$\sin \theta = \sqrt{\frac{1 - \cos 2\theta}{2}} \quad \text{and} \quad \cos \theta = \sqrt{\frac{1 + \cos 2\theta}{2}}$$

to find values for  $\sin \theta$  and  $\cos \theta$  in the rotation formulas.

f. A nondegenerate conic section of the form

Ex. 5, p. 972

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$$

is **1.** a parabola if  $B^2 - 4AC = 0$ ; **2.** an ellipse or a circle if  $B^2 - 4AC < 0$ ; **3.** a hyperbola if  $B^2 - 4AC > 0$ .

## 9.5 Parametric Equations

a. The relationship between the parametric equations  $x = f(t)$  and  $y = g(t)$  and plane curves is described in the first box on page 975.

b. Point plotting can be used to graph a plane curve described by parametric equations. See the second box on page 975.

Ex. 1, p. 976

c. Plane curves can be sketched by eliminating the parameter  $t$  and graphing the resulting rectangular equation. It is sometimes necessary to change the domain of the rectangular equation to be consistent with the domain for the parametric equation in  $x$ .

Ex. 2, p. 977;

Ex. 3, p. 978

d. Infinitely many pairs of parametric equations can represent the same plane curve. One pair for  $y = f(x)$  is  $x = t$  and  $y = f(t)$ , in which  $t$  is in the domain of  $f$ .

Ex. 4, p. 979

## DEFINITIONS AND CONCEPTS

## EXAMPLES

## 9.6 Conic Sections in Polar Coordinates

- a. The focus-directrix definitions of the conic sections are given in the box on page 985. For all points on a conic, the ratio of the distance from a fixed point (focus) and the distance from a fixed line (directrix) is constant and is called its eccentricity. If  $e = 1$ , the conic is a parabola. If  $e < 1$ , the conic is an ellipse. If  $e > 1$ , the conic is a hyperbola.

- b. Standard forms of the polar equations of conics are

$$r = \frac{ep}{1 \pm e \cos \theta} \quad \text{and} \quad r = \frac{ep}{1 \pm e \sin \theta},$$

in which  $(r, \theta)$  is a point on the conic's graph,  $e$  is the eccentricity, and  $p$  is the distance between the focus (located at the pole) and the directrix. Details are shown in the box on page 986.

- c. A procedure for graphing the polar equation of a conic is given in the box on page 987.

Ex. 1, p. 987;

Ex. 2, p. 988;

Ex. 3, p. 990

## REVIEW EXERCISES

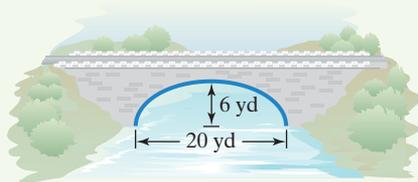

## 9.1

In Exercises 1–8, graph each ellipse and locate the foci.

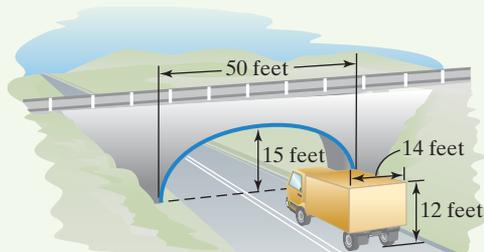

- $\frac{x^2}{36} + \frac{y^2}{25} = 1$
- $\frac{y^2}{25} + \frac{x^2}{16} = 1$
- $4x^2 + y^2 = 16$
- $4x^2 + 9y^2 = 36$
- $\frac{(x-1)^2}{16} + \frac{(y+2)^2}{9} = 1$
- $\frac{(x+1)^2}{9} + \frac{(y-2)^2}{16} = 1$
- $4x^2 + 9y^2 + 24x - 36y + 36 = 0$
- $9x^2 + 4y^2 - 18x + 8y - 23 = 0$

In Exercises 9–11, find the standard form of the equation of each ellipse satisfying the given conditions.

- Foci:  $(-4, 0)$ ,  $(4, 0)$ ; Vertices:  $(-5, 0)$ ,  $(5, 0)$
- Foci:  $(0, -3)$ ,  $(0, 3)$ ; Vertices:  $(0, -6)$ ,  $(0, 6)$
- Major axis horizontal with length 12; length of minor axis = 4; center:  $(-3, 5)$ .
- A semielliptical arch supports a bridge that spans a river 20 yards wide. The center of the arch is 6 yards above the river's center. Write an equation for the ellipse so that the  $x$ -axis coincides with the water level and the  $y$ -axis passes through the center of the arch.

- A semielliptical archway has a height of 15 feet at the center and a width of 50 feet, as shown in the figure. The 50-foot width consists of a two-lane road. Can a truck that is 12 feet high and 14 feet wide drive under the archway without going into the other lane?

- An elliptical pool table has a ball placed at each focus. If one ball is hit toward the side of the table, explain what will occur.

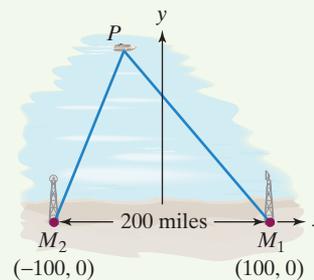

## 9.2

In Exercises 15–22, graph each hyperbola. Locate the foci and find the equations of the asymptotes.

- $\frac{x^2}{16} - y^2 = 1$
- $\frac{y^2}{16} - x^2 = 1$
- $9x^2 - 16y^2 = 144$
- $4y^2 - x^2 = 16$
- $\frac{(x-2)^2}{25} - \frac{(y+3)^2}{16} = 1$
- $\frac{(y+2)^2}{25} - \frac{(x-3)^2}{16} = 1$
- $y^2 - 4y - 4x^2 + 8x - 4 = 0$
- $x^2 - y^2 - 2x - 2y - 1 = 0$

In Exercises 23–24, find the standard form of the equation of each hyperbola satisfying the given conditions.

- Foci:  $(0, -4)$ ,  $(0, 4)$ ; Vertices:  $(0, -2)$ ,  $(0, 2)$
- Foci:  $(-8, 0)$ ,  $(8, 0)$ ; Vertices:  $(-3, 0)$ ,  $(3, 0)$
- Explain why it is not possible for a hyperbola to have foci at  $(0, -2)$  and  $(0, 2)$  and vertices at  $(0, -3)$  and  $(0, 3)$ .
- Radio tower  $M_2$  is located 200 miles due west of radio tower  $M_1$ . The situation is illustrated in the figure shown, where a coordinate system has been superimposed. Simultaneous radio signals are sent from each tower to a ship, with the signal from  $M_2$  received 500 microseconds before the signal from  $M_1$ . Assuming that radio signals travel at 0.186 mile per microsecond, determine the equation of the hyperbola on which the ship is located.

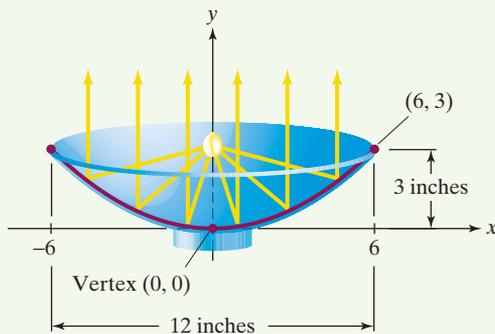

## 9.3

In Exercises 27–33, find the vertex, focus, and directrix of each parabola with the given equation. Then graph the parabola.

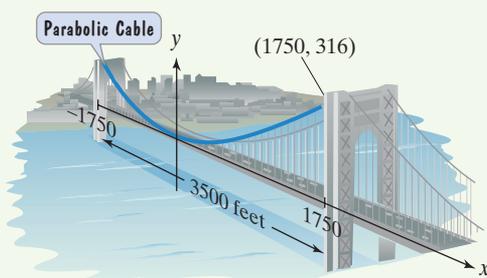

27.  $y^2 = 8x$
28.  $x^2 + 16y = 0$
29.  $(y - 2)^2 = -16x$
30.  $(x - 4)^2 = 4(y + 1)$
31.  $x^2 + 4y = 4$
32.  $y^2 - 4x - 10y + 21 = 0$
33.  $x^2 - 4x - 2y = 0$

In Exercises 34–35, find the standard form of the equation of each parabola satisfying the given conditions.

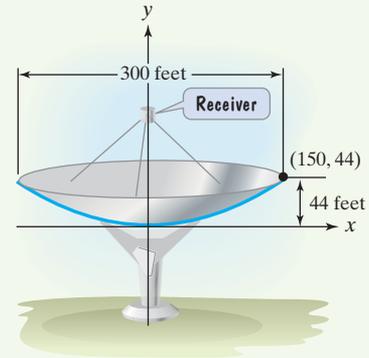

34. Focus:  $(12, 0)$ ; Directrix:  $x = -12$
35. Focus:  $(0, -11)$ ; Directrix:  $y = 11$
36. An engineer is designing headlight units for automobiles. The unit has a parabolic surface with a diameter of 12 inches and a depth of 3 inches. The situation is illustrated in the figure, where a coordinate system has been superimposed. What is the equation of the parabola in this system? Where should the light source be placed? Describe this placement relative to the vertex.

37. The George Washington Bridge spans the Hudson River from New York to New Jersey. Its two towers are 3500 feet apart and rise 316 feet above the road. As shown in the figure, the cable between the towers has the shape of a parabola and the cable just touches the sides of the road midway between the towers. What is the height of the cable 1000 feet from a tower?

38. The giant satellite dish in the figure shown is in the shape of a parabolic surface. Signals strike the surface and are reflected to the focus, where the receiver is located. The diameter of the dish is 300 feet and its depth is 44 feet. How far, to the nearest foot, from the base of the dish should the receiver be placed?

## 9.4

In Exercises 39–46, identify the conic represented by each equation without completing the square or using a rotation of axes.

39.  $y^2 + 4x + 2y - 15 = 0$
40.  $x^2 + 16y^2 - 160y + 384 = 0$
41.  $16x^2 + 64x + 9y^2 - 54y + 1 = 0$
42.  $4x^2 - 9y^2 - 8x + 12y - 144 = 0$
43.  $5x^2 + 2\sqrt{3}xy + 3y^2 - 18 = 0$
44.  $5x^2 - 8xy + 7y^2 - 9\sqrt{5}x - 9 = 0$
45.  $x^2 + 6xy + 9y^2 - 2y = 0$
46.  $x^2 - 2xy + 3y^2 + 2x + 4y - 1 = 0$

In Exercises 47–51,

- a. Rewrite the equation in a rotated  $x'y'$ -system without an  $x'y'$ -term.
  - b. Express the equation involving  $x'$  and  $y'$  in the standard form of a conic section.
  - c. Use the rotated system to graph the equation.
47.  $xy - 4 = 0$
  48.  $x^2 + xy + y^2 - 1 = 0$
  49.  $4x^2 + 10xy + 4y^2 - 9 = 0$
  50.  $6x^2 - 6\sqrt{3}xy + 14y^2 - 45 = 0$
  51.  $x^2 + 2\sqrt{3}xy + 3y^2 - 12\sqrt{3}x + 12y = 0$

## 9.5

In Exercises 52–57, eliminate the parameter and graph the plane curve represented by the parametric equations. Use arrows to show the orientation of each plane curve.

52.  $x = 2t - 1, y = 1 - t; -\infty < t < \infty$
53.  $x = t^2, y = t - 1; -1 \leq t \leq 3$
54.  $x = 4t^2, y = t + 1; -\infty < t < \infty$
55.  $x = 4 \sin t, y = 3 \cos t; 0 \leq t < \pi$
56.  $x = 3 + 2 \cos t, y = 1 + 2 \sin t; 0 \leq t < 2\pi$
57.  $x = 3 \sec t, y = 3 \tan t; 0 \leq t \leq \frac{\pi}{4}$

58. Find two different sets of parametric equations for  $y = x^2 + 6$ .
59. The path of a projectile that is launched  $h$  feet above the ground with an initial velocity of  $v_0$  feet per second and at an angle  $\theta$  with the horizontal is given by the parametric equations

$$x = (v_0 \cos \theta)t \quad \text{and} \quad y = h + (v_0 \sin \theta)t - 16t^2,$$

where  $t$  is the time, in seconds, after the projectile was launched. A football player throws a football with an initial velocity of 100 feet per second at an angle of  $40^\circ$  to the horizontal. The ball leaves the player's hand at a height of 6 feet.

- Find the parametric equations that describe the position of the ball as a function of time.
- Describe the ball's position after 1, 2, and 3 seconds. Round to the nearest tenth of a foot.
- How long, to the nearest tenth of a second, is the ball in flight? What is the total horizontal distance that it travels before it lands?
- Graph the parametric equations in part (a) using a graphing utility. Use the graph to determine when the ball is at its maximum height. What is its maximum height? Round answers to the nearest tenth.

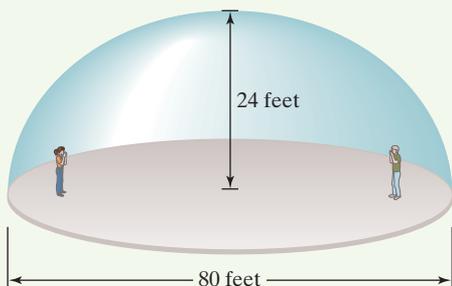

## CHAPTER 9 TEST

In Exercises 1–5, graph the conic section with the given equation. For ellipses, find the foci. For hyperbolas, find the foci and give the equations of the asymptotes. For parabolas, find the vertex, focus, and directrix.

- $9x^2 - 4y^2 = 36$
- $x^2 = -8y$
- $\frac{(x+2)^2}{25} + \frac{(y-5)^2}{9} = 1$
- $4x^2 - y^2 + 8x + 2y + 7 = 0$
- $(x+5)^2 = 8(y-1)$

In Exercises 6–8, find the standard form of the equation of the conic section satisfying the given conditions.

- Ellipse; Foci:  $(-7, 0)$ ,  $(7, 0)$ ; Vertices:  $(-10, 0)$ ,  $(10, 0)$
  - Hyperbola; Foci:  $(0, -10)$ ,  $(0, 10)$ ; Vertices:  $(0, -7)$ ,  $(0, 7)$
  - Parabola; Focus:  $(50, 0)$ ; Directrix:  $x = -50$
9. A sound whispered at one focus of a whispering gallery can be heard at the other focus. The figure below shows a whispering gallery whose cross section is a semielliptical arch with a height of 24 feet and a width of 80 feet. How far from the room's center should two people stand so that they can whisper back and forth and be heard?

## 9.6

In Exercises 60–65,

- If necessary, write the equation in one of the standard forms for a conic in polar coordinates.
- Determine values for  $e$  and  $p$ . Use the value of  $e$  to identify the conic section.
- Graph the given polar equation.

60.  $r = \frac{4}{1 - \sin \theta}$

61.  $r = \frac{6}{1 + \cos \theta}$

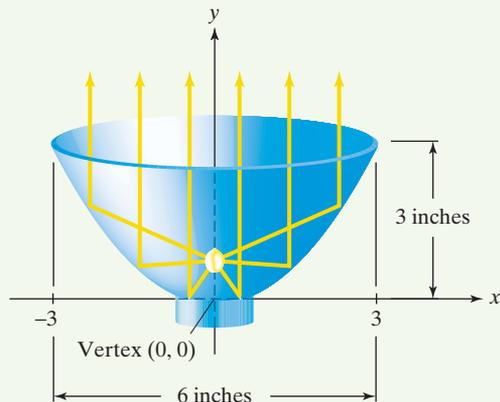

62.  $r = \frac{6}{2 + \sin \theta}$

63.  $r = \frac{2}{3 - 2 \cos \theta}$

64.  $r = \frac{6}{3 + 6 \sin \theta}$

65.  $r = \frac{8}{4 + 16 \cos \theta}$

10. An engineer is designing headlight units for cars. The unit shown in the figure below has a parabolic surface with a diameter of 6 inches and a depth of 3 inches.

- Using the coordinate system that has been positioned on the unit, find the parabola's equation.
- If the light source is located at the focus, describe its placement relative to the vertex.

In Exercises 11–12, identify each equation without completing the square or using a rotation of axes.

11.  $x^2 + 9y^2 + 10x - 18y + 25 = 0$

12.  $x^2 + y^2 + xy + 3x - y - 3 = 0$

13. For the equation

$$7x^2 - 6\sqrt{3}xy + 13y^2 - 16 = 0,$$

determine what angle of rotation would eliminate the  $x'y'$ -term in a rotated  $x'y'$ -system.

In Exercises 14–15, eliminate the parameter and graph the plane curve represented by the parametric equations. Use arrows to show the orientation of each plane curve.

14.  $x = t^2, y = t - 1; -\infty < t < \infty$

15.  $x = 1 + 3 \sin t, y = 2 \cos t; 0 \leq t < 2\pi$

In Exercises 16–17, identify the conic section and graph the polar equation.

16.  $r = \frac{2}{1 - \cos \theta}$

17.  $r = \frac{4}{2 + \sin \theta}$

## CUMULATIVE REVIEW EXERCISES (CHAPTERS P–9)

Solve each equation or inequality in Exercises 1–7.

1.  $2(x - 3) + 5x = 8(x - 1)$

2.  $-3(2x - 4) > 2(6x - 12)$

3.  $x - 5 = \sqrt{x + 7}$

4.  $(x - 2)^2 = 20$

5.  $|2x - 1| \geq 7$

6.  $3x^3 + 4x^2 - 7x + 2 = 0$

7.  $\log_2(x + 1) + \log_2(x - 1) = 3$

Solve each system in Exercises 8–10.

8. 
$$\begin{cases} 3x + 4y = 2 \\ 2x + 5y = -1 \end{cases}$$

9. 
$$\begin{cases} 2x^2 - y^2 = -8 \\ x - y = 6 \end{cases}$$

10. (Use matrices.)

$$\begin{cases} x - y + z = 17 \\ -4x + y + 5z = -2 \\ 2x + 3y + z = 8 \end{cases}$$

In Exercises 11–13, graph each equation, function, or system in a rectangular coordinate system.

11.  $f(x) = (x - 1)^2 - 4$

12.  $\frac{x^2}{9} + \frac{y^2}{4} = 1$

13. 
$$\begin{cases} 5x + y \leq 10 \\ y \geq \frac{1}{4}x + 2 \end{cases}$$

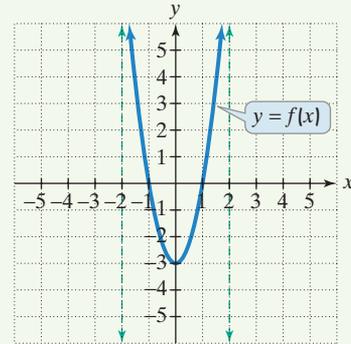

14. a. List all possible rational roots of

$$32x^3 - 52x^2 + 17x + 3 = 0.$$

b. The graph of  $f(x) = 32x^3 - 52x^2 + 17x + 3$  is shown in a  $[-1, 3, 1]$  by  $[-2, 6, 1]$  viewing rectangle. Use the graph of  $f$  and synthetic division to solve the equation in part (a).

15. The figure shows the graph of  $y = f(x)$  and its two vertical asymptotes.

- Find the domain and the range of  $f$ .
- What is the relative minimum and where does it occur?
- Find the interval on which  $f$  is increasing.
- Find  $f(-1) - f(0)$ .
- Find  $(f \circ f)(1)$ .
- Use arrow notation to complete this statement:

$$f(x) \rightarrow \infty \text{ as } \underline{\hspace{2cm}} \text{ or as } \underline{\hspace{2cm}}.$$

- Graph  $g(x) = f(x - 2) + 1$ .
- Graph  $h(x) = -f(2x)$ .

16. If  $f(x) = x^2 - 4$  and  $g(x) = x + 2$ , find  $(g \circ f)(x)$ .

17. Expand using logarithmic properties. Where possible, evaluate logarithmic expressions.

$$\log_5 \left( \frac{x^3 \sqrt{y}}{125} \right)$$

- Write the slope-intercept form of the equation of the line passing through  $(1, -4)$  and  $(-5, 8)$ .
- Rent-a-Truck charges a daily rental rate for a truck of \$39 plus \$0.16 a mile. A competing agency, Ace Truck Rentals, charges \$25 a day plus \$0.24 a mile for the same truck. How many miles must be driven in a day to make the daily cost of both agencies the same? What will be the cost?
- The local cable television company offers two deals. Basic cable service with one movie channel costs \$35 per month. Basic service with two movie channels cost \$45 per month. Find the charge for the basic cable service and the charge for each movie channel.

21. Verify the identity:  $\frac{\csc \theta - \sin \theta}{\sin \theta} = \cot^2 \theta$ .

22. Graph one complete cycle of  $y = 2 \cos(2x + \pi)$ .

23. If  $\mathbf{v} = 3\mathbf{i} - 6\mathbf{j}$  and  $\mathbf{w} = \mathbf{i} + \mathbf{j}$ , find  $(\mathbf{v} \cdot \mathbf{w})\mathbf{w}$ .

24. Solve for  $\theta$ :  $\sin 2\theta = \sin \theta, 0 \leq \theta < 2\pi$ .

25. In oblique triangle  $ABC$ ,  $A = 64^\circ$ ,  $B = 72^\circ$ , and  $a = 13.6$ . Solve the triangle. Round lengths to the nearest tenth.

# SEQUENCES, INDUCTION, AND PROBABILITY

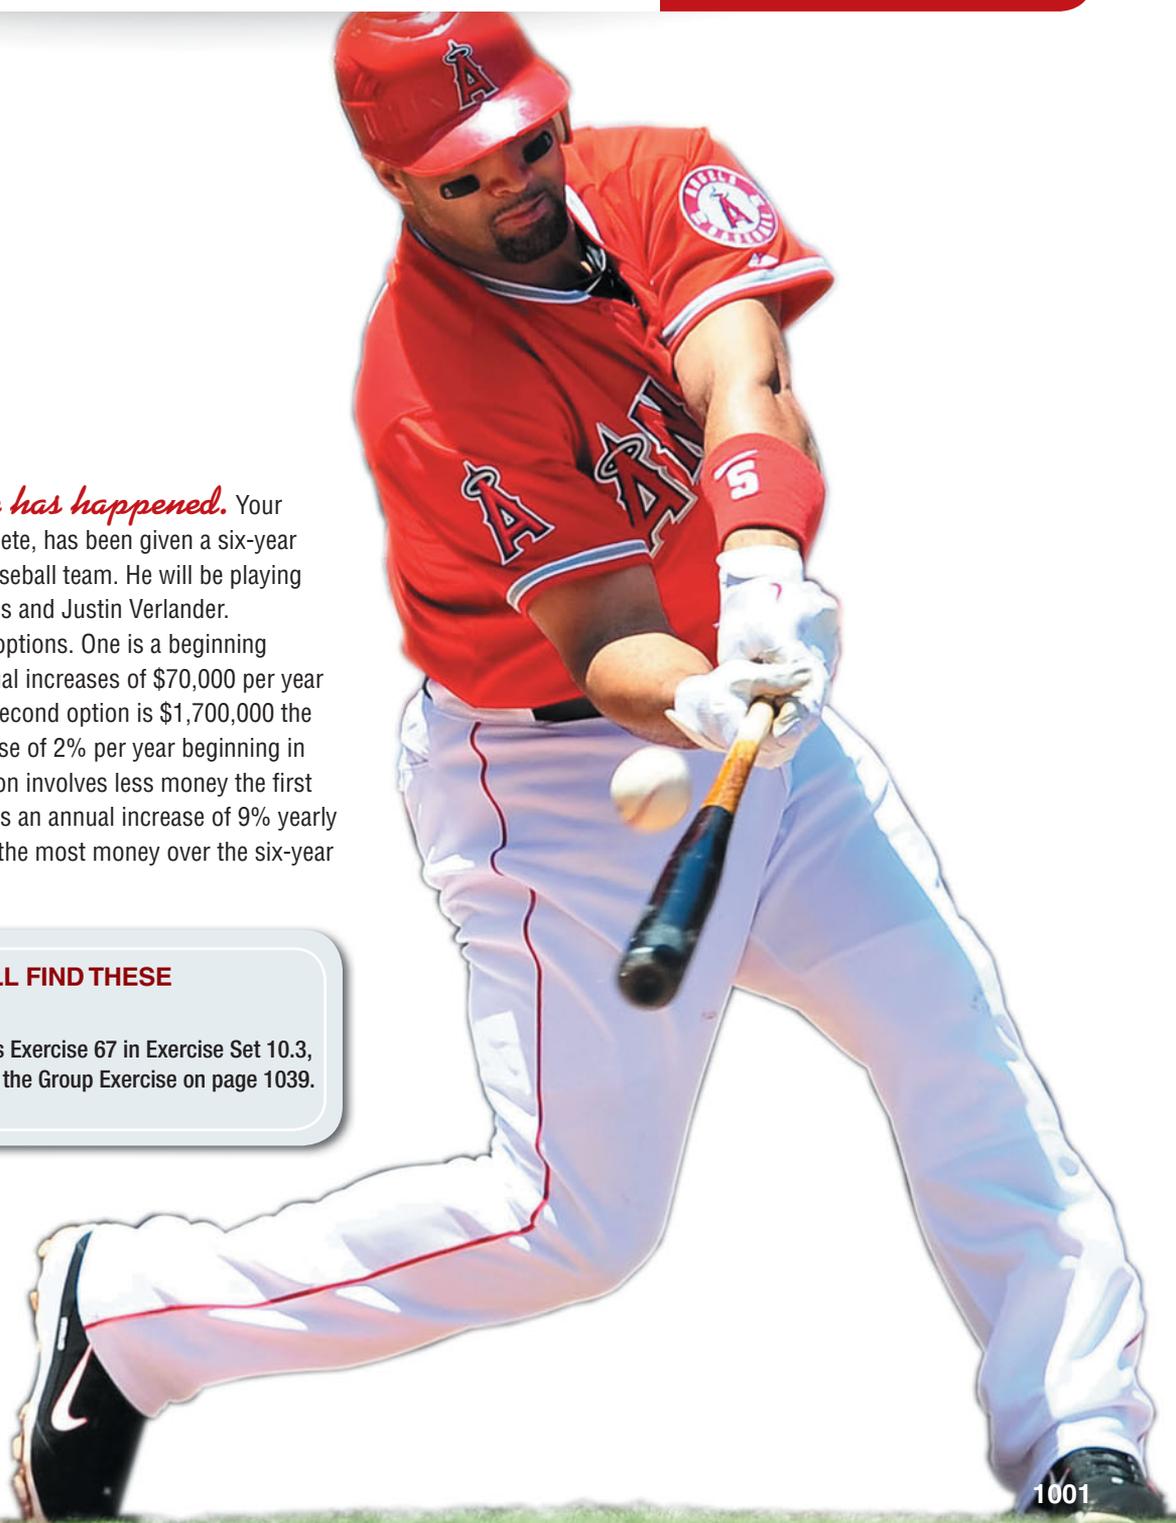

## CHAPTER

# 10

*Something incredible has happened.* Your college roommate, a gifted athlete, has been given a six-year contract with a professional baseball team. He will be playing against the likes of Albert Pujols and Justin Verlander. Management offers him three options. One is a beginning salary of \$1,700,000 with annual increases of \$70,000 per year starting in the second year. A second option is \$1,700,000 the first year with an annual increase of 2% per year beginning in the second year. The third option involves less money the first year—\$1,500,000—but there is an annual increase of 9% yearly after that. Which option offers the most money over the six-year contract?

A similar problem appears as Exercise 67 in Exercise Set 10.3, and this problem appears as the Group Exercise on page 1039.

## SECTION 10.1

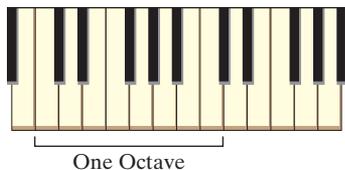

## Sequences and Summation Notation

## Objectives

- 1 Find particular terms of a sequence from the general term.
- 2 Use recursion formulas.
- 3 Use factorial notation.
- 4 Use summation notation.

## Blitzer Bonus

## Fibonacci Numbers on the Piano Keyboard

Numbers in the Fibonacci sequence can be found in an octave on the piano keyboard. The octave contains 2 black keys in one cluster and 3 black keys in another cluster, for a total of 5 black keys. It also has 8 white keys, for a total of 13 keys. The numbers 2, 3, 5, 8, and 13 are the third through seventh terms of the Fibonacci sequence.

## Sequences

Many creations in nature involve intricate mathematical designs, including a variety of spirals. For example, the arrangement of the individual florets in the head of a sunflower forms spirals. In some species, there are 21 spirals in the clockwise direction and 34 in the counterclockwise direction. The precise numbers depend on the species of sunflower: 21 and 34, or 34 and 55, or 55 and 89, or even 89 and 144.

This observation becomes even more interesting when we consider a sequence of numbers investigated by Leonardo of Pisa, also known as Fibonacci, an Italian mathematician of the thirteenth century. The **Fibonacci sequence** of numbers is an infinite sequence that begins as follows:

$$1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, 233, \dots$$

The first two terms are 1. Every term thereafter is the sum of the two preceding terms. For example, the third term, 2, is the sum of the first and second terms:  $1 + 1 = 2$ . The fourth term, 3, is the sum of the second and third terms:  $1 + 2 = 3$ , and so on. Did you know that the number of spirals in a daisy or a sunflower, 21 and 34, are two Fibonacci numbers? The number of spirals in a pine cone, 8 and 13, and a pineapple, 8 and 13, are also Fibonacci numbers.

We can think of the Fibonacci sequence as a function. The terms of the sequence

$$1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, 233, \dots$$

are the range values for a function  $f$  whose domain is the set of positive integers.

Domain:	1,	2,	3,	4,	5,	6,	7,	...
	↓	↓	↓	↓	↓	↓	↓	
Range:	1,	1,	2,	3,	5,	8,	13,	...

Thus,  $f(1) = 1, f(2) = 1, f(3) = 2, f(4) = 3, f(5) = 5, f(6) = 8, f(7) = 13$ , and so on.

The letter  $a$  with a subscript is used to represent function values of a sequence, rather than the usual function notation. The subscripts make up the domain of the sequence and they identify the location of a term. Thus,  $a_1$  represents the first term of the sequence,  $a_2$  represents the second term,  $a_3$  the third term, and so on. This notation is shown for the first six terms of the Fibonacci sequence:

$$\begin{array}{cccccc}
 1, & 1, & 2, & 3, & 5, & 8. \\
 \uparrow & \uparrow & \uparrow & \uparrow & \uparrow & \uparrow \\
 a_1 = 1 & a_2 = 1 & a_3 = 2 & a_4 = 3 & a_5 = 5 & a_6 = 8
 \end{array}$$

The notation  $a_n$  represents the  $n$ th term, or **general term**, of a sequence. The entire sequence is represented by  $\{a_n\}$ .

### Definition of a Sequence

An **infinite sequence**  $\{a_n\}$  is a function whose domain is the set of positive integers. The function values, or **terms**, of the sequence are represented by

$$a_1, a_2, a_3, a_4, \dots, a_n, \dots$$

Sequences whose domains consist only of the first  $n$  positive integers are called **finite sequences**.

- 1 Find particular terms of a sequence from the general term.

### EXAMPLE 1 Writing Terms of a Sequence from the General Term

Write the first four terms of the sequence whose  $n$ th term, or general term, is given:

a.  $a_n = 3n + 4$       b.  $a_n = \frac{(-1)^n}{3^n - 1}$ .

### SOLUTION

- a. We need to find the first four terms of the sequence whose general term is  $a_n = 3n + 4$ . To do so, we replace  $n$  in the formula with 1, 2, 3, and 4.

$$\begin{array}{ll} \begin{array}{l} a_1, \text{ 1st} \\ \text{term} \end{array} & 3 \cdot 1 + 4 = 3 + 4 = 7 \\ \begin{array}{l} a_2, \text{ 2nd} \\ \text{term} \end{array} & 3 \cdot 2 + 4 = 6 + 4 = 10 \\ \begin{array}{l} a_3, \text{ 3rd} \\ \text{term} \end{array} & 3 \cdot 3 + 4 = 9 + 4 = 13 \\ \begin{array}{l} a_4, \text{ 4th} \\ \text{term} \end{array} & 3 \cdot 4 + 4 = 12 + 4 = 16 \end{array}$$

The first four terms are 7, 10, 13, and 16. The sequence defined by  $a_n = 3n + 4$  can be written as

$$7, 10, 13, 16, \dots, 3n + 4, \dots$$

- b. We need to find the first four terms of the sequence whose general term is  $a_n = \frac{(-1)^n}{3^n - 1}$ . To do so, we replace each occurrence of  $n$  in the formula with 1, 2, 3, and 4.

$$\begin{array}{ll} \begin{array}{l} a_1, \text{ 1st} \\ \text{term} \end{array} & \frac{(-1)^1}{3^1 - 1} = \frac{-1}{3 - 1} = -\frac{1}{2} \\ \begin{array}{l} a_2, \text{ 2nd} \\ \text{term} \end{array} & \frac{(-1)^2}{3^2 - 1} = \frac{1}{9 - 1} = \frac{1}{8} \\ \begin{array}{l} a_3, \text{ 3rd} \\ \text{term} \end{array} & \frac{(-1)^3}{3^3 - 1} = \frac{-1}{27 - 1} = -\frac{1}{26} \\ \begin{array}{l} a_4, \text{ 4th} \\ \text{term} \end{array} & \frac{(-1)^4}{3^4 - 1} = \frac{1}{81 - 1} = \frac{1}{80} \end{array}$$

The first four terms are  $-\frac{1}{2}, \frac{1}{8}, -\frac{1}{26}$ , and  $\frac{1}{80}$ . The sequence defined by  $\frac{(-1)^n}{3^n - 1}$  can be written as

$$-\frac{1}{2}, \frac{1}{8}, -\frac{1}{26}, \frac{1}{80}, \dots, \frac{(-1)^n}{3^n - 1}, \dots$$

-  **Check Point 1** Write the first four terms of the sequence whose  $n$ th term, or general term, is given:

a.  $a_n = 2n + 5$       b.  $a_n = \frac{(-1)^n}{2^n + 1}$ .

Although sequences are usually named with the letter  $a$ , any lowercase letter can be used. For example, the first four terms of the sequence  $\{b_n\} = \left\{\left(\frac{1}{2}\right)^n\right\}$  are  $b_1 = \frac{1}{2}, b_2 = \frac{1}{4}, b_3 = \frac{1}{8}$ , and  $b_4 = \frac{1}{16}$ .

Because a sequence is a function whose domain is the set of positive integers, the **graph of a sequence** is a set of discrete points. For example, consider the sequence whose general term is  $a_n = \frac{1}{n}$ . How does the graph of this sequence differ from the

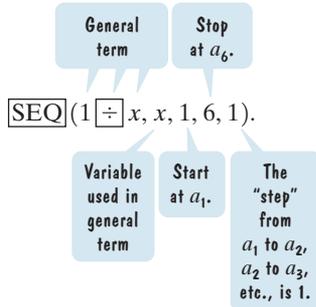

### GREAT QUESTION!

What effect does  $(-1)^n$  have on the terms of a sequence?

The factor  $(-1)^n$  in the general term of a sequence causes the signs of the terms to alternate between positive and negative, depending on whether  $n$  is even or odd.

**TECHNOLOGY**

Graphing utilities can write the terms of a sequence and graph them. For example, to find the first six terms of  $\{a_n\} = \left\{\frac{1}{n}\right\}$ , enter

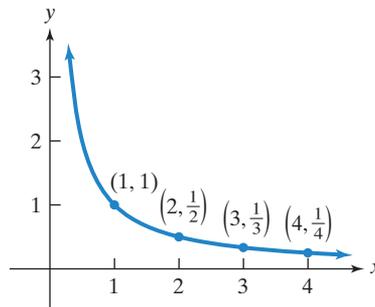

The first few terms of the sequence are shown in the viewing rectangle. By pressing the right arrow key to scroll right, you can see the remaining terms.

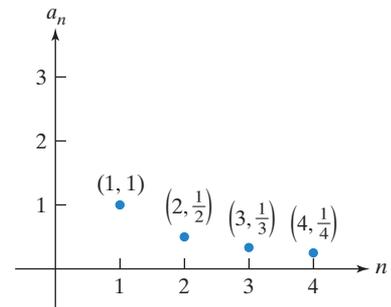

```
seq(1/X,X,1,6,1)
{1 .5 .33333333...
Ans:Frac
{1 1/2 1/3 1/4 ...
```

**2** Use recursion formulas.

graph of the function  $f(x) = \frac{1}{x}$ ? The graph of  $f(x) = \frac{1}{x}$  is shown in **Figure 10.1(a)** for positive values of  $x$ . To obtain the graph of the sequence  $\{a_n\} = \left\{\frac{1}{n}\right\}$ , remove all the points from the graph of  $f$  except those whose  $x$ -coordinates are positive integers. Thus, we remove all points except  $(1, 1)$ ,  $(2, \frac{1}{2})$ ,  $(3, \frac{1}{3})$ ,  $(4, \frac{1}{4})$ , and so on. The remaining points are the graph of the sequence  $\{a_n\} = \left\{\frac{1}{n}\right\}$ , shown in **Figure 10.1(b)**. Notice that the horizontal axis is labeled  $n$  and the vertical axis is labeled  $a_n$ .

**FIGURE 10.1(a)** The graph of  $f(x) = \frac{1}{x}, x > 0$

**FIGURE 10.1(b)** The graph of  $\{a_n\} = \left\{\frac{1}{n}\right\}$

Comparing a continuous graph to the graph of a sequence

**Recursion Formulas**

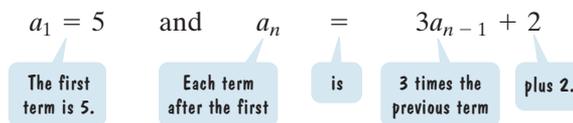

In Example 1, the formulas used for the  $n$ th term of a sequence expressed the term as a function of  $n$ , the number of the term. Sequences can also be defined using **recursion formulas**. A recursion formula defines the  $n$ th term of a sequence as a function of the previous term. Our next example illustrates that if the first term of a sequence is known, then the recursion formula can be used to determine the remaining terms.

**EXAMPLE 2** Using a Recursion Formula

Find the first four terms of the sequence in which  $a_1 = 5$  and  $a_n = 3a_{n-1} + 2$  for  $n \geq 2$ .

**SOLUTION**

Let's be sure we understand what is given.

Now let's write the first four terms of this sequence.

$$\begin{aligned}
 a_1 &= 5 && \text{This is the given first term.} \\
 a_2 &= 3a_1 + 2 && \text{Use } a_n = 3a_{n-1} + 2, \text{ with } n = 2. \\
 &= 3(5) + 2 = 17 && \text{Thus, } a_2 = 3a_{2-1} + 2 = 3a_1 + 2. \\
 &&& \text{Substitute 5 for } a_1. \\
 a_3 &= 3a_2 + 2 && \text{Again use } a_n = 3a_{n-1} + 2, \text{ with } n = 3. \\
 &= 3(17) + 2 = 53 && \text{Substitute 17 for } a_2. \\
 a_4 &= 3a_3 + 2 && \text{Notice that } a_4 \text{ is defined in terms of } a_3. \\
 &&& \text{We used } a_n = 3a_{n-1} + 2, \text{ with } n = 4. \\
 &= 3(53) + 2 = 161 && \text{Use the value of } a_3, \text{ the third term,} \\
 &&& \text{obtained above.}
 \end{aligned}$$

The first four terms are 5, 17, 53, and 161.

 **Check Point 2** Find the first four terms of the sequence in which  $a_1 = 3$  and  $a_n = 2a_{n-1} + 5$  for  $n \geq 2$ .

**3** Use factorial notation.

### Blitzer Bonus

#### Factorials from 0 through 20

0!	1
1!	1
2!	2
3!	6
4!	24
5!	120
6!	720
7!	5040
8!	40,320
9!	362,880
10!	3,628,800
11!	39,916,800
12!	479,001,600
13!	6,227,020,800
14!	87,178,291,200
15!	1,307,674,368,000
16!	20,922,789,888,000
17!	355,687,428,096,000
18!	6,402,373,705,728,000
19!	121,645,100,408,832,000
20!	2,432,902,008,176,640,000

As  $n$  increases,  $n!$  grows very rapidly. Factorial growth is more explosive than exponential growth discussed in Chapter 4.

### TECHNOLOGY

Most calculators have factorial keys. To find  $5!$ , most calculators use one of the following:

**Many Scientific Calculators**

$$5 \boxed{x!}$$

**Many Graphing Calculators**

$$5 \boxed{!} \boxed{\text{ENTER}}$$

Because  $n!$  becomes quite large as  $n$  increases, your calculator will display these larger values in scientific notation.

### Factorial Notation

Products of consecutive positive integers occur quite often in sequences. These products can be expressed in a special notation, called **factorial notation**.

#### Factorial Notation

If  $n$  is a positive integer, the notation  $n!$  (read “ $n$  factorial”) is the product of all positive integers from  $n$  down through 1.

$$n! = n(n-1)(n-2) \cdots (3)(2)(1)$$

$0!$  (zero factorial), by definition, is 1.

$$0! = 1$$

The values of  $n!$  for the first six positive integers are

$$1! = 1$$

$$2! = 2 \cdot 1 = 2$$

$$3! = 3 \cdot 2 \cdot 1 = 6$$

$$4! = 4 \cdot 3 \cdot 2 \cdot 1 = 24$$

$$5! = 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1 = 120$$

$$6! = 6 \cdot 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1 = 720.$$

Factorials affect only the number or variable that they follow unless grouping symbols appear. For example,

$$2 \cdot 3! = 2(3 \cdot 2 \cdot 1) = 2 \cdot 6 = 12$$

whereas

$$(2 \cdot 3)! = 6! = 6 \cdot 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1 = 720.$$

In this sense, factorials are similar to exponents.

### EXAMPLE 3 Finding Terms of a Sequence Involving Factorials

Write the first four terms of the sequence whose  $n$ th term is

$$a_n = \frac{2^n}{(n-1)!}.$$

#### SOLUTION

We need to find the first four terms of the sequence. To do so, we replace each  $n$  in

$\frac{2^n}{(n-1)!}$  with 1, 2, 3, and 4.

$$a_1, \text{ 1st term} \quad \frac{2^1}{(1-1)!} = \frac{2}{0!} = \frac{2}{1} = 2$$

$$a_2, \text{ 2nd term} \quad \frac{2^2}{(2-1)!} = \frac{4}{1!} = \frac{4}{1} = 4$$

$$a_3, \text{ 3rd term} \quad \frac{2^3}{(3-1)!} = \frac{8}{2!} = \frac{8}{2 \cdot 1} = 4$$

$$a_4, \text{ 4th term} \quad \frac{2^4}{(4-1)!} = \frac{16}{3!} = \frac{16}{3 \cdot 2 \cdot 1} = \frac{16}{6} = \frac{8}{3}$$

The first four terms are 2, 4, 4, and  $\frac{8}{3}$ .

 **Check Point 3** Write the first four terms of the sequence whose  $n$ th term is

$$a_n = \frac{20}{(n + 1)!}$$

When evaluating fractions with factorials in the numerator and the denominator, try to reduce the fraction before performing the multiplications. For example, consider  $\frac{26!}{21!}$ . Rather than write out 26! as the product of all integers from 26 down to 1, we can express 26! as

$$26! = 26 \cdot 25 \cdot 24 \cdot 23 \cdot 22 \cdot 21!$$

In this way, we can divide both the numerator and the denominator by the common factor, 21!.

$$\frac{26!}{21!} = \frac{26 \cdot 25 \cdot 24 \cdot 23 \cdot 22 \cdot \cancel{21!}}{\cancel{21!}} = 26 \cdot 25 \cdot 24 \cdot 23 \cdot 22 = 7,893,600$$

**EXAMPLE 4** Evaluating Fractions with Factorials

Evaluate each factorial expression:

a.  $\frac{10!}{2!8!}$       b.  $\frac{(n + 1)!}{n!}$

**SOLUTION**

a.  $\frac{10!}{2!8!} = \frac{10 \cdot 9 \cdot \cancel{8!}}{2 \cdot 1 \cdot \cancel{8!}} = \frac{90}{2} = 45$

b.  $\frac{(n + 1)!}{n!} = \frac{(n + 1) \cdot \cancel{n!}}{\cancel{n!}} = n + 1$       ...

 **Check Point 4** Evaluate each factorial expression:

a.  $\frac{14!}{2!12!}$       b.  $\frac{n!}{(n - 1)!}$

**4** Use summation notation.

**Summation Notation**

It is sometimes useful to find the sum of the first  $n$  terms of a sequence. For example, consider the cost of raising a child born in the United States in 2006 to a middle-income (\$43,200–\$72,600 per year) family, shown in **Table 10.1**.

**Table 10.1** The Cost of Raising a Child Born in the U.S. in 2006 to a Middle-Income Family

Year	2006	2007	2008	2009	2010	2011	2012	2013	2014
Average Cost	\$10,600	\$10,930	\$11,270	\$11,960	\$12,330	\$12,710	\$12,950	\$13,350	\$13,760
	Child is under 1.	Child is 1.	Child is 2.	Child is 3.	Child is 4.	Child is 5.	Child is 6.	Child is 7.	Child is 8.
Year	2015	2016	2017	2018	2019	2020	2021	2022	2023
Average Cost	\$13,970	\$14,400	\$14,840	\$16,360	\$16,860	\$17,390	\$18,430	\$19,000	\$19,590
	Child is 9.	Child is 10.	Child is 11.	Child is 12.	Child is 13.	Child is 14.	Child is 15.	Child is 16.	Child is 17.

Source: U.S. Department of Agriculture

We can let  $a_n$  represent the cost of raising a child in year  $n$ , where  $n = 1$  corresponds to 2006,  $n = 2$  to 2007,  $n = 3$  to 2008, and so on. The terms of the finite sequence in **Table 10.1** are given as follows:

10,600,	10,930,	11,270,	11,960,	12,330,	12,710,	12,950,	13,350,	13,760,
$a_1$	$a_2$	$a_3$	$a_4$	$a_5$	$a_6$	$a_7$	$a_8$	$a_9$
13,970,	14,400,	14,840,	16,360,	16,860,	17,390,	18,430,	19,000,	19,590.
$a_{10}$	$a_{11}$	$a_{12}$	$a_{13}$	$a_{14}$	$a_{15}$	$a_{16}$	$a_{17}$	$a_{18}$

Why might we want to add the terms of this sequence? We do this to find the total cost of raising a child born in 2006 from birth through age 17. Thus,

$$\begin{aligned} a_1 + a_2 + a_3 + a_4 + a_5 + a_6 + a_7 + a_8 + a_9 + a_{10} + a_{11} + a_{12} + a_{13} + a_{14} + a_{15} + a_{16} + a_{17} + a_{18} \\ = 10,600 + 10,930 + 11,270 + 11,960 + 12,330 + 12,710 + 12,950 + 13,350 + 13,760 \\ + 13,970 + 14,400 + 14,840 + 16,360 + 16,860 + 17,390 + 18,430 + 19,000 + 19,590 \\ = 260,700. \end{aligned}$$

We see that the total cost of raising a child born in 2006 from birth through age 17 is \$260,700.

There is a compact notation for expressing the sum of the first  $n$  terms of a sequence. For example, rather than write

$$a_1 + a_2 + a_3 + a_4 + a_5 + a_6 + a_7 + a_8 + a_9 + a_{10} + a_{11} + a_{12} + a_{13} + a_{14} + a_{15} + a_{16} + a_{17} + a_{18},$$

we can use *summation notation* to express the sum as

$$\sum_{i=1}^{18} a_i.$$

We read this expression as “the sum as  $i$  goes from 1 to 18 of  $a_i$ .” The letter  $i$  is called the *index of summation* and is not related to the use of  $i$  to represent  $\sqrt{-1}$ .

You can think of the symbol  $\Sigma$  (the uppercase Greek letter sigma) as an instruction to add up the terms of a sequence.

### Summation Notation

The sum of the first  $n$  terms of a sequence is represented by the **summation notation**

$$\sum_{i=1}^n a_i = a_1 + a_2 + a_3 + a_4 + \cdots + a_n,$$

where  $i$  is the **index of summation**,  $n$  is the **upper limit of summation**, and 1 is the **lower limit of summation**.

Any letter can be used for the index of summation. The letters  $i$ ,  $j$ , and  $k$  are used commonly. Furthermore, the lower limit of summation can be an integer other than 1.

When we write out a sum that is given in summation notation, we are **expanding the summation notation**. Example 5 shows how to do this.

### EXAMPLE 5 Using Summation Notation

Expand and evaluate the sum:

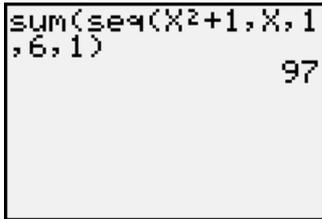

$$\text{a. } \sum_{i=1}^6 (i^2 + 1) \quad \text{b. } \sum_{k=4}^7 [(-2)^k - 5] \quad \text{c. } \sum_{i=1}^5 3.$$

## TECHNOLOGY

Graphing utilities can calculate the sum of a sequence. For example, to find the sum of the sequence in Example 5(a), enter

**SUM** **SEQ**  $(x^2 + 1, x, 1, 6, 1)$ .

Then press **ENTER**; 97 should be displayed. Use this capability to verify Example 5(b).

## SOLUTION

- a. To find  $\sum_{i=1}^6 (i^2 + 1)$ , we must replace  $i$  in the expression  $i^2 + 1$  with all consecutive integers from 1 to 6, inclusive. Then we add.

$$\begin{aligned}\sum_{i=1}^6 (i^2 + 1) &= (1^2 + 1) + (2^2 + 1) + (3^2 + 1) + (4^2 + 1) \\ &\quad + (5^2 + 1) + (6^2 + 1) \\ &= 2 + 5 + 10 + 17 + 26 + 37 \\ &= 97\end{aligned}$$

- b. The index of summation in  $\sum_{k=4}^7 [(-2)^k - 5]$  is  $k$ . First we evaluate  $(-2)^k - 5$  for all consecutive integers from 4 through 7, inclusive. Then we add.

$$\begin{aligned}\sum_{k=4}^7 [(-2)^k - 5] &= [(-2)^4 - 5] + [(-2)^5 - 5] \\ &\quad + [(-2)^6 - 5] + [(-2)^7 - 5] \\ &= (16 - 5) + (-32 - 5) + (64 - 5) + (-128 - 5) \\ &= 11 + (-37) + 59 + (-133) \\ &= -100\end{aligned}$$

- c. To find  $\sum_{i=1}^5 3$ , we observe that every term of the sum is 3. The notation  $i = 1$  through 5 indicates that we must add the first five terms of a sequence in which every term is 3.

$$\sum_{i=1}^5 3 = 3 + 3 + 3 + 3 + 3 = 15 \quad \dots$$

 **Check Point 5** Expand and evaluate the sum:

a.  $\sum_{i=1}^6 2i^2$

b.  $\sum_{k=3}^5 (2^k - 3)$

c.  $\sum_{i=1}^5 4$ .

Although the domain of a sequence is the set of positive integers, any integers can be used for the limits of summation. For a given sum, we can vary the upper and lower limits of summation, as well as the letter used for the index of summation. By doing so, we can produce different-looking summation notations for the same sum. For example, the sum of the squares of the first four positive integers,  $1^2 + 2^2 + 3^2 + 4^2$ , can be expressed in a number of equivalent ways:

$$\begin{aligned}\sum_{i=1}^4 i^2 &= 1^2 + 2^2 + 3^2 + 4^2 = 30 \\ \sum_{i=0}^3 (i+1)^2 &= (0+1)^2 + (1+1)^2 + (2+1)^2 + (3+1)^2 \\ &= 1^2 + 2^2 + 3^2 + 4^2 = 30 \\ \sum_{k=2}^5 (k-1)^2 &= (2-1)^2 + (3-1)^2 + (4-1)^2 + (5-1)^2 \\ &= 1^2 + 2^2 + 3^2 + 4^2 = 30.\end{aligned}$$

**EXAMPLE 6** Writing Sums in Summation Notation

Express each sum using summation notation:

$$\text{a. } 1^3 + 2^3 + 3^3 + \cdots + 7^3 \qquad \text{b. } 1 + \frac{1}{3} + \frac{1}{9} + \frac{1}{27} + \cdots + \frac{1}{3^{n-1}}$$

**SOLUTION**In each case, we will use 1 as the lower limit of summation and  $i$  for the index of summation.

- a. The sum  $1^3 + 2^3 + 3^3 + \cdots + 7^3$  has seven terms, each of the form  $i^3$ , starting at  $i = 1$  and ending at  $i = 7$ . Thus,

$$1^3 + 2^3 + 3^3 + \cdots + 7^3 = \sum_{i=1}^7 i^3.$$

- b. The sum

$$1 + \frac{1}{3} + \frac{1}{9} + \frac{1}{27} + \cdots + \frac{1}{3^{n-1}}$$

has  $n$  terms, each of the form  $\frac{1}{3^{i-1}}$ , starting at  $i = 1$  and ending at  $i = n$ . Thus,

$$1 + \frac{1}{3} + \frac{1}{9} + \frac{1}{27} + \cdots + \frac{1}{3^{n-1}} = \sum_{i=1}^n \frac{1}{3^{i-1}}. \quad \dots$$

 **Check Point 6** Express each sum using summation notation:

$$\text{a. } 1^2 + 2^2 + 3^2 + \cdots + 9^2 \qquad \text{b. } 1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \cdots + \frac{1}{2^{n-1}}$$

**Table 10.2** contains some important properties of sums expressed in summation notation.

Table 10.2 Properties of Sums

Property	Example
1. $\sum_{i=1}^n ca_i = c \sum_{i=1}^n a_i$ , $c$ any real number	$\sum_{i=1}^4 3i^2 = 3 \cdot 1^2 + 3 \cdot 2^2 + 3 \cdot 3^2 + 3 \cdot 4^2$ $3 \sum_{i=1}^4 i^2 = 3(1^2 + 2^2 + 3^2 + 4^2) = 3 \cdot 1^2 + 3 \cdot 2^2 + 3 \cdot 3^2 + 3 \cdot 4^2$ <p>Conclusion: <math>\sum_{i=1}^4 3i^2 = 3 \sum_{i=1}^4 i^2</math></p>
2. $\sum_{i=1}^n (a_i + b_i) = \sum_{i=1}^n a_i + \sum_{i=1}^n b_i$	$\sum_{i=1}^4 (i + i^2) = (1 + 1^2) + (2 + 2^2) + (3 + 3^2) + (4 + 4^2)$ $\sum_{i=1}^4 i + \sum_{i=1}^4 i^2 = (1 + 2 + 3 + 4) + (1^2 + 2^2 + 3^2 + 4^2)$ $= (1 + 1^2) + (2 + 2^2) + (3 + 3^2) + (4 + 4^2)$ <p>Conclusion: <math>\sum_{i=1}^4 (i + i^2) = \sum_{i=1}^4 i + \sum_{i=1}^4 i^2</math></p>
3. $\sum_{i=1}^n (a_i - b_i) = \sum_{i=1}^n a_i - \sum_{i=1}^n b_i$	$\sum_{i=3}^5 (i^2 - i^3) = (3^2 - 3^3) + (4^2 - 4^3) + (5^2 - 5^3)$ $\sum_{i=3}^5 i^2 - \sum_{i=3}^5 i^3 = (3^2 + 4^2 + 5^2) - (3^3 + 4^3 + 5^3)$ $= (3^2 - 3^3) + (4^2 - 4^3) + (5^2 - 5^3)$ <p>Conclusion: <math>\sum_{i=3}^5 (i^2 - i^3) = \sum_{i=3}^5 i^2 - \sum_{i=3}^5 i^3</math></p>

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- $\{a_n\} = a_1, a_2, a_3, a_4, \dots, a_n, \dots$  represents an infinite \_\_\_\_\_, a function whose domain is the set of positive \_\_\_\_\_. The function values  $a_1, a_2, a_3, \dots$  are called the \_\_\_\_\_.
- The  $n$ th term of a sequence, represented by  $a_n$ , is called the \_\_\_\_\_ term.

Write the second term of each sequence.

- $a_n = 5n - 6$  \_\_\_\_\_
- $a_n = \frac{(-1)^n}{4^n - 1}$  \_\_\_\_\_
- $a_n = 2a_{n-1} - 4, a_1 = 3$  \_\_\_\_\_

- $5!$ , called 5 \_\_\_\_\_, is the product of all positive integers from \_\_\_\_\_ down through \_\_\_\_\_. By definition,  $0! =$  \_\_\_\_\_.
- $\frac{(n+3)!}{(n+2)!} =$  \_\_\_\_\_
- $\sum_{i=1}^n a_i =$  \_\_\_\_\_ + \_\_\_\_\_ + \_\_\_\_\_ +  $\dots$  + \_\_\_\_\_. In this summation notation,  $i$  is called the \_\_\_\_\_ of summation,  $n$  is the \_\_\_\_\_ of summation, and 1 is the \_\_\_\_\_ of summation.

## EXERCISE SET 10.1

### Practice Exercises

In Exercises 1–12, write the first four terms of each sequence whose general term is given.

- |  |  |
|--|--|
| 1. $a_n = 3n + 2$                      | 2. $a_n = 4n - 1$                      |
| 3. $a_n = 3^n$                         | 4. $a_n = \left(\frac{1}{3}\right)^n$  |
| 5. $a_n = (-3)^n$                      | 6. $a_n = \left(-\frac{1}{3}\right)^n$ |
| 7. $a_n = (-1)^n(n + 3)$               | 8. $a_n = (-1)^{n+1}(n + 4)$           |
| 9. $a_n = \frac{2n}{n + 4}$            | 10. $a_n = \frac{3n}{n + 5}$           |
| 11. $a_n = \frac{(-1)^{n+1}}{2^n - 1}$ | 12. $a_n = \frac{(-1)^{n+1}}{2^n + 1}$ |

The sequences in Exercises 13–18 are defined using recursion formulas. Write the first four terms of each sequence.

- $a_1 = 7$  and  $a_n = a_{n-1} + 5$  for  $n \geq 2$
- $a_1 = 12$  and  $a_n = a_{n-1} + 4$  for  $n \geq 2$
- $a_1 = 3$  and  $a_n = 4a_{n-1}$  for  $n \geq 2$
- $a_1 = 2$  and  $a_n = 5a_{n-1}$  for  $n \geq 2$
- $a_1 = 4$  and  $a_n = 2a_{n-1} + 3$  for  $n \geq 2$
- $a_1 = 5$  and  $a_n = 3a_{n-1} - 1$  for  $n \geq 2$

In Exercises 19–22, the general term of a sequence is given and involves a factorial. Write the first four terms of each sequence.

- |                            |                                |
|----------------------------|--------------------------------|
| 19. $a_n = \frac{n^2}{n!}$ | 20. $a_n = \frac{(n+1)!}{n^2}$ |
| 21. $a_n = 2(n+1)!$        | 22. $a_n = -2(n-1)!$           |

In Exercises 23–28, evaluate each factorial expression.

- |                         |                             |
|-------------------------|-----------------------------|
| 23. $\frac{17!}{15!}$   | 24. $\frac{18!}{16!}$       |
| 25. $\frac{16!}{2!14!}$ | 26. $\frac{20!}{2!18!}$     |
| 27. $\frac{(n+2)!}{n!}$ | 28. $\frac{(2n+1)!}{(2n)!}$ |

In Exercises 29–42, find each indicated sum.

- |  |  |
|--|--|
| 29. $\sum_{i=1}^6 5i$                          | 30. $\sum_{i=1}^6 7i$                          |
| 31. $\sum_{i=1}^4 2i^2$                        | 32. $\sum_{i=1}^5 i^3$                         |
| 33. $\sum_{k=1}^5 k(k+4)$                      | 34. $\sum_{k=1}^4 (k-3)(k+2)$                  |
| 35. $\sum_{i=1}^4 \left(-\frac{1}{2}\right)^i$ | 36. $\sum_{i=2}^4 \left(-\frac{1}{3}\right)^i$ |
| 37. $\sum_{i=5}^9 11$                          | 38. $\sum_{i=3}^7 12$                          |
| 39. $\sum_{i=0}^4 \frac{(-1)^i}{i!}$           | 40. $\sum_{i=0}^4 \frac{(-1)^{i+1}}{(i+1)!}$   |
| 41. $\sum_{i=1}^5 \frac{i!}{(i-1)!}$           | 42. $\sum_{i=1}^5 \frac{(i+2)!}{i!}$           |

In Exercises 43–54, express each sum using summation notation. Use 1 as the lower limit of summation and  $i$  for the index of summation.

- $1^2 + 2^2 + 3^2 + \dots + 15^2$
- $1^4 + 2^4 + 3^4 + \dots + 12^4$
- $2 + 2^2 + 2^3 + \dots + 2^{11}$
- $5 + 5^2 + 5^3 + \dots + 5^{12}$
- $1 + 2 + 3 + \dots + 30$
- $1 + 2 + 3 + \dots + 40$
- $\frac{1}{2} + \frac{2}{3} + \frac{3}{4} + \dots + \frac{14}{14+1}$

50.  $\frac{1}{3} + \frac{2}{4} + \frac{3}{5} + \cdots + \frac{16}{16+2}$

51.  $4 + \frac{4^2}{2} + \frac{4^3}{3} + \cdots + \frac{4^n}{n}$

52.  $\frac{1}{9} + \frac{2}{9^2} + \frac{3}{9^3} + \cdots + \frac{n}{9^n}$

53.  $1 + 3 + 5 + \cdots + (2n - 1)$

54.  $a + ar + ar^2 + \cdots + ar^{n-1}$

In Exercises 55–60, express each sum using summation notation. Use a lower limit of summation of your choice and  $k$  for the index of summation.

55.  $5 + 7 + 9 + 11 + \cdots + 31$

56.  $6 + 8 + 10 + 12 + \cdots + 32$

57.  $a + ar + ar^2 + \cdots + ar^{12}$

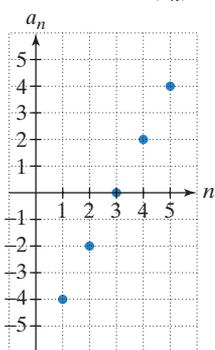

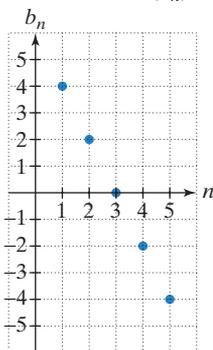

58.  $a + ar + ar^2 + \cdots + ar^{14}$

59.  $a + (a + d) + (a + 2d) + \cdots + (a + nd)$

60.  $(a + d) + (a + d^2) + \cdots + (a + d^n)$

### Practice Plus

In Exercises 61–68, use the graphs of  $\{a_n\}$  and  $\{b_n\}$  to find each indicated sum.

 The Graph of  $\{a_n\}$ 

 The Graph of  $\{b_n\}$ 

61.  $\sum_{i=1}^5 (a_i^2 + 1)$

62.  $\sum_{i=1}^5 (b_i^2 - 1)$

63.  $\sum_{i=1}^5 (2a_i + b_i)$

64.  $\sum_{i=1}^5 (a_i + 3b_i)$

65.  $\sum_{i=4}^5 \left(\frac{a_i}{b_i}\right)^2$

66.  $\sum_{i=4}^5 \left(\frac{a_i}{b_i}\right)^3$

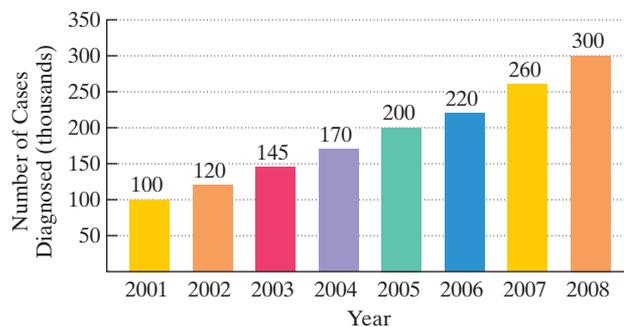

67.  $\sum_{i=1}^5 a_i^2 + \sum_{i=1}^5 b_i^2$

68.  $\sum_{i=1}^5 a_i^2 - \sum_{i=3}^5 b_i^2$

### Application Exercises

69. One in one hundred is the ratio of individuals in the U.S. population with autistic disorder, better known as autism. The disorder involves severe deficits in language, social bonding, and imagination, and is often accompanied by mental retardation. The bar graph at the top of the next column shows the number of autism cases diagnosed in the United States from 2001 through 2008.

Autism Cases Diagnosed in the United States

Source: Lilienfeld et al., *Psychology*, Second Edition, Pearson, 2011.

Let  $a_n$  represent the number of autism cases diagnosed in the United States, in thousands,  $n$  years after 2000.

a. Use the numbers given in the graph to find and interpret

$$\sum_{i=1}^8 a_i.$$

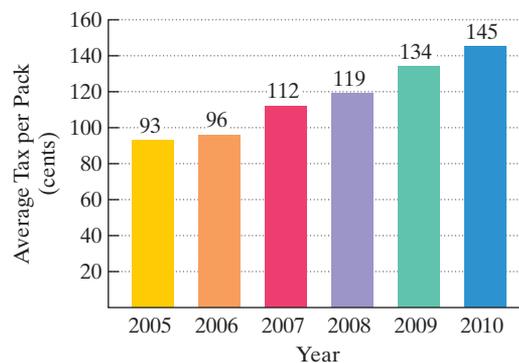

b. The finite sequence whose general term is

$$a_n = 28n + 63,$$

where  $n = 1, 2, 3, \dots, 8$ , models the number of autism cases diagnosed in the United States, in thousands,  $n$  years after 2000. Use this model to find  $\sum_{i=1}^8 a_i$ . Does this underestimate or overestimate the actual sum in part (a)? By how much?

70. The bar graph shows the average state cigarette tax per pack from 2005 through 2010.

Average State Cigarette Tax per Pack

Source: "Trends in Average State Cigarette Tax Rates." Campaign for Tobacco-Free Kids

Let  $a_n$  represent the average state cigarette tax per pack, in cents,  $n$  years after 2004.

a. Use the numbers given in the graph to find and interpret

$$\frac{1}{6} \sum_{i=1}^6 a_i.$$

b. The finite sequence whose general term is

$$a_n = 11n + 78,$$

where  $n = 1, 2, 3, 4, 5, 6$ , models the average state cigarette tax per pack, in cents,  $n$  years after 2004. Use this model to find  $\frac{1}{6} \sum_{i=1}^6 a_i$ . How does this compare with the actual value you obtained in part (a)?

71. A deposit of \$6000 is made in an account that earns 6% interest compounded quarterly. The balance in the account after  $n$  quarters is given by the sequence

$$a_n = 6000 \left( 1 + \frac{0.06}{4} \right)^n, \quad n = 1, 2, 3, \dots$$

Find the balance in the account after five years. Round to the nearest cent.

72. A deposit of \$10,000 is made in an account that earns 8% interest compounded quarterly. The balance in the account after  $n$  quarters is given by the sequence

$$a_n = 10,000 \left( 1 + \frac{0.08}{4} \right)^n, \quad n = 1, 2, 3, \dots$$

Find the balance in the account after six years. Round to the nearest cent.

### Writing in Mathematics

73. What is a sequence? Give an example with your description.  
 74. Explain how to write terms of a sequence if the formula for the general term is given.  
 75. What does the graph of a sequence look like? How is it obtained?  
 76. What is a recursion formula?  
 77. Explain how to find  $n!$  if  $n$  is a positive integer.  
 78. Explain the best way to evaluate  $\frac{900!}{899!}$  without a calculator.  
 79. What is the meaning of the symbol  $\Sigma$ ? Give an example with your description.  
 80. You buy a new car for \$24,000. At the end of  $n$  years, the value of your car is given by the sequence

$$a_n = 24,000 \left( \frac{3}{4} \right)^n, \quad n = 1, 2, 3, \dots$$

Find  $a_5$  and write a sentence explaining what this value represents. Describe the  $n$ th term of the sequence in terms of the value of your car at the end of each year.

### Technology Exercises

In Exercises 81–85, use a calculator's factorial key to evaluate each expression.

81.  $\frac{200!}{198!}$       82.  $\left( \frac{300}{20} \right)!$       83.  $\frac{20!}{300}$

84.  $\frac{20!}{(20-3)!}$       85.  $\frac{54!}{(54-3)!3!}$

86. Use the **SEQ** (sequence) capability of a graphing utility to verify the terms of the sequences you obtained for any five sequences from Exercises 1–12 or 19–22.

87. Use the **SUM** **SEQ** (sum of the sequence) capability of a graphing utility to verify any five of the sums you obtained in Exercises 29–42.

88. As  $n$  increases, the terms of the sequence

$$a_n = \left( 1 + \frac{1}{n} \right)^n$$

get closer and closer to the number  $e$  (where  $e \approx 2.7183$ ). Use a calculator to find  $a_{10}$ ,  $a_{100}$ ,  $a_{1000}$ ,  $a_{10,000}$ , and  $a_{100,000}$ , comparing these terms to your calculator's decimal approximation for  $e$ .

Many graphing utilities have a sequence-graphing mode that plots the terms of a sequence as points on a rectangular coordinate system. Consult your manual; if your graphing utility has this capability, use it to graph each of the sequences in Exercises 89–92. What appears to be happening to the terms of each sequence as  $n$  gets larger?

89.  $a_n = \frac{n}{n+1}$   $n: [0, 10, 1]$  by  $a_n: [0, 1, 0.1]$

90.  $a_n = \frac{100}{n}$   $n: [0, 1000, 100]$  by  $a_n: [0, 1, 0.1]$

91.  $a_n = \frac{2n^2 + 5n - 7}{n^3}$   $n: [0, 10, 1]$  by  $a_n: [0, 2, 0.2]$

92.  $a_n = \frac{3n^4 + n - 1}{5n^4 + 2n^2 + 1}$   $n: [0, 10, 1]$  by  $a_n: [0, 1, 0.1]$

### Critical Thinking Exercises

**Make Sense?** In Exercises 93–96, determine whether each statement makes sense or does not make sense, and explain your reasoning.

93. Now that I've studied sequences, I realize that the joke in this cartoon is based on the fact that you can't have a negative number of sheep.

WHEN MATHEMATICIANS CAN'T SLEEP

Harry Blair

94. By writing  $a_1, a_2, a_3, a_4, \dots, a_n, \dots$ , I can see that the range of a sequence is the set of positive integers.  
 95. It makes a difference whether or not I use parentheses around the expression following the summation symbol, because the value of  $\sum_{i=1}^8 (i+7)$  is 92, but the value of  $\sum_{i=1}^8 i+7$  is 43.  
 96. Without writing out the terms, I can see that  $(-1)^{2n}$  in  $a_n = \frac{(-1)^{2n}}{3n}$  causes the terms to alternate in sign.

In Exercises 97–100, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

$$97. \frac{n!}{(n-1)!} = \frac{1}{n-1}$$

98. The Fibonacci sequence 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, ... can be defined recursively using  $a_0 = 1, a_1 = 1$ ;  $a_n = a_{n-2} + a_{n-1}$ , where  $n \geq 2$ .

$$99. \sum_{i=1}^2 (-1)^i 2^i = 0$$

$$100. \sum_{i=1}^2 a_i b_i = \sum_{i=1}^2 a_i \sum_{i=1}^2 b_i$$

101. Write the first five terms of the sequence whose first term is 9 and whose general term is

$$a_n = \begin{cases} \frac{a_{n-1}}{2} & \text{if } a_{n-1} \text{ is even} \\ 3a_{n-1} + 5 & \text{if } a_{n-1} \text{ is odd} \end{cases}$$

for  $n \geq 2$ .

### Group Exercise

102. Enough curiosities involving the Fibonacci sequence exist to warrant a flourishing Fibonacci Association, which publishes a quarterly journal. Do some research on the Fibonacci sequence by consulting the Internet or the research department of your library, and find one property that interests you. After doing this research, get together with your group to share these intriguing properties.

### Preview Exercises

Exercises 103–105 will help you prepare for the material covered in the next section.

103. Consider the sequence 8, 3, -2, -7, -12, ... Find  $a_2 - a_1$ ,  $a_3 - a_2$ ,  $a_4 - a_3$ , and  $a_5 - a_4$ . What do you observe?

104. Consider the sequence whose  $n$ th term is  $a_n = 4n - 3$ . Find  $a_2 - a_1$ ,  $a_3 - a_2$ ,  $a_4 - a_3$ , and  $a_5 - a_4$ . What do you observe?

105. Use the formula  $a_n = 4 + (n-1)(-7)$  to find the eighth term of the sequence 4, -3, -10, ...

## SECTION 10.2 Arithmetic Sequences

### Objectives

- 1 Find the common difference for an arithmetic sequence.
- 2 Write terms of an arithmetic sequence.
- 3 Use the formula for the general term of an arithmetic sequence.
- 4 Use the formula for the sum of the first  $n$  terms of an arithmetic sequence.

- 1 Find the common difference for an arithmetic sequence.

Your grandmother and her financial counselor are looking at options in case an adult residential facility is needed in the future. The good news is that your grandmother's total assets are \$500,000. The bad news is that adult residential community costs average \$64,130 annually, increasing by \$1800 each year. In this section, we will see how sequences can be used to model your grandmother's situation and help her to identify realistic options.

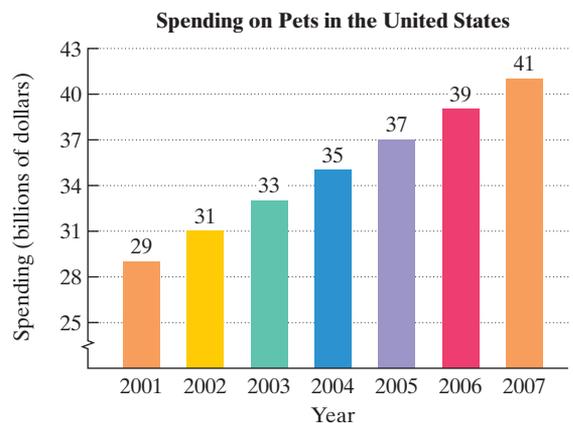

### Arithmetic Sequences

The bar graph in **Figure 10.2** shows how much Americans spent on their pets, rounded to the nearest billion dollars, each year from 2001 through 2007.

The graph illustrates that each year spending increased by \$2 billion. The sequence of annual spending

29, 31, 33, 35, 37, 39, 41, ...

shows that each term after the first, 29, differs from the preceding term by a constant amount, namely, 2. This sequence is an example of an *arithmetic sequence*.

**FIGURE 10.2**

Source: American Pet Products Manufacturers Association

This sequence is an example of an *arithmetic sequence*.

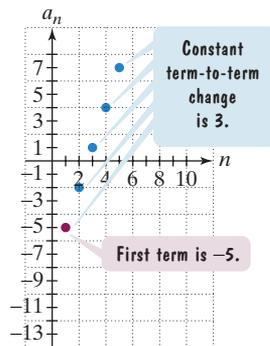

**Definition of an Arithmetic Sequence**

An **arithmetic sequence** is a sequence in which each term after the first differs from the preceding term by a constant amount. The difference between consecutive terms is called the **common difference** of the sequence.

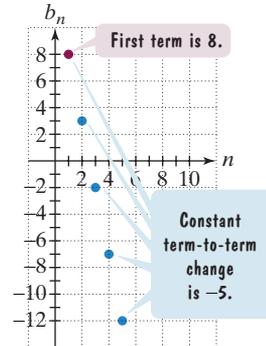

The common difference,  $d$ , is found by subtracting any term from the term that directly follows it. In the following examples, the common difference is found by subtracting the first term from the second term,  $a_2 - a_1$ .

<b>Arithmetic Sequence</b>	<b>Common Difference</b>
142, 146, 150, 154, 158, ...	$d = 146 - 142 = 4$
-5, -2, 1, 4, 7, ...	$d = -2 - (-5) = -2 + 5 = 3$
8, 3, -2, -7, -12, ...	$d = 3 - 8 = -5$

**Figure 10.3** shows the graphs of the last two arithmetic sequences in our list. The common difference for the increasing sequence in **Figure 10.3(a)** is 3. The common difference for the decreasing sequence in **Figure 10.3(b)** is -5.

**FIGURE 10.3(a)** The graph of  $\{a_n\} = -5, -2, 1, 4, 7, \dots$

**FIGURE 10.3(b)** The graph of  $\{b_n\} = 8, 3, -2, -7, -12, \dots$

The graph of each arithmetic sequence in **Figure 10.3** forms a set of discrete points lying on a straight line. This illustrates that **an arithmetic sequence is a linear function whose domain is the set of positive integers.**

If the first term of an arithmetic sequence is  $a_1$ , each term after the first is obtained by adding  $d$ , the common difference, to the previous term. This can be expressed recursively as follows:

$$a_n = a_{n-1} + d.$$

Add  $d$  to the term in any position to get the next term.

To use this recursion formula, we must be given the first term.

- 2 Write terms of an arithmetic sequence.

### EXAMPLE 1 Writing the Terms of an Arithmetic Sequence

Write the first six terms of the arithmetic sequence in which  $a_1 = 6$  and  $a_n = a_{n-1} - 2$ .

#### SOLUTION

The recursion formula  $a_1 = 6$  and  $a_n = a_{n-1} - 2$  indicates that each term after the first, 6, is obtained by adding  $-2$  to the previous term.

$$\begin{array}{ll} a_1 = 6 & \text{This is given.} \\ a_2 = a_1 - 2 = 6 - 2 = 4 & \text{Use } a_n = a_{n-1} - 2 \text{ with } n = 2. \\ a_3 = a_2 - 2 = 4 - 2 = 2 & \text{Use } a_n = a_{n-1} - 2 \text{ with } n = 3. \\ a_4 = a_3 - 2 = 2 - 2 = 0 & \text{Use } a_n = a_{n-1} - 2 \text{ with } n = 4. \\ a_5 = a_4 - 2 = 0 - 2 = -2 & \text{Use } a_n = a_{n-1} - 2 \text{ with } n = 5. \\ a_6 = a_5 - 2 = -2 - 2 = -4 & \text{Use } a_n = a_{n-1} - 2 \text{ with } n = 6. \end{array}$$

The first six terms are

$$6, 4, 2, 0, -2, \text{ and } -4.$$

...

-  **Check Point 1** Write the first six terms of the arithmetic sequence in which  $a_1 = 100$  and  $a_n = a_{n-1} - 30$ .

- 3 Use the formula for the general term of an arithmetic sequence.

### The General Term of an Arithmetic Sequence

Consider an arithmetic sequence whose first term is  $a_1$  and whose common difference is  $d$ . We are looking for a formula for the general term,  $a_n$ . Let's begin by writing the first six terms. The first term is  $a_1$ . The second term is  $a_1 + d$ . The third term is  $a_1 + d + d$ , or  $a_1 + 2d$ . Thus, we start with  $a_1$  and add  $d$  to each successive term. The first six terms are

$$\begin{array}{cccccc} a_1, & a_1 + d, & a_1 + 2d, & a_1 + 3d, & a_1 + 4d, & a_1 + 5d. \\ \text{\scriptsize } a_1, \text{ first} & \text{\scriptsize } a_2, \text{ second} & \text{\scriptsize } a_3, \text{ third} & \text{\scriptsize } a_4, \text{ fourth} & \text{\scriptsize } a_5, \text{ fifth} & \text{\scriptsize } a_6, \text{ sixth} \\ \text{\scriptsize term} & \text{\scriptsize term} & \text{\scriptsize term} & \text{\scriptsize term} & \text{\scriptsize term} & \text{\scriptsize term} \end{array}$$

Compare the coefficient of  $d$  and the subscript of  $a$  denoting the term number. Can you see that the coefficient of  $d$  is 1 less than the subscript of  $a$  denoting the term number?

$$\begin{array}{ll} a_3: \text{ third term} = a_1 + 2d & a_4: \text{ fourth term} = a_1 + 3d \\ \text{One less than 3, or 2, is} & \text{One less than 4, or 3, is} \\ \text{the coefficient of } d. & \text{the coefficient of } d. \end{array}$$

Thus, the formula for the  $n$ th term is

$$a_n: \text{ nth term} = a_1 + (n - 1)d.$$

One less than  $n$ , or  $n - 1$ , is the coefficient of  $d$ .

### General Term of an Arithmetic Sequence

The  $n$ th term (the general term) of an arithmetic sequence with first term  $a_1$  and common difference  $d$  is

$$a_n = a_1 + (n - 1)d.$$

**EXAMPLE 2** Using the Formula for the General Term of an Arithmetic Sequence

Find the eighth term of the arithmetic sequence whose first term is 4 and whose common difference is  $-7$ .

**SOLUTION**

To find the eighth term,  $a_8$ , we replace  $n$  in the formula with 8,  $a_1$  with 4, and  $d$  with  $-7$ .

$$a_n = a_1 + (n - 1)d$$

$$a_8 = 4 + (8 - 1)(-7) = 4 + 7(-7) = 4 + (-49) = -45$$

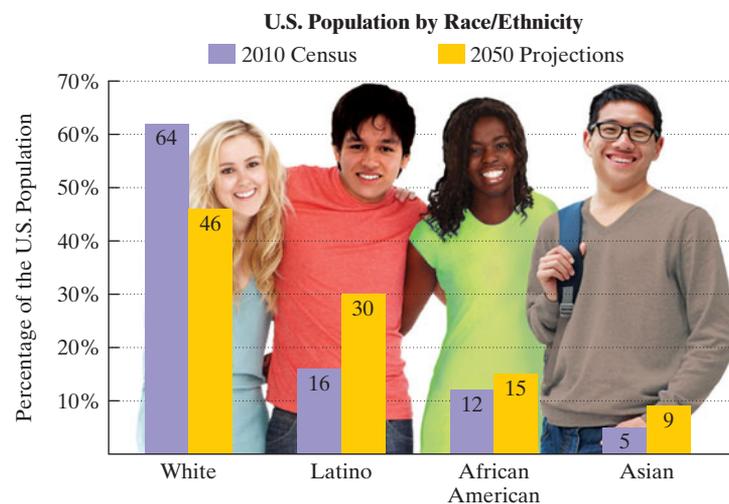

The eighth term is  $-45$ . We can check this result by writing the first eight terms of the sequence:

$$4, -3, -10, -17, -24, -31, -38, -45. \quad \dots$$

 **Check Point 2** Find the ninth term of the arithmetic sequence whose first term is 6 and whose common difference is  $-5$ .

**EXAMPLE 3** Using an Arithmetic Sequence to Model Changes in the U.S. Population

The graph in **Figure 10.4** shows the percentage of the U.S. population by race/ethnicity for 2010, with projections by the U.S. Census Bureau for 2050.

**FIGURE 10.4**

Source: U.S. Census Bureau

The data show that in 2010, 64% of the U.S. population was white. On average, this is projected to decrease by approximately 0.45% per year.

- Write a formula for the  $n$ th term of the arithmetic sequence that describes the percentage of the U.S. population that will be white  $n$  years after 2009.
- What percentage of the U.S. population is projected to be white in 2030?

## SOLUTION

- a. With a yearly decrease of 0.45%, we can express the percentage of the white population by the following arithmetic sequence:

$$64, \quad 64 - 0.45 = 63.55, \quad 63.55 - 0.45 = 63.10, \dots$$

$a_1$ : percentage of whites in the population in 2010, 1 year after 2009

$a_2$ : percentage of whites in the population in 2011, 2 years after 2009

$a_3$ : percentage of whites in the population in 2012, 3 years after 2009

In the sequence  $64, 63.55, 63.10, \dots$ , the first term,  $a_1$ , represents the percentage of the population that was white in 2010. Each subsequent year this amount decreases by 0.45%, so  $d = -0.45$ . We use the formula for the general term of an arithmetic sequence to write the  $n$ th term of the sequence that describes the percentage of whites in the population  $n$  years after 2009.

$$a_n = a_1 + (n - 1)d \quad \text{This is the formula for the general term of an arithmetic sequence.}$$

$$a_n = 64 + (n - 1)(-0.45) \quad a_1 = 64 \text{ and } d = -0.45.$$

$$a_n = 64 - 0.45n + 0.45 \quad \text{Distribute } -0.45 \text{ to each term in parentheses.}$$

$$a_n = -0.45n + 64.45 \quad \text{Simplify.}$$

Thus, the percentage of the U.S. population that will be white  $n$  years after 2009 can be described by

$$a_n = -0.45n + 64.45.$$

- b. Now we need to project the percentage of the population that will be white in 2030. The year 2030 is 21 years after 2009. Thus,  $n = 21$ . We substitute 21 for  $n$  in  $a_n = -0.45n + 64.45$ .

$$a_{21} = -0.45(21) + 64.45 = 55$$

The 21st term of the sequence is 55. Thus, 55% of the U.S. population is projected to be white in 2030. ...

 **Check Point 3** The data in **Figure 10.4** show that in 2010, 16% of the U.S. population was Latino. On average, this is projected to increase by approximately 0.35% per year.

- a. Write a formula for the  $n$ th term of the arithmetic sequence that describes the percentage of the U.S. population that will be Latino  $n$  years after 2009.
- b. What percentage of the U.S. population is projected to be Latino in 2030?

- 4** Use the formula for the sum of the first  $n$  terms of an arithmetic sequence.

### The Sum of the First $n$ Terms of an Arithmetic Sequence

The sum of the first  $n$  terms of an arithmetic sequence, denoted by  $S_n$ , and called the  **$n$ th partial sum**, can be found without having to add up all the terms. Let

$$S_n = a_1 + a_2 + a_3 + \dots + a_n$$

be the sum of the first  $n$  terms of an arithmetic sequence. Because  $d$  is the common difference between terms,  $S_n$  can be written forward and backward as follows:

Forward: Start with the first term,  $a_1$ . Keep adding  $d$ .

$$S_n = a_1 + (a_1 + d) + (a_1 + 2d) + \dots + a_n$$

Backward: Start with the last term,  $a_n$ . Keep subtracting  $d$ .

$$S_n = a_n + (a_n - d) + (a_n - 2d) + \dots + a_1$$

$$2S_n = (a_1 + a_n) + (a_1 + a_n) + (a_1 + a_n) + \dots + (a_1 + a_n). \quad \text{Add the two equations.}$$

Consider the last equation

$$2S_n = (a_1 + a_n) + (a_1 + a_n) + (a_1 + a_n) + \cdots + (a_1 + a_n).$$

Because there are  $n$  sums of  $(a_1 + a_n)$  on the right side, we can express this side as  $n(a_1 + a_n)$ . Thus, the last equation can be written as follows:

$$\begin{aligned} 2S_n &= n(a_1 + a_n) \\ S_n &= \frac{n}{2}(a_1 + a_n). \quad \text{Solve for } S_n \text{, dividing both sides by 2.} \end{aligned}$$

We have proved the following result:

### The Sum of the First $n$ Terms of an Arithmetic Sequence

The sum,  $S_n$ , of the first  $n$  terms of an arithmetic sequence is given by

$$S_n = \frac{n}{2}(a_1 + a_n),$$

in which  $a_1$  is the first term and  $a_n$  is the  $n$ th term.

To find the sum of the terms of an arithmetic sequence using  $S_n = \frac{n}{2}(a_1 + a_n)$ , we need to know the first term,  $a_1$ , the last term,  $a_n$ , and the number of terms,  $n$ . The following examples illustrate how to use this formula.

#### EXAMPLE 4 Finding the Sum of $n$ Terms of an Arithmetic Sequence

Find the sum of the first 100 terms of the arithmetic sequence: 1, 3, 5, 7, . . .

#### SOLUTION

By finding the sum of the first 100 terms of 1, 3, 5, 7, . . . , we are finding the sum of the first 100 odd numbers. To find the sum of the first 100 terms,  $S_{100}$ , we replace  $n$  in the formula with 100.

$$\begin{aligned} S_n &= \frac{n}{2}(a_1 + a_n) \\ S_{100} &= \frac{100}{2}(a_1 + a_{100}) \end{aligned}$$

The first term,  $a_1$ , is 1.

We must find  $a_{100}$ , the 100th term.

We use the formula for the general term of a sequence to find  $a_{100}$ . The common difference,  $d$ , of 1, 3, 5, 7, . . . , is 2.

$$\begin{aligned} a_n &= a_1 + (n - 1)d && \text{This is the formula for the } n\text{th term of an arithmetic sequence. Use it to find the 100th term.} \\ a_{100} &= 1 + (100 - 1) \cdot 2 && \text{Substitute 100 for } n, 2 \text{ for } d, \text{ and } 1 \text{ (the first term) for } a_1. \\ &= 1 + 99 \cdot 2 && \text{Perform the subtraction in parentheses.} \\ &= 1 + 198 = 199 && \text{Multiply } (99 \cdot 2 = 198) \text{ and then add.} \end{aligned}$$

Now we are ready to find the sum of the 100 terms 1, 3, 5, 7, . . . , 199.

$$\begin{aligned} S_n &= \frac{n}{2}(a_1 + a_n) && \text{Use the formula for the sum of the first } n \text{ terms of an arithmetic sequence. Let } n = 100, a_1 = 1, \text{ and } a_{100} = 199. \\ S_{100} &= \frac{100}{2}(1 + 199) = 50(200) = 10,000 \end{aligned}$$

The sum of the first 100 odd numbers is 10,000. Equivalently, the 100th partial sum of the sequence 1, 3, 5, 7, . . . is 10,000. •••

 **Check Point 4** Find the sum of the first 15 terms of the arithmetic sequence: 3, 6, 9, 12, . . .

**EXAMPLE 5** Using  $S_n$  to Evaluate a Summation

Find the following sum:  $\sum_{i=1}^{25} (5i - 9)$ .

**SOLUTION**

$$\begin{aligned}\sum_{i=1}^{25} (5i - 9) &= (5 \cdot 1 - 9) + (5 \cdot 2 - 9) + (5 \cdot 3 - 9) + \cdots + (5 \cdot 25 - 9) \\ &= -4 \qquad + 1 \qquad + 6 \qquad + \cdots + 116\end{aligned}$$

By evaluating the first three terms and the last term, we see that  $a_1 = -4$ ;  $d$ , the common difference, is  $1 - (-4)$ , or 5; and  $a_{25}$ , the last term, is 116.

$$S_n = \frac{n}{2}(a_1 + a_n) \quad \text{Use the formula for the sum of the first } n \text{ terms of an arithmetic sequence. Let } n = 25, a_1 = -4, \text{ and } a_{25} = 116.$$

$$S_{25} = \frac{25}{2}(-4 + 116) = \frac{25}{2}(112) = 1400$$

Thus,

$$\sum_{i=1}^{25} (5i - 9) = 1400. \quad \dots$$

 **Check Point 5** Find the following sum:  $\sum_{i=1}^{30} (6i - 11)$ .

**EXAMPLE 6** Modeling Total Residential Community Costs over a Six-Year Period

Your grandmother has assets of \$500,000. One option that she is considering involves an adult residential community for a six-year period beginning in 2014. The model

$$a_n = 1800n + 64,130$$

describes yearly adult residential community costs  $n$  years after 2013. Does your grandmother have enough to pay for the facility?

**SOLUTION**

We must find the sum of an arithmetic sequence whose general term is  $a_n = 1800n + 64,130$ . The first term of the sequence corresponds to the facility's costs in the year 2014. The last term corresponds to costs in the year 2019. Because the model describes costs  $n$  years after 2013,  $n = 1$  describes the year 2014 and  $n = 6$  describes the year 2019.

$$a_n = 1800n + 64,130$$

$$a_1 = 1800 \cdot 1 + 64,130 = 65,930$$

$$a_6 = 1800 \cdot 6 + 64,130 = 74,930$$

This is the given formula for the general term of the sequence.

Find  $a_1$  by replacing  $n$  with 1.

Find  $a_6$  by replacing  $n$  with 6.

The first year the facility will cost \$65,930. By year 6, the facility will cost \$74,930. Now we must find the sum of the costs for all six years. We focus on the sum of the first six terms of the arithmetic sequence

$$65,930, 67,730, \dots, 74,930.$$

$a_1$

$a_2$

$a_6$

**TECHNOLOGY**

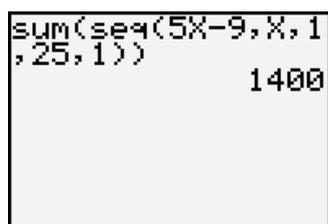

To find

$$\sum_{i=1}^{25} (5i - 9)$$

on a graphing utility, enter

**SUM** **SEQ**  $(5x - 9, x, 1, 25, 1)$ .

Then press **ENTER**.

We find the sum of the first six terms of

$$65,930, 67,730, \dots, 74,930$$

using the formula for the sum of the first  $n$  terms of an arithmetic sequence. We are adding six terms:  $n = 6$ . The first term is 65,930:  $a_1 = 65,930$ . The last term—that is, the sixth term—is 74,930:  $a_6 = 74,930$ .

$$S_n = \frac{n}{2}(a_1 + a_n)$$

$$S_6 = \frac{6}{2}(65,930 + 74,930) = 3(140,860) = 422,580$$

Total adult residential community costs for your grandmother are predicted to be \$422,580. Because your grandmother's assets are \$500,000, she has enough to pay for the facility for the six-year period. ●●●

 **Check Point 6** In Example 6, how much would it cost for the adult residential community for a ten-year period beginning in 2014?

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- A sequence in which each term after the first differs from the preceding term by a constant amount is called a/an \_\_\_\_\_ sequence. The difference between consecutive terms is called the \_\_\_\_\_ of the sequence.
- The  $n$ th term of the sequence described in Exercise 1 is given by the formula  $a_n = \underline{\hspace{2cm}}$ , where  $a_1$  is the \_\_\_\_\_ and  $d$  is the \_\_\_\_\_ of the sequence.
- The sum,  $S_n$ , of the first  $n$  terms of the sequence described in Exercise 1 is given by the formula  $S_n = \underline{\hspace{2cm}}$ , where  $a_1$  is the \_\_\_\_\_ and  $a_n$  is the \_\_\_\_\_.
- The first term of  $\sum_{i=1}^{20} (6i - 4)$  is \_\_\_\_\_ and the last term is \_\_\_\_\_.
- The first three terms of  $\sum_{i=1}^{17} (5i + 3)$  are \_\_\_\_\_, \_\_\_\_\_, and \_\_\_\_\_. The common difference is \_\_\_\_\_.

## EXERCISE SET 10.2

### Practice Exercises

In Exercises 1–14, write the first six terms of each arithmetic sequence.

- $a_1 = 200, d = 20$
- $a_1 = 300, d = 50$
- $a_1 = -7, d = 4$
- $a_1 = -8, d = 5$
- $a_1 = 300, d = -90$
- $a_1 = 200, d = -60$
- $a_1 = \frac{5}{2}, d = -\frac{1}{2}$
- $a_1 = \frac{3}{4}, d = -\frac{1}{4}$
- $a_n = a_{n-1} + 6, a_1 = -9$
- $a_n = a_{n-1} + 4, a_1 = -7$
- $a_n = a_{n-1} - 10, a_1 = 30$
- $a_n = a_{n-1} - 20, a_1 = 50$
- $a_n = a_{n-1} - 0.4, a_1 = 1.6$
- $a_n = a_{n-1} - 0.3, a_1 = -1.7$

In Exercises 15–22, find the indicated term of the arithmetic sequence with first term,  $a_1$ , and common difference,  $d$ .

- Find  $a_6$  when  $a_1 = 13, d = 4$ .
- Find  $a_{16}$  when  $a_1 = 9, d = 2$ .
- Find  $a_{50}$  when  $a_1 = 7, d = 5$ .
- Find  $a_{60}$  when  $a_1 = 8, d = 6$ .
- Find  $a_{200}$  when  $a_1 = -40, d = 5$ .
- Find  $a_{150}$  when  $a_1 = -60, d = 5$ .
- Find  $a_{60}$  when  $a_1 = 35, d = -3$ .
- Find  $a_{70}$  when  $a_1 = -32, d = 4$ .

In Exercises 23–34, write a formula for the general term (the  $n$ th term) of each arithmetic sequence. Do not use a recursion formula. Then use the formula for  $a_n$  to find  $a_{20}$ , the 20th term of the sequence.

- 1, 5, 9, 13, ...
- 2, 7, 12, 17, ...
- 7, 3, -1, -5, ...
- 6, 1, -4, -9, ...
- $a_1 = 9, d = 2$
- $a_1 = 6, d = 3$
- $a_1 = -20, d = -4$
- $a_1 = -70, d = -5$
- $a_n = a_{n-1} + 3, a_1 = 4$
- $a_n = a_{n-1} + 5, a_1 = 6$
- $a_n = a_{n-1} - 10, a_1 = 30$
- $a_n = a_{n-1} - 12, a_1 = 24$
- Find the sum of the first 20 terms of the arithmetic sequence: 4, 10, 16, 22, ...
- Find the sum of the first 25 terms of the arithmetic sequence: 7, 19, 31, 43, ...
- Find the sum of the first 50 terms of the arithmetic sequence: -10, -6, -2, 2, ...
- Find the sum of the first 50 terms of the arithmetic sequence: -15, -9, -3, 3, ...
- Find  $1 + 2 + 3 + 4 + \dots + 100$ , the sum of the first 100 natural numbers.
- Find  $2 + 4 + 6 + 8 + \dots + 200$ , the sum of the first 100 positive even integers.

41. Find the sum of the first 60 positive even integers.
42. Find the sum of the first 80 positive even integers.
43. Find the sum of the even integers between 21 and 45.
44. Find the sum of the odd integers between 30 and 54.

For Exercises 45–50, write out the first three terms and the last term. Then use the formula for the sum of the first  $n$  terms of an arithmetic sequence to find the indicated sum.

45.  $\sum_{i=1}^{17} (5i + 3)$

46.  $\sum_{i=1}^{20} (6i - 4)$

47.  $\sum_{i=1}^{30} (-3i + 5)$

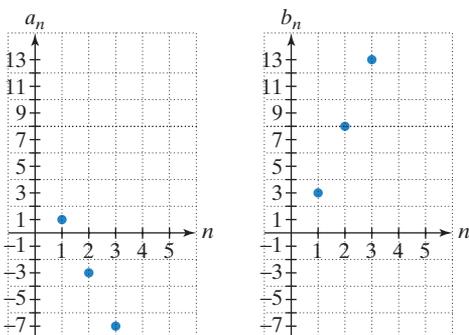

48.  $\sum_{i=1}^{40} (-2i + 6)$

49.  $\sum_{i=1}^{100} 4i$

50.  $\sum_{i=1}^{50} (-4i)$

### Practice Plus

Use the graphs of the arithmetic sequences  $\{a_n\}$  and  $\{b_n\}$  to solve Exercises 51–58.

51. Find  $a_{14} + b_{12}$ .
52. Find  $a_{16} + b_{18}$ .
53. If  $\{a_n\}$  is a finite sequence whose last term is  $-83$ , how many terms does  $\{a_n\}$  contain?
54. If  $\{b_n\}$  is a finite sequence whose last term is  $93$ , how many terms does  $\{b_n\}$  contain?
55. Find the difference between the sum of the first 14 terms of  $\{b_n\}$  and the sum of the first 14 terms of  $\{a_n\}$ .
56. Find the difference between the sum of the first 15 terms of  $\{b_n\}$  and the sum of the first 15 terms of  $\{a_n\}$ .
57. Write a linear function  $f(x) = mx + b$ , whose domain is the set of positive integers, that represents  $\{a_n\}$ .
58. Write a linear function  $g(x) = mx + b$ , whose domain is the set of positive integers, that represents  $\{b_n\}$ .

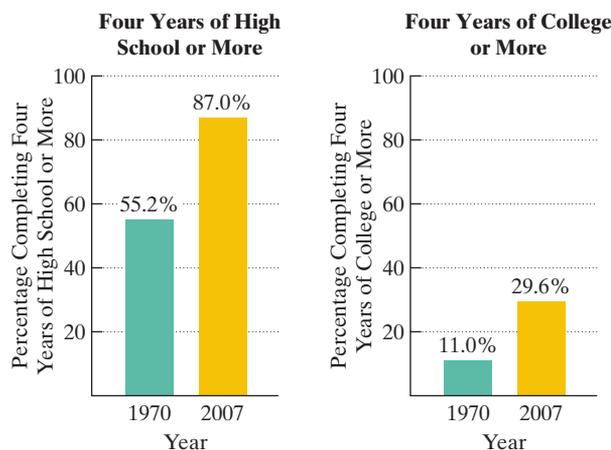

Use a system of two equations in two variables,  $a_1$  and  $d$ , to solve Exercises 59–60.

59. Write a formula for the general term (the  $n$ th term) of the arithmetic sequence whose second term,  $a_2$ , is 4 and whose sixth term,  $a_6$ , is 16.
60. Write a formula for the general term (the  $n$ th term) of the arithmetic sequence whose third term,  $a_3$ , is 7 and whose eighth term,  $a_8$ , is 17.

### Application Exercises

The bar graphs show changes in educational attainment for Americans ages 25 and older from 1970 to 2007. Exercises 61–62 involve developing arithmetic sequences that model the data.

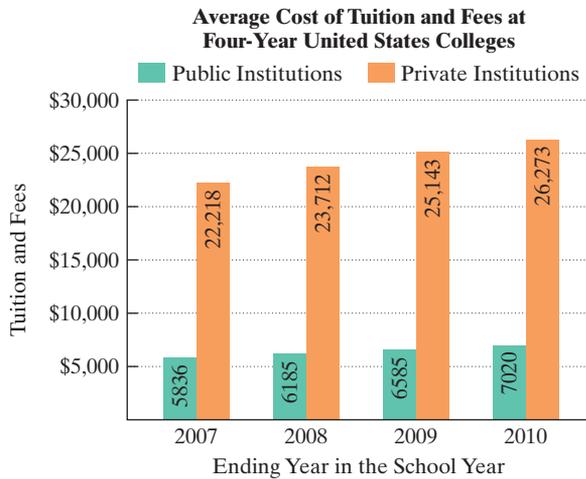

Educational Attainment for Americans Ages 25 and Older

Source: U.S. Census Bureau

61. In 1970, 11.0% of Americans ages 25 and older had completed four years of college or more. On average, this percentage has increased by approximately 0.5 each year.
  - a. Write a formula for the  $n$ th term of the arithmetic sequence that models the percentage of Americans ages 25 and older who had or will have completed four years of college or more  $n$  years after 1969.
  - b. Use the model from part (a) to project the percentage of Americans ages 25 and older who will have completed four years of college or more by 2019.
62. In 1970, 55.2% of Americans ages 25 and older had completed four years of high school or more. On average, this percentage has increased by approximately 0.86 each year.
  - a. Write a formula for the  $n$ th term of the arithmetic sequence that models the percentage of Americans ages 25 and older who had or will have completed four years of high school or more  $n$  years after 1969.
  - b. Use the model from part (a) to project the percentage of Americans ages 25 and older who will have completed four years of high school or more by 2019.
63. Company A pays \$24,000 yearly with raises of \$1600 per year. Company B pays \$28,000 yearly with raises of \$1000 per year. Which company will pay more in year 10? How much more?
64. Company A pays \$23,000 yearly with raises of \$1200 per year. Company B pays \$26,000 yearly with raises of \$800 per year. Which company will pay more in year 10? How much more?

In Exercises 65–66, we revisit the data from Chapter P showing the average cost of tuition and fees at public and private four-year U.S. colleges.

Source: The College Board

65. a. Use the numbers shown in the bar graph to find the total cost of tuition and fees at public colleges for a four-year period from the school year ending in 2007 through the school year ending in 2010.

b. The model

$$a_n = 395n + 5419$$

describes the cost of tuition and fees at public colleges in academic year  $n$ , where  $n = 1$  corresponds to the school year ending in 2007,  $n = 2$  to the school year ending in 2008, and so on. Use this model and the formula for  $S_n$  to find the total cost of tuition and fees at public colleges for a four-year period from the school year ending in 2007 through the school year ending in 2010. How does this compare with the actual sum you obtained in part (a)?

66. a. Use the numbers shown in the bar graph to find the total cost of tuition and fees at private colleges for a four-year period from the school year ending in 2007 through the school year ending in 2010.

b. The model

$$a_n = 1360n + 20,938$$

describes the cost of tuition and fees at private colleges in academic year  $n$ , where  $n = 1$  corresponds to the school year ending in 2007,  $n = 2$  to the school year ending in 2008, and so on. Use this model and the formula for  $S_n$  to find the total cost of tuition and fees at private colleges for a four-year period from the school year ending in 2007 through the school year ending in 2010. Does the model underestimate or overestimate the actual sum that you obtained in part (a)? By how much?

67. Use one of the models in Exercises 65–66 and the formula for  $S_n$  to find the total cost of tuition and fees for your undergraduate education. How well does the model describe your anticipated costs?

68. A company offers a starting yearly salary of \$33,000 with raises of \$2500 per year. Find the total salary over a ten-year period.
69. You are considering two job offers. Company A will start you at \$19,000 a year and guarantee a raise of \$2600 per year. Company B will start you at a higher salary, \$27,000 a year but will only guarantee a raise of \$1200 per year. Find the total salary that each company will pay over a ten-year period. Which company pays the greater total amount?
70. A theater has 30 seats in the first row, 32 seats in the second row, increasing by 2 seats per row for a total of 26 rows. How many seats are there in the theater?
71. A section in a stadium has 20 seats in the first row, 23 seats in the second row, increasing by 3 seats each row for a total of 38 rows. How many seats are in this section of the stadium?

### Writing in Mathematics

72. What is an arithmetic sequence? Give an example with your explanation.
73. What is the common difference in an arithmetic sequence?
74. Explain how to find the general term of an arithmetic sequence.
75. Explain how to find the sum of the first  $n$  terms of an arithmetic sequence without having to add up all the terms.

### Technology Exercises

76. Use the **SEQ** (sequence) capability of a graphing utility and the formula you obtained for  $a_n$  to verify the value you found for  $a_{20}$  in any five exercises from Exercises 23–34.
77. Use the capability of a graphing utility to calculate the sum of a sequence to verify any five of your answers to Exercises 45–50.

### Critical Thinking Exercises

**Make Sense?** In Exercises 78–81, determine whether each statement makes sense or does not make sense, and explain your reasoning.

78. Rather than performing the addition, I used the formula  $S_n = \frac{n}{2}(a_1 + a_n)$  to find the sum of the first 30 terms of the sequence 2, 4, 8, 16, 32, . . . .
79. I was able to find the sum of the first 50 terms of an arithmetic sequence even though I did not identify every term.
80. The sequence for the number of seats per row in our movie theater as the rows move toward the back is arithmetic with  $d = 1$  so people don't block the view of those in the row behind them.
81. Beginning at 6:45 A.M., a bus stops on my block every 23 minutes, so I used the formula for the  $n$ th term of an arithmetic sequence to describe the stopping time for the  $n$ th bus of the day.
82. In the sequence 21,700, 23,172, 24,644, 26,116, . . . , which term is 314,628?

83. A *degree-day* is a unit used to measure the fuel requirements of buildings. By definition, each degree that the average daily temperature is below  $65^{\circ}\text{F}$  is 1 degree-day. For example, an average daily temperature of  $42^{\circ}\text{F}$  constitutes 23 degree-days. If the average temperature on January 1 was  $42^{\circ}\text{F}$  and fell  $2^{\circ}\text{F}$  for each subsequent day up to and including January 10, how many degree-days are included from January 1 to January 10?

84. Show that the sum of the first  $n$  positive odd integers,

$$1 + 3 + 5 + \cdots + (2n - 1),$$

is  $n^2$ .

### Preview Exercises

Exercises 85–87 will help you prepare for the material covered in the next section.

85. Consider the sequence  $1, -2, 4, -8, 16, \dots$ . Find  $\frac{a_2}{a_1}, \frac{a_3}{a_2}, \frac{a_4}{a_3}$ , and  $\frac{a_5}{a_4}$ . What do you observe?

86. Consider the sequence whose  $n$ th term is  $a_n = 3 \cdot 5^n$ . Find  $\frac{a_2}{a_1}, \frac{a_3}{a_2}, \frac{a_4}{a_3}$ , and  $\frac{a_5}{a_4}$ . What do you observe?

87. Use the formula  $a_n = a_1 3^{n-1}$  to find the seventh term of the sequence  $11, 33, 99, 297, \dots$ .

## SECTION 10.3

### Geometric Sequences and Series

#### Objectives

- 1 Find the common ratio of a geometric sequence.
- 2 Write terms of a geometric sequence.
- 3 Use the formula for the general term of a geometric sequence.
- 4 Use the formula for the sum of the first  $n$  terms of a geometric sequence.
- 5 Find the value of an annuity.
- 6 Use the formula for the sum of an infinite geometric series.

Here we are at the closing moments of a job interview. You're shaking hands with the manager. You managed to answer all the tough questions without losing your poise, and now you've been offered a job. As a matter of fact, your qualifications are so terrific that you've been offered two jobs—one just the day before, with a rival company in the same field! One company offers \$30,000 the first year, with increases of 6% per year for four years after

that. The other offers \$32,000 the first year, with annual increases of 3% per year after that. Over a five-year period, which is the better offer?

If salary raises amount to a certain percent each year, the yearly salaries over time form a geometric sequence. In this section, we investigate geometric sequences and their properties. After studying the section, you will be in a position to decide which job offer to accept: You will know which company will pay you more over five years.

- 1 Find the common ratio of a geometric sequence.

#### Geometric Sequences

Figure 10.5 shows a sequence in which the number of squares is increasing. From left to right, the number of squares is 1, 5, 25, 125, and 625. In this sequence, each term after the first, 1, is obtained by multiplying the preceding term by a constant amount, namely, 5. This sequence of increasing numbers of squares is an example of a *geometric sequence*.

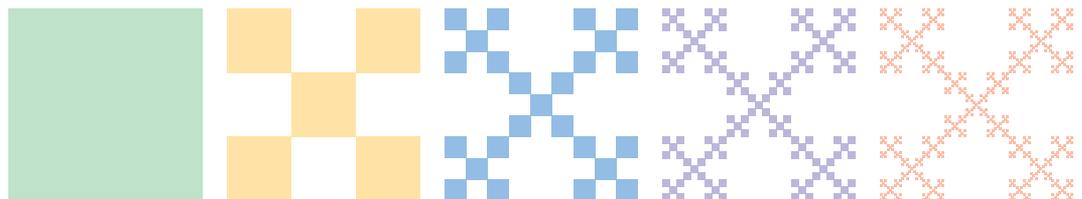

FIGURE 10.5 A geometric sequence of squares

### Definition of a Geometric Sequence

A **geometric sequence** is a sequence in which each term after the first is obtained by multiplying the preceding term by a fixed nonzero constant. The amount by which we multiply each time is called the **common ratio** of the sequence.

The common ratio,  $r$ , is found by dividing any term after the first term by the term that directly precedes it. In the following examples, the common ratio is found by dividing the second term by the first term,  $\frac{a_2}{a_1}$ .

### GREAT QUESTION!

**What happens to the terms of a geometric sequence when the common ratio is negative?**

When the common ratio is negative, the signs of the terms alternate.

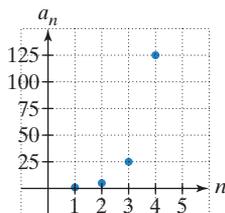

FIGURE 10.6 The graph of  $\{a_n\} = 1, 5, 25, 125, \dots$

Geometric sequence	Common ratio
1, 5, 25, 125, 625, ...	$r = \frac{5}{1} = 5$
4, 8, 16, 32, 64, ...	$r = \frac{8}{4} = 2$
6, -12, 24, -48, 96, ...	$r = \frac{-12}{6} = -2$
9, -3, 1, $-\frac{1}{3}$ , $\frac{1}{9}$ , ...	$r = \frac{-3}{9} = -\frac{1}{3}$

Figure 10.6 shows a partial graph of the first geometric sequence in our list. The graph forms a set of discrete points lying on the exponential function  $f(x) = 5^{x-1}$ . This illustrates that **a geometric sequence with a positive common ratio other than 1 is an exponential function whose domain is the set of positive integers.**

How do we write out the terms of a geometric sequence when the first term and the common ratio are known? We multiply the first term by the common ratio to get the second term, multiply the second term by the common ratio to get the third term, and so on.

- Write terms of a geometric sequence.

### EXAMPLE 1 Writing the Terms of a Geometric Sequence

Write the first six terms of the geometric sequence with first term 6 and common ratio  $\frac{1}{3}$ .

#### SOLUTION

The first term is 6. The second term is  $6 \cdot \frac{1}{3}$ , or 2. The third term is  $2 \cdot \frac{1}{3}$ , or  $\frac{2}{3}$ . The fourth term is  $\frac{2}{3} \cdot \frac{1}{3}$ , or  $\frac{2}{9}$ , and so on. The first six terms are

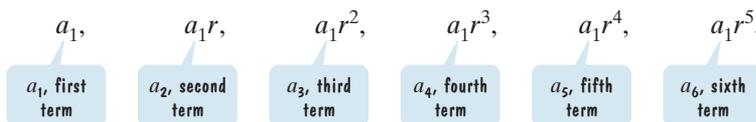

$$6, 2, \frac{2}{3}, \frac{2}{9}, \frac{2}{27}, \text{ and } \frac{2}{81} \quad \dots$$

**Check Point 1** Write the first six terms of the geometric sequence with first term 12 and common ratio  $\frac{1}{2}$ .

- Use the formula for the general term of a geometric sequence.

### The General Term of a Geometric Sequence

Consider a geometric sequence whose first term is  $a_1$  and whose common ratio is  $r$ . We are looking for a formula for the general term,  $a_n$ . Let's begin by writing the first six terms. The first term is  $a_1$ . The second term is  $a_1r$ . The third term is  $a_1r \cdot r$ , or  $a_1r^2$ . The fourth term is  $a_1r^2 \cdot r$ , or  $a_1r^3$ , and so on. Starting with  $a_1$  and multiplying each successive term by  $r$ , the first six terms are

Can you see that the exponent on  $r$  is 1 less than the subscript of  $a$  denoting the term number?

$$a_3: \text{third term} = a_1 r^2$$

One less than 3, or 2, is the exponent on  $r$ .

$$a_4: \text{fourth term} = a_1 r^3$$

One less than 4, or 3, is the exponent on  $r$ .

Thus, the formula for the  $n$ th term is

$$a_n = a_1 r^{n-1}.$$

One less than  $n$ , or  $n - 1$ , is the exponent on  $r$ .

## GREAT QUESTION!

When using  $a_1 r^{n-1}$  to find the  $n$ th term of a geometric sequence, what should I do first?

Be careful with the order of operations when evaluating

$$a_1 r^{n-1}.$$

First subtract 1 in the exponent and then raise  $r$  to that power. Finally, multiply the result by  $a_1$ .

## General Term of a Geometric Sequence

The  $n$ th term (the general term) of a geometric sequence with first term  $a_1$  and common ratio  $r$  is

$$a_n = a_1 r^{n-1}.$$

## Blitzer Bonus

### Geometric Population Growth

Economist Thomas Malthus (1766–1834) predicted that population would increase as a geometric sequence and food production would increase as an arithmetic sequence. He concluded that eventually population would exceed food production. If two sequences, one geometric and one arithmetic, are increasing, the geometric sequence will eventually overtake the arithmetic sequence, regardless of any head start that the arithmetic sequence might initially have.

## EXAMPLE 2 Using the Formula for the General Term of a Geometric Sequence

Find the eighth term of the geometric sequence whose first term is  $-4$  and whose common ratio is  $-2$ .

### SOLUTION

To find the eighth term,  $a_8$ , we replace  $n$  in the formula with 8,  $a_1$  with  $-4$ , and  $r$  with  $-2$ .

$$a_n = a_1 r^{n-1}$$

$$a_8 = -4(-2)^{8-1} = -4(-2)^7 = -4(-128) = 512$$

The eighth term is 512. We can check this result by writing the first eight terms of the sequence:

$$-4, 8, -16, 32, -64, 128, -256, 512. \quad \dots$$

 **Check Point 2** Find the seventh term of the geometric sequence whose first term is 5 and whose common ratio is  $-3$ .

In Chapter 3, we studied exponential functions of the form  $f(x) = b^x$  and used an exponential function to model the growth of the U.S. population from 1970 through 2010 (Example 1 on page 467). From 2000 through 2010, the nation's population grew at the slowest rate since the 1930s. Consequently, in our next example, we consider the country's population growth from 2000 through 2010. Because a geometric sequence is an exponential function whose domain is the set of positive integers, geometric and exponential growth mean the same thing.

**EXAMPLE 3** Geometric Population Growth

The table shows the population of the United States in 2000 and 2010, with estimates given by the Census Bureau for 2001 through 2009.

Year	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010
Population (millions)	281.4	284.0	286.6	289.3	292.0	294.7	297.4	300.2	303.0	305.8	308.7

- Show that the population is increasing geometrically.
- Write the general term for the geometric sequence modeling the population of the United States, in millions,  $n$  years after 1999.
- Project the U.S. population, in millions, for the year 2020.

**SOLUTION**

- First, we use the sequence of population growth, 281.4, 284.0, 286.6, 289.3, and so on, to divide the population for each year by the population in the preceding year.

$$\frac{284.0}{281.4} \approx 1.009, \quad \frac{286.6}{284.0} \approx 1.009, \quad \frac{289.3}{286.6} \approx 1.009$$

Continuing in this manner, we will keep getting approximately 1.009. This means that the population is increasing geometrically with  $r \approx 1.009$ . The population of the United States in any year shown in the sequence is approximately 1.009 times the population the year before.

- The sequence of the U.S. population growth is

$$281.4, 284.0, 286.6, 289.3, 292.0, 294.7, \dots$$

Because the population is increasing geometrically, we can find the general term of this sequence using

$$a_n = a_1 r^{n-1}.$$

In this sequence,  $a_1 = 281.4$  and [from part (a)]  $r \approx 1.009$ . We substitute these values into the formula for the general term. This gives the general term for the geometric sequence modeling the U.S. population, in millions,  $n$  years after 1999.

$$a_n = 281.4(1.009)^{n-1}$$

- We can use the formula for the general term,  $a_n$ , in part (b) to project the U.S. population for the year 2020. The year 2020 is 21 years after 1999—that is,  $2020 - 1999 = 21$ . Thus,  $n = 21$ . We substitute 21 for  $n$  in  $a_n = 281.4(1.009)^{n-1}$ .

$$a_{21} = 281.4(1.009)^{21-1} = 281.4(1.009)^{20} \approx 336.6$$

The model projects that the United States will have a population of approximately 336.6 million in the year 2020. ●●●

 **Check Point 3** Write the general term for the geometric sequence

$$3, 6, 12, 24, 48, \dots$$

Then use the formula for the general term to find the eighth term.

## Blitzer Bonus || Ponzi Schemes and Geometric Sequences

A ponzi scheme is an investment fraud that pays returns to existing investors from funds contributed by new investors rather than from legitimate investment activity. Here's a simplified example:

The number of investors needed to continue this Ponzi scheme,

$$2, 4, 8, 16, \dots,$$

and the money collected in each round,

$$\$200, \$400, \$800, \$1600, \dots,$$

form rapidly growing geometric sequences. With no legitimate earnings, the scheme requires a consistent geometric flow of money from new investors to continue. Ponzi schemes tend to collapse when it becomes difficult to recruit new investors or when a large number of investors ask to cash out.

- 4 Use the formula for the sum of the first  $n$  terms of a geometric sequence.

### The Sum of the First $n$ Terms of a Geometric Sequence

The sum of the first  $n$  terms of a geometric sequence, denoted by  $S_n$  and called the  **$n$ th partial sum**, can be found without having to add up all the terms. Recall that the first  $n$  terms of a geometric sequence are

$$a_1, a_1r, a_1r^2, \dots, a_1r^{n-2}, a_1r^{n-1}.$$

We proceed as follows:

$$S_n = a_1 + a_1r + a_1r^2 + \dots + a_1r^{n-2} + a_1r^{n-1}$$

$S_n$  is the sum of the first  $n$  terms of the sequence.

$$rS_n = a_1r + a_1r^2 + a_1r^3 + \dots + a_1r^{n-1} + a_1r^n$$

Multiply both sides of the equation by  $r$ .

$$S_n - rS_n = a_1 - a_1r^n$$

Subtract the second equation from the first equation.

$$S_n(1 - r) = a_1(1 - r^n)$$

Factor out  $S_n$  on the left and  $a_1$  on the right.

$$S_n = \frac{a_1(1 - r^n)}{1 - r}.$$

Solve for  $S_n$  by dividing both sides by  $1 - r$  (assuming that  $r \neq 1$ ).

### GREAT QUESTION!

What is the sum of the first  $n$  terms of a geometric sequence if the common ratio is 1?

If the common ratio is 1, the geometric sequence is

$$a_1, a_1, a_1, a_1, \dots$$

The sum of the first  $n$  terms of this sequence is  $na_1$ :

$$\begin{aligned} S_n &= \underbrace{a_1 + a_1 + a_1 + \dots + a_1}_{\text{There are } n \text{ terms}} \\ &= na_1. \end{aligned}$$

We have proved the following result:

### The Sum of the First $n$ Terms of a Geometric Sequence

The sum,  $S_n$ , of the first  $n$  terms of a geometric sequence is given by

$$S_n = \frac{a_1(1 - r^n)}{1 - r},$$

in which  $a_1$  is the first term and  $r$  is the common ratio ( $r \neq 1$ ).

To find the sum of the terms of a geometric sequence using  $S_n = \frac{a_1(1 - r^n)}{1 - r}$ , we need to know the first term,  $a_1$ , the common ratio,  $r$ , and the number of terms,  $n$ . The following examples illustrate how to use this formula.

#### EXAMPLE 4 Finding the Sum of the First $n$ Terms of a Geometric Sequence

Find the sum of the first 18 terms of the geometric sequence:  $2, -8, 32, -128, \dots$

#### SOLUTION

To find the sum of the first 18 terms,  $S_{18}$ , we replace  $n$  in the formula with 18.

$$S_n = \frac{a_1(1 - r^n)}{1 - r}$$

$$S_{18} = \frac{a_1(1 - r^{18})}{1 - r}$$

The first term,  $a_1$ , is 2.

We must find  $r$ , the common ratio.

We can find the common ratio by dividing the second term of  $2, -8, 32, -128, \dots$  by the first term.

$$r = \frac{a_2}{a_1} = \frac{-8}{2} = -4$$

Now we are ready to find the sum of the first 18 terms of  $2, -8, 32, -128, \dots$

$$S_n = \frac{a_1(1 - r^n)}{1 - r} \quad \text{Use the formula for the sum of the first } n \text{ terms of a geometric sequence.}$$

$$S_{18} = \frac{2[1 - (-4)^{18}]}{1 - (-4)} \quad a_1 \text{ (the first term)} = 2, r = -4, \text{ and } n = 18 \text{ because we want the sum of the first 18 terms.}$$

$$= -27,487,790,694 \quad \text{Use a calculator.}$$

The sum of the first 18 terms is  $-27,487,790,694$ . Equivalently, this number is the 18th partial sum of the sequence  $2, -8, 32, -128, \dots$  ●●●

**Check Point 4** Find the sum of the first nine terms of the geometric sequence:  $2, -6, 18, -54, \dots$

#### EXAMPLE 5 Using $S_n$ to Evaluate a Summation

Find the following sum:  $\sum_{i=1}^{10} 6 \cdot 2^i$ .

#### SOLUTION

Let's write out a few terms in the sum.

$$\sum_{i=1}^{10} 6 \cdot 2^i = 6 \cdot 2 + 6 \cdot 2^2 + 6 \cdot 2^3 + \dots + 6 \cdot 2^{10}$$

**TECHNOLOGY**

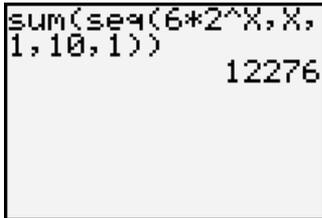

To find

$$\sum_{i=1}^{10} 6 \cdot 2^i$$

on a graphing utility, enter

`SUM` `SEQ` `(6 × 2x, x, 1, 10, 1).`

Then press `ENTER`.

Do you see that each term after the first is obtained by multiplying the preceding term by 2? To find the sum of the 10 terms ( $n = 10$ ), we need to know the first term,  $a_1$ , and the common ratio,  $r$ . The first term is  $6 \cdot 2$  or 12:  $a_1 = 12$ . The common ratio is 2.

$$S_n = \frac{a_1(1 - r^n)}{1 - r}$$

Use the formula for the sum of the first  $n$  terms of a geometric sequence.

$$S_{10} = \frac{12(1 - 2^{10})}{1 - 2} = 12,276$$

$a_1$  (the first term) = 12,  $r = 2$ , and  $n = 10$  because we are adding 10 terms.

Use a calculator.

Thus,

$$\sum_{i=1}^{10} 6 \cdot 2^i = 12,276.$$

**Check Point 5** Find the following sum:  $\sum_{i=1}^8 2 \cdot 3^i$ .

Some of the exercises in the previous Exercise Set involved situations in which salaries increased by a fixed amount each year. A more realistic situation is one in which salary raises increase by a certain percent each year. Example 6 shows how such a situation can be modeled using a geometric sequence.

**EXAMPLE 6** Computing a Lifetime Salary

A union contract specifies that each worker will receive a 5% pay increase each year for the next 30 years. One worker is paid \$20,000 the first year. What is this person's total lifetime salary over a 30-year period?

**SOLUTION**

The salary for the first year is \$20,000. With a 5% raise, the second-year salary is computed as follows:

$$\text{Salary for year 2} = 20,000 + 20,000(0.05) = 20,000(1 + 0.05) = 20,000(1.05).$$

Each year, the salary is 1.05 times what it was in the previous year. Thus, the salary for year 3 is 1.05 times 20,000(1.05), or  $20,000(1.05)^2$ . The salaries for the first five years are given in the table.

**Yearly Salaries**

Year 1	Year 2	Year 3	Year 4	Year 5	...
20,000	$20,000(1.05)$	$20,000(1.05)^2$	$20,000(1.05)^3$	$20,000(1.05)^4$	...

The numbers in the bottom row form a geometric sequence with  $a_1 = 20,000$  and  $r = 1.05$ . To find the total salary over 30 years, we use the formula for the sum of the first  $n$  terms of a geometric sequence, with  $n = 30$ .

$$S_n = \frac{a_1(1 - r^n)}{1 - r}$$

$$S_{30} = \frac{20,000[1 - (1.05)^{30}]}{1 - 1.05}$$

Total salary over 30 years

$$= \frac{20,000[1 - (1.05)^{30}]}{-0.05} \approx 1,328,777$$

Use a calculator.

The total salary over the 30-year period is approximately \$1,328,777.

 **Check Point 6** A job pays a salary of \$30,000 the first year. During the next 29 years, the salary increases by 6% each year. What is the total lifetime salary over the 30-year period?

**5** Find the value of an annuity.

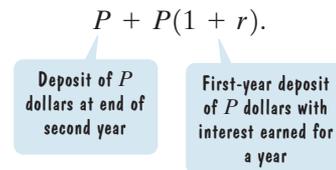

**Annuities**

The compound interest formula

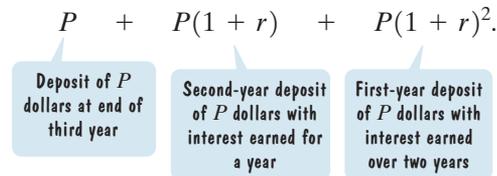

$$A = P(1 + r)^t$$

gives the future value,  $A$ , after  $t$  years, when a fixed amount of money,  $P$ , the principal, is deposited in an account that pays an annual interest rate  $r$  (in decimal form) compounded once a year. However, money is often invested in small amounts at periodic intervals. For example, to save for retirement, you might decide to place \$1000 into an Individual Retirement Account (IRA) at the end of each year until you retire. An **annuity** is a sequence of equal payments made at equal time periods. An IRA is an example of an annuity.

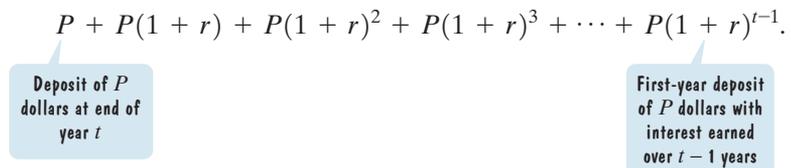

Suppose  $P$  dollars is deposited into an account at the end of each year. The account pays an annual interest rate,  $r$ , compounded annually. At the end of the first year, the account contains  $P$  dollars. At the end of the second year,  $P$  dollars is deposited again. At the time of this deposit, the first deposit has received interest earned during the second year. The **value of the annuity** is the sum of all deposits made plus all interest paid. Thus, the value of the annuity after two years is

The value of the annuity after three years is

The value of the annuity after  $t$  years is

This is the sum of the terms of a geometric sequence with first term  $P$  and common ratio  $1 + r$ . We use the formula

$$S_n = \frac{a_1(1 - r^n)}{1 - r}$$

to find the sum of the terms:

$$S_t = \frac{P[1 - (1 + r)^t]}{1 - (1 + r)} = \frac{P[1 - (1 + r)^t]}{-r} = \frac{P[(1 + r)^t - 1]}{r}.$$

This formula gives the value of an annuity after  $t$  years if interest is compounded once a year. We can adjust the formula to find the value of an annuity if equal payments are made at the end of each of  $n$  yearly compounding periods.

Value of an Annuity: Interest Compounded  $n$  Times per Year

If  $P$  is the deposit made at the end of each compounding period for an annuity at  $r$  percent annual interest compounded  $n$  times per year, the value,  $A$ , of the annuity after  $t$  years is

$$A = \frac{P \left[ \left( 1 + \frac{r}{n} \right)^{nt} - 1 \right]}{\frac{r}{n}}$$

*Blitzer Bonus***Stashing Cash and Making Taxes Less Taxing**

As you prepare for your future career, retirement probably seems very far away. Making regular deposits into an IRA may not be fun, but there is a special incentive from Uncle Sam that makes it far more appealing. Traditional IRAs are **tax-deferred savings plans**. This means that you do not pay taxes on deposits and interest until you begin withdrawals, typically at retirement. Before then, yearly deposits count as adjustments to gross income and are not part of your taxable income. Not only do you get a tax break now, but also you ultimately earn more. This is because you do not pay taxes on interest from year to year, allowing earnings to accumulate until you start withdrawals. With a tax code that encourages long-term savings, opening an IRA early in your career is a smart way to gain more control over how you will spend a large part of your life.

**EXAMPLE 7** Determining the Value of an Annuity

At age 25, to save for retirement, you decide to deposit \$200 at the end of each month into an IRA that pays 7.5% compounded monthly.

- How much will you have from the IRA when you retire at age 65?
- Find the interest.

**SOLUTION**

- Because you are 25, the amount that you will have from the IRA when you retire at 65 is its value after 40 years.

$$A = \frac{P \left[ \left( 1 + \frac{r}{n} \right)^{nt} - 1 \right]}{\frac{r}{n}}$$

Use the formula for the value of an annuity.

$$A = \frac{200 \left[ \left( 1 + \frac{0.075}{12} \right)^{12 \cdot 40} - 1 \right]}{\frac{0.075}{12}}$$

The annuity involves month-end deposits of \$200:  $P = 200$ . The interest rate is 7.5%:  $r = 0.075$ . The interest is compounded monthly:  $n = 12$ . The number of years is 40:  $t = 40$ .

$$= \frac{200[(1 + 0.00625)^{480} - 1]}{0.00625}$$

Using parentheses keys, this can be performed in a single step on a graphing calculator.

$$= \frac{200[(1.00625)^{480} - 1]}{0.00625}$$

$$\approx \frac{200(19.8989 - 1)}{0.00625}$$

Use a calculator to find  $(1.00625)^{480}$ :

$1.00625$   $y^x$   $480$   $=$ .

$$\approx 604,765$$

After 40 years, you will have approximately \$604,765 when retiring at age 65.

- Interest = Value of the IRA – Total deposits  
 $\approx \$604,765 - \$200 \cdot 12 \cdot 40$

\$200 per month  $\times$  12 months  
per year  $\times$  40 years

$$= \$604,765 - \$96,000 = \$508,765$$

The interest is approximately \$508,765, more than five times the amount of your contributions to the IRA. ●●●

 **Check Point 7** At age 30, to save for retirement, you decide to deposit \$100 at the end of each month into an IRA that pays 9.5% compounded monthly.

- a. How much will you have from the IRA when you retire at age 65?
- b. Find the interest.

**6** Use the formula for the sum of an infinite geometric series.

**Geometric Series**

An infinite sum of the form

$$a_1 + a_1r + a_1r^2 + a_1r^3 + \dots + a_1r^{n-1} + \dots$$

with first term  $a_1$  and common ratio  $r$  is called an **infinite geometric series**. How can we determine which infinite geometric series have sums and which do not? We look at what happens to  $r^n$  as  $n$  gets larger in the formula for the sum of the first  $n$  terms of this series, namely,

$$S_n = \frac{a_1(1 - r^n)}{1 - r}.$$

If  $r$  is any number between  $-1$  and  $1$ , that is,  $-1 < r < 1$ , the term  $r^n$  approaches  $0$  as  $n$  gets larger. For example, consider what happens to  $r^n$  for  $r = \frac{1}{2}$ :

$$\left(\frac{1}{2}\right)^1 = \frac{1}{2} \quad \left(\frac{1}{2}\right)^2 = \frac{1}{4} \quad \left(\frac{1}{2}\right)^3 = \frac{1}{8} \quad \left(\frac{1}{2}\right)^4 = \frac{1}{16} \quad \left(\frac{1}{2}\right)^5 = \frac{1}{32} \quad \left(\frac{1}{2}\right)^6 = \frac{1}{64}.$$

These numbers are approaching 0 as  $n$  gets larger.

Take another look at the formula for the sum of the first  $n$  terms of a geometric sequence.

$$S_n = \frac{a_1(1 - r^n)}{1 - r}$$

If  $-1 < r < 1$ ,  $r^n$  approaches 0 as  $n$  gets larger.

Let us replace  $r^n$  with  $0$  in the formula for  $S_n$ . This change gives us a formula for the sum of an infinite geometric series with a common ratio between  $-1$  and  $1$ .

**The Sum of an Infinite Geometric Series**

If  $-1 < r < 1$  (equivalently,  $|r| < 1$ ), then the sum of the infinite geometric series

$$a_1 + a_1r + a_1r^2 + a_1r^3 + \dots,$$

in which  $a_1$  is the first term and  $r$  is the common ratio, is given by

$$S = \frac{a_1}{1 - r}.$$

If  $|r| \geq 1$ , the infinite series does not have a sum.

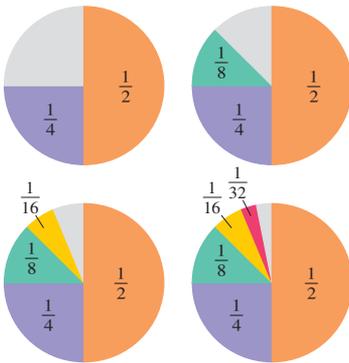

To use the formula for the sum of an infinite geometric series, we need to know the first term and the common ratio. For example, consider

$$\text{First term, } a_1, \text{ is } \frac{1}{2}. \quad \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \frac{1}{32} + \cdots$$

$$\text{Common ratio, } r, \text{ is } \frac{a_2}{a_1}.$$

$$r = \frac{1/4}{1/2} = \frac{1}{4} \cdot 2 = \frac{1}{2}$$

**FIGURE 10.7** The sum  $\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \frac{1}{32} + \cdots$  is approaching 1.

With  $r = \frac{1}{2}$ , the condition that  $|r| < 1$  is met, so the infinite geometric series has a sum given by  $S = \frac{a_1}{1 - r}$ . The sum of the series is found as follows:

$$\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \frac{1}{32} + \cdots = \frac{a_1}{1 - r} = \frac{\frac{1}{2}}{1 - \frac{1}{2}} = \frac{\frac{1}{2}}{\frac{1}{2}} = 1.$$

Thus, the sum of the infinite geometric series is 1. Notice how this is illustrated in **Figure 10.7**. As more terms are included, the sum is approaching the area of one complete circle.

### EXAMPLE 8 Finding the Sum of an Infinite Geometric Series

Find the sum of the infinite geometric series:  $\frac{3}{8} - \frac{3}{16} + \frac{3}{32} - \frac{3}{64} + \cdots$ .

#### SOLUTION

Before finding the sum, we must find the common ratio.

$$r = \frac{a_2}{a_1} = \frac{-\frac{3}{16}}{\frac{3}{8}} = -\frac{3}{16} \cdot \frac{8}{3} = -\frac{1}{2}$$

Because  $r = -\frac{1}{2}$ , the condition that  $|r| < 1$  is met. Thus, the infinite geometric series has a sum.

$$S = \frac{a_1}{1 - r}$$

This is the formula for the sum of an infinite geometric series. Let  $a_1 = \frac{3}{8}$  and  $r = -\frac{1}{2}$ .

$$= \frac{\frac{3}{8}}{1 - \left(-\frac{1}{2}\right)} = \frac{\frac{3}{8}}{\frac{3}{2}} = \frac{3}{8} \cdot \frac{2}{3} = \frac{1}{4}$$

Thus, the sum of  $\frac{3}{8} - \frac{3}{16} + \frac{3}{32} - \frac{3}{64} + \cdots$  is  $\frac{1}{4}$ . Put in an informal way, as we continue to add more and more terms, the sum is approximately  $\frac{1}{4}$ . ●●●

**Check Point 8** Find the sum of the infinite geometric series:  
 $3 + 2 + \frac{4}{3} + \frac{8}{9} + \cdots$

We can use the formula for the sum of an infinite geometric series to express a repeating decimal as a fraction in lowest terms.

**EXAMPLE 9** Writing a Repeating Decimal as a Fraction

Express  $0.\overline{7}$  as a fraction in lowest terms.

**SOLUTION**

$$0.\overline{7} = 0.7777 \dots = \frac{7}{10} + \frac{7}{100} + \frac{7}{1000} + \frac{7}{10,000} + \dots$$

Observe that  $0.\overline{7}$  is an infinite geometric series with first term  $\frac{7}{10}$  and common ratio  $\frac{1}{10}$ . Because  $r = \frac{1}{10}$ , the condition that  $|r| < 1$  is met. Thus, we can use our formula to find the sum. Therefore,

$$0.\overline{7} = \frac{a_1}{1 - r} = \frac{\frac{7}{10}}{1 - \frac{1}{10}} = \frac{\frac{7}{10}}{\frac{9}{10}} = \frac{7}{10} \cdot \frac{10}{9} = \frac{7}{9}$$

An equivalent fraction for  $0.\overline{7}$  is  $\frac{7}{9}$ . ...

**Check Point 9** Express  $0.\overline{9}$  as a fraction in lowest terms.

Infinite geometric series have many applications, as illustrated in Example 10.

**EXAMPLE 10** Tax Rebates and the Multiplier Effect

A tax rebate that returns a certain amount of money to taxpayers can have a total effect on the economy that is many times this amount. In economics, this phenomenon is called the **multiplier effect**. Suppose, for example, that the government reduces taxes so that each consumer has \$2000 more income. The government assumes that each person will spend 70% of this (= \$1400). The individuals and businesses receiving this \$1400 in turn spend 70% of it (= \$980), creating extra income for other people to spend, and so on. Determine the total amount spent on consumer goods from the initial \$2000 tax rebate.

**SOLUTION**

The total amount spent is given by the infinite geometric series

$$1400 + 980 + 686 + \dots$$

70% of  
1400

70% of  
980

The first term is 1400:  $a_1 = 1400$ . The common ratio is 70%, or 0.7:  $r = 0.7$ . Because  $r = 0.7$ , the condition that  $|r| < 1$  is met. Thus, we can use our formula to find the sum. Therefore,

$$1400 + 980 + 686 + \dots = \frac{a_1}{1 - r} = \frac{1400}{1 - 0.7} \approx 4667.$$

This means that the total amount spent on consumer goods from the initial \$2000 rebate is approximately \$4667. ...

**Check Point 10** Rework Example 10 and determine the total amount spent on consumer goods with a \$1000 tax rebate and 80% spending down the line.

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- A sequence in which each term after the first is obtained by multiplying the preceding term by a fixed nonzero constant is called a/an \_\_\_\_\_ sequence. The amount by which we multiply each time is called the \_\_\_\_\_ of the sequence.
- The  $n$ th term of the sequence described in Exercise 1 is given by the formula  $a_n = \underline{\hspace{2cm}}$ , where  $a_1$  is the \_\_\_\_\_ and  $r$  is the \_\_\_\_\_ of the sequence.
- The sum,  $S_n$ , of the first  $n$  terms of the sequence described in Exercise 1 is given by the formula  $S_n = \underline{\hspace{2cm}}$ , where  $a_1$  is the \_\_\_\_\_ and  $r$  is the \_\_\_\_\_,  $r \neq 1$ .
- A sequence of equal payments made at equal time periods is called a/an \_\_\_\_\_. Its value,  $A$ , after  $t$  years is given by the formula

$$A = \frac{P[(1 + \frac{r}{n})^{nt} - 1]}{\frac{r}{n}},$$

where \_\_\_\_\_ is the deposit made at the end of each compounding period at \_\_\_\_\_ percent annual interest compounded \_\_\_\_\_ times per year.

- An infinite sum of the form

$$a_1 + a_1r + a_1r^2 + a_1r^3 + \dots$$

is called a/an \_\_\_\_\_.

If  $-1 < r < \underline{\hspace{2cm}}$ , its sum,  $S$ , is given by the

formula  $S = \underline{\hspace{2cm}}$ . The series does not have a sum if \_\_\_\_\_.

- The first four terms of  $\sum_{i=1}^6 2^i$  are \_\_\_\_\_, \_\_\_\_\_, \_\_\_\_\_, and \_\_\_\_\_. The common ratio is \_\_\_\_\_.

Determine whether each sequence is arithmetic or geometric.

- 4, 8, 12, 16, 20, ... \_\_\_\_\_
- 4, 8, 16, 32, 64, ... \_\_\_\_\_
- 1, -3, 9, -27, 81, ... \_\_\_\_\_
- 1, 1, 3, 5, 7, ... \_\_\_\_\_

## EXERCISE SET 10.3

### Practice Exercises

In Exercises 1–8, write the first five terms of each geometric sequence.

- $a_1 = 5, r = 3$
- $a_1 = 4, r = 3$
- $a_1 = 20, r = \frac{1}{2}$
- $a_1 = 24, r = \frac{1}{3}$
- $a_n = -4a_{n-1}, a_1 = 10$
- $a_n = -3a_{n-1}, a_1 = 10$
- $a_n = -5a_{n-1}, a_1 = -6$
- $a_n = -6a_{n-1}, a_1 = -2$

In Exercises 9–16, use the formula for the general term (the  $n$ th term) of a geometric sequence to find the indicated term of each sequence with the given first term,  $a_1$ , and common ratio,  $r$ .

- Find  $a_8$  when  $a_1 = 6, r = 2$ .
- Find  $a_8$  when  $a_1 = 5, r = 3$ .
- Find  $a_{12}$  when  $a_1 = 5, r = -2$ .
- Find  $a_{12}$  when  $a_1 = 4, r = -2$ .
- Find  $a_{40}$  when  $a_1 = 1000, r = -\frac{1}{2}$ .
- Find  $a_{30}$  when  $a_1 = 8000, r = -\frac{1}{2}$ .
- Find  $a_8$  when  $a_1 = 1,000,000, r = 0.1$ .
- Find  $a_8$  when  $a_1 = 40,000, r = 0.1$ .

In Exercises 17–24, write a formula for the general term (the  $n$ th term) of each geometric sequence. Then use the formula for  $a_n$  to find  $a_7$ , the seventh term of the sequence.

- 3, 12, 48, 192, ...
- 3, 15, 75, 375, ...
- 18, 6, 2,  $\frac{2}{3}$ , ...
- 12, 6, 3,  $\frac{3}{2}$ , ...

- 1.5, -3, 6, -12, ...
- 5, -1,  $\frac{1}{5}, -\frac{1}{25}, \dots$
- 0.0004, -0.004, 0.04, -0.4, ...
- 0.0007, -0.007, 0.07, -0.7, ...

Use the formula for the sum of the first  $n$  terms of a geometric sequence to solve Exercises 25–30.

- Find the sum of the first 12 terms of the geometric sequence: 2, 6, 18, 54, ...
- Find the sum of the first 12 terms of the geometric sequence: 3, 6, 12, 24, ...
- Find the sum of the first 11 terms of the geometric sequence: 3, -6, 12, -24, ...
- Find the sum of the first 11 terms of the geometric sequence: 4, -12, 36, -108, ...
- Find the sum of the first 14 terms of the geometric sequence:  $-\frac{3}{2}, 3, -6, 12, \dots$
- Find the sum of the first 14 terms of the geometric sequence:  $-\frac{1}{24}, \frac{1}{12}, -\frac{1}{6}, \frac{1}{3}, \dots$

In Exercises 31–36, find the indicated sum. Use the formula for the sum of the first  $n$  terms of a geometric sequence.

- $\sum_{i=1}^8 3^i$
- $\sum_{i=1}^6 4^i$
- $\sum_{i=1}^{10} 5 \cdot 2^i$
- $\sum_{i=1}^7 4(-3)^i$
- $\sum_{i=1}^6 (\frac{1}{2})^{i+1}$
- $\sum_{i=1}^6 (\frac{1}{3})^{i+1}$

In Exercises 37–44, find the sum of each infinite geometric series.

37.  $1 + \frac{1}{3} + \frac{1}{9} + \frac{1}{27} + \dots$       38.  $1 + \frac{1}{4} + \frac{1}{16} + \frac{1}{64} + \dots$   
 39.  $3 + \frac{3}{4} + \frac{3}{4^2} + \frac{3}{4^3} + \dots$       40.  $5 + \frac{5}{6} + \frac{5}{6^2} + \frac{5}{6^3} + \dots$   
 41.  $1 - \frac{1}{2} + \frac{1}{4} - \frac{1}{8} + \dots$       42.  $3 - 1 + \frac{1}{3} - \frac{1}{9} + \dots$   
 43.  $\sum_{i=1}^{\infty} 8(-0.3)^{i-1}$       44.  $\sum_{i=1}^{\infty} 12(-0.7)^{i-1}$

In Exercises 45–50, express each repeating decimal as a fraction in lowest terms.

45.  $0.\overline{5} = \frac{5}{10} + \frac{5}{100} + \frac{5}{1000} + \frac{5}{10,000} + \dots$   
 46.  $0.\overline{1} = \frac{1}{10} + \frac{1}{100} + \frac{1}{1000} + \frac{1}{10,000} + \dots$   
 47.  $0.\overline{47} = \frac{47}{100} + \frac{47}{10,000} + \frac{47}{1,000,000} + \dots$   
 48.  $0.\overline{83} = \frac{83}{100} + \frac{83}{10,000} + \frac{83}{1,000,000} + \dots$   
 49.  $0.\overline{257}$   
 50.  $0.\overline{529}$

In Exercises 51–56, the general term of a sequence is given. Determine whether the sequence is arithmetic, geometric, or neither. If the sequence is arithmetic, find the common difference; if it is geometric, find the common ratio.

51.  $a_n = n + 5$       52.  $a_n = n - 3$   
 53.  $a_n = 2^n$       54.  $a_n = (\frac{1}{2})^n$   
 55.  $a_n = n^2 + 5$       56.  $a_n = n^2 - 3$

**Practice Plus**

In Exercises 57–62, let

$$\{a_n\} = -5, 10, -20, 40, \dots,$$

$$\{b_n\} = 10, -5, -20, -35, \dots,$$

and

$$\{c_n\} = -2, 1, -\frac{1}{2}, \frac{1}{4}, \dots$$

57. Find  $a_{10} + b_{10}$ .  
 58. Find  $a_{11} + b_{11}$ .  
 59. Find the difference between the sum of the first 10 terms of  $\{a_n\}$  and the sum of the first 10 terms of  $\{b_n\}$ .  
 60. Find the difference between the sum of the first 11 terms of  $\{a_n\}$  and the sum of the first 11 terms of  $\{b_n\}$ .  
 61. Find the product of the sum of the first 6 terms of  $\{a_n\}$  and the sum of the infinite series containing all the terms of  $\{c_n\}$ .  
 62. Find the product of the sum of the first 9 terms of  $\{a_n\}$  and the sum of the infinite series containing all the terms of  $\{c_n\}$ .

In Exercises 63–64, find  $a_2$  and  $a_3$  for each geometric sequence.

63.  $8, a_2, a_3, 27$   
 64.  $2, a_2, a_3, -54$

**Application Exercises**

Use the formula for the general term (the  $n$ th term) of a geometric sequence to solve Exercises 65–68.

In Exercises 65–66, suppose you save \$1 the first day of a month, \$2 the second day, \$4 the third day, and so on. That is, each day you save twice as much as you did the day before.

65. What will you put aside for savings on the fifteenth day of the month?  
 66. What will you put aside for savings on the thirtieth day of the month?  
 67. A professional baseball player signs a contract with a beginning salary of \$3,000,000 for the first year and an annual increase of 4% per year beginning in the second year. That is, beginning in year 2, the athlete’s salary will be 1.04 times what it was in the previous year. What is the athlete’s salary for year 7 of the contract? Round to the nearest dollar.  
 68. You are offered a job that pays \$30,000 for the first year with an annual increase of 5% per year beginning in the second year. That is, beginning in year 2, your salary will be 1.05 times what it was in the previous year. What can you expect to earn in your sixth year on the job?

In Exercises 69–70, you will develop geometric sequences that model the population growth for California and Texas, the two most-populated U.S. states.

69. The table shows the population of California for 2000 and 2010, with estimates given by the U.S. Census Bureau for 2001 through 2009.

Year	2000	2001	2002	2003	2004	2005
Population in millions	33.87	34.21	34.55	34.90	35.25	35.60

Year	2006	2007	2008	2009	2010
Population in millions	36.00	36.36	36.72	37.09	37.25

- a. Divide the population for each year by the population in the preceding year. Round to two decimal places and show that California has a population increase that is approximately geometric.  
 b. Write the general term of the geometric sequence modeling California’s population, in millions,  $n$  years after 1999.  
 c. Use your model from part (b) to project California’s population, in millions, for the year 2020. Round to two decimal places.  
 70. The table shows the population of Texas for 2000 and 2010, with estimates given by the U.S. Census Bureau for 2001 through 2009.

Year	2000	2001	2002	2003	2004	2005
Population in millions	20.85	21.27	21.70	22.13	22.57	23.02

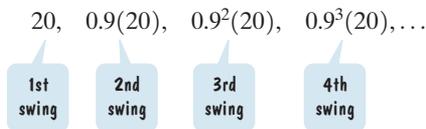

Year	2006	2007	2008	2009	2010
Population in millions	23.48	23.95	24.43	24.92	25.15

- a. Divide the population for each year by the population in the preceding year. Round to two decimal places and show that Texas has a population increase that is approximately geometric.
- b. Write the general term of the geometric sequence modeling Texas's population, in millions,  $n$  years after 1999.
- c. Use your model from part (b) to project Texas's population, in millions, for the year 2020. Round to two decimal places.

Use the formula for the sum of the first  $n$  terms of a geometric sequence to solve Exercises 71–76.

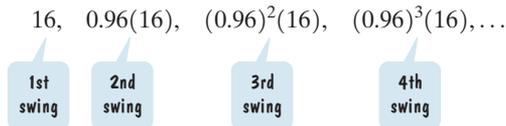

In Exercises 71–72, you save \$1 the first day of a month, \$2 the second day, \$4 the third day, continuing to double your savings each day.

- 71. What will your total savings be for the first 15 days?
- 72. What will your total savings be for the first 30 days?
- 73. A job pays a salary of \$24,000 the first year. During the next 19 years, the salary increases by 5% each year. What is the total lifetime salary over the 20-year period? Round to the nearest dollar.
- 74. You are investigating two employment opportunities. Company A offers \$30,000 the first year. During the next four years, the salary is guaranteed to increase by 6% per year. Company B offers \$32,000 the first year, with guaranteed annual increases of 3% per year after that. Which company offers the better total salary for a five-year contract? By how much? Round to the nearest dollar.
- 75. A pendulum swings through an arc of 20 inches. On each successive swing, the length of the arc is 90% of the previous length.

After 10 swings, what is the total length of the distance the pendulum has swung?

- 76. A pendulum swings through an arc of 16 inches. On each successive swing, the length of the arc is 96% of the previous length.

After 10 swings, what is the total length of the distance the pendulum has swung?

Use the formula for the value of an annuity to solve Exercises 77–84. Round answers to the nearest dollar.

- 77. To save money for a sabbatical to earn a master's degree, you deposit \$2000 at the end of each year in an annuity that pays 7.5% compounded annually.
  - a. How much will you have saved at the end of five years?
  - b. Find the interest.

- 78. To save money for a sabbatical to earn a master's degree, you deposit \$2500 at the end of each year in an annuity that pays 6.25% compounded annually.
  - a. How much will you have saved at the end of five years?
  - b. Find the interest.
- 79. At age 25, to save for retirement, you decide to deposit \$50 at the end of each month in an IRA that pays 5.5% compounded monthly.
  - a. How much will you have from the IRA when you retire at age 65?
  - b. Find the interest.
- 80. At age 25, to save for retirement, you decide to deposit \$75 at the end of each month in an IRA that pays 6.5% compounded monthly.
  - a. How much will you have from the IRA when you retire at age 65?
  - b. Find the interest.
- 81. To offer scholarship funds to children of employees, a company invests \$10,000 at the end of every three months in an annuity that pays 10.5% compounded quarterly.
  - a. How much will the company have in scholarship funds at the end of ten years?
  - b. Find the interest.
- 82. To offer scholarship funds to children of employees, a company invests \$15,000 at the end of every three months in an annuity that pays 9% compounded quarterly.
  - a. How much will the company have in scholarship funds at the end of ten years?
  - b. Find the interest.
- 83. Here are two ways of investing \$30,000 for 20 years.

Lump-Sum Deposit	Rate	Time
\$30,000	5% compounded annually	20 years

Periodic Deposits	Rate	Time
\$1500 at the end of each year	5% compounded annually	20 years

After 20 years, how much more will you have from the lump-sum investment than from the annuity?

- 84. Here are two ways of investing \$40,000 for 25 years.

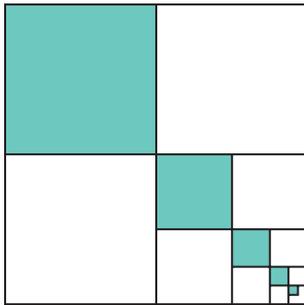

Lump-Sum Deposit	Rate	Time
\$40,000	6.5% compounded annually	25 years

Periodic Deposits	Rate	Time
\$1600 at the end of each year	6.5% compounded annually	25 years

After 25 years, how much more will you have from the lump-sum investment than from the annuity?

Use the formula for the sum of an infinite geometric series to solve Exercises 85–87.

85. A new factory in a small town has an annual payroll of \$6 million. It is expected that 60% of this money will be spent in the town by factory personnel. The people in the town who receive this money are expected to spend 60% of what they receive in the town, and so on. What is the total of all this spending, called the *total economic impact* of the factory, on the town each year?
86. How much additional spending will be generated by a \$10 billion tax rebate if 60% of all income is spent?
87. If the shading process shown in the figure is continued indefinitely, what fractional part of the largest square will eventually be shaded?

### Writing in Mathematics

88. What is a geometric sequence? Give an example with your explanation.
89. What is the common ratio in a geometric sequence?
90. Explain how to find the general term of a geometric sequence.
91. Explain how to find the sum of the first  $n$  terms of a geometric sequence without having to add up all the terms.
92. What is an annuity?
93. What is the difference between a geometric sequence and an infinite geometric series?
94. How do you determine if an infinite geometric series has a sum? Explain how to find the sum of such an infinite geometric series.
95. Would you rather have \$10,000,000 and a brand new BMW, or 1¢ today, 2¢ tomorrow, 4¢ on day 3, 8¢ on day 4, 16¢ on day 5, and so on, for 30 days? Explain.
96. For the first 30 days of a flu outbreak, the number of students on your campus who become ill is increasing. Which is worse: The number of students with the flu is increasing arithmetically or is increasing geometrically? Explain your answer.

### Technology Exercises

97. Use the **SEQ** (sequence) capability of a graphing utility and the formula you obtained for  $a_n$  to verify the value you found for  $a_7$  in any three exercises from Exercises 17–24.
98. Use the capability of a graphing utility to calculate the sum of a sequence to verify any three of your answers to Exercises 31–36.

In Exercises 99–100, use a graphing utility to graph the function. Determine the horizontal asymptote for the graph of  $f$  and discuss its relationship to the sum of the given series.

#### 99. Function Series

$$f(x) = \frac{2\left[1 - \left(\frac{1}{3}\right)^x\right]}{1 - \frac{1}{3}} \quad 2 + 2\left(\frac{1}{3}\right) + 2\left(\frac{1}{3}\right)^2 + 2\left(\frac{1}{3}\right)^3 + \cdots$$

#### 100. Function Series

$$f(x) = \frac{4[1 - (0.6)^x]}{1 - 0.6} \quad 4 + 4(0.6) + 4(0.6)^2 + 4(0.6)^3 + \cdots$$

### Critical Thinking Exercises

**Make Sense?** In Exercises 101–104, determine whether each statement makes sense or does not make sense, and explain your reasoning.

101. There's no end to the number of geometric sequences that I can generate whose first term is 5 if I pick nonzero numbers  $r$  and multiply 5 by each value of  $r$  repeatedly.
102. I've noticed that the big difference between arithmetic and geometric sequences is that arithmetic sequences are based on addition and geometric sequences are based on multiplication.
103. I modeled California's population growth with a geometric sequence, so my model is an exponential function whose domain is the set of natural numbers.
104. I used a formula to find the sum of the infinite geometric series  $3 + 1 + \frac{1}{3} + \frac{1}{9} + \cdots$  and then checked my answer by actually adding all the terms.

In Exercises 105–108, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

105. The sequence 2, 6, 24, 120, . . . is an example of a geometric sequence.
106. The sum of the geometric series  $\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \cdots + \frac{1}{512}$  can only be estimated without knowing precisely what terms occur between  $\frac{1}{8}$  and  $\frac{1}{512}$ .
107.  $10 - 5 + \frac{5}{2} - \frac{5}{4} + \cdots = \frac{10}{1 - \frac{1}{2}}$
108. If the  $n$ th term of a geometric sequence is  $a_n = 3(0.5)^{n-1}$ , the common ratio is  $\frac{1}{2}$ .
109. In a pest-eradication program, sterilized male flies are released into the general population each day. Ninety percent of those flies will survive a given day. How many flies should be released each day if the long-range goal of the program is to keep 20,000 sterilized flies in the population?
110. You are now 25 years old and would like to retire at age 55 with a retirement fund of \$1,000,000. How much should you deposit at the end of each month for the next 30 years in an IRA paying 10% annual interest compounded monthly to achieve your goal? Round to the nearest dollar.

### Group Exercise

**111.** Group members serve as a financial team analyzing the three options given to the professional baseball player described in the chapter opener on page 705. As a group, determine which option provides the most amount of money over the six-year contract and which provides the least. Describe one advantage and one disadvantage to each option.

### Preview Exercises

Exercises 112–114 will help you prepare for the material covered in the next section.

In Exercises 112–113, show that

$$1 + 2 + 3 + \cdots + n = \frac{n(n+1)}{2}$$

is true for the given value of  $n$ .

**112.**  $n = 3$ : Show that  $1 + 2 + 3 = \frac{3(3+1)}{2}$ .

**113.**  $n = 5$ : Show that  $1 + 2 + 3 + 4 + 5 = \frac{5(5+1)}{2}$ .

**114.** Simplify:  $\frac{k(k+1)(2k+1)}{6} + (k+1)^2$ .

## CHAPTER 10 Mid-Chapter Check Point

**WHAT YOU KNOW:** We learned that a sequence is a function whose domain is the set of positive integers. In an arithmetic sequence, each term after the first differs from the preceding term by a constant, the common difference,  $d$ . In a geometric sequence, each term after the first is obtained by multiplying the preceding term by a nonzero constant, the common ratio,  $r$ . We found the general term of arithmetic sequences  $[a_n = a_1 + (n-1)d]$  and geometric sequences  $[a_n = a_1r^{n-1}]$  and used these formulas to find particular terms. We determined the sum of the first  $n$  terms of arithmetic sequences  $\left[S_n = \frac{n}{2}(a_1 + a_n)\right]$  and geometric sequences  $\left[S_n = \frac{a_1(1-r^n)}{1-r}\right]$ . Finally, we determined the sum of an infinite geometric series,

$$a_1 + a_1r + a_1r^2 + a_1r^3 + \cdots, \text{ if } -1 < r < 1 \left( S = \frac{a_1}{1-r} \right).$$

In Exercises 1–4, write the first five terms of each sequence. Assume that  $d$  represents the common difference of an arithmetic sequence and  $r$  represents the common ratio of a geometric sequence.

- 1.**  $a_n = (-1)^{n+1} \frac{n}{(n-1)!}$       **2.**  $a_1 = 5, d = -3$   
**3.**  $a_1 = 5, r = -3$       **4.**  $a_1 = 3, a_n = -a_{n-1} + 4$

In Exercises 5–7, write a formula for the general term (the  $n$ th term) of each sequence. Then use the formula to find the indicated term.

- 5.** 2, 6, 10, 14,  $\dots$ ;  $a_{20}$       **6.** 3, 6, 12, 24,  $\dots$ ;  $a_{10}$   
**7.**  $\frac{3}{2}, 1, \frac{1}{2}, 0, \dots$ ;  $a_{30}$

**8.** Find the sum of the first ten terms of the sequence:

$$5, 10, 20, 40, \dots$$

**9.** Find the sum of the first 50 terms of the sequence:

$$-2, 0, 2, 4, \dots$$

**10.** Find the sum of the first ten terms of the sequence:

$$-20, 40, -80, 160, \dots$$

**11.** Find the sum of the first 100 terms of the sequence:

$$4, -2, -8, -14, \dots$$

In Exercises 12–15, find each indicated sum.

**12.**  $\sum_{i=1}^4 (i+4)(i-1)$       **13.**  $\sum_{i=1}^{50} (3i-2)$

**14.**  $\sum_{i=1}^6 \left(\frac{3}{2}\right)^i$       **15.**  $\sum_{i=1}^{\infty} \left(-\frac{2}{5}\right)^{i-1}$

**16.** Express  $0.\overline{45}$  as a fraction in lowest terms.

**17.** Express the sum using summation notation. Use  $i$  for the index of summation.

$$\frac{1}{3} + \frac{2}{4} + \frac{3}{5} + \cdots + \frac{18}{20}$$

**18.** A skydiver falls 16 feet during the first second of a dive, 48 feet during the second second, 80 feet during the third second, 112 feet during the fourth second, and so on. Find the distance that the skydiver falls during the 15th second and the total distance the skydiver falls in 15 seconds.

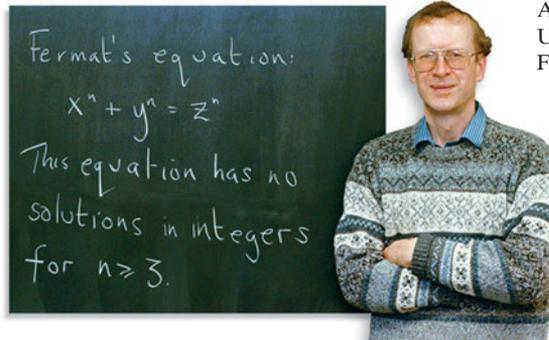

**19.** If the average value of a house increases 10% per year, how much will a house costing \$120,000 be worth in 10 years? Round to the nearest dollar.

## SECTION 10.4

## Mathematical Induction

*Objectives*

- 1 Understand the principle of mathematical induction.
- 2 Prove statements using mathematical induction.

After ten years of work, Princeton University's Andrew Wiles proved Fermat's Last Theorem.

Pierre de Fermat (1601–1665) was a lawyer who enjoyed studying mathematics. In a margin of one of his books, he claimed that no positive integers satisfy

$$x^n + y^n = z^n$$

if  $n$  is an integer greater than or equal to 3.

If  $n = 2$ , we can find positive integers satisfying  $x^n + y^n = z^n$ , or  $x^2 + y^2 = z^2$ :

$$3^2 + 4^2 = 5^2.$$

However, Fermat claimed that no positive integers satisfy

$$x^3 + y^3 = z^3, \quad x^4 + y^4 = z^4, \quad x^5 + y^5 = z^5,$$

and so on. Fermat claimed to have a proof of his conjecture but added, “The margin of my book is too narrow to write it down.” Some believe that he never had a proof and intended to frustrate his colleagues.

In 1994, 40-year-old Princeton math professor Andrew Wiles proved Fermat's Last Theorem using a principle called *mathematical induction*. In this section, you will learn how to use this powerful method to prove statements about the positive integers.

- 1 Understand the principle of mathematical induction.

**The Principle of Mathematical Induction**

How do we prove statements using mathematical induction? Let's consider an example. We will prove a statement that appears to give a correct formula for the sum of the first  $n$  positive integers:

$$S_n: 1 + 2 + 3 + \cdots + n = \frac{n(n+1)}{2}.$$

We can verify  $S_n$  for, say, the first four positive integers. If  $n = 1$ , the statement  $S_1$  is

$$\begin{array}{l} \text{Take the first term on the left.} \quad 1 \stackrel{?}{=} \frac{1(1+1)}{2} \quad \text{Substitute 1 for } n \text{ on the right.} \end{array}$$

$$1 \stackrel{?}{=} \frac{1 \cdot 2}{2}$$

$$1 = 1 \checkmark. \quad \text{This true statement shows that } S_1 \text{ is true.}$$

If  $n = 2$ , the statement  $S_2$  is

$$\begin{array}{l} \text{Add the first two terms on the left.} \quad 1 + 2 \stackrel{?}{=} \frac{2(2+1)}{2} \quad \text{Substitute 2 for } n \text{ on the right.} \end{array}$$

$$3 \stackrel{?}{=} \frac{2 \cdot 3}{2}$$

$$3 = 3 \checkmark. \quad \text{This true statement shows that } S_2 \text{ is true.}$$

If  $n = 3$ , the statement  $S_3$  is

Add the first three terms on the left.

$$1 + 2 + 3 \stackrel{?}{=} \frac{3(3 + 1)}{2}$$

Substitute 3 for  $n$  on the right.

$$6 \stackrel{?}{=} \frac{3 \cdot 4}{2}$$

$$6 = 6 \checkmark. \text{ This true statement shows that } S_3 \text{ is true.}$$

Finally, if  $n = 4$ , the statement  $S_4$  is

Add the first four terms on the left.

$$1 + 2 + 3 + 4 \stackrel{?}{=} \frac{4(4 + 1)}{2}$$

Substitute 4 for  $n$  on the right.

$$10 \stackrel{?}{=} \frac{4 \cdot 5}{2}$$

$$10 = 10 \checkmark. \text{ This true statement shows that } S_4 \text{ is true.}$$

This approach does *not* prove that the given statement  $S_n$  is true for every positive integer  $n$ . The fact that the formula produces true statements for  $n = 1, 2, 3$ , and 4 does not guarantee that it is valid for all positive integers  $n$ . Thus, we need to be able to verify the truth of  $S_n$  without verifying the statement for each and every one of the positive integers.

A legitimate proof of the given statement  $S_n$  involves a technique called **mathematical induction**.

### The Principle of Mathematical Induction

Let  $S_n$  be a statement involving the positive integer  $n$ . If

1.  $S_1$  is true, and
2. the truth of the statement  $S_k$  implies the truth of the statement  $S_{k+1}$ , for every positive integer  $k$ ,

then the statement  $S_n$  is true for all positive integers  $n$ .

**FIGURE 10.8** Falling dominoes illustrate the principle of mathematical

The principle of mathematical induction can be illustrated using an unending line of dominoes, as shown in **Figure 10.8**. If the first domino is pushed over, it knocks down the next, which knocks down the next, and so on, in a chain reaction. To topple all the dominoes in the infinite sequence, two conditions must be satisfied:

1. The first domino must be knocked down.
2. If the domino in position  $k$  is knocked down, then the domino in position  $k + 1$  must be knocked down.

If the second condition is not satisfied, it does not follow that all the dominoes will topple. For example, suppose the dominoes are spaced far enough apart so that a falling domino does not push over the next domino in the line.

The domino analogy provides the two steps that are required in a proof by mathematical induction.

### The Steps in a Proof by Mathematical Induction

Let  $S_n$  be a statement involving the positive integer  $n$ . To prove that  $S_n$  is true for all positive integers  $n$  requires two steps.

- Step 1** Show that  $S_1$  is true.
- Step 2** Show that if  $S_k$  is assumed to be true, then  $S_{k+1}$  is also true, for every positive integer  $k$ .

Notice that to prove  $S_n$ , we work only with the statements  $S_1$ ,  $S_k$ , and  $S_{k+1}$ . Our first example provides practice in writing these statements.

### EXAMPLE 1 Writing $S_1$ , $S_k$ , and $S_{k+1}$

For the given statement  $S_n$ , write the three statements  $S_1$ ,  $S_k$ , and  $S_{k+1}$ .

- a.  $S_n: 1 + 2 + 3 + \cdots + n = \frac{n(n+1)}{2}$
- b.  $S_n: 1^2 + 2^2 + 3^2 + \cdots + n^2 = \frac{n(n+1)(2n+1)}{6}$

### SOLUTION

a. We begin with

$$S_n: 1 + 2 + 3 + \cdots + n = \frac{n(n+1)}{2}.$$

Write  $S_1$  by taking the first term on the left and replacing  $n$  with 1 on the right.

$$S_1: 1 = \frac{1(1+1)}{2}$$

Write  $S_k$  by taking the sum of the first  $k$  terms on the left and replacing  $n$  with  $k$  on the right.

$$S_k: 1 + 2 + 3 + \cdots + k = \frac{k(k+1)}{2}$$

Write  $S_{k+1}$  by taking the sum of the first  $k+1$  terms on the left and replacing  $n$  with  $k+1$  on the right.

$$S_{k+1}: 1 + 2 + 3 + \cdots + (k+1) = \frac{(k+1)[(k+1)+1]}{2}$$

$$S_{k+1}: 1 + 2 + 3 + \cdots + (k+1) = \frac{(k+1)(k+2)}{2}$$

Simplify on the right.

b. We begin with

$$S_n: 1^2 + 2^2 + 3^2 + \cdots + n^2 = \frac{n(n+1)(2n+1)}{6}.$$

Write  $S_1$  by taking the first term on the left and replacing  $n$  with 1 on the right.

$$S_1: 1^2 = \frac{1(1+1)(2 \cdot 1 + 1)}{6}$$

Using  $S_n: 1^2 + 2^2 + 3^2 + \cdots + n^2 = \frac{n(n+1)(2n+1)}{6}$ , we write  $S_k$  by taking the sum of the first  $k$  terms on the left and replacing  $n$  with  $k$  on the right.

$$S_k: 1^2 + 2^2 + 3^2 + \cdots + k^2 = \frac{k(k+1)(2k+1)}{6}$$

Write  $S_{k+1}$  by taking the sum of the first  $k+1$  terms on the left and replacing  $n$  with  $k+1$  on the right.

$$S_{k+1}: 1^2 + 2^2 + 3^2 + \cdots + (k+1)^2 = \frac{(k+1)[(k+1)+1][2(k+1)+1]}{6}$$

$$S_{k+1}: 1^2 + 2^2 + 3^2 + \cdots + (k+1)^2 = \frac{(k+1)(k+2)(2k+3)}{6}$$

Simplify on the right. ●●●

 **Check Point 1** For the given statement  $S_n$ , write the three statements  $S_1$ ,  $S_k$ , and  $S_{k+1}$ .

a.  $2 + 4 + 6 + \cdots + 2n = n(n + 1)$

b.  $1^3 + 2^3 + 3^3 + \cdots + n^3 = \frac{n^2(n + 1)^2}{4}$

Always simplify  $S_{k+1}$  before trying to use mathematical induction to prove that  $S_n$  is true. For example, consider

$$S_n: 1^2 + 3^2 + 5^2 + \cdots + (2n - 1)^2 = \frac{n(2n - 1)(2n + 1)}{3}.$$

Begin by writing  $S_{k+1}$  as follows:

$$S_{k+1}: 1^2 + 3^2 + 5^2 + \cdots + [2(k + 1) - 1]^2 = \frac{(k + 1)[2(k + 1) - 1][2(k + 1) + 1]}{3}.$$

The sum of the first  $k + 1$  terms
Replace  $n$  with  $k + 1$  on the right side of  $S_n$ .

Now simplify both sides of the equation.

$$S_{k+1}: 1^2 + 3^2 + 5^2 + \cdots + (2k + 2 - 1)^2 = \frac{(k + 1)(2k + 2 - 1)(2k + 2 + 1)}{3}$$

$$S_{k+1}: 1^2 + 3^2 + 5^2 + \cdots + (2k + 1)^2 = \frac{(k + 1)(2k + 1)(2k + 3)}{3}$$

**2** Prove statements using mathematical induction.

### Proving Statements about Positive Integers Using Mathematical Induction

Now that we know how to find  $S_1$ ,  $S_k$ , and  $S_{k+1}$ , let's see how we can use these statements to carry out the two steps in a proof by mathematical induction. In Examples 2 and 3, we will use the statements  $S_1$ ,  $S_k$ , and  $S_{k+1}$  to prove each of the statements  $S_n$  that we worked with in Example 1.

#### EXAMPLE 2 Proving a Formula by Mathematical Induction

Use mathematical induction to prove that

$$1 + 2 + 3 + \cdots + n = \frac{n(n + 1)}{2}$$

for all positive integers  $n$ .

#### SOLUTION

**Step 1 Show that  $S_1$  is true.** Statement  $S_1$  is

$$1 = \frac{1(1 + 1)}{2}.$$

Simplifying on the right, we obtain  $1 = 1$ . This true statement shows that  $S_1$  is true.

**Step 2 Show that if  $S_k$  is true, then  $S_{k+1}$  is true.** Using  $S_k$  and  $S_{k+1}$  from Example 1(a), show that the truth of  $S_k$ ,

$$1 + 2 + 3 + \cdots + k = \frac{k(k + 1)}{2},$$

implies the truth of  $S_{k+1}$ ,

$$1 + 2 + 3 + \cdots + (k + 1) = \frac{(k + 1)(k + 2)}{2}.$$

$S_k$ :

$$1 + 2 + 3 + \cdots + k = \frac{k(k+1)}{2}$$

$S_{k+1}$ :

$$1 + 2 + 3 + \cdots + (k+1) = \frac{(k+1)(k+2)}{2}$$

The statements  $S_k$  and  $S_{k+1}$  (repeated)

We will work with  $S_k$ . Because we assume that  $S_k$  is true, we add the next consecutive integer after  $k$ —namely,  $k + 1$ —to both sides.

$$1 + 2 + 3 + \cdots + k = \frac{k(k+1)}{2}$$

This is  $S_k$ , which we assume is true.

$$1 + 2 + 3 + \cdots + k + (k+1) = \frac{k(k+1)}{2} + (k+1)$$

Add  $k + 1$  to both sides of the equation.

We do not have to write this  $k$  because  $k$  is understood to be the integer that precedes  $k + 1$ .

$$1 + 2 + 3 + \cdots + (k+1) = \frac{k(k+1)}{2} + \frac{2(k+1)}{2}$$

Write the right side with a common denominator of 2.

$$1 + 2 + 3 + \cdots + (k+1) = \frac{(k+1)}{2}(k+2)$$

Factor out the common factor  $\frac{k+1}{2}$  on the right.

$$1 + 2 + 3 + \cdots + (k+1) = \frac{(k+1)(k+2)}{2}$$

This final result is the statement  $S_{k+1}$ .

We have shown that if we assume that  $S_k$  is true and we add  $k + 1$  to both sides of  $S_k$ , then  $S_{k+1}$  is also true. By the principle of mathematical induction, the statement  $S_n$ , namely,

$$1 + 2 + 3 + \cdots + n = \frac{n(n+1)}{2},$$

is true for every positive integer  $n$ . ...

**Check Point 2** Use mathematical induction to prove that

$$2 + 4 + 6 + \cdots + 2n = n(n+1)$$

for all positive integers  $n$ .

### EXAMPLE 3 Proving a Formula by Mathematical Induction

Use mathematical induction to prove that

$$1^2 + 2^2 + 3^2 + \cdots + n^2 = \frac{n(n+1)(2n+1)}{6}$$

for all positive integers  $n$ .

#### SOLUTION

**Step 1 Show that  $S_1$  is true.** Statement  $S_1$  is

$$1^2 = \frac{1(1+1)(2 \cdot 1 + 1)}{6}.$$

Simplifying, we obtain  $1 = \frac{1 \cdot 2 \cdot 3}{6}$ . Further simplification on the right gives the statement  $1 = 1$ . This true statement shows that  $S_1$  is true.

**Step 2 Show that if  $S_k$  is true, then  $S_{k+1}$  is true.** Using  $S_k$  and  $S_{k+1}$  from Example 1(b), show that the truth of

$$S_k: 1^2 + 2^2 + 3^2 + \cdots + k^2 = \frac{k(k+1)(2k+1)}{6}$$

implies the truth of

$$S_{k+1}: 1^2 + 2^2 + 3^2 + \cdots + (k+1)^2 = \frac{(k+1)(k+2)(2k+3)}{6}.$$

We will work with  $S_k$ . Because we assume that  $S_k$  is true, we add the square of the next consecutive integer after  $k$ , namely,  $(k + 1)^2$ , to both sides of the equation.

$$\begin{aligned}
 1^2 + 2^2 + 3^2 + \cdots + k^2 &= \frac{k(k + 1)(2k + 1)}{6} && \text{This is } S_k \text{ assumed to be true. We must} \\
 &&& \text{work with this and show } S_{k+1} \text{ is true.} \\
 1^2 + 2^2 + 3^2 + \cdots + k^2 + (k + 1)^2 &= \frac{k(k + 1)(2k + 1)}{6} + (k + 1)^2 && \text{Add } (k + 1)^2 \text{ to both sides.} \\
 1^2 + 2^2 + 3^2 + \cdots + (k + 1)^2 &= \frac{k(k + 1)(2k + 1)}{6} + \frac{6(k + 1)^2}{6} && \text{It is not necessary to write } k^2 \text{ on the} \\
 &&& \text{left. Express the right side with the least} \\
 &&& \text{common denominator, 6.} \\
 &= \frac{(k + 1)}{6} [k(2k + 1) + 6(k + 1)] && \text{Factor out the common factor } \frac{k + 1}{6}. \\
 &= \frac{(k + 1)}{6} (2k^2 + 7k + 6) && \text{Multiply and combine like terms.} \\
 &= \frac{(k + 1)}{6} (k + 2)(2k + 3) && \text{Factor } 2k^2 + 7k + 6. \\
 &= \frac{(k + 1)(k + 2)(2k + 3)}{6} && \text{This final statement is } S_{k+1}.
 \end{aligned}$$

We have shown that if we assume that  $S_k$  is true, and we add  $(k + 1)^2$  to both sides of  $S_k$ , then  $S_{k+1}$  is also true. By the principle of mathematical induction, the statement  $S_n$ , namely,

$$1^2 + 2^2 + 3^2 + \cdots + n^2 = \frac{n(n + 1)(2n + 1)}{6},$$

is true for every positive integer  $n$ . ...

 **Check Point 3** Use mathematical induction to prove that

$$1^3 + 2^3 + 3^3 + \cdots + n^3 = \frac{n^2(n + 1)^2}{4}$$

for all positive integers  $n$ .

Example 4 illustrates how mathematical induction can be used to prove statements about positive integers that do not involve sums.

#### EXAMPLE 4 Using the Principle of Mathematical Induction

Prove that 2 is a factor of  $n^2 + 5n$  for all positive integers  $n$ .

#### SOLUTION

**Step 1 Show that  $S_1$  is true.** Statement  $S_1$  reads

$$2 \text{ is a factor of } 1^2 + 5 \cdot 1.$$

Simplifying the arithmetic, the statement reads

$$2 \text{ is a factor of } 6.$$

This statement is true: That is,  $6 = 2 \cdot 3$ . This shows that  $S_1$  is true.

**Step 2 Show that if  $S_k$  is true, then  $S_{k+1}$  is true.** Let's use  $S_n$ : 2 is a factor of  $n^2 + 5n$  to write  $S_k$  and  $S_{k+1}$ :

$$S_k: \quad 2 \text{ is a factor of } k^2 + 5k.$$

$$S_{k+1}: \quad 2 \text{ is a factor of } (k + 1)^2 + 5(k + 1).$$

We can rewrite statement  $S_{k+1}$  by simplifying the algebraic expression in the statement as follows:

$$(k + 1)^2 + 5(k + 1) = k^2 + 2k + 1 + 5k + 5 = k^2 + 7k + 6.$$

Use the formula  $(A + B)^2 = A^2 + 2AB + B^2$ .

Statement  $S_{k+1}$  now reads

$$2 \text{ is a factor of } k^2 + 7k + 6.$$

We need to use statement  $S_k$ —that is, 2 is a factor of  $k^2 + 5k$ —to prove statement  $S_{k+1}$ . We do this as follows:

$$k^2 + 7k + 6 = (k^2 + 5k) + (2k + 6) = (k^2 + 5k) + 2(k + 3).$$

We assume that 2 is a factor of  $k^2 + 5k$  because we assume  $S_k$  is true.

Factoring the last two terms shows that 2 is a factor of  $2k + 6$ .

The voice balloons show that 2 is a factor of  $k^2 + 5k$  and of  $2(k + 3)$ . Thus, if  $S_k$  is true, 2 is a factor of the sum  $(k^2 + 5k) + 2(k + 3)$ , or of  $k^2 + 7k + 6$ . This is precisely the statement  $S_{k+1}$ . We have shown that if we assume that  $S_k$  is true, then  $S_{k+1}$  is also true. By the principle of mathematical induction, the statement  $S_n$ , namely 2 is a factor of  $n^2 + 5n$ , is true for every positive integer  $n$ . ●●●

 **Check Point 4** Prove that 2 is a factor of  $n^2 + n$  for all positive integers  $n$ .

### CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- The principle of mathematical \_\_\_\_\_ states that a statement involving positive integers is true for all positive integers when two conditions have been satisfied:

The first condition states that the statement is true for the positive integer \_\_\_\_\_.

The second condition states that if the statement is true for some positive integer  $k$ , it is also true for the next positive integer \_\_\_\_\_.

- Consider the statement

$$2 + 4 + 6 + \cdots + 2n = n(n + 1).$$

If  $n = 1$ , the statement is  $2 = 1(1 + 1)$ .

If  $n = 2$ , the statement is  $2 + 4 = 2(2 + 1)$ .

If  $n = 3$ , the statement is \_\_\_\_\_.

If  $n = k + 1$ , the statement is \_\_\_\_\_.

- Consider the statement

$$3 + 7 + 11 + \cdots + (4n - 1) = n(2n + 1).$$

If  $n = 1$ , the statement is  $3 = 1(2 + 1)$ .

If  $n = 2$ , the statement is  $3 + 7 = 2(4 + 1)$ .

If  $n = 3$ , the statement is \_\_\_\_\_.

If  $n = k + 1$ , the statement before the algebra is simplified is \_\_\_\_\_.

If  $n = k + 1$ , the statement after the algebra is simplified is \_\_\_\_\_.

- Consider the statement

$$2 \text{ is a factor of } n^2 + 3n.$$

If  $n = 1$ , the statement is 2 is a factor of \_\_\_\_\_.

If  $n = 2$ , the statement is 2 is a factor of \_\_\_\_\_.

If  $n = 3$ , the statement is 2 is a factor of \_\_\_\_\_.

If  $n = k + 1$ , the statement before the algebra is simplified is 2 is a factor of \_\_\_\_\_.

If  $n = k + 1$ , the statement after the algebra is simplified is 2 is a factor of \_\_\_\_\_.

- $k^2 + 3k + 2 = (k^2 + k) + 2$  (\_\_\_\_\_)

## EXERCISE SET 10.4

## Practice Exercises

In Exercises 1–4, a statement  $S_n$  about the positive integers is given. Write statements  $S_1$ ,  $S_2$ , and  $S_3$ , and show that each of these statements is true.

- $S_n$ :  $1 + 3 + 5 + \cdots + (2n - 1) = n^2$
- $S_n$ :  $3 + 4 + 5 + \cdots + (n + 2) = \frac{n(n + 5)}{2}$
- $S_n$ : 2 is a factor of  $n^2 - n$ .
- $S_n$ : 3 is a factor of  $n^3 - n$ .

In Exercises 5–10, a statement  $S_n$  about the positive integers is given. Write statements  $S_k$  and  $S_{k+1}$ , simplifying statement  $S_{k+1}$  completely.

- $S_n$ :  $4 + 8 + 12 + \cdots + 4n = 2n(n + 1)$
- $S_n$ :  $3 + 4 + 5 + \cdots + (n + 2) = \frac{n(n + 5)}{2}$
- $S_n$ :  $3 + 7 + 11 + \cdots + (4n - 1) = n(2n + 1)$
- $S_n$ :  $2 + 7 + 12 + \cdots + (5n - 3) = \frac{n(5n - 1)}{2}$
- $S_n$ : 2 is a factor of  $n^2 - n + 2$ .
- $S_n$ : 2 is a factor of  $n^2 - n$ .

In Exercises 11–24, use mathematical induction to prove that each statement is true for every positive integer  $n$ .

- $4 + 8 + 12 + \cdots + 4n = 2n(n + 1)$
- $3 + 4 + 5 + \cdots + (n + 2) = \frac{n(n + 5)}{2}$
- $1 + 3 + 5 + \cdots + (2n - 1) = n^2$
- $3 + 6 + 9 + \cdots + 3n = \frac{3n(n + 1)}{2}$
- $3 + 7 + 11 + \cdots + (4n - 1) = n(2n + 1)$
- $2 + 7 + 12 + \cdots + (5n - 3) = \frac{n(5n - 1)}{2}$
- $1 + 2 + 2^2 + \cdots + 2^{n-1} = 2^n - 1$
- $1 + 3 + 3^2 + \cdots + 3^{n-1} = \frac{3^n - 1}{2}$
- $2 + 4 + 8 + \cdots + 2^n = 2^{n+1} - 2$
- $\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \cdots + \frac{1}{2^n} = 1 - \frac{1}{2^n}$
- $1 \cdot 2 + 2 \cdot 3 + 3 \cdot 4 + \cdots + n(n + 1) = \frac{n(n + 1)(n + 2)}{3}$
- $1 \cdot 3 + 2 \cdot 4 + 3 \cdot 5 + \cdots + n(n + 2) = \frac{n(n + 1)(2n + 7)}{6}$
- $\frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \cdots + \frac{1}{n(n + 1)} = \frac{n}{n + 1}$
- $\frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \frac{1}{4 \cdot 5} + \cdots + \frac{1}{(n + 1)(n + 2)} = \frac{n}{2n + 4}$

## Practice Plus

In Exercises 25–34, use mathematical induction to prove that each statement is true for every positive integer  $n$ .

- 2 is a factor of  $n^2 - n$ .
- 2 is a factor of  $n^2 + 3n$ .

27. 6 is a factor of  $n(n + 1)(n + 2)$ .

28. 3 is a factor of  $n(n + 1)(n - 1)$ .

$$29. \sum_{i=1}^n 5 \cdot 6^i = 6(6^n - 1) \qquad 30. \sum_{i=1}^n 7 \cdot 8^i = 8(8^n - 1)$$

31.  $n + 2 > n$

32. If  $0 < x < 1$ , then  $0 < x^n < 1$ .

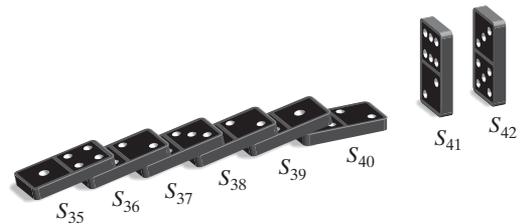

$$33. (ab)^n = a^n b^n \qquad 34. \left(\frac{a}{b}\right)^n = \frac{a^n}{b^n}$$

## Writing in Mathematics

- Explain how to use mathematical induction to prove that a statement is true for every positive integer  $n$ .
- Consider the statement  $S_n$  given by

$$n^2 - n + 41 \text{ is prime.}$$

Although  $S_1, S_2, \dots, S_{40}$  are true,  $S_{41}$  is false. Verify that  $S_{41}$  is false. Then describe how this is illustrated by the dominoes in the figure. What does this tell you about a pattern, or formula, that seems to work for several values of  $n$ ?

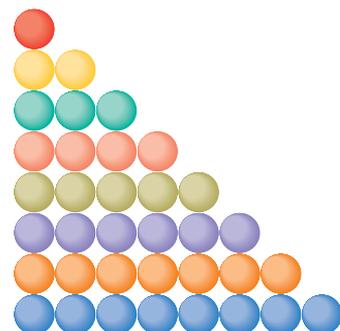

## Critical Thinking Exercises

**Make Sense?** In Exercises 37–40, determine whether each statement makes sense or does not make sense, and explain your reasoning.

- I use mathematical induction to prove that statements are true for all real numbers  $n$ .
- I begin proofs by mathematical induction by writing  $S_k$  and  $S_{k+1}$ , both of which I assume to be true.
- When a line of falling dominoes is used to illustrate the principle of mathematical induction, it is not necessary for all the dominoes to topple.
- This triangular arrangement of 36 circles illustrates that

$$1 + 2 + 3 + \cdots + n = \frac{n(n + 1)}{2}$$

is true for  $n = 8$ .

Some statements are false for the first few positive integers, but true for some positive integer  $m$  on. In these instances, you can prove  $S_n$  for  $n \geq m$  by showing that  $S_m$  is true and that  $S_k$  implies  $S_{k+1}$  when  $k \geq m$ . Use this extended principle of mathematical induction to prove that each statement in Exercises 41–42 is true.

41. Prove that  $n^2 > 2n + 1$  for  $n \geq 3$ . Show that the formula is true for  $n = 3$  and then use step 2 of mathematical induction.
42. Prove that  $2^n > n^2$  for  $n \geq 5$ . Show that the formula is true for  $n = 5$  and then use step 2 of mathematical induction.

In Exercises 43–44, find  $S_1$  through  $S_5$  and then use the pattern to make a conjecture about  $S_n$ . Prove the conjectured formula for  $S_n$  by mathematical induction.

43.  $S_n: \frac{1}{4} + \frac{1}{12} + \frac{1}{24} + \cdots + \frac{1}{2n(n+1)} = ?$
44.  $S_n: \left(1 - \frac{1}{2}\right)\left(1 - \frac{1}{3}\right)\left(1 - \frac{1}{4}\right) \cdots \left(1 - \frac{1}{n+1}\right) = ?$

### Group Exercise

45. Fermat's most notorious theorem, described in the section opener on page 744, baffled the greatest minds for more than three centuries. In 1994, after ten years of work, Princeton University's Andrew Wiles proved Fermat's Last Theorem. *People* magazine put him on its list of "the 25 most intriguing people of the year," the Gap asked him to model jeans, and Barbara Walters chased him for an interview. "Who's Barbara Walters?" asked the bookish Wiles, who had somehow gone through life without a television.

Using the 1993 PBS documentary "Solving Fermat: Andrew Wiles" or information about Andrew Wiles on the Internet, research and present a group seminar on what Wiles did to prove Fermat's Last Theorem, problems along the way, and the role of mathematical induction in the proof.

### Preview Exercises

Exercises 46–48 will help you prepare for the material covered in the next section. Each exercise involves observing a pattern in the expanded form of the binomial expression  $(a + b)^n$ .

$$(a + b)^1 = a + b$$

$$(a + b)^2 = a^2 + 2ab + b^2$$

$$(a + b)^3 = a^3 + 3a^2b + 3ab^2 + b^3$$

$$(a + b)^4 = a^4 + 4a^3b + 6a^2b^2 + 4ab^3 + b^4$$

$$(a + b)^5 = a^5 + 5a^4b + 10a^3b^2 + 10a^2b^3 + 5ab^4 + b^5$$

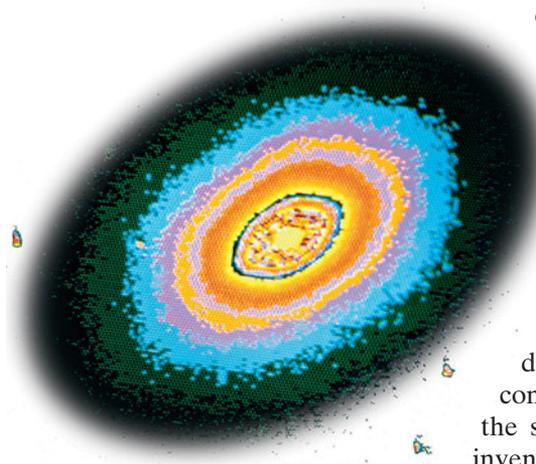

46. Describe the pattern for the exponents on  $a$ .
47. Describe the pattern for the exponents on  $b$ .
48. Describe the pattern for the sum of the exponents on the variables in each term.

## SECTION 10.5

### The Binomial Theorem

#### Objectives

- 1 Evaluate a binomial coefficient.
- 2 Expand a binomial raised to a power.
- 3 Find a particular term in a binomial expansion.

Galaxies are groupings of billions of stars bound together by gravity. Some galaxies, such as the Centaurus galaxy shown here, are elliptical in shape.

Is mathematics discovered or invented? For example, planets revolve in elliptical orbits. Does that mean that the ellipse is out there, waiting for the mind to discover it? Or do people create the definition of an ellipse just as they compose a song? And is it possible for the same mathematics to be discovered/invented by independent researchers separated by time, place, and culture? This is precisely what occurred when mathematicians attempted to find efficient methods for raising binomials to higher and higher powers, such as

$$(x + 2)^3, (x + 2)^4, (x + 2)^5, (x + 2)^6,$$

and so on. In this section, we study higher powers of binomials and a method first discovered/invented by great minds in Eastern and Western cultures working independently.

- 1 Evaluate a binomial coefficient.

### Binomial Coefficients

Before turning to powers of binomials, we introduce a special notation that uses factorials.

#### Definition of a Binomial Coefficient $\binom{n}{r}$

For nonnegative integers  $n$  and  $r$ , with  $n \geq r$ , the expression  $\binom{n}{r}$  (read “ $n$  above  $r$ ”) is called a **binomial coefficient** and is defined by

$$\binom{n}{r} = \frac{n!}{r!(n-r)!}$$

The symbol  ${}_nC_r$  is often used in place of  $\binom{n}{r}$  to denote binomial coefficients.

#### EXAMPLE 1 Evaluating Binomial Coefficients

Evaluate:

a.  $\binom{6}{2}$       b.  $\binom{3}{0}$       c.  $\binom{9}{3}$       d.  $\binom{4}{4}$ .

#### SOLUTION

In each case, we apply the definition of the binomial coefficient.

$$\text{a. } \binom{6}{2} = \frac{6!}{2!(6-2)!} = \frac{6!}{2!4!} = \frac{6 \cdot 5 \cdot \cancel{4!}}{2 \cdot 1 \cdot \cancel{4!}} = 15$$

$$\text{b. } \binom{3}{0} = \frac{3!}{0!(3-0)!} = \frac{\cancel{3!}}{0!\cancel{3!}} = \frac{1}{1} = 1$$

Remember that  $0! = 1$ .

$$\text{c. } \binom{9}{3} = \frac{9!}{3!(9-3)!} = \frac{9!}{3!6!} = \frac{9 \cdot 8 \cdot 7 \cdot \cancel{6!}}{3 \cdot 2 \cdot 1 \cdot \cancel{6!}} = 84$$

$$\text{d. } \binom{4}{4} = \frac{4!}{4!(4-4)!} = \frac{\cancel{4!}}{\cancel{4!}0!} = \frac{1}{1} = 1$$

...

 **Check Point 1** Evaluate:

a.  $\binom{6}{3}$       b.  $\binom{6}{0}$       c.  $\binom{8}{2}$       d.  $\binom{3}{3}$ .

### The Binomial Theorem

When we write out the *binomial expression*  $(a + b)^n$ , where  $n$  is a positive integer, a number of patterns begin to appear.

$$(a + b)^1 = a + b$$

$$(a + b)^2 = a^2 + 2ab + b^2$$

$$(a + b)^3 = a^3 + 3a^2b + 3ab^2 + b^3$$

$$(a + b)^4 = a^4 + 4a^3b + 6a^2b^2 + 4ab^3 + b^4$$

$$(a + b)^5 = a^5 + 5a^4b + 10a^3b^2 + 10a^2b^3 + 5ab^4 + b^5$$

### TECHNOLOGY

Graphing utilities can compute binomial coefficients. For example, to find  $\binom{6}{2}$ , many utilities require the sequence

$$6 \boxed{[nCr]} 2 \boxed{[ENTER]}.$$

The graphing utility will display 15. Consult your manual and verify the other evaluations in Example 1.

- 2 Expand a binomial raised to a power.

$$(a + b)^1 = a + b$$

$$(a + b)^2 = a^2 + 2ab + b^2$$

$$(a + b)^3 = a^3 + 3a^2b + 3ab^2 + b^3$$

$$(a + b)^4 = a^4 + 4a^3b + 6a^2b^2 + 4ab^3 + b^4$$

$$(a + b)^5 = a^5 + 5a^4b + 10a^3b^2 + 10a^2b^3 + 5ab^4 + b^5$$

Observing patterns in the expansion of  $(a + b)^n$  (repeated)

Each expanded form of the binomial expression is a polynomial. Observe the following patterns:

1. The first term in the expansion of  $(a + b)^n$  is  $a^n$ . The exponents on  $a$  decrease by 1 in each successive term.
2. The exponents on  $b$  in the expansion of  $(a + b)^n$  increase by 1 in each successive term. In the first term, the exponent on  $b$  is 0. (Because  $b^0 = 1$ ,  $b$  is not shown in the first term.) The last term is  $b^n$ .
3. The sum of the exponents on the variables in any term in the expansion of  $(a + b)^n$  is equal to  $n$ .
4. The number of terms in the polynomial expansion is one greater than the power of the binomial,  $n$ . There are  $n + 1$  terms in the expanded form of  $(a + b)^n$ .

Using these observations, the variable parts of the expansion of  $(a + b)^6$  are

$$a^6, a^5b, a^4b^2, a^3b^3, a^2b^4, ab^5, b^6.$$

The first term is  $a^6$ , with the exponents on  $a$  decreasing by 1 in each successive term. The exponents on  $b$  increase from 0 to 6, with the last term being  $b^6$ . The sum of the exponents in each term is equal to 6.

We can generalize from these observations to obtain the variable parts of the expansion of  $(a + b)^n$ . They are

$$a^n, a^{n-1}b, a^{n-2}b^2, a^{n-3}b^3, \dots, ab^{n-1}, b^n.$$

Sum of exponents:  
 $n - 1 + 1 = n$

Sum of exponents:  
 $n - 3 + 3 = n$

Sum of exponents:  
 $1 + n - 1 = n$

Exponents on  $a$  are decreasing by 1.  
Exponents on  $b$  are increasing by 1.

If we use binomial coefficients and the pattern for the variable part of each term, a formula called the **Binomial Theorem** can be used to expand any positive integral power of a binomial.

### A Formula for Expanding Binomials: The Binomial Theorem

For any positive integer  $n$ ,

$$\begin{aligned} (a + b)^n &= \binom{n}{0}a^n + \binom{n}{1}a^{n-1}b + \binom{n}{2}a^{n-2}b^2 + \binom{n}{3}a^{n-3}b^3 + \dots + \binom{n}{n}b^n \\ &= \sum_{r=0}^n \binom{n}{r}a^{n-r}b^r. \end{aligned}$$

### EXAMPLE 2 Using the Binomial Theorem

Expand:  $(x + 2)^4$ .

#### SOLUTION

We use the Binomial Theorem

$$(a + b)^n = \binom{n}{0}a^n + \binom{n}{1}a^{n-1}b + \binom{n}{2}a^{n-2}b^2 + \binom{n}{3}a^{n-3}b^3 + \dots + \binom{n}{n}b^n$$

to expand  $(x + 2)^4$ . In  $(x + 2)^4$ ,  $a = x$ ,  $b = 2$ , and  $n = 4$ . In the expansion, powers of  $x$  are in descending order, starting with  $x^4$ . Powers of 2 are in ascending order, starting with  $2^0$ . (Because  $2^0 = 1$ , a 2 is not shown in the first term.) The sum of the exponents on  $x$  and 2 in each term is equal to 4, the exponent in the expression  $(x + 2)^4$ .

## TECHNOLOGY

You can use a graphing utility's table feature to find the five binomial coefficients in Example 2.

Enter  $y_1 = 4 \text{ nCr } x$ .

X	Y1
0	1
1	4
2	6
3	4
4	1
5	0

$X=0$

$$(x + 2)^4 = \binom{4}{0}x^4 + \binom{4}{1}x^3 \cdot 2 + \binom{4}{2}x^2 \cdot 2^2 + \binom{4}{3}x \cdot 2^3 + \binom{4}{4}2^4$$

These binomial coefficients are evaluated using  $\binom{n}{r} = \frac{n!}{r!(n-r)!}$ .

$$= \frac{4!}{0!4!}x^4 + \frac{4!}{1!3!}x^3 \cdot 2 + \frac{4!}{2!2!}x^2 \cdot 4 + \frac{4!}{3!1!}x \cdot 8 + \frac{4!}{4!0!} \cdot 16$$

$$\frac{4!}{2!2!} = \frac{4 \cdot 3 \cdot 2!}{2! \cdot 2 \cdot 1} = \frac{12}{2} = 6$$

Take a few minutes to verify the other factorial evaluations.

$$= 1 \cdot x^4 + 4x^3 \cdot 2 + 6x^2 \cdot 4 + 4x \cdot 8 + 1 \cdot 16$$

$$= x^4 + 8x^3 + 24x^2 + 32x + 16$$

 **Check Point 2** Expand:  $(x + 1)^4$ .

## EXAMPLE 3 Using the Binomial Theorem

Expand:  $(2x - y)^5$ .

## SOLUTION

Because the Binomial Theorem involves the addition of two terms raised to a power, we rewrite  $(2x - y)^5$  as  $[2x + (-y)]^5$ . We use the Binomial Theorem

$$(a + b)^n = \binom{n}{0}a^n + \binom{n}{1}a^{n-1}b + \binom{n}{2}a^{n-2}b^2 + \binom{n}{3}a^{n-3}b^3 + \cdots + \binom{n}{n}b^n$$

to expand  $[2x + (-y)]^5$ . In  $[2x + (-y)]^5$ ,  $a = 2x$ ,  $b = -y$ , and  $n = 5$ . In the expansion, powers of  $2x$  are in descending order, starting with  $(2x)^5$ . Powers of  $-y$  are in ascending order, starting with  $(-y)^0$ . [Because  $(-y)^0 = 1$ , a  $-y$  is not shown in the first term.] The sum of the exponents on  $2x$  and  $-y$  in each term is equal to 5, the exponent in the expression  $(2x - y)^5$ .

$$(2x - y)^5 = [2x + (-y)]^5$$

$$= \binom{5}{0}(2x)^5 + \binom{5}{1}(2x)^4(-y) + \binom{5}{2}(2x)^3(-y)^2 + \binom{5}{3}(2x)^2(-y)^3 + \binom{5}{4}(2x)(-y)^4 + \binom{5}{5}(-y)^5$$

Evaluate binomial coefficients using  $\binom{n}{r} = \frac{n!}{r!(n-r)!}$ .

$$= \frac{5!}{0!5!}(2x)^5 + \frac{5!}{1!4!}(2x)^4(-y) + \frac{5!}{2!3!}(2x)^3(-y)^2 + \frac{5!}{3!2!}(2x)^2(-y)^3 + \frac{5!}{4!1!}(2x)(-y)^4 + \frac{5!}{5!0!}(-y)^5$$

$$\frac{5!}{2!3!} = \frac{5 \cdot 4 \cdot 3!}{2 \cdot 1 \cdot 3!} = 10$$

Take a few minutes to verify the other factorial evaluations.

$$= 1(2x)^5 + 5(2x)^4(-y) + 10(2x)^3(-y)^2 + 10(2x)^2(-y)^3 + 5(2x)(-y)^4 + 1(-y)^5$$

Raise both factors in these parentheses to the indicated powers.

$$= 1(32x^5) + 5(16x^4)(-y) + 10(8x^3)(-y)^2 + 10(4x^2)(-y)^3 + 5(2x)(-y)^4 + 1(-y)^5$$

Now raise  $-y$  to the indicated powers.

$$= 1(32x^5) + 5(16x^4)(-y) + 10(8x^3)y^2 + 10(4x^2)(-y^3) + 5(2x)y^4 + 1(-y^5)$$

Multiplying factors in each of the six terms gives us the desired expansion:

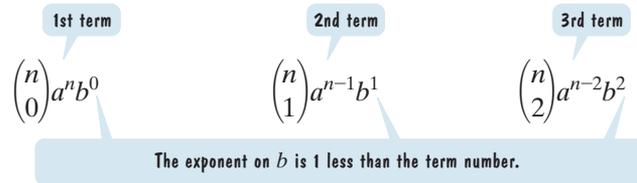

$$(2x - y)^5 = 32x^5 - 80x^4y + 80x^3y^2 - 40x^2y^3 + 10xy^4 - y^5.$$

 **Check Point 3** Expand:  $(x - 2y)^5$ .

**3** Find a particular term in a binomial expansion.

### Finding a Particular Term in a Binomial Expansion

By observing the terms in the formula for expanding binomials, we can find a formula for finding a particular term without writing the entire expansion.

Based on the observation in the bottom voice balloon, the  $(r + 1)$ st term of the expansion of  $(a + b)^n$  is the term that contains  $b^r$ .

#### Finding a Particular Term in a Binomial Expansion

The  $(r + 1)$ st term of the expansion of  $(a + b)^n$  is

$$\binom{n}{r} a^{n-r} b^r.$$

#### EXAMPLE 4 Finding a Single Term of a Binomial Expansion

Find the fourth term in the expansion of  $(3x + 2y)^7$ .

#### SOLUTION

The fourth term in the expansion of  $(3x + 2y)^7$  contains  $(2y)^3$ . To find the fourth term, first note that  $4 = 3 + 1$ . Equivalently, the fourth term of  $(3x + 2y)^7$  is the  $(3 + 1)$ st term. Thus,  $r = 3$ ,  $a = 3x$ ,  $b = 2y$ , and  $n = 7$ . The fourth term is

$$\binom{7}{3} (3x)^{7-3} (2y)^3 = \binom{7}{3} (3x)^4 (2y)^3 = \frac{7!}{3!(7-3)!} (3x)^4 (2y)^3.$$

Use the formula for the  $(r + 1)$ st term of  $(a + b)^n$ :  
 $\binom{n}{r} a^{n-r} b^r$ .

We use  $\binom{n}{r} = \frac{n!}{r!(n-r)!}$  to evaluate  $\binom{7}{3}$ .

Now we need to evaluate the factorial expression and raise  $3x$  and  $2y$  to the indicated powers. We obtain

$$\frac{7!}{3!4!} (81x^4)(8y^3) = \frac{7 \cdot 6 \cdot 5 \cdot 4!}{3 \cdot 2 \cdot 1 \cdot 4!} (81x^4)(8y^3) = 35(81x^4)(8y^3) = 22,680x^4y^3.$$

The fourth term of  $(3x + 2y)^7$  is  $22,680x^4y^3$ . ...

 **Check Point 4** Find the fifth term in the expansion of  $(2x + y)^9$ .

## Blitzer Bonus || The Universality of Mathematics

Pascal's triangle is an array of numbers showing coefficients of the terms in the expansions of  $(a + b)^n$ . Although credited to French mathematician Blaise Pascal (1623–1662), the triangular array of numbers appeared in a Chinese document printed in 1303. The Binomial Theorem was known in Eastern cultures prior to its discovery in Europe. The same mathematics is often discovered/invented by independent researchers separated by time, place, and culture.

### Binomial Expansions

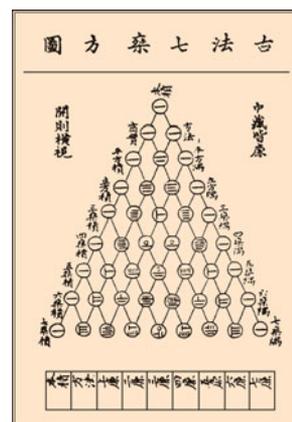

$$\begin{aligned}(a + b)^0 &= 1 \\(a + b)^1 &= a + b \\(a + b)^2 &= a^2 + 2ab + b^2 \\(a + b)^3 &= a^3 + 3a^2b + 3ab^2 + b^3 \\(a + b)^4 &= a^4 + 4a^3b + 6a^2b^2 + 4ab^3 + b^4 \\(a + b)^5 &= a^5 + 5a^4b + 10a^3b^2 + 10a^2b^3 + 5ab^4 + b^5\end{aligned}$$

### Pascal's Triangle

Coefficients in the Expansions

$$\begin{array}{ccccccc} & & & & & & 1 \\ & & & & & 1 & 1 \\ & & & & 1 & 2 & 1 \\ & & & 1 & 3 & 3 & 1 \\ & & 1 & 4 & 6 & 4 & 1 \\ & 1 & 5 & 10 & 10 & 5 & 1 \\ 1 & 6 & 15 & 20 & 15 & 6 & 1 \\ 1 & 7 & 21 & 35 & 35 & 21 & 7 & 1 \\ 1 & 8 & 28 & 56 & 70 & 56 & 28 & 8 & 1\end{array}$$

### Chinese Document: 1303

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- $\binom{n}{r}$  is called a/an \_\_\_\_\_ coefficient.
- $\binom{8}{2} = \frac{!}{!-!}$
- $\binom{n}{r} = \underline{\hspace{2cm}}$
- $(x + 2)^5 = \binom{5}{0}x^5 + \underline{\hspace{1cm}}x^4 \cdot 2 + \underline{\hspace{1cm}}x^3 \cdot 2^2 + \underline{\hspace{1cm}}x^2 \cdot 2^3 + \underline{\hspace{1cm}}x \cdot 2^4 + \underline{\hspace{1cm}} \cdot 2^5$
- $(a + b)^n = \binom{n}{0}a^n + \underline{\hspace{1cm}}a^{n-1}b + \underline{\hspace{1cm}}a^{n-2}b^2 + \underline{\hspace{1cm}}a^{n-3}b^3 + \cdots + \underline{\hspace{1cm}}b^n$   
The sum of the exponents on  $a$  and  $b$  in each term is \_\_\_\_\_.
- The formula in Exercise 5 is called the \_\_\_\_\_ Theorem.
- The  $(r + 1)$ st term of the expansion of  $(a + b)^n$  is  $\binom{n}{r}$  \_\_\_\_\_.

## EXERCISE SET 10.5

### Practice Exercises

In Exercises 1–8, evaluate the given binomial coefficient.

- $\binom{8}{3}$
- $\binom{7}{2}$
- $\binom{12}{1}$
- $\binom{11}{1}$
- $\binom{6}{6}$
- $\binom{15}{2}$
- $\binom{100}{2}$
- $\binom{100}{98}$

In Exercises 9–30, use the Binomial Theorem to expand each binomial and express the result in simplified form.

- $(x + 2)^3$
- $(3x + y)^3$
- $(5x - 1)^3$
- $(2x + 1)^4$
- $(x^2 + 2y)^4$
- $(y - 3)^4$
- $(2x^3 - 1)^4$
- $(x + 4)^3$
- $(x + 3y)^3$
- $(4x - 1)^3$
- $(3x + 1)^4$
- $(x^2 + y)^4$
- $(y - 4)^4$
- $(2x^5 - 1)^4$

23.  $(c + 2)^5$                       24.  $(c + 3)^5$   
 25.  $(x - 1)^5$                      26.  $(x - 2)^5$   
 27.  $(3x - y)^5$                   28.  $(x - 3y)^5$   
 29.  $(2a + b)^6$                   30.  $(a + 2b)^6$

In Exercises 31–38, write the first three terms in each binomial expansion, expressing the result in simplified form.

31.  $(x + 2)^8$                       32.  $(x + 3)^8$   
 33.  $(x - 2y)^{10}$                   34.  $(x - 2y)^9$   
 35.  $(x^2 + 1)^{16}$                   36.  $(x^2 + 1)^{17}$   
 37.  $(y^3 - 1)^{20}$                   38.  $(y^3 - 1)^{21}$

In Exercises 39–48, find the term indicated in each expansion.

39.  $(2x + y)^6$ ; third term        40.  $(x + 2y)^6$ ; third term  
 41.  $(x - 1)^9$ ; fifth term         42.  $(x - 1)^{10}$ ; fifth term  
 43.  $(x^2 + y^3)^8$ ; sixth term     44.  $(x^3 + y^2)^8$ ; sixth term  
 45.  $(x - \frac{1}{2})^9$ ; fourth term     46.  $(x + \frac{1}{2})^8$ ; fourth term  
 47.  $(x^2 + y)^{22}$ ; the term containing  $y^{14}$   
 48.  $(x + 2y)^{10}$ ; the term containing  $y^6$

**Practice Plus**

In Exercises 49–52, use the Binomial Theorem to expand each expression and write the result in simplified form.

49.  $(x^3 + x^{-2})^4$                       50.  $(x^2 + x^{-3})^4$   
 51.  $(x^{\frac{1}{3}} - x^{-\frac{1}{3}})^3$                       52.  $(x^{\frac{2}{3}} - \frac{1}{\sqrt[3]{x}})^3$

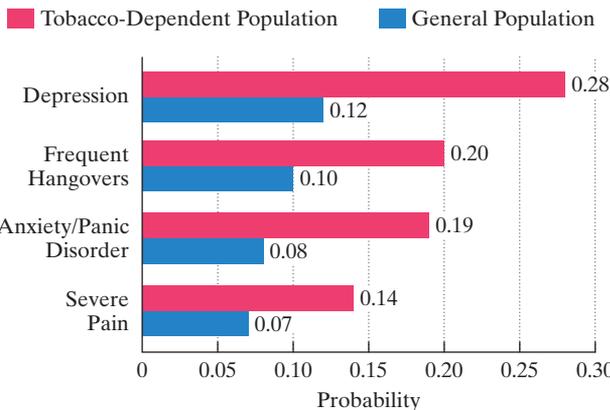

In Exercises 53–54, find  $\frac{f(x + h) - f(x)}{h}$  and simplify.

53.  $f(x) = x^4 + 7$                       54.  $f(x) = x^5 + 8$   
 55. Find the middle term in the expansion of  $(\frac{3}{x} + \frac{x}{3})^{10}$ .  
 56. Find the middle term in the expansion of  $(\frac{1}{x} - x^2)^{12}$ .

**Application Exercises**

The graph shows that U.S. smokers have a greater probability of suffering from some ailments than the general adult population. Exercises 57–58 are based on some of the probabilities, expressed as decimals, shown to the right of the bars. In each exercise, use a calculator to determine the probability, correct to four decimal places.

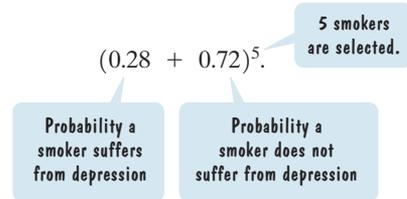

**Probability That United States Adults Suffer from Various Ailments**

Source: MARS 2005 OTC/DTC Pharmaceutical Study

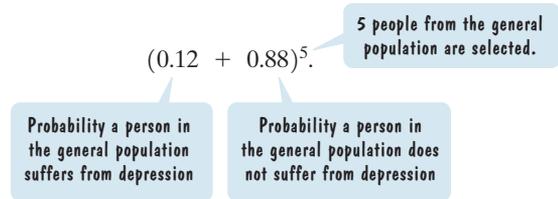

If the probability an event will occur is  $p$  and the probability it will not occur is  $q$ , then each term in the expansion of  $(p + q)^n$  represents a probability.

57. The probability that a smoker suffers from depression is 0.28. If five smokers are randomly selected, the probability that three of them will suffer from depression is the third term of the binomial expansion of

What is this probability?

58. The probability that a person in the general population suffers from depression is 0.12. If five people from the general population are randomly selected, the probability that three of them will suffer from depression is the third term of the binomial expansion of

What is this probability?

**Writing in Mathematics**

59. Explain how to evaluate  $\binom{n}{r}$ . Provide an example with your explanation.  
 60. Describe the pattern in the exponents on  $a$  in the expansion of  $(a + b)^n$ .  
 61. Describe the pattern in the exponents on  $b$  in the expansion of  $(a + b)^n$ .  
 62. What is true about the sum of the exponents on  $a$  and  $b$  in any term in the expansion of  $(a + b)^n$ ?  
 63. How do you determine how many terms there are in a binomial expansion?  
 64. Explain how to use the Binomial Theorem to expand a binomial. Provide an example with your explanation.  
 65. Explain how to find a particular term in a binomial expansion without having to write out the entire expansion.  
 66. Describe how you would use mathematical induction to prove

$$(a + b)^n = \binom{n}{0}a^n + \binom{n}{1}a^{n-1}b + \binom{n}{2}a^{n-2}b^2 + \dots + \binom{n}{n-1}ab^{n-1} + \binom{n}{n}b^n.$$

What happens when  $n = 1$ ? Write the statement that we assume to be true. Write the statement that we must prove. What must be done to the left side of the assumed statement to make it look like the left side of the statement that must be proved? (More detail on the actual proof is found in Exercise 85.)

## Technology Exercises

67. Use the  $\boxed{nCr}$  key on a graphing utility to verify your answers in Exercises 1–8.

In Exercises 68–69, graph each of the functions in the same viewing rectangle. Describe how the graphs illustrate the Binomial Theorem.

$$\begin{aligned} 68. f_1(x) &= (x + 2)^3 & f_2(x) &= x^3 \\ f_3(x) &= x^3 + 6x^2 & f_4(x) &= x^3 + 6x^2 + 12x \\ f_5(x) &= x^3 + 6x^2 + 12x + 8 \end{aligned}$$

Use a  $[-10, 10, 1]$  by  $[-30, 30, 10]$  viewing rectangle.

$$\begin{aligned} 69. f_1(x) &= (x + 1)^4 & f_2(x) &= x^4 \\ f_3(x) &= x^4 + 4x^3 & f_4(x) &= x^4 + 4x^3 + 6x^2 \\ f_5(x) &= x^4 + 4x^3 + 6x^2 + 4x \\ f_6(x) &= x^4 + 4x^3 + 6x^2 + 4x + 1 \end{aligned}$$

Use a  $[-5, 5, 1]$  by  $[-30, 30, 10]$  viewing rectangle.

In Exercises 70–72, use the Binomial Theorem to find a polynomial expansion for each function. Then use a graphing utility and an approach similar to the one in Exercises 68 and 69 to verify the expansion.

$$\begin{aligned} 70. f_1(x) &= (x - 1)^3 & 71. f_1(x) &= (x - 2)^4 \\ 72. f_1(x) &= (x + 2)^6 \end{aligned}$$

## Critical Thinking Exercises

**Make Sense?** In Exercises 73–76, determine whether each statement makes sense or does not make sense, and explain your reasoning.

73. In order to expand  $(x^3 - y^4)^5$ , I find it helpful to rewrite the expression inside the parentheses as  $x^3 + (-y^4)$ .
74. Without writing the expansion of  $(x - 1)^6$ , I can see that the terms have alternating positive and negative signs.
75. I use binomial coefficients to expand  $(a + b)^n$ , where  $\binom{n}{1}$  is the coefficient of the first term,  $\binom{n}{2}$  is the coefficient of the second term, and so on.
76. One of the terms in my binomial expansion is  $\binom{7}{5}x^2y^4$ .

In Exercises 77–80, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

77. The binomial expansion for  $(a + b)^n$  contains  $n$  terms.
78. The Binomial Theorem can be written in condensed form as

$$(a + b)^n = \sum_{r=0}^n \binom{n}{r} a^{n-r} b^r.$$

79. The sum of the binomial coefficients in  $(a + b)^n$  cannot be  $2^n$ .
80. There are no values of  $a$  and  $b$  such that

$$(a + b)^4 = a^4 + b^4.$$

81. Use the Binomial Theorem to expand and then simplify the result:  $(x^2 + x + 1)^3$ .

*Hint:* Write  $x^2 + x + 1$  as  $x^2 + (x + 1)$ .

82. Find the term in the expansion of  $(x^2 + y^2)^5$  containing  $x^4$  as a factor.

83. Prove that

$$\binom{n}{r} = \binom{n}{n-r}.$$

84. Show that

$$\binom{n}{r} + \binom{n}{r+1} = \binom{n+1}{r+1}.$$

*Hints:*

$$(n-r)! = (n-r)(n-r-1)!$$

$$(r+1)! = (r+1)r!$$

85. Follow the outline below and use mathematical induction to prove the Binomial Theorem:

$$\begin{aligned} (a + b)^n &= \binom{n}{0}a^n + \binom{n}{1}a^{n-1}b + \binom{n}{2}a^{n-2}b^2 \\ &\quad + \cdots + \binom{n}{n-1}ab^{n-1} + \binom{n}{n}b^n. \end{aligned}$$

- Verify the formula for  $n = 1$ .
- Replace  $n$  with  $k$  and write the statement that is assumed true. Replace  $n$  with  $k + 1$  and write the statement that must be proved.
- Multiply both sides of the statement assumed to be true by  $a + b$ . Add exponents on the left. On the right, distribute  $a$  and  $b$ , respectively.
- Collect like terms on the right. At this point, you should have

$$\begin{aligned} (a + b)^{k+1} &= \binom{k}{0}a^{k+1} + \left[ \binom{k}{0} + \binom{k}{1} \right] a^k b \\ &\quad + \left[ \binom{k}{1} + \binom{k}{2} \right] a^{k-1} b^2 + \left[ \binom{k}{2} + \binom{k}{3} \right] a^{k-2} b^3 \\ &\quad + \cdots + \left[ \binom{k}{k-1} + \binom{k}{k} \right] ab^k + \binom{k}{k} b^{k+1}. \end{aligned}$$

- Use the result of Exercise 84 to add the binomial sums in brackets. For example, because  $\binom{n}{r} + \binom{n}{r+1}$

$$= \binom{n+1}{r+1}, \text{ then } \binom{k}{0} + \binom{k}{1} = \binom{k+1}{1} \text{ and}$$

$$\binom{k}{1} + \binom{k}{2} = \binom{k+1}{2}.$$

- Because  $\binom{k}{0} = \binom{k+1}{0}$  (why?) and  $\binom{k}{k} = \binom{k+1}{k+1}$  (why?), substitute these results and the results from part (e) into the equation in part (d). This should give the statement that we were required to prove in the second step of the mathematical induction process.

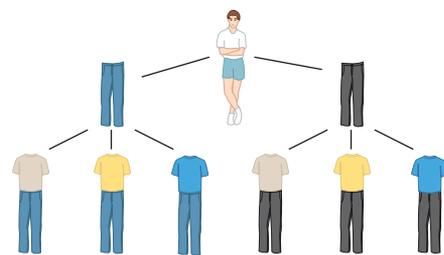

Preview Exercises

Exercises 86–88 will help you prepare for the material covered in the next section.

86. Evaluate  $\frac{n!}{(n-r)!}$  for  $n = 20$  and  $r = 3$ .

87. Evaluate  $\frac{n!}{(n-r)!r!}$  for  $n = 8$  and  $r = 3$ .

88. You can choose from two pairs of jeans (one blue, one black) and three T-shirts (one beige, one yellow, and one blue), as shown in the diagram.

True or false: The diagram shows that you can form  $2 \times 3$ , or 6, different outfits.

## SECTION 10.6

## Counting Principles, Permutations, and Combinations

### Objectives

- 1 Use the Fundamental Counting Principle.
- 2 Use the permutations formula.
- 3 Distinguish between permutation problems and combination problems.
- 4 Use the combinations formula.

- 1 Use the Fundamental Counting Principle.

Have you ever imagined what your life would be like if you won the lottery? What changes would you make? Before you fantasize about becoming a person of leisure with a staff of obedient elves, think about this: The probability of winning top prize in the lottery is about the same as the probability of being struck by lightning. There are millions of possible number combinations in lottery games and only one way of winning the grand prize. Determining the probability of winning involves calculating the chance of getting the winning combination from all possible outcomes. In this section, we begin preparing for the surprising world of probability by looking at methods for counting possible outcomes.

### The Fundamental Counting Principle

It's early morning, you're groggy, and you have to select something to wear for your 8 A.M. class. (What *were* you thinking of when you signed up for a class at that hour?!) Fortunately, your "lecture wardrobe" is rather limited—just two pairs of jeans to choose from (one blue, one black), three T-shirts to choose from (one beige, one yellow, and one blue), and two pairs of sneakers to select from (one black pair, one red pair). Your possible outfits are shown in **Figure 10.9**.

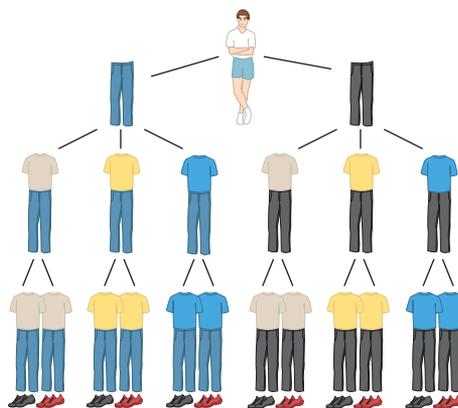

FIGURE 10.9 Selecting a wardrobe

The **tree diagram**, so named because of its branches, shows that you can form 12 outfits from your two pairs of jeans, three T-shirts, and two pairs of sneakers. Notice that the number of outfits can be obtained by multiplying the number of choices for jeans, 2, the number of choices for the T-shirts, 3, and the number of choices for the sneakers, 2:

$$2 \cdot 3 \cdot 2 = 12.$$

We can generalize this idea to any two or more groups of items—not just jeans, T-shirts, and sneakers—with the **Fundamental Counting Principle**:

### The Fundamental Counting Principle

The number of ways in which a series of successive things can occur is found by multiplying the number of ways in which each thing can occur.

For example, if you own 30 pairs of jeans, 20 T-shirts, and 12 pairs of sneakers, you have

$$30 \cdot 20 \cdot 12 = 7200$$

choices for your wardrobe!

### EXAMPLE 1 Options in Planning a Course Schedule

Next semester you are planning to take three courses—math, English, and humanities. Based on time blocks and highly recommended professors, there are 8 sections of math, 5 of English, and 4 of humanities that you find suitable. Assuming no scheduling conflicts, how many different three-course schedules are possible?

#### SOLUTION

This situation involves making choices with three groups of items.

We use the Fundamental Counting Principle to find the number of three-course schedules. Multiply the number of choices for each of the three groups:

$$8 \cdot 5 \cdot 4 = 160.$$

Thus, there are 160 different three-course schedules. ...

The number of possible ways of playing the first four moves on each side in a game of chess is 318,979,564,000.

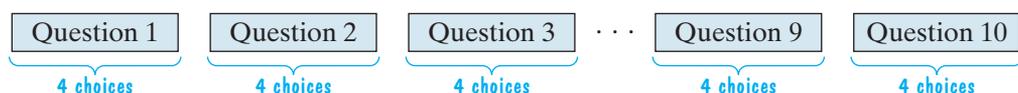

**Check Point 1** A pizza can be ordered with three choices of size (small, medium, or large), four choices of crust (thin, thick, crispy, or regular), and six choices of toppings (ground beef, sausage, pepperoni, bacon, mushrooms, or onions). How many different one-topping pizzas can be ordered?

### EXAMPLE 2 A Multiple-Choice Test

You are taking a multiple-choice test that has ten questions. Each of the questions has four answer choices, with one correct answer per question. If you select one of these four choices for each question and leave nothing blank, in how many ways can you answer the questions?

#### SOLUTION

This situation involves making choices with ten questions.

We use the Fundamental Counting Principle to determine the number of ways that you can answer the questions on the test. Multiply the number of choices, 4, for each of the ten questions.

$$4 \cdot 4 \cdot 4 \cdot 4 \cdot 4 \cdot 4 \cdot 4 \cdot 4 \cdot 4 \cdot 4 = 4^{10} = 1,048,576$$

Thus, you can answer the questions in 1,048,576 different ways. ...

Are you surprised that there are over one million ways of answering a ten-question multiple-choice test? Of course, there is only one way to answer the test and receive a perfect score. The probability of guessing your way into a perfect score involves calculating the chance of getting a perfect score, just one way from all 1,048,576 possible outcomes. In short, prepare for the test and do not rely on guessing!

*Blitzer Bonus*  
**Running Out of Telephone Numbers**

By the year 2020, portable telephones used for business and pleasure will all be videophones. At that time, U.S. population is expected to be 323 million. Faxes, beepers, cellphones, computer phone lines, and business lines may result in certain areas running out of phone numbers. Solution: Add more digits!

With or without extra digits, we expect that the 2020 videophone greeting will still be “hello,” a word created by Thomas Edison in 1877. Phone inventor Alexander Graham Bell preferred “ahoy,” but “hello” won out, appearing in the *Oxford English Dictionary* in 1883.

(Source: *New York Times*)

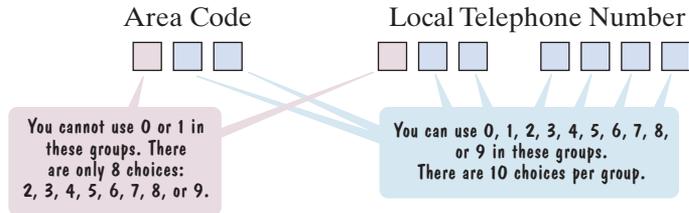

**Check Point 2** You are taking a multiple-choice test that has six questions. Each of the questions has three answer choices, with one correct answer per question. If you select one of these three choices for each question and leave nothing blank, in how many ways can you answer the questions?

**EXAMPLE 3 Telephone Numbers in the United States**

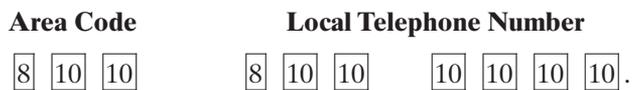

Telephone numbers in the United States begin with three-digit area codes followed by seven-digit local telephone numbers. Area codes and local telephone numbers cannot begin with 0 or 1. How many different telephone numbers are possible?

**SOLUTION**

This situation involves making choices with ten groups of items.

Here are the numbers of choices for each of the ten groups of items:

We use the Fundamental Counting Principle to determine the number of different telephone numbers that are possible. The total number of telephone numbers possible is

$$8 \cdot 10 \cdot 10 \cdot 8 \cdot 10 \cdot 10 \cdot 10 \cdot 10 \cdot 10 \cdot 10 = 6,400,000,000.$$

There are six billion four hundred million different telephone numbers that are possible. ...

**Check Point 3** License plates in a particular state display two letters followed by three numbers, such as AT-887 or BB-013. How many different license plates can be manufactured?

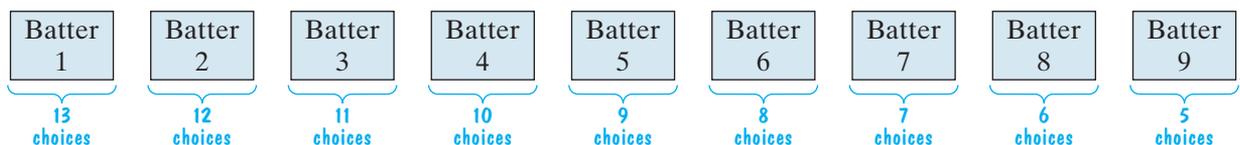

**2** Use the permutations formula.

**Permutations**

You are the coach of a little league baseball team. There are 13 players on the team (and lots of parents hovering in the background, dreaming of stardom for their little “Albert Pujols”). You need to choose a batting order having 9 players. The order

makes a difference, because, for instance, if bases are loaded and “Little Albert” is fourth or fifth at bat, his possible home run will drive in three additional runs. How many batting orders can you form?

You can choose any of 13 players for the first person at bat. Then you will have 12 players from which to choose the second batter, then 11 from which to choose the third batter, and so on. The situation can be shown as follows:

We use the Fundamental Counting Principle to find the number of batting orders. The total number of batting orders is

$$13 \cdot 12 \cdot 11 \cdot 10 \cdot 9 \cdot 8 \cdot 7 \cdot 6 \cdot 5 = 259,459,200.$$

Nearly 260 million batting orders are possible for your 13-player little league team. Each batting order is called a *permutation* of 13 players taken 9 at a time. The number of permutations of 13 players taken 9 at a time is 259,459,200.

A **permutation** is an ordered arrangement of items that occurs when

- No item is used more than once. (Each of the 9 players in the batting order bats exactly once.)
- The order of arrangement makes a difference.

We can obtain a formula for finding the number of permutations of 13 players taken 9 at a time by rewriting our computation:

$$\begin{aligned} 13 \cdot 12 \cdot 11 \cdot 10 \cdot 9 \cdot 8 \cdot 7 \cdot 6 \cdot 5 \\ = \frac{13 \cdot 12 \cdot 11 \cdot 10 \cdot 9 \cdot 8 \cdot 7 \cdot 6 \cdot 5 \cdot \boxed{4 \cdot 3 \cdot 2 \cdot 1}}{\boxed{4 \cdot 3 \cdot 2 \cdot 1}} = \frac{13!}{4!} = \frac{13!}{(13 - 9)!}. \end{aligned}$$

Thus, the number of permutations of 13 things taken 9 at a time is  $\frac{13!}{(13 - 9)!}$ . The special notation  ${}_{13}P_9$  is used to replace the phrase “the number of permutations of 13 things taken 9 at a time.” Using this new notation, we can write

$${}_{13}P_9 = \frac{13!}{(13 - 9)!}.$$

The numerator of this expression is the number of items, 13 team members, expressed as a factorial: 13!. The denominator is also a factorial. It is the factorial of the difference between the number of items, 13, and the number of items in each permutation, 9 batters:  $(13 - 9)!$ .

The notation  ${}_n P_r$  means the **number of permutations of  $n$  things taken  $r$  at a time**. We can generalize from the situation in which 9 batters were taken from 13 players. By generalizing, we obtain the following formula for the number of permutations if  $r$  items are taken from  $n$  items.

### Permutations of $n$ Things Taken $r$ at a Time

The number of possible permutations if  $r$  items are taken from  $n$  items is

$${}_n P_r = \frac{n!}{(n - r)!}.$$

### GREAT QUESTION!

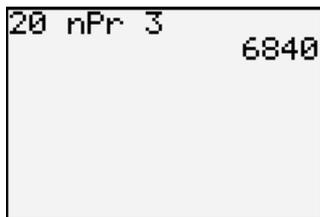

**Do I have to use the formula for  ${}_n P_r$  to solve permutation problems?**

No. Because all permutation problems are also fundamental counting problems, they can be solved using the formula for  ${}_n P_r$  or using the Fundamental Counting Principle.

**TECHNOLOGY**

Graphing utilities have a menu item for calculating permutations, usually labeled  ${}_nP_r$ . For example, to find  ${}_{20}P_3$ , the keystrokes are

$$20 \left[ \frac{nPr}{nPr} \right] 3 \left[ \text{ENTER} \right].$$

If you are using a scientific calculator, check your manual for the location of the menu item for calculating permutations and the required keystrokes.

*Blitzer Bonus*

### How to Pass the Time for $2\frac{1}{2}$ Million Years

If you were to arrange 15 different books on a shelf and it took you one minute for each permutation, the entire task would take 2,487,965 years.

Source: Isaac Asimov's *Book of Facts*.

- 3** Distinguish between permutation problems and combination problems.

**EXAMPLE 4** Using the Formula for Permutations

You and 19 of your friends have decided to form an Internet marketing consulting firm. The group needs to choose three officers—a CEO, an operating manager, and a treasurer. In how many ways can those offices be filled?

**SOLUTION**

Your group is choosing  $r = 3$  officers from a group of  $n = 20$  people (you and 19 friends). The order in which the officers are chosen matters because the CEO, the operating manager, and the treasurer each have different responsibilities. Thus, we are looking for the number of permutations of 20 things taken 3 at a time. We use the formula

$${}_nP_r = \frac{n!}{(n-r)!}$$

with  $n = 20$  and  $r = 3$ .

$${}_{20}P_3 = \frac{20!}{(20-3)!} = \frac{20!}{17!} = \frac{20 \cdot 19 \cdot 18 \cdot 17!}{17!} = \frac{20 \cdot 19 \cdot 18 \cdot \cancel{17!}}{\cancel{17!}} = 20 \cdot 19 \cdot 18 = 6840$$

Thus, there are 6840 different ways of filling the three offices. ●●●

-  **Check Point 4** A corporation has seven members on its board of directors. In how many different ways can it elect a president, vice-president, secretary, and treasurer?

**EXAMPLE 5** Using the Formula for Permutations

You need to arrange seven of your favorite books along a small shelf. How many different ways can you arrange the books, assuming that the order of the books makes a difference to you?

**SOLUTION**

Because you are using all seven of your books in every possible arrangement, you are arranging  $r = 7$  books from a group of  $n = 7$  books. Thus, we are looking for the number of permutations of 7 things taken 7 at a time. We use the formula

$${}_nP_r = \frac{n!}{(n-r)!}$$

with  $n = 7$  and  $r = 7$ .

$${}_7P_7 = \frac{7!}{(7-7)!} = \frac{7!}{0!} = \frac{7!}{1} = 5040$$

Thus, you can arrange the books in 5040 ways. There are 5040 different possible permutations. ●●●

-  **Check Point 5** In how many ways can six books be lined up along a shelf?

**Combinations**

Throughout the history of entertainment, performers have featured choreography in their acts. Singers who are known for their serious moves include Beyoncé, Lady Gaga, Shakira, Justin Timberlake, and Usher.

Imagine that you ask your friends the following question: “Of these five entertainers, which three would you select to be included in a documentary on singers and choreography?” You are not asking your friends to rank their three favorite

artists in any kind of order—they should merely select the three to be included in the documentary.

One friend answers, “Beyoncé, Lady Gaga, and Usher.” Another responds, “Usher, Lady Gaga, and Beyoncé.” These two people have the same artists in their group of selections, even if they are named in a different order. We are interested in which artists are named, not the order in which they are named, for the documentary. Because the items are taken without regard to order, this is not a permutation problem. No ranking of any sort is involved.

Later on, you ask your roommate which three artists she would select for the documentary. She names Justin Timberlake, Beyoncé, and Usher. Her selection is different from those of your two other friends because different entertainers are cited.

Mathematicians describe the group of artists given by your roommate as a *combination*. A **combination** of items occurs when

- The items are selected from the same group (the five entertainers who are known for their choreography).
- No item is used more than once. (You may view Beyoncé as a phenomenal performer, but your three selections cannot be Beyoncé, Beyoncé, and Beyoncé.)
- The order of the items makes no difference. (Beyoncé, Lady Gaga, Usher is the same group in the documentary as Usher, Lady Gaga, Beyoncé.)

Do you see the difference between a permutation and a combination? A permutation is an ordered arrangement of a given group of items. A combination is a group of items taken without regard to their order. **Permutation** problems involve situations in which **order matters**. **Combination** problems involve situations in which the **order** of the items **makes no difference**.

### EXAMPLE 6 Distinguishing between Permutations and Combinations

For each of the following problems, determine whether the problem is one involving permutations or combinations. (It is not necessary to solve the problem.)

- Six students are running for student government president, vice president, and treasurer. The student with the greatest number of votes becomes the president, the second highest vote-getter becomes vice president, and the student who gets the third largest number of votes will be treasurer. How many different outcomes are possible for these three positions?
- Six people are on the board of supervisors for your neighborhood park. A three-person committee is needed to study the possibility of expanding the park. How many different committees could be formed from the six people?
- Baskin-Robbins offers 31 different flavors of ice cream. One of its items is a bowl consisting of three scoops of ice cream, each a different flavor. How many such bowls are possible?

### SOLUTION

- Students are choosing three student government officers from six candidates. The order in which the officers are chosen makes a difference because each of the offices (president, vice president, treasurer) is different. Order matters. This is a problem involving permutations.

- b. A three-person committee is to be formed from the six-person board of supervisors. The order in which the three people are selected does not matter because they are not filling different roles on the committee. Because order makes no difference, this is a problem involving combinations.
- c. A three-scoop bowl of three different flavors is to be formed from Baskin-Robbins's 31 flavors. The order in which the three scoops of ice cream are put into the bowl is irrelevant. A bowl with chocolate, vanilla, and strawberry is exactly the same as a bowl with vanilla, strawberry, and chocolate. Different orderings do not change things, and so this is a problem involving combinations. ●●●

**Check Point 6** For each of the following problems, explain if the problem is one involving permutations or combinations. (It is not necessary to solve the problem.)

- a. How many ways can you select 6 free DVDs from a list of 200 DVDs?
- b. In a race in which there are 50 runners and no ties, in how many ways can the first three finishers come in?

**4** Use the combinations formula.

### A Formula for Combinations

We have seen that the notation  ${}_n P_r$  means the number of permutations of  $n$  things taken  $r$  at a time. Similarly, the notation  ${}_n C_r$  means the number of combinations of  $n$  things taken  $r$  at a time.

We can develop a formula for  ${}_n C_r$  by comparing permutations and combinations. Consider the letters A, B, C, and D. The number of permutations of these four letters taken three at a time is

$${}_4 P_3 = \frac{4!}{(4 - 3)!} = \frac{4!}{1!} = \frac{4 \cdot 3 \cdot 2 \cdot 1}{1} = 24.$$

Here are the 24 permutations:

ABC,	ABD,	ACD,	BCD,
ACB,	ADB,	ADC,	BDC,
BAC,	BAD,	CAD,	CBD,
BCA,	BDA,	CDA,	CDB,
CAB,	DAB,	DAC,	DBC,
CBA,	DBA,	DCA,	DCB.

This column contains only one combination, ABC.

This column contains only one combination, ABD.

This column contains only one combination, ACD.

This column contains only one combination, BCD.

Because the order of items makes no difference in determining combinations, each column of six permutations represents one combination. There is a total of four combinations:

ABC,    ABD,    ACD,    BCD.

Thus,  ${}_4 C_3 = 4$ : The number of combinations of 4 things taken 3 at a time is 4. With 24 permutations and only four combinations, there are 6, or  $3!$ , times as many permutations as there are combinations.

In general, there are  $r!$  times as many permutations of  $n$  things taken  $r$  at a time as there are combinations of  $n$  things taken  $r$  at a time. Thus, we find the number of combinations of  $n$  things taken  $r$  at a time by dividing the number of permutations of  $n$  things taken  $r$  at a time by  $r!$ .

$${}_n C_r = \frac{{}_n P_r}{r!} = \frac{\frac{n!}{(n - r)!}}{r!} = \frac{n!}{(n - r)!r!}$$

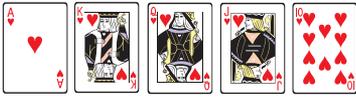

FIGURE 10.10 A royal flush

If you are a card player, it does not get any better than to be dealt the 5-card poker hand shown in **Figure 10.10**. This hand is called a *royal flush*. It consists of an ace, king, queen, jack, and 10, all of the same suit: all hearts, all diamonds, all clubs, or all spades. The probability of being dealt a royal flush involves calculating the number of ways of being dealt such a hand: just 4 of all 2,598,960 possible hands. In the next section, we move from counting possibilities to computing probabilities.

 **Check Point 8** How many different 4-card hands can be dealt from a deck that has 16 different cards?

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- If you can choose one item from a group of  $M$  items and a second item from a group of  $N$  items, then the total number of two-item choices is \_\_\_\_\_.
- The number of ways in which a series of successive things can occur is found by \_\_\_\_\_ the number of ways in which each thing can occur. This is called the \_\_\_\_\_ Principle.
- The number of possible permutations if  $r$  objects are taken from  $n$  items is  ${}_n P_r =$  \_\_\_\_\_.
- The number of possible combinations if  $r$  objects are taken from  $n$  items is  ${}_n C_r =$  \_\_\_\_\_.
- The formula for  ${}_n C_r$  has the same numerator as the formula for  ${}_n P_r$  but contains an extra factor of \_\_\_\_\_ in the denominator.

## EXERCISE SET 10.6

### Practice Exercises

In Exercises 1–8, use the formula for  ${}_n P_r$  to evaluate each expression.

- ${}_9 P_4$
- ${}_7 P_3$
- ${}_8 P_5$
- ${}_{10} P_4$
- ${}_6 P_6$
- ${}_9 P_9$
- ${}_8 P_0$
- ${}_6 P_0$

In Exercises 9–16, use the formula for  ${}_n C_r$  to evaluate each expression.

- ${}_9 C_5$
- ${}_{10} C_6$
- ${}_{11} C_4$
- ${}_{12} C_5$
- ${}_7 C_7$
- ${}_4 C_4$
- ${}_5 C_0$
- ${}_6 C_0$

In Exercises 17–20, does the problem involve permutations or combinations? Explain your answer. (It is not necessary to solve the problem.)

- A medical researcher needs 6 people to test the effectiveness of an experimental drug. If 13 people have volunteered for the test, in how many ways can 6 people be selected?
- Fifty people purchase raffle tickets. Three winning tickets are selected at random. If first prize is \$1000, second prize is \$500, and third prize is \$100, in how many different ways can the prizes be awarded?
- How many different four-letter passwords can be formed from the letters A, B, C, D, E, F, and G if no repetition of letters is allowed?
- Fifty people purchase raffle tickets. Three winning tickets are selected at random. If each prize is \$500, in how many different ways can the prizes be awarded?

### Practice Plus

In Exercises 21–28, evaluate each expression.

- $\frac{{}_7 P_3}{3!} - {}_7 C_3$
- $\frac{{}_{20} P_2}{2!} - {}_{20} C_2$
- $1 - \frac{{}_3 P_2}{{}_4 P_3}$
- $1 - \frac{{}_5 P_3}{{}_{10} P_4}$
- $\frac{{}_7 C_3}{{}_5 C_4} - \frac{98!}{96!}$
- $\frac{{}_{10} C_3}{{}_6 C_4} - \frac{46!}{44!}$
- $\frac{{}_4 C_2 \cdot {}_6 C_1}{{}_{18} C_3}$
- $\frac{{}_5 C_1 \cdot {}_7 C_2}{{}_{12} C_3}$

### Application Exercises

Use the Fundamental Counting Principle to solve Exercises 29–40.

- The model of the car you are thinking of buying is available in nine different colors and three different styles (hatchback, sedan, or station wagon). In how many ways can you order the car?
- A popular brand of pen is available in three colors (red, green, or blue) and four writing tips (bold, medium, fine, or micro). How many different choices of pens do you have with this brand?
- An ice cream store sells two drinks (sodas or milk shakes), in four sizes (small, medium, large, or jumbo), and five flavors (vanilla, strawberry, chocolate, coffee, or pistachio). In how many ways can a customer order a drink?

32. A restaurant offers the following lunch menu.

Main Course	Vegetables	Beverages	Desserts
Ham	Potatoes	Coffee	Cake
Chicken	Peas	Tea	Pie
Fish	Green beans	Milk	Ice cream
Beef		Soda	

If one item is selected from each of the four groups, in how many ways can a meal be ordered? Describe two such orders.

33. You are taking a multiple-choice test that has five questions. Each of the questions has three answer choices, with one correct answer per question. If you select one of these three choices for each question and leave nothing blank, in how many ways can you answer the questions?
34. You are taking a multiple-choice test that has eight questions. Each of the questions has three answer choices, with one correct answer per question. If you select one of these three choices for each question and leave nothing blank, in how many ways can you answer the questions?
35. In the original plan for area codes in 1945, the first digit could be any number from 2 through 9, the second digit was either 0 or 1, and the third digit could be any number except 0. With this plan, how many different area codes were possible?
36. How many different four-letter radio station call letters can be formed if the first letter must be W or K?
37. Six performers are to present their comedy acts on a weekend evening at a comedy club. One of the performers insists on being the last stand-up comic of the evening. If this performer's request is granted, how many different ways are there to schedule the appearances?
38. Five singers are to perform at a night club. One of the singers insists on being the last performer of the evening. If this singer's request is granted, how many different ways are there to schedule the appearances?
39. In the *Cambridge Encyclopedia of Language* (Cambridge University Press, 1987), author David Crystal presents five sentences that make a reasonable paragraph regardless of their order. The sentences are as follows:
- Mark had told him about the foxes.
  - John looked out the window.
  - Could it be a fox?
  - However, nobody had seen one for months.
  - He thought he saw a shape in the bushes.

How many different five-sentence paragraphs can be formed if the paragraph begins with "He thought he saw a shape in the bushes" and ends with "John looked out of the window"?

40. A television programmer is arranging the order that five movies will be seen between the hours of 6 P.M. and 4 A.M. Two of the movies have a G rating and they are to be shown in the first two time blocks. One of the movies is rated NC-17 and it is to be shown in the last of the time blocks, from 2 A.M. until 4 A.M. Given these restrictions, in how many ways can the five movies be arranged during the indicated time blocks?

Use the formula for  ${}_nP_r$  to solve Exercises 41–48.

41. A club with ten members is to choose three officers—president, vice president, and secretary-treasurer. If each office is to be held by one person and no person can hold more than one office, in how many ways can those offices be filled?
42. A corporation has ten members on its board of directors. In how many different ways can it elect a president, vice president, secretary, and treasurer?
43. For a segment of a radio show, a disc jockey can play 7 songs. If there are 13 songs to select from, in how many ways can the program for this segment be arranged?
44. Suppose you are asked to list, in order of preference, the three best movies you have seen this year. If you saw 20 movies during the year, in how many ways can the three best be chosen and ranked?
45. In a race in which six automobiles are entered and there are no ties, in how many ways can the first three finishers come in?
46. In a production of *West Side Story*, eight actors are considered for the male roles of Tony, Riff, and Bernardo. In how many ways can the director cast the male roles?
47. Nine bands have volunteered to perform at a benefit concert, but there is only enough time for five of the bands to play. How many lineups are possible?
48. How many arrangements can be made using four of the letters of the word COMBINE if no letter is to be used more than once?

Use the formula for  ${}_nC_r$  to solve Exercises 49–56.

49. An election ballot asks voters to select three city commissioners from a group of six candidates. In how many ways can this be done?
50. A four-person committee is to be elected from an organization's membership of 11 people. How many different committees are possible?
51. Of 12 possible books, you plan to take 4 with you on vacation. How many different collections of 4 books can you take?
52. There are 14 standbys who hope to get seats on a flight, but only 6 seats are available on the plane. How many different ways can the 6 people be selected?
53. You volunteer to help drive children at a charity event to the zoo, but you can fit only 8 of the 17 children present in your van. How many different groups of 8 children can you drive?
54. Of the 100 people in the U.S. Senate, 18 serve on the Foreign Relations Committee. How many ways are there to select Senate members for this committee (assuming party affiliation is not a factor in selection)?
55. To win at LOTTO in the state of Florida, one must correctly select 6 numbers from a collection of 53 numbers (1 through 53). The order in which the selection is made does not matter. How many different selections are possible?
56. To win in the New York State lottery, one must correctly select 6 numbers from 59 numbers. The order in which the selection is made does not matter. How many different selections are possible?

In Exercises 57–66, solve by the method of your choice.

57. In a race in which six automobiles are entered and there are no ties, in how many ways can the first four finishers come in?
58. A book club offers a choice of 8 books from a list of 40. In how many ways can a member make a selection?
59. A medical researcher needs 6 people to test the effectiveness of an experimental drug. If 13 people have volunteered for the test, in how many ways can 6 people be selected?
60. Fifty people purchase raffle tickets. Three winning tickets are selected at random. If first prize is \$1000, second prize is \$500, and third prize is \$100, in how many different ways can the prizes be awarded?
61. From a club of 20 people, in how many ways can a group of three members be selected to attend a conference?
62. Fifty people purchase raffle tickets. Three winning tickets are selected at random. If each prize is \$500, in how many different ways can the prizes be awarded?
63. How many different four-letter passwords can be formed from the letters A, B, C, D, E, F, and G if no repetition of letters is allowed?
64. Nine comedy acts will perform over two evenings. Five of the acts will perform on the first evening and the order in which the acts perform is important. How many ways can the schedule for the first evening be made?
65. Using 15 flavors of ice cream, how many cones with three different flavors can you create if it is important to you which flavor goes on the top, middle, and bottom?
66. Baskin-Robbins offers 31 different flavors of ice cream. One of its items is a bowl consisting of three scoops of ice cream, each a different flavor. How many such bowls are possible?

Exercises 67–72 are based on the following jokes about books:

- “Outside of a dog, a book is man’s best friend. Inside of a dog, it’s too dark to read.”—Groucho Marx
  - “I recently bought a book of free verse. For \$12.”  
—George Carlin
  - “If a word in the dictionary was misspelled, how would we know?”—Steven Wright
  - “Encyclopedia is a Latin term. It means ‘to paraphrase a term paper.’ ”—Greg Ray
  - “A bookstore is one of the only pieces of evidence we have that people are still thinking.”—Jerry Seinfeld
  - “I honestly believe there is absolutely nothing like going to bed with a good book. Or a friend who’s read one.”  
—Phyllis Diller
67. In how many ways can these six jokes be ranked from best to worst?
  68. If Phyllis Diller’s joke about books is excluded, in how many ways can the remaining five jokes be ranked from best to worst?
  69. In how many ways can people select their three favorite jokes from these comments about books?
  70. In how many ways can people select their two favorite jokes from these comments about books?

71. If the order in which these jokes are told makes a difference in terms of how they are received, how many ways can they be delivered if George Carlin’s joke is delivered first and Jerry Seinfeld’s joke is told last?
72. If the order in which these jokes are told makes a difference in terms of how they are received, how many ways can they be delivered if a joke by a man is told first?

### Writing in Mathematics

73. Explain the Fundamental Counting Principle.
74. Write an original problem that can be solved using the Fundamental Counting Principle. Then solve the problem.
75. What is a permutation?
76. Describe what  ${}_n P_r$  represents.
77. Write a word problem that can be solved by evaluating  ${}_7 P_3$ .
78. What is a combination?
79. Explain how to distinguish between permutation and combination problems.
80. Write a word problem that can be solved by evaluating  ${}_7 C_3$ .

### Technology Exercises

81. Use a graphing utility with an  $\boxed{{}_n P_r}$  menu item to verify your answers in Exercises 1–8.
82. Use a graphing utility with an  $\boxed{{}_n C_r}$  menu item to verify your answers in Exercises 9–16.

### Critical Thinking Exercises

**Make Sense?** In Exercises 83–86, determine whether each statement makes sense or does not make sense, and explain your reasoning.

83. I used the Fundamental Counting Principle to determine the number of five-digit ZIP codes that are available to the U.S. Postal Service.
84. I used the permutations formula to determine the number of ways the manager of a baseball team can form a 9-player batting order from a team of 25 players.
85. I used the combinations formula to determine how many different four-note sound sequences can be created from the notes C, D, E, F, G, A, and B.
86. I used the permutations formula to determine the number of ways people can select their 9 favorite baseball players from a team of 25 players.

In Exercises 87–90, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

87. The number of ways to choose four questions out of ten questions on an essay test is  ${}_{10} P_4$ .
88. If  $r > 1$ ,  ${}_n P_r$  is less than  ${}_n C_r$ .
89.  ${}_7 P_3 = 3! \cdot {}_7 C_3$
90. The number of ways to pick a winner and first runner-up in a talent contest with 20 contestants is  ${}_{20} C_2$ .
91. Five men and five women line up at a checkout counter in a store. In how many ways can they line up if the first person in line is a woman and the people in line alternate woman, man, woman, man, and so on?
92. How many four-digit odd numbers less than 6000 can be formed using the digits 2, 4, 6, 7, 8, and 9?

93. A mathematics exam consists of 10 multiple-choice questions and 5 open-ended problems in which all work must be shown. If an examinee must answer 8 of the multiple-choice questions and 3 of the open-ended problems, in how many ways can the questions and problems be chosen?

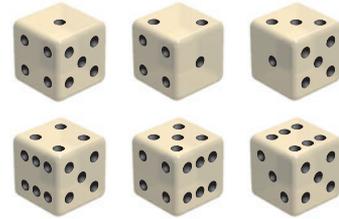

### Group Exercise

94. The group should select real-world situations where the Fundamental Counting Principle can be applied. These could involve the number of possible student ID numbers on your campus, the number of possible phone numbers in your community, the number of meal options at a local restaurant, the number of ways a person in the group can select outfits for class, the number of ways a condominium can be purchased in a nearby community, and so on. Once situations have been selected, group members should determine in how many ways each part of the task can be done. Group members will need to obtain menus, find out about telephone-digit requirements in the community, count shirts, pants, shoes in closets, visit condominium sales offices, and so on. Once the group reassembles, apply the Fundamental Counting Principle to determine the number of available options in each situation. Because these numbers may be quite large, use a calculator.

### Preview Exercises

Exercises 95–97 will help you prepare for the material covered in the next section.

The figure shows that when a die is rolled, there are six equally likely outcomes: 1, 2, 3, 4, 5, or 6. Use this information to solve each exercise.

95. What fraction of the outcomes is less than 5?  
 96. What fraction of the outcomes is not less than 5?  
 97. What fraction of the outcomes is even or greater than 3?

## SECTION 10.7

## Probability

### Objectives

- 1 Compute empirical probability.
- 2 Compute theoretical probability.
- 3 Find the probability that an event will not occur.
- 4 Find the probability of one event or a second event occurring.
- 5 Find the probability of one event and a second event occurring.

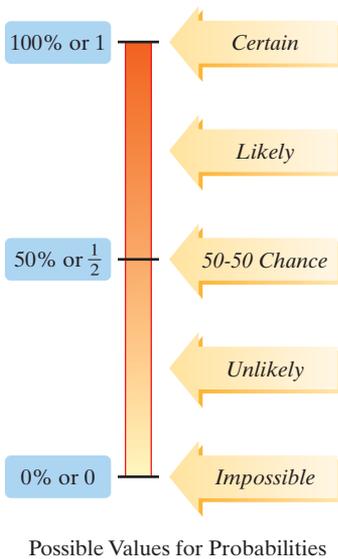

How many hours of sleep do you typically get each night? **Table 10.3** indicates that 75 million out of 300 million Americans are getting six hours of sleep on a typical night. The *probability* of an American getting six hours of sleep on a typical night is  $\frac{75}{300}$ . This fraction can be reduced to  $\frac{1}{4}$ , or expressed as 0.25, or 25%. Thus, 25% of Americans get six hours of sleep each night.

We find a probability by dividing one number by another. Probabilities are assigned to an *event*, such as getting six hours of sleep on a typical night. Events that are certain to occur are assigned probabilities of 1, or 100%. For example, the probability that a given individual will eventually die is 1. Although Woody Allen whined, “I don’t want to achieve immortality through my work. I want to achieve it through not dying,” death (and taxes) are always certain. By contrast, if an event cannot occur, its probability is 0. Regrettably, the probability that Elvis will return and serenade us with one final reprise of “Don’t Be Cruel” (and we hope we’re not) is 0.

**Table 10.3** The Hours of Sleep Americans Get on a Typical Night

Hours of Sleep	Number of Americans, in millions
4 or less	12
5	27
6	75
7	90
8	81
9	9
10 or more	6
	Total: 300

Source: Discovery Health Media

Probabilities of events are expressed as numbers ranging from 0 to 1, or 0% to 100%. The closer the probability of a given event is to 1, the more likely it is that the event will occur. The closer the probability of a given event is to 0, the less likely it is that the event will occur.

### Empirical Probability

Empirical probability applies to situations in which we observe how frequently an event occurs. We use the following formula to compute the empirical probability of an event:

#### Computing Empirical Probability

The **empirical probability** of event  $E$ , denoted by  $P(E)$ , is

$$P(E) = \frac{\text{observed number of times } E \text{ occurs}}{\text{total number of observed occurrences}}$$

- 1 Compute empirical probability.

### EXAMPLE 1 Empirical Probabilities with Real-World Data

When women turn 40, their gynecologists typically remind them that it is time to undergo mammography screening for breast cancer. The data in **Table 10.4** are based on 100,000 U.S. women, ages 40 to 50, who participated in mammography screening.

**Table 10.4** Mammography Screening on 100,000 U.S. Women, Ages 40 to 50

	Breast Cancer	No Breast Cancer
Positive Mammogram	720	6944
Negative Mammogram	80	92,256

$720 + 80 = 800$   
 women have breast cancer.

$6944 + 92,256 = 99,200$   
 women do not have breast cancer.

$720 + 6944 = 7664$   
 women have positive mammograms.

$80 + 92,256 = 92,336$   
 women have negative mammograms.

Source: Gerd Gigerenzer, *Calculated Risks*, Simon and Schuster, 2002

- Use **Table 10.4** to find the probability that a woman aged 40 to 50 has breast cancer.
- Among women without breast cancer, find the probability of a positive mammogram.
- Among women with positive mammograms, find the probability of not having breast cancer.

### SOLUTION

- We begin with the probability that a woman aged 40 to 50 has breast cancer. The probability of having breast cancer is the number of women with breast cancer divided by the total number of women.

$$\begin{aligned}
 P(\text{breast cancer}) &= \frac{\text{number of women with breast cancer}}{\text{total number of women}} \\
 &= \frac{800}{100,000} = \frac{1}{125} = 0.008
 \end{aligned}$$

The empirical probability that a woman aged 40 to 50 has breast cancer is  $\frac{1}{125}$ , or 0.008.

- b. Now, we find the probability of a positive mammogram among women without breast cancer. Thus, we restrict the data to women without breast cancer:

	No Breast Cancer
Positive Mammogram	6944
Negative Mammogram	92,256

Within the restricted data, the probability of a positive mammogram is the number of women with positive mammograms divided by the total number of women.

$$\begin{aligned}
 P(\text{positive mammogram}) &= \frac{\text{number of women with positive mammograms}}{\text{total number of women in the restricted data}} \\
 &= \frac{6944}{6944 + 92,256} = \frac{6944}{99,200} = 0.07
 \end{aligned}$$

This is the total number of women without breast cancer.

Among women without breast cancer, the empirical probability of a positive mammogram is  $\frac{6944}{99,200}$ , or 0.07.

- c. Now, we find the probability of not having breast cancer among women with positive mammograms. Thus, we restrict the data to women with positive mammograms:

	Breast Cancer	No Breast Cancer
Positive Mammogram	720	6944

Within the restricted data, the probability of not having breast cancer is the number of women with no breast cancer divided by the total number of women.

$$\begin{aligned}
 P(\text{no breast cancer}) &= \frac{\text{number of women with no breast cancer}}{\text{total number of women in the restricted data}} \\
 &= \frac{6944}{720 + 6944} = \frac{6944}{7664} \approx 0.906
 \end{aligned}$$

This is the total number of women with positive mammograms.

Among women with positive mammograms, the probability of not having breast cancer is  $\frac{6944}{7664}$ , or approximately 0.906. ...

 **Check Point 1** Use the data in **Table 10.4** to solve this exercise. Express probabilities as fractions and as decimals rounded to three decimal places.

- Find the probability that a woman aged 40 to 50 has a positive mammogram.
- Among women with breast cancer, find the probability of a positive mammogram.
- Among women with positive mammograms, find the probability of having breast cancer.

2 Compute theoretical probability.

**Theoretical Probability**

You toss a coin. Although it is equally likely to land either heads up, denoted by  $H$ , or tails up, denoted by  $T$ , the actual outcome is uncertain. Any occurrence for which the outcome is uncertain is called an **experiment**. Thus, tossing a coin is an example of an experiment. The set of all possible outcomes of an experiment is the **sample space** of the experiment, denoted by  $S$ . The sample space for the coin-tossing experiment is

$$S = \{H, T\}.$$

Lands heads up

Lands tails up

We can define an event more formally using these concepts. An **event**, denoted by  $E$ , is any subcollection, or subset, of a sample space. For example, the subset  $E = \{T\}$  is the event of landing tails up when a coin is tossed.

Theoretical probability applies to situations like this, in which the sample space only contains equally likely outcomes, all of which are known. To calculate the theoretical probability of an event, we divide the number of outcomes resulting in the event by the number of outcomes in the sample space.

**Computing Theoretical Probability**

If an event  $E$  has  $n(E)$  equally likely outcomes and its sample space  $S$  has  $n(S)$  equally likely outcomes, the **theoretical probability** of event  $E$ , denoted by  $P(E)$ , is

$$P(E) = \frac{\text{number of outcomes in event } E}{\text{number of outcomes in sample space } S} = \frac{n(E)}{n(S)}.$$

The sum of the theoretical probabilities of all possible outcomes in the sample space is 1.

How can we use this formula to compute the probability of a coin landing tails up? We use the following sets:

$$E = \{T\} \qquad S = \{H, T\}.$$

This is the event of landing tails up.

This is the sample space with all equally likely outcomes.

The probability of a coin landing tails up is

$$P(E) = \frac{\text{number of outcomes that result in tails up}}{\text{total number of possible outcomes}} = \frac{n(E)}{n(S)} = \frac{1}{2}.$$

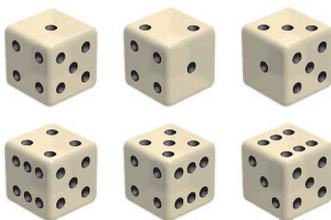

FIGURE 10.11 Outcomes when a die is rolled

Theoretical probability applies to many games of chance, including rolling dice, lotteries, card games, and roulette. The next example deals with the experiment of rolling a die. **Figure 10.11** illustrates that when a die is rolled, there are six equally likely outcomes. The sample space can be shown as

$$S = \{1, 2, 3, 4, 5, 6\}.$$

**EXAMPLE 2** Computing Theoretical Probability

A die is rolled. Find the probability of getting a number less than 5.

**SOLUTION**

The sample space of equally likely outcomes is  $S = \{1, 2, 3, 4, 5, 6\}$ . There are six outcomes in the sample space, so  $n(S) = 6$ .

We are interested in the probability of getting a number less than 5. The event of getting a number less than 5 can be represented by

$$E = \{1, 2, 3, 4\}.$$

There are four outcomes in this event, so  $n(E) = 4$ .

The probability of rolling a number less than 5 is

$$P(E) = \frac{n(E)}{n(S)} = \frac{4}{6} = \frac{2}{3}.$$

**Check Point 2** A die is rolled. Find the probability of getting a number greater than 4.

**EXAMPLE 3** Computing Theoretical Probability

Two ordinary six-sided dice are rolled. What is the probability of getting a sum of 8?

**SOLUTION**

Each die has six equally likely outcomes. By the Fundamental Counting Principle, there are  $6 \cdot 6$ , or 36, equally likely outcomes in the sample space. That is,  $n(S) = 36$ . The 36 outcomes are shown below as ordered pairs. The five ways of rolling a sum of 8 appear in the green highlighted diagonal.

		Second Die					
		1	2	3	4	5	6
First Die	1	(1, 1)	(1, 2)	(1, 3)	(1, 4)	(1, 5)	(1, 6)
	2	(2, 1)	(2, 2)	(2, 3)	(2, 4)	(2, 5)	(2, 6)
	3	(3, 1)	(3, 2)	(3, 3)	(3, 4)	(3, 5)	(3, 6)
	4	(4, 1)	(4, 2)	(4, 3)	(4, 4)	(4, 5)	(4, 6)
	5	(5, 1)	(5, 2)	(5, 3)	(5, 4)	(5, 5)	(5, 6)
	6	(6, 1)	(6, 2)	(6, 3)	(6, 4)	(6, 5)	(6, 6)

$$S = \{(1, 1), (1, 2), (1, 3), (1, 4), (1, 5), (1, 6), (2, 1), (2, 2), (2, 3), (2, 4), (2, 5), (2, 6), (3, 1), (3, 2), (3, 3), (3, 4), (3, 5), (3, 6), (4, 1), (4, 2), (4, 3), (4, 4), (4, 5), (4, 6), (5, 1), (5, 2), (5, 3), (5, 4), (5, 5), (5, 6), (6, 1), (6, 2), (6, 3), (6, 4), (6, 5), (6, 6)\}$$

The phrase “getting a sum of 8” describes the event

$$E = \{(6, 2), (5, 3), (4, 4), (3, 5), (2, 6)\}.$$

This event has 5 outcomes, so  $n(E) = 5$ . Thus, the probability of getting a sum of 8 is

$$P(E) = \frac{n(E)}{n(S)} = \frac{5}{36}.$$

**Check Point 3** What is the probability of getting a sum of 5 when two six-sided dice are rolled?

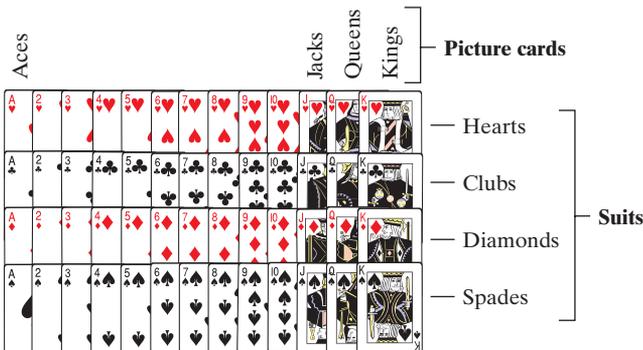

FIGURE 10.12 A standard 52-card bridge deck

**Computing Theoretical Probability without Listing an Event and the Sample Space**

In some situations, we can compute theoretical probability without having to write out each event and each sample space. For example, suppose you are dealt one card from a standard 52-card deck, illustrated in **Figure 10.12**. The deck has four suits: Hearts and diamonds are red, and clubs and spades are black. Each suit has 13 different face values—A(ace), 2, 3, 4, 5, 6, 7, 8, 9, 10, J(jack), Q(queen), and K(king). Jacks, queens, and kings are called **picture cards** or **face cards**.

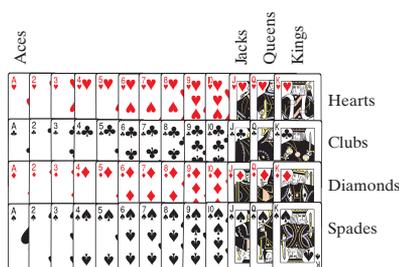

FIGURE 10.12 A standard 52-card bridge deck (repeated)

### EXAMPLE 4 Probability and a Deck of 52 Cards

You are dealt one card from a standard 52-card deck. Find the probability of being dealt a heart.

#### SOLUTION

Let  $E$  be the event of being dealt a heart. Because there are 13 hearts in the deck, the event of being dealt a heart can occur in 13 ways. The number of outcomes in event  $E$  is 13:  $n(E) = 13$ . With 52 cards in the deck, the total number of possible ways of being dealt a single card is 52. The number of outcomes in the sample space is 52:  $n(S) = 52$ . The probability of being dealt a heart is

$$P(E) = \frac{n(E)}{n(S)} = \frac{13}{52} = \frac{1}{4}. \quad \dots$$

 **Check Point 4** If you are dealt one card from a standard 52-card deck, find the probability of being dealt a king.

If your state has a lottery drawing each week, the probability that someone will win the top prize is relatively high. If there is no winner this week, it is virtually certain that eventually someone will be graced with millions of dollars. So, why are you so unlucky compared to this undisclosed someone? In Example 5, we provide an answer to this question, using the counting principles discussed in Section 8.6.

### EXAMPLE 5 Probability and Combinations: Winning the Lottery

Florida's lottery game, LOTTO, is set up so that each player chooses six different numbers from 1 to 53. If the six numbers chosen match the six numbers drawn randomly, the player wins (or shares) the top cash prize. (As of this writing, the top cash prize has ranged from \$7 million to \$106.5 million.) With one LOTTO ticket, what is the probability of winning this prize?

#### SOLUTION

Because the order of the six numbers does not matter, this is a situation involving combinations. Let  $E$  be the event of winning the lottery with one ticket. With one LOTTO ticket, there is only one way of winning. Thus,  $n(E) = 1$ . The sample space is the set of all possible six-number combinations. We can use the combinations formula

$${}_n C_r = \frac{n!}{(n-r)!r!}$$

to find the total number of possible combinations. We are selecting  $r = 6$  numbers from a collection of  $n = 53$  numbers.

$${}_{53} C_6 = \frac{53!}{(53-6)!6!} = \frac{53!}{47!6!} = \frac{53 \cdot 52 \cdot 51 \cdot 50 \cdot 49 \cdot 48 \cdot \cancel{47!}}{\cancel{47!} \cdot 6 \cdot 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1} = 22,957,480$$

*Blitzer Bonus***Comparing the Probability of Dying to the Probability of Winning Florida's LOTTO**

As a healthy nonsmoking 30-year-old, your probability of dying this year is approximately 0.001. Divide this probability by the probability of winning LOTTO with one ticket:

$$\frac{0.001}{0.0000000436} \approx 22,936.$$

A healthy 30-year-old is nearly 23,000 times more likely to die this year than to win Florida's lottery.

There are nearly 23 million number combinations possible in LOTTO. If a person buys one LOTTO ticket, the probability of winning is

$$P(E) = \frac{n(E)}{n(S)} = \frac{1}{22,957,480} \approx 0.0000000436.$$

The probability of winning the top prize with one LOTTO ticket is  $\frac{1}{22,957,480}$ , or about 1 in 23 million. ●●●

Suppose that a person buys 5000 different tickets in Florida's LOTTO. Because that person has selected 5000 different combinations of the six numbers, the probability of winning is

$$\frac{5000}{22,957,480} \approx 0.000218.$$

The chances of winning top prize are about 218 in a million. At \$1 per LOTTO ticket, it is highly probable that our LOTTO player will be \$5000 poorer. Knowing a little probability helps a lotto.

 **Check Point 5** People lose interest when they do not win at games of chance, including Florida's LOTTO. With drawings twice weekly instead of once, the game described in Example 5 was brought in to bring back lost players and increase ticket sales. The original LOTTO was set up so that each player chose six different numbers from 1 to 49, rather than from 1 to 53, with a lottery drawing only once a week. With one LOTTO ticket, what was the probability of winning the top cash prize in Florida's original LOTTO? Express the answer as a fraction and as a decimal correct to ten places.

- 3** Find the probability that an event will not occur.

**Probability of an Event Not Occurring**

If we know  $P(E)$ , the probability of an event  $E$ , we can determine the probability that the event will not occur, denoted by  $P(\text{not } E)$ . Because the sum of the probabilities of all possible outcomes in any situation is 1,

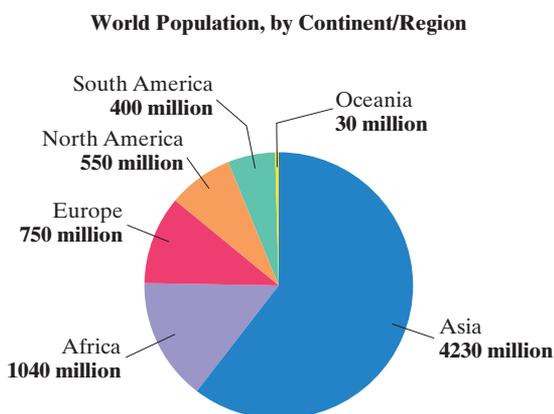

$$P(E) + P(\text{not } E) = 1.$$

We now solve this equation for  $P(\text{not } E)$ , the probability that event  $E$  will not occur, by subtracting  $P(E)$  from both sides. The resulting formula is given in the following box.

**The Probability of an Event Not Occurring**

The probability that an event  $E$  will not occur is equal to 1 minus the probability that it will occur.

$$P(\text{not } E) = 1 - P(E)$$

**FIGURE 10.13**  
Source: U.S. Census Bureau

### EXAMPLE 6 The Probability of an Event Not Occurring

The circle graph in **Figure 10.13** shows the distribution, by continent, of the world's 7 billion, or 7000 million, people. If one person is randomly selected, find the probability that the person does not live in Asia. Express the probability as a simplified fraction and as a decimal rounded to the nearest thousandth.

#### SOLUTION

We use the probability that the selected person *does* live in Asia to find the probability that the selected person does not live in this region.

$P$  (does not live in Asia)

$$\begin{aligned}
 &= 1 - P(\text{lives in Asia}) \\
 &= 1 - \frac{4230}{7000} \\
 &= \frac{7000}{7000} - \frac{4230}{7000} = \frac{2770}{7000} = \frac{277}{700} \approx 0.396
 \end{aligned}$$

The graph shows 4230 million people living in Asia.

World population, 7000 million, was given, but can be obtained by adding the numbers in the six sectors.

The probability that a randomly selected person does not live in Asia is  $\frac{277}{700}$ , or approximately 0.396. ●●●

**Check Point 6** If one person is randomly selected from the world population represented in **Figure 10.13**, find the probability that the person does not live in North America. Express the probability as a simplified fraction and as a decimal rounded to the nearest thousandth.

- 4 Find the probability of one event or a second event occurring.

### Or Probabilities with Mutually Exclusive Events

Suppose that you randomly select one card from a deck of 52 cards. Let  $A$  be the event of selecting a king and let  $B$  be the event of selecting a queen. Only one card is selected, so it is impossible to get both a king and a queen. The events of selecting a king and a queen cannot occur simultaneously. They are called *mutually exclusive events*. If it is impossible for any two events,  $A$  and  $B$ , to occur simultaneously, they are said to be **mutually exclusive**. If  $A$  and  $B$  are mutually exclusive events, the probability that either  $A$  or  $B$  will occur is determined by adding their individual probabilities.

#### Or Probabilities with Mutually Exclusive Events

If  $A$  and  $B$  are mutually exclusive events, then

$$P(A \text{ or } B) = P(A) + P(B).$$

Using set notation,  $P(A \cup B) = P(A) + P(B)$ .

**EXAMPLE 7** The Probability of Either of Two Mutually Exclusive Events Occurring

If one card is randomly selected from a deck of cards, what is the probability of selecting a king or a queen?

**SOLUTION**

We find the probability that either of these mutually exclusive events will occur by adding their individual probabilities.

$$P(\text{king or queen}) = P(\text{king}) + P(\text{queen}) = \frac{4}{52} + \frac{4}{52} = \frac{8}{52} = \frac{2}{13}$$

The probability of selecting a king or a queen is  $\frac{2}{13}$ . ...

**Check Point 7** If you roll a single, six-sided die, what is the probability of getting either a 4 or a 5?

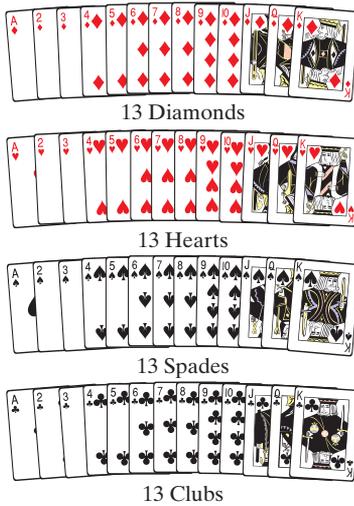

FIGURE 10.14 A deck of 52 cards

**Or Probabilities with Events That Are Not Mutually Exclusive**

Consider the deck of 52 cards shown in **Figure 10.14**. Suppose that these cards are shuffled and you randomly select one card from the deck. What is the probability of selecting a diamond or a picture card (jack, queen, king)? Begin by adding their individual probabilities.

$$P(\text{diamond}) + P(\text{picture card}) = \frac{13}{52} + \frac{12}{52}$$

There are 13 diamonds in the deck of 52 cards.

There are 12 picture cards in the deck of 52 cards.

However, this sum is not the probability of selecting a diamond or a picture card. The problem is that there are three cards that are *simultaneously* diamonds and picture cards, shown in **Figure 10.15**. The events of selecting a diamond and selecting a picture card are not mutually exclusive. It is possible to select a card that is both a diamond and a picture card.

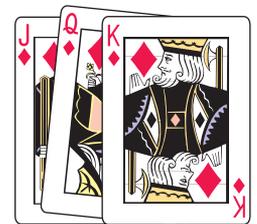

FIGURE 10.15 Three diamonds are picture cards.

The situation is illustrated in the diagram in **Figure 10.16**. Why can't we find the probability of selecting a diamond or a picture card by adding their individual probabilities? The diagram shows that three of the cards, the three diamonds that are picture cards, get counted twice when we add the individual probabilities. First the three cards get counted as diamonds and then they get counted as picture cards. In order to avoid the error of counting the three cards twice, we need to subtract the probability of getting a diamond and a picture card,  $\frac{3}{52}$ , as follows:

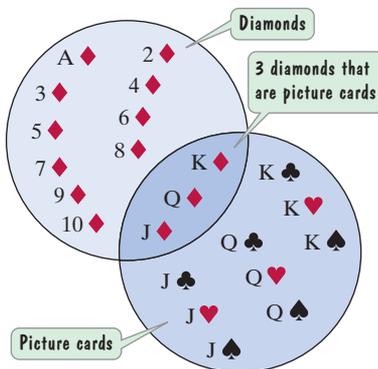

FIGURE 10.16

$$\begin{aligned} P(\text{diamond or picture card}) &= P(\text{diamond}) + P(\text{picture card}) - P(\text{diamond and picture card}) \\ &= \frac{13}{52} + \frac{12}{52} - \frac{3}{52} = \frac{13 + 12 - 3}{52} = \frac{22}{52} = \frac{11}{26} \end{aligned}$$

Thus, the probability of selecting a diamond or a picture card is  $\frac{11}{26}$ .

In general, if  $A$  and  $B$  are events that are not mutually exclusive, the probability that  $A$  or  $B$  will occur is determined by adding their individual probabilities and then subtracting the probability that  $A$  and  $B$  occur simultaneously.

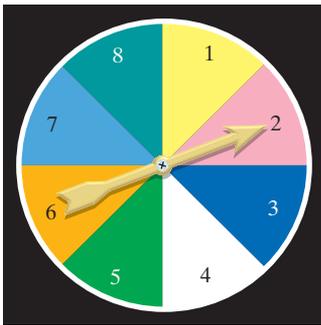

**Or Probabilities with Events That Are Not Mutually Exclusive**

If  $A$  and  $B$  are not mutually exclusive events, then

$$P(A \text{ or } B) = P(A) + P(B) - P(A \text{ and } B).$$

Using set notation,

$$P(A \cup B) = P(A) + P(B) - P(A \cap B).$$

**FIGURE 10.17** It is equally probable that the pointer will land on any one of the eight regions.

**EXAMPLE 8** An Or Probability with Events That Are Not Mutually Exclusive

**Figure 10.17** illustrates a spinner. It is equally probable that the pointer will land on any one of the eight regions, numbered 1 through 8. If the pointer lands on a borderline, spin again. Find the probability that the pointer will stop on an even number or a number greater than 5.

**SOLUTION**

It is possible for the pointer to land on a number that is both even and greater than 5. Two of the numbers, 6 and 8, are even and greater than 5. These events are not mutually exclusive. The probability of landing on a number that is even or greater than 5 is calculated as follows:

$$\begin{aligned}
 P\left(\begin{array}{l} \text{even or} \\ \text{greater than 5} \end{array}\right) &= P(\text{even}) + P(\text{greater than 5}) - P\left(\begin{array}{l} \text{even and} \\ \text{greater than 5} \end{array}\right) \\
 &= \frac{4}{8} + \frac{3}{8} - \frac{2}{8} \\
 &= \frac{4 + 3 - 2}{8} = \frac{5}{8}.
 \end{aligned}$$

Four of the eight numbers, 2, 4, 6, and 8, are even.

Three of the eight numbers, 6, 7, and 8, are greater than 5.

Two of the eight numbers, 6 and 8, are even and greater than 5.

The probability that the pointer will stop on an even number or a number greater than 5 is  $\frac{5}{8}$ . ...

**Check Point 8** Use **Figure 10.17** to find the probability that the pointer will stop on an odd number or a number less than 5.

**EXAMPLE 9** An Or Probability with Real-World Data

**Table 10.5** shows the marital status of the U.S. population in 2010. Numbers in the table are expressed in millions.

**Table 10.5** Marital Status of the U.S. Population, Ages 15 or Older, 2010, in Millions

	Married	Never Married	Divorced	Widowed	Total
<b>Male</b>	65	40	10	3	118
<b>Female</b>	65	34	14	11	124
<b>Total</b>	130	74	24	14	242

Source: U.S. Census Bureau

If one person is randomly selected from the population represented in **Table 10.5**, find the probability that

- the person is divorced or male.
- the person is married or divorced.

Express probabilities as simplified fractions and as decimals rounded to the nearest hundredth.

### SOLUTION

- It is possible to select a person who is both divorced and male. Thus, these events are not mutually exclusive.

$P(\text{divorced or male})$

$$\begin{aligned} &= P(\text{divorced}) + P(\text{male}) - P(\text{divorced and male}) \\ &= \frac{24}{242} + \frac{118}{242} - \frac{10}{242} \end{aligned}$$

Of the 242 million Americans, 24 million are divorced.

Of the 242 million Americans, 118 million are male.

Of the 242 million Americans, 10 million are divorced and male.

$$= \frac{24 + 118 - 10}{242} = \frac{132}{242} = \frac{22 \cdot 6}{22 \cdot 11} = \frac{6}{11} \approx 0.55$$

The probability of selecting a person who is divorced or male is  $\frac{6}{11}$ , or approximately 0.55.

- It is impossible to select a person who is both married and divorced. These events are mutually exclusive.

$P(\text{married or divorced})$

$$\begin{aligned} &= P(\text{married}) + P(\text{divorced}) \\ &= \frac{130}{242} + \frac{24}{242} \end{aligned}$$

Of the 242 million Americans, 130 million are married.

Of the 242 million Americans, 24 million are divorced.

$$= \frac{130 + 24}{242} = \frac{154}{242} = \frac{22 \cdot 7}{22 \cdot 11} = \frac{7}{11} \approx 0.64$$

The probability of selecting a person who is married or divorced is  $\frac{7}{11}$ , or approximately 0.64. •••

 **Check Point 9** If one person is randomly selected from the population represented in **Table 10.5**, find the probability that

- the person is married or female.
- the person is divorced or widowed.

Express probabilities as simplified fractions and as decimals rounded to the nearest hundredth.

- 5** Find the probability of one event and a second event occurring.

### And Probabilities with Independent Events

Suppose that you toss a fair coin two times in succession. The outcome of the first toss, heads or tails, does not affect what happens when you toss the coin a second time. For example, the occurrence of tails on the first toss does not make tails more likely or less likely to occur on the second toss. The repeated toss of a coin produces

*independent events* because the outcome of one toss does not influence the outcome of others. Two events are **independent events** if the occurrence of either of them has no effect on the probability of the other.

If two events are independent, we can calculate the probability of the first occurring and the second occurring by multiplying their probabilities.

**And Probabilities with Independent Events**

If  $A$  and  $B$  are independent events, then

$$P(A \text{ and } B) = P(A) \cdot P(B).$$

**EXAMPLE 10** Independent Events on a Roulette Wheel

**Figure 10.18** shows a U.S. roulette wheel that has 38 numbered slots (1 through 36, 0, and 00). Of the 38 compartments, 18 are black, 18 are red, and 2 are green. A play has the dealer spin the wheel and a small ball in opposite directions. As the ball slows to a stop, it can land with equal probability on any one of the 38 numbered slots. Find the probability of red occurring on two consecutive plays.

**SOLUTION**

The wheel has 38 equally likely outcomes and 18 are red. Thus, the probability of red occurring on a play is  $\frac{18}{38}$ , or  $\frac{9}{19}$ . The result that occurs on each play is independent of all previous results. Thus,

$$P(\text{red and red}) = P(\text{red}) \cdot P(\text{red}) = \frac{9}{19} \cdot \frac{9}{19} = \frac{81}{361} \approx 0.224.$$

The probability of red occurring on two consecutive plays is  $\frac{81}{361}$ . •••

Some roulette players incorrectly believe that if red occurs on two consecutive plays, then another color is “due.” Because the events are independent, the outcomes of previous spins have no effect on any other spins.

**Check Point 10** Find the probability of green occurring on two consecutive plays on a roulette wheel.

The *and* rule for independent events can be extended to cover three or more events. Thus, if  $A$ ,  $B$ , and  $C$  are independent events, then

$$P(A \text{ and } B \text{ and } C) = P(A) \cdot P(B) \cdot P(C).$$

**EXAMPLE 11** Independent Events in a Family

The picture in the margin shows a family that has had nine girls in a row. Find the probability of this occurrence.

**SOLUTION**

If two or more events are independent, we can find the probability of them all occurring by multiplying their probabilities. The probability of a baby girl is  $\frac{1}{2}$ , so the probability of nine girls in a row is  $\frac{1}{2}$  used as a factor nine times.

$$\begin{aligned} P(\text{nine girls in a row}) &= \frac{1}{2} \cdot \frac{1}{2} \cdot \frac{1}{2} \cdot \frac{1}{2} \cdot \frac{1}{2} \cdot \frac{1}{2} \cdot \frac{1}{2} \cdot \frac{1}{2} \cdot \frac{1}{2} \\ &= \left(\frac{1}{2}\right)^9 = \frac{1}{512} \end{aligned}$$

The probability of a run of nine girls in a row is  $\frac{1}{512}$ . (If another child is born into the family, this event is independent of the other nine, and the probability of a girl is still  $\frac{1}{2}$ .) •••

FIGURE 10.18 A U.S. roulette wheel

 **Check Point 11** Find the probability of a family having four boys in a row.
**CONCEPT AND VOCABULARY CHECK**

Fill in each blank so that the resulting statement is true.

- Probability that is based on situations in which we observe how frequently an event occurs is called \_\_\_\_\_ probability.
- The set of all possible outcomes of an experiment is called the \_\_\_\_\_ of the experiment.
- The theoretical probability of event  $E$ , denoted by \_\_\_\_\_, is the \_\_\_\_\_ divided by the \_\_\_\_\_.
- A standard bridge deck has \_\_\_\_\_ cards with four suits: \_\_\_\_\_ and \_\_\_\_\_ are red, and \_\_\_\_\_ and \_\_\_\_\_ are black.
- The probability of winning a lottery with one lottery ticket is the number of ways of winning, which is precisely \_\_\_\_\_, divided by the total number of possible \_\_\_\_\_.
- Because  $P(E) + P(\text{not } E) = 1$ , then  $P(\text{not } E) = \underline{\hspace{2cm}}$  and  $P(E) = \underline{\hspace{2cm}}$ .
- If it is impossible for events  $A$  and  $B$  to occur simultaneously, the events are said to be \_\_\_\_\_. For such events,  $P(A \text{ or } B) = \underline{\hspace{2cm}}$ .
- If it is possible for events  $A$  and  $B$  to occur simultaneously, then  $P(A \text{ or } B) = \underline{\hspace{2cm}}$ .
- If the occurrence of one event has no effect on the probability of another event, the events are said to be \_\_\_\_\_. For such events  $P(A \text{ and } B) = \underline{\hspace{2cm}}$ .

**EXERCISE SET 10.7****Practice and Application Exercises**

Shown again is the table indicating the marital status of the U.S. population in 2010. Numbers in the table are expressed in millions. Use the data in the table to solve Exercises 1–10. Express probabilities as simplified fractions and as decimals rounded to the nearest hundredth.

Marital Status of the U.S. Population, Ages 15 or Older, 2010, in Millions

	Married	Never Married	Divorced	Widowed	Total
Male	65	40	10	3	118
Female	65	34	14	11	124
Total	130	74	24	14	242

If one person is randomly selected from the population described in the table, find the probability that the person

- is divorced.
- has never been married.
- is female.
- is male.
- is a widowed male.
- is a widowed female.
- Among those who are divorced, find the probability of selecting a woman.
- Among those who are divorced, find the probability of selecting a man.
- Among men, find the probability of selecting a married person.
- Among women, find the probability of selecting a married person.

In Exercises 11–16, a die is rolled. Find the probability of getting

- a 4.
- a 5.
- an odd number.
- a number greater than 3.
- a number greater than 4.
- a number greater than 7.

In Exercises 17–20, you are dealt one card from a standard 52-card deck. Find the probability of being dealt

- a queen.
- a diamond.
- a picture card.
- a card greater than 3 and less than 7.

In Exercises 21–22, a fair coin is tossed two times in succession. The sample space of equally likely outcomes is  $\{HH, HT, TH, TT\}$ . Find the probability of getting

- two heads.
- the same outcome on each toss.

In Exercises 23–24, you select a family with three children. If  $M$  represents a male child and  $F$  a female child, the sample space of equally likely outcomes is  $\{MMM, MMF, MFM, MFF, FMM, FMF, FFM, FFF\}$ . Find the probability of selecting a family with

- at least one male child.
- at least two female children.

In Exercises 25–26, a single die is rolled twice. The 36 equally likely outcomes are shown as follows:

		Second Roll					
		1	2	3	4	5	6
First Roll	1	(1, 1)	(1, 2)	(1, 3)	(1, 4)	(1, 5)	(1, 6)
	2	(2, 1)	(2, 2)	(2, 3)	(2, 4)	(2, 5)	(2, 6)
	3	(3, 1)	(3, 2)	(3, 3)	(3, 4)	(3, 5)	(3, 6)
	4	(4, 1)	(4, 2)	(4, 3)	(4, 4)	(4, 5)	(4, 6)
	5	(5, 1)	(5, 2)	(5, 3)	(5, 4)	(5, 5)	(5, 6)
	6	(6, 1)	(6, 2)	(6, 3)	(6, 4)	(6, 5)	(6, 6)

Find the probability of getting

25. two numbers whose sum is 4.
26. two numbers whose sum is 6.
27. To play the California lottery, a person has to select 6 out of 51 numbers, paying \$1 for each six-number selection. If you pick six numbers that are the same as the ones drawn by the lottery, you win mountains of money. What is the probability that a person with one combination of six numbers will win? What is the probability of winning if 100 different lottery tickets are purchased?
28. A state lottery is designed so that a player chooses six numbers from 1 to 30 on one lottery ticket. What is the probability that a player with one lottery ticket will win? What is the probability of winning if 100 different lottery tickets are purchased?

Exercises 29–30 involve a deck of 52 cards. If necessary, refer to the picture of a deck of cards, **Figure 10.12** on page 000.

29. A poker hand consists of five cards.
  - a. Find the total number of possible five-card poker hands.
  - b. A diamond flush is a five-card hand consisting of all diamonds. Find the number of possible diamond flushes.
  - c. Find the probability of being dealt a diamond flush.
30. If you are dealt 3 cards from a shuffled deck of 52 cards, find the probability that all 3 cards are picture cards.

The table shows the educational attainment of the U.S. population, ages 25 and over. Use the data in the table, expressed in millions, to solve Exercises 31–36.

**Educational Attainment, in Millions, of the United States Population, Ages 25 and Over**

	Less Than 4 Years High School	4 Years High School Only	Some College [Less Than 4 Years]	4 Years College [or More]	Total
<b>Male</b>	14	25	20	23	82
<b>Female</b>	15	31	24	22	92
<b>Total</b>	29	56	44	45	174

Source: U.S. Census Bureau

Find the probability, expressed as a simplified fraction, that a randomly selected American, age 25 or over,

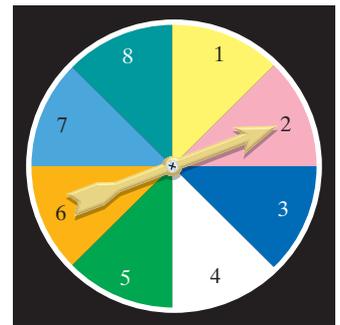

31. has not completed four years (or more) of college.
32. has not completed four years of high school.

33. has completed four years of high school only or less than four years of college.
34. has completed less than four years of high school or four years of high school only.
35. has completed four years of high school only or is a man.
36. has completed four years of high school only or is a woman.

In Exercises 37–42, you are dealt one card from a 52-card deck. Find the probability that

37. you are not dealt a king.
38. you are not dealt a picture card.
39. you are dealt a 2 or a 3.
40. you are dealt a red 7 or a black 8.
41. you are dealt a 7 or a red card.
42. you are dealt a 5 or a black card.

In Exercises 43–44, it is equally probable that the pointer on the spinner shown will land on any one of the eight regions, numbered 1 through 8. If the pointer lands on a borderline, spin again.

Find the probability that the pointer will stop on

43. an odd number or a number less than 6.
44. an odd number or a number greater than 3.

Use this information to solve Exercises 45–46. The mathematics department of a college has 8 male professors, 11 female professors, 14 male teaching assistants, and 7 female teaching assistants. If a person is selected at random from the group, find the probability that the selected person is

45. a professor or a male.
46. a professor or a female.

In Exercises 47–50, a single die is rolled twice. Find the probability of rolling

47. a 2 the first time and a 3 the second time.
48. a 5 the first time and a 1 the second time.
49. an even number the first time and a number greater than 2 the second time.
50. an odd number the first time and a number less than 3 the second time.
51. If you toss a fair coin six times, what is the probability of getting all heads?
52. If you toss a fair coin seven times, what is the probability of getting all tails?
53. The probability that South Florida will be hit by a major hurricane (category 4 or 5) in any single year is  $\frac{1}{16}$ . (Source: National Hurricane Center)

- a. What is the probability that South Florida will be hit by a major hurricane two years in a row?
- b. What is the probability that South Florida will be hit by a major hurricane in three consecutive years?

- c. What is the probability that South Florida will not be hit by a major hurricane in the next ten years?
- d. What is the probability that South Florida will be hit by a major hurricane at least once in the next ten years?

### Writing in Mathematics

54. Describe the difference between theoretical probability and empirical probability.
55. Give an example of an event whose probability must be determined empirically rather than theoretically.
56. Write a probability word problem whose answer is one of the following fractions:  $\frac{1}{6}$  or  $\frac{1}{4}$  or  $\frac{1}{3}$ .
57. Explain how to find the probability of an event not occurring. Give an example.
58. What are mutually exclusive events? Give an example of two events that are mutually exclusive.
59. Explain how to find *or* probabilities with mutually exclusive events. Give an example.
60. Give an example of two events that are not mutually exclusive.
61. Explain how to find *or* probabilities with events that are not mutually exclusive. Give an example.
62. Explain how to find *and* probabilities with independent events. Give an example.
63. The president of a large company with 10,000 employees is considering mandatory cocaine testing for every employee. The test that would be used is 90% accurate, meaning that it will detect 90% of the cocaine users who are tested, and that 90% of the nonusers will test negative. This also means that the test gives 10% false positive. Suppose that 1% of the employees actually use cocaine. Find the probability that someone who tests positive for cocaine use is, indeed, a user.

*Hint:* Find the following probability fraction:

$$\frac{\text{the number of employees who test positive and are cocaine users}}{\text{the number of employees who test positive}}$$

This fraction is given by

$$\frac{90\% \text{ of } 1\% \text{ of } 10,000}{\text{the number who test positive who actually use cocaine plus the number who test positive who do not use cocaine}}$$

What does this probability indicate in terms of the percentage of employees who test positive who are not actually users? Discuss these numbers in terms of the issue of mandatory drug testing. Write a paper either in favor of or against mandatory drug testing, incorporating the actual percentage accuracy for such tests.

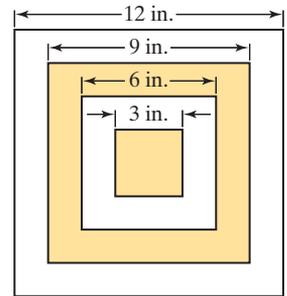

### Critical Thinking Exercises

**Make Sense?** In Exercises 64–67, determine whether each statement makes sense or does not make sense, and explain your reasoning.

64. The probability that Jill will win the election is 0.7 and the probability that she will not win is 0.4.
65. Assuming the next U.S. president will be a Democrat or a Republican, the probability of a Republican president is 0.5.

66. The probability that I will go to graduate school is 1.5.
67. When I toss a coin, the probability of getting heads *or* tails is 1, but the probability of getting heads *and* tails is 0.

68. The target in the figure shown contains four squares. If a dart thrown at random hits the target, find the probability that it will land in a yellow region.

69. Suppose that it is a week in which the cash prize in Florida's LOTTO is promised to exceed \$50 million. If a person purchases 22,957,480 tickets in LOTTO at \$1 per ticket (all possible combinations), isn't this a guarantee of winning the lottery? Because the probability in this situation is 1, what's wrong with doing this?
70. Some three-digit numbers, such as 101 and 313, read the same forward and backward. If you select a number from all three-digit numbers, find the probability that it will read the same forward and backward.
71. In a class of 50 students, 29 are Democrats, 11 are business majors, and 5 of the business majors are Democrats. If one student is randomly selected from the class, find the probability of choosing
- a Democrat who is not a business major.
  - a student who is neither a Democrat nor a business major.
72. On New Year's Eve, the probability of a person driving while intoxicated or having a driving accident is 0.35. If the probability of driving while intoxicated is 0.32 and the probability of having a driving accident is 0.09, find the probability of a person having a driving accident while intoxicated.
73. a. If two people are selected at random, the probability that they do not have the same birthday (day and month) is  $\frac{365}{365} \cdot \frac{364}{365}$ . Explain why this is so. (Ignore leap years and assume 365 days in a year.)
- If three people are selected at random, find the probability that they all have different birthdays.
  - If three people are selected at random, find the probability that at least two of them have the same birthday.
  - If 20 people are selected at random, find the probability that at least 2 of them have the same birthday.
  - How large a group is needed to give a 0.5 chance of at least two people having the same birthday?

### Group Exercise

74. Research and present a group report on state lotteries. Include answers to some or all of the following questions: Which states do not have lotteries? Why not? How much is spent per capita on lotteries? What are some of the lottery games? What is the probability of winning top prize in these games? What income groups spend the greatest amount of money on lotteries? If your state has a lottery, what does it do with the money it makes? Is the way the money is spent what was promised when the lottery first began?

Preview Exercises

Exercises 75–77 will help you prepare for the material covered in the first section of the next chapter.

75. Use the table to complete each statement.

	x approaches 4 from the left.			x approaches 4 from the right.			
<b>x</b>	3.9	3.99	3.999	4	4.001	4.01	4.1
$f(x) = \frac{x^2 - 6x + 8}{x - 4}$	1.9	1.99	1.999	Undefined	2.001	2.01	2.1

- a.  $f(4)$  is undefined because \_\_\_\_\_.
- b. If  $x$  is less than 4 and approaches 4 from the left, the values of  $f(x)$  are getting closer to the integer \_\_\_\_\_.
- c. If  $x$  is greater than 4 and approaches 4 from the right, the values of  $f(x)$  are getting closer to the integer \_\_\_\_\_.

76. Graph  $f(x) = \frac{x^2 - 6x + 8}{x - 4}$ , the function in Exercise 75. Begin by simplifying the function's equation. How does your graph illustrate the statement in Exercise 75(b) and the statement in Exercise 75(c)?
77. Graph the compound function:

$$f(x) = \begin{cases} 2x - 4 & \text{if } x \neq 3 \\ -5 & \text{if } x = 3 \end{cases}$$

# CHAPTER 10

## Summary, Review, and Test

### SUMMARY

#### DEFINITIONS AND CONCEPTS

##### 10.1 Sequences and Summation Notation

- a. An infinite sequence  $\{a_n\}$  is a function whose domain is the set of positive integers. The function values, or terms, are represented by

$$a_1, a_2, a_3, a_4, \dots, a_n, \dots$$

- b. Sequences can be defined using recursion formulas that define the  $n$ th term as a function of the previous term.
- c. Factorial Notation:

$$n! = n(n - 1)(n - 2) \cdots (3)(2)(1) \quad \text{and} \quad 0! = 1$$

- d. Summation Notation:

$$\sum_{i=1}^n a_i = a_1 + a_2 + a_3 + a_4 + \cdots + a_n$$

##### 10.2 Arithmetic Sequences

- a. In an arithmetic sequence, each term after the first differs from the preceding term by a constant, the common difference. Subtract any term from the term that directly follows to find the common difference.

- b. General term or  $n$ th term:  $a_n = a_1 + (n - 1)d$ . The first term is  $a_1$  and the common difference is  $d$ .

- c. Sum of the first  $n$  terms:  $S_n = \frac{n}{2}(a_1 + a_n)$

#### EXAMPLES

Ex. 1, p. 1003

Ex. 2, p. 1004

Ex. 3, p. 1005;  
Ex. 4, p. 1006

Ex. 5, p. 1007;  
Ex. 6, p. 1009

List of arithmetic sequences and common differences, p. 1014;  
Ex. 1, p. 1015  
Ex. 2, p. 1016;  
Ex. 3, p. 1016

Ex. 4, p. 1018;  
Ex. 5, p. 1019;  
Ex. 6, p. 1019

## DEFINITIONS AND CONCEPTS

## EXAMPLES

## 10.3 Geometric Sequences and Series

a. In a geometric sequence, each term after the first is obtained by multiplying the preceding term by a nonzero constant, the common ratio. Divide any term after the first by the term that directly precedes it to find the common ratio.

List of geometric sequences and common ratios, p. 1024;  
Ex. 1, p. 1024

b. General term or  $n$ th term:  $a_n = a_1 r^{n-1}$ . The first term is  $a_1$  and the common ratio is  $r$ .

Ex. 2, p. 1025;  
Ex. 3, p. 1026

c. Sum of the first  $n$  terms:  $S_n = \frac{a_1(1 - r^n)}{1 - r}$ ,  $r \neq 1$

Ex. 4, p. 1028;  
Ex. 5, p. 1028;  
Ex. 6, p. 1029

d. An annuity is a sequence of equal payments made at equal time periods. The value of an annuity,  $A$ , is the sum of all deposits made plus all interest paid, given by

Ex. 7, p. 1031

$$A = \frac{P \left[ \left( 1 + \frac{r}{n} \right)^{nt} - 1 \right]}{\frac{r}{n}}$$

The deposit made at the end of each period is  $P$ , the annual interest rate is  $r$ , compounded  $n$  times per year, and  $t$  is the number of years deposits have been made.

e. The sum of the infinite geometric series  $a_1 + a_1 r + a_1 r^2 + a_1 r^3 + \dots$  is  $S = \frac{a_1}{1 - r}$ ;  $|r| < 1$ . If  $|r| \geq 1$ , the infinite series does not have a sum.

Ex. 8, p. 1033;  
Ex. 9, p. 1034;  
Ex. 10, p. 1034

## 10.4 Mathematical Induction

To prove that  $S_n$  is true for all positive integers  $n$ ,

Ex. 2, p. 1043;

1. Show that  $S_1$  is true.

Ex. 3, p. 1044;

2. Show that if  $S_k$  is assumed true, then  $S_{k+1}$  is also true, for every positive integer  $k$ .

Ex. 4, p. 1045

## 10.5 The Binomial Theorem

a. Binomial coefficient:  $\binom{n}{r} = \frac{n!}{r!(n-r)!}$

Ex. 1, p. 1049

b. Binomial Theorem:

Ex. 2, p. 1050;  
Ex. 3, p. 1051

$$(a + b)^n = \binom{n}{0} a^n + \binom{n}{1} a^{n-1} b + \binom{n}{2} a^{n-2} b^2 + \dots + \binom{n}{n} b^n$$

c. The  $(r + 1)$ st term in the expansion of  $(a + b)^n$  is

Ex. 4, p. 1052

$$\binom{n}{r} a^{n-r} b^r.$$

## 10.6 Counting Principles, Permutations, and Combinations

a. The Fundamental Counting Principle: The number of ways in which a series of successive things can occur is found by multiplying the number of ways in which each thing can occur.

Ex. 1, p. 1057;  
Ex. 2, p. 1057;  
Ex. 3, p. 1058

b. A permutation from a group of items occurs when no item is used more than once and the order of arrangement makes a difference.

c. Permutations Formula: The number of possible permutations if  $r$  items are taken from  $n$  items is

Ex. 4, p. 1060;  
Ex. 5, p. 1060

$${}_n P_r = \frac{n!}{(n-r)!}$$

d. A combination from a group of items occurs when no item is used more than once and the order of items makes no difference.

Ex. 6, p. 1061

e. Combinations Formula: The number of possible combinations if  $r$  items are taken from  $n$  items is

Ex. 7, p. 1063;  
Ex. 8, p. 1063

$${}_n C_r = \frac{n!}{(n-r)!r!}$$

## DEFINITIONS AND CONCEPTS

## EXAMPLES

## 10.7 Probability

- a. Empirical probability applies to situations in which we observe the frequency of the occurrence of an event. The empirical probability of event  $E$  is Ex. 1, p. 1068

$$P(E) = \frac{\text{observed number of times } E \text{ occurs}}{\text{total number of observed occurrences}}$$

- b. Theoretical probability applies to situations in which the sample space of all equally likely outcomes is known. The theoretical probability of event  $E$  is Ex. 2, p. 1070;  
Ex. 3, p. 1071;  
Ex. 4, p. 1072;  
Ex. 5, p. 1072

$$P(E) = \frac{\text{number of outcomes in event } E}{\text{number of outcomes in sample space } S} = \frac{n(E)}{n(S)}$$

- c. Probability of an event not occurring:  $P(\text{not } E) = 1 - P(E)$ . Ex. 6, p. 1074

- d. If it is impossible for events  $A$  and  $B$  to occur simultaneously, the events are mutually exclusive.

- e. If  $A$  and  $B$  are mutually exclusive events, then  $P(A \text{ or } B) = P(A) + P(B)$ . Ex. 7, p. 1075

- f. If  $A$  and  $B$  are not mutually exclusive events, then Ex. 8, p. 1076;  
Ex. 9, p. 1076

$$P(A \text{ or } B) = P(A) + P(B) - P(A \text{ and } B).$$

- g. Two events are independent if the occurrence of either of them has no effect on the probability of the other.

- h. If  $A$  and  $B$  are independent events, then Ex. 10, p. 1078

$$P(A \text{ and } B) = P(A) \cdot P(B).$$

- i. The probability of a succession of independent events is the product of each of their probabilities. Ex. 11, p. 1078

## REVIEW EXERCISES

## 10.1

In Exercises 1–6, write the first four terms of each sequence whose general term is given.

$$1. a_n = 7n - 4 \qquad 2. a_n = (-1)^n \frac{n+2}{n+1}$$

$$3. a_n = \frac{1}{(n-1)!} \qquad 4. a_n = \frac{(-1)^{n+1}}{2^n}$$

$$5. a_1 = 9 \text{ and } a_n = \frac{2}{3a_{n-1}} \text{ for } n \geq 2$$

$$6. a_1 = 4 \text{ and } a_n = 2a_{n-1} + 3 \text{ for } n \geq 2$$

$$7. \text{ Evaluate: } \frac{40!}{4!38!}$$

In Exercises 8–9, find each indicated sum.

$$8. \sum_{i=1}^5 (2i^2 - 3) \qquad 9. \sum_{i=0}^4 (-1)^{i+1} i!$$

In Exercises 10–11, express each sum using summation notation. Use  $i$  for the index of summation.

$$10. \frac{1}{3} + \frac{2}{4} + \frac{3}{5} + \cdots + \frac{15}{17} \qquad 11. 4^3 + 5^3 + 6^3 + \cdots + 13^3$$

## 10.2

In Exercises 12–15, write the first six terms of each arithmetic sequence.

$$12. a_1 = 7, d = 4 \qquad 13. a_1 = -4, d = -5$$

$$14. a_1 = \frac{3}{2}, d = -\frac{1}{2} \qquad 15. a_{n+1} = a_n + 5, a_1 = -2$$

In Exercises 16–18, find the indicated term of the arithmetic sequence with first term,  $a_1$ , and common difference,  $d$ .

$$16. \text{ Find } a_6 \text{ when } a_1 = 5, d = 3.$$

$$17. \text{ Find } a_{12} \text{ when } a_1 = -8, d = -2.$$

$$18. \text{ Find } a_{14} \text{ when } a_1 = 14, d = -4.$$

In Exercises 19–21, write a formula for the general term (the  $n$ th term) of each arithmetic sequence. Do not use a recursion formula. Then use the formula for  $a_n$  to find  $a_{20}$ , the 20th term of the sequence.

$$19. -7, -3, 1, 5, \dots$$

$$20. a_1 = 200, d = -20$$

$$21. a_n = a_{n-1} - 5, a_1 = 3$$

$$22. \text{ Find the sum of the first 22 terms of the arithmetic sequence: } 5, 12, 19, 26, \dots$$

$$23. \text{ Find the sum of the first 15 terms of the arithmetic sequence: } -6, -3, 0, 3, \dots$$

$$24. \text{ Find } 3 + 6 + 9 + \cdots + 300, \text{ the sum of the first 100 positive multiples of 3.}$$

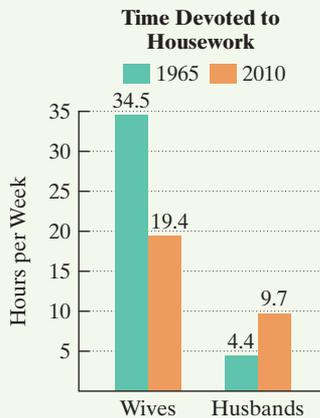

In Exercises 25–27, use the formula for the sum of the first  $n$  terms of an arithmetic sequence to find the indicated sum.

$$25. \sum_{i=1}^{16} (3i + 2)$$

$$26. \sum_{i=1}^{25} (-2i + 6)$$

$$27. \sum_{i=1}^{30} (-5i)$$

28. The bar graph shows the number of hours per week devoted to housework by wives and husbands in 1965 and 2010.

Source: James Henslin, *Sociology*, Eleventh Edition, Pearson, 2012.

In 1965, wives averaged 34.5 hours per week doing housework. On average, this has decreased by approximately 0.3 hour per year since then.

- Write a formula for the  $n$ th term of the arithmetic sequence that describes the number of hours per week devoted to housework by wives  $n$  years after 1964.
  - Use the model to project the number of hours per week wives will devote to housework in 2020.
29. A company offers a starting salary of \$31,500 with raises of \$2300 per year. Find the total salary over a ten-year period.
30. A theater has 25 seats in the first row and 35 rows in all. Each successive row contains one additional seat. How many seats are in the theater?

### 10.3

In Exercises 31–34, write the first five terms of each geometric sequence.

31.  $a_1 = 3, r = 2$                       32.  $a_1 = \frac{1}{2}, r = \frac{1}{2}$   
 33.  $a_1 = 16, r = -\frac{1}{2}$                     34.  $a_n = -5a_{n-1}, a_1 = -1$

In Exercises 35–37, use the formula for the general term (the  $n$ th term) of a geometric sequence to find the indicated term of each sequence.

35. Find  $a_7$  when  $a_1 = 2, r = 3$ .  
 36. Find  $a_6$  when  $a_1 = 16, r = \frac{1}{2}$ .  
 37. Find  $a_5$  when  $a_1 = -3, r = 2$ .

In Exercises 38–40, write a formula for the general term (the  $n$ th term) of each geometric sequence. Then use the formula for  $a_n$  to find  $a_8$ , the eighth term of the sequence.

38.  $1, 2, 4, 8, \dots$                       39.  $100, 10, 1, \frac{1}{10}, \dots$   
 40.  $12, -4, \frac{4}{3}, -\frac{4}{9}, \dots$   
 41. Find the sum of the first 15 terms of the geometric sequence:  $5, -15, 45, -135, \dots$   
 42. Find the sum of the first 7 terms of the geometric sequence:  $8, 4, 2, 1, \dots$

In Exercises 43–45, use the formula for the sum of the first  $n$  terms of a geometric sequence to find the indicated sum.

43.  $\sum_{i=1}^6 5^i$                                       44.  $\sum_{i=1}^7 3(-2)^i$   
 45.  $\sum_{i=1}^5 2\left(\frac{1}{4}\right)^{i-1}$

In Exercises 46–49, find the sum of each infinite geometric series.

46.  $9 + 3 + 1 + \frac{1}{3} + \dots$                     47.  $2 - 1 + \frac{1}{2} - \frac{1}{4} + \dots$   
 48.  $-6 + 4 - \frac{8}{3} + \frac{16}{9} - \dots$   
 49.  $\sum_{i=1}^{\infty} 5(0.8)^i$

In Exercises 50–51, express each repeating decimal as a fraction in lowest terms.

50.  $0.\overline{6}$     51.  $0.\overline{47}$

52. The table shows the population of Florida for 2000 and 2010, with estimates given by the U.S. Census Bureau for 2001 through 2009.

Year	2000	2001	2002	2003	2004	2005
Population in millions	15.98	16.24	16.50	16.76	17.03	17.30

Year	2006	2007	2008	2009	2010
Population in millions	17.58	17.86	18.15	18.44	18.80

- Divide the population, for each year by the population in the preceding year. Round to two decimal places and show that Florida has a population increase that is approximately geometric.
  - Write the general term of the geometric sequence modeling Florida's population, in millions,  $n$  years after 1999.
  - Use your model from part (b) to project Florida's population, in millions, for the year 2030. Round to two decimal places.
53. A job pays \$32,000 for the first year with an annual increase of 6% per year beginning in the second year. What is the salary in the sixth year? What is the total salary paid over this six-year period? Round answers to the nearest dollar.

In Exercises 54–55, use the formula for the value of an annuity and round to the nearest dollar.

54. You spend \$10 per week on lottery tickets, averaging \$520 per year. Instead of buying tickets, if you deposited the \$520 at the end of each year in an annuity paying 6% compounded annually,
  - How much would you have after 20 years?
  - Find the interest.
55. To save for retirement, you decide to deposit \$100 at the end of each month in an IRA that pays 5.5% compounded monthly.
  - How much will you have from the IRA after 30 years?
  - Find the interest.

56. A factory in an isolated town has an annual payroll of \$4 million. It is estimated that 70% of this money is spent within the town, that people in the town receiving this money will again spend 70% of what they receive in the town, and so on. What is the total of all this spending in the town each year?

10.4

In Exercises 57–61, use mathematical induction to prove that each statement is true for every positive integer  $n$ .

57.  $5 + 10 + 15 + \dots + 5n = \frac{5n(n + 1)}{2}$   
 58.  $1 + 4 + 4^2 + \dots + 4^{n-1} = \frac{4^n - 1}{3}$   
 59.  $2 + 6 + 10 + \dots + (4n - 2) = 2n^2$   
 60.  $1 \cdot 3 + 2 \cdot 4 + 3 \cdot 5 + \dots + n(n + 2) = \frac{n(n + 1)(2n + 7)}{6}$   
 61. 2 is a factor of  $n^2 + 5n$ .

10.5

In Exercises 62–63, evaluate the given binomial coefficient.

62.  $\binom{11}{8}$                       63.  $\binom{90}{2}$

In Exercises 64–67, use the Binomial Theorem to expand each binomial and express the result in simplified form.

64.  $(2x + 1)^3$                       65.  $(x^2 - 1)^4$   
 66.  $(x + 2y)^5$                       67.  $(x - 2)^6$

In Exercises 68–69, write the first three terms in each binomial expansion, expressing the result in simplified form.

68.  $(x^2 + 3)^8$                       69.  $(x - 3)^9$

In Exercises 70–71, find the term indicated in each expansion.

70.  $(x + 2)^5$ ; fourth term                      71.  $(2x - 3)^6$ ; fifth term

10.6

In Exercises 72–75, evaluate each expression.

72.  ${}_8P_3$                       73.  ${}_9P_5$   
 74.  ${}_8C_3$                       75.  ${}_{13}C_{11}$

In Exercises 76–82, solve by the method of your choice.

76. A popular brand of pen comes in red, green, blue, or black ink. The writing tip can be chosen from extra bold, bold, regular, fine, or micro. How many different choices of pens do you have with this brand?  
 77. A stock can go up, go down, or stay unchanged. How many possibilities are there if you own five stocks?  
 78. A club with 15 members is to choose four officers—president, vice president, secretary, and treasurer. In how many ways can these offices be filled?  
 79. How many different ways can a director select 4 actors from a group of 20 actors to attend a workshop on performing in rock musicals?  
 80. From the 20 CDs that you've bought during the past year, you plan to take 3 with you on vacation. How many different sets of three CDs can you take?

81. How many different ways can a director select from 20 male actors and cast the roles of Mark, Roger, Angel, and Collins in the musical *Rent*?  
 82. In how many ways can five airplanes line up for departure on a runway?

10.7

Suppose that a survey of 350 college students is taken. Each student is asked the type of college attended (public or private) and the family's income level (low, middle, high). Use the data in the table to solve Exercises 83–88. Express probabilities as simplified fractions.

	Public	Private	Total
Low	120	20	140
Middle	110	50	160
High	22	28	50
Total	252	98	350

Find the probability that a randomly selected student in the survey

83. attends a public college.  
 84. is not from a high-income family.  
 85. is from a middle-income or a high-income family.  
 86. attends a private college or is from a high-income family.  
 87. Among people who attend a public college, find the probability that a randomly selected student is from a low-income family.  
 88. Among people from a middle-income family, find the probability that a randomly selected student attends a private college.

In Exercises 89–90, a die is rolled. Find the probability of

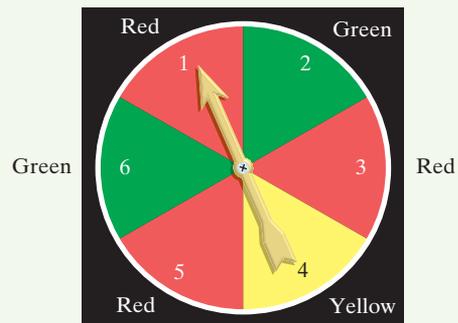

89. getting a number less than 5.  
 90. getting a number less than 3 or greater than 4.

In Exercises 91–92, you are dealt one card from a 52-card deck. Find the probability of

91. getting an ace or a king.  
 92. getting a queen or a red card.

In Exercises 93–95, it is equally probable that the pointer on the spinner shown will land on any one of the six regions, numbered 1 through 6, and colored as shown. If the pointer lands on a borderline, spin again. Find the probability of

93. not stopping on yellow.  
 94. stopping on red or a number greater than 3.  
 95. stopping on green on the first spin and stopping on a number less than 4 on the second spin.

96. A lottery game is set up so that each player chooses five different numbers from 1 to 20. If the five numbers match the five numbers drawn in the lottery, the player wins (or shares) the top cash prize. What is the probability of winning the prize
- with one lottery ticket?
  - with 100 different lottery tickets?
97. What is the probability of a family having five boys born in a row?
98. The probability of a flood in any given year in a region prone to floods is 0.2.
- What is the probability of a flood two years in a row?
  - What is the probability of a flood for three consecutive years?
  - What is the probability of no flooding for four consecutive years?

## CHAPTER 10 TEST

1. Write the first five terms of the sequence whose general term is  $a_n = \frac{(-1)^{n+1}}{n^2}$ .

In Exercises 2–4, find each indicated sum.

- $\sum_{i=1}^5 (i^2 + 10)$
- $\sum_{i=1}^{20} (3i - 4)$
- $\sum_{i=1}^{15} (-2)^i$

In Exercises 5–7, evaluate each expression.

- $\binom{9}{2}$
- ${}_{10}P_3$
- ${}_{10}C_3$

8. Express the sum using summation notation. Use  $i$  for the index of summation.

$$\frac{2}{3} + \frac{3}{4} + \frac{4}{5} + \cdots + \frac{21}{22}$$

In Exercises 9–10, write a formula for the general term (the  $n$ th term) of each sequence. Do not use a recursion formula. Then use the formula to find the twelfth term of the sequence.

- 4, 9, 14, 19, ...
- 16, 4, 1,  $\frac{1}{4}$ , ...

In Exercises 11–12, use a formula to find the sum of the first ten terms of each sequence.

- 7, -14, 28, -56, ...
  - 7, -14, -21, -28, ...
13. Find the sum of the infinite geometric series:

$$4 + \frac{4}{2} + \frac{4}{2^2} + \frac{4}{2^3} + \cdots$$

- Express  $0.\overline{73}$  in fractional notation.
- A job pays \$30,000 for the first year with an annual increase of 4% per year beginning in the second year. What is the total salary paid over an eight-year period? Round to the nearest dollar.
- Use mathematical induction to prove that for every positive integer  $n$ ,

$$1 + 4 + 7 + \cdots + (3n - 2) = \frac{n(3n - 1)}{2}$$

- Use the Binomial Theorem to expand and simplify:  $(x^2 - 1)^5$ .

- Use the Binomial Theorem to write the first three terms in the expansion and simplify:  $(x + y^2)^8$ .
- A human resource manager has 11 applicants to fill three different positions. Assuming that all applicants are equally qualified for any of the three positions, in how many ways can this be done?
- From the ten books that you've recently bought but not read, you plan to take four with you on vacation. How many different sets of four books can you take?
- How many seven-digit local telephone numbers can be formed if the first three digits are 279?

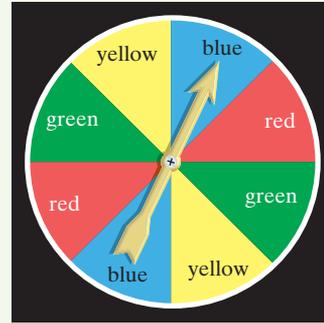

A class is collecting data on eye color and gender. They organize the data they collected into the table shown. Numbers in the table represent the number of students from the class that belong to each of the categories. Use the data to solve Exercises 22–25. Express probabilities as simplified fractions.

	Brown	Blue	Green
Male	22	18	10
Female	18	20	12

Find the probability that a randomly selected student from this class

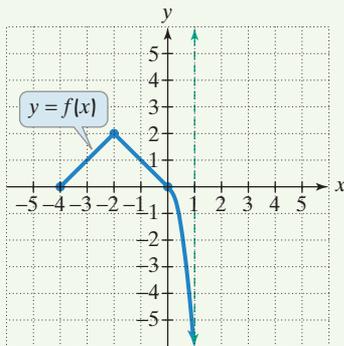

- does not have brown eyes.
- has brown eyes or blue eyes.
- is female or has green eyes.
- Among the students with blue eyes, find the probability of selecting a male.
- A lottery game is set up so that each player chooses six different numbers from 1 to 15. If the six numbers match the six numbers drawn in the lottery, the player wins (or shares) the top cash prize. What is the probability of winning the prize with 50 different lottery tickets?
- One card is randomly selected from a deck of 52 cards. Find the probability of selecting a black card or a picture card.
- A group of students consists of 10 male freshmen, 15 female freshmen, 20 male sophomores, and 5 female sophomores. If one person is randomly selected from the group, find the probability of selecting a freshman or a female.

29. A quiz consisting of four multiple-choice questions has four available options (a, b, c, or d) for each question. If a person guesses at every question, what is the probability of answering all questions correctly?
30. If the spinner shown is spun twice, find the probability that the pointer lands on red on the first spin and blue on the second spin.

### CUMULATIVE REVIEW EXERCISES (CHAPTERS P–10)

The figure shows the graph of  $y = f(x)$  and its vertical asymptote. Use the graph to solve Exercises 1–9.

- Find the domain and the range of  $f$ .
- Does  $f$  have a relative maximum or a relative minimum? What is this relative maximum or minimum and where does it occur?
- Find the interval on which  $f$  is decreasing.
- Is  $f$  even, odd, or neither?
- For what value(s) of  $x$  is  $f(x) = 1$ ?
- Find  $(f \circ f)(-4)$ .
- Use arrow notation to complete this statement:  
 $f(x) \rightarrow -\infty$  as \_\_\_\_\_
- Graph  $g(x) = f(x - 2) + 1$ .
- Graph  $h(x) = -f(2x)$ .

In Exercises 10–22, solve each equation, inequality, or system of equations.

- $-2(x - 5) + 10 = 3(x + 2)$
- $3x^2 - 6x + 2 = 0$
- $\log_2 x + \log_2(2x - 3) = 1$
- $x^{\frac{1}{2}} - 6x^{\frac{1}{4}} + 8 = 0$
- $|2x + 1| \leq 1$
- $\frac{x - 1}{x + 3} \leq 0$
- $2x^3 + 3x^2 - 8x + 3 = 0$
- $e^{2x} - 6e^x + 8 = 0$
- $6x^2 - 6 < 5x$
- $30e^{0.7x} = 240$
- $\begin{cases} 4x^2 + 3y^2 = 48 \\ 3x^2 + 2y^2 = 35 \end{cases}$

21. (Use matrices.)

$$\begin{cases} x - 2y + z = 16 \\ 2x - y - z = 14 \\ 3x + 5y - 4z = -10 \end{cases}$$

22.  $\begin{cases} x - y = 1 \\ x^2 - x - y = 1 \end{cases}$

In Exercises 23–29, graph each equation, function, or system in a rectangular coordinate system. If two functions are indicated, graph both in the same system.

- $100x^2 + y^2 = 25$
- $4x^2 - 9y^2 - 16x + 54y - 29 = 0$
- $f(x) = \frac{x^2 - 1}{x - 2}$
- $\begin{cases} 2x - y \geq 4 \\ x \leq 2 \end{cases}$
- $f(x) = x^2 - 4x - 5$
- $f(x) = \sqrt[3]{x + 4}$  and  $f^{-1}$
- $f(x) = \log_2 x$  and  $g(x) = -\log_2(x + 1)$

In Exercises 30–31, let  $f(x) = -x^2 - 2x + 1$  and  $g(x) = x - 1$ .

- Find  $(f \circ g)(x)$  and  $(g \circ f)(x)$ .
- Find  $\frac{f(x + h) - f(x)}{h}$  and simplify.
- If  $A = \begin{bmatrix} 4 & 2 \\ 1 & -1 \\ 0 & 5 \end{bmatrix}$  and  $B = \begin{bmatrix} 2 & 4 \\ 3 & 1 \end{bmatrix}$ , find  $AB - 4A$ .
- Find the partial fraction decomposition for  $\frac{2x^2 - 10x + 2}{(x - 2)(x^2 + 2x + 2)}$ .
- Expand and simplify:  $(x^3 + 2y)^5$ .
- Use the formula for the sum of the first  $n$  terms of an arithmetic sequence to find  $\sum_{i=1}^{50} (4i - 25)$ .

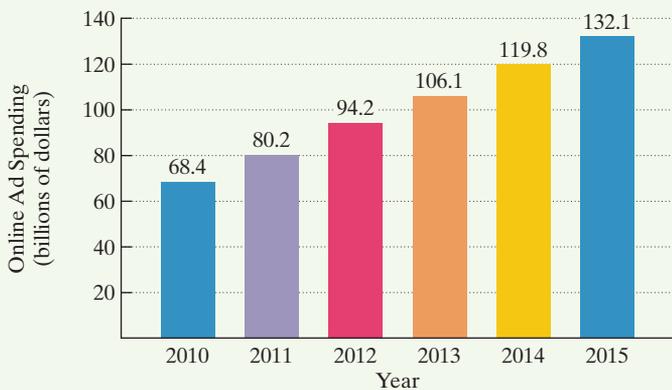

In Exercises 36–37, write the linear function in slope-intercept form satisfying the given conditions.

- Graph of  $f$  passes through  $(6, 3)$  and  $(-2, 1)$ .
- Graph of  $g$  passes through  $(0, -2)$  and is perpendicular to the line whose equation is  $x - 5y - 20 = 0$ .
- For a summer sales job, you are choosing between two pay arrangements: a weekly salary of \$200 plus 5% commission on sales, or a straight 15% commission. For how many dollars of sales will the earnings be the same regardless of the pay arrangement?

39. The perimeter of a soccer field is 300 yards. If the length is 50 yards longer than the width, what are the field's dimensions?
40. If 10 pens and 12 pads cost \$42, and 5 of the same pens and 10 of the same pads cost \$29, find the cost of a pen and a pad.
41. A ball is thrown vertically upward from the top of a 96-foot-tall building with an initial velocity of 80 feet per second. The height of the ball above ground,  $s(t)$ , in feet, after  $t$  seconds is modeled by the position function
- $$s(t) = -16t^2 + 80t + 96.$$
- After how many seconds will the ball strike the ground?
  - When does the ball reach its maximum height? What is the maximum height?
42. The current,  $I$ , in amperes, flowing in an electrical circuit varies inversely as the resistance,  $R$ , in ohms, in the circuit. When the resistance of an electric percolator is 22 ohms, it draws 5 amperes of current. How much current is needed when the resistance is 10 ohms?
43. The bar graph shows online ad spending worldwide, in billions of dollars, for 2010 and 2011, with projections from 2012 through 2015. Develop a linear function that models the data. Then use the function to make a projection about what might occur after 2015.

Worldwide Online Ad Spending

Source: eMarketer

44. An object moves in simple harmonic motion described by  $d = 10 \sin \frac{3\pi}{4} t$ , where  $t$  is measured in seconds and  $d$  in inches. Find **a.** the maximum displacement; **b.** the frequency; and **c.** the time required for one oscillation.

Verify each identity in Exercises 45–46.

45.  $\tan x + \frac{1}{\tan x} = \frac{1}{\sin x \cos x}$

46.  $\frac{1 - \tan^2 x}{1 + \tan^2 x} = \cos 2x$

47. Graph one period:  $y = -2 \cos(3x - \pi)$ .

 In Exercises 48–49, solve each equation on the interval  $[0, 2\pi)$ .

48.  $4 \cos^2 x = 3$

49.  $2 \sin^2 x + 3 \cos x - 3 = 0$

50. Find the exact value of  $\cot \left[ \cos^{-1} \left( -\frac{5}{6} \right) \right]$ .

51. Graph the polar equation:  $r = 1 + 2 \cos \theta$ .

52. In oblique triangle  $ABC$ ,  $A = 34^\circ$ ,  $a = 22$ , and  $b = 32$ . Solve the triangle(s). Round lengths to the nearest tenth and angle measures to the nearest degree.

53. Use the parametric equations

$$x = \sin t, \quad y = 1 + \cos^2 t, \quad -\frac{\pi}{2} < t < \frac{\pi}{2}$$

and eliminate the parameter. Graph the plane curve represented by the parametric equations. Use arrows to show the orientation of the curve.

## SECTION 11.1

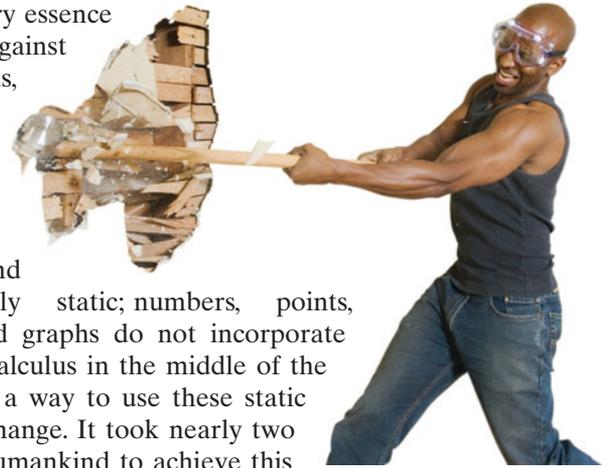

## Finding Limits Using Tables and Graphs

## Objectives

- 1 Understand limit notation.
- 2 Find limits using tables.
- 3 Find limits using graphs.
- 4 Find one-sided limits and use them to determine if a limit exists.

Motion and change are the very essence of life. Moving air brushes against our faces, rain falls on our heads, birds fly past us, plants spring from the earth, grow, and then die, and rocks thrown upward reach a maximum height before falling to the ground.

The tools of algebra and trigonometry are essentially static; numbers, points, lines, equations, functions, and graphs do not incorporate motion. The development of calculus in the middle of the seventeenth century provided a way to use these static tools to analyze motion and change. It took nearly two thousand years of effort for humankind to achieve this feat, made possible by a revolutionary concept called *limits*. The invention of limits marked a turning point in human history, having as dramatic an impact on our lives as the invention of the wheel and the printing press. In this section, we introduce this bold and dramatic style of thinking about mathematics.

- 1 Understand limit notation.

## An Introduction to Limits

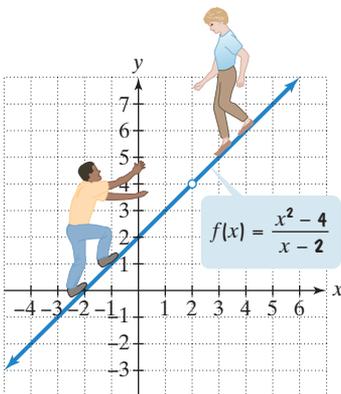

Suppose that you and a friend are walking along the graph of the function

$$f(x) = \frac{x^2 - 4}{x - 2}.$$

**Figure 11.1** illustrates that you are walking uphill and your friend is walking downhill. Because 2 is not in the domain of the function, there is a hole in the graph at  $x = 2$ . Warning signs along the graph might be appropriate: Caution:  $f(2)$  is undefined! If you or your friend reach 2, you will fall through the hole and splatter onto the  $x$ -axis.

Obviously, there is a problem at  $x = 2$ . But what happens along the graph of  $f(x) = \frac{x^2 - 4}{x - 2}$  as you and your friend walk very, very close to  $x = 2$ ? What function value,  $f(x)$ , will each of you approach? One way to answer this question is to construct a table of function values to analyze numerically the behavior of  $f$  as  $x$  gets closer and closer to 2. Remember that you are walking uphill, approaching 2 from the left side of 2. Your friend is walking downhill, approaching 2 from the right side of 2. Thus, we must include values of  $x$  that are less than 2 and values of  $x$  that are greater than 2.

In **Table 11.1** at the top of the next page, we choose values of  $x$  close to 2. As  $x$  approaches 2 from the left, we arbitrarily start with  $x = 1.99$ . Then we select two additional values of  $x$  that are closer to 2, but still less than 2. We choose 1.999 and 1.9999. As  $x$  approaches 2 from the right, we arbitrarily start with  $x = 2.01$ . Then we select two additional values of  $x$  that are closer to 2, but still greater than 2. We choose 2.001 and 2.0001. Finally, evaluate  $f$  at each chosen value of  $x$  to obtain **Table 11.1**.

**FIGURE 11.1** Walking along the graph of  $f$ , very close to 2

## TECHNOLOGY

A graphing utility with a TABLE feature can be used to generate the entries in **Table 11.1**. In TBLSET, change Auto to Ask for Indpnt, the independent variable. Here is a typical screen that verifies **Table 11.1**.

X	Y1	Y2
1.99	3.99	
1.999	3.999	
1.9999	3.9999	
2.0001	4.0001	
2.001	4.001	
2.01	4.01	

V1 (X^2-4)/(X-2)

**Table 11.1**

$x$	1.99	1.999	1.9999	2	2.0001	2.001	2.01
$f(x) = \frac{x^2 - 4}{x - 2}$	3.99	3.999	3.9999	Undefined	4.0001	4.001	4.01

$x$  approaches 2 from the left.       $x$  approaches 2 from the right.

$f(x)$  gets closer to 4.       $f(x)$  gets closer to 4.

From **Table 11.1**, it appears that as  $x$  gets closer to 2, the values of  $f(x) = \frac{x^2 - 4}{x - 2}$  get closer to 4. We say that

“The limit of  $\frac{x^2 - 4}{x - 2}$  as  $x$  approaches 2 equals the number 4.”

We can express this sentence in a mathematical notation called **limit notation**. We use an arrow for the word *approaches*. Likewise, we use *lim* as shorthand for the word *limit*. Thus, the limit notation for the English sentence in quotations is

$$\lim_{x \rightarrow 2} \frac{x^2 - 4}{x - 2} = 4. \quad \text{The limit of } \frac{x^2 - 4}{x - 2} \text{ as } x \text{ approaches 2 equals the number 4.}$$

Calculus is the study of limits and their applications. Limits are the foundation of the concepts that you will encounter in calculus.

### Limit Notation and Its Description

Suppose that  $f$  is a function defined on some open interval containing the number  $a$ . The function  $f$  may or may not be defined at  $a$ . The **limit notation**

$$\lim_{x \rightarrow a} f(x) = L$$

is read “the limit of  $f(x)$  as  $x$  approaches  $a$  equals the number  $L$ .” This means that as  $x$  gets closer to  $a$ , but remains unequal to  $a$ , the corresponding values of  $f(x)$  get closer to  $L$ .

## 2 Find limits using tables.

### Finding Limits Using Tables

To find  $\lim_{x \rightarrow a} f(x)$ , use a graphing utility with a TABLE feature or create a table by hand. Approach  $a$  from the left, choosing values of  $x$  that are close to  $a$  but still less than  $a$ . Then approach  $a$  from the right, choosing values of  $x$  that are close to  $a$  but still greater than  $a$ . Evaluate  $f$  at each chosen value of  $x$  to obtain the desired table.

Choose values of  $x$  so that the table makes it obvious what the corresponding values of  $f(x)$  are getting close to. If the values of  $f(x)$  are getting close to the number  $L$ , we infer that

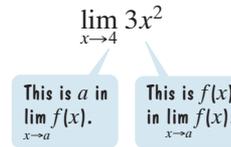

$$\lim_{x \rightarrow a} f(x) = L.$$

**EXAMPLE 1** Finding a Limit Using a Table

Find:  $\lim_{x \rightarrow 4} 3x^2$ .

**SOLUTION**

As  $x$  gets closer to 4, but remains unequal to 4, we must find the number that the corresponding values of  $3x^2$  get closer to. The voice balloons shown below indicate that in this limit problem,  $f(x) = 3x^2$  and  $a = 4$ .

In making a table, we choose values of  $x$  close to 4. As  $x$  approaches 4 from the left, we arbitrarily start with  $x = 3.99$ . Then we select two additional values of  $x$  that are closer to 4, but still less than 4. We choose 3.999 and 3.9999. As  $x$  approaches 4 from the right, we arbitrarily start with  $x = 4.01$ . Then we select two additional numbers that are closer to 4 but still greater than 4. We choose 4.001 and 4.0001. Finally, we evaluate  $f$  at each chosen value of  $x$  to obtain **Table 11.2**. The values of  $f(x)$  in the table are rounded to four decimal places.

		x approaches 4 from the left.			x approaches 4 from the right.	
<b>Table 11.2</b>				→ ←		
$x$		3.99	3.999	3.9999	4.0001	4.001
$f(x) = 3x^2$		47.7603	47.9760	47.9976	48.0024	48.0240
		f(x) gets closer to 48.			f(x) gets closer to 48.	

From **Table 11.2**, it appears that as  $x$  gets closer to 4, the values of  $3x^2$  get closer to 48. We infer that

$$\lim_{x \rightarrow 4} 3x^2 = 48.$$

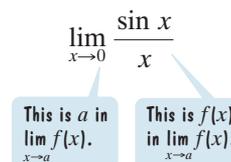

**Check Point 1** Find:  $\lim_{x \rightarrow 3} 4x^2$ .

**EXAMPLE 2** Finding a Limit Using a Table

Find:  $\lim_{x \rightarrow 0} \frac{\sin x}{x}$ .

**SOLUTION**

As  $x$  gets closer to 0, but remains unequal to 0, we must find the number that the corresponding values of  $\frac{\sin x}{x}$  get closer to. The voice balloons shown below indicate that in this limit problem  $f(x) = \frac{\sin x}{x}$  and  $a = 0$ .

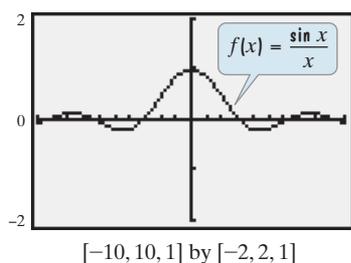

## TECHNOLOGY

### Graphic Connections

The graph of  $f(x) = \frac{\sin x}{x}$  illustrates that as  $x$  gets closer to 0, the values of  $f(x)$  are approaching 1. This supports our inference that

$$\lim_{x \rightarrow 0} \frac{\sin x}{x} = 1.$$

Because division by 0 is undefined, the domain of  $f(x) = \frac{\sin x}{x}$  is  $\{x \mid x \neq 0\}$ . Thus,  $f$  is not defined at 0. However, in this limit problem, we do not care what is happening at  $x = 0$ . We are interested in the behavior of the function as  $x$  gets close to 0. **Table 11.3** shows the values of  $f(x)$ , rounded to five decimal places, as  $x$  approaches 0 from the left and from the right. Values of  $x$  in the table are measured in radians.

Table 11.3

	x approaches 0 from the left.			x approaches 0 from the right.		
$x$	-0.03	-0.02	-0.01	0.01	0.02	0.03
$f(x) = \frac{\sin x}{x}$	0.99985	0.99993	0.99998	0.99998	0.99993	0.99985

$f(x)$  gets closer to 1.

$f(x)$  gets closer to 1.

From **Table 11.3**, it appears that as  $x$  gets closer to 0, the values of  $\frac{\sin x}{x}$  get closer to 1. We infer that

$$\lim_{x \rightarrow 0} \frac{\sin x}{x} = 1.$$

**Check Point 2** Find:  $\lim_{x \rightarrow 0} \frac{\cos x - 1}{x}$ .

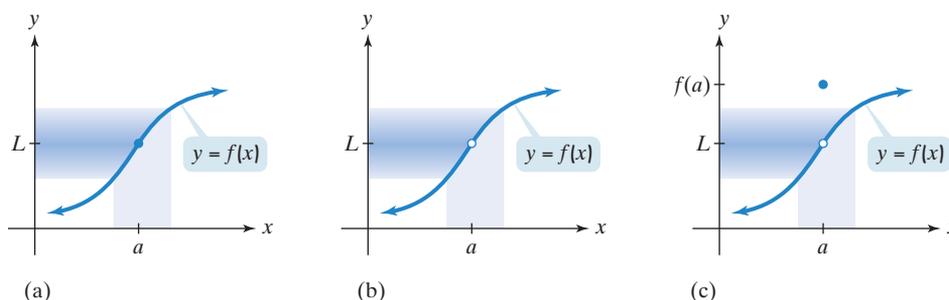

### 3 Find limits using graphs.

### Finding Limits Using Graphs

The limit statement

$$\lim_{x \rightarrow a} f(x) = L$$

is illustrated in **Figure 11.2**. In the three graphs, the number that  $x$  is approaching,  $a$ , is shown on the  $x$ -axis. The limit,  $L$ , is shown on the  $y$ -axis. Take a few minutes to examine the graphs. Can you see that as  $x$  approaches  $a$  along the  $x$ -axis,  $f(x)$  approaches  $L$  along the  $y$ -axis? In each graph, as  $x$  gets closer to  $a$ , the values of  $f(x)$  get closer to  $L$ .

**FIGURE 11.2** In each graph, as  $x$  gets closer to  $a$ , the values of  $f$  get closer to  $L$ :  $\lim_{x \rightarrow a} f(x) = L$ .

In **Figure 11.2(a)**, as  $x$  approaches  $a$ ,  $f(x)$  approaches  $L$ . At  $a$ , the value of the function is  $L$ :  $f(a) = L$ . In **Figure 11.2(b)**, as  $x$  approaches  $a$ ,  $f(x)$  approaches  $L$ . This is true although  $f$  is not defined at  $a$ , shown by the hole in the graph. In **Figure 11.2(c)**, we again see that as  $x$  approaches  $a$ ,  $f(x)$  approaches  $L$ . Notice, however, that the value of the function at  $a$ ,  $f(a)$ , shown by the blue dot, is not equal to the limit:  $f(a) \neq L$ . What you get as you approach  $a$  is not the same as what you get at  $a$ .

Example 3 illustrates that the graph of a function can sometimes be helpful in finding limits.

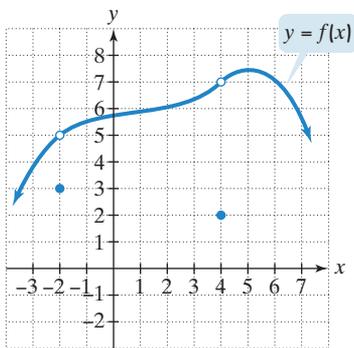

FIGURE 11.3

**EXAMPLE 3** Finding a Limit Using a Graph

Use the graph in **Figure 11.3** to find each of the following:

- a.  $\lim_{x \rightarrow 4} f(x)$
- b.  $f(4)$ .

**SOLUTION**

a. To find  $\lim_{x \rightarrow 4} f(x)$ , examine the graph of  $f$  near  $x = 4$ . As  $x$  gets closer to 4, the values of  $f(x)$  get closer to the  $y$ -coordinate of the point shown by the open dot on the right. The  $y$ -coordinate of this point is 7. Thus, as  $x$  gets closer to 4, the values of  $f(x)$  get closer to 7. We conclude from the graph that

$$\lim_{x \rightarrow 4} f(x) = 7.$$

b. To find  $f(4)$ , examine the graph of  $f$  at  $x = 4$ . At  $x = 4$ , the open dot is not included in the graph of  $f$ . The graph of  $f$  at 4 is shown by the closed dot with coordinates  $(4, 2)$ . Thus,  $f(4) = 2$ . ...

In Example 3, notice that the value of  $f$  at 4 has nothing to do with the conclusion that  $\lim_{x \rightarrow 4} f(x) = 7$ . Regardless of how  $f$  is defined at 4, it is still true that  $\lim_{x \rightarrow 4} f(x) = 7$ . Furthermore, if  $f$  were undefined at 4, the limit of  $f(x)$  as  $x \rightarrow 4$  would still equal 7.

**Check Point 3** Use the graph in **Figure 11.3** to find each of the following:

- a.  $\lim_{x \rightarrow -2} f(x)$
- b.  $f(-2)$ .

**EXAMPLE 4** Finding a Limit by Graphing a Function

Graph the function

$$f(x) = \begin{cases} 2x - 4 & \text{if } x \neq 3 \\ -5 & \text{if } x = 3. \end{cases}$$

Use the graph to find  $\lim_{x \rightarrow 3} f(x)$ .

**SOLUTION**

This piecewise function is defined by two equations. Graph the piece defined by the linear function,  $f(x) = 2x - 4$ , using the  $y$ -intercept,  $-4$ , and the slope, 2. Because  $x = 3$  is not included, show an open dot on the line corresponding to  $x = 3$ . This open dot, with coordinates  $(3, 2)$ , is shown in **Figure 11.4**.

Now we complete the graph using  $f(x) = -5$  if  $x = 3$ . This part of the function is graphed as the point  $(3, -5)$ , shown as a closed blue dot in **Figure 11.4**.

To find  $\lim_{x \rightarrow 3} f(x)$ , examine the graph of  $f$  near  $x = 3$ . As  $x$  gets closer to 3, the values of  $f(x)$  get closer to the  $y$ -coordinate of the point shown by the open dot. The  $y$ -coordinate of this point is 2. We conclude from the graph that

$$\lim_{x \rightarrow 3} f(x) = 2. \quad \dots$$

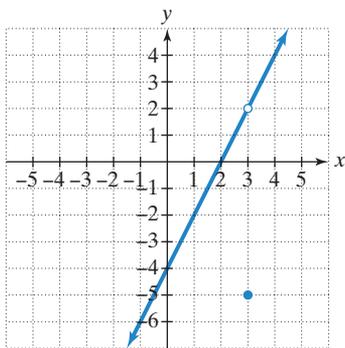

FIGURE 11.4 As  $x$  gets closer to 3, what number are the function values getting closer to?

**Check Point 4** Graph the function

$$f(x) = \begin{cases} 3x - 2 & \text{if } x \neq 2 \\ 1 & \text{if } x = 2. \end{cases}$$

Use the graph to find  $\lim_{x \rightarrow 2} f(x)$ .

- 4 Find one-sided limits and use them to determine if a limit exists.

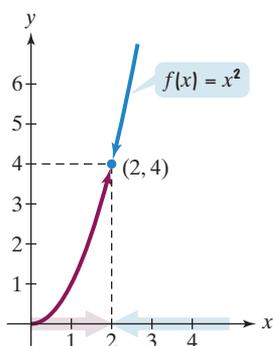

FIGURE 11.5 As  $x$  approaches 2 from the left (red arrow) or from the right (blue arrow), values of  $f(x)$  get closer to 4.

## One-Sided Limits

The graph in **Figure 11.5** shows a portion of the graph of the function  $f(x) = x^2$ . The graph illustrates that

$$\lim_{x \rightarrow 2} x^2 = 4.$$

As  $x$  gets closer to 2, but remains unequal to 2, the corresponding values of  $f(x)$  get closer to 4. The values of  $x$  near 2 fall into two categories: those that lie to the left of 2, shown by the red arrow on the  $x$ -axis, and those that lie to the right of 2, shown by the blue arrow on the  $x$ -axis.

The values of  $x$  can get closer to 2 in two ways. The values of  $x$  can approach 2 from the left, through numbers that are less than 2. **Table 11.4** shows some values of  $x$  and the corresponding values of  $f(x)$  rounded to four decimal places. The red portion of the graph in **Figure 11.5** shows that as  $x$  approaches 2 from the left of 2,  $f(x)$  approaches 4.

Table 11.4

$x$	1.99	1.999	1.9999 $\rightarrow$
$f(x) = x^2$	3.9601	3.9960	3.9996 $\rightarrow$

We say that “the limit of  $x^2$  as  $x$  approaches 2 from the left equals 4.” The mathematical notation for this English sentence is

$$\lim_{x \rightarrow 2^-} x^2 = 4.$$

The notation  $x \rightarrow 2^-$  indicates that  $x$  is less than 2 and is approaching 2 from the left.

The values of  $x$  can also approach 2 from the right, through numbers that are greater than 2. **Table 11.5** shows some values of  $x$  and the corresponding values of  $f(x)$  rounded to four decimal places. The blue portion of the graph in **Figure 11.5** shows that as  $x$  approaches 2 from the right of 2,  $f(x)$  approaches 4.

Table 11.5

$x$	$\leftarrow$ 2.0001	2.001	2.01
$f(x) = x^2$	$\leftarrow$ 4.0004	4.0040	4.0401

We say that “the limit of  $x^2$  as  $x$  approaches 2 from the right equals 4.” The mathematical notation for this English sentence is

$$\lim_{x \rightarrow 2^+} x^2 = 4.$$

The notation  $x \rightarrow 2^+$  indicates that  $x$  is greater than 2 and is approaching 2 from the right.

In general, if  $x$  approaches  $a$  from one side, we have a **one-sided limit**.

### One-Sided Limits

**Left-Hand Limit** The limit notation

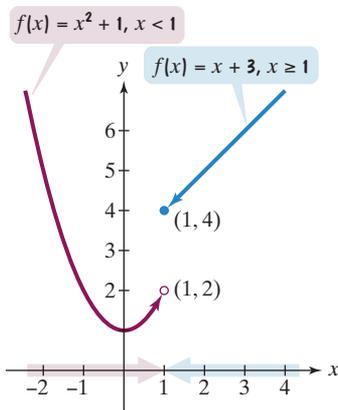

$$\lim_{x \rightarrow a^-} f(x) = L$$

is read “the limit of  $f(x)$  as  $x$  approaches  $a$  from the left equals  $L$ ” and is called the **left-hand limit**. This means that as  $x$  gets closer to  $a$ , but remains less than  $a$ , the corresponding values of  $f(x)$  get closer to  $L$ .

**Right-Hand Limit** The limit notation

$$\lim_{x \rightarrow a^+} f(x) = L$$

is read “the limit of  $f(x)$  as  $x$  approaches  $a$  from the right equals  $L$ ” and is called the **right-hand limit**. This means that as  $x$  gets closer to  $a$ , but remains greater than  $a$ , the corresponding values of  $f(x)$  get closer to  $L$ .

**FIGURE 11.6** As  $x$  approaches 1 from the left (red arrow) and from the right (blue arrow), values of  $f(x)$  do not get closer to a single number.

A function's graph can be helpful in finding one-sided limits. For example, **Figure 11.6** shows the graph of the piecewise function

$$f(x) = \begin{cases} x^2 + 1 & \text{if } x < 1 \\ x + 3 & \text{if } x \geq 1. \end{cases}$$

The red portion of the graph, part of a parabola, illustrates that as  $x$  approaches 1 from the left, the corresponding values of  $f(x)$  get closer to 2. The left-hand limit is 2:

$$\lim_{x \rightarrow 1^-} f(x) = 2.$$

The blue portion of the graph, part of a line, illustrates that as  $x$  approaches 1 from the right, the corresponding values of  $f(x)$  get closer to 4. The right-hand limit is 4:

$$\lim_{x \rightarrow 1^+} f(x) = 4.$$

Because  $\lim_{x \rightarrow 1^-} f(x) = 2$  and  $\lim_{x \rightarrow 1^+} f(x) = 4$ , there is no single number that the values of  $f(x)$  are close to when  $x$  is close to 1. In this case, we say that  **$f$  has no limit as  $x$  approaches 1** or that  **$\lim_{x \rightarrow 1} f(x)$  does not exist**.

In general, a function  $f$  has a limit as  $x$  approaches  $a$  if and only if the left-hand limit equals the right-hand limit.

### Equal and Unequal One-Sided Limits

- One-sided limits can be used to show that a function has a limit as  $x$  approaches  $a$ .

$$\lim_{x \rightarrow a} f(x) = L \text{ if and only if both}$$

$$\lim_{x \rightarrow a^-} f(x) = L \text{ and } \lim_{x \rightarrow a^+} f(x) = L.$$

- One-sided limits can be used to show that a function has no limit as  $x$  approaches  $a$ .

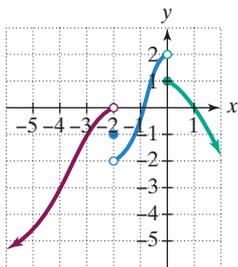

$$\text{If } \lim_{x \rightarrow a^-} f(x) = L \text{ and } \lim_{x \rightarrow a^+} f(x) = M, \text{ where } L \neq M,$$

$$\lim_{x \rightarrow a} f(x) \text{ does not exist.}$$

## GREAT QUESTION!

**Can you clarify the use of the word *from* when describing one-sided limits?**

The word *from* is helpful in distinguishing left- and right-hand limits. A left-hand limit means you approach the given  $x$ -value *from* the left. It does not mean that you approach toward the left on the graph. A right-hand limit means you approach the given  $x$ -value *from* the right. It does not mean you approach toward the right on the graph.

**FIGURE 11.7**

### EXAMPLE 5 Finding One-Sided Limits Using a Graph

Use the graph of the piecewise function  $f$  in **Figure 11.7** to find each of the following, or state that the limit or function value does not exist:

- a.  $\lim_{x \rightarrow -2^-} f(x)$       b.  $\lim_{x \rightarrow -2^+} f(x)$       c.  $\lim_{x \rightarrow -2} f(x)$       d.  $f(-2)$ .

### SOLUTION

- a. To find  $\lim_{x \rightarrow -2^-} f(x)$ , examine the portion of the graph shown in red that is near, but to the left of  $x = -2$ . As  $x$  approaches  $-2$  from the left, the values of  $f(x)$  get close to the  $y$ -coordinate of the point shown by the red open dot. This point,  $(-2, 0)$ , has a  $y$ -coordinate of 0. Thus,

$$\lim_{x \rightarrow -2^-} f(x) = 0.$$

- b. To find  $\lim_{x \rightarrow -2^+} f(x)$ , examine the portion of the graph shown in blue that is near but to the right of  $x = -2$ . As  $x$  approaches  $-2$  from the right, the

values of  $f(x)$  get close to the  $y$ -coordinate of the point shown by the blue open dot. This point,  $(-2, -2)$ , has a  $y$ -coordinate of  $-2$ . Thus,

$$\lim_{x \rightarrow -2^+} f(x) = -2.$$

c. We found that

$$\lim_{x \rightarrow -2^-} f(x) = 0 \quad \text{and} \quad \lim_{x \rightarrow -2^+} f(x) = -2.$$

The limit as  $x$  approaches  $-2$  from the left equals  $0$ .

The limit as  $x$  approaches  $-2$  from the right equals  $-2$ .

Because the left- and right-hand limits are unequal,  $\lim_{x \rightarrow -2} f(x)$  does not exist.

d. To find  $f(-2)$ , examine the graph of  $f$  at  $x = -2$ . The graph of  $f$  at  $-2$  is shown by the blue closed dot with coordinates  $(-2, -1)$ . Thus,  $f(-2) = -1$ .

 **Check Point 5** Use the graph of the piecewise function  $f$  in **Figure 11.7** to find each of the following, or state that the limit or function value does not exist:

- a.  $\lim_{x \rightarrow 0} f(x)$       b.  $\lim_{x \rightarrow 0^+} f(x)$       c.  $\lim_{x \rightarrow 0^-} f(x)$       d.  $f(0)$ .

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- The notation  $\lim_{x \rightarrow a} f(x) = L$  is read “the \_\_\_\_\_ of \_\_\_\_\_ as \_\_\_\_\_ approaches \_\_\_\_\_ equals the number \_\_\_\_\_.”
- The notation  $\lim_{x \rightarrow a} f(x) = L$  means that as \_\_\_\_\_ gets closer to \_\_\_\_\_, but remains unequal to \_\_\_\_\_, the corresponding values of \_\_\_\_\_ get closer to \_\_\_\_\_.
- True or false: If  $\lim_{x \rightarrow a} f(x) = L$ , then the value of  $f$  at  $a$  is equal to  $L$ . \_\_\_\_\_
- The notation  $\lim_{x \rightarrow a} f(x) = L$  is called the \_\_\_\_\_ limit. The notation means that as \_\_\_\_\_ gets closer to \_\_\_\_\_, but remains less than \_\_\_\_\_, the corresponding values of \_\_\_\_\_ get closer to \_\_\_\_\_.
- The notation  $\lim_{x \rightarrow a^+} f(x) = L$  is called the \_\_\_\_\_ limit. The notation means that as \_\_\_\_\_ gets closer to \_\_\_\_\_, but remains greater than \_\_\_\_\_, the corresponding values of \_\_\_\_\_ get closer to \_\_\_\_\_.
- If  $\lim_{x \rightarrow a} f(x) = L$  and  $\lim_{x \rightarrow a^+} f(x) = L$ , then  $\lim_{x \rightarrow a} f(x)$  \_\_\_\_\_.
- If  $\lim_{x \rightarrow a} f(x) = L$  and  $\lim_{x \rightarrow a^+} f(x) = M$ , where  $L \neq M$ , then  $\lim_{x \rightarrow a} f(x)$  \_\_\_\_\_.

## EXERCISE SET 11.1

### Practice Exercises

In Exercises 1–4, use each table to find the indicated limit.

1.  $\lim_{x \rightarrow 2} 2x^2$

$x$	1.99	1.999	1.9999 $\rightarrow$ $\leftarrow$ 2.0001	2.001	2.01
$f(x) = 2x^2$	7.9202	7.9920	7.9992 $\rightarrow$ $\leftarrow$ 8.0008	8.0080	8.0802

2.  $\lim_{x \rightarrow 3} 5x^2$

$x$	2.99	2.999	2.9999 $\rightarrow$ $\leftarrow$ 3.0001	3.001	3.01
$f(x) = 5x^2$	44.701	44.970	44.997 $\rightarrow$ $\leftarrow$ 45.003	45.030	45.301

3.  $\lim_{x \rightarrow 0} \frac{\sin 3x}{x}$

$x$	-0.03	-0.02	-0.01 $\rightarrow$ $\leftarrow$ 0.01	0.02	0.03
$f(x) = \frac{\sin 3x}{x}$	2.9960	2.9982	2.9996 $\rightarrow$ $\leftarrow$ 2.9996	2.9982	2.9960

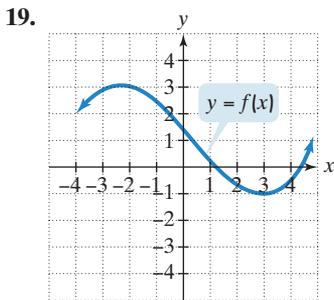

4.  $\lim_{x \rightarrow 0} \frac{\sin 4x}{\sin 2x}$

$x$	-0.03	-0.02	-0.01 $\rightarrow$ $\leftarrow$ 0.01	0.02	0.03
$f(x) = \frac{\sin 4x}{\sin 2x}$	1.9964	1.9984	1.9996 $\rightarrow$ $\leftarrow$ 1.9996	1.9984	1.9964

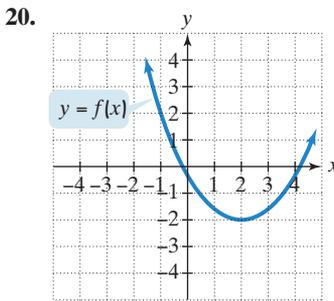

In Exercises 5–18, construct a table to find the indicated limit.

- |  |  |
|--|--|
| 5. $\lim_{x \rightarrow 2} 5x^2$                     | 6. $\lim_{x \rightarrow 2} (x^2 - 1)$                |
| 7. $\lim_{x \rightarrow 3} \frac{1}{x - 2}$          | 8. $\lim_{x \rightarrow 4} \frac{1}{x - 3}$          |
| 9. $\lim_{x \rightarrow 0} \frac{x}{x^2 + 1}$        | 10. $\lim_{x \rightarrow 0} \frac{x + 1}{x^2 + 1}$   |
| 11. $\lim_{x \rightarrow -2} \frac{x^3 + 8}{x + 2}$  | 12. $\lim_{x \rightarrow -5} \frac{x^2 - 25}{x + 5}$ |
| 13. $\lim_{x \rightarrow 0} \frac{2x^2 + x}{\sin x}$ | 14. $\lim_{x \rightarrow 0} \frac{\sin x^2}{x}$      |
| 15. $\lim_{x \rightarrow 0} \frac{\tan x}{x}$        | 16. $\lim_{x \rightarrow 0} \frac{x^2}{\sec x - 1}$  |
17.  $\lim_{x \rightarrow 0} f(x)$ , where  $f(x) = \begin{cases} x + 1 & \text{if } x < 0 \\ 2x + 1 & \text{if } x \geq 0 \end{cases}$
18.  $\lim_{x \rightarrow 0} f(x)$ , where  $f(x) = \begin{cases} x + 2 & \text{if } x < 0 \\ 3x + 2 & \text{if } x \geq 0 \end{cases}$

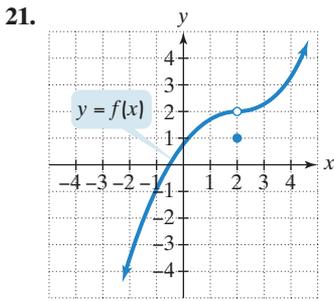

In Exercises 19–22, use the graph of  $f$  to find the indicated limit and function value.

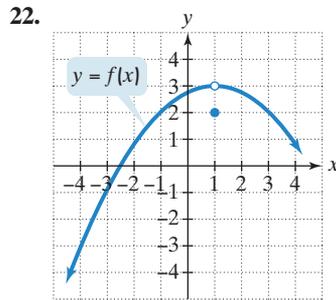

19. a.  $\lim_{x \rightarrow 3} f(x)$       b.  $f(3)$

20. a.  $\lim_{x \rightarrow 2} f(x)$       b.  $f(2)$

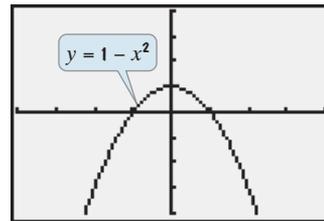

21. a.  $\lim_{x \rightarrow 2} f(x)$       b.  $f(2)$

22. a.  $\lim_{x \rightarrow 1} f(x)$       b.  $f(1)$

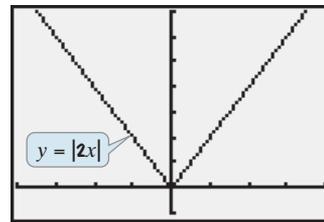

In Exercises 23–26, use the graph and the viewing rectangle shown below the graph to find the indicated limit.

23.  $\lim_{x \rightarrow 2} (1 - x^2)$

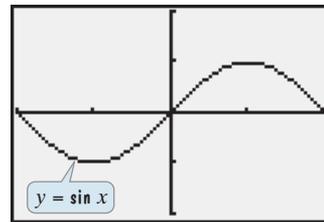

$[-4, 4, 1]$  by  $[-4, 4, 1]$

24.  $\lim_{x \rightarrow 2} |2x|$

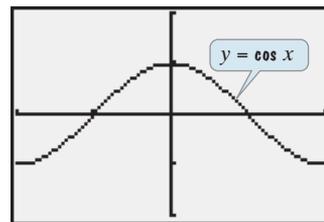

$[-4, 4, 1]$  by  $[-1, 7, 1]$

25.  $\lim_{x \rightarrow -2} \sin x$

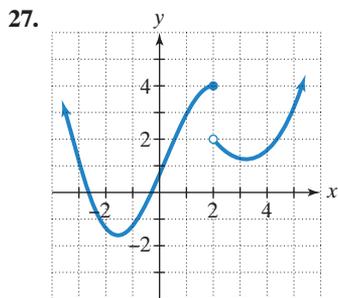

$[-\pi, \pi, \frac{\pi}{2}]$  by  $[-2, 2, 1]$

26.  $\lim_{x \rightarrow \frac{\pi}{2}} \cos x$

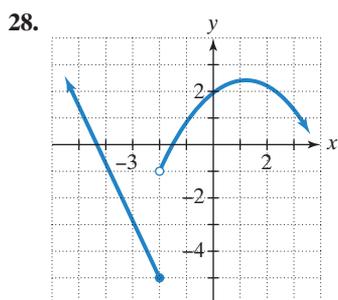

$[-\pi, \pi, \frac{\pi}{2}]$  by  $[-2, 2, 1]$

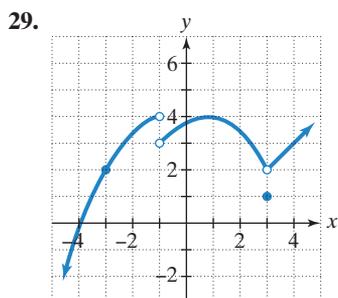

In Exercises 27–32, the graph of a function is given. Use the graph to find the indicated limits and function values, or state that the limit or function value does not exist.

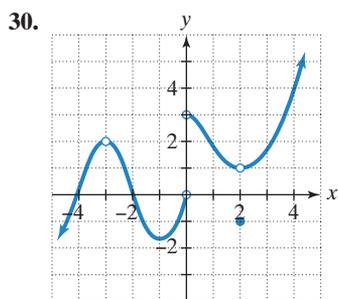

- a.  $\lim_{x \rightarrow 2^-} f(x)$    b.  $\lim_{x \rightarrow 2^+} f(x)$    c.  $\lim_{x \rightarrow 2} f(x)$    d.  $f(2)$

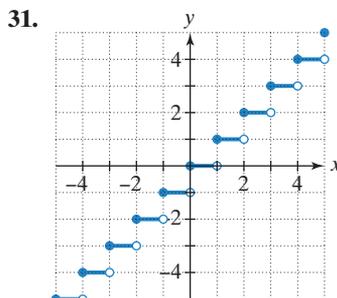

- a.  $\lim_{x \rightarrow -2^-} f(x)$    b.  $\lim_{x \rightarrow -2^+} f(x)$    c.  $\lim_{x \rightarrow -2} f(x)$    d.  $f(-2)$

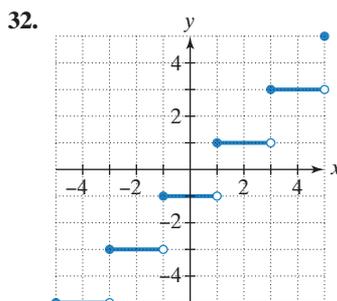

- a.  $\lim_{x \rightarrow 3^-} f(x)$    b.  $\lim_{x \rightarrow 3^+} f(x)$    c.  $\lim_{x \rightarrow 3} f(x)$    d.  $f(-3)$   
 e.  $\lim_{x \rightarrow -1^-} f(x)$    f.  $\lim_{x \rightarrow -1^+} f(x)$    g.  $\lim_{x \rightarrow -1} f(x)$    h.  $f(-1)$   
 i.  $\lim_{x \rightarrow 3^-} f(x)$    j.  $\lim_{x \rightarrow 3^+} f(x)$    k.  $\lim_{x \rightarrow 3} f(x)$    l.  $f(3)$

- a.  $\lim_{x \rightarrow 3^-} f(x)$    b.  $\lim_{x \rightarrow 3^+} f(x)$    c.  $\lim_{x \rightarrow 3} f(x)$    d.  $f(-3)$   
 e.  $\lim_{x \rightarrow 0^-} f(x)$    f.  $\lim_{x \rightarrow 0^+} f(x)$    g.  $\lim_{x \rightarrow 0} f(x)$    h.  $f(0)$   
 i.  $\lim_{x \rightarrow 2^-} f(x)$    j.  $\lim_{x \rightarrow 2^+} f(x)$    k.  $\lim_{x \rightarrow 2} f(x)$    l.  $f(2)$

- a.  $\lim_{x \rightarrow 2^-} f(x)$    b.  $\lim_{x \rightarrow 2^+} f(x)$    c.  $\lim_{x \rightarrow 2} f(x)$    d.  $f(2)$   
 e.  $\lim_{x \rightarrow 2.5^-} f(x)$    f.  $\lim_{x \rightarrow 2.5^+} f(x)$    g.  $\lim_{x \rightarrow 2.5} f(x)$    h.  $f(2.5)$

- a.  $\lim_{x \rightarrow 3^-} f(x)$    b.  $\lim_{x \rightarrow 3^+} f(x)$    c.  $\lim_{x \rightarrow 3} f(x)$    d.  $f(3)$   
 e.  $\lim_{x \rightarrow 3.5^-} f(x)$    f.  $\lim_{x \rightarrow 3.5^+} f(x)$    g.  $\lim_{x \rightarrow 3.5} f(x)$    h.  $f(3.5)$

In Exercises 33–54, graph each function. Then use your graph to find the indicated limit, or state that the limit does not exist.

33.  $f(x) = 2x + 1, \lim_{x \rightarrow 3} f(x)$    34.  $f(x) = 2x - 1, \lim_{x \rightarrow 3} f(x)$

35.  $f(x) = 4 - x^2, \lim_{x \rightarrow 3} f(x)$    36.  $f(x) = 9 - x^2, \lim_{x \rightarrow 2} f(x)$

37.  $f(x) = |x + 1|, \lim_{x \rightarrow -1} f(x)$    38.  $f(x) = |x + 2|, \lim_{x \rightarrow 2} f(x)$

39.  $f(x) = \frac{1}{x}, \lim_{x \rightarrow -1} f(x)$    40.  $f(x) = \frac{1}{x^2}, \lim_{x \rightarrow -1} f(x)$

41.  $f(x) = \frac{x^2 - 1}{x - 1}, \lim_{x \rightarrow 1} f(x)$    42.  $f(x) = \frac{x^2 - 100}{x - 10}, \lim_{x \rightarrow 10} f(x)$

43.  $f(x) = e^x, \lim_{x \rightarrow 0} f(x)$    44.  $f(x) = \ln x, \lim_{x \rightarrow 1} f(x)$

45.  $f(x) = \sin x, \lim_{x \rightarrow \pi} f(x)$    46.  $f(x) = \cos x, \lim_{x \rightarrow \pi} f(x)$

47.  $f(x) = \begin{cases} x + 1 & \text{if } x \neq 2 \\ 5 & \text{if } x = 2 \end{cases}, \lim_{x \rightarrow 2} f(x)$

48.  $f(x) = \begin{cases} x - 1 & \text{if } x \neq 3 \\ 4 & \text{if } x = 3 \end{cases}, \lim_{x \rightarrow 3} f(x)$

49.  $f(x) = \begin{cases} x + 3 & \text{if } x < 0 \\ 4 & \text{if } x \geq 0 \end{cases}, \lim_{x \rightarrow 0} f(x)$

50.  $f(x) = \begin{cases} x + 4 & \text{if } x < 0 \\ 5 & \text{if } x \geq 0 \end{cases}, \lim_{x \rightarrow 0} f(x)$

51.  $f(x) = \begin{cases} 2x & \text{if } x < 1 \\ x + 1 & \text{if } x \geq 1 \end{cases}, \lim_{x \rightarrow 1} f(x)$

52.  $f(x) = \begin{cases} 3x & \text{if } x < 1 \\ x + 2 & \text{if } x \geq 1 \end{cases}, \lim_{x \rightarrow 1} f(x)$

53.  $f(x) = \begin{cases} x + 1 & \text{if } x < 0 \\ \sin x & \text{if } x \geq 0 \end{cases}, \lim_{x \rightarrow 0} f(x)$

$$54. f(x) = \begin{cases} x & \text{if } x < 0 \\ \cos x & \text{if } x \geq 0, \lim_{x \rightarrow 0} f(x) \end{cases}$$

**Practice Plus**

In Exercises 55–56, use the equations for the functions  $f$  and  $g$  to graph the function  $y = (f \circ g)(x)$ . Then use the graph of  $f \circ g$  to find the indicated limit.

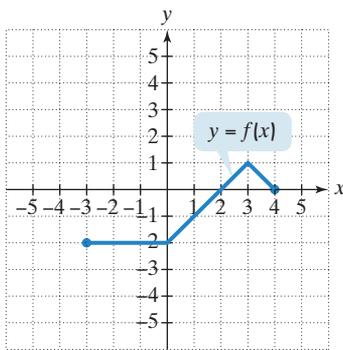

55.  $f(x) = x^2 - 5, g(x) = \sqrt{x}; \lim_{x \rightarrow 2} (f \circ g)(x)$

56.  $f(x) = x^2 + 3, g(x) = \sqrt{x}; \lim_{x \rightarrow 1} (f \circ g)(x)$

In Exercises 57–58, use the equation for the function  $f$  to find and graph the function  $y = f^{-1}(x)$ . Then use the graph of  $f^{-1}$  to find the indicated limit.

57.  $f(x) = x^3 - 2; \lim_{x \rightarrow 6} f^{-1}(x)$     58.  $f(x) = x^3 - 4; \lim_{x \rightarrow 4} f^{-1}(x)$

In Exercises 59–66, use the graph of  $y = f(x)$  to graph each function  $g$ . Then use the graph of  $g$  to find the indicated limit.

59.  $g(x) = f(x) + 2; \lim_{x \rightarrow 3} g(x)$

60.  $g(x) = f(x) - 2; \lim_{x \rightarrow 3} g(x)$

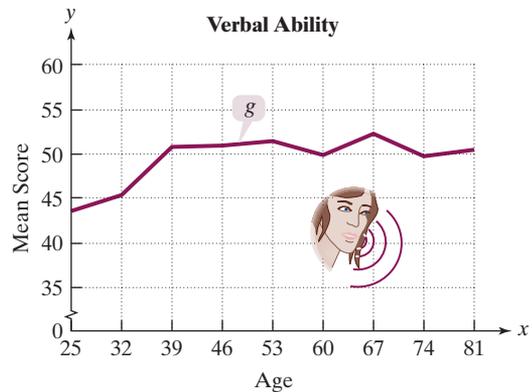

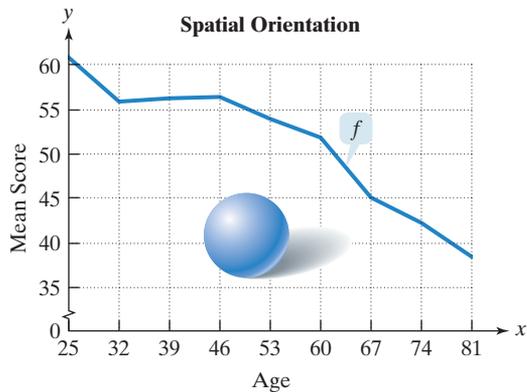

61.  $g(x) = f(x + 3); \lim_{x \rightarrow 1} g(x)$

62.  $g(x) = f(x + 2); \lim_{x \rightarrow 2} g(x)$

68. You are riding along an expressway traveling  $x$  miles per hour. The function  $f(x) = 0.015x^2 + x + 10$  describes the recommended safe distance,  $f(x)$ , in feet, between your car and other cars on the expressway. Use the values in the table below to find  $\lim_{x \rightarrow 60} f(x)$ . Describe what this means in terms of your car's speed and the recommended safe distance.

$x$	59.9	59.99	$59.999 \rightarrow \leftarrow 60.001$	60.01	60.1
$f(x) = 0.015x^2 + x + 10$	123.72	123.972	$123.997 \rightarrow \leftarrow 124.003$	124.028	124.28

Functions can be used to model changes in intellectual abilities over one's life span. The graphs of  $f$  and  $g$  show mean scores on standardized tests measuring spatial orientation and verbal ability, respectively, as a function of age. Use the graphs of  $f$  and  $g$  to solve Exercises 69–70.

Source: Wade and Tavris, *Psychology Sixth Edition*, Prentice Hall, 2000

69. What mean score in spatial orientation is associated with a person whose age is close to 67? Use limit notation to express the answer.

63.  $g(x) = -f(x); \lim_{x \rightarrow -3^+} g(x)$

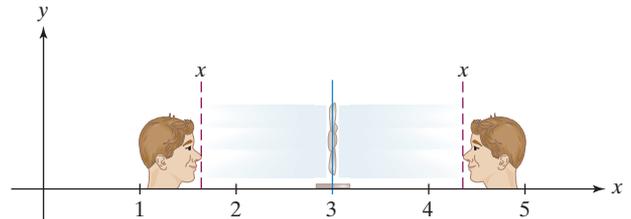

64.  $g(x) = -2f(x); \lim_{x \rightarrow -3^+} g(x)$

65.  $g(x) = f(2x); \lim_{x \rightarrow 1} g(x)$

66.  $g(x) = f(\frac{1}{2}x); \lim_{x \rightarrow 1} g(x)$

**Application Exercises**

67. You are approaching a fan located at 3 on the  $x$ -axis.

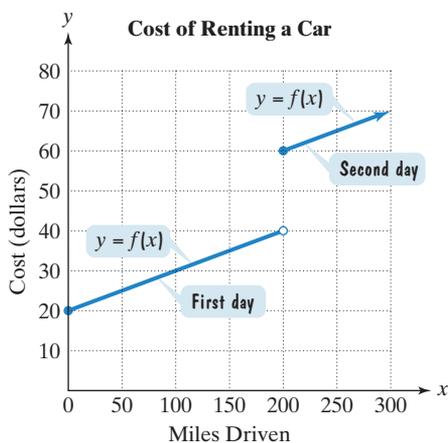

The function  $f$  describes the breeze that you feel,  $f(x)$ , in miles per hour, when your nose is at position  $x$  on the  $x$ -axis. Use the values in the table to solve this exercise.

$x$	2.9	2.99	$2.999 \rightarrow \leftarrow 3.001$	3.01	3.1
$f(x)$	7.7	7.92	$7.991 \rightarrow \leftarrow 7.991$	7.92	7.7

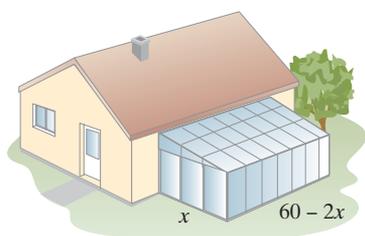

- Find  $\lim_{x \rightarrow 3} f(x)$ . Describe what this means in terms of the location of your nose and the breeze that you feel.
- Would it be a good idea to move closer so that you actually reach  $x = 3$ ? Describe the difference between what you feel for  $\lim_{x \rightarrow 3} f(x)$  and  $f(3)$ .

70. What mean score in verbal ability is associated with a person whose age is close to 60? Use limit notation to express the answer.

71. You rent a car from a company that charges \$20 per day plus \$0.10 per mile. The car is driven 200 miles in the first day. The figure shows the graph of the cost,  $f(x)$ , in dollars, as a function of the miles,  $x$ , that you drive the car.

- Find  $\lim_{x \rightarrow 100} f(x)$ . Interpret the limit, referring to miles driven and cost.
  - For the first day only, what is the rental cost approaching as the mileage gets closer to 200?
  - What is the cost to rent the car at the start of the second day?
72. You are building a greenhouse next to your house, as shown in the figure. Because the house will be used for one side of the enclosure, only three sides will need to be enclosed. You have 60 feet of fiberglass to enclose the three walls.

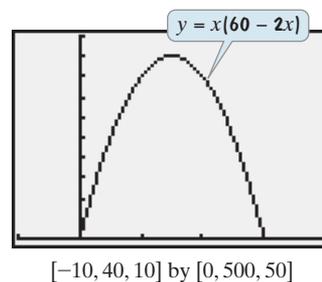

The function  $f(x) = x(60 - 2x)$  describes the area of the greenhouse that you can enclose,  $f(x)$ , in square feet, if the width of the greenhouse is  $x$  feet.

- Use the table shown to find  $\lim_{x \rightarrow 15} f(x)$ .

X	Y1
14.7	449.82
14.8	449.92
14.9	449.98
15	
15.1	449.98
15.2	449.92
15.3	449.82

Y1  $X*(60-2X)$

- Use the graph shown to find  $\lim_{x \rightarrow 15} f(x)$ . Do you get the same limit as you did in part (a)? What information about the limit is shown by the graph that might not be obvious from the table?

### Writing in Mathematics

- Explain how to read  $\lim_{x \rightarrow a} f(x) = L$ .
- What does the limit notation  $\lim_{x \rightarrow a} f(x) = L$  mean?
- Without showing the details, explain how to use a table to find  $\lim_{x \rightarrow 4} x^2$ .
- Explain how a graph can be used to find a limit.
- When we find  $\lim_{x \rightarrow a} f(x)$ , we do not care about the value of the function at  $x = a$ . Explain why this is so.
- Explain how to read  $\lim_{x \rightarrow a} f(x) = L$ .
- What does the limit notation  $\lim_{x \rightarrow a} f(x) = L$  mean?
- Explain how to read  $\lim_{x \rightarrow a} f(x) = L$ .
- What does the limit notation  $\lim_{x \rightarrow a} f(x) = L$  mean?
- What does it mean if the limits in Exercises 79 and 81 are not both equal to the same number  $L$ ?

### Technology Exercises

- Use the **TABLE** feature of your graphing utility to verify any five of the limits that you found in Exercises 5–16.
- Use the **ZOOM IN** feature of your graphing utility to verify any five of the limits that you found in Exercises 33–46. Zoom in on the graph of the given function,  $f$ , near  $x = a$  to verify each limit.

In Exercises 85–88, estimate  $\lim_{x \rightarrow a} f(x)$  by using the **TABLE** feature of your graphing utility to create a table of values. Then use the **ZOOM IN** feature to zoom in on the graph of  $f$  near  $x = a$  to justify or improve your estimate.

- $\lim_{x \rightarrow 0} \frac{2^x - 1}{x}$
- $\lim_{x \rightarrow 4} \frac{\ln x - \ln 4}{x - 4}$
- $\lim_{x \rightarrow 1} \frac{x^{3/2} - 1}{x - 1}$
- $\lim_{x \rightarrow 0} \frac{x^2}{1 - \cos 2x}$

### Critical Thinking Exercises

**Make Sense?** In Exercises 89–92, determine whether each statement makes sense or does not make sense, and explain your reasoning.

- Limits indicate that a graph can get really close to values without actually reaching them.
- I'm working with a function that is undefined at 5, so  $\lim_{x \rightarrow 5} f(x)$  does not exist.

- 91. I'm working with a function that is undefined at 3, but defined at 2.99, 2.999, 2.9999, as well as at 3.01, 3.001, and 3.0001.
- 92. I'm working with a function for which  $\lim_{x \rightarrow a^-} f(x) \neq \lim_{x \rightarrow a^+} f(x)$ , so I cannot draw the graph of the function near  $a$  without lifting my pencil off the paper.
- 93. Give an example of a function that is not defined at 2 for which  $\lim_{x \rightarrow 2} f(x) = 5$ .
- 94. Consider the function  $f(x) = 3x + 2$ . As  $x$  approaches 1,  $f(x)$  approaches 5:  $\lim_{x \rightarrow 1} f(x) = 5$ . Find the values of  $x$  such that  $f(x)$  is within 0.1 of 5 by solving  $|f(x) - 5| < 0.1$ .  
Then find the values of  $x$  such that  $f(x)$  is within 0.01 of 5.
- 95. Find an estimate of  $3^\pi$  ( $\pi \approx 3.14159265$ ) by taking a sequence of rational numbers,  $x_1, x_2, x_3, \dots$  that approaches  $\pi$ . Obtain your estimate by evaluating  $3^{x_1}, 3^{x_2}, 3^{x_3}, \dots$

**Preview Exercises**

Exercises 96–98 will help you prepare for the material covered in the next section.

- 96. a. Graph the piecewise function:

$$f(x) = \begin{cases} x^2 + 5 & \text{if } x < 2 \\ 3x + 1 & \text{if } x \geq 2. \end{cases}$$

- b. Use your graph from part (a) to find each of the following limits, or indicate that the limit does not exist:  $\lim_{x \rightarrow 2^-} f(x)$ ;  $\lim_{x \rightarrow 2^+} f(x)$ ;  $\lim_{x \rightarrow 2} f(x)$ .

- 97. Simplify:  $\frac{x^2 - x - 6}{x - 3}$ .

- 98. Rationalize the numerator:  $\frac{\sqrt{4 + x} - 2}{x}$ .

**SECTION 11.2**

**Finding Limits Using Properties of Limits**

*Objectives*

- 1 Find limits of constant functions and the identity function.
- 2 Find limits using properties of limits.
- 3 Find one-sided limits using properties of limits.
- 4 Find limits of fractional expressions in which the limit of the denominator is zero.

Isaac Newton

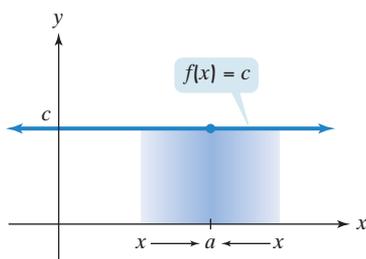

Gottfried Leibniz

Calculus was invented independently by British mathematician Isaac Newton (1642–1727) and German mathematician Gottfried Leibniz (1646–1716). Although Newton stated that limits were the basic concept in calculus, neither he nor Leibniz was able to express the idea of a limit in a precise mathematical fashion. In essence, Newton and Leibniz developed calculus into a powerful tool even though they could not fully understand why the tool worked.

A great triumph of calculus came with the work of German mathematician Karl Weierstrass (1815–1897). Weierstrass provided a precise definition of  $\lim_{x \rightarrow a} f(x) = L$ , placing calculus on a sound footing almost two hundred years after its invention. The properties of limits presented in this section are theorems that you will prove in calculus using this definition. In this section, you will learn to apply these properties to find limits.

**Limits Involving Constant Functions and the Identity Function**

We frequently encounter the constant function,  $f(x) = c$ , and the identity function,  $f(x) = x$ . **Figure 11.8** shows the graph of the constant function. The graph is a horizontal line. What does this mean about the limit as  $x$  approaches  $a$ ? Regardless of how close  $x$  is to  $a$ , the corresponding value of  $f(x)$  is  $c$ . Thus, if  $f(x) = c$ , then  $\lim_{x \rightarrow a} f(x) = c$ .

**FIGURE 11.8** The graph of the constant function  $f(x) = c$ . No matter how close  $x$  is to  $a$ , the corresponding value of  $f(x)$  is  $c$ .

- 1 Find limits of constant functions and the identity function.

### Limit of a Constant Function

For the constant function  $f(x) = c$ ,

$$\lim_{x \rightarrow a} f(x) = \lim_{x \rightarrow a} c = c,$$

where  $a$  is any number. In words, regardless of what number  $x$  is approaching, the limit of any constant is that constant.

### EXAMPLE 1 Finding Limits of Constant Functions

Find the following limits:

a.  $\lim_{x \rightarrow 4} 7$       b.  $\lim_{x \rightarrow 0} (-5)$ .

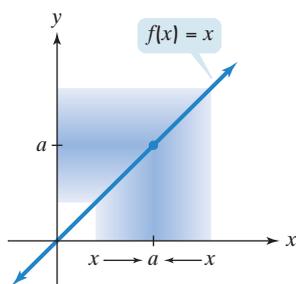

### SOLUTION

Regardless of what number  $x$  is approaching, the limit of any constant is that constant:  $\lim_{x \rightarrow a} c = c$ . Using this formula, we find the given limits.

a.  $\lim_{x \rightarrow 4} 7 = 7$       b.  $\lim_{x \rightarrow 0} (-5) = -5$       ...

 **Check Point 1** Find the following limits:

a.  $\lim_{x \rightarrow 8} 11$       b.  $\lim_{x \rightarrow 0} (-9)$ .

**FIGURE 11.9** The graph of the identity function  $f(x) = x$ . No matter how close  $x$  is to  $a$ , the corresponding value of  $f(x)$  is just as close to  $a$ .

The graph of the identity function,  $f(x) = x$ , is shown in **Figure 11.9**. Each input for this function is associated with an identical output. What does this mean about the limit as  $x$  approaches  $a$ ? For any value of  $a$ , as  $x$  gets closer to  $a$ , the corresponding value of  $f(x)$  is just as close to  $a$ . Thus, if  $f(x) = x$ , then  $\lim_{x \rightarrow a} f(x) = a$ .

### Limit of the Identity Function

For the identity function  $f(x) = x$ ,

$$\lim_{x \rightarrow a} f(x) = \lim_{x \rightarrow a} x = a,$$

where  $a$  is any number. In words, the limit of  $x$  as  $x$  approaches any number is that number.

### EXAMPLE 2 Finding Limits of the Identity Function

Find the following limits:

a.  $\lim_{x \rightarrow 7} x$       b.  $\lim_{x \rightarrow -\pi} x$ .

### SOLUTION

We use the formula  $\lim_{x \rightarrow a} x = a$ . The number that  $x$  is approaching is also the limit.

a.  $\lim_{x \rightarrow 7} x = 7$       b.  $\lim_{x \rightarrow -\pi} x = -\pi$       ...

 **Check Point 2** Find the following limits:

a.  $\lim_{x \rightarrow 19} x$       b.  $\lim_{x \rightarrow -\sqrt{2}} x$ .

- 2 Find limits using properties of limits.

## Properties of Limits

How do we find the limit of a sum, such as

$$\lim_{x \rightarrow 5} (x + 7)?$$

We find the limit of each function in the sum:

$$\lim_{x \rightarrow 5} x = 5 \quad \text{and} \quad \lim_{x \rightarrow 5} 7 = 7.$$

Use the formula  
 $\lim_{x \rightarrow a} x = a$ .

Use the formula  
 $\lim_{x \rightarrow a} c = c$ .

*Blitzer Bonus***The Feud Over Who Invented Calculus**

“How dare Leibniz publish a book on calculus!” fumed Isaac Newton. “He stole my ideas when he was in England. This will not pass easily.”

Although Newton and Leibniz invented calculus independently, Newton’s overwhelming fear of criticism kept him from publishing. Leibniz published his work on calculus in 1684; Newton waited over 20 years after he invented calculus and did not publish until 1687. Newton was dismayed that he did not publish his version first. Leibniz was accused of plagiarism in a report written by members of the Royal Society in England. The author of the report was not a matter of public record, for Newton himself had written most of it. Newton’s accusations against Leibniz set off a bitter dispute between British mathematicians and mathematicians on Continental Europe that lasted over 100 years.

Then we add each of these limits. Thus,

$$\lim_{x \rightarrow 5} (x + 7) = \lim_{x \rightarrow 5} x + \lim_{x \rightarrow 5} 7 = 5 + 7 = 12.$$

This is an application of a limit property involving the limit of a sum.

**The Limit of a Sum**

If  $\lim_{x \rightarrow a} f(x) = L$  and  $\lim_{x \rightarrow a} g(x) = M$ , then

$$\lim_{x \rightarrow a} [f(x) + g(x)] = \lim_{x \rightarrow a} f(x) + \lim_{x \rightarrow a} g(x) = L + M.$$

In words, the limit of the sum of two functions equals the sum of their limits.

**EXAMPLE 3 Finding the Limit of a Sum**

Find:  $\lim_{x \rightarrow -4} (x + 9)$ .

**SOLUTION**

The two functions in this limit problem are  $f(x) = x$  and  $g(x) = 9$ . We seek the limit of the sum of these functions.

$$\begin{aligned} \lim_{x \rightarrow -4} (x + 9) &= \lim_{x \rightarrow -4} x + \lim_{x \rightarrow -4} 9 && \text{The limit of a sum is the sum of the limits.} \\ &= -4 + 9 && \lim_{x \rightarrow a} x = a \text{ and } \lim_{x \rightarrow a} c = c. \\ &= 5 \end{aligned}$$

 **Check Point 3** Find:  $\lim_{x \rightarrow -3} (x + 16)$ .

In calculus, you will prove the following property involving the limit of the difference of two functions:

**The Limit of a Difference**

If  $\lim_{x \rightarrow a} f(x) = L$  and  $\lim_{x \rightarrow a} g(x) = M$ , then

$$\lim_{x \rightarrow a} [f(x) - g(x)] = \lim_{x \rightarrow a} f(x) - \lim_{x \rightarrow a} g(x) = L - M.$$

In words, the limit of the difference of two functions equals the difference of their limits.

**EXAMPLE 4 Finding the Limit of a Difference**

Find:  $\lim_{x \rightarrow 5} (12 - x)$ .

**SOLUTION**

The two functions in this limit problem are  $f(x) = 12$  and  $g(x) = x$ . We seek the limit of the difference of these functions.

$$\begin{aligned} \lim_{x \rightarrow 5} (12 - x) &= \lim_{x \rightarrow 5} 12 - \lim_{x \rightarrow 5} x && \text{The limit of a difference is the difference of the limits.} \\ &= 12 - 5 && \lim_{x \rightarrow a} c = c \text{ and } \lim_{x \rightarrow a} x = a. \\ &= 7 \end{aligned}$$

 **Check Point 4** Find:  $\lim_{x \rightarrow 14} (19 - x)$ .

Now we consider a property that will enable you to find the limit of the product of two functions.

**The Limit of a Product**

If  $\lim_{x \rightarrow a} f(x) = L$  and  $\lim_{x \rightarrow a} g(x) = M$ , then

$$\lim_{x \rightarrow a} [f(x) \cdot g(x)] = \lim_{x \rightarrow a} f(x) \cdot \lim_{x \rightarrow a} g(x) = LM.$$

In words, the limit of the product of two functions equals the product of their limits.

**EXAMPLE 5** Finding the Limit of a Product

Find:  $\lim_{x \rightarrow 5} (-6x)$ .

**SOLUTION**

The two functions in this limit problem are  $f(x) = -6$  and  $g(x) = x$ . We seek the limit of the product of these functions.

$$\begin{aligned} \lim_{x \rightarrow 5} (-6x) &= \lim_{x \rightarrow 5} (-6) \cdot \lim_{x \rightarrow 5} x && \text{The limit of a product is the product of the limits.} \\ &= -6 \cdot 5 && \lim_{x \rightarrow a} c = c \text{ and } \lim_{x \rightarrow a} x = a. \\ &= -30 \end{aligned}$$

 **Check Point 5** Find:  $\lim_{x \rightarrow 7} (-10x)$ .

**EXAMPLE 6** Finding Limits Using Properties of Limits

Find the following limits:

a.  $\lim_{x \rightarrow -3} (7x - 4)$       b.  $\lim_{x \rightarrow 5} 6x^2$ .

**SOLUTION**

$$\begin{aligned} \text{a. } \lim_{x \rightarrow -3} (7x - 4) &= \lim_{x \rightarrow -3} (7x) - \lim_{x \rightarrow -3} 4 && \text{The limit of a difference is the} \\ & && \text{difference of the limits.} \\ &= \lim_{x \rightarrow -3} 7 \cdot \lim_{x \rightarrow -3} x - \lim_{x \rightarrow -3} 4 && \text{The limit of a product is the product} \\ & && \text{of the limits.} \\ &= 7(-3) - 4 && \lim_{x \rightarrow a} c = c \text{ and } \lim_{x \rightarrow a} x = a. \\ &= -21 - 4 \\ &= -25 \\ \text{b. } \lim_{x \rightarrow 5} 6x^2 &= \lim_{x \rightarrow 5} 6 \cdot \lim_{x \rightarrow 5} x^2 && \text{The limit of a product is the product} \\ & && \text{of the limits.} \\ &= 6 \cdot \lim_{x \rightarrow 5} (x \cdot x) && \lim_{x \rightarrow a} c = c \\ &= 6 \cdot \lim_{x \rightarrow 5} x \cdot \lim_{x \rightarrow 5} x && \text{The limit of a product is the product} \\ & && \text{of the limits.} \\ &= 6 \cdot 5 \cdot 5 && \lim_{x \rightarrow a} x = a \\ &= 150 \end{aligned}$$

 **Check Point 6** Find the following limits:

a.  $\lim_{x \rightarrow -5} (3x - 7)$       b.  $\lim_{x \rightarrow 3} 8x^2$ .

The procedure used to find  $\lim_{x \rightarrow 5} 6x^2$  in Example 6(b) can be used to determine the limit of any monomial function in the form  $f(x) = b_n x^n$ , where  $n$  is a positive integer and  $b_n$  is a constant.

$$\begin{aligned} \lim_{x \rightarrow a} b_n x^n &= \lim_{x \rightarrow a} b_n \cdot \lim_{x \rightarrow a} x^n && \text{The limit of a product is the product of the limits.} \\ &= b_n \cdot \lim_{x \rightarrow a} \underbrace{(x \cdot x \cdot x \cdots x)}_n && \lim_{x \rightarrow a} c = c \\ &= b_n \cdot \lim_{x \rightarrow a} x \cdot \lim_{x \rightarrow a} x \cdot \lim_{x \rightarrow a} x \cdots \lim_{x \rightarrow a} x && \text{The limit of the product containing } n \text{ factors is the product of the limits.} \\ &= b_n \cdot \underbrace{a \cdot a \cdot a \cdots a}_n && \text{There are } n \text{ factors of } \lim_{x \rightarrow a} x. \\ &= b_n a^n && \lim_{x \rightarrow a} x = a \\ &= b_n a^n && \text{There are } n \text{ factors of } a. \\ &= b_n a^n && \text{This is the monomial function } f(x) = b_n x^n \text{ evaluated at } a. \end{aligned}$$

**The Limit of a Monomial**  
 If  $n$  is a positive integer and  $b_n$  is a constant, then

$$\lim_{x \rightarrow a} b_n x^n = b_n a^n$$

for any number  $a$ . In words, the limit of a monomial as  $x$  approaches  $a$  is the monomial evaluated at  $a$ .

**EXAMPLE 7** Finding the Limit of a Monomial

Find:  $\lim_{x \rightarrow 2} (-6x^4)$ .

**SOLUTION**

The limit of the monomial  $-6x^4$  as  $x$  approaches 2 is the monomial evaluated at 2. Thus, we find the limit by substituting 2 for  $x$ .

$$\lim_{x \rightarrow 2} (-6x^4) = -6 \cdot 2^4 = -6 \cdot 16 = -96 \quad \dots$$

 **Check Point 7** Find:  $\lim_{x \rightarrow 2} (-7x^3)$ .

How do we find the limit of a polynomial function

$$f(x) = b_n x^n + b_{n-1} x^{n-1} + \cdots + b_1 x + b_0$$

as  $x$  approaches  $a$ ? A polynomial is a sum of monomials. Thus, the limit of a polynomial is the sum of the limits of its monomials.

$$\begin{aligned} \lim_{x \rightarrow a} f(x) &= \lim_{x \rightarrow a} (b_n x^n + b_{n-1} x^{n-1} + \cdots + b_1 x + b_0) && f \text{ is a polynomial function.} \\ &= \lim_{x \rightarrow a} b_n x^n + \lim_{x \rightarrow a} b_{n-1} x^{n-1} + \cdots + \lim_{x \rightarrow a} b_1 x + \lim_{x \rightarrow a} b_0 && \text{The limit of a sum is the sum of the limits.} \\ &= b_n a^n + b_{n-1} a^{n-1} + \cdots + b_1 a + b_0 && \text{Find limits by evaluating monomials at } a. \text{ Find the last limit in the sum using } \lim_{x \rightarrow a} c = c \text{ with } c = b_0. \\ &= f(a) && \text{This is the polynomial function } f(x) = b_n x^n + b_{n-1} x^{n-1} + \cdots + b_1 x + b_0 \text{ evaluated at } a. \end{aligned}$$

### The Limit of a Polynomial

If  $f$  is a polynomial function, then

$$\lim_{x \rightarrow a} f(x) = f(a)$$

for any number  $a$ . In words, the limit of a polynomial as  $x$  approaches  $a$  is the polynomial evaluated at  $a$ .

### EXAMPLE 8 Finding the Limit of a Polynomial

Find:  $\lim_{x \rightarrow 3} (4x^3 + 2x^2 - 6x + 5)$ .

#### SOLUTION

The limit of the polynomial  $4x^3 + 2x^2 - 6x + 5$  as  $x$  approaches 3 is the polynomial evaluated at 3. Thus, we find the limit by substituting 3 for  $x$ .

$$\begin{aligned} \lim_{x \rightarrow 3} (4x^3 + 2x^2 - 6x + 5) &= 4 \cdot 3^3 + 2 \cdot 3^2 - 6 \cdot 3 + 5 \\ &= 4 \cdot 27 + 2 \cdot 9 - 6 \cdot 3 + 5 \\ &= 108 + 18 - 18 + 5 \\ &= 113 \end{aligned}$$

...

 **Check Point 8** Find:  $\lim_{x \rightarrow 2} (7x^3 + 3x^2 - 5x + 3)$ .

A linear function,  $f(x) = mx + b$ , is a polynomial function of degree one. This means that the limit of a linear function as  $x$  approaches  $a$  is the linear function evaluated at  $a$ :

$$\lim_{x \rightarrow a} (mx + b) = ma + b.$$

For example,

$$\lim_{x \rightarrow 4} (3x - 7) = 3 \cdot 4 - 7 = 12 - 7 = 5.$$

The next limit property involves the limit of a function to a power, such as

$$\lim_{x \rightarrow 2} (x^2 + 2x - 3)^4.$$

To find such a limit, first find  $\lim_{x \rightarrow 2} (x^2 + 2x - 3)$ :

$$\lim_{x \rightarrow 2} (x^2 + 2x - 3) = 2^2 + 2 \cdot 2 - 3 = 4 + 4 - 3 = 5.$$

The limit that we seek is found by taking this limit, 5, and raising it to the fourth power. Thus,

$$\lim_{x \rightarrow 2} (x^2 + 2x - 3)^4 = \left[ \lim_{x \rightarrow 2} (x^2 + 2x - 3) \right]^4 = 5^4 = 625.$$

### The Limit of a Power

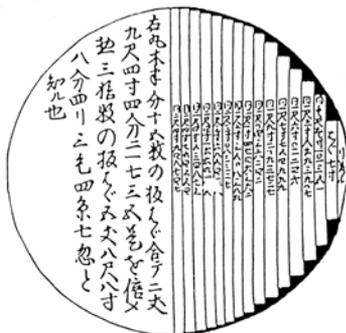

If  $\lim_{x \rightarrow a} f(x) = L$  and  $n$  is a positive integer, then

$$\lim_{x \rightarrow a} [f(x)]^n = \left[ \lim_{x \rightarrow a} f(x) \right]^n = L^n.$$

In words, the limit of a function to a power is found by taking the limit of the function and then raising this limit to the power.

### Blitzer Bonus Calculus in Japan

Mathematics was developed simultaneously in various cultures in all parts of the world. Seki Kowa, a 17th-century Japanese mathematician, is credited with the invention of calculus in Japan. The illustration shown below was drawn in 1670 by a pupil of Seki Kowa. It measures the circle's area with a series of rectangles.

**EXAMPLE 9** Finding the Limit of a PowerFind:  $\lim_{x \rightarrow 5} (2x - 7)^3$ .**SOLUTION**

The limit of the linear function  $f(x) = 2x - 7$  as  $x$  approaches 5 is the linear function evaluated at 5. Because this function is raised to the third power, the limit that we seek is the limit of the linear function raised to the third power.

$$\lim_{x \rightarrow 5} (2x - 7)^3 = \left[ \lim_{x \rightarrow 5} (2x - 7) \right]^3 = (2 \cdot 5 - 7)^3 = 3^3 = 27 \quad \dots$$

 **Check Point 9** Find:  $\lim_{x \rightarrow 4} (3x - 5)^3$ .

How do we find the limit of a root? Recall that if  $\sqrt[n]{L}$  represents a real number and  $n \geq 2$ , then

$$\sqrt[n]{L} = L^{1/n}.$$

Because a root is a power, we find the limit of a root using a similar procedure for finding the limit of a power.

**The Limit of a Root**

If  $\lim_{x \rightarrow a} f(x) = L$  and  $n$  is a positive integer greater than or equal to 2, then

$$\lim_{x \rightarrow a} \sqrt[n]{f(x)} = \sqrt[n]{\lim_{x \rightarrow a} f(x)} = \sqrt[n]{L}$$

provided that all roots represent real numbers. In words, the limit of the  $n$ th root of a function is found by taking the limit of the function and then taking the  $n$ th root of this limit.

**EXAMPLE 10** Finding the Limit of a RootFind:  $\lim_{x \rightarrow -2} \sqrt{4x^2 + 5}$ .**SOLUTION**

The limit of the quadratic (polynomial) function  $f(x) = 4x^2 + 5$  as  $x$  approaches  $-2$  is the function evaluated at  $-2$ . Because we have the square root of this function, the limit that we seek is the square root of the limit of the quadratic function.

$$\lim_{x \rightarrow -2} \sqrt{4x^2 + 5} = \sqrt{\lim_{x \rightarrow -2} (4x^2 + 5)} = \sqrt{4(-2)^2 + 5} = \sqrt{16 + 5} = \sqrt{21} \quad \dots$$

 **Check Point 10** Find:  $\lim_{x \rightarrow -1} \sqrt{6x^2 - 4}$ .

We have considered limits of sums, differences, products, and roots. We conclude with a property that deals with the limit of a quotient.

**The Limit of a Quotient**

If  $\lim_{x \rightarrow a} f(x) = L$  and  $\lim_{x \rightarrow a} g(x) = M$ ,  $M \neq 0$ , then

$$\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \frac{\lim_{x \rightarrow a} f(x)}{\lim_{x \rightarrow a} g(x)} = \frac{L}{M}, M \neq 0.$$

In words, the limit of the quotient of two functions equals the quotient of their limits, **provided that the limit of the denominator is not zero**.

Before possibly applying the quotient property, begin by finding the limit of the denominator. If this limit is not zero, you can apply the quotient property. If this limit is zero, the quotient property cannot be used.

### EXAMPLE 11 Finding the Limit of a Quotient

Find:  $\lim_{x \rightarrow 1} \frac{x^3 - 3x^2 + 7}{2x - 5}$ .

#### SOLUTION

The two functions in this limit problem are  $f(x) = x^3 - 3x^2 + 7$  and  $g(x) = 2x - 5$ . We seek the limit of the quotient of these functions. Can we use the quotient property for limits? We answer the question by finding the limit of the denominator,  $g(x)$ .

$$\lim_{x \rightarrow 1} (2x - 5) = 2 \cdot 1 - 5 = -3$$

Because the limit of the denominator is not zero, we can apply the quotient property for limits. The limit of the quotient is the quotient of the limits.

$$\lim_{x \rightarrow 1} \frac{x^3 - 3x^2 + 7}{2x - 5} = \frac{\lim_{x \rightarrow 1} (x^3 - 3x^2 + 7)}{\lim_{x \rightarrow 1} (2x - 5)} = \frac{1^3 - 3 \cdot 1^2 + 7}{2 \cdot 1 - 5} = \frac{5}{-3} = -\frac{5}{3} \dots$$

 **Check Point 11** Find:  $\lim_{x \rightarrow 2} \frac{x^2 - 4x + 1}{3x - 5}$ .

We've considered a number of limit properties. Let's take a moment to summarize these properties.

### Properties of Limits

#### Formulas for Finding Limits

- $\lim_{x \rightarrow a} c = c$
- $\lim_{x \rightarrow a} x = a$
- If  $f$  is a polynomial (linear, quadratic, cubic, etc.) function,  $\lim_{x \rightarrow a} f(x) = f(a)$ .

#### Limits of Sums, Differences, Products, Powers, Roots, and Quotients

If  $\lim_{x \rightarrow a} f(x) = L$  and  $\lim_{x \rightarrow a} g(x) = M$ , then

- $\lim_{x \rightarrow a} [f(x) + g(x)] = \lim_{x \rightarrow a} f(x) + \lim_{x \rightarrow a} g(x) = L + M$ .
- $\lim_{x \rightarrow a} [f(x) - g(x)] = \lim_{x \rightarrow a} f(x) - \lim_{x \rightarrow a} g(x) = L - M$ .
- $\lim_{x \rightarrow a} [f(x) \cdot g(x)] = \lim_{x \rightarrow a} f(x) \cdot \lim_{x \rightarrow a} g(x) = LM$ .
- $\lim_{x \rightarrow a} [f(x)]^n = [\lim_{x \rightarrow a} f(x)]^n = L^n$ , where  $n \geq 2$  is an integer.
- $\lim_{x \rightarrow a} \sqrt[n]{f(x)} = \sqrt[n]{\lim_{x \rightarrow a} f(x)} = \sqrt[n]{L}$ , where  $n \geq 2$  is an integer and all roots represent real numbers.
- $\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \frac{\lim_{x \rightarrow a} f(x)}{\lim_{x \rightarrow a} g(x)} = \frac{L}{M}$ ,  $M \neq 0$ .

- 3 Find one-sided limits using properties of limits.

### Properties of Limits and Piecewise Functions

In Section 11.1, we used graphs of piecewise functions to find one-sided limits. We can now find such limits by applying properties of limits to the appropriate part of a piecewise function's equation.

#### EXAMPLE 12 Using Limit Properties to Find One-Sided Limits

Consider the piecewise function defined by

$$f(x) = \begin{cases} x^2 + 5 & \text{if } x < 2 \\ 3x + 1 & \text{if } x \geq 2. \end{cases}$$

Find each of the following limits, or state that the limit does not exist:

- a.  $\lim_{x \rightarrow 2^-} f(x)$       b.  $\lim_{x \rightarrow 2^+} f(x)$       c.  $\lim_{x \rightarrow 2} f(x)$ .

#### SOLUTION

- a. To find  $\lim_{x \rightarrow 2^-} f(x)$ , we look at values of  $f(x)$  when  $x$  is close to 2 but less than 2. Because  $x$  is less than 2, we use the first line of the piecewise function's equation,  $f(x) = x^2 + 5$ .

$$\lim_{x \rightarrow 2^-} f(x) = \lim_{x \rightarrow 2^-} (x^2 + 5) = 2^2 + 5 = 9$$

- b. To find  $\lim_{x \rightarrow 2^+} f(x)$ , we look at values of  $f(x)$  when  $x$  is close to 2 but greater than 2. Because  $x$  is greater than 2, we use the second line of the piecewise function's equation,  $f(x) = 3x + 1$ .

$$\lim_{x \rightarrow 2^+} f(x) = \lim_{x \rightarrow 2^+} (3x + 1) = 3 \cdot 2 + 1 = 7$$

- c. We found that

$$\lim_{x \rightarrow 2^-} f(x) = 9 \quad \text{and} \quad \lim_{x \rightarrow 2^+} f(x) = 7.$$

The limit as  $x$  approaches 2 from the left equals 9.

The limit as  $x$  approaches 2 from the right equals 7.

These one-sided limits are illustrated in **Figure 11.10**. Because the left- and right-hand limits are unequal,  $\lim_{x \rightarrow 2} f(x)$  does not exist. ...

- Check Point 12** Consider the piecewise function defined by

$$f(x) = \begin{cases} -1 & \text{if } x < 1 \\ \sqrt[3]{2x - 1} & \text{if } x \geq 1. \end{cases}$$

Find each of the following limits, or state that the limit does not exist:

- a.  $\lim_{x \rightarrow 1^-} f(x)$       b.  $\lim_{x \rightarrow 1^+} f(x)$       c.  $\lim_{x \rightarrow 1} f(x)$ .

- 4 Find limits of fractional expressions in which the limit of the denominator is zero.

### Strategies for Finding Limits When the Limit of the Denominator Is Zero

When taking the limit of a fractional expression in which the limit of the denominator is zero, the quotient property for limits cannot be used. In such cases, it is necessary to rewrite the expression before the limit can be found. Factoring is one technique that can be used to rewrite an expression.

#### EXAMPLE 13 Using Factoring to Find a Limit

Find:  $\lim_{x \rightarrow 3} \frac{x^2 - x - 6}{x - 3}$ .

#### SOLUTION

The limit of the denominator is zero:

$$\lim_{x \rightarrow 3} (x - 3) = 3 - 3 = 0.$$

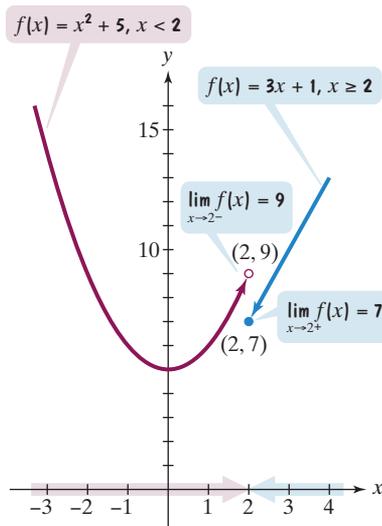

FIGURE 11.10

**GREAT QUESTION!**

**Can I apply the quotient property for limits when the limit of the denominator is zero?**

No. Avoid this common error:

**INCORRECT!**

$$\begin{aligned} \lim_{x \rightarrow 3} \frac{x^2 - x - 6}{x - 3} &= \frac{\lim_{x \rightarrow 3} (x^2 - x - 6)}{\lim_{x \rightarrow 3} (x - 3)} \\ &= \frac{3^2 - 3 - 6}{3 - 3} = \frac{0}{0} = 1. \end{aligned}$$

Do not use the quotient property if the limit of the denominator is zero. Furthermore, division by zero is not permitted:  $\frac{0}{0}$  is not equal to 1.

Thus, the quotient property for limits cannot be used. Instead, try simplifying the expression using factoring:

$$\frac{x^2 - x - 6}{x - 3} = \frac{(x - 3)(x + 2)}{x - 3}.$$

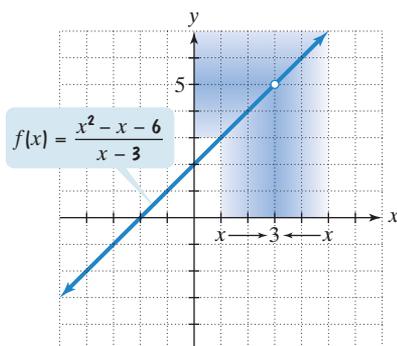

We seek the limit of this expression as  $x$  approaches 3. Because  $x$  is close to 3 but not equal to 3, the common factor in the numerator and denominator,  $x - 3$ , is not equal to zero. With  $x - 3 \neq 0$ , we can divide the numerator and denominator by  $x - 3$ . Cancel the common factor,  $x - 3$ , and then take the limit.

$$\lim_{x \rightarrow 3} \frac{x^2 - x - 6}{x - 3} = \lim_{x \rightarrow 3} \frac{\cancel{(x - 3)}(x + 2)}{\cancel{x - 3}} = \lim_{x \rightarrow 3} (x + 2) = 3 + 2 = 5 \quad \dots$$

The graph of  $f(x) = \frac{x^2 - x - 6}{x - 3}$  is shown in **Figure 11.11**. The hole in the graph at  $x = 3$  shows that  $f(3)$  is undefined. However, as  $x$  approaches 3, the graph shows that the values of  $f$  get closer to 5. This verifies the limit that we found in Example 13:

$$\lim_{x \rightarrow 3} \frac{x^2 - x - 6}{x - 3} = 5.$$

 **Check Point 13** Find:  $\lim_{x \rightarrow 1} \frac{x^2 + 2x - 3}{x - 1}$ .

**FIGURE 11.11** As  $x$  approaches 3, values of  $f$  get closer to 5:

$$\lim_{x \rightarrow 3} \frac{x^2 - x - 6}{x - 3} = 5.$$

Rationalizing the numerator or denominator of a fractional expression is another technique that can be used to find a limit when the limit of the denominator is zero.

**EXAMPLE 14** Rationalizing a Numerator to Find a Limit

Find:  $\lim_{x \rightarrow 0} \frac{\sqrt{4 + x} - 2}{x}$ .

**SOLUTION**

As  $x$  approaches 0, the denominator of the expression approaches zero. Thus, the quotient property for limits cannot be used. Instead, try rewriting the expression by rationalizing the numerator. If we multiply the numerator and denominator by  $\sqrt{4 + x} + 2$ , the numerator will not contain radicals.

$$\begin{aligned} \lim_{x \rightarrow 0} \frac{\sqrt{4 + x} - 2}{x} &= \lim_{x \rightarrow 0} \frac{\sqrt{4 + x} - 2}{x} \cdot \frac{\sqrt{4 + x} + 2}{\sqrt{4 + x} + 2} && \text{Rationalize the numerator.} \end{aligned}$$

$$= \lim_{x \rightarrow 0} \frac{(\sqrt{4 + x})^2 - 2^2}{x(\sqrt{4 + x} + 2)} \quad (\sqrt{a} - \sqrt{b})(\sqrt{a} + \sqrt{b}) = (\sqrt{a})^2 - (\sqrt{b})^2$$

$$= \lim_{x \rightarrow 0} \frac{4 + x - 4}{x(\sqrt{4 + x} + 2)} \quad (\sqrt{4 + x})^2 = 4 + x$$

$$= \lim_{x \rightarrow 0} \frac{x}{x(\sqrt{4 + x} + 2)} \quad \text{Simplify: } 4 + x - 4 = x.$$

$$= \lim_{x \rightarrow 0} \frac{1}{\sqrt{4 + x} + 2} \quad \text{Divide both the numerator and denominator by } x. \text{ This is permitted because } x \text{ approaches } 0 \text{ but is not equal to } 0.$$

$$= \frac{\lim_{x \rightarrow 0} 1}{\sqrt{\lim_{x \rightarrow 0} (4 + x)} + \lim_{x \rightarrow 0} 2} \quad \text{Use limit properties.}$$

$$= \frac{1}{\sqrt{4 + 0} + 2} \quad \text{Take the limits.}$$

$$= \frac{1}{2 + 2} = \frac{1}{4} \quad \text{Simplify.} \quad \dots$$

 **Check Point 14** Find:  $\lim_{x \rightarrow 0} \frac{\sqrt{9+x} - 3}{x}$ .

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- $\lim_{x \rightarrow a} c = \underline{\hspace{2cm}}$
  - $\lim_{x \rightarrow a} x = \underline{\hspace{2cm}}$
  - If  $f$  is a polynomial function, then  $\lim_{x \rightarrow a} f(x) = \underline{\hspace{2cm}}$ .
- If  $\lim_{x \rightarrow a} f(x) = L$  and  $\lim_{x \rightarrow a} g(x) = M$ , use  $L$ ,  $M$ , or both to complete the statements in Exercises 4–9.
- $\lim_{x \rightarrow a} [f(x) + g(x)] = \underline{\hspace{2cm}}$
  - $\lim_{x \rightarrow a} [f(x) - g(x)] = \underline{\hspace{2cm}}$
  - $\lim_{x \rightarrow a} [f(x) \cdot g(x)] = \underline{\hspace{2cm}}$
  - $\lim_{x \rightarrow a} [f(x)]^n = \underline{\hspace{2cm}}$ , where  $n \geq 2$  is an integer
  - $\lim_{x \rightarrow a} \sqrt[n]{f(x)} = \underline{\hspace{2cm}}$ , where  $n \geq 2$  is an integer and all roots represent real numbers

9.  $\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \underline{\hspace{2cm}}$ ,  $M \neq 0$

10. For the piecewise function defined by

$$f(x) = \begin{cases} x^2 + 5 & \text{if } x < 2 \\ x^3 + 1 & \text{if } x \geq 2 \end{cases}$$

we find  $\lim_{x \rightarrow 2^-} f(x)$  using  $f(x) = \underline{\hspace{2cm}}$

and we find  $\lim_{x \rightarrow 2^+} f(x)$  using  $f(x) = \underline{\hspace{2cm}}$ .

- True or false:  $\lim_{x \rightarrow 6} \frac{x^2 - 25}{x - 5} = \frac{\lim_{x \rightarrow 6} (x^2 - 25)}{\lim_{x \rightarrow 6} (x - 5)}$   $\underline{\hspace{2cm}}$
- True or false:  $\lim_{x \rightarrow 5} \frac{x^2 - 25}{x - 5} = \frac{\lim_{x \rightarrow 5} (x^2 - 25)}{\lim_{x \rightarrow 5} (x - 5)}$   $\underline{\hspace{2cm}}$

## EXERCISE SET 11.2

### Practice Exercises

In Exercises 1–42, use properties of limits to find the indicated limit. It may be necessary to rewrite an expression before limit properties can be applied.

- $\lim_{x \rightarrow 2} 8$
- $\lim_{x \rightarrow 2} x$
- $\lim_{x \rightarrow 6} (3x - 4)$
- $\lim_{x \rightarrow 2} 7x^2$
- $\lim_{x \rightarrow 5} (x^2 - 3x - 4)$
- $\lim_{x \rightarrow 2} (5x - 8)^3$
- $\lim_{x \rightarrow 1} (2x^2 - 3x + 5)^2$
- $\lim_{x \rightarrow 4} \sqrt{x^2 + 9}$
- $\lim_{x \rightarrow 5} \frac{x}{x + 1}$
- $\lim_{x \rightarrow 2} \frac{x^2 - 1}{x - 1}$
- $\lim_{x \rightarrow 1} \frac{x^2 - 1}{x - 1}$
- $\lim_{x \rightarrow 2} \frac{2x - 4}{x - 2}$
- $\lim_{x \rightarrow 1} \frac{x^2 + 2x - 3}{x^2 - 1}$
- $\lim_{x \rightarrow 3} (-6)$
- $\lim_{x \rightarrow 3} x$
- $\lim_{x \rightarrow 7} (4x - 3)$
- $\lim_{x \rightarrow 3} 5x^2$
- $\lim_{x \rightarrow 6} (x^2 - 4x - 7)$
- $\lim_{x \rightarrow 4} (6x - 21)^3$
- $\lim_{x \rightarrow 2} (2x^2 + 3x - 1)^2$
- $\lim_{x \rightarrow 1} \sqrt{5x^2 + 4}$
- $\lim_{x \rightarrow 2} \frac{3x}{x - 4}$
- $\lim_{x \rightarrow 3} \frac{x^2 - 4}{x - 2}$
- $\lim_{x \rightarrow 2} \frac{x^2 - 4}{x - 2}$
- $\lim_{x \rightarrow 3} \frac{4x - 12}{x - 3}$
- $\lim_{x \rightarrow 3} \frac{x^2 - x - 6}{x^2 - 9}$

- $\lim_{x \rightarrow 2} \frac{x^3 - 2x^2 + 4x - 8}{x^4 - 2x^3 + x - 2}$
- $\lim_{x \rightarrow 0} \frac{\sqrt{1+x} - 1}{x}$
- $\lim_{x \rightarrow 2} [(x + 1)^2(3x - 1)^3]$
- $\lim_{x \rightarrow 4} \frac{\sqrt{x} - 2}{x - 4}$
- $\lim_{x \rightarrow 2} \frac{\frac{1}{x} - \frac{1}{2}}{x - 2}$
- $\lim_{x \rightarrow 4} \frac{\sqrt{x} + 5}{x - 5}$
- $\lim_{x \rightarrow 0} \frac{\frac{1}{x+3} - \frac{1}{3}}{x}$
- $\lim_{x \rightarrow 2} \frac{x^2 - 4}{x^3 - 8}$
- $\lim_{x \rightarrow -1} \frac{x^3 + 2x^2 + x}{x^4 + x^3 + 2x + 2}$
- $\lim_{x \rightarrow 0} \frac{\sqrt{16+x} - 4}{x}$
- $\lim_{x \rightarrow -1} [(x + 2)^3(3x + 2)]$
- $\lim_{x \rightarrow 9} \frac{\sqrt{x} - 3}{x - 9}$
- $\lim_{x \rightarrow 3} \frac{\frac{1}{x} - \frac{1}{3}}{x - 3}$
- $\lim_{x \rightarrow 9} \frac{\sqrt{x} + 10}{x - 10}$
- $\lim_{x \rightarrow 0} \frac{\frac{1}{x+4} - \frac{1}{4}}{x}$
- $\lim_{x \rightarrow 1} \frac{x^2 - 1}{x^3 - 1}$

In Exercises 43–50, a piecewise function is given. Use properties of limits to find the indicated limit, or state that the limit does not exist.

- $f(x) = \begin{cases} x + 5 & \text{if } x < 1 \\ x + 7 & \text{if } x \geq 1 \end{cases}$ 
  - $\lim_{x \rightarrow 1^-} f(x)$
  - $\lim_{x \rightarrow 1^+} f(x)$
  - $\lim_{x \rightarrow 1} f(x)$
- $f(x) = \begin{cases} x + 6 & \text{if } x < 1 \\ x + 9 & \text{if } x \geq 1 \end{cases}$ 
  - $\lim_{x \rightarrow 1^-} f(x)$
  - $\lim_{x \rightarrow 1^+} f(x)$
  - $\lim_{x \rightarrow 1} f(x)$

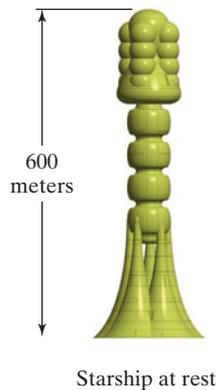

45.  $f(x) = \begin{cases} x^2 + 5 & \text{if } x < 2 \\ x^3 + 1 & \text{if } x \geq 2 \end{cases}$
- a.  $\lim_{x \rightarrow 2^-} f(x)$       b.  $\lim_{x \rightarrow 2^+} f(x)$       c.  $\lim_{x \rightarrow 2} f(x)$
46.  $f(x) = \begin{cases} x^2 + 6 & \text{if } x < 2 \\ x^3 + 2 & \text{if } x \geq 2 \end{cases}$
- a.  $\lim_{x \rightarrow 2^-} f(x)$       b.  $\lim_{x \rightarrow 2^+} f(x)$       c.  $\lim_{x \rightarrow 2} f(x)$
47.  $f(x) = \begin{cases} \frac{x^2 - 9}{x - 3} & \text{if } x \neq 3 \\ 5 & \text{if } x = 3 \end{cases}$
- a.  $\lim_{x \rightarrow 3^-} f(x)$       b.  $\lim_{x \rightarrow 3^+} f(x)$       c.  $\lim_{x \rightarrow 3} f(x)$
48.  $f(x) = \begin{cases} \frac{x^2 - 16}{x - 4} & \text{if } x \neq 4 \\ 7 & \text{if } x = 4 \end{cases}$
- a.  $\lim_{x \rightarrow 4^-} f(x)$       b.  $\lim_{x \rightarrow 4^+} f(x)$       c.  $\lim_{x \rightarrow 4} f(x)$
49.  $f(x) = \begin{cases} 1 - x & \text{if } x < 1 \\ 2 & \text{if } x = 1 \\ x^2 - 1 & \text{if } x > 1 \end{cases}$
- a.  $\lim_{x \rightarrow 1^-} f(x)$       b.  $\lim_{x \rightarrow 1^+} f(x)$       c.  $\lim_{x \rightarrow 1} f(x)$
50.  $f(x) = \begin{cases} 4 - x & \text{if } x < 1 \\ 2 & \text{if } x = 1 \\ x^2 + 2 & \text{if } x > 1 \end{cases}$
- a.  $\lim_{x \rightarrow 1^-} f(x)$       b.  $\lim_{x \rightarrow 1^+} f(x)$       c.  $\lim_{x \rightarrow 1} f(x)$

### Practice Plus

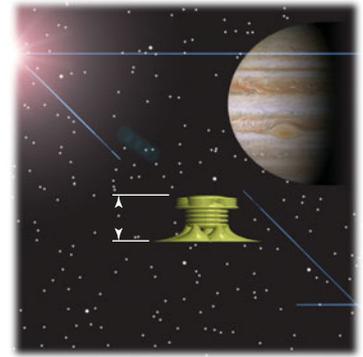

51. Let  $f(x) = x^3 - x^2 + 5x - 1$  and  $g(x) = 2$ . Find  $\lim_{x \rightarrow 3} (f \circ g)(x)$  and  $\lim_{x \rightarrow 3} (g \circ f)(x)$ .
52. Let  $f(x) = x^3 + x^2 - 6x - 1$  and  $g(x) = 3$ . Find  $\lim_{x \rightarrow 4} (f \circ g)(x)$  and  $\lim_{x \rightarrow 4} (g \circ f)(x)$ .
53. Let  $f(x) = \frac{2}{x}$  and  $g(x) = \frac{3}{x - 1}$ .  
Find  $\lim_{x \rightarrow 1} (f \circ g)(x)$  and  $\lim_{x \rightarrow 1} (g \circ f)(x)$ .
54. Let  $f(x) = \frac{4}{x - 1}$  and  $g(x) = \frac{1}{x + 2}$ .  
Find  $\lim_{x \rightarrow 1} (f \circ g)(x)$  and  $\lim_{x \rightarrow 1} (g \circ f)(x)$ .
55. Let  $f(x) = x^2 + 4, x \geq 0$ . Find  $\lim_{x \rightarrow 8} f^{-1}(x)$ .
56. Let  $f(x) = x^2 + 9, x \geq 0$ . Find  $\lim_{x \rightarrow 25} f^{-1}(x)$ .
57. Let  $f(x) = \frac{2x + 1}{x - 1}$ . Find  $\lim_{x \rightarrow 4} f^{-1}(x)$ .
58. Let  $f(x) = \frac{2x + 3}{x + 4}$ . Find  $\lim_{x \rightarrow 5} f^{-1}(x)$ .

### Application Exercises

In Albert Einstein's special theory of relativity, time slows down and length in the direction of motion decreases from the point of view of an observer watching an object moving at velocities approaching the speed of light. (The speed of light is approximately 186,000 miles per second. At this speed, a beam of light can travel around the world about seven times in a single second.) Einstein's theory, verified with experiments in atomic physics, forms the basis of Exercises 59–60.

Starship at rest

Change in starship's length when moving at 99% of light's speed when viewed by an observer

59. The formula

$$L = L_0 \sqrt{1 - \frac{v^2}{c^2}}$$

expresses the length,  $L$ , of a starship moving at velocity  $v$  with respect to an observer on Earth, where  $L_0$  is the length of the starship at rest and  $c$  is the speed of light.

- a. Find  $\lim_{v \rightarrow c^-} L$ .
- b. If a starship is traveling at velocities approaching the speed of light, what does the limit in part (a) indicate about its length from the perspective of a stationary viewer on Earth?
- c. Explain why a left-hand limit is used in part (a).
60. The formula

$$R_a = R_f \sqrt{1 - \frac{v^2}{c^2}}$$

expresses the aging rate of an astronaut,  $R_a$ , relative to the aging rate of a friend on Earth,  $R_f$ , where  $v$  is the astronaut's velocity and  $c$  is the speed of light.

- a. Find  $\lim_{v \rightarrow c^-} R_a$ .
- b. If you are traveling in a starship at velocities approaching the speed of light, what does the limit in part (a) indicate about your aging rate relative to a friend on Earth?
- c. Explain why a left-hand limit is used in part (a).

### Writing in Mathematics

61. Explain how to find the limit of a constant. Then express your written explanation using limit notation.
62. Explain how to find the limit of the identity function  $f(x) = x$ . Then express your written explanation using limit notation.
63. Explain how to find the limit of a sum. Then express your written explanation using limit notation.
64. Explain how to find the limit of a difference. Then express your written explanation using limit notation.
65. Explain how to find the limit of a product. Then express your written explanation using limit notation.
66. Describe how to find the limit of a polynomial function. Provide an example with your description.
67. Explain how to find the following limit:  $\lim_{x \rightarrow 2} (3x^2 - 10)^3$ . Then use limit notation to write the limit property that supports your explanation.

68. Explain how to find the following limit:  $\lim_{x \rightarrow 2} \sqrt{5x - 6}$ . Then use limit notation to write the limit property that supports your explanation.
69. Explain how to find the limit of a quotient if the limit of the denominator is not zero. Then express your written explanation using limit notation.
70. Write an example involving the limit of a quotient in which the quotient property for limits cannot be applied. Explain why the property cannot be applied to your limit problem.
71. Explain why

$$\lim_{x \rightarrow 4} \frac{(x + 4)(x - 4)}{x - 4}$$

can be found by first dividing the numerator and the denominator of the expression by  $x - 4$ . Division by zero is undefined. How can we be sure that we are not dividing the numerator and the denominator by zero?

### Technology Exercises

72. Use the **TABLE** feature of your graphing utility to verify any five of the limits that you found in Exercises 1–42.
73. Use the **ZOOM IN** feature of your graphing utility to verify any five of the limits that you found in Exercises 1–42. Zoom in on the graph of the given function,  $f$ , near  $x = a$  to verify each limit.

### Critical Thinking Exercises

**Make Sense?** In Exercises 74–77, determine whether each statement makes sense or does not make sense, and explain your reasoning.

74. I evaluated a polynomial function  $f$  at 3 and obtained 7, so 7 must be  $\lim_{x \rightarrow 3} f(x)$ .
75. I'm working with functions  $f$  and  $g$  for which  $\lim_{x \rightarrow 4} f(x) = 0$ ,  $\lim_{x \rightarrow 4} g(x) = -5$ , and  $\lim_{x \rightarrow 4} [f(x) - g(x)] = 5$ .
76. I'm working with functions  $f$  and  $g$  for which  $\lim_{x \rightarrow 4} f(x) = 0$ ,  $\lim_{x \rightarrow 4} g(x) = -5$ , and  $\lim_{x \rightarrow 4} \frac{f(x)}{g(x)} = 0$ .
77. I'm working with functions  $f$  and  $g$  for which  $\lim_{x \rightarrow 4} f(x) = 0$ ,  $\lim_{x \rightarrow 4} g(x) = -5$ , and  $\lim_{x \rightarrow 4} \frac{g(x)}{f(x)} \neq 0$ .

In Exercises 78–79, find the indicated limit.

78.  $\lim_{x \rightarrow 0} x \left( 1 - \frac{1}{x} \right)$
79.  $\lim_{x \rightarrow 4} \left( \frac{1}{x} - \frac{1}{4} \right) \left( \frac{1}{x - 4} \right)$

In Exercises 80–81, find  $\lim_{h \rightarrow 0} \frac{f(a + h) - f(a)}{h}$ .

80.  $f(x) = x^2 + 2x - 3, a = 1$
81.  $f(x) = \sqrt{x}, a = 1$

In Exercises 82–83, use properties of limits and the following limits

$$\begin{aligned} \lim_{x \rightarrow 0} \frac{\sin x}{x} &= 1, & \lim_{x \rightarrow 0} \frac{\cos x - 1}{x} &= 0, \\ \lim_{x \rightarrow 0} \sin x &= 0, & \lim_{x \rightarrow 0} \cos x &= 1 \end{aligned}$$

to find the indicated limit.

82.  $\lim_{x \rightarrow 0} \frac{\tan x}{x}$
83.  $\lim_{x \rightarrow 0} \frac{2 \sin x + \cos x - 1}{3x}$

### Group Exercises

84. Below is a list of ten common errors involving algebra, trigonometry, and limits that students frequently make in calculus. Group members should examine each error and describe the mistake. Where possible, correct each error. Finally, group members should offer suggestions for avoiding each error.

- a.  $(x + h)^3 - x^3 = x^3 + h^3 - x^3 = h^3$
- b.  $\frac{1}{a + b} = \frac{1}{a} + \frac{1}{b}$
- c.  $\frac{1}{a + b} = \frac{1}{a} + b$
- d.  $\sqrt{x + h} - \sqrt{x} = \sqrt{x} + \sqrt{h} - \sqrt{x} = \sqrt{h}$
- e.  $\frac{\sin 2x}{x} = \sin 2$
- f.  $\frac{a + bx}{a} = 1 + bx$
- g.  $\lim_{x \rightarrow 1} \frac{x^3 - 1}{x - 1} = \frac{1^3 - 1}{1 - 1} = \frac{0}{0} = 1$
- h.  $\sin(x + h) - \sin x = \sin x + \sin h - \sin x = \sin h$
- i.  $ax = bx$ , so  $a = b$
- j. To find  $\lim_{x \rightarrow 4} \frac{x^2 - 9}{x - 3}$ , it is necessary to rewrite  $\frac{x^2 - 9}{x - 3}$  by factoring  $x^2 - 9$ .

85. Research and present a group report about the history of the feud between Newton and Leibniz over who invented calculus. What other interests did these men have in addition to mathematics? What practical problems led them to the invention of calculus? What were their personalities like? Whose version established the notation and rules of calculus that we use today?

### Preview Exercises

Exercises 86–88 will help you prepare for the material covered in the next section. In each exercise, use what occurs near 3 and at 3 to graph the function in an open interval about 3. (Graphs will vary.) Is it necessary to lift your pencil off the paper to obtain each graph? Explain your answer.

86.  $\lim_{x \rightarrow 3} f(x) = 5; f(3) = 5$
87.  $\lim_{x \rightarrow 3} f(x) = 5; f(3) = 6$
88.  $\lim_{x \rightarrow 3} f(x) = 5; \lim_{x \rightarrow 3^+} f(x) = 6; f(3) = 5$

## SECTION 11.3

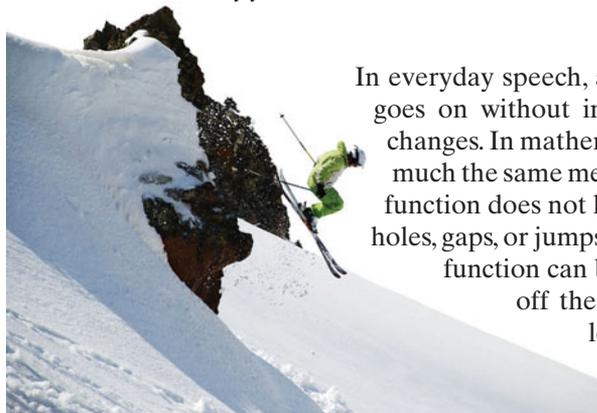

## Limits and Continuity

## Objectives

- 1 Determine whether a function is continuous at a number.
- 2 Determine for what numbers a function is discontinuous.

- 1 Determine whether a function is continuous at a number.

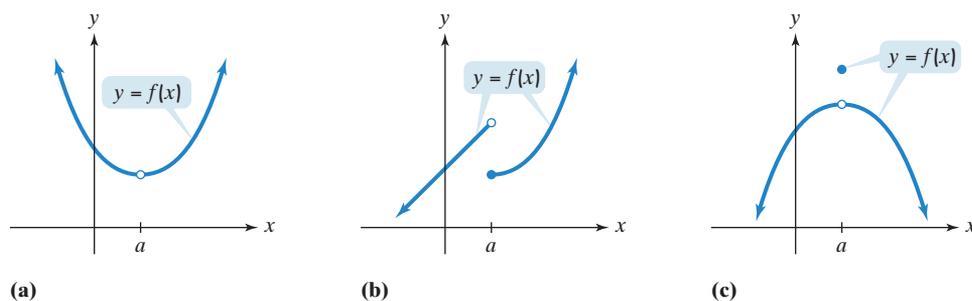

Why you should not ski down discontinuous slopes

In everyday speech, a continuous process is one that goes on without interruption and without abrupt changes. In mathematics, a continuous function has much the same meaning. The graph of a continuous function does not have interrupting breaks, such as holes, gaps, or jumps. Thus, the graph of a continuous function can be drawn without lifting a pencil off the paper. In this section, you will learn how limits can be used to describe continuity.

## Limits and Continuity

**Figure 11.12** shows three graphs that cannot be drawn without lifting a pencil from the paper. In each case, there appears to be an interruption of the graph of  $f$  at  $x = a$ .

**FIGURE 11.12** Each graph has an interruption at  $x = a$ .

Examine **Figure 11.12(a)**. The interruption occurs because the open dot indicates there is no point on the graph corresponding to  $x = a$ . This shows that  $f(a)$  is not defined.

Now, examine **Figure 11.12(b)**. The closed blue dot at  $x = a$  shows that  $f(a)$  is defined. However, there is a jump at  $a$ . As  $x$  approaches  $a$  from the left, the values of  $f$  get closer to the  $y$ -coordinate of the point shown by the open dot. By contrast, as  $x$  approaches  $a$  from the right, the values of  $f$  get closer to the  $y$ -coordinate of the point shown by the closed dot. There is no single limit as  $x$  approaches  $a$ . The jump in the graph reflects the fact that  $\lim_{x \rightarrow a} f(x)$  does not exist.

Finally, examine **Figure 11.12(c)**. The closed blue dot at  $x = a$  shows that  $f(a)$  is defined. Furthermore, as  $x$  approaches  $a$  from the left or from the right, the values of  $f$  get closer to the  $y$ -coordinate of the point shown by the open dot. Thus,  $\lim_{x \rightarrow a} f(x)$  exists. However, there is still an interruption at  $a$ . Do you see why? The limit as  $x$  approaches  $a$ ,  $\lim_{x \rightarrow a} f(x)$ , is the  $y$ -coordinate of the open dot. By contrast, the value of the function at  $a$ ,  $f(a)$ , is the  $y$ -coordinate of the closed dot. The interruption in the graph reflects the fact that  $\lim_{x \rightarrow a} f(x)$  and  $f(a)$  are not equal.

We now provide a precise definition of what it means for a function to be continuous at a number. Notice how each part of this definition avoids the interruptions that occurred in **Figure 11.12**.

### Definition of a Function Continuous at a Number

A function  $f$  is **continuous at  $a$**  when three conditions are satisfied.

1.  $f$  is defined at  $a$ ; that is,  $a$  is in the domain of  $f$ , so that  $f(a)$  is a real number.
2.  $\lim_{x \rightarrow a} f(x)$  exists.
3.  $\lim_{x \rightarrow a} f(x) = f(a)$

If  $f$  is not continuous at  $a$ , we say that  $f$  is **discontinuous at  $a$** . Each of the functions whose graph is shown in **Figure 11.12** on the previous page is discontinuous at  $a$ .

### EXAMPLE 1 Determining Whether a Function Is Continuous at a Number

Determine whether the function

$$f(x) = \frac{2x + 1}{2x^2 - x - 1}$$

is continuous: **a.** at 2; **b.** at 1.

#### SOLUTION

According to the definition, three conditions must be satisfied to have continuity at  $a$ .

- a.** To determine whether  $f(x) = \frac{2x + 1}{2x^2 - x - 1}$  is continuous at 2, we check the conditions for continuity with  $a = 2$ .

**Condition 1  $f$  is defined at  $a$ .** Is  $f(2)$  defined?

$$f(2) = \frac{2 \cdot 2 + 1}{2 \cdot 2^2 - 2 - 1} = \frac{4 + 1}{8 - 2 - 1} = \frac{5}{5} = 1$$

Because  $f(2)$  is a real number, 1,  $f(2)$  is defined.

**Condition 2  $\lim_{x \rightarrow a} f(x)$  exists.** Does  $\lim_{x \rightarrow 2} f(x)$  exist?

$$\begin{aligned} \lim_{x \rightarrow 2} f(x) &= \lim_{x \rightarrow 2} \frac{2x + 1}{2x^2 - x - 1} = \frac{\lim_{x \rightarrow 2} (2x + 1)}{\lim_{x \rightarrow 2} (2x^2 - x - 1)} \\ &= \frac{2 \cdot 2 + 1}{2 \cdot 2^2 - 2 - 1} = \frac{4 + 1}{8 - 2 - 1} = \frac{5}{5} = 1 \end{aligned}$$

Using properties of limits, we see that  $\lim_{x \rightarrow 2} f(x)$  exists.

**Condition 3  $\lim_{x \rightarrow a} f(x) = f(a)$**  Does  $\lim_{x \rightarrow 2} f(x) = f(2)$ ? We found that  $\lim_{x \rightarrow 2} f(x) = 1$  and  $f(2) = 1$ . Thus, as  $x$  gets closer to 2, the corresponding values of  $f(x)$  get closer to the function value at 2:  $\lim_{x \rightarrow 2} f(x) = f(2)$ .

Because the three conditions are satisfied, we conclude that  $f$  is continuous at 2.

- b.** To determine whether  $f(x) = \frac{2x + 1}{2x^2 - x - 1}$  is continuous at 1, we check the conditions for continuity with  $a = 1$ .

**Condition 1  $f$  is defined at  $a$ .** Is  $f(1)$  defined? Factor the denominator of the function's equation:

$$f(x) = \frac{2x + 1}{(x - 1)(2x + 1)}$$

Denominator is zero at  $x = 1$ .

Denominator is zero at  $x = -\frac{1}{2}$ .

Because division by zero is undefined, the domain of  $f$  is  $\{x \mid x \neq 1, x \neq -\frac{1}{2}\}$ . Thus,  $f$  is not defined at 1.

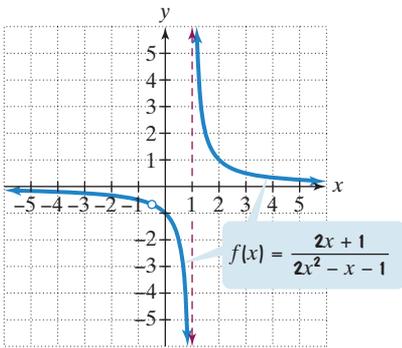

FIGURE 11.13  $f$  is continuous at 2. It is not continuous at 1 or at  $-\frac{1}{2}$ .

Because one of the three conditions is not satisfied, we conclude that  $f$  is not continuous at 1. Equivalently, we can say that  $f$  is discontinuous at 1.

The graph of  $f(x) = \frac{2x + 1}{2x^2 - x - 1}$  is shown in **Figure 11.13**. The graph verifies our work in Example 1. Can you see that  $f$  is continuous at 2? By contrast, it is not continuous at 1, where the graph has a vertical asymptote.

The graph in **Figure 11.13** also reveals a discontinuity at  $-\frac{1}{2}$ . The open dot indicates that there is no point on the graph corresponding to  $x = -\frac{1}{2}$ . Can you see what is happening as  $x$  approaches  $-\frac{1}{2}$ ?

$$\lim_{x \rightarrow -\frac{1}{2}} \frac{2x + 1}{2x^2 - x - 1} = \lim_{x \rightarrow -\frac{1}{2}} \frac{2x + 1}{(x - 1)(2x + 1)} = \lim_{x \rightarrow -\frac{1}{2}} \frac{1}{x - 1} = \frac{1}{-\frac{1}{2} - 1} = -\frac{2}{3}$$

As  $x$  gets closer to  $-\frac{1}{2}$ , the graph of  $f$  gets closer to  $-\frac{2}{3}$ . Because  $f$  is not defined at  $-\frac{1}{2}$ , the graph has a hole at  $(-\frac{1}{2}, -\frac{2}{3})$ . This is shown by the open dot in **Figure 11.13**.

 **Check Point 1** Determine whether the function

$$f(x) = \frac{x - 2}{x^2 - 4}$$

is continuous: **a.** at 1; **b.** at 2.

- 2** Determine for what numbers a function is discontinuous.

### Determining Where Functions Are Discontinuous

We have seen that the limit of a polynomial function as  $x$  approaches  $a$  is the polynomial function evaluated at  $a$ . Thus, if  $f$  is a polynomial function, then  $\lim_{x \rightarrow a} f(x) = f(a)$  for any number  $a$ . This means that **a polynomial function is continuous at every number**.

Many of the functions discussed throughout this book are continuous at every number in their domain. For example, rational functions are continuous at every number, except any at which they are not defined. At numbers that are not in the domain of a rational function, a hole in the graph or an asymptote appears. Exponential, logarithmic, sine, and cosine functions are continuous at every number in their domain. Like rational functions, the tangent, cotangent, secant, and cosecant functions are continuous at every number, except any at which they are not defined. At numbers that are not in the domain of these trigonometric functions, an asymptote occurs.

## GREAT QUESTION!

**What's the bottom line on when functions are continuous and when they're not?**

Most functions are always continuous at every number in their domain, including polynomial, rational, radical, exponential, logarithmic, and trigonometric functions. Most of the discontinuities you will encounter in calculus will be due to jumps in piecewise functions.

Example 2 illustrates how to determine where a piecewise function is discontinuous.

### EXAMPLE 2 Determining Where a Piecewise Function Is Discontinuous

Determine for what numbers  $x$ , if any, the following function is discontinuous:

$$f(x) = \begin{cases} x + 2 & \text{if } x \leq 0 \\ 2 & \text{if } 0 < x \leq 1. \\ x^2 + 2 & \text{if } x > 1 \end{cases}$$

$$f(x) = \begin{cases} x + 2 & \text{if } x \leq 0 \\ 2 & \text{if } 0 < x \leq 1 \\ x^2 + 2 & \text{if } x > 1 \end{cases}$$

The given piecewise function (repeated)

### SOLUTION

First, let's determine whether each of the three pieces of  $f$  is continuous. The first piece,  $f(x) = x + 2$ , is a linear function; it is continuous at every number  $x$ . The second piece,  $f(x) = 2$ , a constant function, is continuous at every number  $x$ . And the third piece,  $f(x) = x^2 + 2$ , a polynomial function, is also continuous at every number  $x$ . Thus, these three functions, a linear function, a constant function, and a polynomial function, can be graphed without lifting a pencil from the paper. However, the pieces change at  $x = 0$  and at  $x = 1$ . Is it necessary to lift a pencil from the paper when graphing  $f$  at these values? It appears that we must investigate continuity at 0 and at 1.

To determine whether the function is continuous at 0, we check the conditions for continuity with  $a = 0$ .

**Condition 1  $f$  is defined at  $a$ .** Is  $f(0)$  defined? Because  $a = 0$ , we use the first line of the piecewise function, where  $x \leq 0$ .

$$\begin{aligned} f(x) &= x + 2 && \text{This is the function's equation for } x \leq 0, \text{ which includes } x = 0. \\ f(0) &= 0 + 2 && \text{Replace } x \text{ with } 0. \\ &= 2 \end{aligned}$$

Because  $f(0)$  is a real number, 2,  $f(0)$  is defined.

**Condition 2  $\lim_{x \rightarrow a} f(x)$  exists.** Does  $\lim_{x \rightarrow 0} f(x)$  exist? To answer this question, we look at the values of  $f(x)$  when  $x$  is close to 0. Let us investigate the left- and right-hand limits. If these limits are equal, then  $\lim_{x \rightarrow 0} f(x)$  exists. To find  $\lim_{x \rightarrow 0} f(x)$ , the left-hand limit, we look at the values of  $f(x)$  when  $x$  is close to 0 but less than 0. Because  $x$  is less than 0, we use the first line of the piecewise function,  $f(x) = x + 2$  if  $x \leq 0$ . Thus,

$$\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^-} (x + 2) = 0 + 2 = 2.$$

To find  $\lim_{x \rightarrow 0^+} f(x)$ , the right-hand limit, we look at the values of  $f(x)$  when  $x$  is close to 0 but greater than 0. Because  $x$  is greater than 0, we use the second line of the piecewise function,  $f(x) = 2$  if  $0 < x \leq 1$ . Thus,

$$\lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} 2 = 2.$$

Because the left- and right-hand limits are both equal to 2,  $\lim_{x \rightarrow 0} f(x) = 2$ . Thus, we see that  $\lim_{x \rightarrow 0} f(x)$  exists.

**Condition 3  $\lim_{x \rightarrow a} f(x) = f(a)$**  Does  $\lim_{x \rightarrow 0} f(x) = f(0)$ ? We found that  $\lim_{x \rightarrow 0} f(x) = 2$  and  $f(0) = 2$ . This means that as  $x$  gets closer to 0, the corresponding values of  $f(x)$  get closer to the function value at 0:  $\lim_{x \rightarrow 0} f(x) = f(0)$ .

Because the three conditions are satisfied, we conclude that  $f$  is continuous at 0.

Now we must determine whether the function is continuous at 1, the other value of  $x$  where the pieces change. We check the conditions for continuity with  $a = 1$ .

**Condition 1  $f$  is defined at  $a$ .** Is  $f(1)$  defined? Because  $a = 1$ , we use the second line of the piecewise function, where  $0 < x \leq 1$ .

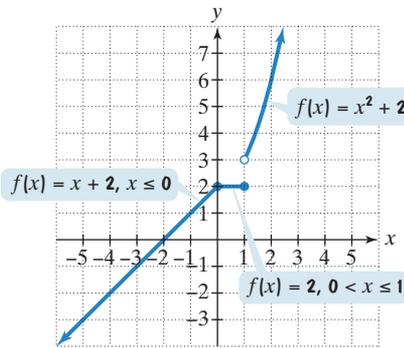

$$\begin{aligned} f(x) &= 2 && \text{This is the function's equation for } 0 < x \leq 1, \text{ which includes } x = 1. \\ f(1) &= 2 && \text{Replace } x \text{ with } 1. \end{aligned}$$

Because  $f(1)$  is a real number, 2,  $f(1)$  is defined.

**Condition 2  $\lim_{x \rightarrow a} f(x)$  exists.** Does  $\lim_{x \rightarrow 1} f(x)$  exist? We investigate left- and right-hand limits as  $x$  approaches 1. To find  $\lim_{x \rightarrow 1^-} f(x)$ , the left-hand limit, we look at values of  $f(x)$  when  $x$  is close to 1 but less than 1. Thus, we use the second line of the piecewise function,  $f(x) = 2$  if  $0 < x \leq 1$ . The left-hand limit is

$$\lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^-} 2 = 2.$$

**FIGURE 11.14** This piecewise function is continuous at 0, where pieces change, and discontinuous at 1, where pieces change.

To find  $\lim_{x \rightarrow 1^+} f(x)$ , the right-hand limit, we look at values of  $f(x)$  when  $x$  is close to 1 but greater than 1. Thus, we use the third line of the piecewise function,  $f(x) = x^2 + 2$  if  $x > 1$ . The right-hand limit is

$$\lim_{x \rightarrow 1^+} f(x) = \lim_{x \rightarrow 1^+} (x^2 + 2) = 1^2 + 2 = 3.$$

The left- and right-hand limits are not equal:  $\lim_{x \rightarrow 1^-} f(x) = 2$  and  $\lim_{x \rightarrow 1^+} f(x) = 3$ . This means that  $\lim_{x \rightarrow 1} f(x)$  does not exist.

Because one of the three conditions is not satisfied, we conclude that  $f$  is not continuous at 1.

In summary, the given function is discontinuous at 1 only. The graph of  $f$ , shown in **Figure 11.14**, illustrates this conclusion. ●●●

 **Check Point 2** Determine for what numbers  $x$ , if any, the following function is discontinuous:

$$f(x) = \begin{cases} 2x & \text{if } x \leq 0 \\ x^2 + 1 & \text{if } 0 < x \leq 2. \\ 7 - x & \text{if } x > 2 \end{cases}$$

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

1. A function  $f$  is continuous at  $a$  when three conditions are satisfied.

- $f$  is defined at \_\_\_\_\_, so that \_\_\_\_\_ is a real number.
- $\lim$  \_\_\_\_\_ exists.
- $\lim$  \_\_\_\_\_ = \_\_\_\_\_

2. True or false: For the function  $f(x) = \frac{1}{x-3}$ ,  $f$  is not defined at 3, so  $f$  is discontinuous at 3. \_\_\_\_\_

3. True or false: For the piecewise function defined by

$$f(x) = \begin{cases} \frac{x^2 - 25}{x - 5} & \text{if } x \neq 5 \\ 12 & \text{if } x = 5, \end{cases}$$

$\lim_{x \rightarrow 5} f(x)$  exists and is equal to 10, so  $f$  is continuous at 5. \_\_\_\_\_

4. Consider the piecewise function defined by

$$f(x) = \begin{cases} 1 - x & \text{if } x < 1 \\ 0 & \text{if } x = 1. \\ x^2 - 1 & \text{if } x > 1 \end{cases}$$

We find  $\lim_{x \rightarrow 1^-} f(x)$  using  $f(x) =$  \_\_\_\_\_. We find

$\lim_{x \rightarrow 1^+} f(x)$  using  $f(x) =$  \_\_\_\_\_. The function's definition indicates that  $f(1) =$  \_\_\_\_\_. If we

determine that  $\lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^+} f(x) = f(1)$ , we can conclude that \_\_\_\_\_.

5. True or false: A polynomial function is continuous at every number. \_\_\_\_\_
6. True or false: A piecewise function is always discontinuous at each of its jumps. \_\_\_\_\_

## EXERCISE SET 11.3

### Practice Exercises

In Exercises 1–18, use the definition of continuity to determine whether  $f$  is continuous at  $a$ .

1.  $f(x) = 2x + 5$   
 $a = 1$

2.  $f(x) = 3x + 4$   
 $a = 1$

3.  $f(x) = x^2 - 3x + 7$   
 $a = 4$

4.  $f(x) = x^2 - 5x + 6$   
 $a = 4$

5.  $f(x) = \frac{x^2 + 4}{x - 2}$   
 $a = 3$

6.  $f(x) = \frac{x^2 + 6}{x - 5}$   
 $a = 6$

7.  $f(x) = \frac{x + 5}{x - 5}$   
 $a = 5$

8.  $f(x) = \frac{x + 7}{x - 7}$   
 $a = 7$

9.  $f(x) = \frac{x - 5}{x + 5}$   
 $a = 5$

10.  $f(x) = \frac{x - 7}{x + 7}$   
 $a = 7$

11.  $f(x) = \frac{x^2 + 5x}{x^2 - 5x}$   
 $a = 0$

12.  $f(x) = \frac{x^2 + 8x}{x^2 - 8x}$   
 $a = 0$

13.  $f(x) = \begin{cases} \frac{x^2 - 4}{x - 2} & \text{if } x \neq 2 \\ 5 & \text{if } x = 2 \end{cases}$   
 $a = 2$

14.  $f(x) = \begin{cases} \frac{x^2 - 36}{x - 6} & \text{if } x \neq 6 \\ 13 & \text{if } x = 6 \end{cases}$   
 $a = 6$

$$15. f(x) = \begin{cases} x - 5 & \text{if } x \leq 0 \\ x^2 + x - 5 & \text{if } x > 0 \end{cases}$$

$a = 0$

$$16. f(x) = \begin{cases} x - 4 & \text{if } x \leq 0 \\ x^2 + x - 4 & \text{if } x > 0 \end{cases}$$

$a = 0$

$$17. f(x) = \begin{cases} 1 - x & \text{if } x < 1 \\ 0 & \text{if } x = 1 \\ x^2 - 1 & \text{if } x > 1 \end{cases}$$

$a = 1$

$$18. f(x) = \begin{cases} 2 - x & \text{if } x < 1 \\ 1 & \text{if } x = 1 \\ x^2 & \text{if } x > 1 \end{cases}$$

$a = 1$

In Exercises 19–34, determine for what numbers, if any, the given function is discontinuous.

$$19. f(x) = x^2 + 4x - 6$$

$$20. f(x) = x^2 + 8x - 10$$

$$21. f(x) = \frac{x + 1}{(x + 1)(x - 4)}$$

$$22. f(x) = \frac{x + 2}{(x + 2)(x - 5)}$$

$$23. f(x) = \frac{\sin x}{x}$$

$$24. f(x) = \frac{1 - \cos x}{x}$$

$$25. f(x) = \pi$$

$$26. f(x) = c$$

$$27. f(x) = \begin{cases} x - 1 & \text{if } x \leq 1 \\ x^2 & \text{if } x > 1 \end{cases}$$

$$28. f(x) = \begin{cases} x - 2 & \text{if } x \leq 2 \\ x^2 - 1 & \text{if } x > 2 \end{cases}$$

$$29. f(x) = \begin{cases} \frac{x^2 - 1}{x - 1} & \text{if } x \neq 1 \\ 2 & \text{if } x = 1 \end{cases}$$

$$30. f(x) = \begin{cases} \frac{x^2 - 9}{x - 3} & \text{if } x \neq 3 \\ 6 & \text{if } x = 3 \end{cases}$$

$$31. f(x) = \begin{cases} x + 6 & \text{if } x \leq 0 \\ 6 & \text{if } 0 < x \leq 2 \\ x^2 + 1 & \text{if } x > 2 \end{cases}$$

$$32. f(x) = \begin{cases} x + 7 & \text{if } x \leq 0 \\ 7 & \text{if } 0 < x \leq 3 \\ x^2 - 1 & \text{if } x > 3 \end{cases}$$

$$33. f(x) = \begin{cases} 5x & \text{if } x < 4 \\ 21 & \text{if } x = 4 \\ x^2 + 4 & \text{if } x > 4 \end{cases}$$

$$34. f(x) = \begin{cases} 7x & \text{if } x < 6 \\ 41 & \text{if } x = 6 \\ x^2 + 6 & \text{if } x > 6 \end{cases}$$

**Practice Plus**

In Exercises 35–38, graph each function. Then determine for what numbers, if any, the function is discontinuous.

$$35. f(x) = \begin{cases} \sin x & \text{if } -\pi \leq x < 0 \\ -\sin x & \text{if } 0 \leq x < \pi \\ \cos x & \text{if } \pi \leq x \leq 2\pi \end{cases}$$

$$36. f(x) = \begin{cases} -\cos x & \text{if } -\pi \leq x < 0 \\ -\sin x & \text{if } 0 \leq x < \pi \\ \sin x & \text{if } \pi \leq x \leq 2\pi \end{cases}$$

$$37. f(x) = \begin{cases} -1 & \text{if } x \text{ is an integer.} \\ 1 & \text{if } x \text{ is not an integer.} \end{cases}$$

$$38. f(x) = \begin{cases} 2 & \text{if } x \text{ is an odd integer.} \\ -2 & \text{if } x \text{ is not an odd integer.} \end{cases}$$

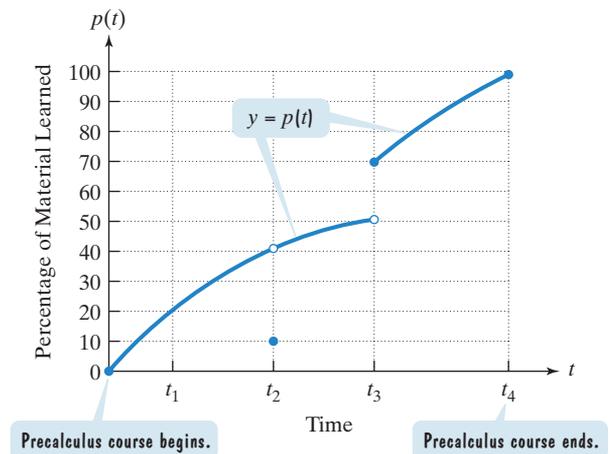

In Exercises 39–42, determine for what numbers, if any, the function is discontinuous. Construct a table to find any required limits.

$$39. f(x) = \begin{cases} \frac{\sin 2x}{x} & \text{if } x \neq 0 \\ 2 & \text{if } x = 0 \end{cases} \quad 40. f(x) = \begin{cases} \frac{\sin 3x}{x} & \text{if } x \neq 0 \\ 3 & \text{if } x = 0 \end{cases}$$

$$41. f(x) = \begin{cases} \frac{\cos x}{x - \frac{\pi}{2}} & \text{if } x \neq \frac{\pi}{2} \\ 1 & \text{if } x = \frac{\pi}{2} \end{cases} \quad 42. f(x) = \begin{cases} \frac{\sin x}{x - \pi} & \text{if } x \neq \pi \\ 1 & \text{if } x = \pi \end{cases}$$

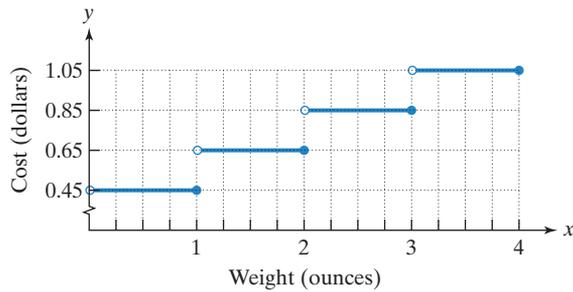

**Application Exercises**

43. The graph represents the percentage of required topics in a precalculus course,  $p(t)$ , that a student learned at various times,  $t$ , throughout the course. At time  $t_2$ , the student panicked for an instant during an exam. At time  $t_3$ , after working on a set of cumulative review exercises, a big jump in understanding suddenly took place.

- Find  $\lim_{t \rightarrow t_1} p(t)$  and  $p(t_1)$ .
- Is  $p$  continuous at  $t_1$ ? Use the definition of continuity to explain your answer.
- Find  $\lim_{t \rightarrow t_2} p(t)$  and  $p(t_2)$ .
- Is  $p$  continuous at  $t_2$ ? Use the definition of continuity to explain your answer.
- Find  $\lim_{t \rightarrow t_3} p(t)$  and  $p(t_3)$ .
- Is  $p$  continuous at  $t_3$ ? Use the definition of continuity to explain your answer.
- Find  $\lim_{t \rightarrow t_4} p(t)$  and  $p(t_4)$ .
- Explain the meaning of both the limit and the function value in part (g) in terms of the time in the course and the percentage of topics learned.

44. The figure shows the cost of mailing a first-class letter,  $f(x)$ , as a function of its weight,  $x$ , in ounces.

Source: Lynn E. Baring, Postmaster, Inverness, CA

- Find  $\lim_{x \rightarrow 3^-} f(x)$ .
  - Find  $\lim_{x \rightarrow 3^+} f(x)$ .
  - What can you conclude about  $\lim_{x \rightarrow 3} f(x)$ ? How is this shown by the graph?
  - What aspect of costs for mailing a letter causes the graph to jump vertically by the same amount at its discontinuities?
45. The following piecewise function gives the tax owed,  $T(x)$ , by a single taxpayer in 2011 on a taxable income of  $x$  dollars.
- $$T(x) = \begin{cases} 0.10x & \text{if } 0 < x \leq 8500 \\ 850.00 + 0.15(x - 8500) & \text{if } 8500 < x \leq 34,500 \\ 4750.00 + 0.25(x - 34,500) & \text{if } 34,500 < x \leq 83,600 \\ 17,025.00 + 0.28(x - 83,600) & \text{if } 83,600 < x \leq 174,400 \\ 42,449.00 + 0.33(x - 174,400) & \text{if } 174,400 < x \leq 379,150 \\ 110,016.50 + 0.35(x - 379,150) & \text{if } x > 379,150. \end{cases}$$
- Determine whether  $T$  is continuous at 8500.
  - Determine whether  $T$  is continuous at 34,500.
  - If  $T$  had discontinuities, use one of these discontinuities to describe a situation where it might be advantageous to earn less money in taxable income.

### Writing in Mathematics

- Explain how to determine whether a function is continuous at a number.
- If a function is not defined at  $a$ , how is this shown on the function's graph?
- If a function is defined at  $a$ , but  $\lim_{x \rightarrow a} f(x)$  does not exist, how is this shown on the function's graph?
- If a function is defined at  $a$ ,  $\lim_{x \rightarrow a} f(x)$  exists, but  $\lim_{x \rightarrow a} f(x) \neq f(a)$ , how is this shown on the function's graph?
- In Exercises 43–44, functions that modeled learning in a precalculus course and the cost of mailing a letter had jumps in their graphs. Describe another situation that can be modeled by a function with discontinuities. What aspect of this situation causes the discontinuities?
- Give two examples of the use of the word *continuous* in everyday English. Compare its use in your examples to its meaning in mathematics.

### Technology Exercises

52. Use your graphing utility to graph any five of the functions in Exercises 1–18 and verify whether  $f$  is continuous at  $a$ .

53. Estimate  $\lim_{x \rightarrow 0^+} (1 + x)^{1/x}$  by using the **TABLE** feature of your graphing utility to create a table of values. Then use the **ZOOM IN** feature to zoom in on the graph of  $f$  near and to the right of  $x = 0$  to justify or improve your estimate.

### Critical Thinking Exercises

**Make Sense?** In Exercises 54–57, determine whether each statement makes sense or does not make sense, and explain your reasoning.

- If  $\lim_{x \rightarrow a} f(x) \neq f(a)$  and  $\lim_{x \rightarrow a} f(x)$  exists, I can redefine  $f(a)$  to make  $f$  continuous at  $a$ .
- If  $\lim_{x \rightarrow a} f(x) \neq f(a)$  and  $\lim_{x \rightarrow a} f(x) \neq \lim_{x \rightarrow a} f(x)$ , I can redefine  $f(a)$  to make  $f$  continuous at  $a$ .
- $f$  and  $g$  are both continuous at  $a$ , although  $f + g$  is not.
- $f$  and  $g$  are both continuous at  $a$ , although  $\frac{f}{g}$  is not.
- Define  $f(x) = \frac{x^2 - 81}{x - 9}$  at  $x = 9$  so that the function becomes continuous at 9.
- Is it possible to define  $f(x) = \frac{1}{x - 9}$  at  $x = 9$  so that the function becomes continuous at 9? How does this discontinuity differ from the discontinuity in Exercise 58?

60. For the function

$$f(x) = \begin{cases} x^2 & \text{if } x < 1 \\ Ax - 3 & \text{if } x \geq 1 \end{cases}$$

find  $A$  so that the function is continuous at 1.

### Group Exercise

- In this exercise, the group will define three piecewise functions. Each function should have three pieces and two values of  $x$  at which the pieces change.
  - Define and graph a piecewise function that is continuous at both values of  $x$  where the pieces change.
  - Define and graph a piecewise function that is continuous at one value of  $x$  where the pieces change and discontinuous at the other value of  $x$  where the pieces change.
  - Define and graph a piecewise function that is discontinuous at both values of  $x$  where the pieces change.

At the end of the activity, group members should turn in the functions and their graphs. Do not use any of the piecewise functions or graphs that appear anywhere in this book.

### Preview Exercises

Exercises 62–64 will help you prepare for the material covered in the next section. In each exercise, find the indicated difference quotient and simplify.

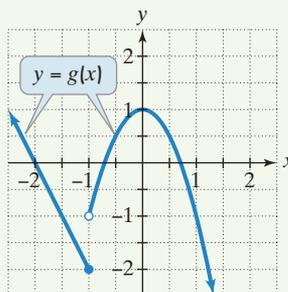

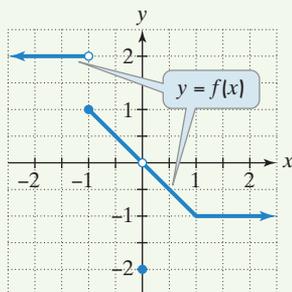

- If  $f(x) = x^2 + x$ , find  $\frac{f(2 + h) - f(2)}{h}$ .
- If  $f(x) = x^3$ , find  $\frac{f(x + h) - f(x)}{h}$ .
- If  $s(t) = -16t^2 + 48t + 160$ , find  $\frac{s(a + h) - s(a)}{h}$ .

# CHAPTER 11 Mid-Chapter Check Point

**WHAT YOU KNOW:** We learned that  $\lim_{x \rightarrow a} f(x) = L$  means that as  $x$  gets closer to  $a$ , but remains unequal to  $a$ , the corresponding values of  $f(x)$  get closer to  $L$ . We found limits using tables, graphs, and properties of limits. The quotient property for limits did not apply to fractional expressions in which the limit of the denominator is zero. In these cases, rewriting the expression using factoring or rationalizing the numerator or denominator was helpful

before finding the limit. We saw that if the left-hand limit,  $\lim_{x \rightarrow a^-} f(x)$ , ( $x$  approaches  $a$  from the left) is not equal to the right-hand limit,  $\lim_{x \rightarrow a^+} f(x)$ , ( $x$  approaches  $a$  from the right), then  $\lim_{x \rightarrow a} f(x)$  does not exist. Finally, we defined continuity in terms of limits. A function  $f$  is continuous at  $a$  when  $f$  is defined at  $a$ ,  $\lim_{x \rightarrow a} f(x)$  exists, and  $\lim_{x \rightarrow a} f(x) = f(a)$ . If  $f$  is not continuous at  $a$ , we say that  $f$  is discontinuous at  $a$ .

In Exercises 1–7, use the graphs of  $f$  and  $g$  to find the indicated limit or function value, or state that the limit or function value does not exist.

1.  $\lim_{x \rightarrow -1^-} f(x)$
2.  $\lim_{x \rightarrow -1^+} f(x)$
3.  $\lim_{x \rightarrow -1} f(x)$
4.  $\lim_{x \rightarrow 1} [f(x) + g(x)]$
5.  $\lim_{x \rightarrow 0} [f(x) - g(x)]$
6.  $(f - g)(0)$
7.  $\lim_{x \rightarrow 1} \sqrt{10 + f(x)}$
8. Use the graph of  $f$  shown above to determine for what numbers the function is discontinuous. Then use the definition of continuity to verify each discontinuity.

In Exercises 9–11, use the table to find the indicated limit.

$x$	-0.03	-0.02	-0.01	-0.007	0.007	0.01	0.02	0.03
$f(x) = \frac{\sin x}{2x^2 - x}$	-0.9433	-0.9615	-0.9804	-0.9862	-1.014	-1.02	-1.042	-1.064
$g(x) = \frac{e^x - \tan x}{\cos^2 x}$	1.0014	1.0006	1.0002	1.0001	1.0001	1.0001	1.0006	1.0013

9.  $\lim_{x \rightarrow 0} f(x)$
10.  $\lim_{x \rightarrow 0} g(x)$
11.  $\lim_{x \rightarrow 0} \frac{4g(x)}{[f(x)]^2}$

In Exercises 12–17, find the limits.

12.  $\lim_{x \rightarrow -2} (x^3 - x + 5)$
13.  $\lim_{x \rightarrow 3} \sqrt{x^2 - 3x + 4}$
14.  $\lim_{x \rightarrow 5} \frac{2x^2 - x + 4}{x - 1}$
15.  $\lim_{x \rightarrow 5} \frac{2x^2 - 7x - 15}{x - 5}$
16.  $\lim_{x \rightarrow 0} \frac{\sqrt{x^2 + 9} - 3}{x^2}$
17.  $\lim_{x \rightarrow 0} \frac{1}{x + 10} - \frac{1}{x}$

In Exercises 18–19, a piecewise function is given. Use the function to find the indicated limit, or state that the limit does not exist.

18.  $f(x) = \begin{cases} 9 - 2x & \text{if } x < 4 \\ \sqrt{x - 4} & \text{if } x \geq 4 \end{cases}$ 
  - a.  $\lim_{x \rightarrow 4^-} f(x)$
  - b.  $\lim_{x \rightarrow 4^+} f(x)$
  - c.  $\lim_{x \rightarrow 4} f(x)$

19.  $f(x) = \begin{cases} \frac{x^4 - 16}{x - 2} & \text{if } x \neq 2 \\ 32 & \text{if } x = 2 \end{cases}$ 
  - a.  $\lim_{x \rightarrow 2^-} f(x)$
  - b.  $\lim_{x \rightarrow 2^+} f(x)$
  - c.  $\lim_{x \rightarrow 2} f(x)$

In Exercises 20–21, use the definition of continuity to determine whether  $f$  is continuous at  $a$ .

20.  $f(x) = \begin{cases} \sqrt{3 - x} & \text{if } x \leq 3 \\ x^2 - 3x & \text{if } x > 3 \end{cases}$   
 $a = 3$
21.  $f(x) = \begin{cases} \frac{(x + 3)^2 - 9}{x} & \text{if } x \neq 0 \\ 6 & \text{if } x = 0 \end{cases}$   
 $a = 0$

22. Determine for what numbers, if any, the following function is discontinuous:

$$f(x) = \begin{cases} \frac{x^2 - 1}{x + 1} & \text{if } x < -1 \\ 2x & \text{if } -1 \leq x \leq 5 \\ 3x - 4 & \text{if } x > 5 \end{cases}$$

## SECTION 11.4

## Introduction to Derivatives

## Objectives

- 1 Find slopes and equations of tangent lines.
- 2 Find the derivative of a function.
- 3 Find average and instantaneous rates of change.
- 4 Find instantaneous velocity.

Things change over time and most changes occur at uneven rates. This is illustrated in the chapter opener (page 1091) with a sequence of photos of a young boy transforming into an adult. What does calculus have to say about this radical transformation?

In this section, we will see how calculus allows motion and change to be analyzed by “freezing the frame” of a continuously changing process, instant by instant. For example, **Figure 11.15** shows a male’s changing height over intervals of time. Over the period of time from  $P$  to  $D$ , his average rate of growth is his change in height—that is, his height at time  $D$  minus his height at time  $P$ —divided by the change in time from  $P$  to  $D$ .

The lines  $PD$ ,  $PC$ ,  $PB$ , and  $PA$  shown in **Figure 11.15** have slopes that show the man’s average growth rates for successively shorter periods of time. Calculus makes these time frames so small that their limit approaches a single point—that is, a single instant in time. This point is shown as point  $P$  in **Figure 11.15**. The slope of the line that touches the graph at  $P$  gives the man’s growth rate at one instant in time,  $P$ .

Keep this informal discussion of this man and his growth rate in mind as you read this section. We begin with the calculus that describes the slope of the line that touches the graph in **Figure 11.15** at  $P$ .

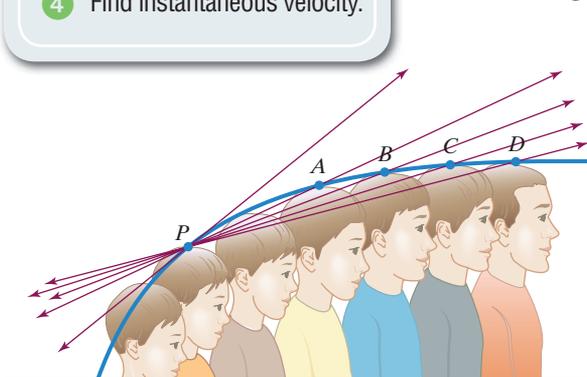

FIGURE 11.15

- 1 Find slopes and equations of tangent lines.

## Slopes and Equations of Tangent Lines

In Chapter 1, we saw that if the graph of a function is not a straight line, the **average rate of change** between any two points is the slope of the line containing the two points. We called this line a **secant line**.

**Figure 11.16** shows the graph of a male’s height, in inches, as a function of his age, in years. Two points on the graph are labeled:  $(13, 57)$  and  $(18, 76)$ . At age 13, this person was 57 inches tall, and at age 18, he was 76 inches tall. The slope of the secant line containing these two points is

$$\frac{76 - 57}{18 - 13} = \frac{19}{5} = 3\frac{4}{5}.$$

Slope is the change in the  $y$ -coordinates divided by the change in the  $x$ -coordinates.

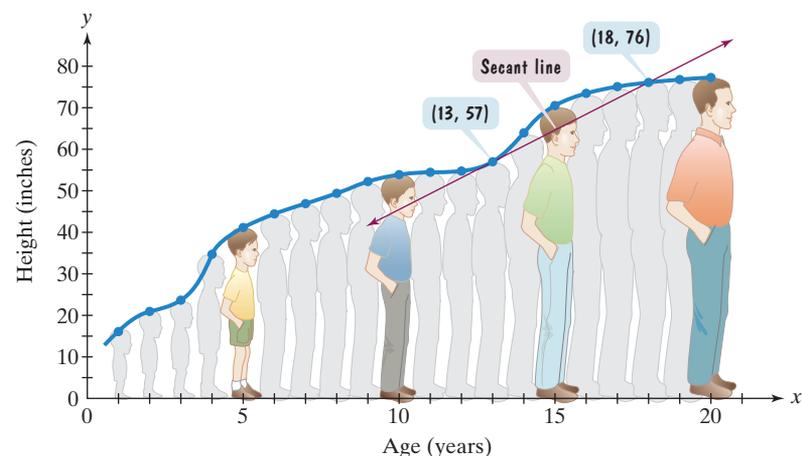

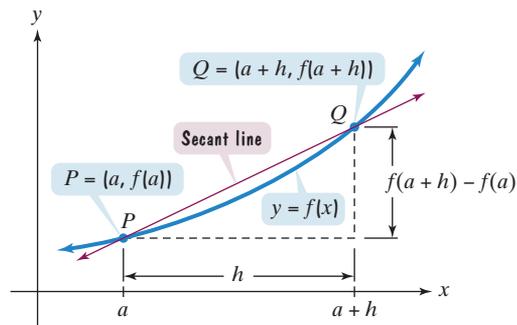

FIGURE 11.16 Height as a function of age

The man’s average rate of change, or average growth rate, from 13 to 18 was  $3\frac{4}{5}$  inches per year.

How can we find this person’s growth rate at the instant when he was 13? We can find this *instantaneous rate of change* by repeating the computation of slope from 13 to 17, then from 13 to 16, then from 13 to 15, again from 13 to 14, again from 13 to  $13\frac{1}{2}$ , and once again from 13 to 13.01. What limit is approached by these computations as the shrinking interval of time gets closer and closer to the instant when the man was 13?

We answer these questions by considering the graph of any function  $f$ , shown in **Figure 11.17**. We need to find the slope, or steepness, of this curve at the point  $P = (a, f(a))$ . This slope will reveal the function’s instantaneous rate of change at  $a$ . We begin by choosing a second point,  $Q$ , whose  $x$ -coordinate is  $a + h$ , where  $h \neq 0$ . The point  $Q = (a + h, f(a + h))$  is shown in **Figure 11.17**.

How do we find the average rate of change of  $f$  between points  $P$  and  $Q$ ? We find the slope of the secant line, the line containing  $P$  and  $Q$ .

**FIGURE 11.17** Finding the average rate of change, or the slope of the secant line

Slope of secant line

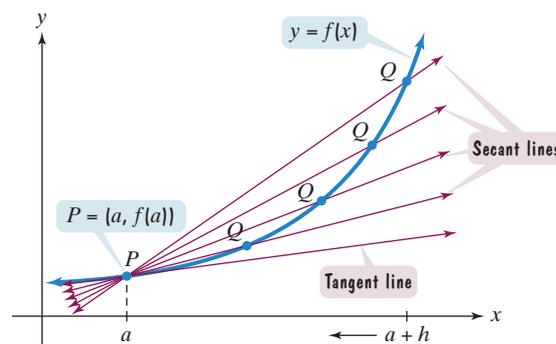

$$= \frac{f(a + h) - f(a)}{a + h - a} \quad \text{Slope is the change in } y\text{-coordinates, } f(a + h) - f(a),$$

$$= \frac{f(a + h) - f(a)}{h} \quad \text{Simplify.}$$

*divided by the change in } x\text{-coordinates, } (a + h) - a.*

Do you recognize this expression as the difference quotient presented in Chapter 1? We will make use of this expression and our understanding of limits to find the slope of a graph at a specific point.

What happens if the distance labeled  $h$  in **Figure 11.17** approaches 0? The value of the  $x$ -coordinate of point  $Q$ ,  $a + h$ , will get closer and closer to  $a$ . Can you see that  $a$  is the  $x$ -coordinate of point  $P$ ? Thus, as  $h$  approaches 0, point  $Q$  approaches point  $P$ . Examine **Figure 11.18** to see how we visualize the changing position of point  $Q$ .

**FIGURE 11.18** As  $Q$  approaches  $P$ , the succession of secant lines approaches the tangent line.

**Figure 11.18** also shows how the secant line between points  $P$  and  $Q$  changes as  $h$  approaches 0. Note how the position of the secant line changes as the position of  $Q$  changes. The secant line between point  $P$  and point  $Q$  approaches the red line that touches the graph of  $f$  at point  $P$ . This limiting position of the secant line is called the **tangent line** to the graph of  $f$  at the point  $P = (a, f(a))$ .

According to our earlier derivation, the slope of each secant line in **Figure 11.18** is

$$\frac{f(a+h) - f(a)}{h}. \quad \text{This difference quotient is also the average rate of change of } f \text{ from } x_1 = a \text{ to } x_2 = a + h.$$

As  $h$  approaches 0, this slope approaches the slope of the tangent line to the curve at  $(a, f(a))$ . Thus, the slope of the tangent line to the curve at  $(a, f(a))$  is

$$\lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h}.$$

This limit also represents the **instantaneous rate of change of  $f$  with respect to  $x$  at  $a$** .

### Slope of the Tangent Line to a Curve at a Point

The **slope of the tangent line** to the graph of a function  $y = f(x)$  at  $(a, f(a))$  is given by

$$m_{\text{tan}} = \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h}$$

provided that this limit exists. This limit also describes

- the **slope of the graph of  $f$  at  $(a, f(a))$** .
- the **instantaneous rate of change of  $f$  with respect to  $x$  at  $a$** .

### EXAMPLE 1 Finding the Slope of a Tangent Line

Find the slope of the tangent line to the graph of  $f(x) = x^2 + x$  at  $(2, 6)$ .

#### SOLUTION

The slope of the tangent line at  $(a, f(a))$  is

$$m_{\text{tan}} = \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h}.$$

We use this formula to find the slope of the tangent line at the given point. Because we are finding the slope of the tangent line at  $(2, 6)$ , we know that  $a = 2$ .

$$\begin{aligned} m_{\text{tan}} &= \lim_{h \rightarrow 0} \frac{f(2+h) - f(2)}{h} \\ &= \lim_{h \rightarrow 0} \frac{[(2+h)^2 + (2+h)] - [2^2 + 2]}{h} \\ &= \lim_{h \rightarrow 0} \frac{[4 + 4h + h^2 + 2 + h] - 6}{h} \\ &= \lim_{h \rightarrow 0} \frac{h^2 + 5h}{h} \\ &= \lim_{h \rightarrow 0} \frac{h(h+5)}{h} \\ &= \lim_{h \rightarrow 0} (h+5) \\ &= 0 + 5 \\ &= 5 \end{aligned}$$

Because  $a = 2$ , substitute 2 into the formula for each occurrence of  $a$ .

To find  $f(2+h)$ , replace  $x$  in  $f(x) = x^2 + x$  with  $2+h$ . To find  $f(2)$  replace  $x$  with 2.

Square  $2+h$  using  $(A+B)^2 = A^2 + 2AB + B^2$ .

Combine like terms in the numerator.

Factor the numerator.

Divide both the numerator and denominator by  $h$ . This is permitted because  $h$  approaches 0, but  $h \neq 0$ . Use limit properties.

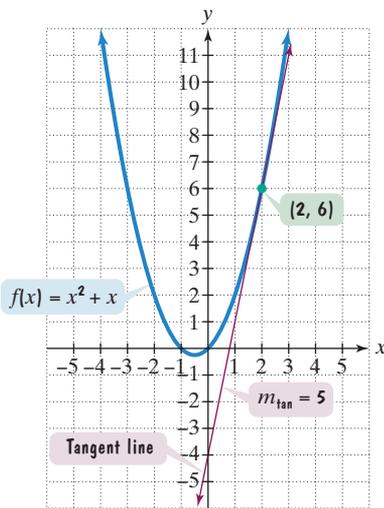

FIGURE 11.19

### TECHNOLOGY

Graphing utilities with a **DRAW TANGENT** feature will draw tangent lines to curves and display their slope-intercept equations. **Figure 11.20** shows the tangent line to the graph of  $y = x^2 + x$  at the point whose  $x$ -coordinate is 2. Also displayed is the slope-intercept equation of the tangent line,  $y = 5x - 4$ .

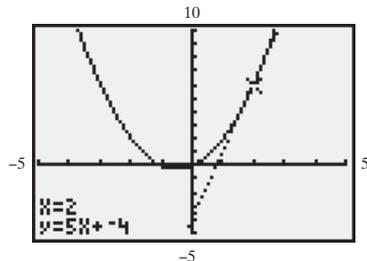

FIGURE 11.20

Thus, the slope of the tangent line to the graph of  $f(x) = x^2 + x$  at (2, 6) is 5. This is shown in **Figure 11.19**. We also say that the slope of the graph of  $f(x) = x^2 + x$  at (2, 6) is 5. ●●●

**Check Point 1** Find the slope of the tangent line to the graph of  $f(x) = x^2 - x$  at (4, 12).

In Example 1, we found the *slope* of the tangent line shown in **Figure 11.19**. We can find an *equation* of this line using the point-slope form of the equation of a line

$$y - y_1 = m(x - x_1).$$

The tangent line passes through (2, 6):  $x_1 = 2$  and  $y_1 = 6$ . The slope of the tangent line is 5:  $m = 5$ . The point-slope equation of the tangent line is

$$y - 6 = 5(x - 2).$$

We can solve for  $y$  and express the equation of the tangent line in slope-intercept form:  $y = mx + b$ . The slope-intercept equation of the tangent line is

$$\begin{aligned} y - 6 &= 5x - 10 && \text{Apply the distributive property.} \\ y &= 5x - 4. && \text{Add 6 to both sides and write in slope-intercept form.} \end{aligned}$$

### EXAMPLE 2 Finding the Slope-Intercept Equation of a Tangent Line

Find the slope-intercept equation of the tangent line to the graph of  $f(x) = \sqrt{x}$  at (4, 2).

#### SOLUTION

We begin by finding the slope of the tangent line to the graph of  $f(x) = \sqrt{x}$  at (4, 2).

$$\begin{aligned} m_{\text{tan}} &= \lim_{h \rightarrow 0} \frac{f(4 + h) - f(4)}{h} \\ &= \lim_{h \rightarrow 0} \frac{\sqrt{4 + h} - 2}{h} \\ &= \lim_{h \rightarrow 0} \left[ \frac{\sqrt{4 + h} - 2}{h} \cdot \frac{\sqrt{4 + h} + 2}{\sqrt{4 + h} + 2} \right] \\ &= \lim_{h \rightarrow 0} \frac{4 + h - 4}{h(\sqrt{4 + h} + 2)} \\ &= \lim_{h \rightarrow 0} \frac{h}{h(\sqrt{4 + h} + 2)} \\ &= \lim_{h \rightarrow 0} \frac{1}{\sqrt{4 + h} + 2} \\ &= \frac{1}{\sqrt{4 + 0} + 2} \\ &= \frac{1}{4} \end{aligned}$$

The slope of the tangent line at  $(a, f(a))$  is  $\lim_{h \rightarrow 0} \frac{f(a + h) - f(a)}{h}$ .

To find  $f(4 + h)$ , replace  $x$  in  $f(x) = \sqrt{x}$  with  $4 + h$ .  $f(4) = \sqrt{4} = 2$

Rationalize the numerator.

Multiply the numerators.

Simplify the numerator.

Divide both the numerator and the denominator by  $h$ . This is permitted because  $h$  approaches 0, but  $h \neq 0$ .

Use limit properties.

Now that we have the slope of the tangent line, we can write the slope-intercept equation. Begin with the point-slope form

$$y - y_1 = m(x - x_1).$$

The tangent line is given to pass through  $(4, 2)$ :  $x_1 = 4$  and  $y_1 = 2$ . We found the slope of the tangent line to be  $\frac{1}{4}$ :  $m = \frac{1}{4}$ . The point-slope equation of the tangent line is

$$y - 2 = \frac{1}{4}(x - 4).$$

Solving for  $y$ , we obtain the slope-intercept equation of the tangent line.

$$y - 2 = \frac{1}{4}x - 1 \quad \text{Apply the distributive property.}$$

$$y = \frac{1}{4}x + 1 \quad \text{Add 2 to both sides. This is the slope-intercept form, } y = mx + b, \text{ of the equation.}$$

The slope-intercept equation of the tangent line to the graph of  $f(x) = \sqrt{x}$  at  $(4, 2)$  is  $y = \frac{1}{4}x + 1$ . **Figure 11.21** shows the graph of  $f$  and the tangent line.

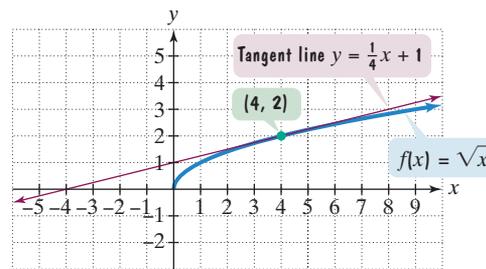

FIGURE 11.21

 **Check Point 2** Find the slope-intercept equation of the tangent line to the graph of  $f(x) = \sqrt{x}$  at  $(1, 1)$ .

**2** Find the derivative of a function.

### The Derivative of a Function

In Examples 1 and 2, we found the slope of a tangent line to the graph of  $f$  at  $(a, f(a))$ , where  $a$  was a specific number. We can also find the slope of a tangent line at  $(x, f(x))$ , where  $x$  can represent any number in the domain of  $f$  for which the slope of the tangent line is defined. The resulting function is called the *derivative of  $f$  at  $x$* .

#### Definition of the Derivative of a Function

Let  $y = f(x)$  denote a function  $f$ . The **derivative of  $f$  at  $x$** , denoted by  $f'(x)$ , read “ $f$  prime of  $x$ ,” is defined by

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x + h) - f(x)}{h}$$

provided that this limit exists. The derivative of a function  $f$  gives the slope of  $f$  for any value of  $x$  in the domain of  $f$ .

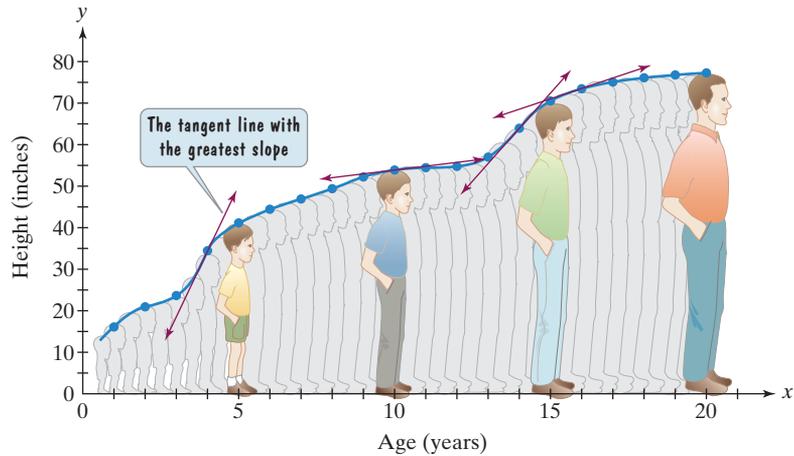

By evaluating the derivative, you can compute the slopes of various tangent lines to the graph of a function. Thus, the derivative gives you a way to analyze your moving world by revealing a function’s instantaneous rate of change at any moment.

*Blitzer Bonus* || The Seeds of Change

Every shape that's born bears in its womb the seeds of change.

—Ovid (Roman poet)

**Figure 11.22** shows a graph involving change, namely, a male's height as a function of his age. The derivative of this function provides a formula for the slope of the tangent line to the function's graph at any point. The figure shows four tangent lines. The derivative of this function would reveal that the tangent line with the greatest slope touches the curve somewhere between  $x = 3$  and  $x = 4$ . Thus, the instantaneous rate of change in the boy's growth is greatest at some moment in time between the ages of 3 and 4.

**FIGURE 11.22** Analyzing continuous change at an instant

**EXAMPLE 3** Finding the Derivative of a Function

- a. Find the derivative of  $f(x) = x^2 + 3x$  at  $x$ . That is, find  $f'(x)$ .
- b. Find the slope of the tangent line to the graph of  $f(x) = x^2 + 3x$  at  $x = -2$  and at  $x = -\frac{3}{2}$ .

**SOLUTION**

- a. We use the definition of the derivative of  $f$  at  $x$  to find the derivative of the given function.

$$\begin{aligned}
 f'(x) &= \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} \\
 &= \lim_{h \rightarrow 0} \frac{[(x+h)^2 + 3(x+h)] - (x^2 + 3x)}{h} \\
 &= \lim_{h \rightarrow 0} \frac{x^2 + 2xh + h^2 + 3x + 3h - x^2 - 3x}{h} \\
 &= \lim_{h \rightarrow 0} \frac{2xh + h^2 + 3h}{h} \\
 &= \lim_{h \rightarrow 0} \frac{h(2x + h + 3)}{h} \\
 &= \lim_{h \rightarrow 0} (2x + h + 3) \\
 &= 2x + 0 + 3 \\
 &= 2x + 3
 \end{aligned}$$

Use the definition of the derivative.

To find  $f(x+h)$ , replace  $x$  in  $f(x) = x^2 + 3x$  with  $x+h$ .

Perform the indicated operations in the numerator.

Simplify the numerator:  $x^2 - x^2 = 0$  and  $3x - 3x = 0$ .

Factor the numerator.

Divide the numerator and the denominator by  $h$ .

Use limit properties. As  $h$  approaches 0, only the term containing  $h$  is affected.

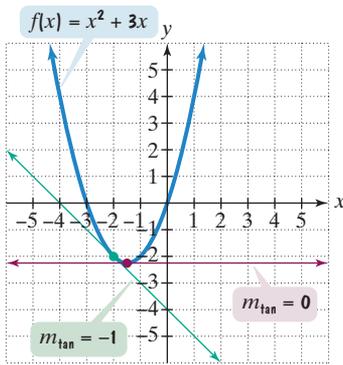

FIGURE 11.23 Two tangent lines to the graph of  $f(x) = x^2 + 3x$  and their slopes

The derivative of  $f(x) = x^2 + 3x$  is

$$f'(x) = 2x + 3.$$

- b. The derivative gives the slope of the tangent line at any point. Thus, to find the slope of the tangent line to the graph of  $f(x) = x^2 + 3x$  at  $x = -2$ , evaluate the derivative at  $-2$ . Similarly, to find the slope of the tangent line at  $x = -\frac{3}{2}$ , evaluate the derivative at  $-\frac{3}{2}$ .

$$f'(x) = 2x + 3$$

$$f'(-2) = 2(-2) + 3 = -4 + 3 = -1$$

$$f'\left(-\frac{3}{2}\right) = 2\left(-\frac{3}{2}\right) + 3 = -3 + 3 = 0$$

Figure 11.23 shows the graph of  $f(x) = x^2 + 3x$  and tangent lines at  $x = -2$  and  $x = -\frac{3}{2}$ . The slope of the decreasing green tangent line at  $x = -2$  is  $-1$ . The slope of the horizontal red tangent line at  $x = -\frac{3}{2}$  is  $0$ . ●●●

### Check Point 3

- Find the derivative of  $f(x) = x^2 - 5x$  at  $x$ . That is, find  $f'(x)$ .
- Find the slope of the tangent line to the graph of  $f(x) = x^2 - 5x$  at  $x = -1$  and at  $x = 3$ .

- 3 Find average and instantaneous rates of change.

### Applications of the Derivative

Many applications of the derivative involve analyzing change by determining a function's instantaneous rate of change at any moment. How do we use the derivative of a function to reveal such changes? We know that the derivative of  $f$  at  $x$  is defined by

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}.$$

Thus, the derivative of  $f$  at  $a$  is

$$f'(a) = \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h}.$$

Do you recognize this limit? It describes the instantaneous rate of change of  $f$  with respect to  $x$  at  $a$ .

#### Average and Instantaneous Rates of Change

**Average Rate of Change** The **average rate of change of  $f$  from  $x = a$  to  $x = a + h$**  is given by the difference quotient

$$\frac{f(a+h) - f(a)}{h}.$$

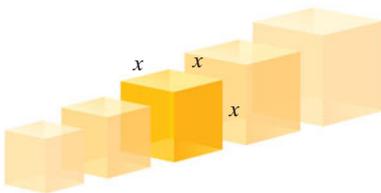

**Instantaneous Rate of Change** The **instantaneous rate of change of  $f$  with respect to  $x$  at  $a$**  is the derivative of  $f$  at  $a$ :

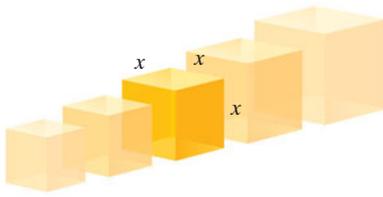

$$f'(a) = \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h}.$$

#### EXAMPLE 4 Finding Average and Instantaneous Rates of Change

The function  $f(x) = x^3$  describes the volume of a cube,  $f(x)$ , in cubic inches, whose length, width, and height each measure  $x$  inches. If  $x$  is changing,

- Find the average rate of change of the volume with respect to  $x$  as  $x$  changes from 5 inches to 5.1 inches and from 5 inches to 5.01 inches.
- Find the instantaneous rate of change of the volume with respect to  $x$  at the moment when  $x = 5$  inches.

**SOLUTION**

- a. As  $x$  changes from 5 to 5.1,  $a = 5$  and  $h = 0.1$ . The average rate of change of the volume with respect to  $x$  as  $x$  changes from 5 to 5.1 is determined as follows.

$$\begin{aligned} & \frac{f(a + h) - f(a)}{h} && \text{The difference quotient gives the average rate of change from } a \text{ to } a + h. \\ & = \frac{f(5 + 0.1) - f(5)}{0.1} && \text{This is the average rate of change from 5 to 5.1.} \\ & = \frac{f(5.1) - f(5)}{0.1} && \text{Simplify.} \\ & = \frac{5.1^3 - 5^3}{0.1} && \text{Use } f(x) = x^3 \text{ and substitute 5.1 and 5, respectively, for } x. \\ & = 76.51 \end{aligned}$$

The average rate of change in the volume is 76.51 cubic inches per inch as  $x$  changes from 5 to 5.1 inches.

As  $x$  changes from 5 to 5.01,  $a = 5$  and  $h = 0.01$ . The average rate of change of the volume with respect to  $x$  as  $x$  changes from 5 to 5.01 is determined as follows.

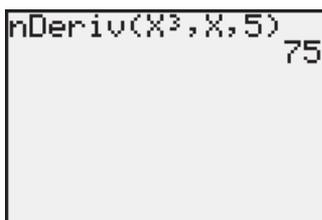

$$\begin{aligned} & \frac{f(a + h) - f(a)}{h} && \text{The difference quotient gives the average rate of change from } a \text{ to } a + h. \\ & = \frac{f(5 + 0.01) - f(5)}{0.01} && \text{This is the average rate of change from 5 to 5.01.} \\ & = \frac{f(5.01) - f(5)}{0.01} && \text{Simplify.} \\ & = \frac{5.01^3 - 5^3}{0.01} && \text{Use } f(x) = x^3 \text{ and substitute 5.01 and 5, respectively, for } x. \\ & = 75.1501 \end{aligned}$$

The average rate of change in the volume is 75.1501 cubic inches per inch as  $x$  changes from 5 to 5.01 inches.

- b. Instantaneous rates of change are given by the derivative. The derivative of  $f$  at  $a$ ,  $f'(a)$ , is the instantaneous rate of change of  $f$  with respect to  $x$  at  $a$ . We must find the instantaneous rate of change of the volume with respect to  $x$  at the moment when  $x = 5$  inches. This means that we must find  $f'(5)$ . We find  $f'(5)$  by first finding  $f'(x)$ , the derivative, and then evaluating  $f'$  at 5.

**TECHNOLOGY**

Graphing utilities have a feature that gives (or approximates) the derivative of a function evaluated at any number. Consult your manual for details. The screen below verifies that if  $f(x) = x^3$ , then  $f'(5) = 75$ .

$$\begin{aligned} f'(x) &= \lim_{h \rightarrow 0} \frac{f(x + h) - f(x)}{h} && \text{Use the definition of the derivative.} \\ &= \lim_{h \rightarrow 0} \frac{(x + h)^3 - x^3}{h} && \text{To find } f(x + h), \text{ replace } x \text{ in } f(x) = x^3 \text{ with } x + h. \\ &= \lim_{h \rightarrow 0} \frac{(x^3 + 3x^2h + 3xh^2 + h^3) - x^3}{h} && \text{Use the Binomial Theorem to cube } x + h. \\ &= \lim_{h \rightarrow 0} \frac{3x^2h + 3xh^2 + h^3}{h} && \text{Simplify the numerator: } x^3 - x^3 = 0. \\ &= \lim_{h \rightarrow 0} \frac{h(3x^2 + 3xh + h^2)}{h} && \text{Factor the numerator.} \\ &= \lim_{h \rightarrow 0} (3x^2 + 3xh + h^2) && \text{Divide the numerator and the denominator by } h. \\ &= 3x^2 + 3x \cdot 0 + 0^2 && \text{Use limit properties. As } h \text{ approaches 0, only terms containing } h \text{ are affected.} \\ &= 3x^2 \end{aligned}$$

The derivative of  $f(x) = x^3$  is  $f'(x) = 3x^2$ . To find the instantaneous change of  $f$  at 5, evaluate the derivative at 5.

$$\begin{aligned}f'(x) &= 3x^2 \\f'(5) &= 3 \cdot 5^2 = 75\end{aligned}$$

The instantaneous rate of change of the volume with respect to  $x$  at the moment when  $x = 5$  inches is 75 cubic inches per inch. Notice how the average rates of change that we computed in part (a), 76.51 and 75.1501, are approaching the instantaneous rate of change, 75. ●●●

 **Check Point 4** Use the function in Example 4,  $f(x) = x^3$ , to find each of the following:

- the average rate of change of the volume with respect to  $x$  as  $x$  changes from 4 inches to 4.1 inches and from 4 inches to 4.01 inches.
- the instantaneous rate of change of the volume with respect to  $x$  at the moment when  $x = 4$  inches.

#### 4 Find instantaneous velocity.

The ideas of calculus are frequently applied to position functions that express an object's position,  $s(t)$ , in terms of time,  $t$ . In the time interval from  $t = a$  to  $t = a + h$ , the change in the object's position is

$$s(a + h) - s(a).$$

The **average velocity** over this time interval is

$$\frac{s(a + h) - s(a)}{h}$$

The numerator is the change in position.

The denominator is the change in time from  $t = a$  to  $t = a + h$ .

Now suppose that we compute the average velocities over shorter and shorter time intervals  $[a, a + h]$ . This means that we let  $h$  approach 0. As in our previous discussion, we define the *instantaneous velocity* at time  $t = a$  to be the limit of these average velocities. This limit is the derivative of  $s$  at  $a$ .

#### Instantaneous Velocity

Suppose that a function expresses an object's position,  $s(t)$ , in terms of time,  $t$ . The **instantaneous velocity** of the object at time  $t = a$  is

$$s'(a) = \lim_{h \rightarrow 0} \frac{s(a + h) - s(a)}{h}.$$

Instantaneous velocity at time  $a$  is also called **velocity** at time  $a$ .

#### EXAMPLE 5 Finding Instantaneous Velocity

A ball is thrown straight up from a rooftop 160 feet high with an initial velocity of 48 feet per second. The function

$$s(t) = -16t^2 + 48t + 160$$

describes the ball's height above the ground,  $s(t)$ , in feet,  $t$  seconds after it is thrown. The ball misses the rooftop on its way down and eventually strikes the ground.

- What is the instantaneous velocity of the ball 2 seconds after it is thrown?
- What is the instantaneous velocity of the ball when it hits the ground?

*Blitzer Bonus*  
**Roller Coasters  
 and Derivatives**

Roller coaster rides give you the opportunity to spend a few hair-raising minutes plunging hundreds of feet, accelerating to 80 miles an hour in seven seconds, and enduring vertical loops that turn you upside-down. By finding a function that models your distance above the ground at every moment of the ride and taking its derivative, you can determine when the instantaneous velocity is the greatest. As you experience the glorious agony of the roller coaster, this is your moment of peak terror.

### SOLUTION

Instantaneous velocity is given by the derivative of a function that expresses an object's position,  $s(t)$ , in terms of time,  $t$ . The instantaneous velocity of the ball at  $a$  seconds is  $s'(a)$ .

$$s'(a) = \lim_{h \rightarrow 0} \frac{s(a+h) - s(a)}{h} \quad \text{This derivative describes instantaneous velocity at time } a.$$

To find  $s(a+h)$ , replace  $t$  in  $s(t) = -16t^2 + 48t + 160$  with  $a+h$ . To find  $s(a)$ , replace  $t$  with  $a$ . Thus,

$$s'(a) = \lim_{h \rightarrow 0} \frac{-16(a+h)^2 + 48(a+h) + 160 - (-16a^2 + 48a + 160)}{h}$$

Take a few minutes to simplify the numerator of the difference quotient and factor out  $h$ . You should obtain

$$s'(a) = \lim_{h \rightarrow 0} \frac{h(-32a - 16h + 48)}{h} = -32a - 16 \cdot 0 + 48 = -32a + 48.$$

The instantaneous velocity of the ball at  $a$  seconds is

$$s'(a) = -32a + 48.$$

- a. The instantaneous velocity of the ball at 2 seconds is found by replacing  $a$  with 2.

$$s'(2) = -32 \cdot 2 + 48 = -64 + 48 = -16$$

Two seconds after the ball is thrown, its instantaneous velocity is  $-16$  feet per second. The negative sign indicates that the ball is moving downward when  $t = 2$  seconds.

- b. To find the instantaneous velocity of the ball when it hits the ground, we need to know how many seconds elapse between the time the ball is thrown from the rooftop and the time it hits the ground. The ball hits the ground when  $s(t)$ , its height above the ground, is 0. Thus, we set  $s(t)$  equal to 0.

$$\begin{aligned} -16t^2 + 48t + 160 &= 0 && \text{Set } s(t) = 0. \\ -16(t^2 - 3t - 10) &= 0 && \text{Factor out } -16. \\ -16(t-5)(t+2) &= 0 && \text{Factor completely.} \\ t-5 = 0 & \quad t+2 = 0 && \text{Set each variable factor equal to 0.} \\ t = 5 & \quad t = -2 && \text{Solve for } t. \end{aligned}$$

Because we are describing the ball's position for  $t \geq 0$ , we discard the solution  $t = -2$ . The ball hits the ground at 5 seconds. Its instantaneous velocity at 5 seconds is found by replacing  $a$  with 5 in  $s'(a)$ .

$$\begin{aligned} s'(a) &= -32a + 48 && \text{This is the ball's instantaneous velocity after } a \text{ seconds.} \\ s'(5) &= -32 \cdot 5 + 48 = -160 + 48 = -112 \end{aligned}$$

The instantaneous velocity of the ball when it hits the ground is  $-112$  feet per second. The negative sign indicates that the ball is moving downward at the instant that it strikes the ground. ●●●

 **Check Point 5** A ball is thrown straight up from ground level with an initial velocity of 96 feet per second. The function

$$s(t) = -16t^2 + 96t$$

describes the ball's height above the ground,  $s(t)$ , in feet,  $t$  seconds after it is thrown.

- a. What is the instantaneous velocity of the ball after 4 seconds?  
 b. What is the instantaneous velocity of the ball when it hits the ground?

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

1. The slope of the tangent line to the graph of a function  $y = f(x)$  at  $(a, f(a))$  is given by

$$\lim_{h \rightarrow 0} \underline{\hspace{2cm}}$$

provided that this limit exists. This limit also describes the \_\_\_\_\_ rate of change of \_\_\_\_\_ with respect to \_\_\_\_\_ at  $a$ .

2. Using  $f(x) = 3x^2 + x$ , we can determine that

$$\lim_{h \rightarrow 0} \frac{f(1+h) - f(1)}{h} = 7.$$

This means that the point-slope equation of the tangent line to the graph of  $f(x) = 3x^2 + x$  at  $(1, 4)$  is  $y - \underline{\hspace{1cm}} = \underline{\hspace{1cm}}(x - \underline{\hspace{1cm}})$ .

3. The derivative of  $f$  at  $x$ , denoted by \_\_\_\_\_, is defined by

$$\lim_{h \rightarrow 0} \underline{\hspace{2cm}}$$

provided that this limit exists.

4. True or false: The derivative of a function  $f$  gives the slope of  $f$  for any value of  $x$  in the domain of  $f'$ .

5. Using  $f(x) = x^2 - 3x + 5$ , we can determine that  $f'(x) = 2x - 3$ . This means that the point-slope equation of the tangent line to the graph of  $f(x) = x^2 - 3x + 5$  at  $(6, 23)$  is  $y - \underline{\hspace{1cm}} = \underline{\hspace{1cm}}(x - \underline{\hspace{1cm}})$ .

6. A foul tip of a baseball is hit straight upward from a height of 4 feet with an initial velocity of 64 feet per second. The function  $s(t) = -16t^2 + 64t + 4$  describes the ball's height above the ground,  $s(t)$ , in feet,  $t$  seconds after it is hit. Using this function, we can determine that  $s'(a) = -32a + 64$ . This tells us that one second after the ball is hit, its instantaneous velocity is \_\_\_\_\_ feet per second. The positive sign indicates that the ball is moving \_\_\_\_\_ when  $t = 1$  second.

## EXERCISE SET 11.4

### Practice Exercises

In Exercises 1–14,

- a. Find the slope of the tangent line to the graph of  $f$  at the given point.  
b. Find the slope-intercept equation of the tangent line to the graph of  $f$  at the given point.

1.  $f(x) = 2x + 3$  at  $(1, 5)$       2.  $f(x) = 4x + 2$  at  $(1, 6)$   
3.  $f(x) = x^2 + 4$  at  $(-1, 5)$       4.  $f(x) = x^2 + 7$  at  $(-1, 8)$   
5.  $f(x) = 5x^2$  at  $(-2, 20)$       6.  $f(x) = 4x^2$  at  $(-2, 16)$   
7.  $f(x) = 2x^2 - x$  at  $(2, 6)$       8.  $f(x) = 3x^2 + x$  at  $(1, 4)$   
9.  $f(x) = 2x^2 + x - 3$  at  $(0, -3)$   
10.  $f(x) = 2x^2 - x + 5$  at  $(0, 5)$   
11.  $f(x) = \sqrt{x}$  at  $(9, 3)$       12.  $f(x) = \sqrt{x}$  at  $(16, 4)$   
13.  $f(x) = \frac{1}{x}$  at  $(1, 1)$       14.  $f(x) = \frac{2}{x}$  at  $(1, 2)$

In Exercises 15–28,

- a. Find the derivative of  $f$  at  $x$ . That is, find  $f'(x)$ .  
b. Find the slope of the tangent line to the graph of  $f$  at each of the two values of  $x$  given to the right of the function.

15.  $f(x) = -3x + 7$ ;  $x = 1, x = 4$   
16.  $f(x) = -5x + 3$ ;  $x = 1, x = 4$   
17.  $f(x) = x^2 - 6$ ;  $x = -1, x = 3$   
18.  $f(x) = x^2 - 8$ ;  $x = -1, x = 3$   
19.  $f(x) = x^2 - 3x + 5$ ;  $x = \frac{3}{2}, x = 2$   
20.  $f(x) = x^2 - 4x + 7$ ;  $x = \frac{3}{2}, x = 2$   
21.  $f(x) = x^3 + 2$ ;  $x = -1, x = 1$   
22.  $f(x) = x^3 - 2$ ;  $x = -1, x = 1$

23.  $f(x) = \sqrt{x}$ ;  $x = 1, x = 4$   
24.  $f(x) = \sqrt{x}$ ;  $x = 25, x = 100$   
25.  $f(x) = \frac{4}{x}$ ;  $x = -2, x = 1$   
26.  $f(x) = \frac{8}{x}$ ;  $x = -2, x = 1$   
27.  $f(x) = 3.2x^2 + 2.1x$ ;  $x = 0, x = 4$   
28.  $f(x) = 1.3x^2 - 1.4x$ ;  $x = 0, x = 4$

### Practice Plus

In Exercises 29–36,

- a. Use transformations of a common graph to obtain the graph of  $f$ .  
b. Find the slope-intercept equation of the tangent line to the graph of  $f$  at the point whose  $x$ -coordinate is given.  
c. Use the  $y$ -intercept and the slope to graph the tangent line in the same rectangular coordinate system as the graph of  $f$ .

29.  $f(x) = (x - 2)^2$ ; tangent line at 3  
30.  $f(x) = (x + 2)^2$ ; tangent line at  $-1$   
31.  $f(x) = \sqrt{x + 1} - 2$ ; tangent line at 0  
32.  $f(x) = \sqrt{x - 1} + 2$ ; tangent line at 2  
33.  $f(x) = x^3 + 2$ ; tangent line at  $-1$   
34.  $f(x) = x^3 - 2$ ; tangent line at 1  
35.  $f(x) = -\frac{1}{x + 3}$ ; tangent line at  $-2$   
36.  $f(x) = -\frac{1}{x - 2}$ ; tangent line at 3

## Application Exercises

37. The function  $f(x) = x^2$  describes the area of a square,  $f(x)$ , in square inches, whose sides each measure  $x$  inches. If  $x$  is changing,
- Find the average rate of change of the area with respect to  $x$  as  $x$  changes from 6 inches to 6.1 inches and from 6 inches to 6.01 inches.
  - Find the instantaneous rate of change of the area with respect to  $x$  at the moment when  $x = 6$  inches.
38. The function  $f(x) = x^2$  describes the area of a square,  $f(x)$ , in square inches, whose sides each measure  $x$  inches. If  $x$  is changing,
- Find the average rate of change of the area with respect to  $x$  as  $x$  changes from 10 inches to 10.1 inches and from 10 inches to 10.01 inches.
  - Find the instantaneous rate of change of the area with respect to  $x$  at the moment when  $x = 10$  inches.

In Exercises 39–42, express all answers in terms of  $\pi$ .

39. The function  $f(x) = \pi x^2$  describes the area of a circle,  $f(x)$ , in square inches, whose radius measures  $x$  inches. If the radius is changing,
- Find the average rate of change of the area with respect to the radius as the radius changes from 2 inches to 2.1 inches and from 2 inches to 2.01 inches.
  - Find the instantaneous rate of change of the area with respect to the radius when the radius is 2 inches.
40. The function  $f(x) = \pi x^2$  describes the area of a circle,  $f(x)$ , in square inches, whose radius measures  $x$  inches. If the radius is changing,
- Find the average rate of change of the area with respect to the radius as the radius changes from 4 inches to 4.1 inches and from 4 inches to 4.01 inches.
  - Find the instantaneous rate of change of the area with respect to the radius when the radius is 4 inches.
41. The function  $f(x) = 4\pi x^2$  describes the surface area,  $f(x)$ , of a sphere of radius  $x$  inches. If the radius is changing, find the instantaneous rate of change of the surface area with respect to the radius when the radius is 6 inches.
42. The function  $f(x) = 5\pi x^2$  describes the volume,  $f(x)$ , of a right circular cylinder of height 5 feet and radius  $x$  feet. If the radius is changing, find the instantaneous rate of change of the volume with respect to the radius when the radius is 8 feet.

43. An explosion causes debris to rise vertically with an initial velocity of 64 feet per second. The function

$$s(t) = -16t^2 + 64t$$

describes the height of the debris above the ground,  $s(t)$ , in feet,  $t$  seconds after the explosion.

- What is the instantaneous velocity of the debris 1 second after the explosion? 3 seconds after the explosion?
  - What is the instantaneous velocity of the debris when it hits the ground?
44. An explosion causes debris to rise vertically with an initial velocity of 72 feet per second. The function

$$s(t) = -16t^2 + 72t$$

describes the height of the debris above the ground,  $s(t)$ , in feet,  $t$  seconds after the explosion.

- What is the instantaneous velocity of the debris  $\frac{1}{2}$  second after the explosion? 4 seconds after the explosion?
- What is the instantaneous velocity of the debris when it hits the ground?

45. A foul tip of a baseball is hit straight upward from a height of 4 feet with an initial velocity of 96 feet per second. The function

$$s(t) = -16t^2 + 96t + 4$$

describes the ball's height above the ground,  $s(t)$ , in feet,  $t$  seconds after it is hit.

- What is the instantaneous velocity of the ball 2 seconds after it is hit? 4 seconds after it is hit?
  - The ball reaches its maximum height above the ground when the instantaneous velocity is zero. After how many seconds does the ball reach its maximum height? What is its maximum height?
46. A foul tip of a baseball is hit straight upward from a height of 4 feet with an initial velocity of 64 feet per second. The function

$$s(t) = -16t^2 + 64t + 4$$

describes the ball's height above the ground,  $s(t)$ , in feet,  $t$  seconds after it is hit.

- What is the instantaneous velocity of the ball 1 second after it is hit? 3 seconds after it is hit?
- The ball reaches its maximum height above the ground when the instantaneous velocity is zero. After how many seconds does the ball reach its maximum height? What is its maximum height?

## Writing in Mathematics

47. Explain how the tangent line to the graph of a function at point  $P$  is related to the secant lines between points  $P$  and  $Q$  on the function's graph.
48. Explain what we mean by the slope of the graph of a function at a point.
49. Explain how to find the slope of  $f(x) = x^2$  at  $(2, 4)$ .
50. Explain how to write an equation of the tangent line to the graph of  $f(x) = x^2$  at  $(2, 4)$ .
51. If you are given  $y = f(x)$ , the equation of function  $f$ , describe how to find  $f'(x)$ .
52. Explain how to use the derivative to compute the slopes of various tangent lines to the graph of a function.
53. Explain how the instantaneous rate of change of a function at a point is related to its average rates of change.
54. If a function expresses an object's position in terms of time, how do you find the instantaneous velocity of the object at any time during its motion?
55. Use the concept of an interval of time to describe how calculus views a particular instant of time.
56. You are about to take a great picture of fog rolling into San Francisco from the middle of the Golden Gate Bridge, 400 feet above the water. Whoops! You accidentally lean too far over the safety rail and drop your camera. Your friend quips, "Well at least you know calculus; you can figure out the velocity with which the camera is going to hit the water." If the camera's height,  $s(t)$ , in feet, over the water after  $t$  seconds is  $s(t) = 400 - 16t^2$ , describe how to determine the camera's velocity at the instant of its demise.

57. A calculus professor introduced the derivative by saying that it could be summed up in one word: *slope*. Explain what this means.
58. For an unusual introduction to calculus using graphics and humor, read the first 100 pages (up through and including Chapter 2) of *The Cartoon Guide to Calculus* (Harpercollins, 2012) by cartoonist and Harvard-educated mathematician Larry Gonick. Write a report describing five new things you learned from the book that you did not know about calculus after completing this chapter. Did you find Gonick's attempt to teach calculus, using cartoon characters talking, commenting, and joking, helpful or distracting? (If you enjoy the use of comic art to humanize the world of functions, limits, and derivatives, and you're planning to take a calculus course in the future, read *The Cartoon Guide to Calculus* in its entirety, where you'll be taught the essentials of first-semester calculus.)

### Technology Exercises

59. Use the **DRAW TANGENT** feature of a graphing utility to graph the functions and tangent lines for any five exercises from Exercises 1–14. Use the equation that is displayed on the screen to verify the slope-intercept equation of the tangent line that you found in each exercise.
60. Without using the **DRAW TANGENT** feature of a graphing utility, graph the function and the tangent line whose equation you found for any five exercises from Exercises 1–14. Does the line appear to be tangent to the graph of  $f$  at the point on  $f$  that is given in the exercise?
61. Use the feature on a graphing utility that gives the derivative of a function evaluated at any number to verify part (b) for any five of your answers in Exercises 15–28.

In Exercises 62–65, find, or approximate to two decimal places, the derivative of each function at the given number using a graphing utility.

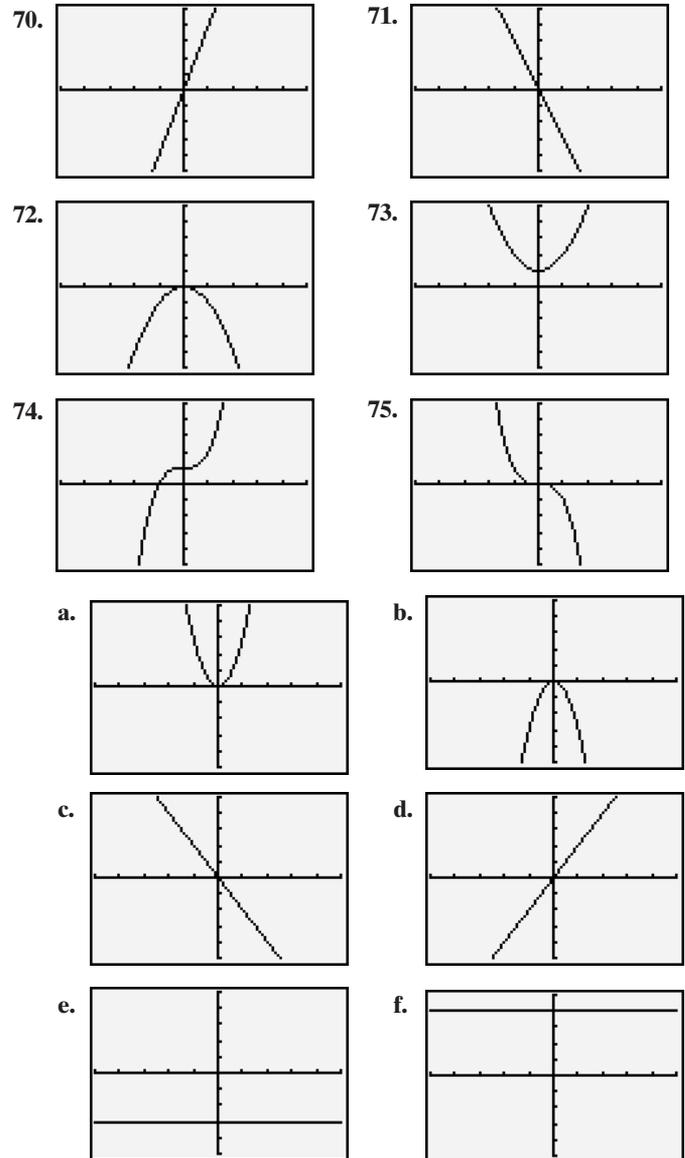

62.  $f(x) = x^4 - x^3 + x^2 - x + 1$  at 1
63.  $f(x) = \frac{x}{x-3}$  at 6
64.  $f(x) = x^2 \cos x$  at  $\frac{\pi}{4}$
65.  $f(x) = e^x \sin x$  at 2

### Critical Thinking Exercises

**Make Sense?** In Exercises 66–69, determine whether each statement makes sense or does not make sense, and explain your reasoning.

66. Because I have two points to work with, I use the formula for slope,  $\frac{y_2 - y_1}{x_2 - x_1}$ , to find the slope of the tangent line to the graph of a function  $y = f(x)$  at  $(a, f(a))$ .
67. I can find the slope of the tangent line to the graph of  $f(x)$  at  $(3, f(3))$  using  $\lim_{h \rightarrow 0} \frac{f(3+h) - f(3)}{h}$  or finding  $f'(x)$  and then replacing  $x$  with 3.
68. I obtained  $f'(x)$  by finding  $\lim_{h \rightarrow 0} [f(x+h) - f(x)]$  and  $\lim_{h \rightarrow 0} h$ , and then using the quotient rule for limits.
69. If  $f(x) = \pi x^2$  describes the area of a circle,  $f(x)$ , with radius  $x$ ,  $f'(5) > f'(2)$  because the area increases more rapidly as the radius increases.

In Exercises 70–75, graphs of functions are shown in  $[-5, 5, 1]$  by  $[-5, 5, 1]$  viewing rectangles. Match each function with the graph of its derivative. Graphs of derivatives are labeled (a)–(f) and are shown in  $[-5, 5, 1]$  by  $[-5, 5, 1]$  viewing rectangles.

76. A ball is thrown straight up from a rooftop 96 feet high with an initial velocity of 80 feet per second. The function

$$s(t) = -16t^2 + 80t + 96$$

- describes the ball's height above the ground,  $s(t)$ , in feet,  $t$  seconds after it is thrown. The ball misses the rooftop on its way down and eventually strikes the ground. What is its instantaneous velocity as it passes the rooftop on the way down?
77. Show that the rate of change of the area of a circle with respect to its radius is equal to the circumference of the circle.
78. Show that the  $x$ -coordinate of the vertex of the parabola whose equation is  $y = ax^2 + bx + c$  occurs when the derivative of the function is zero.
79. For any positive integer  $n$ , prove that if  $f(x) = x^n$ , then  $f'(x) = nx^{n-1}$ .

## CHAPTER 11

## Summary, Review, and Test

## SUMMARY

## DEFINITIONS AND CONCEPTS

## EXAMPLES

## 11.1 Finding Limits Using Tables and Graphs

## a. Limit Notation and Its Description

$\lim_{x \rightarrow a} f(x) = L$  is read “the limit of  $f(x)$  as  $x$  approaches  $a$  equals the number  $L$ .” This means that as  $x$  gets closer to  $a$ , but remains unequal to  $a$ , the corresponding values of  $f(x)$  get closer to  $L$ .

## b. Limits can be found using tables.

Ex. 1, p. 1094;

Ex. 2, p. 1094

## c. Limits can be found using graphs.

Ex. 3, p. 1096;

Ex. 4, p. 1096

## d. Left-Hand Limit

$\lim_{x \rightarrow a^-} f(x) = L$  is read “the limit of  $f(x)$  as  $x$  approaches  $a$  from the left equals  $L$ .” This means that as  $x$  gets closer to  $a$ , but remains less than  $a$ , the corresponding values of  $f(x)$  get closer to  $L$ .

## e. Right-Hand Limit

$\lim_{x \rightarrow a^+} f(x) = L$  is read “the limit of  $f(x)$  as  $x$  approaches  $a$  from the right equals  $L$ .” This means that as  $x$  gets closer to  $a$ , but remains greater than  $a$ , the corresponding values of  $f(x)$  get closer to  $L$ .

f. If  $\lim_{x \rightarrow a^-} f(x) \neq \lim_{x \rightarrow a^+} f(x)$ , then  $\lim_{x \rightarrow a} f(x)$  does not exist.

Ex. 5, p. 1098

## 11.2 Finding Limits Using Properties of Limits

## a. Properties of limits are given in the box on page 1111.

Ex. 1–Ex. 11,  
pp. 1105–1111

## b. Properties of limits can be used to find one-sided limits.

Ex. 12, p. 1112

## c. When taking the limit of a fractional expression in which the limit of the denominator is zero, the quotient property for limits cannot be used. Rewriting the expression using factoring or rationalizing the numerator or denominator may be helpful before the limit is found.

Ex. 13, p. 1112;

Ex. 14, p. 1113

## 11.3 Limits and Continuity

a. A function  $f$  is continuous at  $a$  when  $f$  is defined at  $a$ ,  $\lim_{x \rightarrow a} f(x)$  exists, and  $\lim_{x \rightarrow a} f(x) = f(a)$ . If  $f$  is not continuous at  $a$ , we say that  $f$  is discontinuous at  $a$ .

Ex. 1, p. 1118;

Ex. 2, p. 1119

## 11.4 Introduction to Derivatives

a. The slope of the tangent line to the graph of a function  $y = f(x)$  at  $(a, f(a))$  is given by

Ex. 1, p. 1127;

Ex. 2, p. 1128

$$m_{\tan} = \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h}$$

provided that this limit exists. The limit also describes the slope of the graph of  $f$  at  $(a, f(a))$ .

## b. The Derivative of a Function

The derivative of  $f$  at  $x$  is given by

Ex. 3, p. 1130

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

provided that this limit exists. The derivative gives the slope of  $f$  for any value at  $x$  in the domain of  $f'$ .

c. The derivative of  $f$  at  $a$ ,  $f'(a) = \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h}$ , gives the instantaneous rate of change of  $f$  with respect to  $x$  at  $a$ . Expressions for average and instantaneous rates of change are given in the box on page 1131.

Ex. 4, p. 1131

d. If a function expresses an object's position,  $s(t)$ , in terms of time,  $t$ , the instantaneous velocity of the object at time  $t = a$  is

Ex. 5, p. 1133

$$s'(a) = \lim_{h \rightarrow 0} \frac{s(a+h) - s(a)}{h}$$

## REVIEW EXERCISES

### 11.1

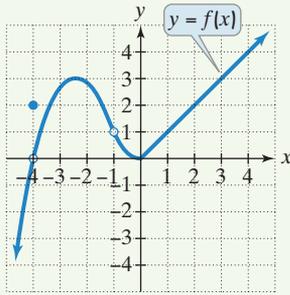

In Exercises 1–3, construct a table to find the indicated limit.

$$1. \lim_{x \rightarrow 1} \frac{x^3 - 1}{x - 1}$$

$$2. \lim_{x \rightarrow 0} \frac{\sqrt{x+1} - 1}{x}$$

$$3. \lim_{x \rightarrow 0} \frac{\sin 2x}{x}$$

In Exercises 4–8, use the graph of  $f$  to find the indicated limit or function value.

$$4. \lim_{x \rightarrow -4} f(x)$$

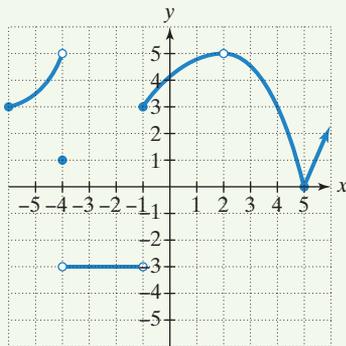

$$5. \lim_{x \rightarrow -1} f(x)$$

$$6. \lim_{x \rightarrow 3} f(x)$$

$$7. f(-4)$$

$$8. f(3)$$

In Exercises 9–23, use the graph of function  $f$  to find the indicated limit or function value, or state that the limit or function value does not exist.

$$9. \lim_{x \rightarrow -6^+} f(x)$$

$$10. \lim_{x \rightarrow -4} f(x)$$

$$11. \lim_{x \rightarrow -4^+} f(x)$$

$$12. \lim_{x \rightarrow -4} f(x)$$

$$13. f(-4)$$

$$14. \lim_{x \rightarrow -1^+} f(x)$$

$$15. \lim_{x \rightarrow -1} f(x)$$

$$16. \lim_{x \rightarrow -1} f(x)$$

$$17. f(-1)$$

$$18. f(2)$$

$$19. \lim_{x \rightarrow 2} f(x)$$

$$20. \lim_{x \rightarrow 2^+} f(x)$$

$$21. \lim_{x \rightarrow 2} f(x)$$

$$22. \lim_{x \rightarrow 5} f(x)$$

$$23. f(5)$$

In Exercises 24–26, graph each function. Then use your graph to find the indicated limit.

$$24. f(x) = \frac{x^2 - 9}{x - 3}, \quad \lim_{x \rightarrow 3} f(x)$$

$$25. f(x) = \sin x, \quad \lim_{x \rightarrow \frac{3\pi}{2}} f(x)$$

$$26. f(x) = \begin{cases} 1 - x & \text{if } x < 0 \\ \cos x & \text{if } x \geq 0, \end{cases} \quad \lim_{x \rightarrow 0} f(x)$$

### 11.2

In Exercises 27–37, find the limit.

$$27. \lim_{x \rightarrow 4} (2x^2 - 5x + 3)$$

$$28. \lim_{x \rightarrow 1} (-2x^3 - x + 5)$$

$$29. \lim_{x \rightarrow 3} (x^2 + 1)^3$$

$$30. \lim_{x \rightarrow 4} \sqrt{x^2 + 9}$$

$$31. \lim_{x \rightarrow 5} \frac{11x - 3}{x^2 + 1}$$

$$32. \lim_{x \rightarrow -4} \frac{x^2 - 16}{x + 4}$$

$$33. \lim_{x \rightarrow 7} \frac{5x - 35}{x - 7}$$

$$34. \lim_{x \rightarrow 0} \frac{\sqrt{x + 100} - 10}{x}$$

$$35. \lim_{x \rightarrow -1} \frac{x^2 - 1}{x^2 + x}$$

$$36. \lim_{x \rightarrow 100} \frac{\sqrt{x} - 10}{x - 100}$$

$$37. \lim_{x \rightarrow 0} \frac{1}{x + 5} - \frac{1}{5}$$

In Exercises 38–40, a piecewise function is given. Use properties of limits to find the indicated limit, or state that the limit does not exist.

$$38. f(x) = \begin{cases} x^2 + 1 & \text{if } x < 2 \\ 3x + 1 & \text{if } x \geq 2 \end{cases}$$

$$a. \lim_{x \rightarrow 2} f(x)$$

$$b. \lim_{x \rightarrow 2^-} f(x)$$

$$c. \lim_{x \rightarrow 2^+} f(x)$$

$$39. f(x) = \begin{cases} \sqrt[3]{x^2 + 7} & \text{if } x < 1 \\ 4x & \text{if } x \geq 1 \end{cases}$$

$$a. \lim_{x \rightarrow 1} f(x)$$

$$b. \lim_{x \rightarrow 1^-} f(x)$$

$$c. \lim_{x \rightarrow 1^+} f(x)$$

$$40. f(x) = \begin{cases} \frac{x^2 - 25}{x + 5} & \text{if } x \neq -5 \\ 13 & \text{if } x = -5 \end{cases}$$

$$a. \lim_{x \rightarrow -5} f(x)$$

$$b. \lim_{x \rightarrow -5^+} f(x)$$

$$c. \lim_{x \rightarrow -5^-} f(x)$$

### 11.3

In Exercises 41–45, use the definition of continuity to determine whether  $f$  is continuous at  $a$ .

$$41. f(x) = 3x^2 - 2x + 1 \quad a = 4$$

$$42. f(x) = \frac{x^2 - 9}{x + 3} \quad a = -3$$

$$43. f(x) = \begin{cases} x^2 + 5x & \text{if } x \neq 0 \\ x^2 - 5x & \text{if } x = 0 \end{cases} \quad a = 0$$

$$44. f(x) = \begin{cases} \frac{x^2 + x}{x^2 - 3x - 4} & \text{if } x \neq -1 \\ \frac{1}{5} & \text{if } x = -1 \end{cases} \quad a = -1$$

$$45. f(x) = \begin{cases} 3x & \text{if } x < 2 \\ 5 & \text{if } x = 2 \\ x + 4 & \text{if } x > 2 \end{cases} \quad a = 2$$

In Exercises 46–51, determine for what numbers, if any, the given function is discontinuous.

$$46. f(x) = x^3 + 5x^2 - 1$$

$$47. f(x) = \frac{x - 1}{(x - 1)(x + 3)}$$

$$48. f(x) = \begin{cases} -1 & \text{if } x < 0 \\ 1 & \text{if } x \geq 0 \end{cases}$$

$$49. f(x) = \begin{cases} 4x & \text{if } x < 5 \\ x^2 - 5 & \text{if } x \geq 5 \end{cases}$$

$$50. f(x) = \begin{cases} \frac{x^2 - 4}{x + 2} & \text{if } x \neq -2 \\ 4 & \text{if } x = -2 \end{cases}$$

$$51. f(x) = \begin{cases} \frac{x^2 - 121}{x - 11} & \text{if } x \neq 11 \\ 20 & \text{if } x = 11 \end{cases}$$

**11.4**

In Exercises 52–53,

a. Find the slope of the tangent line to the graph of  $f$  at the given point.

b. Find the slope-intercept equation of the tangent line to the graph of  $f$  at the given point.

52.  $f(x) = 2x^2 + 5x$  at  $(1, 7)$

53.  $f(x) = x^2 - 7x - 4$  at  $(-1, 4)$

In Exercises 54–57,

a. Find  $f'(x)$ .

b. Find the slope of the tangent line to the graph of  $f$  at each of the two values of  $x$  given to the right of the function.

54.  $f(x) = 3x^2 + 12x - 1$ ;  $x = -2, x = 1$

55.  $f(x) = 2x^3 - x$ ;  $x = -1, x = 1$

56.  $f(x) = \frac{1}{x}$ ;  $x = -2, x = 2$     57.  $f(x) = \sqrt{x}$ ;  $x = 36, x = 81$

58. The function  $f(x) = 5x^2$  describes the volume of a rectangular box,  $f(x)$ , in cubic inches, whose square base has sides that each measure  $x$  inches and whose height is 5 inches. If  $x$  is changing,

a. Find the average rate of change of the volume with respect to  $x$  as  $x$  changes from 2 inches to 2.1 inches and from 2 inches to 2.01 inches.

b. Find the instantaneous rate of change of the volume with respect to  $x$  at the moment when  $x = 2$  inches.

59. The function  $f(x) = \frac{4}{3}\pi x^3$  describes the volume,  $f(x)$ , of a sphere of radius  $x$  inches. If the radius is changing, find the instantaneous rate of change of the volume with respect to the radius when the radius is 5 inches. Express the answer in terms of  $\pi$ .

60. A baseball is thrown straight upward from a height of 5 feet with an initial velocity of 80 feet per second. The function

$$s(t) = -16t^2 + 80t + 5$$

describes the ball's height above the ground,  $s(t)$ , in feet,  $t$  seconds after it is thrown.

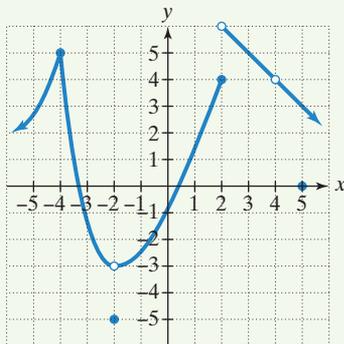

a. What is the instantaneous velocity of the ball 2 seconds after it is thrown? 4 seconds after it is thrown?

b. The ball reaches its maximum height above the ground when the instantaneous velocity is zero. After how many seconds does the ball reach its maximum height? What is the maximum height?

**CHAPTER 11 TEST**

1. Construct a table to find  $\lim_{x \rightarrow 9} \frac{9 - x}{3 - \sqrt{x}}$ .

In Exercises 2–7, use the graph of function  $f$  to find the indicated limit or function value, or state that the limit or function value does not exist.

2.  $\lim_{x \rightarrow -2} f(x)$

3.  $f(-2)$

4.  $\lim_{x \rightarrow 2^-} f(x)$

5.  $\lim_{x \rightarrow 2^+} f(x)$

6.  $\lim_{x \rightarrow 2} f(x)$

7.  $\lim_{x \rightarrow 4} f(x)$

In Exercises 8–10, find the limit.

8.  $\lim_{x \rightarrow -2} (x^2 + x + 1)^4$

9.  $\lim_{x \rightarrow -1} \frac{x^2 - x - 2}{x + 1}$

10.  $\lim_{x \rightarrow 9} \frac{\sqrt{x} - 3}{x - 9}$

In Exercises 11–12, determine whether  $f$  is continuous at  $a$ .

11.  $f(x) = \begin{cases} \frac{x^2 - 1}{x + 1} & \text{if } x \neq -1 \\ 6 & \text{if } x = -1 \end{cases}$   
 $a = -1$

12.  $f(x) = \begin{cases} 2 - x & \text{if } x \leq 2 \\ x^2 - 2x & \text{if } x > 2 \end{cases}$   
 $a = 2$

In Exercises 13–14, find  $f'(x)$ .

13.  $f(x) = x^2 - 5x + 1$       14.  $f(x) = \frac{10}{x}$

15. Find the slope-intercept equation of the tangent line to the graph of  $f(x) = x^2$  at  $(-3, 9)$ .

16. A ball is thrown straight upward. The function

$$s(t) = -16t^2 + 72t$$

describes the ball's height above the ground,  $s(t)$ , in feet,  $t$  seconds after it is thrown. What is the instantaneous velocity of the ball 3 seconds after it is thrown?

## CUMULATIVE REVIEW EXERCISES (CHAPTERS P–11)

Solve each equation or inequality in Exercises 1–5.

- $\frac{1}{x+2} > \frac{3}{x+1}$
- $2x^3 + 11x^2 - 7x - 6 = 0$
- $|2x + 4| > 3$
- $\cos^2 x + \sin x + 1 = 0, 0 \leq x < 2\pi$
- $\log_4(x^2 - 9) - \log_4(x + 3) = 3$

In Exercises 6–15, graph each equation, function, or system in a rectangular coordinate system.

- $f(x) = x^3 + x^2 - 12x$
- $f(x) = \frac{2x^2 - 5x + 2}{x^2 - 4}$
- $f(x) = \begin{cases} -x + 1 & \text{if } -1 \leq x < 1 \\ 2 & \text{if } x = 1 \\ x^2 & \text{if } x > 1 \end{cases}$
- $y = 2 \sin\left(2x + \frac{\pi}{2}\right)$  (Graph one period.)
- $y = \frac{1}{2} \sec 2\pi x, 0 \leq x \leq 2$
- $\begin{cases} x - 2y \leq 4 \\ x \geq 2 \end{cases}$
- $x^2 - 4y^2 - 4x - 24y - 48 = 0$
- $f(x) = \sqrt{x}, g(x) = \sqrt{x-2} + 1$  (Graph  $f$  and  $g$  in the same rectangular coordinate system.)
- $x = 3 \sin t, y = 4 \cos t + 2; 0 \leq t \leq 2\pi$
- $2x^2 + 5xy + 2y^2 - \frac{9}{2} = 0$
- Find  $f'(x)$  if  $f(x) = -2x^2 + 7x - 1$ .
- Find  $f^{-1}(x)$  if  $f(x) = 7x - 1$ .
- Find the limit:  $\lim_{x \rightarrow -3} \frac{x^2 + x - 6}{x^2 + 2x - 3}$ .
- Expand and simplify:  $(x^2 - 3y)^4$ .
- Write the slope-intercept form of the equation of the line passing through the point  $(2, -3)$  and parallel to the line whose equation is  $2x + y - 6 = 0$ .
- Find the dot product  $\mathbf{v} \cdot \mathbf{w}$  and the angle between  $\mathbf{v}$  and  $\mathbf{w}$ :

$$\mathbf{v} = -2\mathbf{i} + \mathbf{j}, \quad \mathbf{w} = 4\mathbf{i} - 3\mathbf{j}.$$

- Find the partial fraction decomposition for

$$\frac{1}{x(x^2 + x + 1)}.$$

Verify each identity in Exercises 23–24.

- $\tan \theta + \cot \theta = \sec \theta \csc \theta$
- $\tan(\theta + \pi) = \tan \theta$
- If  $A = \begin{bmatrix} 2 & 1 & 3 \\ 1 & -1 & 0 \end{bmatrix}$  and  $B = \begin{bmatrix} 1 & 0 \\ 3 & 2 \\ 2 & 1 \end{bmatrix}$ , find  $BA$ .
- Graph the polar equation:  $r = 4 \sin \theta$ .
- Express  $h(x) = (x^2 - 3x + 7)^9$  as a composition of two functions  $f$  and  $g$  such that  $h(x) = (f \circ g)(x)$ .

- Solve using matrices:

$$\begin{cases} 2x - y - 2z = -1 \\ x - 2y - z = 1 \\ x + y + z = 1. \end{cases}$$

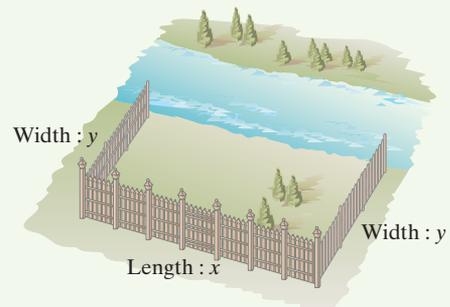

- Use the formula for the sum of the first  $n$  terms of a geometric sequence to find  $\sum_{i=1}^6 4(-2)^i$ .

- Use DeMoivre's Theorem to find

$$[\sqrt{2}(\cos 15^\circ + i \sin 15^\circ)]^4.$$

Write the answer in rectangular form.

- A bank loaned out \$120,000, part of it at 8% per year and the rest at 18% per year.
  - Express the interest,  $I$ , on the two loans as a function of the amount loaned at 8%,  $x$ .
  - If the interest received totaled \$10,000, how much was loaned at each rate?
- A machine produces open boxes using square sheets of metal. The machine cuts equal-sized squares measuring 9 centimeters on a side from each corner. Then the machine shapes the metal into an open box by turning up the sides. If each box must have a volume of 225 cubic centimeters, what should be the dimensions of the piece of sheet metal?
- You have 200 feet of fencing to enclose a small rectangular garden with one side against a barn. If you do not fence the side along the barn, find the length and width of the garden that will maximize its area. What is the largest area that can be enclosed?
- Use Newton's Law of Cooling,  $T = C + (T_0 - C)e^{kt}$ , to solve this exercise. You remove a pie that has a temperature of 375°F from the oven. You leave the pie in a room whose temperature is 72°F. After 60 minutes, the temperature of the pie is 75°F.
  - Write a model for the temperature of the pie,  $T$ , after  $t$  minutes.
  - When will the temperature of the pie be 250°F?
- You just purchased a rectangular waterfront lot along a river's edge. The area of the lot is 60,000 square feet. To create a sense of privacy, you decide to fence along three sides, excluding the side that fronts the river. An expensive fencing along the lot's front length costs \$25 per foot. An inexpensive fencing along the two side widths costs only \$5 per foot. Express the total cost,  $C$ , of fencing along the three sides as a function of the lot's length,  $x$ .

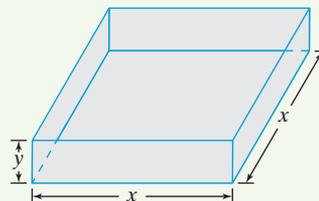

36. Two ships leave a harbor at the same time. One ship travels at a bearing of  $N42^\circ E$  for 23 miles. The other ship travels at a bearing of  $N38^\circ W$  for 72 miles. After both ships are anchored, how far apart are they? Round to the nearest tenth of a mile.
37. At a fixed temperature, the volume of a given mass of gas varies inversely as the pressure applied to the gas. A certain mass of gas has a volume of 40 cubic inches when the pressure is 22 pounds. What is the volume of the gas when the pressure is 30 pounds?
38. A ball is thrown straight upward. The function

$$s(t) = -16t^2 + 40t$$

describes the ball's height above the ground,  $s(t)$ , in feet,  $t$  seconds after it is thrown. What is the instantaneous velocity of the ball 2 seconds after it is thrown?

39. The figure shows an open box with a square base. The box is to have a volume of 4 cubic feet. Express the surface area of the box,  $A$ , as a function of the length of a side of its square base,  $x$ .

40. The function  $f(x) = -2.32x^2 + 76.58x - 559.87$  models the percentage of U.S. students,  $f(x)$ , who are  $x$  years old who say their school is not drug free, where  $12 \leq x \leq 17$ . At what age do 70% of U.S. students say that their school is not drug free? Round to the nearest tenth of a year.

## Where Did That Come From? Selected Proofs

### SECTION 3.3 Properties of Logarithms

#### The Product Rule

Let  $b$ ,  $M$ , and  $N$  be positive real numbers with  $b \neq 1$ .

$$\log_b(MN) = \log_b M + \log_b N$$

#### Proof

We begin by letting  $\log_b M = R$  and  $\log_b N = S$ .

Now we write each logarithm in exponential form.

$$\log_b M = R \quad \text{means} \quad b^R = M.$$

$$\log_b N = S \quad \text{means} \quad b^S = N.$$

By substituting and using a property of exponents, we see that

$$MN = b^R b^S = b^{R+S}.$$

Now we change  $MN = b^{R+S}$  to logarithmic form.

$$MN = b^{R+S} \quad \text{means} \quad \log_b(MN) = R + S.$$

Finally, substituting  $\log_b M$  for  $R$  and  $\log_b N$  for  $S$  gives us

$$\log_b(MN) = \log_b M + \log_b N,$$

the property that we wanted to prove.

The quotient and power rules for logarithms are proved using similar procedures.

#### The Change-of-Base Property

For any logarithmic bases  $a$  and  $b$ , and any positive number  $M$ ,

$$\log_b M = \frac{\log_a M}{\log_a b}.$$

#### Proof

To prove the change-of-base property, we let  $x$  equal the logarithm on the left side:

$$\log_b M = x.$$

Now we rewrite this logarithm in exponential form.

$$\log_b M = x \quad \text{means} \quad b^x = M.$$

Because  $b^x$  and  $M$  are equal, the logarithms with base  $a$  for each of these expressions must be equal. This means that

$$\begin{aligned}\log_a b^x &= \log_a M \\ x \log_a b &= \log_a M && \text{Apply the power rule for logarithms on the left side.} \\ x &= \frac{\log_a M}{\log_a b} && \text{Solve for } x \text{ by dividing both sides by } \log_a b.\end{aligned}$$

In our first step we let  $x$  equal  $\log_b M$ . Replacing  $x$  on the left side by  $\log_b M$  gives us

$$\log_b M = \frac{\log_a M}{\log_a b},$$

which is the change-of-base property.

## SECTION 6.2 The Law of Cosines

### Heron's Formula for the Area of a Triangle

The area of a triangle with sides  $a$ ,  $b$ , and  $c$  is

$$\text{Area} = \sqrt{s(s-a)(s-b)(s-c)},$$

where  $s$  is one-half its perimeter:  $s = \frac{1}{2}(a + b + c)$ .

#### Proof

The proof of Heron's formula begins with a half-angle formula and the Law of Cosines.

$$\begin{aligned}\cos \frac{C}{2} &= \sqrt{\frac{1 + \cos C}{2}} = \sqrt{\frac{1 + \frac{a^2 + b^2 - c^2}{2ab}}{2}} && \text{This is the Law of Cosines} \\ &&& c^2 = a^2 + b^2 - 2ab \cos C \\ &&& \text{solved for } \cos C. \\ &= \sqrt{\frac{a^2 + 2ab + b^2 - c^2}{4ab}} = \sqrt{\frac{(a+b)^2 - c^2}{4ab}} = \sqrt{\frac{(a+b+c)(a+b-c)}{4ab}} \\ &&& \text{Multiply the numerator and denominator of the radicand by } 2ab. \\ &&& \text{Factor } a^2 + 2ab + b^2. \\ &&& \text{Factor the numerator as the difference of two squares.}\end{aligned}$$

We now introduce the expression for one-half the perimeter:  $s = \frac{1}{2}(a + b + c)$ . We replace  $a + b + c$  in the numerator by  $2s$ . We also find an expression for  $a + b - c$  as follows:

$$a + b - c = a + b + c - 2c = 2s - 2c = 2(s - c).$$

Thus,

$$\cos \frac{C}{2} = \sqrt{\frac{(a+b+c)(a+b-c)}{4ab}} = \sqrt{\frac{2s \cdot 2(s-c)}{4ab}} = \sqrt{\frac{s(s-c)}{ab}}.$$

In a similar manner, we obtain

$$\sin \frac{C}{2} = \sqrt{\frac{1 - \cos C}{2}} = \sqrt{\frac{(s-a)(s-b)}{ab}}.$$

From our work in Section 6.1, we know that the area of a triangle is one-half the product of the length of two sides times the sine of their included angle.

$$\begin{aligned}
 \text{Area} &= \frac{1}{2}ab \sin C \\
 &= \frac{1}{2}ab \cdot 2 \sin \frac{C}{2} \cos \frac{C}{2} \\
 &= ab \sqrt{\frac{(s-a)(s-b)}{ab}} \sqrt{\frac{s(s-c)}{ab}} \\
 &= ab \frac{\sqrt{s(s-a)(s-b)(s-c)}}{\sqrt{a^2b^2}} \\
 &= \sqrt{s(s-a)(s-b)(s-c)}
 \end{aligned}$$

$$\sin C = \sin 2\frac{C}{2} = 2 \sin \frac{C}{2} \cos \frac{C}{2}$$

Use the expressions for  $\sin \frac{C}{2}$  and  $\cos \frac{C}{2}$  on page 00.

Multiply the radicands.

$$\text{Simplify: } \frac{ab}{\sqrt{a^2b^2}} = \frac{ab}{ab} = 1.$$

## SECTION 6.5 Complex Numbers in Polar Form; DeMoivre's Theorem

### The Quotient of Two Complex Numbers in Polar Form

Let  $z_1 = r_1(\cos \theta_1 + i \sin \theta_1)$  and  $z_2 = r_2(\cos \theta_2 + i \sin \theta_2)$  be two complex numbers in polar form. Their quotient,  $\frac{z_1}{z_2}$ , is

$$\frac{z_1}{z_2} = \frac{r_1}{r_2} [\cos(\theta_1 - \theta_2) + i \sin(\theta_1 - \theta_2)].$$

#### Proof

We begin by multiplying the numerator and denominator of the quotient,  $\frac{z_1}{z_2}$ , by the conjugate of the expression in parentheses in the denominator. Then we simplify the quotient using the difference formulas for sine and cosine.

$$\begin{aligned}
 \frac{z_1}{z_2} &= \frac{r_1(\cos \theta_1 + i \sin \theta_1)}{r_2(\cos \theta_2 + i \sin \theta_2)} \\
 &= \frac{r_1(\cos \theta_1 + i \sin \theta_1)(\cos \theta_2 - i \sin \theta_2)}{r_2(\cos \theta_2 + i \sin \theta_2)(\cos \theta_2 - i \sin \theta_2)} \\
 &= \frac{r_1(\cos \theta_1 + i \sin \theta_1)(\cos \theta_2 - i \sin \theta_2)}{r_2(\cos^2 \theta_2 + \sin^2 \theta_2)} \\
 &= \frac{r_1(\cos \theta_1 + i \sin \theta_1)(\cos \theta_2 - i \sin \theta_2)}{r_2} \\
 &= \frac{r_1}{r_2} (\cos \theta_1 \cos \theta_2 - i \cos \theta_1 \sin \theta_2 + i \sin \theta_1 \cos \theta_2 - i^2 \sin \theta_1 \sin \theta_2) \\
 &= \frac{r_1}{r_2} [\cos \theta_1 \cos \theta_2 + i(\sin \theta_1 \cos \theta_2 - \cos \theta_1 \sin \theta_2) - i^2 \sin \theta_1 \sin \theta_2] \\
 &= \frac{r_1}{r_2} [\cos \theta_1 \cos \theta_2 + i(\sin \theta_1 \cos \theta_2 - \cos \theta_1 \sin \theta_2) - (-1) \sin \theta_1 \sin \theta_2] \\
 &= \frac{r_1}{r_2} [(\cos \theta_1 \cos \theta_2 + \sin \theta_1 \sin \theta_2) + i(\sin \theta_1 \cos \theta_2 - \cos \theta_1 \sin \theta_2)] \\
 &= \frac{r_1}{r_2} [\cos(\theta_1 - \theta_2) + i \sin(\theta_1 - \theta_2)]
 \end{aligned}$$

This is  $\cos(\theta_1 - \theta_2)$ .

This is  $\sin(\theta_1 - \theta_2)$ .

This is the given quotient.

Multiply the numerator and denominator by the conjugate of the expression in parentheses in the denominator. Recall that the conjugate of  $a + bi$  is  $a - bi$ .

Multiply the conjugates in the denominator.

Use a Pythagorean identity:  $\cos^2 \theta_2 + \sin^2 \theta_2 = 1$ .

Use the FOIL method.

Factor  $i$  from the second and third terms.

$$i^2 = -1$$

Rearrange terms.

## SECTION 6.7 The Dot Product

### Properties of the Dot Product

If  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  are vectors, and  $c$  is a scalar, then

1.  $\mathbf{u} \cdot \mathbf{v} = \mathbf{v} \cdot \mathbf{u}$
2.  $\mathbf{u} \cdot (\mathbf{v} + \mathbf{w}) = \mathbf{u} \cdot \mathbf{v} + \mathbf{u} \cdot \mathbf{w}$
3.  $\mathbf{0} \cdot \mathbf{v} = 0$
4.  $\mathbf{v} \cdot \mathbf{v} = \|\mathbf{v}\|^2$
5.  $(c\mathbf{u}) \cdot \mathbf{v} = c(\mathbf{u} \cdot \mathbf{v}) = \mathbf{u} \cdot (c\mathbf{v})$

### Proof

To prove the second property, let

$$\mathbf{u} = u_1\mathbf{i} + u_2\mathbf{j}, \quad \mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j}, \quad \text{and} \quad \mathbf{w} = w_1\mathbf{i} + w_2\mathbf{j}.$$

Then

$$\begin{aligned} \mathbf{u} \cdot (\mathbf{v} + \mathbf{w}) &= (u_1\mathbf{i} + u_2\mathbf{j}) \cdot [(v_1\mathbf{i} + v_2\mathbf{j}) + (w_1\mathbf{i} + w_2\mathbf{j})] && \text{These are the given vectors.} \\ &= (u_1\mathbf{i} + u_2\mathbf{j}) \cdot [(v_1 + w_1)\mathbf{i} + (v_2 + w_2)\mathbf{j}] && \text{Add horizontal components} \\ &&& \text{and add vertical} \\ &&& \text{components.} \\ &= u_1(v_1 + w_1) + u_2(v_2 + w_2) && \text{Multiply horizontal} \\ &&& \text{components and multiply} \\ &&& \text{vertical components.} \\ &= u_1v_1 + u_1w_1 + u_2v_2 + u_2w_2 && \text{Use the distributive} \\ &&& \text{property.} \\ &= u_1v_1 + u_2v_2 + u_1w_1 + u_2w_2 && \text{Rearrange terms.} \\ &= \mathbf{u} \cdot \mathbf{v} + \mathbf{u} \cdot \mathbf{w}. \end{aligned}$$

This is the dot product of  $\mathbf{u}$  and  $\mathbf{v}$ .

This is the dot product of  $\mathbf{u}$  and  $\mathbf{w}$ .

To prove the third property, let

$$\mathbf{0} = 0\mathbf{i} + 0\mathbf{j} \quad \text{and} \quad \mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j}.$$

Then

$$\begin{aligned} \mathbf{0} \cdot \mathbf{v} &= (0\mathbf{i} + 0\mathbf{j}) \cdot (v_1\mathbf{i} + v_2\mathbf{j}) && \text{These are the given vectors.} \\ &= 0 \cdot v_1 + 0 \cdot v_2 && \text{Multiply horizontal components} \\ &&& \text{and multiply vertical components.} \\ &= 0 + 0 \\ &= 0. \end{aligned}$$

To prove the first part of the fifth property, let

$$\mathbf{u} = u_1\mathbf{i} + u_2\mathbf{j} \quad \text{and} \quad \mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j}.$$

Then

$$\begin{aligned} (c\mathbf{u}) \cdot \mathbf{v} &= [c(u_1\mathbf{i} + u_2\mathbf{j})] \cdot (v_1\mathbf{i} + v_2\mathbf{j}) && \text{These are the given vectors.} \\ &= (cu_1\mathbf{i} + cu_2\mathbf{j}) \cdot (v_1\mathbf{i} + v_2\mathbf{j}) && \text{Multiply each component of } u_1\mathbf{i} + u_2\mathbf{j} \text{ by } c. \\ &= cu_1v_1 + cu_2v_2 && \text{Multiply horizontal components and} \\ &&& \text{multiply vertical components.} \\ &= c(u_1v_1 + u_2v_2) && \text{Factor out } c \text{ from both terms.} \\ &= c(\mathbf{u} \cdot \mathbf{v}) \end{aligned}$$

This is the dot product of  $\mathbf{u}$  and  $\mathbf{v}$ .

## SECTION 9.1 The Ellipse

### The Standard Form of the Equation of an Ellipse with a Horizontal Major Axis Centered at the Origin

#### Proof

Refer to **Figure A.1**.

$$d_1 + d_2 = 2a$$

$$\sqrt{(x + c)^2 + y^2} + \sqrt{(x - c)^2 + y^2} = 2a$$

$$\sqrt{(x + c)^2 + y^2} = 2a - \sqrt{(x - c)^2 + y^2}$$

$$(x + c)^2 + y^2 = 4a^2 - 4a\sqrt{(x - c)^2 + y^2} + (x - c)^2 + y^2$$

$$x^2 + 2cx + c^2 + y^2 = 4a^2 - 4a\sqrt{(x - c)^2 + y^2} + x^2 - 2cx + c^2 + y^2$$

$$4cx - 4a^2 = -4a\sqrt{(x - c)^2 + y^2}$$

$$cx - a^2 = -a\sqrt{(x - c)^2 + y^2}$$

$$(cx - a^2)^2 = a^2[(x - c)^2 + y^2]$$

$$c^2x^2 - 2a^2cx + a^4 = a^2(x^2 - 2cx + c^2 + y^2)$$

$$c^2x^2 - 2a^2cx + a^4 = a^2x^2 - 2a^2cx + a^2c^2 + a^2y^2$$

$$c^2x^2 + a^4 = a^2x^2 + a^2c^2 + a^2y^2$$

$$c^2x^2 - a^2x^2 - a^2y^2 = a^2c^2 - a^4$$

$$(c^2 - a^2)x^2 - a^2y^2 = a^2(c^2 - a^2)$$

$$(a^2 - c^2)x^2 + a^2y^2 = a^2(a^2 - c^2)$$

Refer to the discussion on page 00 and let  $b^2 = a^2 - c^2$  in the preceding equation.

$$b^2x^2 + a^2y^2 = a^2b^2$$

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

The sum of the distances from P to the foci equals a constant,  $2a$ .

Use the distance formula.

Isolate a radical.

Square both sides.

Square  $x + c$  and  $x - c$ .

Simplify and isolate the radical.

Divide both sides by 4.

Square both sides.

Square  $cx - a^2$  and  $x - c$ .

Use the distributive property.

Add  $2a^2cx$  to both sides.

Rearrange the terms.

Factor out  $x^2$  and  $a^2$ , respectively.

Multiply both sides by  $-1$ .

Divide both sides by  $a^2b^2$ .

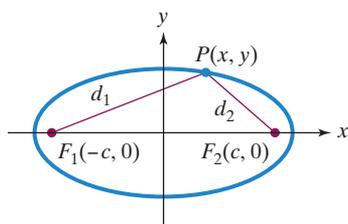

FIGURE A.1

## SECTION 9.2 The Hyperbola

### The Asymptotes of a Hyperbola Centered at the Origin

The hyperbola

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$$

with a horizontal transverse axis has the two asymptotes

$$y = \frac{b}{a}x \quad \text{and} \quad y = -\frac{b}{a}x.$$

**Proof**

Begin by solving the hyperbola's equation for  $y$ .

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$$

This is the standard form of the equation of a hyperbola.

$$\frac{y^2}{b^2} = \frac{x^2}{a^2} - 1$$

We isolate the term involving  $y^2$  to solve for  $y$ .

$$y^2 = \frac{b^2x^2}{a^2} - b^2$$

Multiply both sides by  $b^2$ .

$$y^2 = \frac{b^2x^2}{a^2} \left( 1 - \frac{a^2}{x^2} \right)$$

Factor out  $\frac{b^2x^2}{a^2}$  on the right. Verify that this result is correct by multiplying using the distributive property and obtaining the previous step.

$$y = \pm \sqrt{\frac{b^2x^2}{a^2} \left( 1 - \frac{a^2}{x^2} \right)}$$

Solve for  $y$  using the square root property: If  $u^2 = d$ , then  $u = \pm \sqrt{d}$ .

$$y = \pm \frac{b}{a}x \sqrt{1 - \frac{a^2}{x^2}}$$

Simplify.

As  $|x| \rightarrow \infty$ , the value of  $\frac{a^2}{x^2}$  approaches 0. Consequently, the value of  $y$  can be approximated by

$$y = \pm \frac{b}{a}x.$$

This means that the lines whose equations are  $y = \frac{b}{a}x$  and  $y = -\frac{b}{a}x$  are asymptotes for the graph of the hyperbola.

# APPENDIX B

## The Transition from Precalculus to Calculus

Calculus is the study of limits and their applications. (Limits are introduced in Sections 11.1 and 11.2.)

Precalculus	Calculus
Substitution: The value of function $f$ at $a$ 	Limits: What occurs to the value of a function $f$ as $x$ gets closer to $a$ , but remains unequal to $a$ 

Calculus uses limits to extend ideas and topics from precalculus to more general situations.

Precalculus Topic	Calculus Generalization
Slope of a line	Slope of a curve
Average rate of change; average velocity	Instantaneous rate of change; instantaneous velocity
Location of a quadratic function's [ $f(x) = ax^2 + bx + c$ ] maximum or minimum value	Location of any function's relative maxima and/or minima
Area of a rectangle	Area of a plane region bounded by curves
Length of a line segment	Length of a curve
Center of a circle	Center of gravity (the balance point) of a plane region
Work done by a constant force moving an object along a linear path	Work done by a variable force moving an object along a curved path

The vast array of generalizations made possible by the invention of limits marked a turning point in human history, having as dramatic an impact on our lives as the invention of the wheel and the printing press.

## CHAPTER P

### Exercise Set P.1

19. 60 ft    20. 40 ft    24.  $\{r, e, a, l\}$     30.  $\{1, 2, 3, 7, 8\}$     31.  $\{1, 2, 3, 4, 5, 6, 7, 8, 10\}$     32.  $\{0, 1, 2, 3, 4, 5, 6\}$     34.  $\{e, m, p, t, y\}$
35. a.  $\sqrt{100}$     b. 0,  $\sqrt{100}$     c.  $-9, 0, \sqrt{100}$     d.  $-9, -\frac{4}{5}, 0, 0.25, 9.2, \sqrt{100}$     e.  $\sqrt{3}$     f.  $-9, -\frac{4}{5}, 0, 0.25, \sqrt{3}, 9.2, \sqrt{100}$
36. a.  $\sqrt{49}$     b. 0,  $\sqrt{49}$     c.  $-7, 0, \sqrt{49}$     d.  $-7, -0.\bar{6}, 0, \sqrt{49}$     e.  $\sqrt{50}$     f.  $-7, -0.\bar{6}, 0, \sqrt{49}, \sqrt{50}$
37. a.  $\sqrt{64}$     b. 0,  $\sqrt{64}$     c.  $-11, 0, \sqrt{64}$     d.  $-11, -\frac{5}{6}, 0, 0.75, \sqrt{64}$     e.  $\sqrt{5}, \pi$     f.  $-11, -\frac{5}{6}, 0, 0.75, \sqrt{5}, \pi, \sqrt{64}$     38. a.  $\sqrt{4}$
- b. 0,  $\sqrt{4}$     c.  $-5, 0, \sqrt{4}$     d.  $-5, -0.\bar{3}, 0, \sqrt{4}$     e.  $\sqrt{2}$     f.  $-5, -0.\bar{3}, 0, \sqrt{2}, \sqrt{4}$     40. Answers may vary; an example is  $\frac{1}{2}$ .
72.  $|-3 - (-26)|; 23$     74.  $|-1.2 - (-5.4)|; 4.2$     79. commutative property of addition    88.  $24x - 2$     94.  $10y - 54$
100.  $-5x + 13y + 1$     121.  $x - (x + 4); -4$     123.  $6(-5x); -30x$     124.  $10(-4x); -40x$     129. a. 140 beats per minute  
b. 160 beats per minute    130. a. 95 beats per minute    b. 114 beats per minute    145. does not make sense

### Exercise Set P.2

48.  $30x^{11}y^{12}$     75.  $-60,000,100,000$     76.  $-70,000,100,000$     79.  $6.38 \times 10^{17}$     80.  $5.79 \times 10^{17}$     87.  $6.3 \times 10^7$     88.  $8.2 \times 10^7$
89.  $6.4 \times 10^4$     90.  $4.2 \times 10^4$     91.  $1.22 \times 10^{-11}$     92.  $1.53 \times 10^{-11}$     93.  $2.67 \times 10^{13}$     94.  $3.77 \times 10^{13}$     117.  $\$1.0586 \times 10^{10}$
118.  $\$8.832 \times 10^9$     122.  $3.1536 \times 10^7$     132. does not make sense    134. does not make sense    146. about  $2.94 \times 10^9$  times

### Exercise Set P.3

116. b. 15.8; underestimates by 2.7 million    117.  $\frac{\sqrt{5} + 1}{2}; 1.62$  to 1

### Exercise Set P.4

4. yes;  $x^4 - x^3 + x^2 - 5$     9.  $11x^3 + 7x^2 - 12x - 4; 3$     10.  $12x^3 - 5x^2 - 4x - 4; 3$     11.  $12x^3 + 4x^2 + 12x - 14; 3$
12.  $9x^4 + 4x^3 - 2x + 1; 4$     13.  $6x^2 - 6x + 2; 2$     14.  $6x^3 + 10x^2 + 11x - 8; 3$     16.  $x^3 + 125$     17.  $2x^3 - 9x^2 + 19x - 15$
18.  $2x^3 - 9x^2 + 10x - 3$     19.  $x^2 + 10x + 21$     20.  $x^2 + 13x + 40$     21.  $x^2 - 2x - 15$     22.  $x^2 + x - 2$     23.  $6x^2 + 13x + 5$
24.  $21x^2 + 19x + 4$     25.  $10x^2 - 9x - 9$     26.  $14x^2 - 31x - 10$     27.  $15x^4 - 47x^2 + 28$     28.  $21x^4 - 41x^2 + 10$
29.  $8x^5 - 40x^3 + 3x^2 - 15$     30.  $7x^5 - 14x^3 + 5x^2 - 10$     37.  $16x^4 - 25x^2$     38.  $9x^4 - 16x^2$     52.  $x^3 + 6x^2 + 12x + 8$
53.  $8x^3 + 36x^2 + 54x + 27$     54.  $27x^3 + 108x^2 + 144x + 64$     57.  $27x^3 - 108x^2 + 144x - 64$     58.  $8x^3 - 36x^2 + 54x - 27$
59.  $7x^2 + 38xy + 15y^2$     60.  $6x^2 + 61xy + 63y^2$     61.  $2x^2 + xy - 21y^2$     62.  $6x^2 + 13xy - 5y^2$     63.  $15x^2y^2 + xy - 2$
64.  $14x^4y^2 - 19x^2y - 3$     69.  $x^3 - y^3$     70.  $x^3 + y^3$     71.  $9x^2 - 25y^2$     72.  $49x^2 - 9y^2$     91. a.  $\$54,647$ ; overestimates by  $\$556$
- b.  $M - W = 1.8x^3 - 82x^2 + 2644x - 11,449$     92. b.  $M - W = 1.8x^3 - 82x^2 + 2644x - 11,449$     106. makes sense, although answers may vary

### Exercise Set P.5

5.  $9x^2(x^2 - 2x + 3)$     6.  $6x^2(x^2 - 3x + 2)$     7.  $(x + 5)(x + 3)$     8.  $(2x + 1)(x + 4)$     9.  $(x - 3)(x^2 + 12)$     10.  $(2x + 5)(x^2 + 17)$

CHAPTER 1

Section 1.1

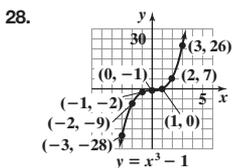

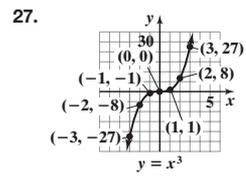

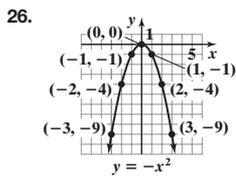

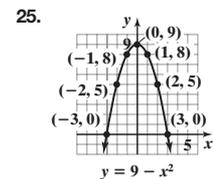

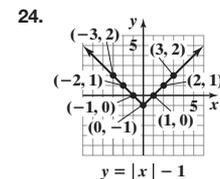

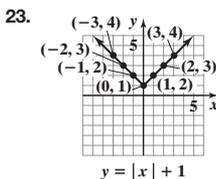

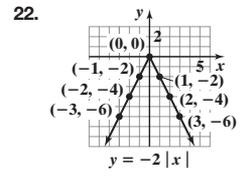

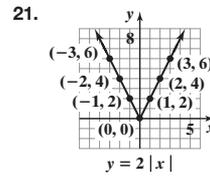

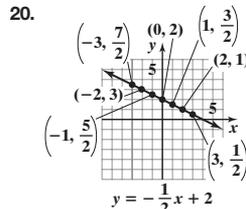

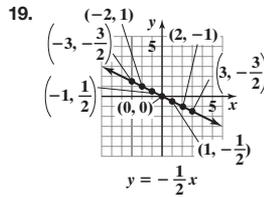

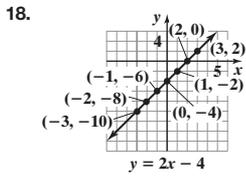

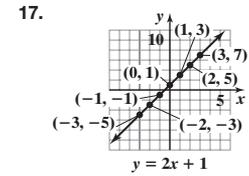

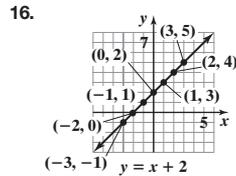

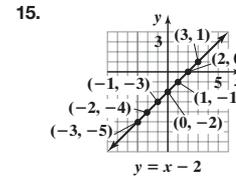

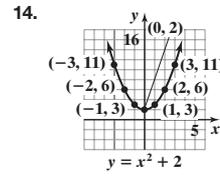

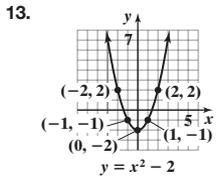

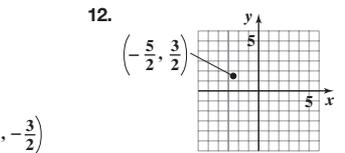

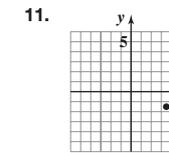

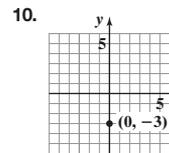

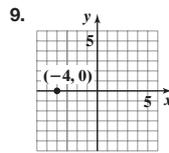

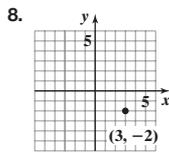

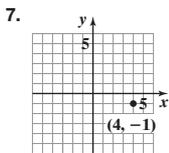

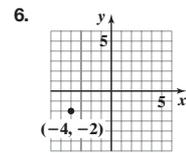

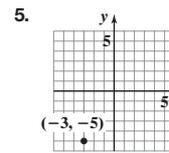

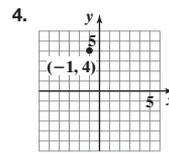

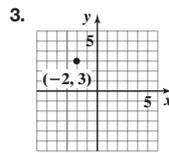

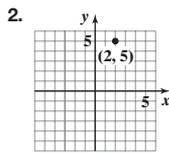

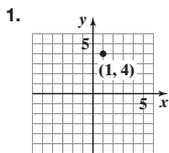

Check Point Exercises

4. minimum  $x$ -value:  $-100$ ; maximum  $x$ -value:  $100$ ; distance between tick marks on  $x$ -axis:  $50$ ; minimum  $y$ -value:  $-100$ ; maximum  $y$ -value:  $100$ ; distance between tick marks on  $y$ -axis:  $10$

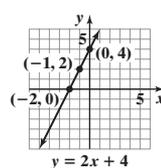

Exercise Set 1.1

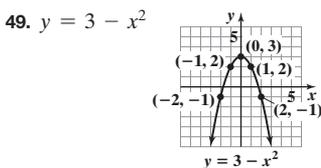

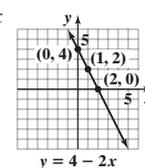

39.  $(-2, 4)$  and  $(1, 1)$

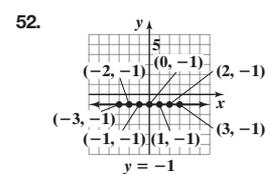

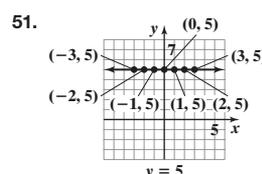

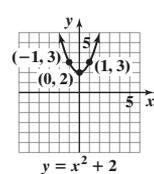

47.  $y = 2x + 4$

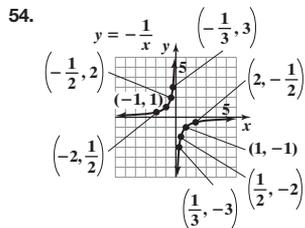

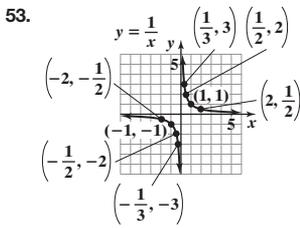

48.  $y = 4 - 2x$

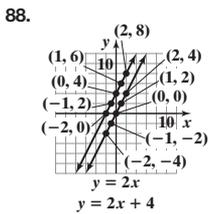

50.  $y = x^2 + 2$

**AA6** Answers to Selected Exercises

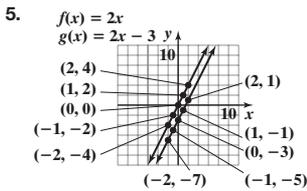

55. b. 19.5%; underestimates by 0.5      d. 46.5%; It's less than the estimate, although answers may vary.      e. 1990; 14%
56. b. 51%; overestimates by 1      d. 21%; It's less than the estimate, although answers may vary.      e. 1980; 72%      67. makes sense
68. does not make sense

89. c. all real numbers      d. all real numbers greater than or equal to 1

**Section 1.2**

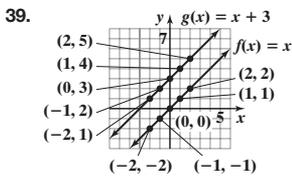

**Check Point Exercises**

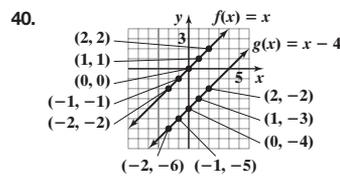

**Exercise Set 1.2**

1. function; {1, 3, 5}; {2, 4, 5}      2. function; {4, 6, 8}; {5, 7, 8}      7. function; {-3, -2, -1, 0}; {-3, -2, -1, 0}
8. function; {-7, -5, -3, 0}; {-7, -5, -3, 0}      27. c.  $-4x + 5$       28. c.  $-3x + 7$       29. b.  $x^2 + 12x + 38$       c.  $x^2 - 2x + 3$

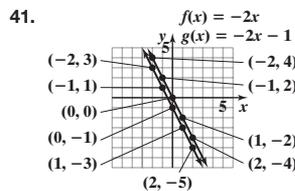

30. b.  $x^2 - 6x - 19$       c.  $x^2 + 10x - 3$       33. c.  $\sqrt{x} + 3$       34. c.  $\sqrt{2x} - 6$       36. c.  $\frac{-4x^3 + 1}{-x^3}$  or  $\frac{4x^3 - 1}{x^3}$       38. c.  $\begin{cases} 1, & \text{if } x < -6 \\ -1, & \text{if } x > -6 \end{cases}$

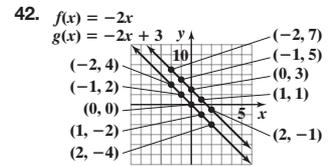

The graph of  $g$  is the graph of  $f$  shifted up by 3 units.

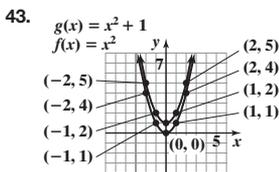

The graph of  $g$  is the graph of  $f$  shifted down by 4 units.

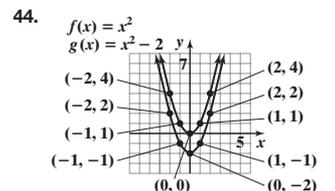

The graph of  $g$  is the graph of  $f$  shifted down by 1 unit.

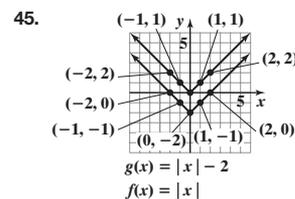

The graph of  $g$  is the graph of  $f$  shifted up by 3 units.

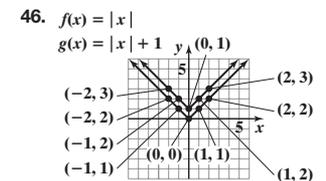

The graph of  $g$  is the graph of  $f$  shifted up by 1 unit.

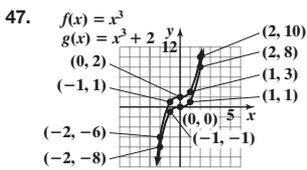

The graph of  $g$  is the graph of  $f$  shifted down by 2 units.

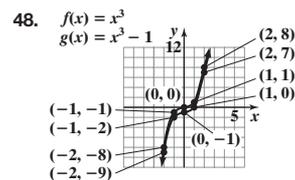

The graph of  $g$  is the graph of  $f$  shifted down by 2 units.

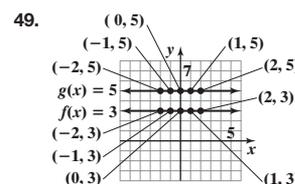

The graph of  $g$  is the graph of  $f$  shifted up by 1 unit.

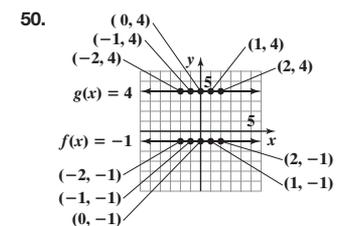

The graph of  $g$  is the graph of  $f$  shifted up by 2 units.

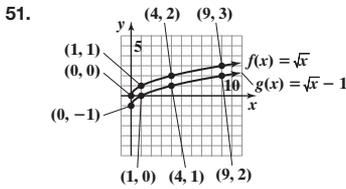

The graph of  $g$  is the graph of  $f$  shifted down by 1 unit.

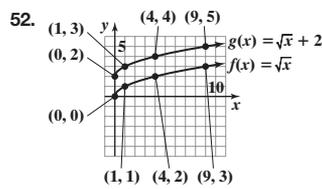

The graph of  $g$  is the graph of  $f$  shifted up by 2 units.

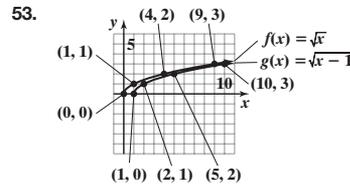

The graph of  $g$  is the graph of  $f$  shifted up by 5 units.

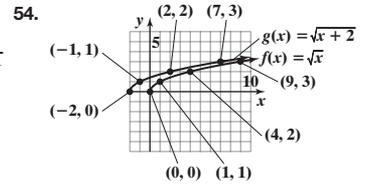

The graph of  $g$  is the graph of  $f$  shifted down by 1 unit.

The graph of  $g$  is the graph of  $f$  shifted up by 2 units.

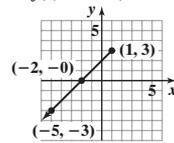

The graph of  $g$  is the graph of  $f$  shifted to the right by 1 unit.

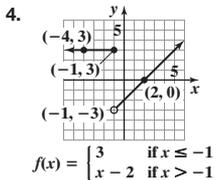

The graph of  $g$  is the graph of  $f$  shifted to the left by 2 units.

The number of doctor visits decreases during childhood and then increases as you get older. The minimum is (20.29, 3.99), which means that the minimum number of annual doctor visits, about 4, occurs at around age 20.

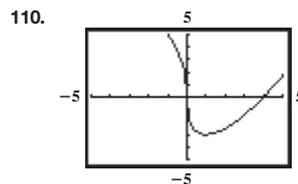

increasing:  $(-\infty, 1)$  or  $(3, \infty)$   
 decreasing:  $(1, 3)$

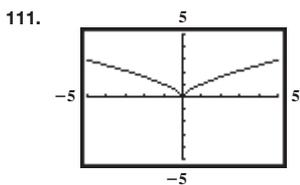

increasing:  $(-2, 0)$  or  $(2, \infty)$   
 decreasing:  $(-\infty, -2)$  or  $(0, 2)$

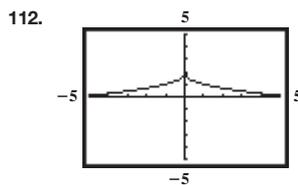

increasing:  $(2, \infty)$   
 decreasing:  $(-\infty, -2)$   
 constant:  $(-2, 2)$

increasing:  $(1, \infty)$   
 decreasing:  $(-\infty, 1)$

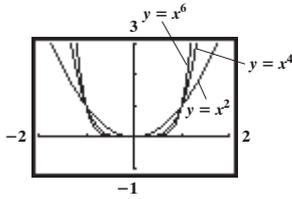

increasing:  $(0, \infty)$   
 decreasing:  $(-\infty, 0)$

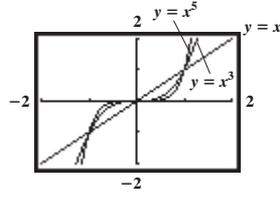

increasing:  $(-\infty, 0)$   
 decreasing:  $(0, \infty)$

113. a.

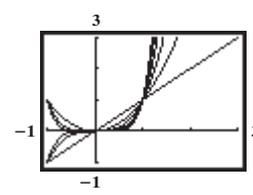

b.

c. increasing:  $(0, \infty)$ ; decreasing:  $(-\infty, 0)$

d.  $f(x) = x^n$  is increasing for  $(-\infty, \infty)$  when  $n$  is positive and odd.

e.

As  $n$  increases the steepness increases.

120. a.  $h$  is even if both  $f$  and  $g$  are even or if both  $f$  and  $g$  are odd.

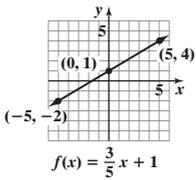

b.  $h$  is odd if  $f$  is odd and  $g$  is even or if  $f$  is even and  $g$  is odd.

122. 3

16.  $y + 2 = -5(x + 4)$ ;  $y = -5x - 22$

17.  $y - 0 = -4(x + 4)$ ;  $y = -4x - 16$

18.  $y + 3 = -2(x - 0)$ ;  $y = -2x - 3$

19.  $y + 2 = -1\left(x + \frac{1}{2}\right)$ ;  $y = -x - \frac{5}{2}$

20.  $y + \frac{1}{4} = -1(x + 4)$ ;  $y = -x - \frac{17}{4}$

21.  $y - 0 = \frac{1}{2}(x - 0)$ ;  $y = \frac{1}{2}x$

22.  $y - 0 = \frac{1}{3}(x - 0)$ ;  $y = \frac{1}{3}x$

23.  $y + 2 = -\frac{2}{3}(x - 6)$ ;  $y = -\frac{2}{3}x + 2$

24.  $y + 4 = -\frac{3}{5}(x - 10)$ ;  $y = -\frac{3}{5}x + 2$

25. using  $(1, 2)$ ,  $y - 2 = 2(x - 1)$ ;  $y = 2x$

26. using  $(3, 5)$ ,  $y - 5 = 2(x - 3)$ ;  $y = 2x - 1$

27. using  $(-3, 0)$ ,  $y - 0 = 1(x + 3)$ ;  $y = x + 3$

28. using  $(-2, 0)$ ,  $y - 0 = 1(x + 2)$ ;  $y = x + 2$

29. using  $(-3, -1)$ ,  $y + 1 = 1(x + 3)$ ;  $y = x + 2$

30. using  $(-2, -4)$ ,  $y + 4 = 1(x + 2)$ ;  $y = x - 2$

31. using  $(-3, -2)$ ,  $y + 2 = \frac{4}{3}(x + 3)$ ;  $y = \frac{4}{3}x + 2$

32. using  $(-3, 6)$ ,  $y - 6 = -\frac{4}{3}(x + 3)$ ;  $y = -\frac{4}{3}x + 2$

33. using  $(-3, -1)$ ,  $y + 1 = 0(x + 3)$ ;  $y = -1$

34. using  $(-2, -5)$ ,  $y + 5 = 0(x + 2)$ ;  $y = -5$

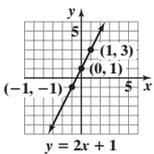

35. using  $(2, 4)$ ,  $y - 4 = 1(x - 2)$ ;  $y = x + 2$

36. using  $(1, -3)$ ,  $y + 3 = -\frac{3}{2}(x - 1)$ ;  $y = -\frac{3}{2}x - \frac{3}{2}$

37. using  $(0, 4)$ ,  $y - 4 = 8(x - 0)$ ;  $y = 8x + 4$

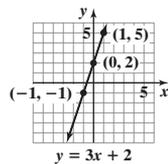

38. using  $(4, 0)$ ,  $y - 0 = \frac{1}{2}(x - 4)$ ;  $y = \frac{1}{2}x - 2$

39.  $m = 2$ ;  $b = 1$

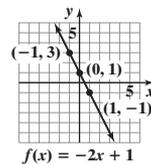

$$y = 2x + 1$$

40.  $m = 3$ ;  $b = 2$

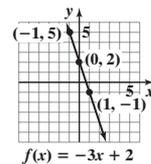

$$y = 3x + 2$$

41.  $m = -2$ ;  $b = 1$

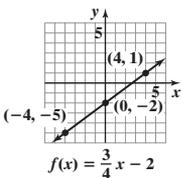

$$f(x) = -2x + 1$$

42.  $m = -3$ ;  $b = 2$

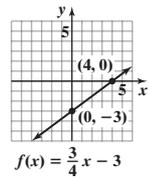

$$f(x) = -3x + 2$$

43.  $m = \frac{3}{4}$ ;  $b = -2$

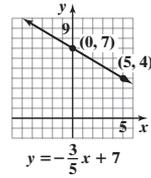

$$f(x) = \frac{3}{4}x - 2$$

44.  $m = \frac{3}{4}$ ;  $b = -3$

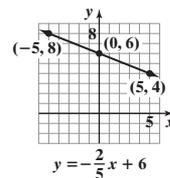

$$f(x) = \frac{3}{4}x - 3$$

45.  $m = -\frac{3}{5}$ ;  $b = 7$

$$y = -\frac{3}{5}x + 7$$

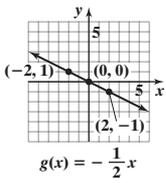

46.  $m = -\frac{2}{5}$ ;  $b = 6$

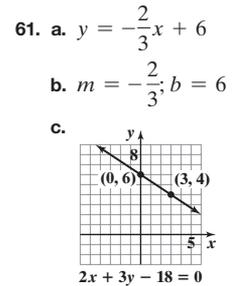

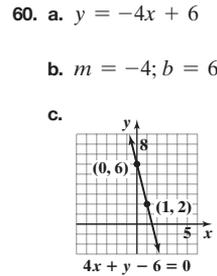

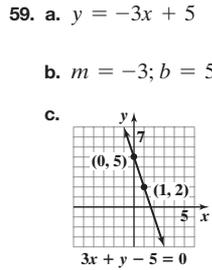

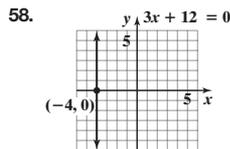

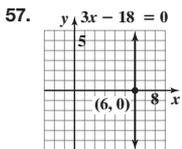

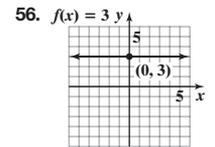

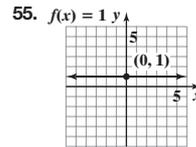

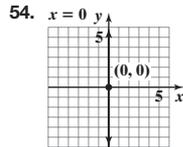

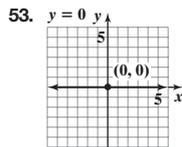

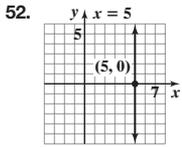

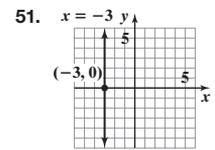

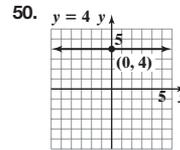

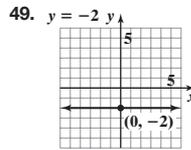

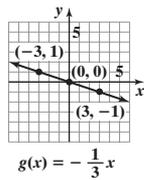

$$y = -\frac{2}{5}x + 6$$

**AA10** Answers to Selected Exercises

47.  $m = -\frac{1}{2}; b = 0$

48.  $m = -\frac{1}{3}; b = 0$

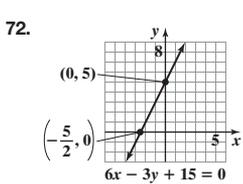

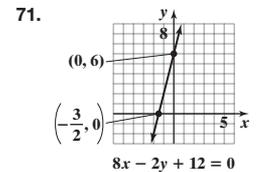

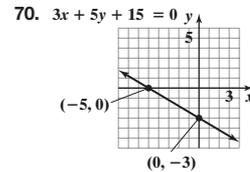

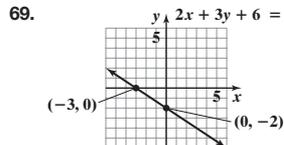

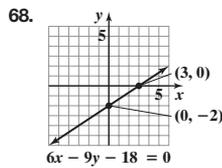

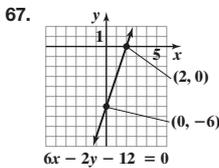

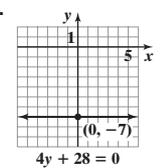

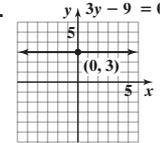

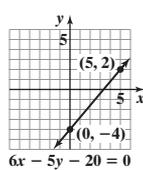

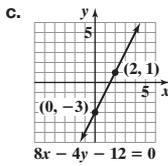

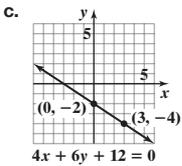

62. a.  $y = -\frac{2}{3}x - 2$   
b.  $m = -\frac{2}{3}; b = -2$

63. a.  $y = 2x - 3$   
b.  $m = 2; b = -3$

64. a.  $y = \frac{6}{5}x - 4$   
b.  $m = \frac{6}{5}; b = -4$

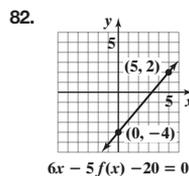

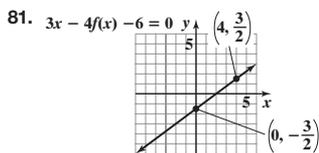

65. a.  $y = 3$   
b.  $m = 0; b = 3$

66. a.  $y = -7$   
b.  $m = 0; b = -7$

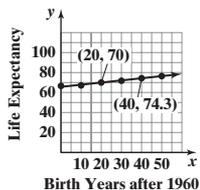

74.  $m = -\frac{b}{a}$ ; falls    75. undefined slope; vertical

76.  $m = \frac{a}{b}$ ; rises    77.  $m = -\frac{A}{B}; b = \frac{C}{B}$     78.  $m = \frac{A}{B}; b = \frac{C}{B}$

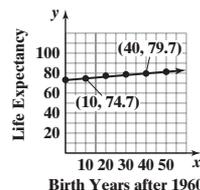

87. a.  $y - 31.1 = 0.78(x - 10)$  or  $y - 38.9 = 0.78(x - 20)$   
c. 54.5%  
88. a.  $y - 45.2 = 0.65(x - 10)$  or  $y - 51.7 = 0.65(x - 20)$

89. a & b. Life Expectancy for United States;  $E(x) = 0.215x + 65.7$   
Males, by Year of Birth

90. Answers will vary due to rounding.

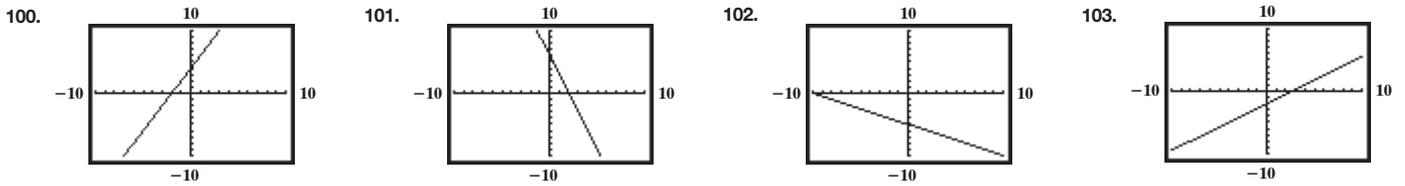

a & b. Life Expectancy for United States;  $E(x) = 0.17x + 72.9$  or  $E(x) = 0.17x + 73$   
Females, by Year of Birth

c. 83.1 yr or 83.2 yr

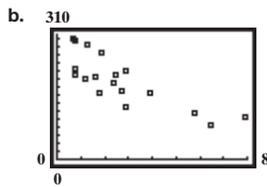

91. Answers will vary; an example is  $y = -2.3x + 255$ , where  $x$  is the percentage of adult females who are literate and  $y$  is under-five mortality per thousand.; Predictions will vary.

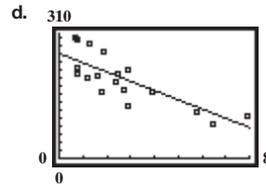

104. a.

$x$	$y$
2.5	211
3.9	167
$\vdots$	$\vdots$

99. a. perimeter: 140 yd; area: 1200 yd<sup>2</sup>  
 b. perimeter: 140 yd; area: 1000 yd<sup>2</sup>

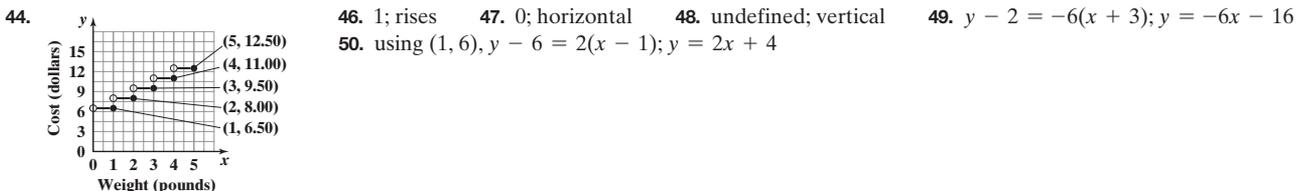

**Exercise Set 1.10**

3. a.  $M(x) = 239.4 - 0.3x$     13. b.  $T(x) = -4x^2 + 520x$     15. b.  $V(2) = 800$ ; If a 2-in. square is cut from each corner, the volume is 800 cubic in.;  $V(3) = 972$ ; if a 3-in. square is cut from each corner, the volume is 972 cubic in.;  $V(4) = 1024$ ; if a 4-in. square is cut from each corner, the volume is 1024 cubic in.;  $V(5) = 980$ ; if a 5-in. square is cut from each corner, the volume is 980 cubic in.;  $V(6) = 864$ ; if a 6-in. square is cut from each corner, the volume is 864 cubic in. Initially, as  $x$  increases,  $V$  increases. When  $x = 4$ ,  $V$  is a maximum. As  $x$  increases beyond 4,  $V$  decreases.    16. b.  $V(3) = 1728$ ; if a 3-in. square is cut from each corner, the volume is 1728 cubic in.;  $V(4) = 1936$ ; if a 4-in. square is cut from each corner, the volume is 1936 cubic in.;  $V(5) = 2000$ ; if a 5-in. square is cut from each corner, the volume is 2000 cubic in.;  $V(6) = 1944$ ; if a 6-in. square is cut from each corner, the volume is 1944 cubic in.;  $V(7) = 1792$ ; if a 7-in. square is cut from each corner, the volume is 1792 cubic in. Initially, as  $x$  increases,  $V$  increases. When  $x = 5$ ,  $V$  is a maximum. As  $x$  increases beyond 5,  $V$  decreases.    19.  $P(x) = x(66 - x)$     20.  $P(x) = x(50 - x)$     23. Let  $x$  be the length of the side perpendicular to the canal.  $A(x) = x(800 - 2x)$     24. Let  $x$  be the length of the side perpendicular to the canal.  $A(x) = x(600 - 2x)$     29. Let  $x$  be the length of the interior wall.  $C(x) = 475x + \frac{1,400,000}{x}$     30. Let  $x$  be the length of the fence.  $C(x) = 29x + \frac{5000}{x}$     32.  $A(x) = \frac{2000}{x} + x^2$
35. a.  $I(x) = 0.15x + 0.07(50,000 - x)$     b. \$31,250 at 15%, \$18,750 at 7%    36. a.  $I(x) = 0.10x + 0.12(18,750 - x)$   
 b. \$6650 at 10%, \$12,100 at 12%    37.  $I(x) = 0.12x - 0.05(8000 - x)$     38.  $I(x) = 0.14x - 0.06(12,000 - x)$     63. does not make sense  
 65. does not make sense

**Chapter 1 Review Exercises**

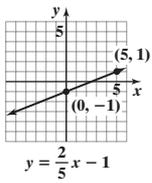

9. a. (20, 8); 8% of college students anticipated a starting salary of \$20 thousand.    15. function; domain: {2, 3, 5}; range: {7}  
 16. function; domain: {1, 2, 13}; range: {10, 500,  $\pi$ }    34. b. -2, 3;  $f(-2) = -3$ ,  $f(3) = -5$     36. odd; symmetric with respect to the origin  
 37. even; symmetric with respect to the y-axis    38. odd; symmetric with respect to the origin  
 39.     40.     42.  $-4x - 2h + 1$   
 43. a. yes; The graph passes the vertical line test.    b. (3, 12); The eagle descended.  
 c. (0, 3) and (12, 17); The eagle's height held steady during the first 3 seconds and the eagle was on the ground for 5 seconds.    d. (17, 30); The eagle was ascending.

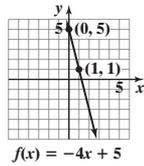

**AA22** Answers to Selected Exercises

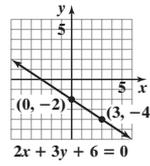

54. Slope:  $\frac{2}{5}$ ; y-intercept:  $-1$

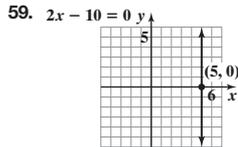

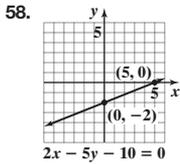

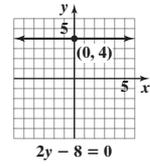

55. Slope:  $-4$ ; y-intercept:  $5$

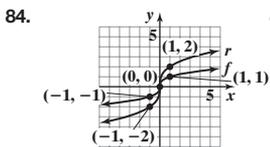

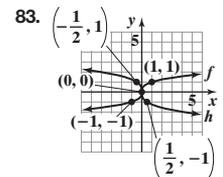

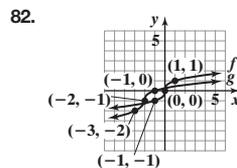

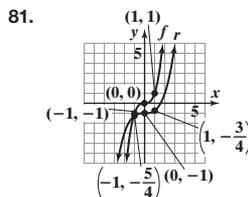

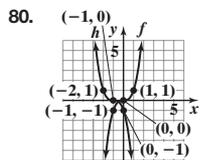

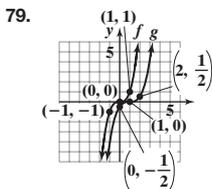

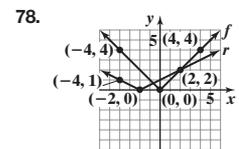

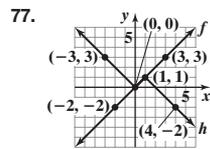

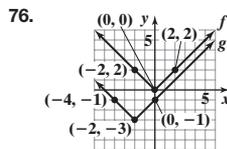

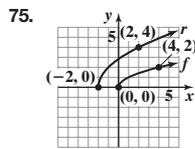

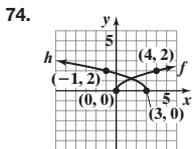

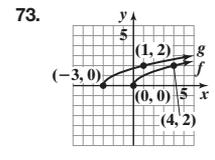

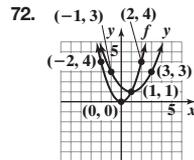

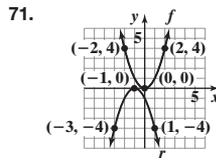

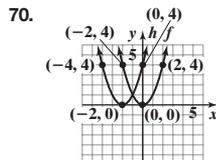

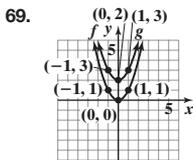

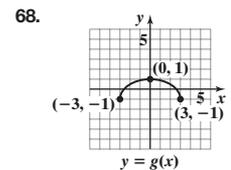

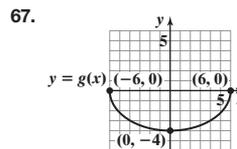

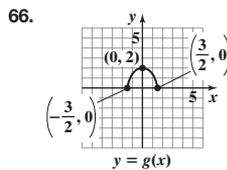

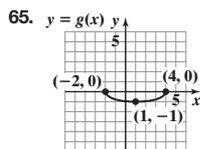

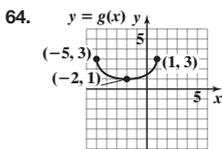

56. Slope:  $-\frac{2}{3}$ ; y-intercept:  $-2$

57. Slope:  $0$ ; y-intercept:  $4$

60. a.  $y - 2.3 = 0.116(x - 15)$  or  $y - 11 = 0.116(x - 90)$  d. 4.3 deaths per 100,000 persons; underestimates by 0.7 death per 100,000 persons; The line passes below the point for France. 63. c. The positive sign means the ball is moving up on (0, 2). The negative sign means the ball is moving down on (2, 4).

86.  $(-\infty, 7) \cup (7, \infty)$  88.  $(-\infty, -7) \cup (-7, 3) \cup (3, \infty)$  91.  $(f + g)(x) = 4x - 6$ ; domain:  $(-\infty, \infty)$ ;  
 $(f - g)(x) = 2x + 4$ ; domain:  $(-\infty, \infty)$ ;  $(fg)(x) = 3x^2 - 16x + 5$ ; domain:  $(-\infty, \infty)$ ;  $(\frac{f}{g})(x) = \frac{3x - 1}{x - 5}$ ;  
 domain:  $(-\infty, 5) \cup (5, \infty)$  92.  $(f + g)(x) = 2x^2 + x$ ; domain:  $(-\infty, \infty)$ ;  $(f - g)(x) = x + 2$ ;  
 domain:  $(-\infty, \infty)$ ;  $(fg)(x) = x^4 + x^3 - x - 1$ ; domain:  $(-\infty, \infty)$ ;  $(\frac{f}{g})(x) = \frac{x^2 + x + 1}{x^2 - 1}$ ;  
 domain:  $(-\infty, -1) \cup (-1, 1) \cup (1, \infty)$

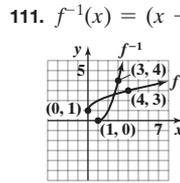

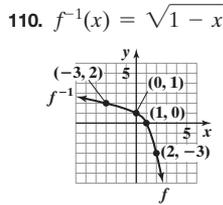

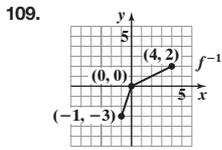

93.  $(f + g)(x) = \sqrt{x + 7} + \sqrt{x - 2}$ ; domain:  $[2, \infty)$ ;  $(f - g)(x) = \sqrt{x + 7} - \sqrt{x - 2}$ ; domain:  $[2, \infty)$ ;  $(fg)(x) = \sqrt{x^2 + 5x - 14}$ ;

domain:  $[2, \infty)$ ;  $(\frac{f}{g})(x) = \frac{\sqrt{x + 7}}{\sqrt{x - 2}}$ ; domain:  $(2, \infty)$  94. a.  $(f \circ g)(x) = 16x^2 - 8x + 4$  b.  $(g \circ f)(x) = 4x^2 + 11$

95. a.  $(f \circ g)(x) = \sqrt{x + 1}$  b.  $(g \circ f)(x) = \sqrt{x} + 1$  96. b.  $(-\infty, 0) \cup (0, \frac{1}{2}) \cup (\frac{1}{2}, \infty)$  97. b.  $[-2, \infty)$

98.  $f(x) = x^4$ ,  $g(x) = x^2 + 2x - 1$  99.  $f(x) = \sqrt[3]{x}$ ,  $g(x) = 7x + 4$  100.  $f(g(x)) = x - \frac{7}{10}$ ;  $g(f(x)) = x - \frac{7}{6}$ ;  $f$  and  $g$  are not inverses of each other.

101.  $f(g(x)) = x$ ;  $g(f(x)) = x$ ;  $f$  and  $g$  are inverses of each other.

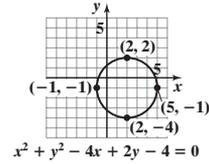

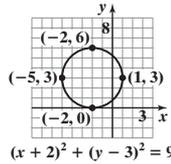

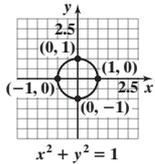

116.  $x^2 + y^2 = 9$   
 117.  $(x+2)^2 + (y-4)^2 = 36$

118. center: (0, 0); radius: 1  
 domain: [-1, 1]; range: [-1, 1]

119. center: (-2, 3); radius: 3  
 domain: [-5, 1]; range: [0, 6]

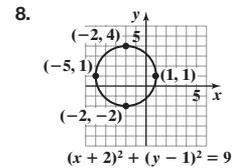

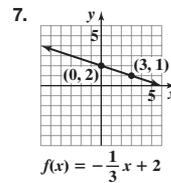

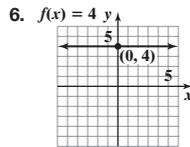

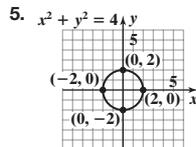

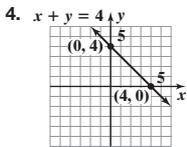

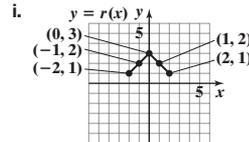

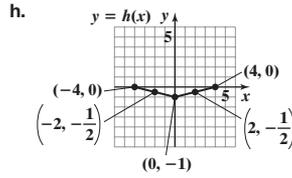

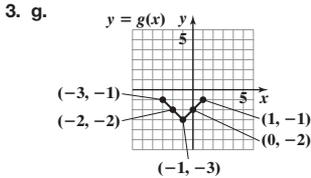

120. center: (2, -1); radius: 3  
 domain: [-1, 5]; range: [-4, 2]

125.  $A(x) = x\left(\frac{400-3x}{2}\right)$

**Chapter 1 Test**

2. e. (-5, -1) or (2, 6)

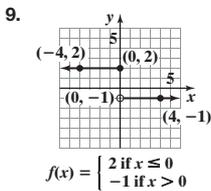

domain:  $(-\infty, \infty)$ ;  
 range:  $(-\infty, \infty)$

domain: [-2, 2];  
 range: [-2, 2]

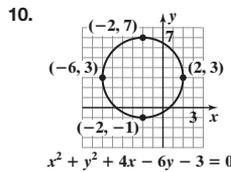

domain:  $(-\infty, \infty)$ ;  
 range: {4}

domain:  $(-\infty, \infty)$ ;  
 range:  $(-\infty, \infty)$

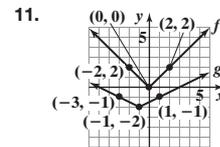

domain: [-5, 1];  
 range: [-2, 4]

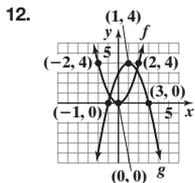

domain:  $(-\infty, \infty)$ ;  
 range: [-1, 2]

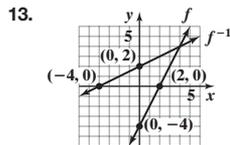

domain: [-6, 2];  
 range: [-1, 7]

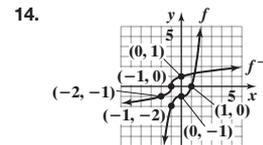

domain of  $f = \text{domain of } g = (-\infty, \infty)$ ;  
 range of  $f = [0, \infty)$ ; range of  $g = [-2, \infty)$

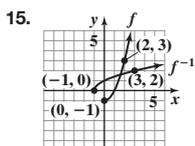

domain of  $f = \text{domain of } g = (-\infty, \infty)$ ;  
 range of  $f = [0, \infty)$ ; range of  $g = (-\infty, 4]$

domain of  $f = \text{range of } f^{-1} = (-\infty, \infty)$ ;  
 range of  $f = \text{domain of } f^{-1} = (-\infty, \infty)$

domain of  $f = \text{range of } f^{-1} = (-\infty, \infty)$ ;  
 range of  $f = \text{domain of } f^{-1} = (-\infty, \infty)$

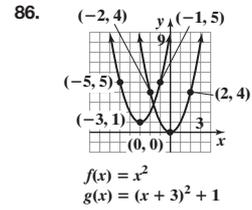

domain of  $f = \text{range of } f^{-1} = [0, \infty)$ ;  
 range of  $f = \text{domain of } f^{-1} = [-1, \infty)$

16.  $f(x-1) = x^2 - 3x - 2$     17.  $2x + h - 1$     19.  $\left(\frac{f}{g}\right)(x) = \frac{x^2 - x - 4}{2x - 6}; (-\infty, 3) \cup (3, \infty)$   
 20.  $(f \circ g)(x) = 4x^2 - 26x + 38$     21.  $(g \circ f)(x) = 2x^2 - 2x - 14$   
 23.  $f(-x) = x^2 + x - 4$ ; neither    24. using (2, 1),  $y - 1 = 3(x - 2)$ ;  $y = 3x - 5$   
 25.  $y - 6 = 4(x + 4)$ ;  $y = 4x + 22$

CHAPTER 2

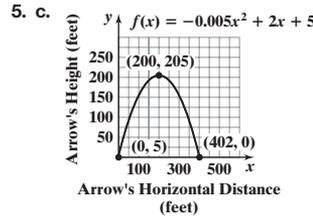

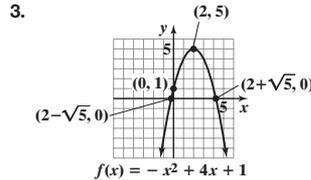

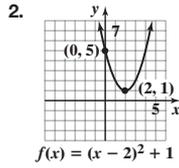

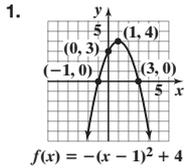

Exercise Set 2.1

4.  $2 + 16i$     63.  $(5 + i\sqrt{15}) + (5 - i\sqrt{15}) = 10; (5 + i\sqrt{15})(5 - i\sqrt{15}) = 25 - 15i^2 = 25 + 15 = 40$

Section 2.2

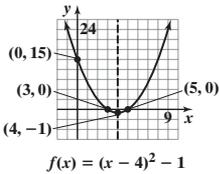

Check Point Exercises

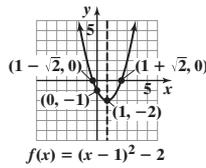

Exercise Set 2.2

10. (2, 12)    11. (-1, 5)    12. (-4, -8)    14. (2, -11)    16. (2, 7)

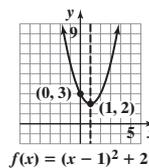

17. domain:  $(-\infty, \infty)$   
range:  $[-1, \infty)$   
axis of symmetry:  $x = 4$

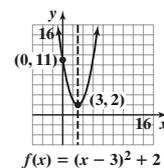

18. domain:  $(-\infty, \infty)$   
range:  $[-2, \infty)$   
axis of symmetry:  $x = 1$

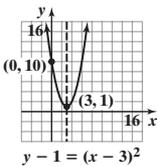

19. domain:  $(-\infty, \infty)$   
range:  $[2, \infty)$   
axis of symmetry:  $x = 1$

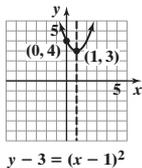

20. domain:  $(-\infty, \infty)$   
range:  $[2, \infty)$   
axis of symmetry:  $x = 3$

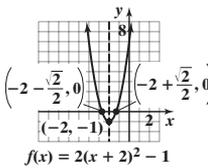

21. domain:  $(-\infty, \infty)$   
range:  $[1, \infty)$   
axis of symmetry:  $x = 3$

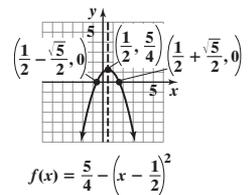

22. domain:  $(-\infty, \infty)$   
range:  $[3, \infty)$   
axis of symmetry:  $x = 1$

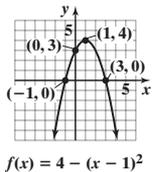

23. domain:  $(-\infty, \infty)$   
range:  $[-1, \infty)$   
axis of symmetry:  $x = -2$

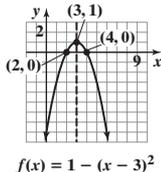

24. domain:  $(-\infty, \infty)$   
range:  $(-\infty, \frac{5}{4}]$   
axis of symmetry:  $x = \frac{1}{2}$

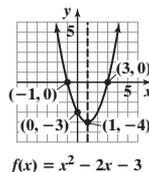

25. domain:  $(-\infty, \infty)$   
range:  $(-\infty, 4]$   
axis of symmetry:  $x = 1$

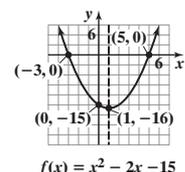

26. domain:  $(-\infty, \infty)$   
range:  $(-\infty, 1]$   
axis of symmetry:  $x = 3$

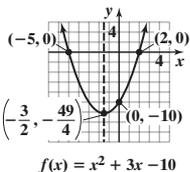

27. domain:  $(-\infty, \infty)$   
range:  $[-4, \infty)$   
axis of symmetry:  $x = 1$

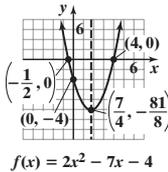

28. domain:  $(-\infty, \infty)$   
range:  $[-16, \infty)$   
axis of symmetry:  $x = 1$

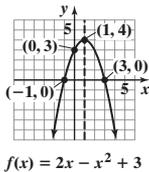

29. domain:  $(-\infty, \infty)$   
range:  $[-\frac{49}{4}, \infty)$   
axis of symmetry:  $x = -\frac{3}{2}$

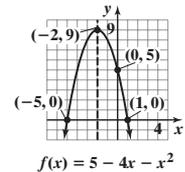

30. domain:  $(-\infty, \infty)$   
range:  $[-\frac{81}{8}, \infty)$   
axis of symmetry:  $x = \frac{7}{4}$

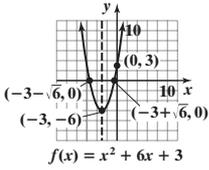

31. domain:  $(-\infty, \infty)$   
range:  $(-\infty, 4]$   
axis of symmetry:  $x = 1$

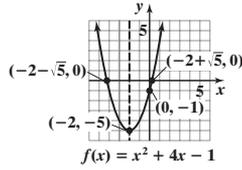

32. domain:  $(-\infty, \infty)$   
range:  $(-\infty, 9]$   
axis of symmetry:  $x = -2$

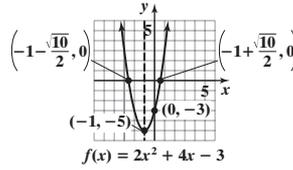

33. domain:  $(-\infty, \infty)$   
 range:  $[-6, \infty)$   
 axis of symmetry:  $x = -3$

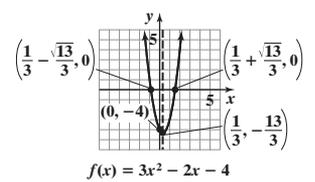

34. domain:  $(-\infty, \infty)$   
 range:  $[-5, \infty)$   
 axis of symmetry:  $x = -2$

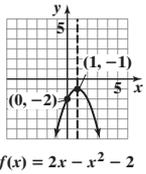

35. domain:  $(-\infty, \infty)$   
 range:  $[-5, \infty)$   
 axis of symmetry:  $x = -1$

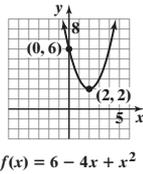

36. domain:  $(-\infty, \infty)$   
 range:  $[-\frac{13}{3}, \infty)$   
 axis of symmetry:  $x = \frac{1}{3}$

37. domain:  $(-\infty, \infty)$   
 range:  $(-\infty, -1]$   
 axis of symmetry:  $x = 1$

38. domain:  $(-\infty, \infty)$   
 range:  $[2, \infty)$   
 axis of symmetry:  $x = 2$

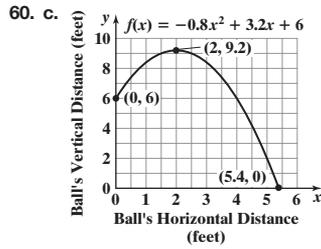

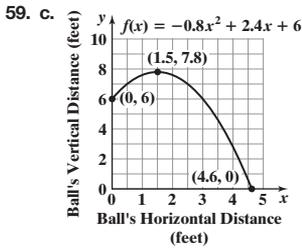

39. a. minimum      b. Minimum is  $-13$  at  $x = 2$ .  
 c. domain:  $(-\infty, \infty)$ ; range:  $[-13, \infty)$   
 40. a. minimum      b. Minimum is  $-11$  at  $x = 2$ .  
 c. domain:  $(-\infty, \infty)$ ; range:  $[-11, \infty)$   
 41. a. maximum      b. Maximum is  $1$  at  $x = 1$ .  
 c. domain:  $(-\infty, \infty)$ ; range:  $(-\infty, 1]$   
 42. a. maximum      b. Maximum is  $21$  at  $x = -3$ .  
 c. domain:  $(-\infty, \infty)$ ; range:  $(-\infty, 21]$

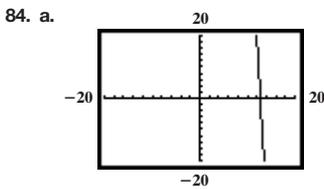

43. a. minimum      b. Minimum is  $-\frac{5}{4}$  at  $x = \frac{1}{2}$ .      c. domain:  $(-\infty, \infty)$ ; range:  $[-\frac{5}{4}, \infty)$   
 44. a. minimum      b. Minimum is  $-\frac{3}{2}$  at  $x = \frac{1}{2}$ .      c. domain:  $(-\infty, \infty)$ ; range:  $[-\frac{3}{2}, \infty)$

45. domain:  $(-\infty, \infty)$ ; range:  $[-2, \infty)$       46. domain:  $(-\infty, \infty)$ ; range:  $(-\infty, -4]$       51.  $f(x) = 2(x + 10)^2 - 5$       53.  $f(x) = -3(x + 2)^2 + 4$

54.  $f(x) = -3(x - 5)^2 - 7$       55.  $f(x) = 3(x - 11)^2$       56.  $f(x) = 3(x - 9)^2$

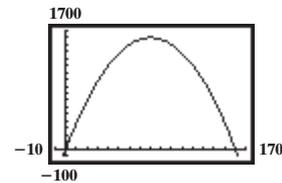

61. 8 and 8; 64      62. 10 and 10; 100      67. 12.5 yd by 12.5 yd; 156.25 sq yd  
 68. 20 yd by 20 yd; 400 sq yd      72. 3 in.; 18 sq in.      74. \$35; \$6125

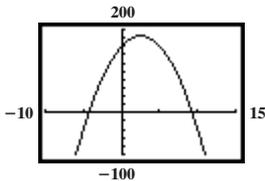

You can only see a little of the parabola.

d. You can choose Xmin and Xmax so the  $x$ -value of the vertex is in the center of the graph. Choose Ymin to include the  $y$ -value of the vertex.

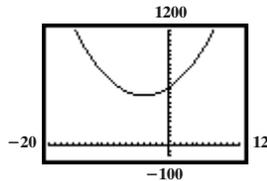

85. (80, 1600)

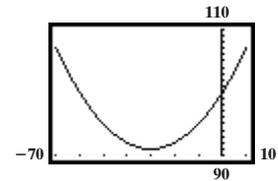

86. (2.5, 185)

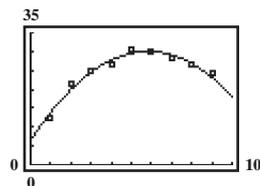

87. (-4, 520)

88. (-30, 91)

89. a & e.

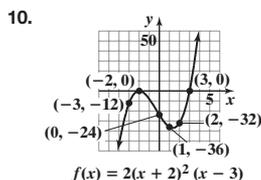

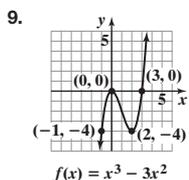

d. The greatest number of viewers actually occurred in Season 5, not Season 6, and the model underestimates the greatest number by 0.5 million.

100.  $f(x) = \frac{1}{2}(x + 3)^2 - 4$       102.  $(\frac{4}{5}, \frac{2}{5})$       103. \$95; \$21,675

107.  $f(2) = -1$ ;  $f(3) = 16$ ; The graph passes through  $(2, -1)$ , which is below the  $x$ -axis, and  $(3, 16)$ , which is above the  $x$ -axis. Since the graph of  $f$  is continuous, it must cross the  $x$ -axis somewhere between 2 and 3 to get from one of these points to the other.

Section 2.3

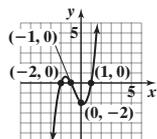

Check Point Exercises

Exercise Set 2.3

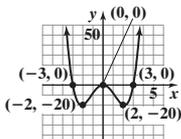

3. polynomial function; degree: 5    4. polynomial function; degree: 7
25.  $x = 5$  has multiplicity 1; The graph crosses the  $x$ -axis;  $x = -4$  has multiplicity 2; The graph touches the  $x$ -axis and turns around.
26.  $x = -5$  has multiplicity 1; The graph crosses the  $x$ -axis;  $x = -2$  has multiplicity 2; The graph touches the  $x$ -axis and turns around.
27.  $x = 3$  has multiplicity 1; The graph crosses the  $x$ -axis;  $x = -6$  has multiplicity 3; The graph crosses the  $x$ -axis.
28.  $x = -\frac{1}{2}$  has multiplicity 1; The graph crosses the  $x$ -axis;  $x = 4$  has multiplicity 3; The graph crosses the  $x$ -axis.
29.  $x = 0$  has multiplicity 1; The graph crosses the  $x$ -axis;  $x = 1$  has multiplicity 2; The graph touches the  $x$ -axis and turns around.
30.  $x = 0$  has multiplicity 1; The graph crosses the  $x$ -axis;  $x = -2$  has multiplicity 2; The graph touches the  $x$ -axis and turns around.
31.  $x = 2, x = -2$  and  $x = -7$  have multiplicity 1; The graph crosses the  $x$ -axis.
32.  $x = 3, x = -3$ , and  $x = -5$  have multiplicity 1; The graph crosses the  $x$ -axis.
37.  $f(-3) = -11; f(-2) = 1$     39.  $f(-3) = -42; f(-2) = 5$

41. a.  $f(x)$  rises to the right and falls to the left.  
 b.  $x = -2, x = 1, x = -1$ ;  
 $f(x)$  crosses the  $x$ -axis at each.  
 c. The  $y$ -intercept is  $-2$ .  
 d. neither  
 e.

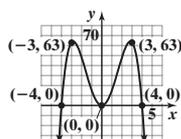

$f(x) = x^3 + 2x^2 - x - 2$

43. a.  $f(x)$  rises to the left and the right.  
 b.  $x = 0, x = 3, x = -3$ ;  
 $f(x)$  crosses the  $x$ -axis at  $-3$  and  $3$ ;  
 $f(x)$  touches the  $x$ -axis at  $0$ .  
 c. The  $y$ -intercept is  $0$ .  
 d.  $y$ -axis symmetry  
 e.

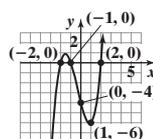

$f(x) = x^4 - 9x^2$

45. a.  $f(x)$  falls to the left and the right.  
 b.  $x = 0, x = 4, x = -4$ ;  
 $f(x)$  crosses the  $x$ -axis at  $-4$  and  $4$ ;  
 $f(x)$  touches the  $x$ -axis at  $0$ .  
 c. The  $y$ -intercept is  $0$ .  
 d.  $y$ -axis symmetry  
 e.

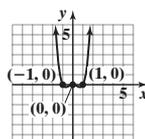

$f(x) = -x^4 + 16x^2$

42. a.  $f(x)$  rises to the right and falls to the left.  
 b.  $x = -1, x = 2, x = -2$ ;  
 $f(x)$  crosses the  $x$ -axis at each.  
 c. The  $y$ -intercept is  $-4$ .  
 d. neither  
 e.

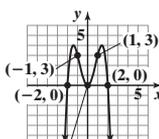

$f(x) = x^3 + x^2 - 4x - 4$

44. a.  $f(x)$  rises to the left and the right.  
 b.  $x = 0, x = 1, x = -1$ ;  
 $f(x)$  touches but does not cross the  $x$ -axis at  $0$ ;  
 $f(x)$  crosses the  $x$ -axis at  $-1$  and  $1$ .  
 c. The  $y$ -intercept is  $0$ .  
 d.  $y$ -axis symmetry  
 e.

$f(x) = x^4 - x^2$

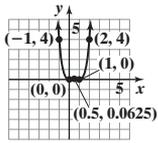

46. a.  $f(x)$  falls to the left and the right.  
 b.  $x = 0, x = 2, x = -2$ ;  
 $f(x)$  touches but does not cross the  $x$ -axis at  $0$ ;  
 $f(x)$  crosses the  $x$ -axis at  $-2$  and  $2$ .  
 c. The  $y$ -intercept is  $0$ .  
 d.  $y$ -axis symmetry  
 e.

$f(x) = -x^4 + 4x^2$

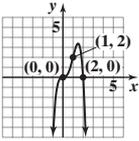

47. a.  $f(x)$  rises to the left and the right.  
 b.  $x = 0, x = 1$ ;  
 $f(x)$  touches the  $x$ -axis at 0 and 1.  
 c. The  $y$ -intercept is 0.  
 d. neither  
 e.

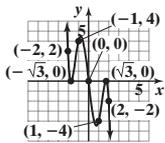

$$f(x) = x^4 - 2x^3 + x^2$$

49. a.  $f(x)$  falls to the left and the right.  
 b.  $x = 0, x = 2$ ;  
 $f(x)$  crosses the  $x$ -axis at 0 and 2.  
 c. The  $y$ -intercept is 0.  
 d. neither  
 e.

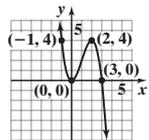

$$f(x) = -2x^4 + 4x^3$$

51. a.  $f(x)$  rises to the left and falls to the right.  
 b.  $x = 0, x = \pm\sqrt{3}$ ;  
 $f(x)$  crosses the  $x$ -axis at 0;  
 $f(x)$  touches the  $x$ -axis at  $\sqrt{3}$  and  $-\sqrt{3}$ .  
 c. The  $y$ -intercept is 0.  
 d. origin symmetry  
 e.

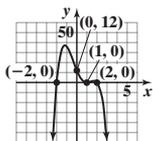

$$f(x) = 6x^3 - 9x - x^5$$

53. a.  $f(x)$  rises to the left and falls to the right.  
 b.  $x = 0, x = 3$ ;  
 $f(x)$  crosses the  $x$ -axis at 3;  
 $f(x)$  touches the  $x$ -axis at 0.  
 c. The  $y$ -intercept is 0.  
 d. neither  
 e.

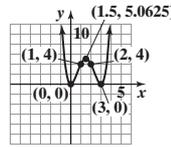

$$f(x) = 3x^2 - x^3$$

55. a.  $f(x)$  falls to the left and the right.  
 b.  $x = 1, x = -2, x = 2$ ;  
 $f(x)$  crosses the  $x$ -axis at  $-2$  and  $2$ ;  
 $f(x)$  touches the  $x$ -axis at  $1$ .  
 c. The  $y$ -intercept is 12.  
 d. neither  
 e.

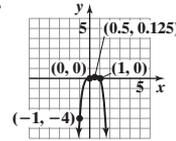

$$f(x) = -3(x-1)^2(x^2-4)$$

48. a.  $f(x)$  rises to the left and the right.  
 b.  $x = 0, x = 3$ ;  
 $f(x)$  touches the  $x$ -axis at 3 and 0.  
 c. The  $y$ -intercept is 0.  
 d. neither  
 e.

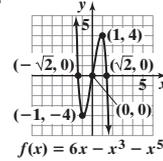

$$f(x) = x^4 - 6x^3 + 9x^2$$

50. a.  $f(x)$  falls to the left and the right.  
 b.  $x = 0, x = 1$ ;  
 $f(x)$  crosses the  $x$ -axis at 0 and 1.  
 c. The  $y$ -intercept is 0.  
 d. neither  
 e.

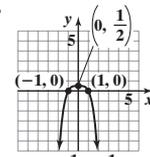

$$f(x) = -2x^4 + 2x^3$$

52. a.  $f(x)$  rises to the left and falls to the right.  
 b.  $x = 0, x = \pm\sqrt{2}$ ;  
 $f(x)$  crosses the  $x$ -axis at  $-\sqrt{2}, 0,$  and  $\sqrt{2}$ .  
 c. The  $y$ -intercept is 0.  
 d. origin symmetry  
 e.

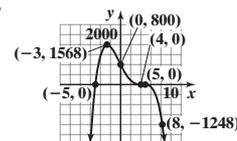

$$f(x) = 6x - x^3 - x^5$$

54. a.  $f(x)$  falls to the left and the right.  
 b.  $x = \pm 1$ ;  
 $f(x)$  crosses the  $x$ -axis at  $-1$  and  $1$ .  
 c. The  $y$ -intercept is  $\frac{1}{2}$ .  
 d.  $y$ -axis symmetry  
 e.

$$f(x) = \frac{1}{2} - \frac{1}{2}x^4$$

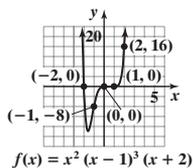

56. a.  $f(x)$  falls to the left and the right.  
 b.  $x = 4, x = -5, x = 5$ ;  
 $f(x)$  crosses the  $x$ -axis at  $-5$  and  $5$ ;  
 $f(x)$  touches the  $x$ -axis at  $4$ .  
 c. The  $y$ -intercept is 800.  
 d. neither  
 e.

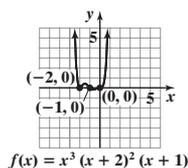

$$f(x) = -2(x-4)^2(x^2-25)$$

# AA28 Answers to Selected Exercises

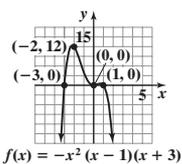

57. a.  $f(x)$  rises to the left and the right.  
 b.  $x = -2, x = 0, x = 1$ ;  
 $f(x)$  crosses the  $x$ -axis at  $-2$  and  $1$ ;  
 $f(x)$  touches the  $x$ -axis at  $0$ .  
 c. The  $y$ -intercept is  $0$ .  
 d. neither  
 e.

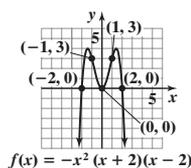

58. a.  $f(x)$  rises to the left and the right.  
 b.  $x = -2, x = -1, x = 0$ ;  
 $f(x)$  crosses the  $x$ -axis at  $-1$  and  $0$ ;  
 $f(x)$  touches the  $x$ -axis at  $-2$ .  
 c. The  $y$ -intercept is  $0$ .  
 d. neither  
 e.

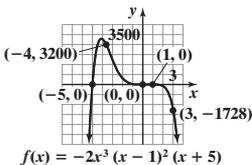

59. a.  $f(x)$  falls to the left and the right.  
 b.  $x = -3, x = 0, x = 1$ ;  
 $f(x)$  crosses the  $x$ -axis at  $-3$  and  $1$ ;  
 $f(x)$  touches the  $x$ -axis at  $0$ .  
 c. The  $y$ -intercept is  $0$ .  
 d. neither  
 e.

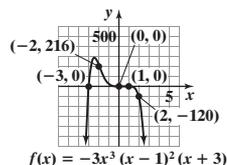

60. a.  $f(x)$  falls to the left and the right.  
 b.  $x = -2, x = 0, x = 2$ ;  
 $f(x)$  crosses the  $x$ -axis at  $-2$  and  $2$ ;  
 $f(x)$  touches the  $x$ -axis at  $0$ .  
 c. The  $y$ -intercept is  $0$ .  
 d.  $y$ -axis symmetry  
 e.

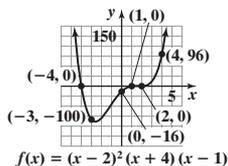

61. a.  $f(x)$  falls to the left and the right.  
 b.  $x = -5, x = 0, x = 1$ ;  
 $f(x)$  crosses the  $x$ -axis at  $-5$  and  $0$ ;

8. all real numbers    21. vertical asymptote:  $x = -4$ ; no holes    22. vertical asymptote:  $x = 3$ ; no holes    23. vertical asymptotes:  $x = -4, x = 0$ ; no holes  
24. vertical asymptotes:  $x = 3, x = 0$ ; no holes    25. vertical asymptote:  $x = -4$ ; hole at  $x = 0$     26. vertical asymptote:  $x = 3$ ; hole at  $x = 0$

27. no vertical asymptotes; no holes    28. no vertical asymptotes; no holes    29. no vertical asymptotes; hole at  $x = 3$     30. no vertical asymptotes; hole at  $x = 5$     31. vertical asymptote:  $x = -3$ ; hole at  $x = 3$     32. vertical asymptote:  $x = -5$ ; hole at  $x = 5$     33. vertical asymptote:  $x = 3$ ; hole at  $x = -7$     34. vertical asymptote:  $x = 4$ ; hole at  $x = -6$     35. no vertical asymptotes; hole at  $x = -7$     36. no vertical asymptotes; hole at  $x = -6$

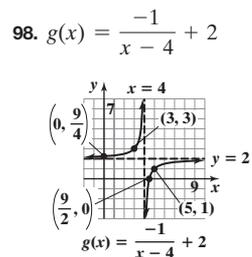

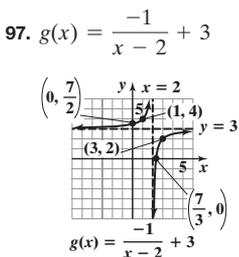

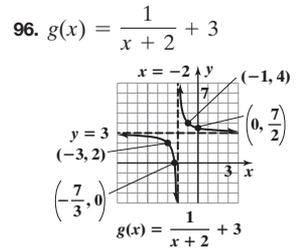

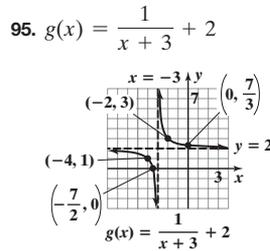

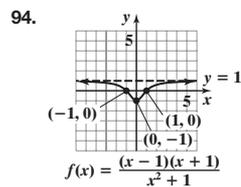

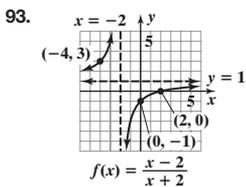

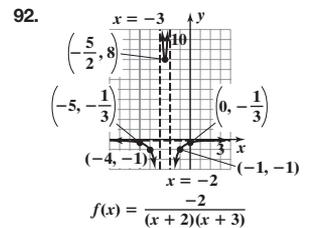

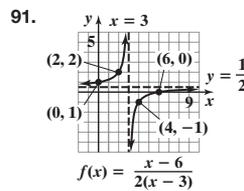

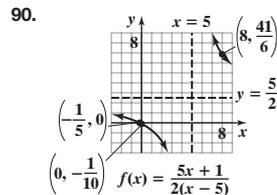

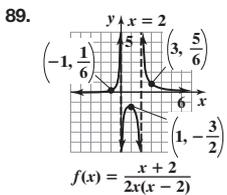

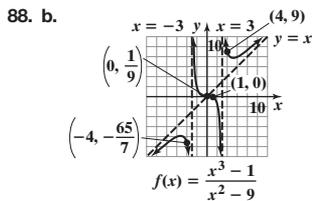

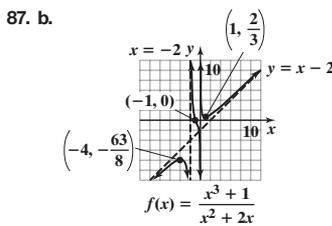

AA32 Answers to Selected Exercises

85. a. Slant asymptote:  $y = x + 4$   
b.

86. a. Slant asymptote:  $y = x$   
b.

99. b.  $\bar{C}(x) = \frac{100x + 100,000}{x}$

c.  $\bar{C}(500) = 300$ , when 500 bicycles are produced, it costs \$300 to produce each bicycle;  $\bar{C}(1000) = 200$ , when 1000 bicycles are produced, it costs \$200 to produce each bicycle;  $\bar{C}(2000) = 150$ , when 2000 bicycles are produced, it costs \$150 to produce each bicycle;  $\bar{C}(4000) = 125$ , when 4000 bicycles are produced, it costs \$125 to produce each bicycle.

d.  $y = 100$ ; The cost per bicycle approaches \$100 as more bicycles are produced.

100. b.  $\bar{C}(x) = \frac{30x + 300,000}{x}$

c.  $\bar{C}(1000) = 330$ , when 1000 pairs of shoes are produced, it costs \$330 to produce each pair;  $\bar{C}(10,000) = 60$ , when 10,000 pairs of shoes are produced, it costs \$60 to produce each pair;  $\bar{C}(100,000) = 33$ , when 100,000 pairs of shoes are produced, it costs \$33 to produce each pair.

d.  $y = 30$ ; The cost per pair of shoes approaches \$30 as more shoes are produced.

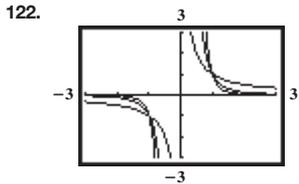

101. d.  $y = 6.5$ ; Over time, the pH level rises back to normal. e. It quickly drops below normal and then slowly begins to approach the normal level.

102. c.  $y = 0$ ; Over time, the drug's concentration will approach 0 mg per liter. 103. 90; An incidence ratio of 10 means 90% of the deaths are smoking related.

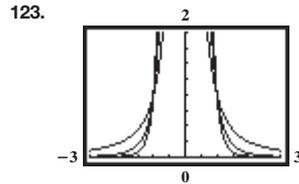

104. 89; An incidence ratio of 9 means about 89% of the deaths are smoking related. 105.  $y = 100$ ; The percentage of deaths cannot exceed 100% as the incidence ratios increase.

106. No; according to the model and its graph, there is no incidence ratio that will produce 100 percentage of deaths. 107. a.  $f(x) = \frac{1.75x^2 - 15.9x + 160}{2.1x^2 - 3.5x + 296}$

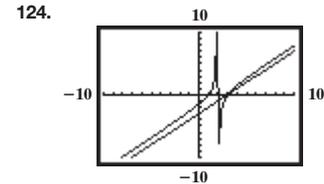

c. 66%; underestimates by 1%

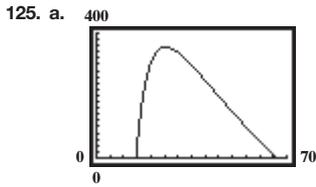

The graph approaches the horizontal asymptote faster and the vertical asymptote more slowly as  $n$  increases.

The graph approaches the horizontal asymptote faster and the vertical asymptote more slowly as  $n$  increases.

$g(x)$  is the graph of a line whereas  $f(x)$  is the graph of a rational function with a slant asymptote; In  $g(x)$ ,  $x - 2$  is a factor of  $x^2 - 5x + 6$ .

b. The graph increases and reaches a maximum of about 356 arrests per 100,000 drivers at age 25.

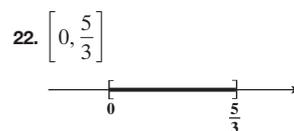

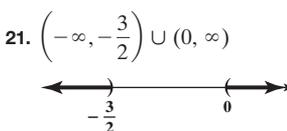

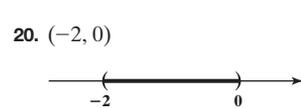

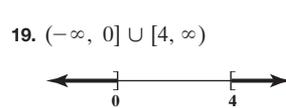

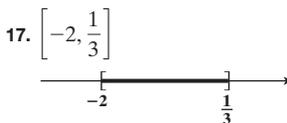

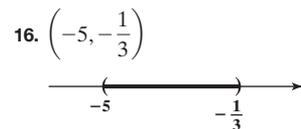

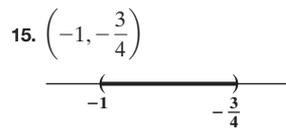

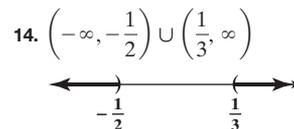

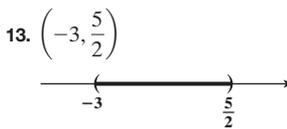

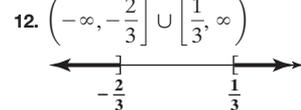

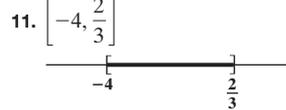

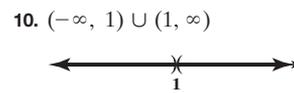

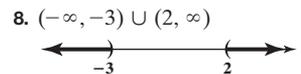

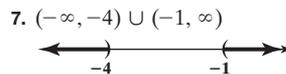

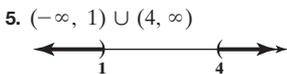

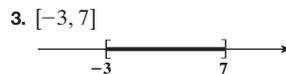

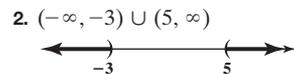

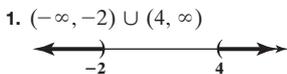

126. does not make sense

13.  $x = \frac{kz^3}{y}; y = \frac{kz^3}{x}$     14.  $x = \frac{k\sqrt[3]{z}}{y}; y = \frac{k\sqrt[3]{z}}{x}$     15.  $x = \frac{kzy}{\sqrt{w}}; y = \frac{x\sqrt{w}}{kz}$     16.  $x = \frac{kzy}{w^2}; y = \frac{xw^2}{kz}$     17.  $x = kz(y + w); y = \frac{x - kz w}{kz}$     18.  $x = kz(y - w); y = \frac{x + kz w}{kz}$     19.  $x = \frac{kz}{y - w}; y = \frac{xw + kz}{x}$     20.  $x = \frac{kz}{y + w}; y = \frac{kz - xw}{x}$     36.  $\frac{1}{3}$  as long as it seems now

37. a.  $C = \frac{kP_1P_2}{d^2}$

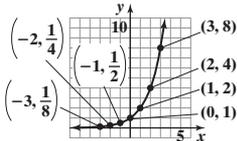

38. Yes, the wind will exert a force of 360 pounds.

39. a. b. Current varies inversely as resistance.

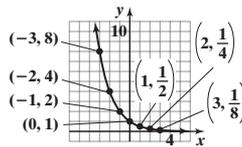

51. makes sense 55. Reduce the resistance by a factor of  $\frac{1}{3}$ .

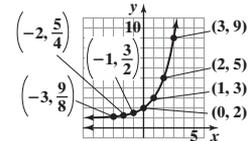

58.  $f(x) = 2^x$

59.  $g(x) = f(-x) = 2^{-x}$

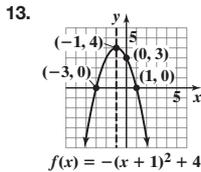

60.  $h(x) = f(x) + 1 = 2^x + 1$

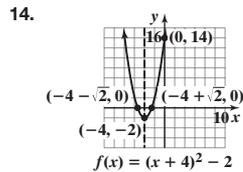

Chapter 2 Review Exercises

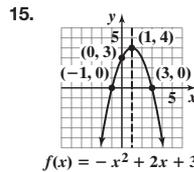

12.  $\left\{ \frac{3}{2} \pm \frac{1}{2}i \right\}$

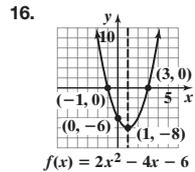

$f(x) = -(x+1)^2 + 4$   
axis of symmetry:  $x = -1$   
domain:  $(-\infty, \infty)$ ; range:  $(-\infty, 4]$

$f(x) = (x+4)^2 - 2$   
axis of symmetry:  $x = -4$   
domain:  $(-\infty, \infty)$ ; range:  $[-2, \infty)$

$f(x) = -x^2 + 2x + 3$   
axis of symmetry:  $x = 1$   
domain:  $(-\infty, \infty)$ ; range:  $(-\infty, 4]$

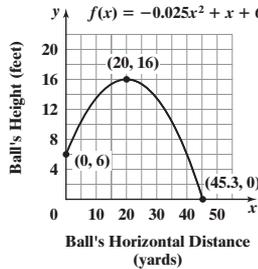

$f(x) = 2x^2 - 4x - 6$   
axis of symmetry:  $x = 1$   
domain:  $(-\infty, \infty)$ ; range:  $[-8, \infty)$

17. a. maximum is  $-57$  at  $x = 7$   
b. domain:  $(-\infty, \infty)$ ; range:  $[685, \infty)$

b. domain:  $(-\infty, \infty)$ ; range:  $(-\infty, -57]$

19. b. 6 ft

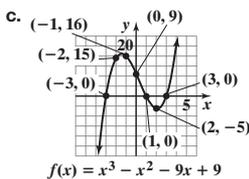

c.  $f(x) = -0.025x^2 + x + 6$

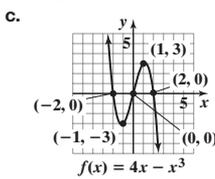

20. 250 yd by 500 yd; 125,000 sq yard

28. b. no; The model indicates increasing deforestation despite a declining rate in which the forest is being cut down.  
29. No; the graph falls to the right, so eventually there would be a negative number of thefts, which is not possible.  
30.  $x = 1$ , multiplicity 1, crosses;  $x = -2$ , multiplicity 2, touches;  $x = -5$ , multiplicity 3, crosses  
31.  $x = -5$ , multiplicity 1, crosses;  $x = 5$ , multiplicity 2, touches  
32.  $f(1)$  is negative and  $f(2)$  is positive, so by the Intermediate Value Theorem,  $f$  has a real zero between 1 and 2.

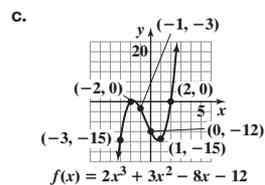

33. a. The graph falls to the left and rises to the right.  
b. no symmetry

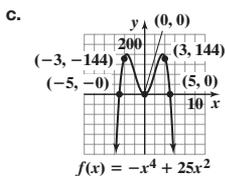

34. a. The graph rises to the left and falls to the right.  
b. origin symmetry

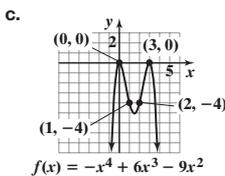

35. a. The graph falls to the left and rises to the right.  
b. no symmetry

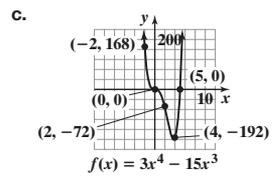

36. a. The graph falls to the left and to the right.  
b. y-axis symmetry

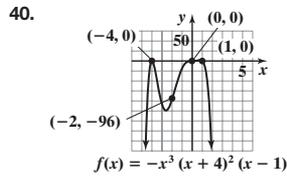

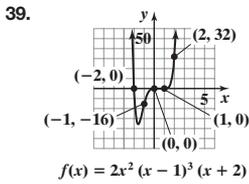

37. a. The graph falls to the left and to the right.  
b. no symmetry

38. a. The graph rises to the left and to the right.  
b. no symmetry

**AA36** Answers to Selected Exercises

42.  $2x^2 - 4x + 1 - \frac{10}{5x-3}$     48.  $\{4, -2 \pm \sqrt{5}\}$

50.  $\pm 1, \pm 2, \pm 4, \pm 8, \pm \frac{8}{3}, \pm \frac{4}{3}, \pm \frac{2}{3}, \pm \frac{1}{3}$

52. 3 or 1 positive real zeros; 2 or 0 negative real zeros

53. No sign variations exist for either  $f(x)$  or  $f(-x)$ , so no real roots exist.

54. b. 1 positive real zero; 2 or no negative real zeros    c. -2 or 1

55. b. 2 or 0 positive real zeros; 1 negative real zero    c.  $-1, \frac{1}{3},$  or  $\frac{1}{2}$

56. a.  $\pm 1, \pm 3, \pm 5, \pm 15, \pm \frac{1}{2}, \pm \frac{1}{4}, \pm \frac{1}{8}, \pm \frac{3}{2}, \pm \frac{3}{4}, \pm \frac{3}{8}, \pm \frac{5}{2}, \pm \frac{5}{4}, \pm \frac{5}{8}, \pm \frac{15}{2}, \pm \frac{15}{4}, \pm \frac{15}{8}$     b. 3 or 1 positive real solutions; no negative real solutions

c.  $\frac{1}{2}, \frac{3}{2},$  or  $\frac{5}{2}$     57. b. 2 or 0 positive real solutions; 1 negative solution    d.  $\left\{ \frac{1}{2}, \frac{-5 - \sqrt{29}}{2}, \frac{-5 + \sqrt{29}}{2} \right\}$

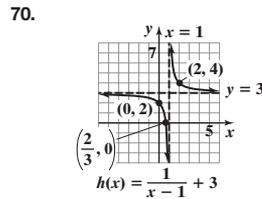

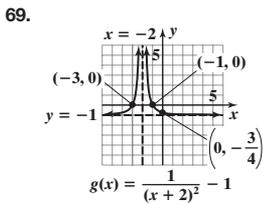

58. b. 2 or zero positive real solutions; 2 or zero negative real solutions    c. -2, -1, 1, or 3

59. b. 1 positive real root; 1 negative real root    c.  $-\frac{1}{2}$  or  $\frac{1}{2}$     60. b. 2 or no positive zeros; 2 or no negative zeros    c. -2, -1,  $\frac{1}{2},$  or 2

61.  $f(x) = x^3 - 6x^2 + 21x - 26$     62.  $f(x) = 2x^4 + 12x^3 + 20x^2 + 12x + 18$     63.  $f(x) = (x-i)(x+i)(x+2)(2x-1)$

64.  $g(x) = (x+1)^2(x-4)^2$     65. 4 real zeros, one with multiplicity two    66. 3 real zeros; 2 nonreal complex zeros

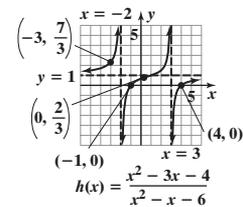

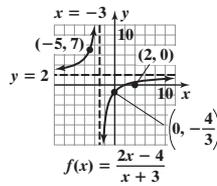

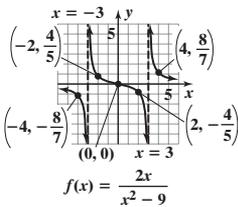

67. 2 real zeros, one with multiplicity two; 2 nonreal complex zeros    68. 1 real zero; 4 nonreal complex zeros

71. Vertical asymptotes:  $x = 3$  and  $x = -3$   
horizontal asymptote:  $y = 0$

72. Vertical asymptote:  $x = -3$   
horizontal asymptote:  $y = 2$

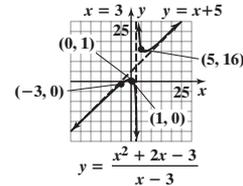

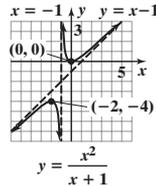

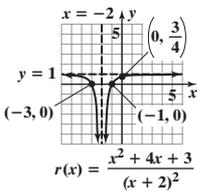

73. Vertical asymptotes:  $x = 3$  and  $x = -2$   
horizontal asymptote:  $y = 1$

74. Vertical asymptote:  $x = -2$   
horizontal asymptote:  $y = 1$

75. Vertical asymptote:  $x = -1$   
no horizontal asymptote  
slant asymptote:  $y = x - 1$

76. Vertical asymptote:  $x = 3$   
no horizontal asymptote  
slant asymptote:  $y = x + 5$

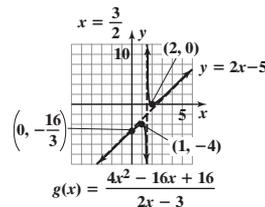

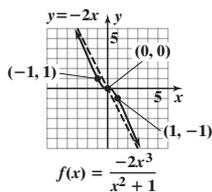

77. No vertical asymptote  
no horizontal asymptote  
slant asymptote:  $y = -2x$

78. Vertical asymptote:  $x = \frac{3}{2}$   
no horizontal asymptote  
slant asymptote:  $y = 2x - 5$

79. b.  $\bar{C}(x) = \frac{25x + 50,000}{x}$

c.  $\bar{C}(50) = 1025$ , when 50 calculators are manufactured, it costs \$1025 to manufacture each;  $\bar{C}(100) = 525$ , when 100 calculators are manufactured, it costs \$525 to manufacture each;  $\bar{C}(1000) = 75$ , when 1000 calculators are manufactured, it costs \$75 to manufacture each;  $\bar{C}(100,000) = 25.5$ , when 100,000 calculators are manufactured, it costs \$25.50 to manufacture each.

d.  $y = 25$ ; costs will approach \$25.

80.  $y = 3000$ ; The number of fish in the pond approaches 3000.  
 81.  $y = 0$ ; As the number of years of education increases the percentage rate of unemployment approaches zero.  
 82. b.  $R(x) = \frac{1.53x + 114.8}{2.99x + 235.5}$     c.  $y = 0.51$ ; Over time the percentage of men in the U.S. population will approach 51%.

85.  $(-3, \frac{1}{2})$

86.  $(-\infty, -4] \cup [-\frac{1}{2}, \infty)$

87.  $(-3, 0) \cup (1, \infty)$

88.  $(-\infty, -2) \cup (6, \infty)$

89.  $[-1, 1) \cup [2, \infty)$

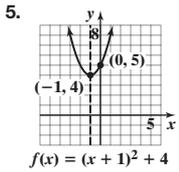

90.  $(-\infty, 4) \cup [\frac{23}{4}, \infty)$

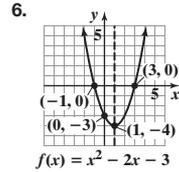

91. a. 261 ft; overestimates by 1 ft    b. speeds exceeding 40 miles per hour

**Chapter 2 Test**

4.  $\{2 \pm i\}$

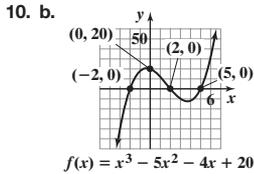

axis of symmetry:  $x = -1$   
 domain:  $(-\infty, \infty)$ ; range:  $[4, \infty)$

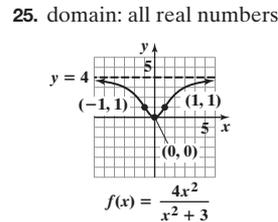

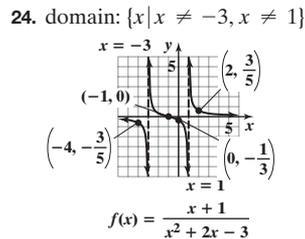

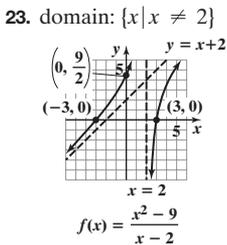

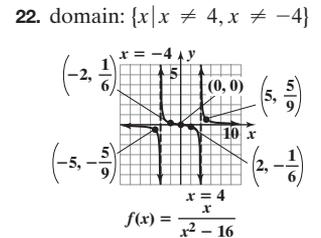

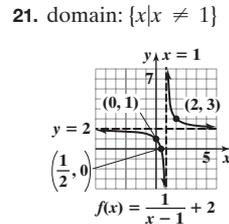

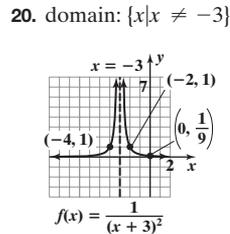

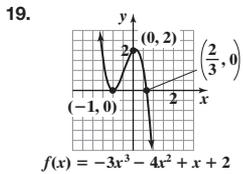

axis of symmetry:  $x = 1$   
 domain:  $(-\infty, \infty)$ ; range:  $[-4, \infty)$

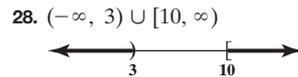

7. a. maximum of 2 at  $x = 3$ ;  
 b. domain:  $(-\infty, \infty)$ ; range:  $(-\infty, 2]$

11. Since the degree of the polynomial is odd and the leading coefficient is positive, the graph of  $f$  should fall to the left and rise to the right. The  $x$ -intercepts should be  $-1, 0,$  and  $1$ .  
 14. 3 or 1 positive real zeros; no negative real zeros  
 16. a.  $\pm 1, \pm 3, \pm 5, \pm 15, \pm \frac{1}{2}, \pm \frac{3}{2}, \pm \frac{5}{2}, \pm \frac{15}{2}$

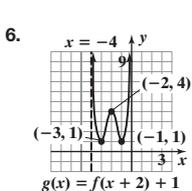

26. a.  $\bar{C}(x) = \frac{300,000 + 10x}{x}$   
 b.  $y = 10$ ; As the number of satellite radio players increases, the average cost approaches \$10.

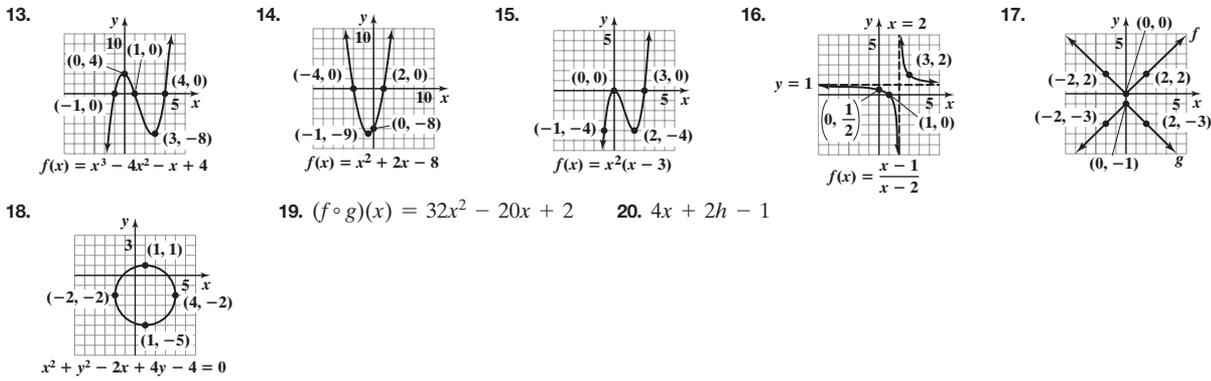

**Cumulative Review Exercises (Chapters P-2)**

1. domain:  $(-2, 2)$ ; range:  $[0, \infty)$     2.  $-1$  and  $1$ , both of multiplicity 2

8.  $\left\{ \frac{5 + \sqrt{13}}{6}, \frac{5 - \sqrt{13}}{6} \right\}$     10.  $\{-3, -1, 2\}$     11.  $(-\infty, 1) \cup (4, \infty)$     12.  $(-\infty, -1) \cup \left(\frac{5}{3}, \infty\right)$

Section 3.1

Check Point Exercises

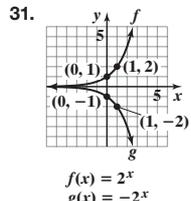

Exercise Set 3.1

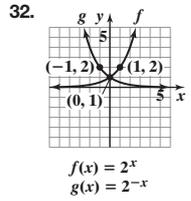

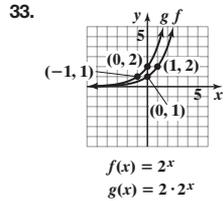

$f(x) = 2^x$   
 $h(x) = 2^x + 2 - 1$   
 asymptote:  $y = -1$   
 domain:  $(-\infty, \infty)$   
 range:  $(-1, \infty)$

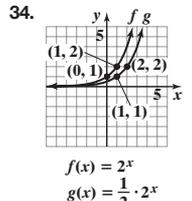

$f(x) = 2^x$   
 $g(x) = -2^x$   
 asymptote:  $y = 0$   
 domain:  $(-\infty, \infty)$   
 range:  $(-\infty, 0)$

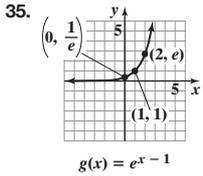

$f(x) = 2^x$   
 $g(x) = 2^{-x}$   
 asymptote:  $y = 0$   
 domain:  $(-\infty, \infty)$   
 range:  $(0, \infty)$

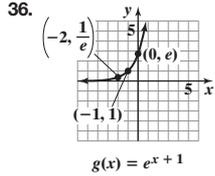

$f(x) = 2^x$   
 $g(x) = 2 \cdot 2^x$   
 asymptote:  $y = 0$   
 domain:  $(-\infty, \infty)$   
 range:  $(0, \infty)$

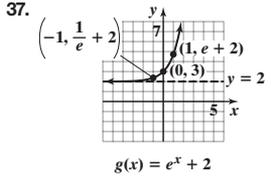

$f(x) = 2^x$   
 $g(x) = \frac{1}{2} \cdot 2^x$   
 asymptote:  $y = 0$   
 domain:  $(-\infty, \infty)$   
 range:  $(0, \infty)$

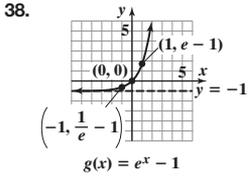

$g(x) = e^{x-1} + 1$   
 asymptote:  $y = 0$   
 domain:  $(-\infty, \infty)$   
 range:  $(0, \infty)$

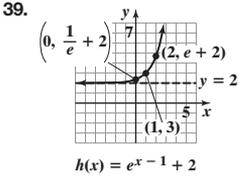

$g(x) = e^x + 1$   
 asymptote:  $y = 0$   
 domain:  $(-\infty, \infty)$   
 range:  $(0, \infty)$

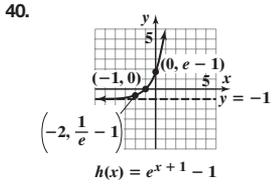

$g(x) = e^x + 2$   
 asymptote:  $y = 2$   
 domain:  $(-\infty, \infty)$   
 range:  $(2, \infty)$

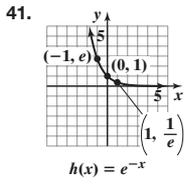

$g(x) = e^x - 1$   
 asymptote:  $y = -1$   
 domain:  $(-\infty, \infty)$   
 range:  $(-1, \infty)$

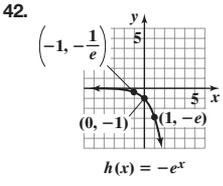

$h(x) = e^{x-1} + 2$   
 asymptote:  $y = 2$   
 domain:  $(-\infty, \infty)$   
 range:  $(2, \infty)$

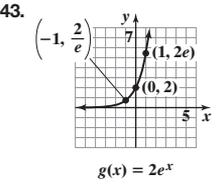

$h(x) = e^{x+1} - 1$   
 asymptote:  $y = -1$   
 domain:  $(-\infty, \infty)$   
 range:  $(-1, \infty)$

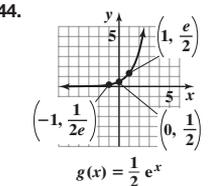

$h(x) = e^{-x}$   
 asymptote:  $y = 0$   
 domain:  $(-\infty, \infty)$   
 range:  $(0, \infty)$

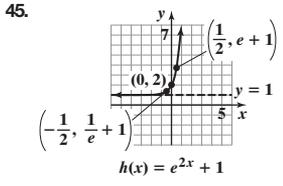

$h(x) = -e^{-x}$   
 asymptote:  $y = 0$   
 domain:  $(-\infty, \infty)$   
 range:  $(-\infty, 0)$

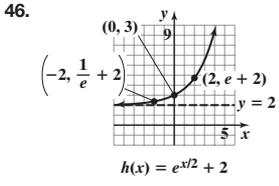

$g(x) = 2e^x$   
 asymptote:  $y = 0$   
 domain:  $(-\infty, \infty)$   
 range:  $(0, \infty)$

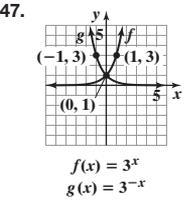

$g(x) = \frac{1}{2} e^x$   
 asymptote:  $y = 0$   
 domain:  $(-\infty, \infty)$   
 range:  $(0, \infty)$

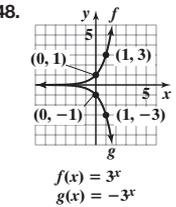

$h(x) = e^{2x} + 1$   
 asymptote:  $y = 1$   
 domain:  $(-\infty, \infty)$   
 range:  $(1, \infty)$

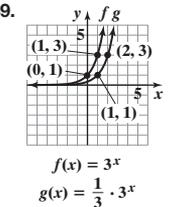

$h(x) = e^{x/2} + 2$   
 asymptote:  $y = 2$   
 domain:  $(-\infty, \infty)$   
 range:  $(2, \infty)$

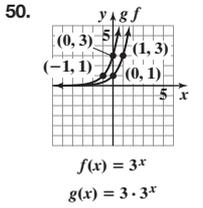

asymptote of  $f$ :  $y = 0$   
 asymptote of  $g$ :  $y = 0$

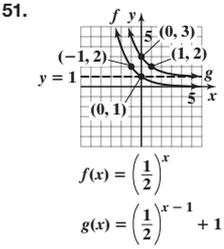

asymptote of  $f$ :  $y = 0$   
 asymptote of  $g$ :  $y = 0$

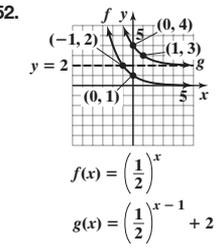

asymptote of  $f$ :  $y = 0$   
 asymptote of  $g$ :  $y = 0$

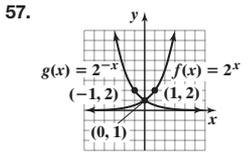

asymptote of  $f$ :  $y = 0$   
 asymptote of  $g$ :  $y = 0$

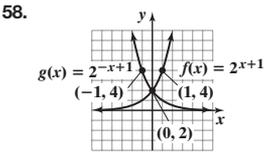

asymptote of  $f$ :  $y = 1$   
 asymptote of  $g$ :  $y = 1$

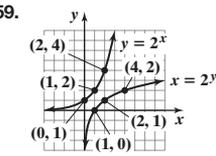

asymptote of  $f$ :  $y = 0$   
 asymptote of  $g$ :  $y = 2$

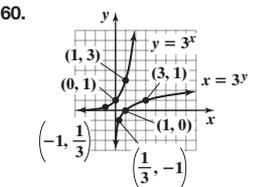

asymptote of  $f$ :  $y = 0$   
 asymptote of  $g$ :  $y = 0$

asymptote of  $f$ :  $y = 0$   
 asymptote of  $g$ :  $y = 0$

asymptote of  $f$ :  $y = 0$   
 asymptote of  $g$ :  $y = 0$

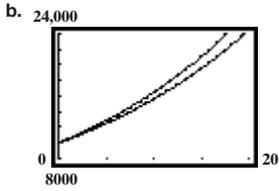

asymptote of  $f$ :  $y = 0$   
 asymptote of  $g$ :  $y = 0$

23.  $\frac{1}{2} \log_4 x - 3$     24.  $\frac{1}{2} \log_5 x - 2$     25.  $2 - \frac{1}{2} \log_6(x + 1)$     26.  $2 - \frac{1}{2} \log_8(x + 1)$     27.  $2 \log_b x + \log_b y - 2 \log_b z$

28.  $3 \log_b x + \log_b y - 2 \log_b z$     29.  $1 + \frac{1}{2} \log x$     30.  $\frac{1}{2} + \frac{1}{2} \ln x$     31.  $\frac{1}{3} \log x - \frac{1}{3} \log y$     32.  $\frac{1}{5} \log x - \frac{1}{5} \log y$

33.  $\frac{1}{2} \log_b x + 3 \log_b y - 3 \log_b z$     34.  $\frac{1}{3} \log_b x + 4 \log_b y - 5 \log_b z$     35.  $\frac{2}{3} \log_5 x + \frac{1}{3} \log_5 y - \frac{2}{3}$     36.  $\frac{1}{5} \log_2 x + \frac{4}{5} \log_2 y - \frac{4}{5}$

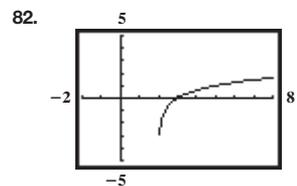

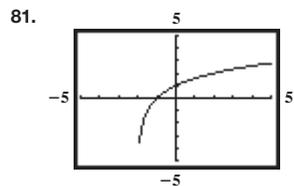

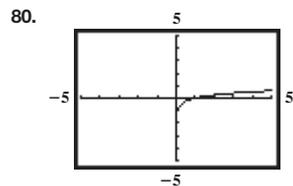

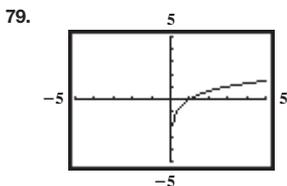

37.  $3 \ln x + \frac{1}{2} \ln(x^2 + 1) - 4 \ln(x + 1)$     38.  $4 \ln x + \frac{1}{2} \ln(x^2 + 3) - 5 \ln(x + 3)$     39.  $1 + 2 \log x + \frac{1}{3} \log(1 - x) - \log 7 - 2 \log(x + 1)$

40.  $2 + 3 \log x + \frac{1}{3} \log(5 - x) - \log 3 - 2 \log(x + 7)$     47.  $\log\left(\frac{2x + 5}{x}\right)$     48.  $\log\left(\frac{3x + 7}{x}\right)$     51.  $\ln(x^{1/2}y)$  or  $\ln(y\sqrt{x})$

52.  $\ln(x^{1/3}y)$  or  $\ln(y\sqrt[3]{x})$     55.  $\ln\left(\frac{x^5}{y^2}\right)$     56.  $\ln\left(\frac{x^7}{y^3}\right)$     57.  $\ln\left(\frac{x^3}{y^{1/3}}\right)$  or  $\ln\left(\frac{x^3}{\sqrt[3]{y}}\right)$     58.  $\ln\left(\frac{x^2}{y^{1/2}}\right)$  or  $\ln\left(\frac{x^2}{\sqrt{y}}\right)$     59.  $\ln\frac{(x + 6)^4}{x^3}$

60.  $\ln\frac{(x + 9)^8}{x^4}$     61.  $\ln\left(\frac{x^3y^5}{z^6}\right)$     62.  $\ln\left(\frac{x^4y^7}{z^3}\right)$     65.  $\log_5\left(\frac{\sqrt{xy}}{(x + 1)^2}\right)$     66.  $\log_4\left((x + 1)^2\sqrt[3]{\frac{x}{y}}\right)$     67.  $\ln\sqrt[3]{\frac{(x + 5)^2}{x(x^2 - 4)}}$

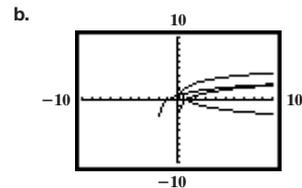

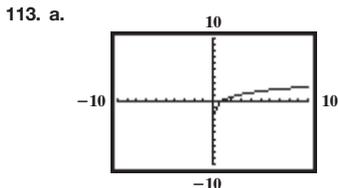

68.  $\ln\sqrt[3]{\frac{(x + 6)^5}{x(x^2 - 25)}}$     69.  $\log\frac{x(x^2 - 1)}{7(x + 1)} = \log\frac{x(x - 1)}{7}$     70.  $\log\frac{x(x^2 - 4)}{15(x + 2)} = \log\frac{x(x - 2)}{15}$

87.  $\frac{1}{2}A - \frac{3}{2}C$     88.  $\frac{1}{2}C - 2A$     90. false;  $\ln 0$  is undefined.    91. false;  $\log_4(2x)^3 = 3 \log_4(2x)$     94. false;  $\ln(x \cdot 1) = \ln x + \ln 1$

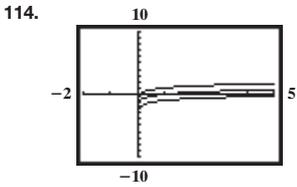

95. true    96. false;  $\ln x + \ln(2x) = \ln(2x^2)$     97. false;  $\log(x + 3) - \log(2x) = \log\left(\frac{x + 3}{2x}\right)$     98. false;  $\log\left(\frac{x + 2}{x - 1}\right) = \log(x + 2) - \log(x - 1)$

102. false;  $e^x = \ln e^{e^x}$

$y = 2 + \log_3 x$  shifts the graph of  $y = \log_3 x$  two units upward;  
 $y = \log_3(x + 2)$  shifts the graph of  $y = \log_3 x$  two units left;  $y = -\log_3 x$  reflects the graph of  $y = \log_3 x$  about the  $x$ -axis.

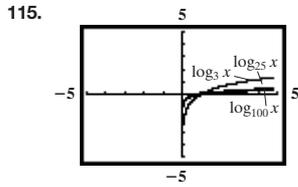

$y = \log(10x) = 1 + \log x$   
 shifts  $y = \log x$  one unit upward;  
 $y = \log(0.1x) = -1 + \log x$   
 shifts  $y = \log x$  one unit downward;  
 the product rule

132. 
$$\frac{f(x+h) - f(x)}{h} = \frac{\log_b(x+h) - \log_b x}{h}$$

$$= \frac{\log_b\left(\frac{x+h}{x}\right)}{h}$$

$$= \frac{1}{h} \log_b\left(1 + \frac{h}{x}\right)$$

$$= \log_b\left(1 + \frac{h}{x}\right)^{\frac{1}{h}}$$

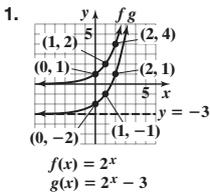

121. makes sense    123. makes sense    129.  $\log e = \log_{10} e = \frac{\ln e}{\ln 10} = \frac{1}{\ln 10}$     130.  $\frac{2A}{B}$

133. Let  $\log_b M = R$  and  $\log_b N = S$ .  
 Then  $\log_b M = R$  means  $b^R = M$  and  $\log_b N = S$  means  $b^S = N$ .  

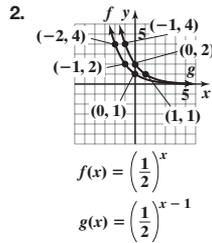

$$\frac{M}{N} = \frac{b^R}{b^S} = b^{R-S}$$

$$\log_b \frac{M}{N} = \log_b b^{R-S} = R - S = \log_b M - \log_b N$$

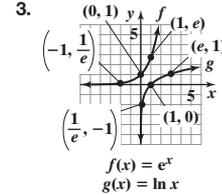

**Mid-Chapter 3 Check Point**

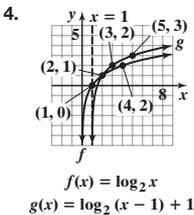

asymptote of  $f$ :  $y = 0$   
 asymptote of  $g$ :  $y = -3$   
 domain of  $f$  = domain of  $g = (-\infty, \infty)$   
 range of  $f = (0, \infty)$ ; range of  $g = (-3, \infty)$

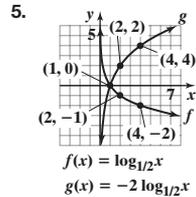

asymptote of  $f$ :  $y = 0$   
 asymptote of  $g$ :  $y = 0$   
 domain of  $f$  = domain of  $g = (-\infty, \infty)$   
 range of  $f$  = range of  $g = (0, \infty)$

asymptote of  $f$ :  $y = 0$   
 asymptote of  $g$ :  $x = 0$   
 domain of  $f$  = range of  $g = (-\infty, \infty)$   
 range of  $f$  = domain of  $g = (0, \infty)$

asymptote of  $f$ :  $x = 0$   
 asymptote of  $g$ :  $x = 1$   
 domain of  $f = (0, \infty)$ ; domain of  $g = (1, \infty)$   
 range of  $f$  = range of  $g = (-\infty, \infty)$

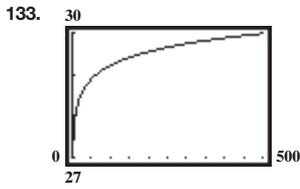

asymptote of  $f$ :  $x = 0$   
 asymptote of  $g$ :  $x = 0$   
 domain of  $f$  = domain of  $g = (0, \infty)$   
 range of  $f$  = range of  $g = (-\infty, \infty)$

8.  $(-\infty, -6) \cup (-6, \infty)$     14. 2  
 15. Evaluation not possible;  $\log_2 \frac{1}{8} = -3$  and  $\log_3(-3)$  is undefined.

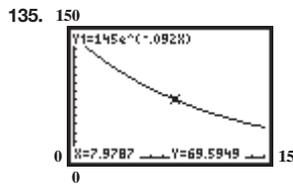

**Exercise Set 3.4**

23.  $\left\{\frac{\ln 3.91}{\ln 10}\right\}; \approx 0.59$     24.  $\left\{\frac{\ln 8.07}{\ln 10}\right\}; \approx 0.91$     27.  $\left\{\frac{\ln 17}{\ln 5}\right\}; \approx 1.76$     28.  $\left\{\frac{\ln 143}{\ln 19}\right\}; \approx 1.69$     31.  $\left\{\frac{\ln 659}{5}\right\}; \approx 1.30$   
 32.  $\left\{\frac{\ln 2568.25}{7}\right\}; \approx 1.12$     33.  $\left\{\frac{\ln 793 - 1}{-5}\right\}; \approx -1.14$     34.  $\left\{\frac{\ln 7957 - 1}{-8}\right\}; \approx -1.00$     35.  $\left\{\frac{\ln 10,478 + 3}{5}\right\}; \approx 2.45$   
 36.  $\left\{\frac{\ln 11,250 + 5}{4}\right\}; \approx 3.58$     37.  $\left\{\frac{\ln 410}{\ln 7} - 2\right\}; \approx 1.09$     38.  $\left\{\frac{\ln 137}{\ln 5} + 3\right\}; \approx 6.06$     39.  $\left\{\frac{\ln 813}{0.3 \ln 7}\right\}; \approx 11.48$   
 40.  $\left\{\frac{7 \ln 0.2}{\ln 3}\right\}; \approx -10.25$     41.  $\left\{\frac{3 \ln 5 + \ln 3}{\ln 3 - 2 \ln 5}\right\}; \approx -2.80$     42.  $\left\{\frac{2 \ln 3 - \ln 7}{2 \ln 7 - \ln 3}\right\}; \approx 0.09$     43.  $\{0, \ln 2\}; \ln 2 \approx 0.69$     44.  $\{\ln 3\}; \approx 1.10$

about 20 years old

Section 3.5

Check Point Exercises

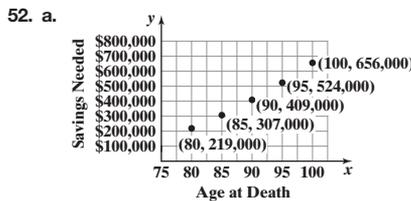

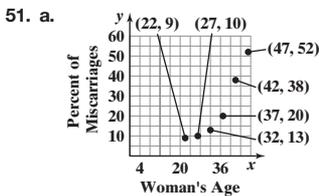

Exercise Set 3.5

15. approximately 8 grams    17. 8 grams after 10 seconds; 4 grams after 20 seconds; 2 grams after 30 seconds; 1 gram after 40 seconds; 0.5 gram after 50 seconds    18. 8 grams after 25,000 years; 4 grams after 50,000 years; 2 grams after 75,000 years; 1 gram after 100,000 years; 0.5 gram after 125,000 years

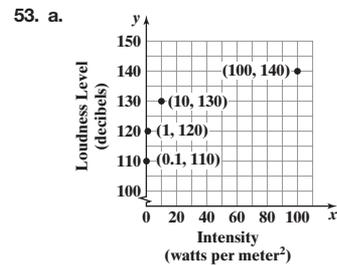

27. a.  $\frac{1}{2} = e^{1.31k}$  yields  $k = \frac{\ln(\frac{1}{2})}{1.31} \approx -0.52912$ .    32. about 39 years after the year when the population was 1400

33.  $2A_0 = A_0e^{kt}$ ,  $2 = e^{kt}$ ,  $\ln 2 = \ln e^{kt}$ ,  $\ln 2 = kt$ ,  $\frac{\ln 2}{k} = t$     34.  $3A_0 = A_0e^{kt}$ ,  $3 = e^{kt}$ ,  $\ln 3 = \ln e^{kt}$ ,  $\ln 3 = kt$ ,  $\frac{\ln 3}{k} = t$

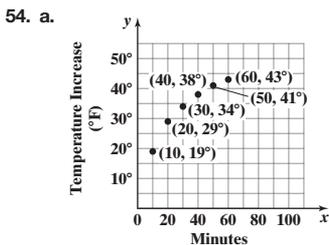

36. b. about 58 yr    38. quite well    39. quite well    47. a.  $T = 45 + 25e^{-0.0916t}$     b. 51°F    48. a.  $T = 70 + 380e^{-0.1004t}$     b. 121°F

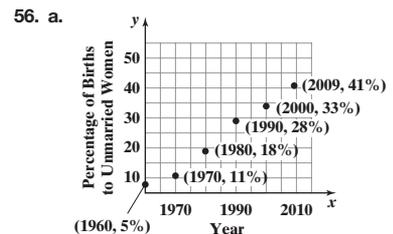

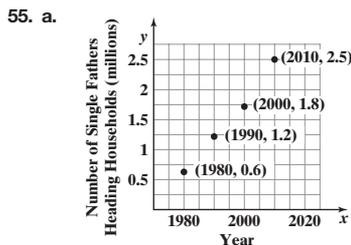

b. exponential function

b. logarithmic function

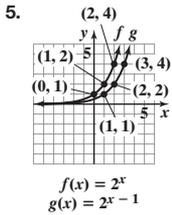

b. logarithmic function

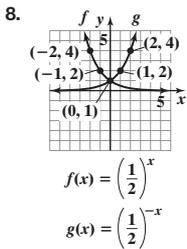

57.  $y = 100e^{(\ln 4.6)x}$ ;  $y = 100e^{1.526x}$     58.  $y = 1000e^{(\ln 7.3)x}$ ;  $y = 1000e^{1.988x}$     59.  $y = 2.5e^{(\ln 0.7)x}$ ;  $y = 2.5e^{-0.357x}$     60.  $y = 4.5e^{(\ln 0.6)x}$ ;  $y = 4.5e^{-0.511x}$   
 70.  $a \approx 0.999$ ; Since  $r$  is close to 1, the model fits the data well.    71.  $r \approx 0.870$ ; Fit is ok, but not great.  
 74.  $y = 201.2(1.011)^x$ ;  $y = 2.657x + 197.923$ ; using exponential; by 2016; using linear: by 2021; Answers will vary.  
 75.  $b. y = 3.46e^{(\ln 1.02)x}$ ;  $y = 3.46e^{0.02x}$ ; by approximately 2%    76. Models will vary. Examples are given. Predictions will vary. For Exercise 47:  $y = 1.402(1.078)^x$ ; For Exercise 48:  $y = 2896.7(1.056)^x$ ; For Exercise 49:  $y = 120 + 4.343 \ln x$ ; For Exercise 50:  $y = -11.629 + 13.424 \ln x$ ; For Exercise 51:  $y = 0.063x - 124.16$ ; For Exercise 52:  $y = 0.742x - 1449.669$   
 77. does not make sense    79. makes sense

Chapter 3 Review Exercises

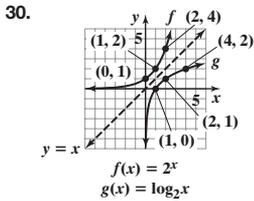

1.  $g(x) = 4^{-x}$     2.  $h(x) = -4^{-x}$     3.  $r(x) = -4^{-x} + 3$     4.  $f(x) = 4^x$

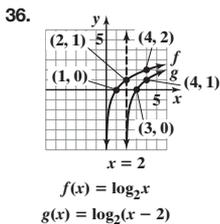

asymptote of  $f$ :  $y = 0$   
 asymptote of  $g$ :  $y = 0$   
 domain of  $f =$  domain of  $g = (-\infty, \infty)$   
 range of  $f =$  range of  $g = (0, \infty)$

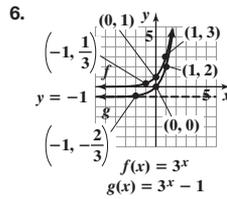

asymptote of  $f$ :  $y = 0$   
 asymptote of  $g$ :  $y = 0$   
 domain of  $f =$  domain of  $g = (-\infty, \infty)$   
 range of  $f =$  range of  $g = (0, \infty)$

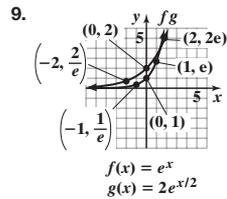

domain of  $f =$  range of  $g = (-\infty, \infty)$   
 range of  $f =$  domain of  $g = (0, \infty)$

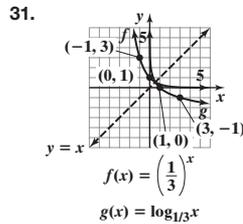

$x$ -intercept:  $(3, 0)$   
 vertical asymptote:  $x = 2$   
 domain:  $(2, \infty)$ ; range:  $(-\infty, \infty)$

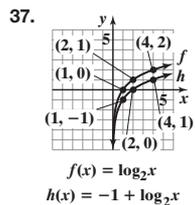

asymptote of  $f$ :  $y = 0$   
 asymptote of  $g$ :  $y = -1$   
 domain of  $f =$  domain of  $g = (-\infty, \infty)$   
 range of  $f = (0, \infty)$ ; range of  $g = (-1, \infty)$

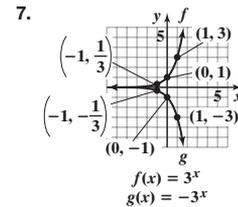

asymptote of  $f$ :  $y = 0$   
 asymptote of  $g$ :  $y = 0$   
 domain of  $f =$  domain of  $g = (-\infty, \infty)$   
 range of  $f =$  range of  $g = (0, \infty)$

domain of  $f =$  range of  $g = (-\infty, \infty)$   
 range of  $f =$  domain of  $g = (0, \infty)$

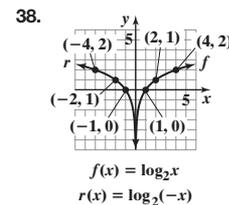

$x$ -intercept:  $(2, 0)$   
 vertical asymptote:  $x = 0$   
 domain:  $(0, \infty)$ ; range:  $(-\infty, \infty)$

asymptote of  $f$ :  $y = 0$   
 asymptote of  $g$ :  $y = 0$   
 domain of  $f =$  domain of  $g = (-\infty, \infty)$   
 range of  $f = (0, \infty)$ ; range of  $g = (-\infty, 0)$

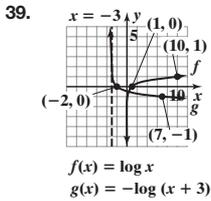

13.  $49^{1/2} = 7$     14.  $4^3 = x$     15.  $3^y = 81$   
 16.  $\log_6 216 = 3$     17.  $\log_b 625 = 4$   
 18.  $\log_{13} 874 = y$   
 21. undefined;  $\log_b x$  is defined only for  $x > 0$ .

32.  $g(x) = \log(-x)$   
 33.  $r(x) = 1 + \log(2 - x)$   
 34.  $h(x) = \log(2 - x)$   
 35.  $f(x) = \log x$

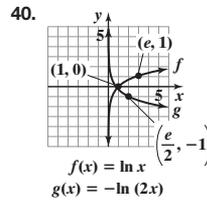

$x$ -intercept:  $(-1, 0)$   
 vertical asymptote:  $x = 0$   
 domain:  $(-\infty, 0)$ ; range:  $(-\infty, \infty)$

Cumulative Review Exercises (Chapters P-3)

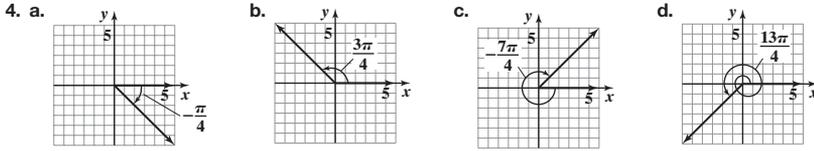

15. using (1, 3),  $y - 3 = -3(x - 1)$ ;  $y = -3x + 6$

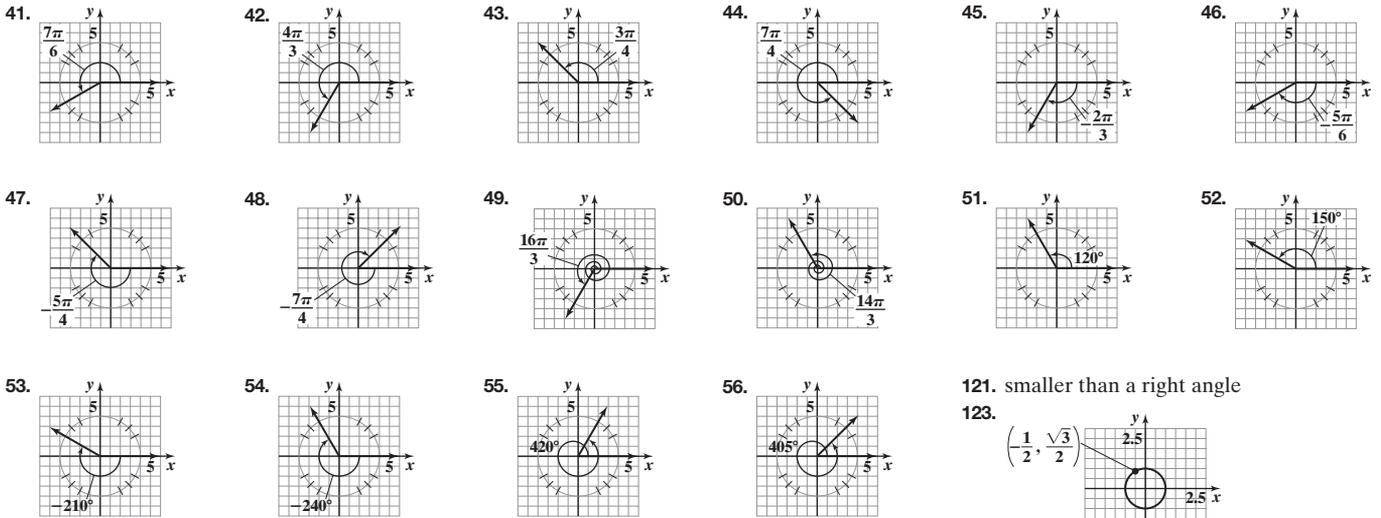

CHAPTER 4

Section 4.1

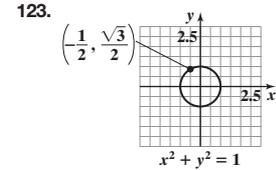

Check Point Exercises

Exercise Set 4.1

121. smaller than a right angle

Exercise Set 4.2

25.  $\tan t = \frac{8}{15}$ ;  $\csc t = \frac{17}{8}$ ;  $\sec t = \frac{17}{15}$ ;  $\cot t = \frac{15}{8}$     26.  $\tan t = \frac{3}{4}$ ;  $\csc t = \frac{5}{3}$ ;  $\sec t = \frac{5}{4}$ ;  $\cot t = \frac{4}{3}$     27.  $\tan t = \frac{\sqrt{2}}{4}$ ;  $\csc t = 3$ ;  $\sec t = \frac{3\sqrt{2}}{4}$ ;  $\cot t = 2\sqrt{2}$   
 28.  $\tan t = \frac{2\sqrt{5}}{5}$ ;  $\csc t = \frac{3}{2}$ ;  $\sec t = \frac{3\sqrt{5}}{5}$ ;  $\cot t = \frac{\sqrt{5}}{2}$     83. a. 1; 0; -1; 0; 1    b. 28 days    84. a. 10 ft; 14 ft; 10 ft; 10 ft; 10 ft; 6 ft  
 b. low tide: 3 A.M., 3 P.M., high tide: 9 A.M., 9 P.M.    c. 12 hr; Low tides occur every 12 hours and high tides occur every 12 hours.  
 98. does not make sense    99. does not make sense

Exercise Set 4.3

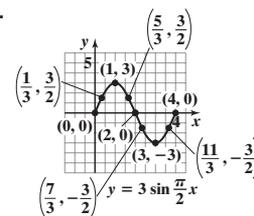

1. 15;  $\sin \theta = \frac{3}{5}$ ;  $\cos \theta = \frac{4}{5}$ ;  $\tan \theta = \frac{3}{4}$ ;  $\csc \theta = \frac{5}{3}$ ;  $\sec \theta = \frac{5}{4}$ ;  $\cot \theta = \frac{4}{3}$     2. 10;  $\sin \theta = \frac{3}{5}$ ;  $\cos \theta = \frac{4}{5}$ ;  $\tan \theta = \frac{3}{4}$ ;  $\csc \theta = \frac{5}{3}$ ;  $\sec \theta = \frac{5}{4}$ ;  $\cot \theta = \frac{4}{3}$   
 3. 20;  $\sin \theta = \frac{20}{29}$ ;  $\cos \theta = \frac{21}{29}$ ;  $\tan \theta = \frac{20}{21}$ ;  $\csc \theta = \frac{29}{20}$ ;  $\sec \theta = \frac{29}{21}$ ;  $\cot \theta = \frac{21}{20}$     4. 8;  $\sin \theta = \frac{8}{17}$ ;  $\cos \theta = \frac{15}{17}$ ;  $\tan \theta = \frac{8}{15}$ ;  $\csc \theta = \frac{17}{8}$ ;  
 $\sec \theta = \frac{17}{15}$ ;  $\cot \theta = \frac{15}{8}$     68. 0.3894; 0.9736; 0.2955, 0.9851; 0.1987, 0.9933; 0.0998, 0.9983; 0.0099998, 0.99998; 9.999998  $\times 10^{-4}$ , 0.9999998;  
 9.99999998  $\times 10^{-5}$ , 0.999999998;  $1 \times 10^{-5}$ , 0.9999999998;  $\frac{\sin \theta}{\theta}$  approaches 1 as  $\theta$  approaches 0.    69. 0.92106, -0.19735; 0.95534, -0.148878;  
 0.98007, -0.099667; 0.99500, -0.04996; 0.99995, -0.005; 0.9999995, -0.0005; 0.999999995, -0.00005;  $\frac{\cos \theta - 1}{\theta}$  approaches  
 0 as  $\theta$  approaches 0.    75. true    76. false    78. In a right triangle, the hypotenuse is greater than either other side. Therefore, both  
 $\frac{\text{opposite}}{\text{hypotenuse}}$  and  $\frac{\text{adjacent}}{\text{hypotenuse}}$  must be less than 1 for an acute angle in a right triangle.    79. As  $\theta$  approaches  $90^\circ$ ,  $\tan \theta$  increases without bound.  
 At  $90^\circ$ ,  $\tan \theta$  is undefined.

Exercise Set 4.4

1.  $\sin \theta = \frac{3}{5}$ ;  $\cos \theta = -\frac{4}{5}$ ;  $\tan \theta = -\frac{3}{4}$ ;  $\csc \theta = \frac{5}{3}$ ;  $\sec \theta = -\frac{5}{4}$ ;  $\cot \theta = -\frac{4}{3}$     2.  $\sin \theta = \frac{5}{13}$ ;  $\cos \theta = -\frac{12}{13}$ ;  $\tan \theta = -\frac{5}{12}$ ;  $\csc \theta = \frac{13}{5}$ ;  
 $\sec \theta = -\frac{13}{12}$ ;  $\cot \theta = -\frac{12}{5}$     3.  $\sin \theta = \frac{3\sqrt{13}}{13}$ ;  $\cos \theta = \frac{2\sqrt{13}}{13}$ ;  $\tan \theta = \frac{3}{2}$ ;  $\csc \theta = \frac{\sqrt{13}}{3}$ ;  $\sec \theta = \frac{\sqrt{13}}{2}$ ;  $\cot \theta = \frac{2}{3}$     4.  $\sin \theta = \frac{7\sqrt{58}}{58}$ ;

80. February 11

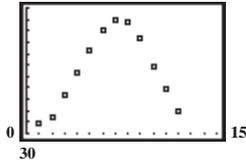

The graphs appear to be the same from  $-\frac{\pi}{2}$  to  $\frac{\pi}{2}$ .

The graph is similar to  $y = \sin x$ , except the amplitude is greater and the curve is less smooth.

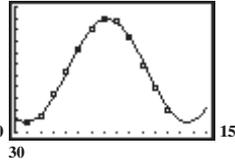

The graph is very similar to  $y = \sin x$ , except the curve is less smooth.

## CHAPTER 5

### Section 5.1

#### Check Point Exercises

1.  $\csc x \tan x = \frac{1}{\sin x} \cdot \frac{\sin x}{\cos x} = \frac{1}{\cos x} = \sec x$

2.  $\cos x \cot x + \sin x = \cos x \cdot \frac{\cos x}{\sin x} + \sin x = \frac{\cos^2 x}{\sin x} + \sin x = \frac{\cos^2 x + \sin^2 x}{\sin x} = \frac{1}{\sin x} = \csc x$

3.  $\sin x - \sin x \cos^2 x = \sin x(1 - \cos^2 x) = \sin x \cdot \sin^2 x = \sin^3 x$     4.  $\frac{1 + \cos \theta}{\sin \theta} = \frac{1}{\sin \theta} + \frac{\cos \theta}{\sin \theta} = \csc \theta + \cot \theta$

5.  $\frac{\sin x}{1 + \cos x} + \frac{1 + \cos x}{\sin x} = \frac{\sin x(\sin x)}{(1 + \cos x)(\sin x)} + \frac{(1 + \cos x)(1 + \cos x)}{(\sin x)(1 + \cos x)} = \frac{\sin^2 x + 1 + 2 \cos x + \cos^2 x}{(1 + \cos x)(\sin x)}$   
 $= \frac{\sin^2 x + \cos^2 x + 1 + 2 \cos x}{(1 + \cos x)(\sin x)} = \frac{1 + 1 + 2 \cos x}{(1 + \cos x)(\sin x)} = \frac{2 + 2 \cos x}{(1 + \cos x)(\sin x)} = \frac{2(1 + \cos x)}{(1 + \cos x)(\sin x)} = \frac{2}{\sin x} = 2 \csc x$

6.  $\frac{\cos x}{1 + \sin x} = \frac{\cos x(1 - \sin x)}{(1 + \sin x)(1 - \sin x)} = \frac{\cos x(1 - \sin x)}{1 - \sin^2 x} = \frac{\cos x(1 - \sin x)}{\cos^2 x} = \frac{1 - \sin x}{\cos x}$

7.  $\frac{\sec x + \csc(-x)}{\sec x \csc x} = \frac{\sec x - \csc x}{\sec x \csc x} = \frac{\frac{1}{\cos x} - \frac{1}{\sin x}}{\frac{1}{\cos x} \cdot \frac{1}{\sin x}} = \frac{\frac{\sin x - \cos x}{\cos x \cdot \sin x}}{\frac{1}{\cos x \cdot \sin x}} = \frac{\sin x - \cos x}{\cos x \cdot \sin x} \cdot \frac{\cos x \cdot \sin x}{1} = \sin x - \cos x$

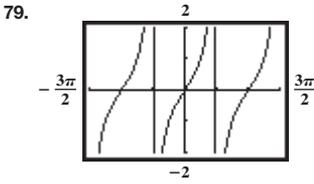

8. Left side:  $\frac{1}{1 + \sin \theta} + \frac{1}{1 - \sin \theta} = \frac{1(1 - \sin \theta)}{(1 + \sin \theta)(1 - \sin \theta)} + \frac{1(1 + \sin \theta)}{(1 - \sin \theta)(1 + \sin \theta)} = \frac{1 - \sin \theta + 1 + \sin \theta}{(1 + \sin \theta)(1 - \sin \theta)} = \frac{2}{1 - \sin^2 \theta}$

Right side:  $2 + 2 \tan^2 \theta = 2 + 2 \left( \frac{\sin^2 \theta}{\cos^2 \theta} \right) = \frac{2 \cos^2 \theta}{\cos^2 \theta} + \frac{2 \sin^2 \theta}{\cos^2 \theta} = \frac{2 \cos^2 \theta + 2 \sin^2 \theta}{\cos^2 \theta} = \frac{2(\cos^2 \theta + \sin^2 \theta)}{\cos^2 \theta} = \frac{2}{\cos^2 \theta} = \frac{2}{1 - \sin^2 \theta}$

AA70 Answers to Selected Exercises

The graph of  $r_2$  is the graph of  $r_1$  rotated  $\frac{\pi}{4}$  or  $45^\circ$ .

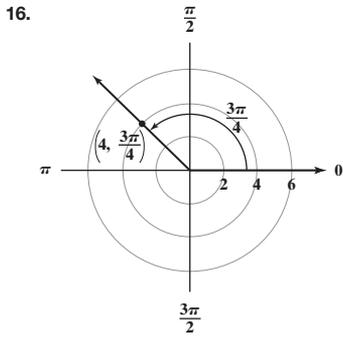

The graph of  $r_2$  is the graph of  $r_1$  rotated  $-\frac{\pi}{6}$  or  $-30^\circ$ .

83. If  $n$  is odd, there are  $n$  loops and  $\theta_{\max} = \pi$  traces the graph once; while if  $n$  is even, there are  $2n$  loops and  $\theta_{\max} = 2\pi$  traces the graph once. In each separate case, as  $n$  increases,  $\sin n\theta$  increases its number of loops.

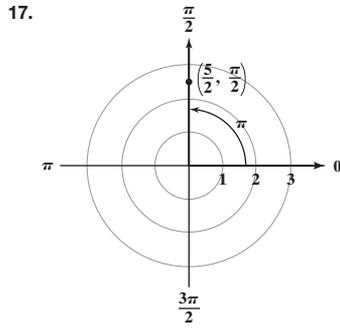

85. There are  $n$  small petals and  $n$  large petals for each value of  $n$ . For odd values of  $n$ , the small petals are inside the large petals. For even  $n$ , they are between the large petals.

Mid-Chapter 6 Check Point

- $C = 107^\circ, b \approx 24.8, c \approx 36.1$
- $B \approx 37^\circ, C \approx 101^\circ, c \approx 92.4$
- no triangle
- $A \approx 26^\circ, C \approx 44^\circ, b \approx 21.6$
- Two triangles:  $A_1 \approx 55^\circ, B_1 \approx 83^\circ, b_1 \approx 19.3; A_2 \approx 125^\circ, B_2 \approx 13^\circ, b_2 \approx 4.4$
- $A \approx 28^\circ, B \approx 42^\circ, C \approx 110^\circ$

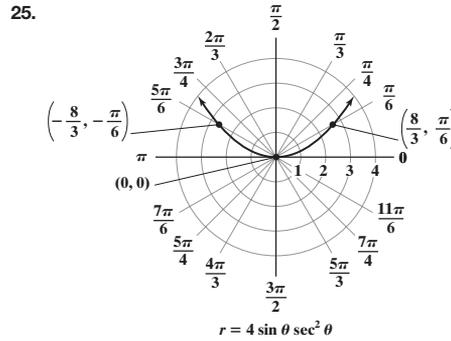

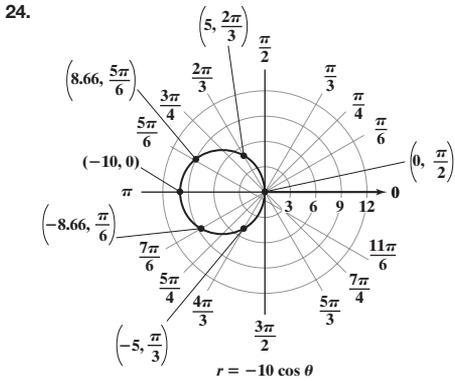

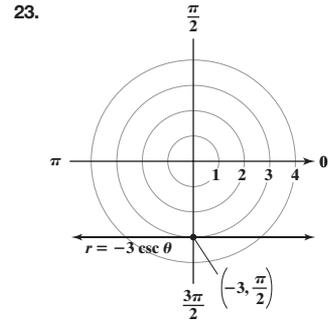

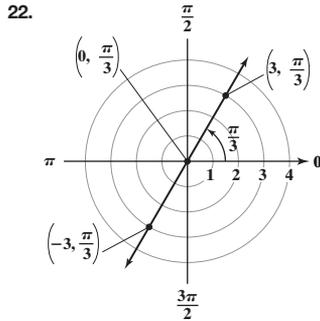

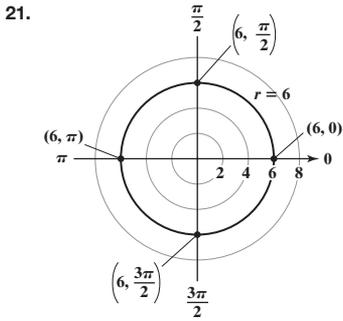

- a.  $(4, \frac{11\pi}{4})$     b.  $(-4, \frac{7\pi}{4})$   
 c.  $(4, -\frac{5\pi}{4})$

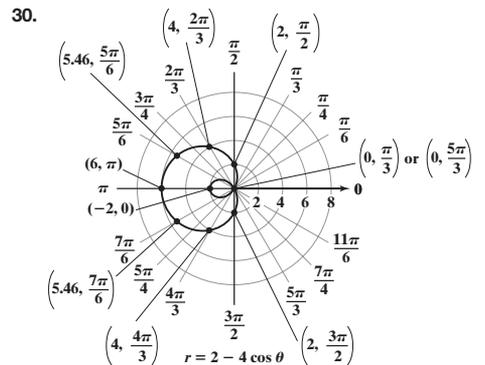

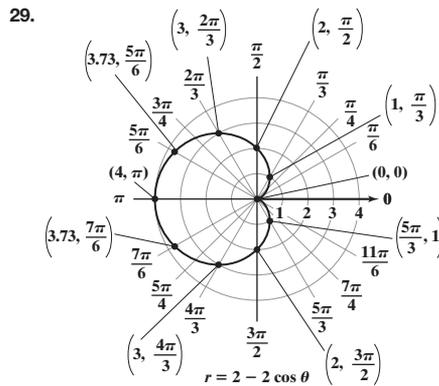

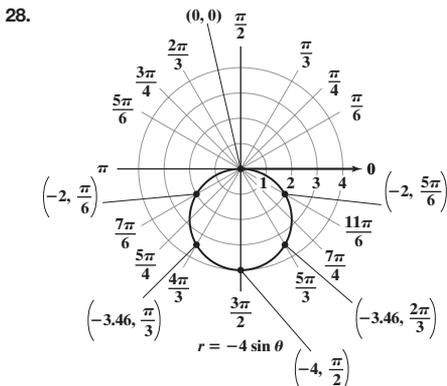

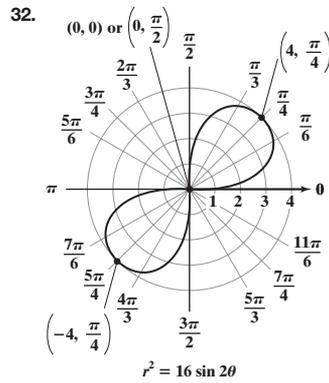

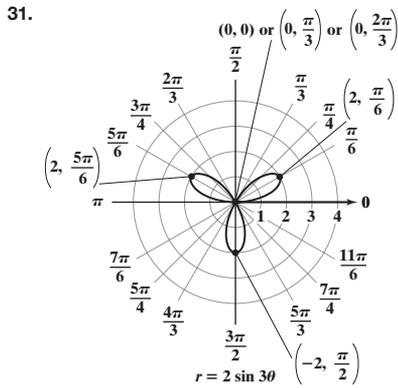

- a.  $(\frac{5}{2}, \frac{5\pi}{2})$     b.  $(-\frac{5}{2}, \frac{3\pi}{2})$   
 c.  $(\frac{5}{2}, -\frac{3\pi}{2})$

18.  $r = \frac{7}{5 \cos \theta - \sin \theta}$

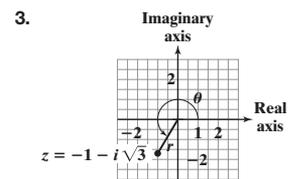

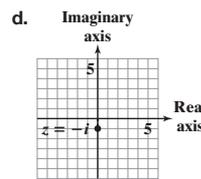

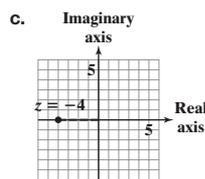

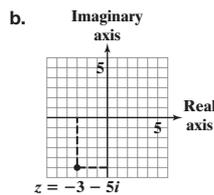

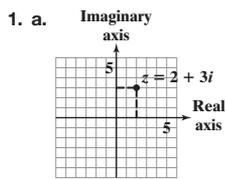

26. a. Has symmetry with respect to the polar axis.    b. May or may not have symmetry with respect to the line  $\theta = \frac{\pi}{2}$ .    c. May or may not have symmetry with respect to the pole.  
 27. a. Has symmetry with respect to the polar axis.    b. Has symmetry with respect to the line  $\theta = \frac{\pi}{2}$ .  
 c. Has symmetry with respect to the pole.

 49. a. has symmetry    b. has symmetry    c. has symmetry

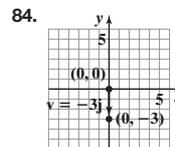

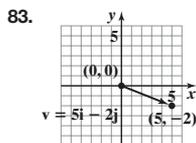

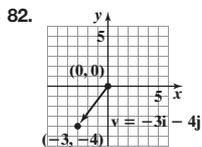

- 61.  $z = 4 + 4\sqrt{3}i$
- 62.  $z = -2\sqrt{3} - 2i$
- 63.  $z = -3 + 3\sqrt{3}i$
- 64.  $z \approx -0.1 + 0.6i$

- 76.  $7(\cos 25^\circ + i \sin 25^\circ)$ ;  $7(\cos 205^\circ + i \sin 205^\circ)$
- 77.  $5(\cos 55^\circ + i \sin 55^\circ)$ ;  $5(\cos 175^\circ + i \sin 175^\circ)$ ;  $5(\cos 295^\circ + i \sin 295^\circ)$

- 78.  $\sqrt{3} + i$ ;  $-1 + i\sqrt{3}$ ;  $-\sqrt{3} - i$ ;  $1 - i\sqrt{3}$
- 81.  $\frac{\sqrt[10]{2}}{2} + \frac{\sqrt[10]{2}}{2}i$ ;  $\approx -0.49 + 0.95i$ ;  $\approx -1.06 - 0.17i$ ;  $\approx -0.17 - 1.06i$ ;  $\approx 0.95 - 0.49i$

AA78 Answers to Selected Exercises

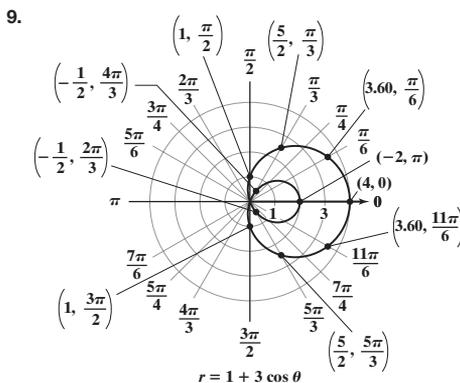

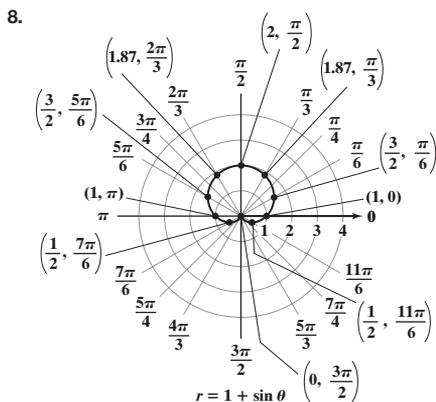

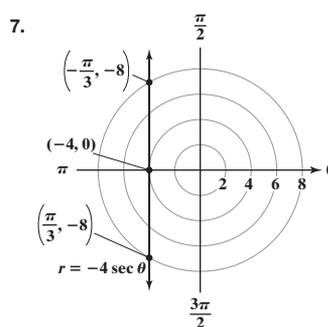

102.  $v_1 = \text{proj}_w v = \frac{50}{41}i + \frac{40}{41}j; v_2 = -\frac{132}{41}i + \frac{165}{41}j$

103.  $v_1 = \text{proj}_w v = -\frac{3}{2}i + \frac{1}{2}j; v_2 = \frac{1}{2}i + \frac{3}{2}j$

Chapter 6 Test

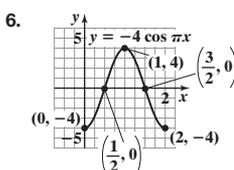

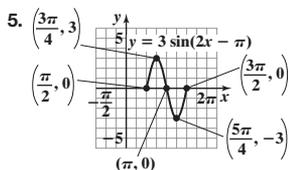

4. : Ordered pairs may vary.

10.  $2(\cos 150^\circ + i \sin 150^\circ)$  or  $2\left(\cos \frac{5\pi}{6} + i \sin \frac{5\pi}{6}\right)$

21. 323 pounds;  $3.4^\circ$

Cumulative Review Exercises (Chapters P-6)

7.  $\sin \theta \csc \theta - \cos^2 \theta = \sin \theta \left(\frac{1}{\sin \theta}\right) - \cos^2 \theta$   
 $= 1 - \cos^2 \theta = \sin^2 \theta$

8.  $\cos\left(\theta + \frac{3\pi}{2}\right) = \cos \theta \cos \frac{3\pi}{2} - \sin \theta \sin \frac{3\pi}{2}$   
 $= \cos \theta(0) - \sin \theta(-1) = \sin \theta$

16.  $\frac{\sqrt{\sqrt{2} + 2}}{2}$

17. a.  $5i + 23j$     b.  $-12$

**CHAPTER 7**

**Exercise Set 7.1**

33.  $\{(x, y) | y = 3x - 5\}$     34.  $\{(x, y) | y = 3x - 4\}$     37.  $\{(x, y) | x + 3y = 2\}$     38.  $\{(x, y) | 2x - y = 1\}$     43.  $x + y = 7; x - y = -1; 3$  and  $4$   
 44.  $x + y = 2; x - y = 8; 5$  and  $-3$     46.  $3x + 2y = 8; 2x - y = 3; 2$  and  $1$     53.  $y = x - 4; y = -\frac{1}{3}x + 4$     54.  $y = \frac{1}{3}x + 2, y = \frac{1}{3}x - 2$   
 55. California: 100 gal; French: 100 gal    57. 18-karat gold: 96 g; 12-karat gold: 204 g    69.  $-6000$ ; When the company produces and sells 200 radios, the loss is \$6000.    70.  $-4000$ ; When the company produces and sells 300 radios, the loss is \$4000.    73. a.  $C(x) = 18,000 + 20x$     b.  $R(x) = 80x$   
 c.  $(300, 24,000)$ ; When 300 canoes are produced and sold, both revenue and cost are \$24,000.    74. a.  $C(x) = 100,000 + 100x$     b.  $R(x) = 300x$   
 c.  $(500, 150,000)$ ; When 500 bicycles are produced and sold, both cost and revenue are \$150,000.    75. a.  $C(x) = 30,000 + 2500x$     b.  $R(x) = 3125x$   
 c.  $(48, 150,000)$ ; For 48 sold-out performances, both cost and revenue are \$150,000.    76. a.  $C(x) = 30,000 + 0.02x$     b.  $R(x) = 0.5x$   
 c.  $(62,500, 31,250)$ ; For 62,500 cards, both cost and revenue are \$31,250.    77. a. 4 million workers; \$4.50 per hour    81. a.  $y = 0.45x + 0.8$   
 c. week 6; 3.5 symptoms; by the intersection point  $(6, 3.5)$     85. Mr. Goodbar: 264 cal; Mounds: 258 cal    87. 3 Mr. Goodbars and 2 Mounds bars  
 106. does not make sense    109.  $y = \frac{a_1c_2 - a_2c_1}{a_1b_2 - a_2b_1}; x = \frac{b_2c_1 - b_1c_2}{a_1b_2 - a_2b_1}$

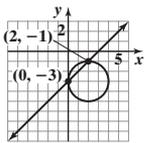

**Exercise Set 7.2**

19.  $y = 2x^2 - x + 3$     20.  $y = 2x^2 - x - 3$     21.  $y = 2x^2 + x - 5$     22.  $y = x^2 - 6x + 8$     29.  $\left\{\left(\frac{8}{a}, -\frac{3}{b}, -\frac{5}{c}\right)\right\}$   
 30.  $\left\{\left(-\frac{9}{a}, \frac{5}{b}, \frac{5}{c}\right)\right\}$     31. b.  $y = 0$  when  $x = 5$ ; The ball hits the ground after 5 seconds.    32. b. 156; When a car is in motion for 6 seconds after the brakes are applied, it travels 156 feet.    49. does not make sense    51. makes sense

**Exercise Set 7.3**

1.  $\frac{A}{x-2} + \frac{B}{x-1}$     2.  $\frac{A}{x-1} + \frac{B}{x+3}$     3.  $\frac{A}{x+2} + \frac{B}{x-3} + \frac{C}{(x-3)^2}$     4.  $\frac{A}{x+1} + \frac{B}{x-2} + \frac{C}{(x-2)^2}$     5.  $\frac{A}{x-1} + \frac{Bx+C}{x^2+1}$   
 6.  $\frac{A}{x-4} + \frac{Bx+C}{x^2+5}$     8.  $\frac{Ax+B}{x^2+7} + \frac{Cx+D}{(x^2+7)^2}$     9.  $\frac{3}{x-3} - \frac{2}{x-2}$     11.  $\frac{7}{x-9} - \frac{4}{x+2}$     12.  $\frac{3}{x-2} + \frac{2}{x+1}$     13.  $\frac{24}{7(x-4)} + \frac{25}{7(x+3)}$   
 14.  $\frac{6}{x-3} + \frac{3}{x+5}$     15.  $\frac{4}{7(x-3)} - \frac{8}{7(2x+1)}$     16.  $\frac{3}{4(x+3)} + \frac{1}{4(x-1)}$     17.  $\frac{3}{x} + \frac{2}{x-1} - \frac{1}{x+3}$     18.  $\frac{3}{x} - \frac{1}{x+1} + \frac{2}{x-5}$   
 19.  $\frac{3}{x} + \frac{4}{x+1} - \frac{3}{x-1}$     20.  $\frac{3}{x} - \frac{5}{x-2} + \frac{4}{x+2}$     23.  $\frac{1}{x-2} - \frac{2}{(x-2)^2} - \frac{5}{(x-2)^3}$     24.  $\frac{2}{x+1} + \frac{4}{(x+1)^2} - \frac{3}{(x+1)^3}$   
 25.  $\frac{7}{x} - \frac{6}{x-1} + \frac{10}{(x-1)^2}$     26.  $\frac{1}{x} + \frac{2}{x+7} - \frac{28}{(x+7)^2}$     27.  $\frac{1}{4(x+1)} + \frac{3}{4(x-1)} + \frac{1}{2(x-1)^2}$   
 28.  $-\frac{1}{4(x+1)} + \frac{1}{4(x-1)} + \frac{1}{4(x+1)^2} + \frac{1}{4(x-1)^2}$     29.  $\frac{3}{x-1} + \frac{2x-4}{x^2+1}$     30.  $\frac{3}{x-4} + \frac{2x-1}{x^2+5}$     31.  $\frac{2}{x+1} + \frac{3x-1}{x^2+2x+2}$   
 32.  $\frac{2}{x-2} - \frac{2x-1}{x^2+2x+2}$     33.  $\frac{1}{4x} + \frac{1}{x^2} - \frac{x+4}{4(x^2+4)}$     34.  $\frac{14}{3(x-1)} + \frac{4}{(x-1)^2} - \frac{14x-4}{3(x^2+2)}$     35.  $\frac{4}{x+1} + \frac{2x-3}{x^2+1}$     36.  $\frac{3}{x+2} - \frac{2}{x^2+4}$   
 37.  $\frac{x+1}{x^2+2} - \frac{2x}{(x^2+2)^2}$     38.  $\frac{1}{x^2+4} + \frac{2x-1}{(x^2+4)^2}$     39.  $\frac{x-2}{x^2-2x+3} + \frac{2x+1}{(x^2-2x+3)^2}$     40.  $\frac{3x}{x^2-2x+2} + \frac{x-2}{(x^2-2x+2)^2}$   
 41.  $\frac{3}{x-2} + \frac{x-1}{x^2+2x+4}$     42.  $-\frac{2}{3(x-1)} + \frac{2x+13}{3(x^2+x+1)}$     43.  $x^3 + x - \frac{1}{2(x+1)} + \frac{3}{2(x-1)}$   
 44.  $x^3 + 4x^2 + 12x + 32 + \frac{80}{x-2} + \frac{32}{(x-2)^2}$     45.  $x + 1 - \frac{2}{x} - \frac{2}{x^2} + \frac{2}{x-1}$     46.  $x^2 + 3x + 1 + \frac{5}{x-2} + \frac{3}{x+1}$     47.  $\frac{1}{x-c} - \frac{1}{x+c}$   
 48.  $\frac{ac+b}{2c} + \frac{ac-b}{2c}$     61. does not make sense    62. does not make sense

68.  $(0, -3)$  and  $(2, -1)$ ;  $0 - (-3) = 3$  and  $(0 - 2)^2 + (-3 + 3)^2 = 4$  are true;  
 $2 - (-1) = 3$  and  $(2 - 2)^2 + (-1 + 3)^2 = 4$  are true.

$(x - 2)^2 + (y + 3)^2 = 4$

**Exercise Set 7.4**

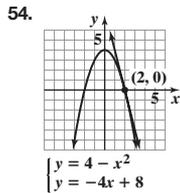

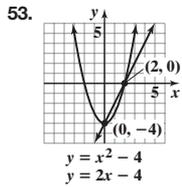

5.  $\{(4, -10), (-3, 11)\}$     13.  $\{(3, 1), (-3, -1), (1, 3), (-1, -3)\}$     19.  $\{(3, 2), (3, -2), (-3, 2), (-3, -2)\}$     21.  $\{(3, 2), (3, -2), (-3, 2), (-3, -2)\}$   
 22.  $\{(1, 2), (1, -2), (-1, 2), (-1, -2)\}$     23.  $\{(2, 1), (2, -1), (-2, 1), (-2, -1)\}$     24.  $\{(\sqrt{5}, \sqrt{2}), (-\sqrt{5}, \sqrt{2}), (-\sqrt{5}, -\sqrt{2}), (\sqrt{5}, -\sqrt{2})\}$   
 26.  $\left\{\left(\frac{\sqrt{31}}{4}, \frac{7}{4}\right), \left(-\frac{\sqrt{31}}{4}, \frac{7}{4}\right)\right\}$     27.  $\{(0, 2), (0, -2), (-1, \sqrt{3}), (-1, -\sqrt{3})\}$     28.  $\{(0, -4), (2\sqrt{3}, 2), (-2\sqrt{3}, 2)\}$   
 29.  $\{(2, 1), (2, -1), (-2, 1), (-2, -1)\}$     30.  $\{(4, 0), (-3, \sqrt{7}), (-3, -\sqrt{7})\}$     31.  $\{(-2\sqrt{2}, -\sqrt{2}), (-1, -4), (1, 4), (2\sqrt{2}, \sqrt{2})\}$   
 32.  $\{(-2, -2), (2, 2), (4, 1), (-4, -1)\}$     34.  $\left\{(1, 1), \left(\frac{19}{29}, -\frac{11}{29}\right)\right\}$     39.  $\left\{(-4, 1), \left(-\frac{5}{2}, \frac{1}{4}\right)\right\}$     41.  $\left\{\left(\frac{12}{5}, -\frac{29}{5}\right), (-2, 3)\right\}$

## AA80 Answers to Selected Exercises

42.  $\{(-5, 0), (4, 3)\}$     45. 2 and 1, 2 and  $-1$ ,  $-2$  and 1, or  $-2$  and  $-1$     46. 3 and 2, 3 and  $-2$ ,  $-3$  and 2, or  $-3$  and  $-2$     47.  $\{(2, -1), (-2, 1)\}$

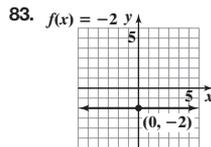

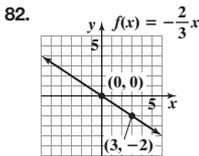

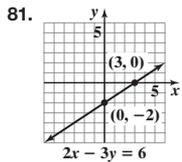

48.  $\{(-3, 2), (3, -2)\}$     49.  $\{(2, 20), (-2, 4), (-3, 0)\}$     50.  $\{(-5, 0), (-3, 18), (3, 72)\}$     51.  $\left\{\left(-1, -\frac{1}{2}\right), \left(-1, \frac{1}{2}\right), \left(1, -\frac{1}{2}\right), \left(1, \frac{1}{2}\right)\right\}$

52.  $\left\{\left(-1, -\frac{1}{3}\right), \left(-1, \frac{1}{3}\right), \left(1, -\frac{1}{3}\right), \left(1, \frac{1}{3}\right)\right\}$

63. a. between the 1940s and the 1960s  
 d. 1919; white collar: 27.5%; farmers: 27.4%;  
 fairly well, although answers may vary.

72. makes sense

## Mid-Chapter 7 Check Point

4.  $\{(x, y) | y = 4x - 5\}$  or  $\{(x, y) | 8x - 2y = 10\}$     7.  $\{(-1, 2, -2)\}$     8.  $\{(4, -2, 3)\}$     9.  $\left\{\left(-\frac{9}{5}, \frac{12}{5}\right), (3, 0)\right\}$

10.  $\{(-2, -1), (-2, 1), (2, -1), (2, 1)\}$     11.  $\{(-\sqrt{7}, 1), (-2, -2), (2, -2), (\sqrt{7}, 1)\}$     13.  $\frac{1}{x-2} - \frac{2}{(x-2)^2} - \frac{5}{(x-2)^3}$

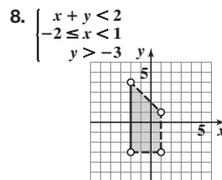

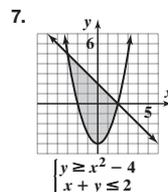

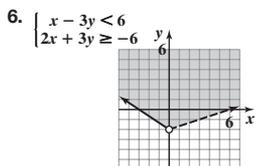

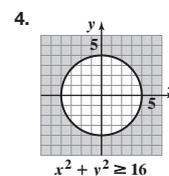

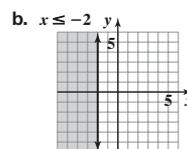

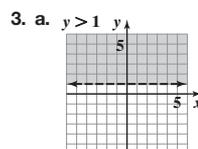

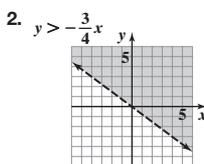

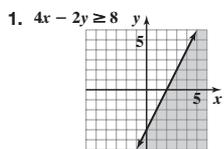

14.  $\frac{5}{x+2} + \frac{3}{x+1} + \frac{2}{x-1}$     15.  $-\frac{2}{x+3} + \frac{3x-5}{x^2+4}$     16.  $\frac{x}{x^2+4} - \frac{4x}{(x^2+4)^2}$     17. a.  $C(x) = 400,000 + 20x$     b.  $R(x) = 100x$

d. (5000, 500,000); The company will break even when it produces and sells 5000 PDAs. At this level, both revenue and cost are \$500,000.

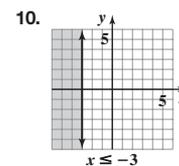

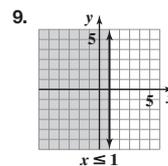

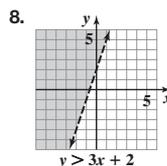

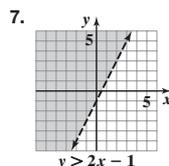

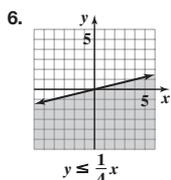

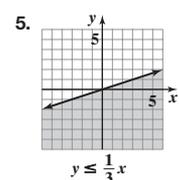

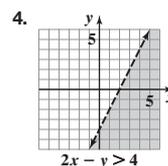

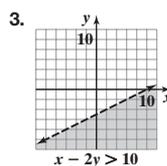

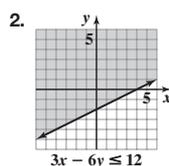

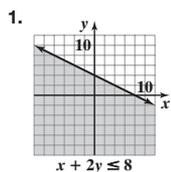

18. 6 roses and 14 carnations

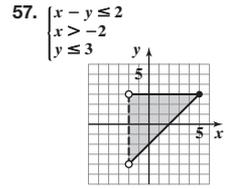

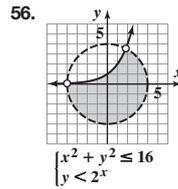

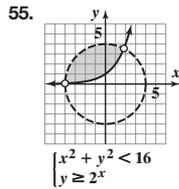

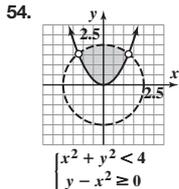

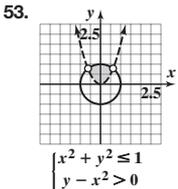

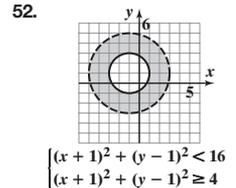

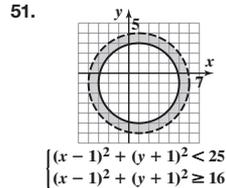

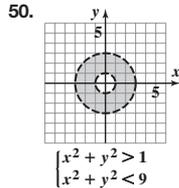

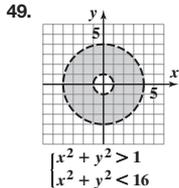

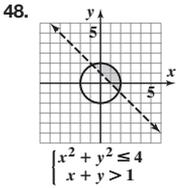

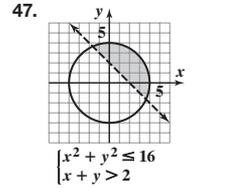

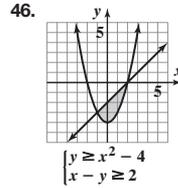

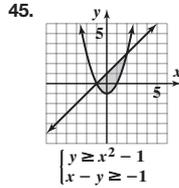

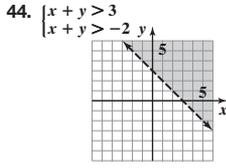

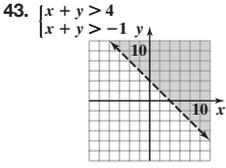

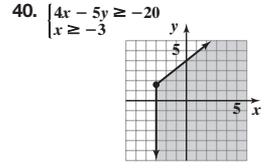

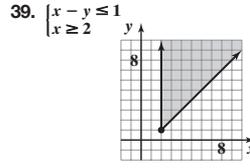

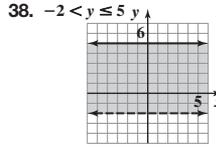

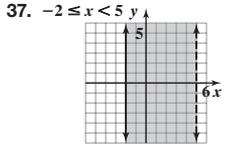

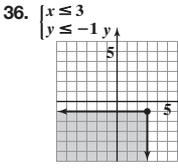

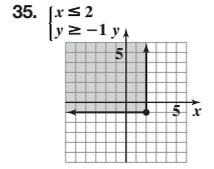

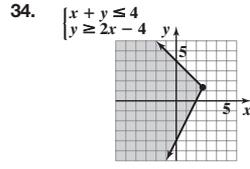

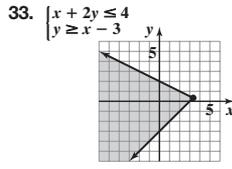

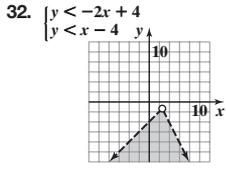

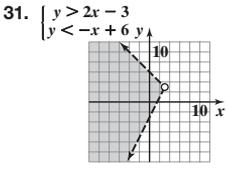

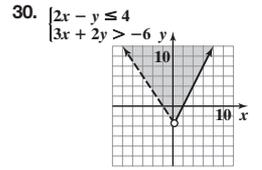

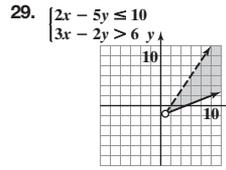

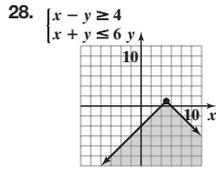

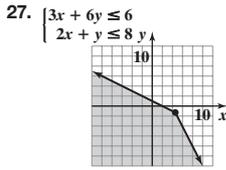

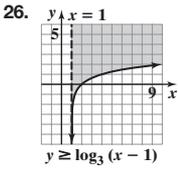

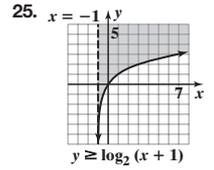

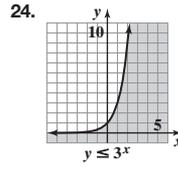

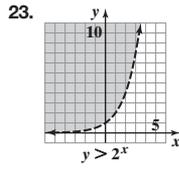

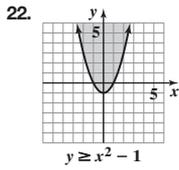

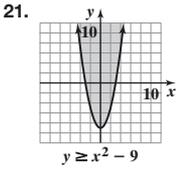

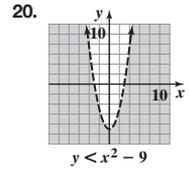

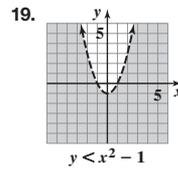

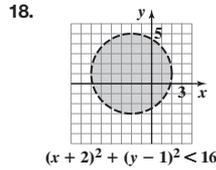

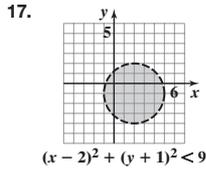

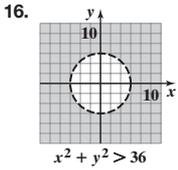

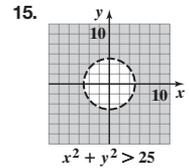

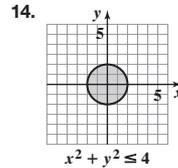

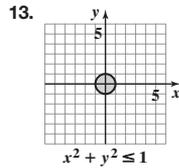

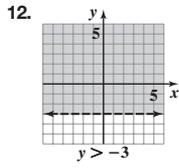

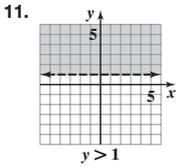

## Section 7.5

### Check Point Exercises

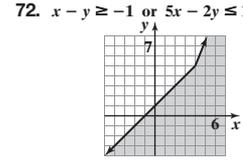

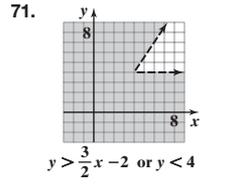

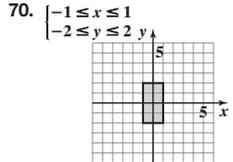

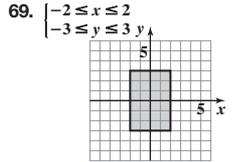

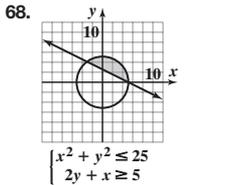

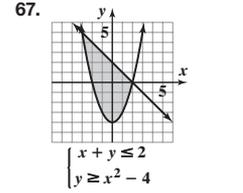

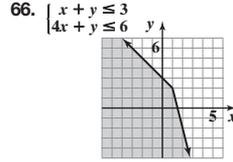

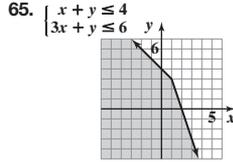

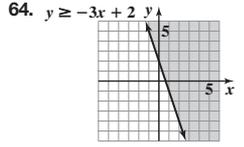

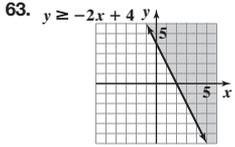

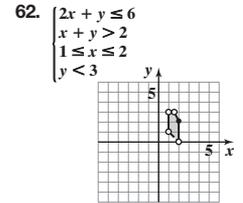

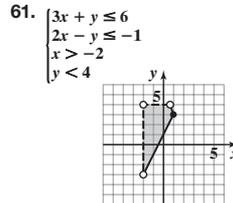

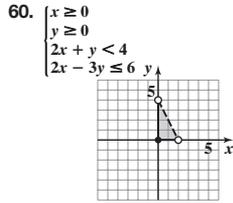

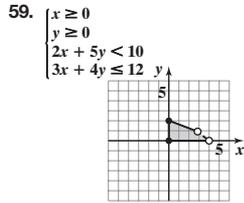

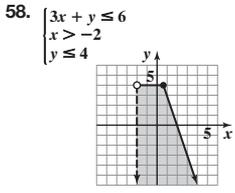

### Exercise Set 7.5

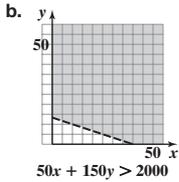

**AA82** Answers to Selected Exercises

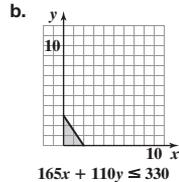

77. Point  $A = (66, 160)$ ;  $5.3(66) - 160 \geq 180$ , or  $189.8 \geq 180$ , is true;  $4.1(66) - 160 \leq 140$ , or  $110.6 \leq 140$ , is true.  
 78. Point  $B = (76, 220)$ ;  $5.3(76) - 220 \geq 180$ , or  $182.8 \geq 180$ , is true;  $4.1(76) - 220 \leq 140$ , or  $91.6 \leq 140$ , is true.

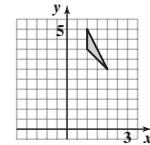

81. a.  $50x + 150y > 2000$

82. a.  $165x + 110y \leq 330$

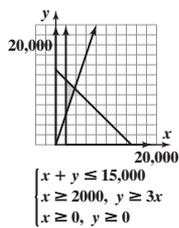

83. b. 
$$\begin{cases} y \geq 0 \\ x + y \geq 5 \\ x \geq 1 \\ 200x + 100y \leq 700 \end{cases}$$

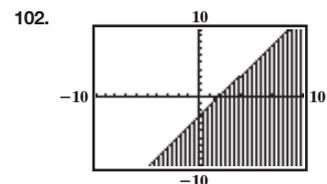

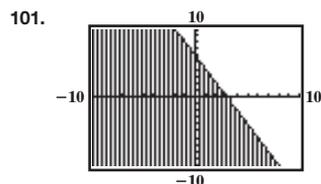

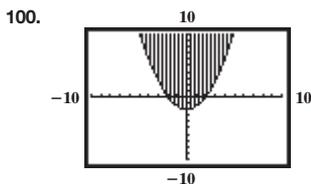

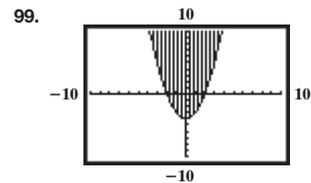

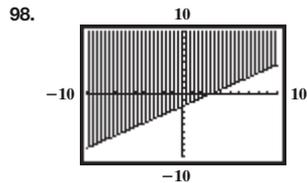

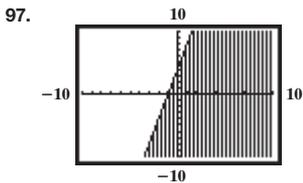

c. Answers may vary. Example:  
 (20, 20): 20 children and 20 adults  
 will cause the elevator to be overloaded.

c. Answers may vary. Example:  
 (1, 1): One egg and one  
 ounce of meat are within the  
 patient's dietary restrictions.

84. 
$$\begin{cases} x + y \leq 15,000 \\ x \geq 2000 \\ y \geq 3x \\ x \geq 0 \\ y \geq 0 \end{cases}$$

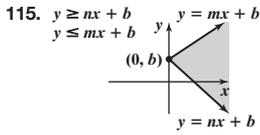

85. a. 27.1

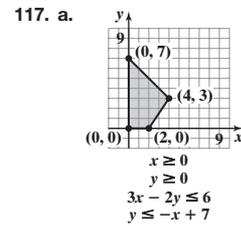

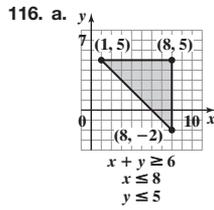

110.  $\begin{cases} x \geq -2 \\ y > -1 \end{cases}$       111.  $\begin{cases} y > x - 3 \\ y \leq x \end{cases}$

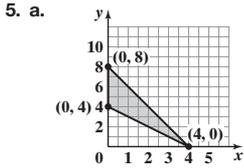

112.  $\begin{cases} x^2 + y^2 \leq 9 \\ y < x^2 \end{cases}$       113.  $x + 2y \leq 6$  or  $2x + y \leq 6$

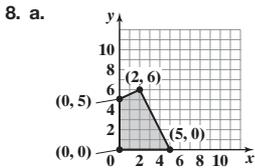

**Exercise Set 7.6**

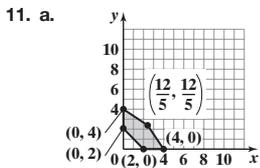

1. (1, 2): 17; (2, 10): 70; (7, 5): 65; (8, 3): 58; maximum:  $z = 70$ ; minimum:  $z = 17$   
 2. (3, 2): 13; (4, 10): 32; (5, 12): 39; (8, 6): 36; (7, 4): 29; maximum:  $z = 39$ ; minimum:  $z = 13$   
 3. (0, 0): 0; (0, 8): 400; (4, 9): 610; (8, 0): 320; maximum:  $z = 610$ ; minimum:  $z = 0$   
 4. (0, 0): 0; (0, 9): 405; (4, 4): 300; (3, 0): 90; maximum:  $z = 405$ ; minimum:  $z = 0$

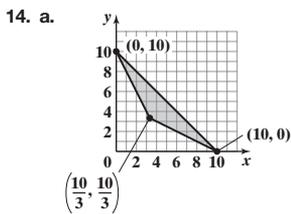

- b. (0, 8): 16; (0, 4): 8; (4, 0): 12

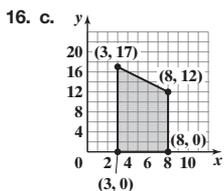

- b. (0, 5): 30; (0, 0): 0; (2, 6): 38; (5, 0): 5

- b. (0, 4): 8; (0, 2): 4; (2, 0): 8; (4, 0): 16;  
 $(\frac{12}{5}, \frac{12}{5}): \frac{72}{5}$

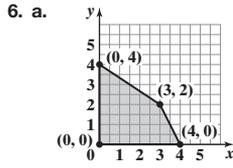

- b. (0, 10): 60; (10, 0): 50;  $(\frac{10}{3}, \frac{10}{3}): \frac{110}{3}$

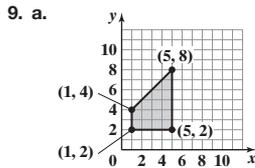

- d. (3, 0): 30; (8, 0): 80; (3, 17): 149; (8, 12): 164

34. (0, 0): 0; (0, 3): 3B; (3, 1): 3B; (2, 0):  $\frac{4}{3}B$ ; maximum value: 3B at (0, 3) and (3, 1)

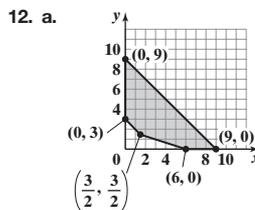

39.  $\begin{bmatrix} 1 & 2 & -1 \\ 0 & -11 & -11 \end{bmatrix}$

- b. (0, 0): 0; (0, 4): 12; (3, 2): 12; (4, 0): 8

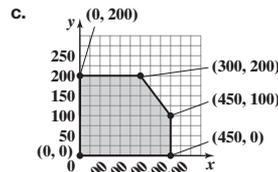

- b. (1, 2): -1; (1, 4): -5; (5, 8): -1; (5, 2): 11

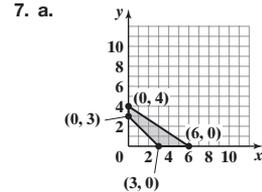

- b. (0, 9): 36; (0, 3): 12; (6, 0): 12; (9, 0): 18;  
 $(\frac{3}{2}, \frac{3}{2}): 9$

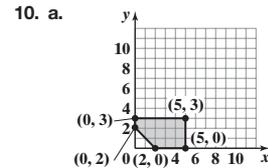

15. a.  $z = 125x + 200y$       b.  $\begin{cases} x \leq 450 \\ y \leq 200 \\ 600x + 900y \leq 360,000 \end{cases}$

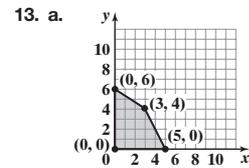

- d. (0, 0): 0; (0, 200): 40,000;  
 (300, 200): 77,500; (450, 100): 76,250;  
 (450, 0): 56,250

- b. (0, 4): 4; (0, 3): 3; (3, 0): 12; (6, 0): 24

- b. (0, 3): -6; (0, 2): -4; (2, 0): 10; (5, 0): 25; (5, 3): 19

- b. (0, 6): 72; (0, 0): 0; (5, 0): 50; (3, 4): 78

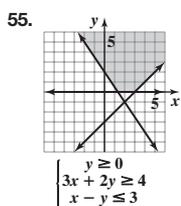

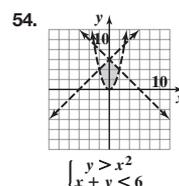

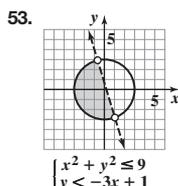

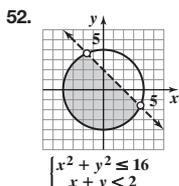

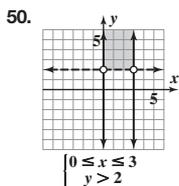

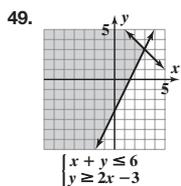

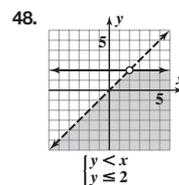

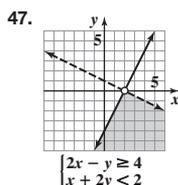

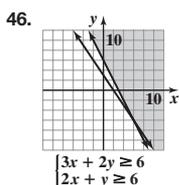

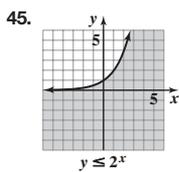

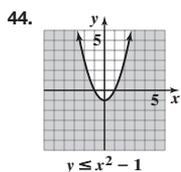

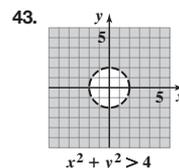

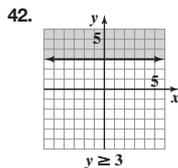

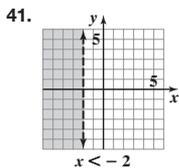

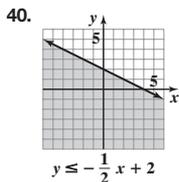

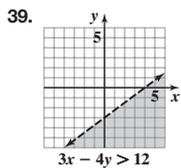

Chapter 7 Review Exercises

6. a.  $C(x) = 60,000 + 200x$     b.  $R(x) = 450x$     c. (240, 108,000); This means the company will break even if it produces and sells 240 desks.

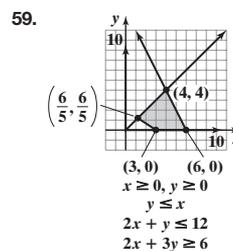

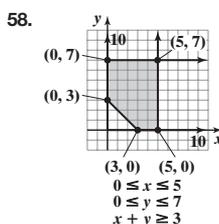

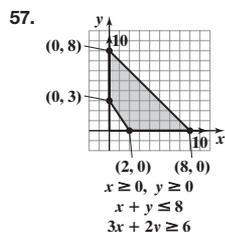

8. a.  $y = 219x + 142$     14.  $y = 3x^2 - 4x + 5$     16.  $\frac{3}{5(x-3)} + \frac{2}{5(x+2)}$     17.  $\frac{6}{x-4} + \frac{5}{x+3}$     18.  $\frac{2}{x} + \frac{3}{x+2} - \frac{1}{x-1}$

20.  $-\frac{4}{x-1} + \frac{4}{x-2} - \frac{2}{(x-2)^2}$     21.  $\frac{6}{5(x-2)} + \frac{-6x+3}{5(x^2+1)}$     22.  $\frac{5}{x-3} + \frac{2x-1}{x^2+4}$     23.  $\frac{x}{x^2+4} - \frac{4x}{(x^2+4)^2}$     26.  $\{(0, 1), (-3, 4)\}$

28.  $\{(3, \sqrt{6}), (3, -\sqrt{6}), (-3, \sqrt{6}), (-3, -\sqrt{6})\}$     33.  $\left\{\left(\frac{5}{2}, -\frac{7}{2}\right), (0, -1)\right\}$     34.  $\{(2, -3), (-2, -3), (3, 2), (-3, 2)\}$

56. (2, 2): 10; (4, 0): 8;  $\left(\frac{1}{2}, \frac{1}{2}\right): \frac{5}{2}$ ; (1, 0): 2; maximum value: 10; minimum value: 2

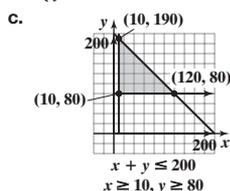

Maximum is 24 at  $x = 0, y = 8$ .

Maximum is 33 at  $x = 5, y = 7$ .

Maximum is 44 at  $x = y = 4$ .

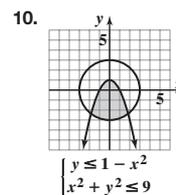

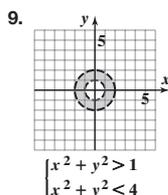

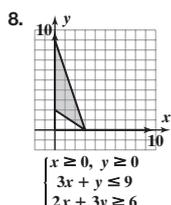

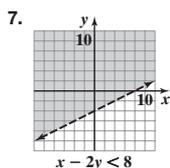

60. b.  $\begin{cases} x + y \leq 200 \\ x \geq 10 \\ y \geq 80 \end{cases}$

d. (10, 80): 33,000; (10, 190): 71,500; (120, 80): 88,000

Chapter 7 Test

6.  $\frac{-1}{10(x+1)} + \frac{x+9}{10(x^2+9)}$

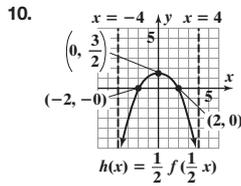

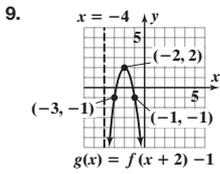

13. a.  $C(x) = 360,000 + 850x$   
14. 40 oz of 20%; 20 oz of 50%

c. (1200, 1,380,000); The company will break even if it produces and sells 1200 computers.

**Cumulative Review Exercises (Chapters P–7)**

1. domain:  $(-2, 2)$ ; range:  $(-\infty, 3]$     3. maximum of 3 at  $x = 0$

11.  $\{3, 4\}$

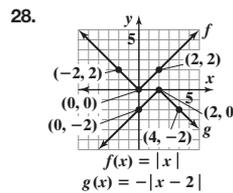

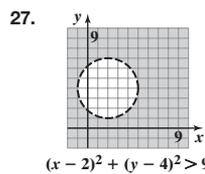

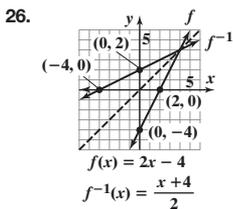

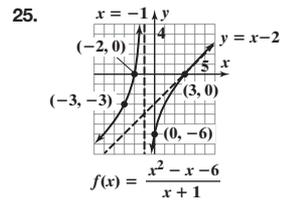

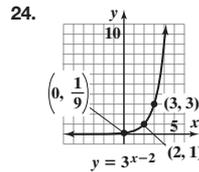

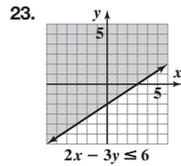

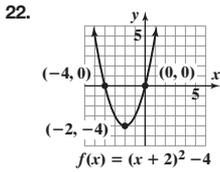

12.  $\left\{ \frac{2 + i\sqrt{3}}{2}, \frac{2 - i\sqrt{3}}{2} \right\}$

15.  $\left\{ -3, \frac{1}{2}, 2 \right\}$

16.  $\{-2\}$

17.  $\{2\}$

20.  $\left\{ \left(-\frac{1}{2}, \frac{1}{2}\right), (2, 8) \right\}$

29.  $(f \circ g)(x) = 2x^2 - 3x$ ;  
 $(g \circ f)(x) = -2x^2 + x + 2$

36.  $\sec \theta - \cos \theta = \frac{1}{\cos \theta} - \cos \theta = \frac{1 - \cos^2 \theta}{\cos \theta} = \frac{\sin^2 \theta}{\cos \theta} = \frac{\sin \theta}{\cos \theta} \sin \theta = \tan \theta \sin \theta$

37.  $\tan x + \tan y = \frac{\sin x}{\cos x} + \frac{\sin y}{\cos y} = \frac{\sin x \cos y + \sin y \cos x}{\cos x \cos y} = \frac{\sin(x + y)}{\cos x \cos y}$

**CHAPTER 8**

**Section 8.1**

**Check Point Exercises**

1. a.  $\left[ \begin{array}{ccc|c} 1 & 6 & -3 & 7 \\ 4 & 12 & -20 & 8 \\ -3 & -2 & 1 & -9 \end{array} \right]$     b.  $\left[ \begin{array}{ccc|c} 1 & 3 & -5 & 2 \\ 1 & 6 & -3 & 7 \\ -3 & -2 & 1 & -9 \end{array} \right]$     c.  $\left[ \begin{array}{ccc|c} 4 & 12 & -20 & 8 \\ 1 & 6 & -3 & 7 \\ 0 & 16 & -8 & 12 \end{array} \right]$

**Exercise Set 8.1**

1.  $\left[ \begin{array}{ccc|c} 2 & 1 & 2 & 2 \\ 3 & -5 & -1 & 4 \\ 1 & -2 & -3 & -6 \end{array} \right]$     2.  $\left[ \begin{array}{ccc|c} 3 & -2 & 5 & 31 \\ 1 & 3 & -3 & -12 \\ -2 & -5 & 3 & 11 \end{array} \right]$     3.  $\left[ \begin{array}{ccc|c} 1 & -1 & 1 & 8 \\ 0 & 1 & -12 & -15 \\ 0 & 0 & 1 & 1 \end{array} \right]$     4.  $\left[ \begin{array}{ccc|c} 1 & -2 & 3 & 9 \\ 0 & 1 & 3 & 5 \\ 0 & 0 & 1 & 2 \end{array} \right]$     5.  $\left[ \begin{array}{ccc|c} 5 & -2 & -3 & 0 \\ 1 & 1 & 0 & 5 \\ 2 & 0 & -3 & 4 \end{array} \right]$

6.  $\left[ \begin{array}{ccc|c} 1 & -2 & 1 & 10 \\ 3 & 1 & 0 & 5 \\ 7 & 0 & 2 & 2 \end{array} \right]$     7.  $\left[ \begin{array}{ccc|c} 2 & 5 & -3 & 1 \\ 0 & 3 & 1 & 0 \\ 1 & -1 & 5 & 0 \\ 5 & -5 & -2 & 0 \end{array} \right]$     8.  $\left[ \begin{array}{ccc|c} 4 & 7 & -8 & 1 \\ 0 & 5 & 1 & 0 \\ 1 & -1 & -1 & 0 \\ 2 & -2 & 11 & 0 \end{array} \right]$     9.  $\begin{cases} 5x + 3z = -11 \\ y - 4z = 12 \\ 7x + 2y = 3 \end{cases}$     10.  $\begin{cases} 7x + 4z = -13 \\ y - 5z = 11 \\ 2x + 7y = 6 \end{cases}$

11.  $\begin{cases} w + x + 4y + z = 3 \\ -w + x - y = 7 \\ 2w + 5z = 11 \\ 12y + 4z = 5 \end{cases}$     12.  $\begin{cases} 4w + x + 5y + z = 6 \\ w - x - z = 8 \\ 3w + 7z = 4 \\ 11y + 5z = 3 \end{cases}$     17.  $\left[ \begin{array}{cccc|c} 1 & -1 & 1 & 1 & 3 \\ 0 & 1 & -2 & -1 & 0 \\ 0 & 2 & 1 & 2 & 5 \\ 0 & 6 & -3 & -1 & -9 \end{array} \right]$     18.  $\left[ \begin{array}{cccc|c} 1 & -5 & 2 & -2 & 4 \\ 0 & 1 & -3 & -1 & 0 \\ 0 & 15 & -4 & 5 & -6 \\ 0 & -19 & 12 & -6 & 13 \end{array} \right]$

19.  $R_2: -3, -18; R_3: -12, -15; R_2: -\frac{3}{5}, -\frac{18}{5}; R_3: -12, -15$     20.  $R_2: -10, -5; R_3: 8, 10; R_2: -2, -1; R_3: 8, 10$     21.  $\{(1, -1, 2)\}$   
 22.  $\{(1, -1, 1)\}$     23.  $\{(3, -1, -1)\}$     24.  $\{(-3, 0, 1)\}$     25.  $\{(2, -1, 1)\}$     26.  $\{(4, -3, 2)\}$     28.  $\{(0, 2, 2)\}$     30.  $\{(1, 1, 2)\}$   
 31.  $\{(-1, 2, -2)\}$     32.  $\{(-1, 6, 3)\}$     33.  $\{(1, 2, -1)\}$     34.  $\{(2, 0, -1)\}$     41.  $f(x) = x^3 - 2x^2 + 3$     42.  $f(x) = -x^3 + 4x^2 - 2$

45. b. 0; The ball hits the ground 3.5 seconds after it is thrown.    46. b.  $s(7) = 118$ ; The ball's height is 118 feet after 7 seconds.    62. makes sense  
 68. For  $z = 0$ ,  $(12z + 1, 10z - 1, z)$  is  $(1, -1, 0)$ ;  $3(1) - 4(-1) + 4(0) = 7$  is true;  $1 - (-1) - 2(0) = 2$  is true;  $2(1) - 3(-1) + 6(0) = 5$  is true.  
 69. For  $z = 1$ ,  $(12z + 1, 10z - 1, z)$  is  $(13, 9, 1)$ ;  $3(13) - 4(9) + 4(1) = 7$  is true;  $13 - 9 - 2(1) = 2$  is true;  $2(13) - 3(9) + 6(1) = 5$  is true.  
 70. a. Answers may vary.    b. This system has more than one solution.

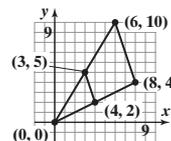

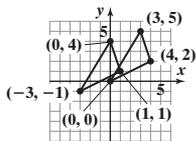

**Exercise Set 8.2**

3.  $\left\{ \left( -2t + 2, 2t + \frac{1}{2}, t \right) \right\}$     4.  $\{(-2 + t, -2 + t, t)\}$     5.  $\{(-3, 4, -2)\}$     6.  $\{(2, -3, 7)\}$     7.  $\{(5 - 2t, -2 + t, t)\}$     8.  $\{(-5 + 7t, 1 + 3t, t)\}$
15.  $\left\{ \left( 1 + \frac{1}{3}t, \frac{1}{3}t, t \right) \right\}$     16.  $\left\{ \left( 2, \frac{1}{2}t - \frac{1}{2}, t \right) \right\}$     17.  $\{(-13t + 5, 5t, t)\}$     18.  $\{(-2t + 3, -2t + 1, t)\}$     19.  $\left\{ \left( 2t - \frac{5}{4}, \frac{13}{4}, t \right) \right\}$     20.  $\{(98, 2t - 43, t)\}$
25. a.  $4w - 2x + 2y - 3z = 0; 7w - x - y - 3z = 0; w + x + y - z = 0$
26. a.  $2w + 17x - 23y + 40z = 0; 2w + 5x + y + 3z = 0; x - 2y + 3z = 0$
27. a.  $w + 2x + 5y + 5z = -3; w + x + 3y + 4z = -1; w - x - y + 2z = 3$
28. a.  $w + y + z = 0; w - x + 2y + 3z = 0; 3w - 2x + 5y + 7z = 0$
33. a.  $\begin{cases} w + z = 380 \\ w + x = 600 \\ x - y = 170 \\ y - z = 50 \end{cases}$     b.  $\{(380 - t, 220 + t, 50 + t, t)\}$
34. a. There is no combination of the foods that can satisfy the given requirements.  
b. There are many combinations of the foods that satisfy the new requirements.
35. a. The system has no solution, so there is no way to satisfy these dietary requirements with no Food 1 available.  
b. 4 oz of Food 1, 0 oz of Food 2, 10 oz of Food 3; 2 oz of Food 1, 5 oz of Food 2, 9 oz of Food 3 (other answers are possible).
36. 7 of product A, 2 of product B, 2 of product C; 7 of product A, 1 of product B, 4 of product C (other answers are possible).
40. a.  $\begin{cases} x_1 - x_6 = 100 \\ x_2 - x_6 + x_7 = 600 \\ x_3 + x_7 = 900 \\ x_1 - x_4 = -200 \\ x_2 - x_4 + x_5 = 100 \\ x_3 + x_5 = 700 \end{cases}$     b.  $\{(t + 100, t - s + 600, -s + 900, t + 300, s - 200, t, s)\}$

**Section 8.3**

**Check Point Exercises**

9. a.  $\begin{bmatrix} 0 & 3 & 4 \\ 0 & 5 & 2 \end{bmatrix} + \begin{bmatrix} -3 & -3 & -3 \\ -1 & -1 & -1 \end{bmatrix} = \begin{bmatrix} -3 & 0 & 1 \\ -1 & 4 & 1 \end{bmatrix}$     b.  $2 \begin{bmatrix} 0 & 3 & 4 \\ 0 & 5 & 2 \end{bmatrix} = \begin{bmatrix} 0 & 6 & 8 \\ 0 & 10 & 4 \end{bmatrix}$

**Exercise Set 8.3**

1. b.  $a_{32}$  does not exist;  $a_{23} = -1$     2. b.  $a_{32}$  does not exist;  $a_{23} = \frac{1}{2}$     3. a.  $3 \times 4$     b.  $a_{32} = \frac{1}{2}; a_{23} = -6$     4. a.  $3 \times 4$     b.  $a_{32} = 0; a_{23} = \pi$
7.  $x = 4; y = 6; z = 3$     8.  $x = 12; y = 2; z = 3$     9. a.  $\begin{bmatrix} 9 & 10 \\ 3 & 9 \end{bmatrix}$     b.  $\begin{bmatrix} -1 & -8 \\ 3 & -5 \end{bmatrix}$     c.  $\begin{bmatrix} -16 & -4 \\ -12 & -8 \end{bmatrix}$     d.  $\begin{bmatrix} 22 & 21 \\ 9 & 20 \end{bmatrix}$
10. a.  $\begin{bmatrix} 6 & 4 \\ 5 & 5 \end{bmatrix}$     b.  $\begin{bmatrix} -10 & 2 \\ -5 & -3 \end{bmatrix}$     c.  $\begin{bmatrix} 8 & -12 \\ 0 & -4 \end{bmatrix}$     d.  $\begin{bmatrix} 10 & 11 \\ 10 & 11 \end{bmatrix}$     11. a.  $\begin{bmatrix} 3 & 2 \\ 6 & 2 \\ 5 & 7 \end{bmatrix}$     b.  $\begin{bmatrix} -1 & 4 \\ 0 & 6 \\ 5 & 5 \end{bmatrix}$     c.  $\begin{bmatrix} -4 & -12 \\ -12 & -16 \\ -20 & -24 \end{bmatrix}$     d.  $\begin{bmatrix} 7 & 7 \\ 15 & 8 \\ 15 & 20 \end{bmatrix}$
12. a.  $\begin{bmatrix} 5 & -2 & 7 \\ -4 & 3 & 1 \end{bmatrix}$     b.  $\begin{bmatrix} 1 & 4 & -5 \\ 2 & 1 & 9 \end{bmatrix}$     c.  $\begin{bmatrix} -12 & -4 & -4 \\ 4 & -8 & -20 \end{bmatrix}$     d.  $\begin{bmatrix} 13 & -3 & 15 \\ -9 & 8 & 7 \end{bmatrix}$     13. a.  $\begin{bmatrix} -3 \\ -1 \\ 0 \end{bmatrix}$     b.  $\begin{bmatrix} 7 \\ -7 \\ 2 \end{bmatrix}$     c.  $\begin{bmatrix} -8 \\ 16 \\ -4 \end{bmatrix}$
- d.  $\begin{bmatrix} -4 \\ -6 \\ 1 \end{bmatrix}$     14. a.  $[10 \ 0 \ 0]$     b.  $[2 \ 4 \ -6]$     c.  $[-24 \ -8 \ 12]$     d.  $[26 \ 2 \ -3]$     15. a.  $\begin{bmatrix} 8 & 0 & -4 \\ 14 & 0 & 6 \\ -1 & 0 & 0 \end{bmatrix}$     b.  $\begin{bmatrix} -4 & -20 & 0 \\ 14 & 24 & 14 \\ 9 & -4 & 4 \end{bmatrix}$
- c.  $\begin{bmatrix} -8 & 40 & 8 \\ -56 & -48 & -40 \\ -16 & 8 & -8 \end{bmatrix}$     d.  $\begin{bmatrix} 18 & -10 & -10 \\ 42 & 12 & 22 \\ 2 & -2 & 2 \end{bmatrix}$     16. a.  $\begin{bmatrix} 3 & 2 & 6 \\ 5 & 2 & -8 \\ -2 & 2 & 3 \end{bmatrix}$     b.  $\begin{bmatrix} 9 & -8 & 4 \\ 7 & -2 & 4 \\ -6 & 2 & -5 \end{bmatrix}$     c.  $\begin{bmatrix} -24 & 12 & -20 \\ -24 & 0 & 8 \\ 16 & -8 & 4 \end{bmatrix}$     d.  $\begin{bmatrix} 12 & 1 & 17 \\ 16 & 4 & -18 \\ -8 & 6 & 5 \end{bmatrix}$
17.  $\begin{bmatrix} -8 & -8 \\ 2 & -9 \\ 8 & -4 \end{bmatrix}$     18.  $\begin{bmatrix} -8 & -8 \\ 2 & -9 \\ 8 & -4 \end{bmatrix}$     19.  $\begin{bmatrix} -1 & 3 \\ -1 & \frac{9}{2} \\ -1 & -2 \end{bmatrix}$     20.  $\begin{bmatrix} -\frac{2}{3} & 2 \\ -\frac{2}{3} & 3 \\ -\frac{2}{3} & -\frac{4}{3} \end{bmatrix}$     21.  $\begin{bmatrix} \frac{1}{3} & \frac{13}{3} \\ -\frac{4}{3} & 6 \\ -\frac{7}{3} & -\frac{4}{3} \end{bmatrix}$     22.  $\begin{bmatrix} 5 & 17 \\ -5 & \frac{45}{2} \\ -11 & -2 \end{bmatrix}$     23.  $\begin{bmatrix} 7 & 27 \\ -8 & 36 \\ -17 & -4 \end{bmatrix}$

24.  $\begin{bmatrix} 17 & -3 \\ 2 & -9 \\ -7 & 16 \end{bmatrix}$     25.  $\begin{bmatrix} 27 & 31 \\ 2 & 2 \\ -4 & 18 \\ -\frac{29}{2} & 6 \end{bmatrix}$     26.  $\begin{bmatrix} 29 & 25 \\ 2 & 2 \\ -3 & \frac{27}{2} \\ -\frac{27}{2} & 8 \end{bmatrix}$     27. a.  $\begin{bmatrix} 0 & 16 \\ 12 & 8 \end{bmatrix}$     b.  $\begin{bmatrix} -7 & 3 \\ 29 & 15 \end{bmatrix}$     28. a.  $\begin{bmatrix} -10 & 12 \\ 25 & -30 \end{bmatrix}$     b.  $\begin{bmatrix} 0 & 0 \\ 9 & -40 \end{bmatrix}$

29. a. [30]    b.  $\begin{bmatrix} 1 & 2 & 3 & 4 \\ 2 & 4 & 6 & 8 \\ 3 & 6 & 9 & 12 \\ 4 & 8 & 12 & 16 \end{bmatrix}$     30. a.  $\begin{bmatrix} -1 & -2 & -3 \\ -2 & -4 & -6 \\ -3 & -6 & -9 \end{bmatrix}$     b. [-14]    31. a.  $\begin{bmatrix} 4 & -5 & 8 \\ 6 & -1 & 5 \\ 0 & 4 & -6 \end{bmatrix}$     b.  $\begin{bmatrix} 5 & -2 & 7 \\ 17 & -3 & 2 \\ 3 & 0 & -5 \end{bmatrix}$

32. a.  $\begin{bmatrix} 3 & 4 & -3 \\ -1 & 7 & -4 \\ 7 & 9 & -6 \end{bmatrix}$     b.  $\begin{bmatrix} 6 & -1 & -1 \\ -4 & -11 & 19 \\ 4 & -7 & 9 \end{bmatrix}$     33. a.  $\begin{bmatrix} 6 & 8 & 16 \\ 11 & 16 & 24 \\ 1 & -1 & 12 \end{bmatrix}$     b.  $\begin{bmatrix} 38 & 27 \\ -16 & -4 \end{bmatrix}$     34. a.  $\begin{bmatrix} 2 & -8 & 20 \\ 8 & 3 & 5 \\ 10 & 2 & 10 \end{bmatrix}$     b.  $\begin{bmatrix} 12 & 14 \\ 9 & 3 \end{bmatrix}$

35. a.  $\begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$     b.  $\begin{bmatrix} 4 & -1 & -3 & 1 \\ -1 & 4 & -3 & 2 \\ 14 & -11 & -3 & -1 \\ 25 & -25 & 0 & -5 \end{bmatrix}$     36. a.  $\begin{bmatrix} 18 & 1 \\ -1 & 15 \end{bmatrix}$     b.  $\begin{bmatrix} 0 & 1 & -7 & 0 \\ 3 & -1 & 1 & 3 \\ 2 & -3 & 17 & 2 \\ 17 & -6 & 8 & 17 \end{bmatrix}$     37.  $\begin{bmatrix} 17 & 7 \\ -5 & -11 \end{bmatrix}$     38.  $\begin{bmatrix} -5 & -7 \\ -1 & 9 \end{bmatrix}$

39.  $\begin{bmatrix} 11 & -1 \\ -7 & -3 \end{bmatrix}$     40.  $\begin{bmatrix} 24 & 0 \\ -33 & -5 \\ -3 & -1 \end{bmatrix}$     41.  $A - C$  is not defined because  $A$  is  $3 \times 2$  and  $C$  is  $2 \times 2$ .

42.  $B - A$  is not defined because  $B$  is  $2 \times 2$  and  $A$  is  $3 \times 2$ .    43.  $\begin{bmatrix} 16 & -16 \\ -12 & 12 \\ 0 & 0 \end{bmatrix}$     44.  $\begin{bmatrix} 28 & 12 \\ -56 & -24 \\ -7 & -3 \end{bmatrix}$     45.  $\begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$     46.  $\begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$

47. Answers will vary.; Example:

$$A(B + C) = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \left( \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} + \begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} \right) = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$$

$$AB + AC = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} + \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} + \begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$$

So,  $A(B + C) = AB + AC$ .

48. Answers will vary.; Example:

$$A + (B + C) = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} + \left( \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} + \begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} \right) = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} + \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$$(A + B) + C = \left( \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} + \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} \right) + \begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 2 & 0 \\ 0 & 0 \end{bmatrix} + \begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

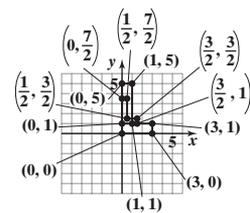

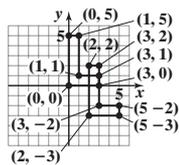

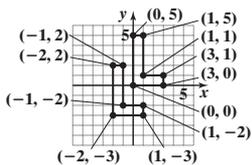

So,  $A + (B + C) = (A + B) + C$ .

49.  $\begin{bmatrix} x \\ -y \end{bmatrix}$ ; It changes the sign of the  $y$ -coordinate.    50.  $\begin{bmatrix} -x \\ y \end{bmatrix}$ ; It changes the sign of the  $x$ -coordinate.

51. a.  $\begin{bmatrix} 1 & 3 & 1 \\ 3 & 3 & 3 \\ 1 & 3 & 1 \end{bmatrix}$     b.  $\begin{bmatrix} 1 & 3 & 1 \\ 3 & 3 & 3 \\ 1 & 3 & 1 \end{bmatrix} + \begin{bmatrix} -1 & -1 & -1 \\ -1 & -1 & -1 \\ -1 & -1 & -1 \end{bmatrix} = \begin{bmatrix} 0 & 2 & 0 \\ 2 & 2 & 2 \\ 0 & 2 & 0 \end{bmatrix}$     c.  $\begin{bmatrix} 1 & 3 & 1 \\ 3 & 3 & 3 \\ 1 & 3 & 1 \end{bmatrix} + \begin{bmatrix} 1 & -2 & 1 \\ -2 & -2 & -2 \\ 1 & -2 & 1 \end{bmatrix} = \begin{bmatrix} 2 & 1 & 2 \\ 1 & 1 & 1 \\ 2 & 1 & 2 \end{bmatrix}$

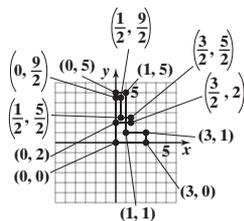

52. a.  $\begin{bmatrix} 1 & 3 & 1 \\ 3 & 3 & 3 \\ 1 & 3 & 1 \end{bmatrix}$     b.  $\begin{bmatrix} 1 & 3 & 1 \\ 3 & 3 & 3 \\ 1 & 3 & 1 \end{bmatrix} + \begin{bmatrix} 2 & -1 & 2 \\ -1 & -1 & -1 \\ 2 & -1 & 2 \end{bmatrix} = \begin{bmatrix} 3 & 2 & 3 \\ 2 & 2 & 2 \\ 3 & 2 & 3 \end{bmatrix}$     c.  $\begin{bmatrix} 1 & 3 & 1 \\ 3 & 3 & 3 \\ 1 & 3 & 1 \end{bmatrix} + \begin{bmatrix} -1 & 0 & -1 \\ 0 & 0 & 0 \\ -1 & 0 & -1 \end{bmatrix} = \begin{bmatrix} 0 & 3 & 0 \\ 3 & 3 & 3 \\ 0 & 3 & 0 \end{bmatrix}$

53.  $\begin{bmatrix} -2 & 1 & 1 & -1 & -1 & -2 \\ -3 & -3 & -2 & -2 & 2 & 2 \end{bmatrix}$     54.  $\begin{bmatrix} 2 & 5 & 5 & 3 & 3 & 2 \\ -3 & -3 & -2 & -2 & 2 & 2 \end{bmatrix}$     55.  $\begin{bmatrix} 0 & \frac{3}{2} & \frac{3}{2} & \frac{1}{2} & \frac{1}{2} & 0 \\ 1 & 1 & \frac{3}{2} & \frac{3}{2} & \frac{7}{2} & \frac{7}{2} \end{bmatrix}$

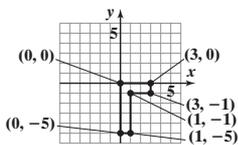

**AA88** Answers to Selected Exercises

56. 
$$\begin{bmatrix} 0 & \frac{3}{2} & \frac{3}{2} & \frac{1}{2} & \frac{1}{2} & 0 \\ 2 & 2 & \frac{5}{2} & \frac{5}{2} & \frac{9}{2} & \frac{9}{2} \end{bmatrix}$$

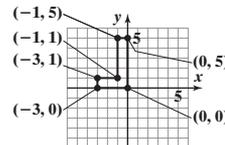

57. a. 
$$\begin{bmatrix} 0 & 3 & 3 & 1 & 1 & 0 \\ 0 & 0 & -1 & -1 & -5 & -5 \end{bmatrix}$$

b. The effect is a reflection across the  $x$ -axis.

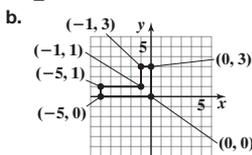

58. a. 
$$\begin{bmatrix} 0 & -3 & -3 & -1 & -1 & 0 \\ 0 & 0 & 1 & 1 & 5 & 5 \end{bmatrix}$$

b. The effect is a reflection across the  $y$ -axis.

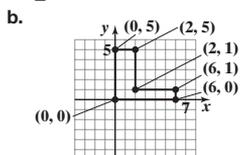

59. a. 
$$\begin{bmatrix} 0 & 0 & -1 & -1 & -5 & -5 \\ 0 & 3 & 3 & 1 & 1 & 0 \end{bmatrix}$$

The effect is a  $90^\circ$  counterclockwise rotation about the origin.

60. a. 
$$\begin{bmatrix} 0 & 6 & 6 & 2 & 2 & 0 \\ 0 & 0 & 1 & 1 & 5 & 5 \end{bmatrix}$$

The effect is a horizontal stretch by a factor of 2.

61. b. 
$$B = \begin{bmatrix} 9 & 29 \\ 65 & 77 \end{bmatrix}$$

c. 
$$B - A = \begin{bmatrix} 7 & 23 \\ 34 & 31 \end{bmatrix}$$

The difference between the percentage of people completing the transition to adulthood in 1960 and 2000 by age and gender

62. a. 
$$M = \begin{bmatrix} 2400 & 2700 & 3000 \\ 2200 & 2500 & 2900 \\ 2000 & 2300 & 2600 \end{bmatrix}$$

b. 
$$W = \begin{bmatrix} 2000 & 2100 & 2400 \\ 1800 & 2000 & 2200 \\ 1600 & 1800 & 2100 \end{bmatrix}$$

c. 
$$M - W = \begin{bmatrix} 400 & 600 & 600 \\ 400 & 500 & 700 \\ 400 & 500 & 500 \end{bmatrix}$$

The differences between the basic caloric needs of men and women by age and activity level

63. a. System 1: The midterm and final both count for 50% of the course grade. System 2: The midterm counts for 30% of the course grade and the final counts for 70%.

b. 
$$\begin{bmatrix} 84 & 87.2 \\ 79 & 81 \\ 90 & 88.4 \\ 73 & 68.6 \\ 69 & 73.4 \end{bmatrix}$$

System 1 grades are listed first (if different). Student 1: B; Student 2: C or B; Student 3: A or B; Student 4: C or D; Student 5: D or C

64. a. 
$$\begin{bmatrix} 15,800 & 18,600 \\ 12,500 & 14,800 \\ 3700 & 4600 \end{bmatrix}$$

82. When a matrix of this type is multiplied by itself, each diagonal element of the product is the square of the corresponding element of the original; all other elements are zero. 83.  $AB = -BA$  so they are anticommutative.

87. 
$$\begin{cases} a_1x + b_1y + c_1z = d_1 \\ a_2x + b_2y + c_2z = d_2 \\ a_3x + b_3y + c_3z = d_3 \end{cases}$$

**Mid-Chapter 8 Check Point**

1.  $\{(1, -1, 2)\}$  6. 
$$\begin{bmatrix} -4 & \frac{1}{2} \\ 3 & 3 \end{bmatrix}$$
 7. 
$$\begin{bmatrix} -12 & -2 \\ -21 & -4 \\ 3 & 1 \end{bmatrix}$$
 8. 
$$\begin{bmatrix} 12 & -4 \\ 22 & -7 \\ -4 & 1 \end{bmatrix}$$

9.  $A + C$  does not exist because  $A$  is  $3 \times 2$  and  $C$  is  $2 \times 2$ . 10. 
$$\begin{bmatrix} \frac{1}{2} & \frac{1}{2} \\ -3 & \frac{1}{2} \end{bmatrix}$$

**Exercise Set 8.4**

2.  $AB = \begin{bmatrix} -3 & -4 \\ 0 & 1 \end{bmatrix}; BA = \begin{bmatrix} -3 & 0 \\ -4 & 1 \end{bmatrix}; B \neq A^{-1}$  3.  $AB = \begin{bmatrix} 8 & -16 \\ -2 & 7 \end{bmatrix}; BA = \begin{bmatrix} 12 & 12 \\ 1 & 3 \end{bmatrix}; B \neq A^{-1}$

4.  $AB = \begin{bmatrix} -6 & -12 \\ 3 & 6 \end{bmatrix}; BA = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}; B \neq A^{-1}$  13. 
$$\begin{bmatrix} \frac{2}{7} & -\frac{3}{7} \\ \frac{1}{7} & \frac{2}{7} \end{bmatrix}$$
 14. 
$$\begin{bmatrix} \frac{1}{6} & \frac{1}{4} \\ \frac{1}{3} & 0 \end{bmatrix}$$
 15. 
$$\begin{bmatrix} 1 & \frac{1}{2} \\ 2 & \frac{3}{2} \end{bmatrix}$$
 16. 
$$\begin{bmatrix} -1 & 3 \\ -\frac{1}{2} & 1 \end{bmatrix}$$

17.  $A$  does not have an inverse.    18.  $A$  does not have an inverse.    19.  $\begin{bmatrix} \frac{1}{2} & 0 & 0 \\ 0 & \frac{1}{4} & 0 \\ 0 & 0 & \frac{1}{6} \end{bmatrix}$     20.  $\begin{bmatrix} \frac{1}{3} & 0 & 0 \\ 0 & \frac{1}{6} & 0 \\ 0 & 0 & \frac{1}{9} \end{bmatrix}$     21.  $\begin{bmatrix} 1 & 1 & 2 \\ 1 & 1 & 1 \\ 2 & 3 & 4 \end{bmatrix}$

22.  $\begin{bmatrix} 3 & 3 & -1 \\ -2 & -2 & 1 \\ -4 & -5 & 2 \end{bmatrix}$     23.  $\begin{bmatrix} 1 & 0 & 1 \\ 1 & 1 & 2 \\ 3 & 2 & 6 \end{bmatrix}$     24.  $\begin{bmatrix} \frac{7}{2} & -2 & -2 \\ -\frac{5}{2} & 1 & 2 \\ -1 & 0 & 1 \end{bmatrix}$     25.  $\begin{bmatrix} -3 & 2 & -4 \\ -1 & 1 & -1 \\ 8 & -5 & 10 \end{bmatrix}$     26.  $\begin{bmatrix} 1 & 2 & -2 \\ -1 & 3 & 0 \\ 0 & -2 & 1 \end{bmatrix}$     27.  $\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & -1 & 0 & 0 \\ 0 & 0 & \frac{1}{3} & 0 \\ -1 & 0 & 0 & 1 \end{bmatrix}$

28.  $\begin{bmatrix} \frac{1}{2} & 0 & 0 & -\frac{1}{4} \\ 0 & 1 & 0 & 0 \\ 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & \frac{1}{2} \end{bmatrix}$     29.  $\begin{bmatrix} 6 & 5 \\ 5 & 4 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 13 \\ 10 \end{bmatrix}$     30.  $\begin{bmatrix} 7 & 5 \\ 3 & 2 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 23 \\ 10 \end{bmatrix}$     31.  $\begin{bmatrix} 1 & 3 & 4 \\ 1 & 2 & 3 \\ 1 & 4 & 3 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} -3 \\ -2 \\ -6 \end{bmatrix}$

32.  $\begin{bmatrix} 1 & 4 & -1 \\ 1 & 3 & -2 \\ 2 & 7 & -5 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 3 \\ 5 \\ 12 \end{bmatrix}$     37. a.  $\begin{bmatrix} 2 & 6 & 6 \\ 2 & 7 & 6 \\ 2 & 7 & 7 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 8 \\ 10 \\ 9 \end{bmatrix}$     b.  $\{(1, 2, -1)\}$     38. a.  $\begin{bmatrix} 1 & 2 & 5 \\ 2 & 3 & 8 \\ -1 & 1 & 2 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 2 \\ 3 \\ 3 \end{bmatrix}$

b.  $\{(-2, -3, 2)\}$     39. a.  $\begin{bmatrix} 1 & -1 & 1 \\ 0 & 2 & -1 \\ 2 & 3 & 0 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 8 \\ -7 \\ 1 \end{bmatrix}$     b.  $\{(2, -1, 5)\}$     40. a.  $\begin{bmatrix} 1 & -6 & 3 \\ 2 & -7 & 3 \\ 4 & -12 & 5 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 11 \\ 14 \\ 25 \end{bmatrix}$     b.  $\{(2, -1, 1)\}$

41. a.  $\begin{bmatrix} 1 & -1 & 2 & 0 \\ 0 & 1 & -1 & 1 \\ -1 & 1 & -1 & 2 \\ 0 & -1 & 1 & -2 \end{bmatrix} \begin{bmatrix} w \\ x \\ y \\ z \end{bmatrix} = \begin{bmatrix} -3 \\ 4 \\ 2 \\ -4 \end{bmatrix}$     42. a.  $\begin{bmatrix} 2 & 0 & 1 & 1 \\ 3 & 0 & 0 & 1 \\ -1 & 1 & -2 & 1 \\ 4 & -1 & 1 & 0 \end{bmatrix} \begin{bmatrix} w \\ x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 6 \\ 9 \\ 4 \\ 6 \end{bmatrix}$     43.  $\begin{bmatrix} \frac{1}{2}e^{-x} & -\frac{1}{2}e^{-3x} \\ \frac{1}{2}e^{-3x} & \frac{1}{2}e^{-5x} \end{bmatrix}$

44.  $\begin{bmatrix} \frac{1}{2}e^{-2x} & \frac{1}{2}e^{-3x} \\ -\frac{1}{2}e^{-x} & \frac{1}{2}e^{-2x} \end{bmatrix}$     45.  $\begin{bmatrix} \frac{1}{8} & \frac{5}{8} \\ \frac{3}{8} & \frac{7}{8} \end{bmatrix}$     46.  $\begin{bmatrix} \frac{1}{4} & \frac{5}{8} \\ \frac{1}{2} & \frac{3}{4} \end{bmatrix}$

47.  $(AB)^{-1} = \begin{bmatrix} -23 & 16 \\ 13 & -9 \end{bmatrix}$ ;  $A^{-1}B^{-1} = \begin{bmatrix} -3 & 11 \\ 8 & -29 \end{bmatrix}$ ;  $B^{-1}A^{-1} = \begin{bmatrix} -23 & 16 \\ 13 & -9 \end{bmatrix}$ ;  $(AB)^{-1} = B^{-1}A^{-1}$

48.  $(AB)^{-1} = \begin{bmatrix} -11 & 26 \\ 19 & -45 \end{bmatrix}$ ;  $A^{-1}B^{-1} = \begin{bmatrix} -79 & 101 \\ 18 & 23 \end{bmatrix}$ ;  $B^{-1}A^{-1} = \begin{bmatrix} -11 & 26 \\ 19 & -45 \end{bmatrix}$ ;  $(AB)^{-1} = B^{-1}A^{-1}$

50.  $\begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} w & x \\ y & z \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ ;  $\begin{bmatrix} aw + by & ax + bz \\ cw + dy & cx + dz \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ ;  $\begin{cases} aw + by = 1 \\ cw + dy = 0 \end{cases}$  and  $\begin{cases} ax + bz = 0 \\ cx + dz = 1 \end{cases}$ ;  
 $w = \frac{d}{ad - bc}$ ,  $x = \frac{-b}{ad - bc}$ ,  $y = \frac{-c}{ad - bc}$ ,  $z = \frac{a}{ad - bc}$ ;  $A^{-1} = \begin{bmatrix} w & x \\ y & z \end{bmatrix} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$

51. The encoded message is 27, -19, 32, -20.; The decoded message is 8, 5, 12, 16 or HELP.  
 52. The encoded message is 33, -21, 83, -61.; The decoded message is 12, 15, 22, 5 or LOVE.  
 53. The encoded message is 14, 85, -33, 4, 18, -7, -18, 19, -9.  
 54. The encoded message is -1, 59, -20, 25, 121, -48, -7, 39, -17.

67.  $\begin{bmatrix} 1 & 0 & 1 \\ 2 & 1 & 3 \\ -1 & 1 & 1 \end{bmatrix}$     68.  $\begin{bmatrix} 1 & 1 & 1 \\ 3 & 5 & 4 \\ 3 & 6 & 5 \end{bmatrix}$     69.  $\begin{bmatrix} 0 & -1 & 0 & 1 \\ -1 & -5 & 0 & 3 \\ -2 & -4 & 1 & -2 \\ -1 & -4 & 0 & 1 \end{bmatrix}$     70.  $\begin{bmatrix} \frac{3}{5} & 0 & -\frac{2}{5} & \frac{1}{5} \\ \frac{1}{5} & 0 & \frac{1}{5} & -\frac{1}{10} \\ 0 & 1 & 0 & 0 \\ -\frac{6}{5} & 0 & \frac{4}{5} & \frac{1}{10} \end{bmatrix}$

71.  $\{(2, 3, -5)\}$     72.  $\{(1, 2, -1)\}$     73.  $\{(1, 2, -1)\}$     74.  $\{(5, 4, -1)\}$     79. does not make sense    86. false

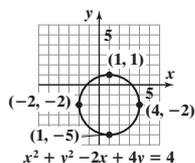

**Exercise Set 8.5**

29.  $\{(-5, -2, 7)\}$     30.  $\{(-2, 3, 4)\}$     31.  $\{(2, -3, 4)\}$     32.  $\{(2, 3, 5)\}$     33.  $\{(3, -1, 2)\}$     34.  $\{(-1, 3, 2)\}$     35.  $\{(2, 3, 1)\}$     36.  $\{(0, 4, 2)\}$
53. The equation of the line is  $y = -\frac{11}{5}x + \frac{8}{5}$ .    54. The equation of the line is  $y = \frac{1}{3}x + \frac{10}{3}$ .    64. -2100    65. 13,200
68. does not make sense    70. does not make sense    71. d. Each determinant has zeros below the main diagonal and  $a$ 's everywhere else.  
 e. Each determinant equals  $a$  raised to the power equal to the order of the determinant.    73. The sign of the value is changed when 2 columns are interchanged in a 2nd order determinant.    74. For both systems,  $x = \frac{c_1b_2 - c_2b_1}{a_1b_2 - a_2b_1}$  and  $y = \frac{a_1c_2 - a_2c_1}{a_1b_2 - a_2b_1}$ .

## AA90 Answers to Selected Exercises

$$75. \begin{vmatrix} x & y & 1 \\ x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \end{vmatrix} = x(y_1 - y_2) - y(x_1 - x_2) + (x_1y_2 - x_2y_1) = 0; \text{ solving for } y, y = \frac{y_1 - y_2}{x_1 - x_2}x + \frac{x_1y_2 - x_2y_1}{x_1 - x_2}, \text{ and } m = \frac{y_1 - y_2}{x_1 - x_2} \text{ and } b = \frac{x_1y_2 - x_2y_1}{x_1 - x_2}.$$

79.

## Chapter 8 Review Exercises

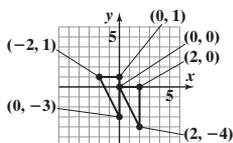

3.  $\{(1, 3, -4)\}$     4.  $\{(-2, -1, 0)\}$     9.  $\{(2t + 4, t + 1, t)\}$     12. a.  $\begin{cases} x + z = 750 \\ y - z = -250 \\ x + y = 500 \end{cases}$     b.  $\{(-t + 750, t - 250, t)\}$     14.  $\begin{bmatrix} 0 & 2 & 3 \\ 8 & 1 & 3 \end{bmatrix}$

15.  $\begin{bmatrix} 0 & -4 \\ 6 & 4 \\ 2 & -10 \end{bmatrix}$     16.  $\begin{bmatrix} -4 & 4 & -1 \\ -2 & -5 & 5 \end{bmatrix}$     17. Not possible since  $B$  is  $3 \times 2$  and  $C$  is  $3 \times 3$ .    18.  $\begin{bmatrix} 2 & 3 & 8 \\ 21 & 5 & 5 \end{bmatrix}$     19.  $\begin{bmatrix} -12 & 14 & 0 \\ 2 & -14 & 18 \end{bmatrix}$

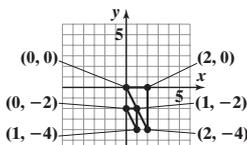

20.  $\begin{bmatrix} 0 & -10 & -15 \\ -40 & -5 & -15 \end{bmatrix}$     21.  $\begin{bmatrix} -1 & -16 \\ 8 & 1 \end{bmatrix}$     22.  $\begin{bmatrix} -10 & -6 & 2 \\ 16 & 3 & 4 \\ -23 & -16 & 7 \end{bmatrix}$     23.  $\begin{bmatrix} -6 & 4 & -8 \\ 0 & 5 & 11 \\ -17 & 13 & -19 \end{bmatrix}$     24.  $\begin{bmatrix} 10 & 5 \\ -2 & -30 \end{bmatrix}$

25. Not possible since  $AB$  is  $2 \times 2$  and  $BA$  is  $3 \times 3$ .    26.  $\begin{bmatrix} 7 & 6 & 5 \\ 2 & -1 & 11 \end{bmatrix}$     27.  $\begin{bmatrix} -6 & -22 & -40 \\ 9 & 43 & 58 \\ -14 & -48 & -94 \end{bmatrix}$     29.  $\begin{bmatrix} 2 & 2 & 2 \\ 1 & 2 & 1 \\ 1 & 2 & 1 \end{bmatrix}$     30.  $\begin{bmatrix} 1 & 1 & 1 \\ -1 & 1 & -1 \\ -1 & 1 & -1 \end{bmatrix}$

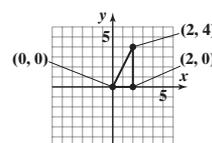

31.  $\begin{bmatrix} -2 & 0 & 0 \\ 1 & 1 & -3 \end{bmatrix}$

32.  $\begin{bmatrix} 0 & 1 & 1 \\ -2 & -2 & -4 \end{bmatrix}$

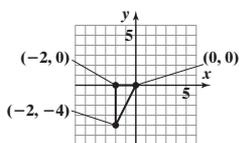

33.  $\begin{bmatrix} 0 & 2 & 2 \\ 0 & 0 & 4 \end{bmatrix}$

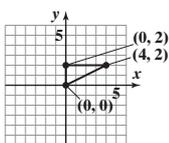

The effect is a reflection over the  $x$ -axis

34.  $\begin{bmatrix} 0 & -2 & -2 \\ 0 & 0 & -4 \end{bmatrix}$

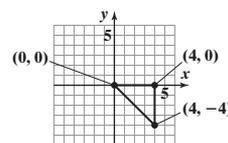

The effect is a reflection over the  $y$ -axis.

35.  $\begin{bmatrix} 0 & 0 & 4 \\ 0 & 2 & 2 \end{bmatrix}$

The effect is a  $90^\circ$  counterclockwise rotation about the origin.

36.  $\begin{bmatrix} 0 & 4 & 4 \\ 0 & 0 & -4 \end{bmatrix}$

The effect is a horizontal stretch by a factor of 2.

37.  $AB = \begin{bmatrix} 1 & 7 \\ 0 & 5 \end{bmatrix}; BA = \begin{bmatrix} 1 & 0 \\ 1 & 5 \end{bmatrix}; B \neq A^{-1}$     41.  $\begin{bmatrix} 3 & 0 & -2 \\ -6 & 1 & 4 \\ 1 & 0 & -1 \end{bmatrix}$     42.  $\begin{bmatrix} 8 & -8 & 5 \\ -3 & 2 & -1 \\ -1 & -1 & 1 \end{bmatrix}$     43. a.  $\begin{bmatrix} 1 & 1 & 2 \\ 0 & 1 & 3 \\ 3 & 0 & -2 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 7 \\ -2 \\ 0 \end{bmatrix}$

b.  $\{(-18, 79, -27)\}$     44. a.  $\begin{bmatrix} 1 & -1 & 2 \\ 0 & 1 & -1 \\ 1 & 0 & 2 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 12 \\ -5 \\ 10 \end{bmatrix}$     b.  $\{(4, -2, 3)\}$     45. The encoded message is 96, 135, 46, 63; The decoded

message is 18, 21, 12, 5 or RULE.    54.  $\{(23, -12, 3)\}$     55.  $\{(-3, 2, 1)\}$     56.  $a = \frac{5}{8}; b = -50; c = 1150$ ; 30- and 50-year-olds are involved in an average of 212.5 automobile accidents per day.

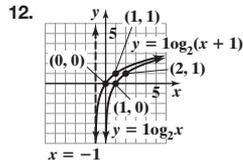

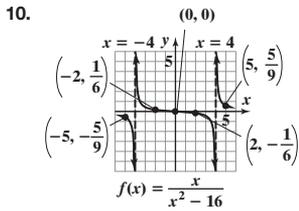

## Chapter 8 Test

3.  $\begin{bmatrix} 5 & 4 \\ 1 & 11 \end{bmatrix}$     4.  $\begin{bmatrix} 5 & -2 \\ 1 & -1 \\ 4 & -1 \end{bmatrix}$     5.  $\begin{bmatrix} 3 & -2 \\ 5 & -5 \\ 1 & 1 \\ 5 & 5 \end{bmatrix}$     6.  $\begin{bmatrix} -1 & 2 \\ -5 & 4 \end{bmatrix}$     8. a.  $\begin{bmatrix} 3 & 5 \\ 2 & -3 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 9 \\ -13 \end{bmatrix}$     b.  $\begin{bmatrix} 3 & 5 \\ 19 & 19 \\ 2 & -3 \\ 19 & 19 \end{bmatrix}$

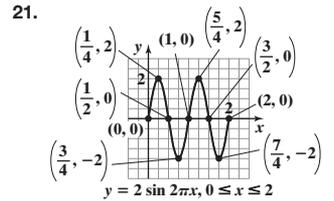

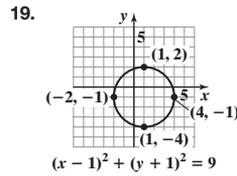

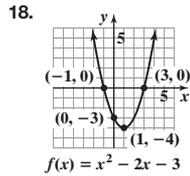

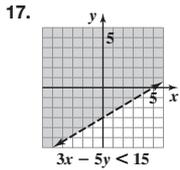

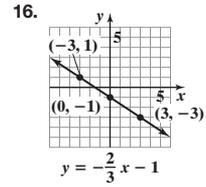

**Cumulative Review Exercises (Chapters P–8)**

1.  $\left\{ \frac{-1 + \sqrt{33}}{4}, \frac{-1 - \sqrt{33}}{4} \right\}$

15.  $\frac{8}{x-3} + \frac{-2}{x-2} + \frac{-3}{x+2}$

23.  $\frac{\cos 2x}{\cos x - \sin x} = \frac{\cos^2 x - \sin^2 x}{\cos x - \sin x} = \frac{(\cos x + \sin x)(\cos x - \sin x)}{\cos x - \sin x} = \cos x + \sin x$

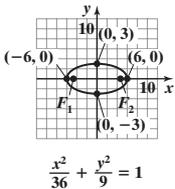

24.  $\frac{3\pi}{2}$       25.  $2i - 13j$

**CHAPTER 9**

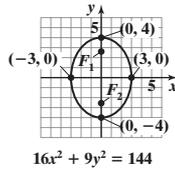

**Section 9.1**

**Check Point Exercises**

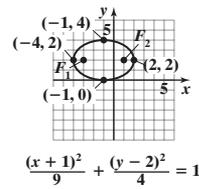

1. foci at  $(-3\sqrt{3}, 0)$  and  $(3\sqrt{3}, 0)$

2. foci at  $(0, -\sqrt{7})$  and  $(0, \sqrt{7})$

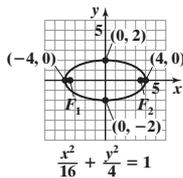

4. foci at  $(-1 - \sqrt{5}, 2)$  and  $(-1 + \sqrt{5}, 2)$

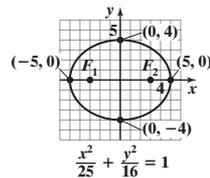

**Exercise Set 9.1**

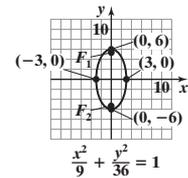

1. foci at  $(-2\sqrt{3}, 0)$  and  $(2\sqrt{3}, 0)$

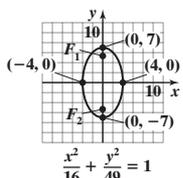

2. foci at  $(-3, 0)$  and  $(3, 0)$

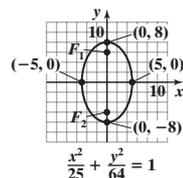

3. foci at  $(0, -3\sqrt{3})$  and  $(0, 3\sqrt{3})$

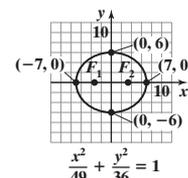

4. foci at  $(0, -\sqrt{33})$  and  $(0, \sqrt{33})$

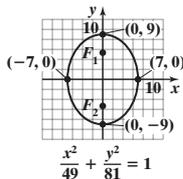

5. foci at  $(0, -\sqrt{39})$  and  $(0, \sqrt{39})$

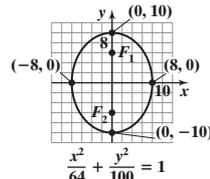

6. foci at  $(-\sqrt{13}, 0)$  and  $(\sqrt{13}, 0)$

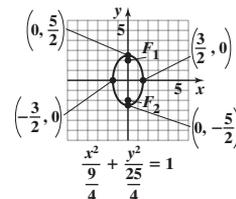

7. foci at  $(0, -4\sqrt{2})$  and  $(0, 4\sqrt{2})$

8. foci at  $(0, -6)$  and  $(0, 6)$

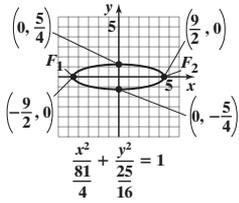

9. foci at  $(0, -2)$  and  $(0, 2)$

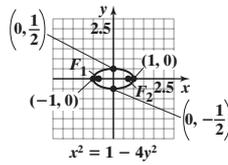

**AA92** Answers to Selected Exercises

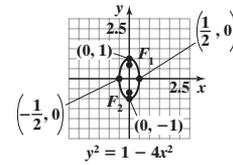

10. foci at  $(-\frac{\sqrt{299}}{4}, 0)$  and  $(\frac{\sqrt{299}}{4}, 0)$

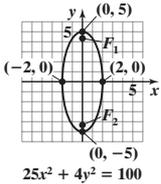

11. foci at  $(-\frac{\sqrt{3}}{2}, 0)$  and  $(\frac{\sqrt{3}}{2}, 0)$

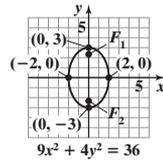

12. foci at  $(0, -\frac{\sqrt{3}}{2})$  and  $(0, \frac{\sqrt{3}}{2})$

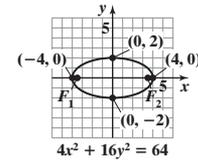

13. foci at  $(0, -\sqrt{21})$  and  $(0, \sqrt{21})$

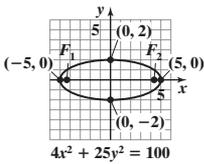

14. foci at  $(0, -\sqrt{5})$  and  $(0, \sqrt{5})$

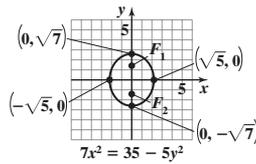

15. foci at  $(-2\sqrt{3}, 0)$  and  $(2\sqrt{3}, 0)$

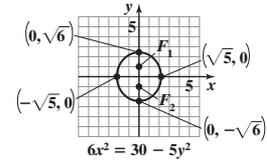

16. foci at  $(-\sqrt{21}, 0)$  and  $(\sqrt{21}, 0)$

17. foci at  $(0, -\sqrt{2})$  and  $(0, \sqrt{2})$

18. foci at  $(0, -1)$  and  $(0, 1)$

19.  $\frac{x^2}{4} + \frac{y^2}{1} = 1$ ; foci at  $(-\sqrt{3}, 0)$  and  $(\sqrt{3}, 0)$

20.  $\frac{x^2}{16} + \frac{y^2}{4} = 1$ ; foci at  $(-2\sqrt{3}, 0)$  and  $(2\sqrt{3}, 0)$

21.  $\frac{x^2}{1} + \frac{y^2}{4} = 1$ ; foci at  $(0, \sqrt{3})$  and  $(0, -\sqrt{3})$

22.  $\frac{x^2}{4} + \frac{y^2}{16} = 1$ ; foci at  $(0, 2\sqrt{3})$  and  $(0, -2\sqrt{3})$

23.  $\frac{(x+1)^2}{4} + \frac{(y-1)^2}{1} = 1$ ; foci at  $(-1 - \sqrt{3}, 1)$  and  $(-1 + \sqrt{3}, 1)$

24.  $\frac{(x+1)^2}{1} + \frac{(y+1)^2}{4} = 1$ ; foci at  $(-1, -1 - \sqrt{3})$  and  $(-1, -1 + \sqrt{3})$

25.  $\frac{x^2}{64} + \frac{y^2}{39} = 1$

26.  $\frac{x^2}{36} + \frac{y^2}{32} = 1$

27.  $\frac{x^2}{33} + \frac{y^2}{49} = 1$

28.  $\frac{x^2}{7} + \frac{y^2}{16} = 1$

29.  $\frac{x^2}{13} + \frac{y^2}{9} = 1$

30.  $\frac{x^2}{4} + \frac{y^2}{8} = 1$

31.  $\frac{x^2}{16} + \frac{y^2}{4} = 1$

32.  $\frac{x^2}{36} + \frac{y^2}{9} = 1$

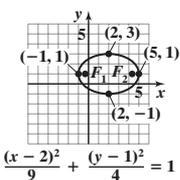

33.  $\frac{(x+2)^2}{4} + \frac{(y-3)^2}{25} = 1$

34.  $\frac{(x-2)^2}{25} + \frac{(y+3)^2}{100} = 1$

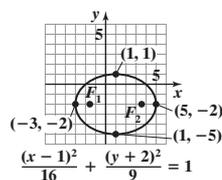

35.  $\frac{(x-7)^2}{4} + \frac{(y-6)^2}{9} = 1$

36.  $\frac{(x-5)^2}{9} + \frac{(y-2)^2}{1} = 1$

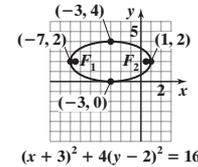

37. foci at  $(2 - \sqrt{5}, 1)$  and  $(2 + \sqrt{5}, 1)$

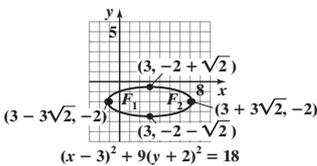

38. foci at  $(1 - \sqrt{7}, -2)$  and  $(1 + \sqrt{7}, -2)$

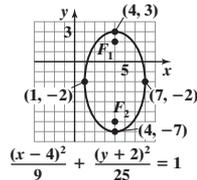

39. foci at  $(-3 - 2\sqrt{3}, 2)$  and  $(-3 + 2\sqrt{3}, 2)$

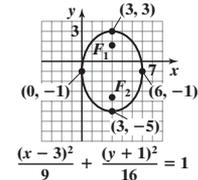

40. foci at  $(-1, -2)$  and  $(7, -2)$

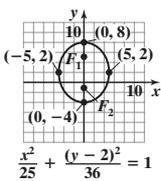

41. foci at  $(4, 2)$  and  $(4, -6)$

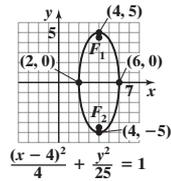

42. foci at  $(3, -1 + \sqrt{7})$  and  $(3, -1 - \sqrt{7})$

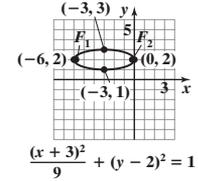

43. foci at  $(0, 2 + \sqrt{11})$ ,  $(0, 2 - \sqrt{11})$

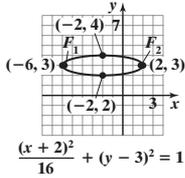

44. foci at  $(4, \sqrt{21})$  and  $(4, -\sqrt{21})$

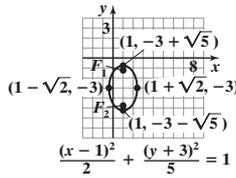

45. foci at  $(-3 - 2\sqrt{2}, 2)$  and  $(-3 + 2\sqrt{2}, 2)$

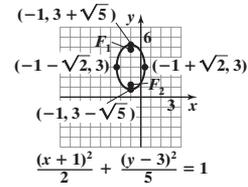

46. foci at  $(-2 - \sqrt{15}, 3)$  and  $(-2 + \sqrt{15}, 3)$

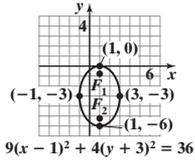

47. foci at  $(1, -3 + \sqrt{3})$  and  $(1, -3 - \sqrt{3})$

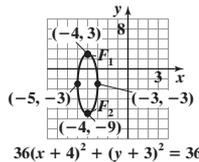

48. foci at  $(-1, 3 + \sqrt{3})$  and  $(-1, 3 - \sqrt{3})$

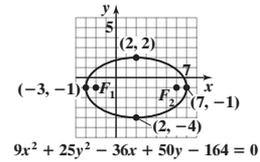

49. foci at  $(1, -3 + \sqrt{5})$  and  $(1, -3 - \sqrt{5})$

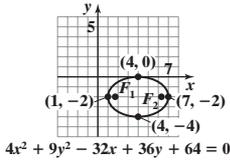

50. foci at  $(-4, -3 + \sqrt{35})$  and  $(-4, -3 - \sqrt{35})$

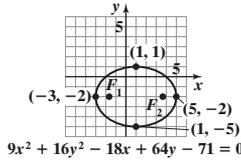

51.  $\frac{(x-2)^2}{25} + \frac{(y+1)^2}{9} = 1$   
foci at  $(-2, -1)$  and  $(6, -1)$

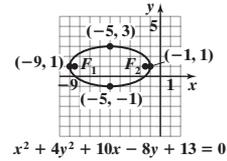

52.  $\frac{(x-4)^2}{9} + \frac{(y+2)^2}{4} = 1$   
foci at  $(4 - \sqrt{5}, -2)$  and  $(4 + \sqrt{5}, -2)$

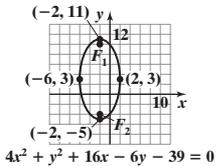

53.  $\frac{(x-1)^2}{16} + \frac{(y+2)^2}{9} = 1$   
foci at  $(1 - \sqrt{7}, -2)$  and  $(1 + \sqrt{7}, -2)$

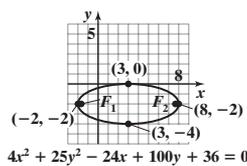

54.  $\frac{(x+5)^2}{16} + \frac{(y-1)^2}{4} = 1$   
foci at  $(-5 - 2\sqrt{3}, 1)$  and  $(-5 + 2\sqrt{3}, 1)$

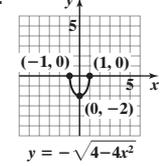

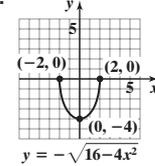

55.  $\frac{(x+2)^2}{16} + \frac{(y-3)^2}{64} = 1$   
foci at  $(-2, 3 + 4\sqrt{3})$  and  $(-2, 3 - 4\sqrt{3})$

56.  $\frac{(x-3)^2}{25} + \frac{(y+2)^2}{4} = 1$   
foci at  $(3 - \sqrt{21}, -2)$  and  $(3 + \sqrt{21}, -2)$

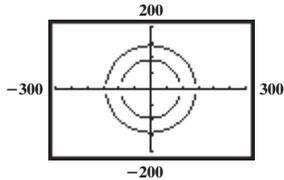

57.  $\{(0, -1), (0, 1)\}$     58.  $\{(0, -5), (0, 5)\}$   
59.  $\{(0, 3)\}$     60.  $\{(-2, 0)\}$   
61.  $\{(0, -2), (1, 0)\}$     62.  $\emptyset$   
63.    64.

68. One person should stand at 10 feet along the 100 foot width and the other person should stand at 90 feet.

78. Earth's orbit:  $\frac{x^2}{8649} + \frac{y^2}{8630.41} = 1$   
Mars's orbit:  $\frac{x^2}{20,093.0625} + \frac{y^2}{19,390.5625} = 1$

81. does not make sense    83.  $\frac{x^2}{36} + \frac{y^2}{36} = 1$

86.  $\frac{c}{a}$  is close to zero when  $c$  is very small. This happens when  $a$  and  $b$  are nearly equal, or when the shape of the graph is nearly circular.

87.  $\frac{x^2}{9} - \frac{y^2}{4} = 1$ ; Terms are separated by subtraction rather than addition.

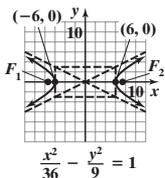

88. b. The equation  $y^2 = -9$  has no real solutions.

89. b. The equation  $x^2 = -16$  has no real solutions.

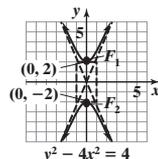

Section 9.2

Check Point Exercises

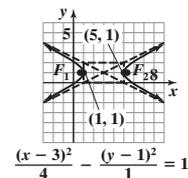

3. foci at  $(-3\sqrt{5}, 0)$  and  $(3\sqrt{5}, 0)$   
asymptotes:  $y = \pm \frac{1}{2}x$

4. foci at  $(0, \sqrt{5})$  and  $(0, -\sqrt{5})$   
asymptotes:  $y = \pm 2x$

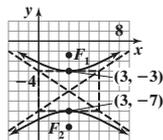

5. foci at  $(3 - \sqrt{5}, 1)$  and  $(3 + \sqrt{5}, 1)$   
asymptotes:  $(y - 1) = \pm \frac{1}{2}(x - 3)$

# AA94 Answers to Selected Exercises

6. foci at  $(3, -5 + \sqrt{13})$  and  $(3, -5 - \sqrt{13})$

asymptotes:  $(y + 5) = \pm \frac{2}{3}(x - 3)$

$$4x^2 - 24x - 9y^2 - 90y - 153 = 0$$

## Exercise Set 9.2

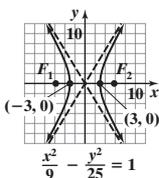

1. vertices at  $(2, 0)$  and  $(-2, 0)$ ; foci at  $(\sqrt{5}, 0)$  and  $(-\sqrt{5}, 0)$ ; graph (b)  
 2. vertices at  $(1, 0)$  and  $(-1, 0)$ ; foci at  $(\sqrt{5}, 0)$  and  $(-\sqrt{5}, 0)$ ; graph (d)  
 3. vertices at  $(0, 2)$  and  $(0, -2)$ ; foci at  $(0, \sqrt{5})$  and  $(0, -\sqrt{5})$ ; graph (a)  
 4. vertices at  $(0, 1)$  and  $(0, -1)$ ; foci at  $(0, \sqrt{5})$  and  $(0, -\sqrt{5})$ ; graph (c)

5.  $y^2 - \frac{x^2}{8} = 1$     6.  $\frac{y^2}{4} - \frac{x^2}{32} = 1$     7.  $\frac{x^2}{9} - \frac{y^2}{7} = 1$     8.  $\frac{x^2}{25} - \frac{y^2}{24} = 1$     9.  $\frac{y^2}{36} - \frac{x^2}{9} = 1$     10.  $\frac{x^2}{16} - \frac{y^2}{64} = 1$

asymptotes:  $y = \pm \frac{1}{2}x$

$$4y^2 - x^2 = 1$$

20. foci:  $(0, \pm \frac{\sqrt{10}}{3})$

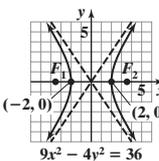

asymptotes:  $y = \pm \frac{1}{3}x$

$$9y^2 - x^2 = 1$$

21. foci:  $(\pm\sqrt{13}, 0)$

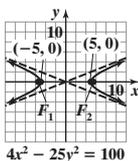

asymptotes:  $y = \pm \frac{3}{2}x$

$$9x^2 - 4y^2 = 36$$

22. foci:  $(\pm\sqrt{29}, 0)$

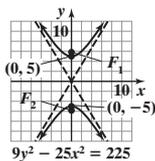

asymptotes:  $y = \pm \frac{2}{5}x$

$$4x^2 - 25y^2 = 100$$

23. foci:  $(0, \pm\sqrt{34})$

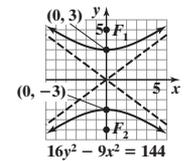

asymptotes:  $y = \pm \frac{5}{3}x$

$$9y^2 - 25x^2 = 225$$

24. foci:  $(0, \pm 5)$

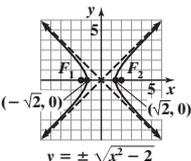

asymptotes:  $y = \pm \frac{3}{4}x$

$$16y^2 - 9x^2 = 144$$

25. foci:  $(\pm 2, 0)$

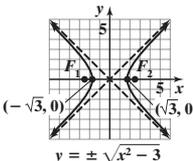

asymptotes:  $y = \pm x$

$$y = \pm \sqrt{x^2 - 2}$$

26. foci:  $(\pm\sqrt{6}, 0)$

asymptotes:  $y = \pm x$

$$y = \pm \sqrt{x^2 - 3}$$

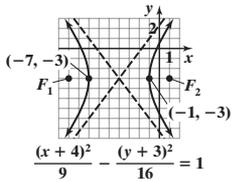

27.  $\frac{x^2}{9} - \frac{y^2}{25} = 1$

30.  $\frac{y^2}{25} - \frac{x^2}{9} = 1$

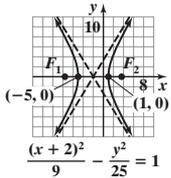

31.  $\frac{(x-2)^2}{4} - \frac{(y+3)^2}{9} = 1$

32.  $\frac{(x+1)^2}{4} - \frac{(y+2)^2}{4} = 1$

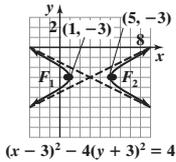

33. foci:  $(-9, -3), (1, -3)$   
 asymptotes:  $(y + 3) = \pm \frac{4}{3}(x + 4)$

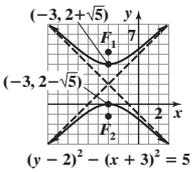

36. foci:  $(-2 \pm \sqrt{34}, 0)$   
 asymptotes:  $y = \pm \frac{5}{3}(x + 2)$

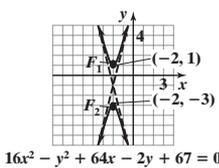

39. foci:  $(3 \pm \sqrt{5}, -3)$   
 asymptotes:  $(y + 3) = \pm \frac{1}{2}(x - 3)$

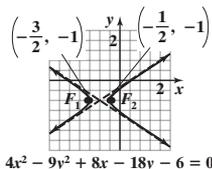

42. foci:  $(-3, 2 \pm \sqrt{10})$   
 asymptotes:  $(y - 2) = \pm (x + 3)$

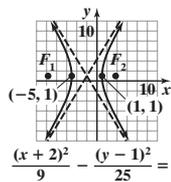

45.  $\frac{(y+1)^2}{4} - \frac{(x+2)^2}{0.25} = 1$   
 foci:  $(-2, -1 \pm \sqrt{4.25})$   
 asymptotes:  $(y + 1) = \pm 4(x + 2)$

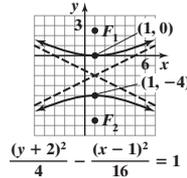

48.  $\frac{(x+1)^2}{\frac{1}{4}} - \frac{(y+1)^2}{\frac{1}{9}} = 1$   
 foci:  $(-1 \pm \frac{\sqrt{13}}{6}, -1)$   
 asymptotes:  $(y + 1) = \pm \frac{2}{3}(x + 1)$

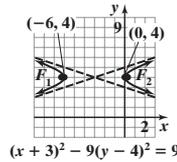

34. foci:  $(-2 \pm \sqrt{34}, 1)$   
 asymptotes:  $(y - 1) = \pm \frac{5}{3}(x + 2)$

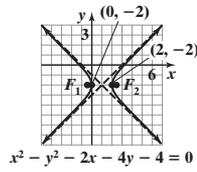

37. foci:  $(1, -2 \pm 2\sqrt{5})$   
 asymptotes:  $(y + 2) = \pm \frac{1}{2}(x - 1)$

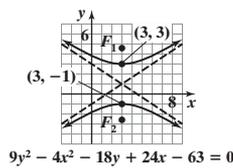

40. foci:  $(-3 \pm \sqrt{10}, 4)$   
 asymptotes:  $(y - 4) = \pm \frac{1}{3}(x + 3)$

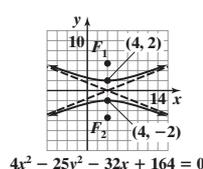

43.  $(x - 1)^2 - (y + 2)^2 = 1$   
 foci:  $(1 \pm \sqrt{2}, -2)$   
 asymptotes:  $(y + 2) = \pm (x - 1)$

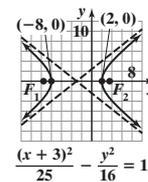

46.  $\frac{(y-1)^2}{4} - \frac{(x-3)^2}{9} = 1$   
 foci:  $(3, 1 \pm \sqrt{13})$   
 asymptotes:  $(y - 1) = \pm \frac{2}{3}(x - 3)$

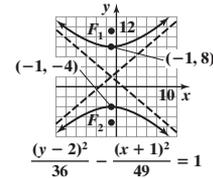

49.  $\frac{y^2}{4} - \frac{(x-4)^2}{25} = 1$   
 foci:  $(4, \pm \sqrt{29})$   
 asymptotes:  $y = \pm \frac{2}{5}(x - 4)$

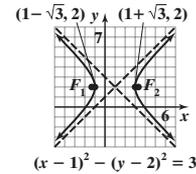

35. foci:  $(-3 \pm \sqrt{41}, 0)$   
 asymptotes:  $y = \pm \frac{4}{5}(x + 3)$

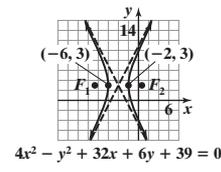

38. foci:  $(-1, 2 \pm \sqrt{85})$   
 asymptotes:  $(y - 2) = \pm \frac{6}{7}(x + 1)$

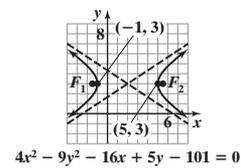

41. foci:  $(1 \pm \sqrt{6}, 2)$   
 asymptotes:  $(y - 2) = \pm (x - 1)$

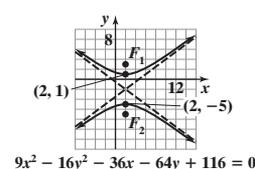

44.  $\frac{(x+4)^2}{4} - \frac{(y-3)^2}{16} = 1$   
 foci:  $(-4 \pm 2\sqrt{5}, 3)$   
 asymptotes:  $(y - 3) = \pm 2(x + 4)$

47.  $\frac{(x-2)^2}{9} - \frac{(y-3)^2}{4} = 1$   
 foci:  $(2 \pm \sqrt{13}, 3)$   
 asymptotes:  $(y - 3) = \pm \frac{2}{3}(x - 2)$

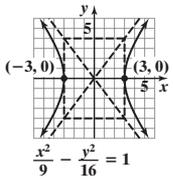

50.  $\frac{(y+2)^2}{9} - \frac{(x-2)^2}{16} = 1$   
 foci:  $(2, -7), (2, 3)$   
 asymptotes:  $(y + 2) = \pm \frac{3}{4}(x - 2)$

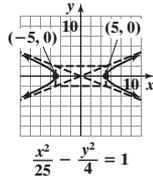

**AA96** Answers to Selected Exercises

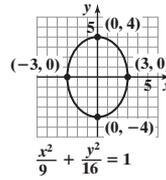

51. domain:  $(-\infty, -3] \cup [3, \infty)$   
range:  $(-\infty, \infty)$

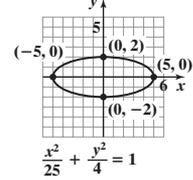

52. domain:  $(-\infty, -5] \cup [5, \infty)$   
range:  $(-\infty, \infty)$

range:  $[-4, 4]$

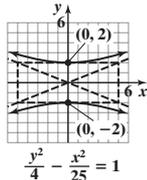

54. domain:  $[-5, 5]$   
range:  $[-2, 2]$

55. domain:  $(-\infty, \infty)$   
range:  $(-\infty, -4] \cup [4, \infty)$

56. domain:  $(-\infty, \infty)$   
range:  $(-\infty, -2] \cup [2, \infty)$

61. If  $M_1$  is located 2640 feet to the right of the origin on the  $x$ -axis, the explosion is located on the right branch of the hyperbola given by the equation  $\frac{x^2}{1,210,000} - \frac{y^2}{5,759,600} = 1$ .

62. a.  $\frac{x^2}{5625} - \frac{y^2}{4375} = 1$

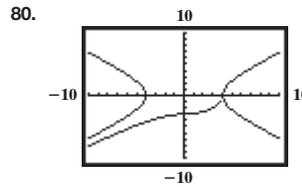

65. a. ellipse      b.  $x^2 + 4y^2 = 4$

66. a. hyperbola      b.  $x^2 - y^2 = 1$

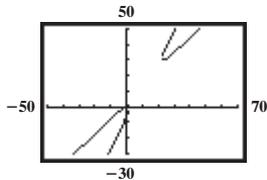

77. ; no; two intersecting lines

78. Answers may vary depending on the choice for  $a$  and  $b$ . For  $a = 2, b = 3$ , a graph is shown. The two graphs open right/left and up/down, sharing a common set of asymptotes given by  $y = \pm \frac{b}{a}x$ .

79.  $2y^2 + (10 - 6x)y + (4x^2 - 3x - 6) = 0$   
 $y = \frac{3x - 5 \pm \sqrt{x^2 - 24x + 37}}{2}$

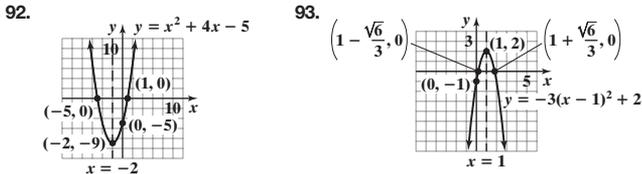

The second equation is a function with domain  $(-\infty, \infty)$ .

The  $xy$ -term rotates the hyperbola.

81. does not make sense    82. makes sense    85. false    89.  $\frac{c}{a}$  will be large when  $a$  is small. When this happens, the asymptotes will be nearly vertical.

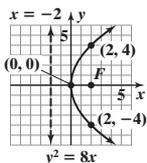

90.  $\frac{y^2}{36} - \frac{(x-5)^2}{20} = 1$     91. Any hyperbola where  $a = b$ , such as  $\frac{x^2}{4} - \frac{y^2}{4} = 1$ , has perpendicular asymptotes.

21.  $x = \frac{3x' - 4y'}{5}$ ;  $y = \frac{4x' + 3y'}{5}$     22.  $x = \frac{3x' - 4y'}{5}$ ;  $y = \frac{4x' + 3y'}{5}$     23.  $x = \sqrt{5}\left(\frac{2x' - y'}{5}\right)$ ;  $y = \sqrt{5}\left(\frac{x' + 2y'}{5}\right)$

24.  $x = \sqrt{10}\left(\frac{3x' - y'}{10}\right)$ ;  $y = \sqrt{10}\left(\frac{x' + 3y'}{10}\right)$     25.  $x = \frac{4x' - 3y'}{5}$ ;  $y = \frac{3x' + 4y'}{5}$     26.  $x = \sqrt{10}\left(\frac{3x' - y'}{10}\right)$ ;  $y = \sqrt{10}\left(\frac{x' + 3y'}{10}\right)$

27. a.  $3x'^2 + y'^2 = 20$

b.  $\frac{x'^2}{\frac{20}{3}} + \frac{y'^2}{20} = 1$

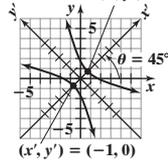

c.  $(x', y') \approx (0, 4.47)$

28. a.  $3x'^2 - y'^2 = 3$

b.  $\frac{x'^2}{1} - \frac{y'^2}{3} = 1$

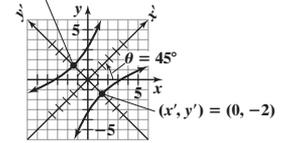

c.  $(x', y') = (1, 0)$

29. a.  $-4x'^2 + 16y'^2 = 64$

b.  $\frac{y'^2}{4} - \frac{x'^2}{16} = 1$

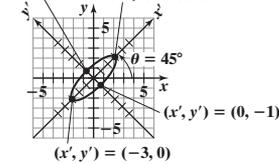

c.  $(x', y') = (0, 2)$

30. a.  $x'^2 + 9y'^2 = 9$

b.  $\frac{x'^2}{9} + \frac{y'^2}{1} = 1$

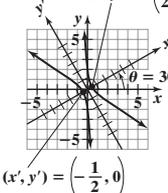

c.  $(x', y') = (0, 1)$

31. a.  $64x'^2 - 16y'^2 = 16$

b.  $\frac{x'^2}{\frac{1}{4}} - \frac{y'^2}{1} = 1$

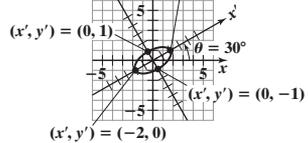

c.  $(x', y') = \left(\frac{1}{2}, 0\right)$

32. a.  $16x'^2 + 64y'^2 = 64$

b.  $\frac{x'^2}{4} + \frac{y'^2}{1} = 1$

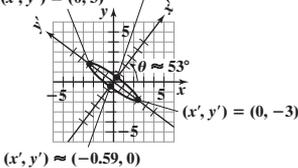

c.  $(x', y') = (2, 0)$

33. a.  $650x'^2 + 25y'^2 = 225$

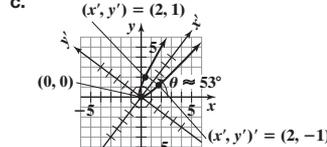

b.  $\frac{x'^2}{\frac{9}{26}} + \frac{y'^2}{9} = 1$

c.  $(x', y') = (0, 3)$

34. a.  $2y'^2 - x' = 0$

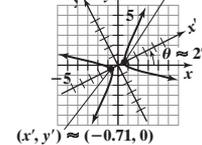

b.  $y'^2 = \frac{1}{2}x'$

35. a.  $50x'^2 - 75y'^2 = 25$

b.  $\frac{x'^2}{\frac{1}{2}} - \frac{y'^2}{\frac{1}{3}} = 1$

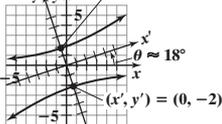

c.  $(x', y') \approx (0.71, 0)$

36. a.  $x'^2 - 9y'^2 = -36$

b.  $\frac{y'^2}{4} - \frac{x'^2}{36} = 1$

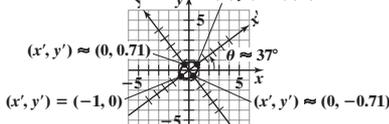

c.  $(x', y') = (0, 2)$

37. a.  $625x'^2 + 1250y'^2 = 625$

b.  $\frac{x'^2}{1} + \frac{y'^2}{\frac{1}{2}} = 1$

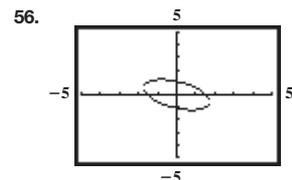

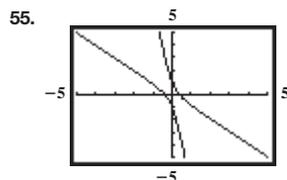

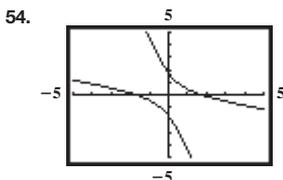

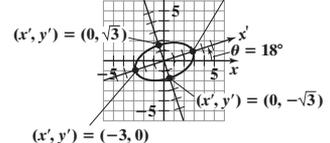

c.  $(x', y') = (1, 0)$

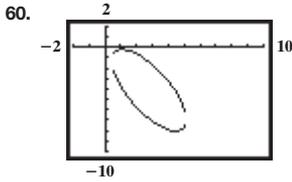

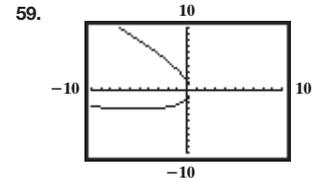

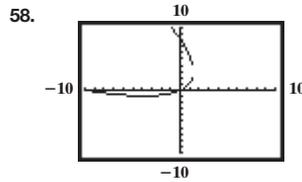

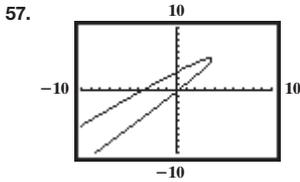

38. a.  $500x'^2 + 1500y'^2 = 4500$

b.  $\frac{x'^2}{9} + \frac{y'^2}{3} = 1$

c.  $(x', y') = (3, 0)$

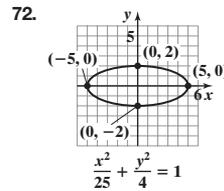

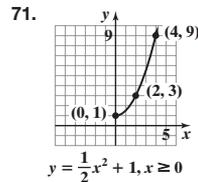

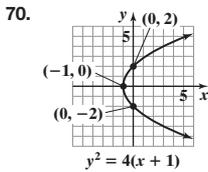

66. In a rotated  $x'y'$ -system,  $x$  and  $y$  are replaced with  $x'$  and  $y'$ , respectively.

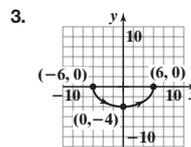

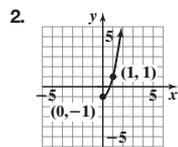

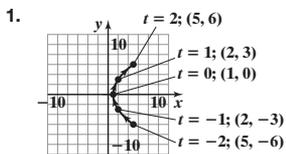

67.  $A' = A \cos^2 \theta + B \sin \theta \cos \theta + C \sin^2 \theta$   
 $C' = A \sin^2 \theta - B \sin \theta \cos \theta + C \cos^2 \theta$   
 $A' + C' = A \cos^2 \theta + B \sin \theta \cos \theta + C \sin^2 \theta + A \sin^2 \theta - B \sin \theta \cos \theta + C \cos^2 \theta$   
 $= A(\cos^2 \theta + \sin^2 \theta) + B(\sin \theta \cos \theta - \sin \theta \cos \theta) + C(\sin^2 \theta + \cos^2 \theta)$   
 $= A(1) + B(0) + C(1)$   
 $= A + C$

68.  $B'^2 - 4A'C'$   
 $= [B(\cos^2 \theta - \sin^2 \theta) + 2(C - A)(\sin \theta \cos \theta)]^2 - 4[A \cos^2 \theta + B \sin \theta \cos \theta + C \sin^2 \theta][A \sin^2 \theta - B \sin \theta \cos \theta + C \cos^2 \theta]$   
 $= 4A^2[(\sin \theta \cos \theta)^2 - (\sin \theta \cos \theta)^2] + B^2[\cos^4 \theta + 2 \cos^2 \theta \sin^2 \theta + \sin^4 \theta] + 4C^2[(\sin \theta \cos \theta)^2 - (\sin \theta \cos \theta)^2]$   
 $+ 4AB[\cos^2 \theta(\sin \theta \cos \theta) - \sin^2 \theta(\sin \theta \cos \theta) - (\sin \theta \cos \theta)(\cos^2 \theta - \sin^2 \theta)]$   
 $- 4AC[\cos^4 \theta + 2(\sin \theta \cos \theta)^2 + \sin^4 \theta] + 4BC[(\sin \theta \cos \theta)(\cos^2 \theta - \sin^2 \theta) - (\sin \theta \cos \theta)(\cos^2 \theta - \sin^2 \theta)]$   
 $= 4A^2[0] + B^2[(\cos^2 \theta + \sin^2 \theta)^2] + 4C^2[0] + 4AB[\sin \theta \cos \theta(\cos^2 \theta - \sin^2 \theta - \cos^2 \theta + \sin^2 \theta)]$   
 $- 4AC[(\cos^2 \theta + \sin^2 \theta)^2] + 4BC[\sin \theta \cos \theta(\cos^2 \theta - \sin^2 \theta - \cos^2 \theta + \sin^2 \theta)]$   
 $= B^2[1^2] + 4AB[0] - 4AC[1^2] + 4BC[0] = B^2 - 4AC$

Check Point Exercises

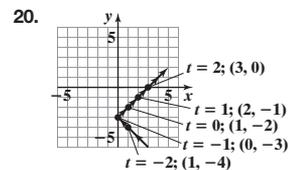

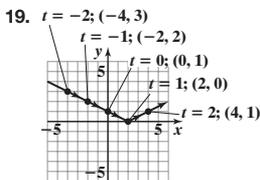

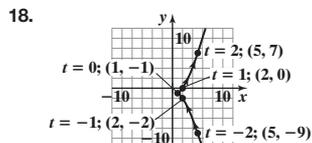

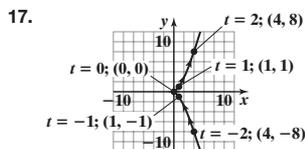

Exercise Set 9.5

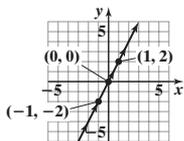

7.  $(60\sqrt{3}, 1)$     8.  $(80\sqrt{2}, -58 + 80\sqrt{2})$

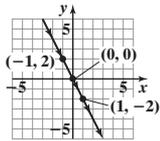

AA102 Answers to Selected Exercises

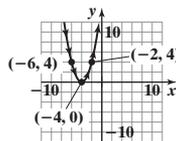

21.  $y = 2x$

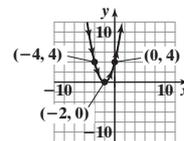

22.  $y = -2x$

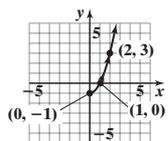

23.  $y = (x + 4)^2$

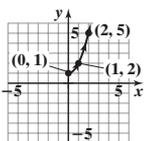

24.  $y = (x + 2)^2$

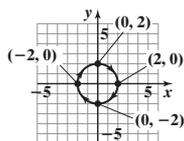

25.  $y = x^2 - 1, x \geq 0$

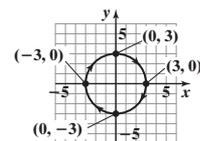

26.  $y = x^2 + 1, x \geq 0$

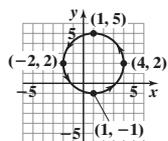

27.  $\frac{x^2}{4} + \frac{y^2}{4} = 1$

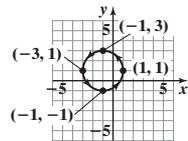

28.  $\frac{x^2}{9} + \frac{y^2}{9} = 1$

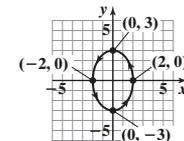

29.  $\frac{(x-1)^2}{9} + \frac{(y-2)^2}{9} = 1$

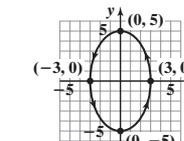

30.  $\frac{(x+1)^2}{4} + \frac{(y-1)^2}{4} = 1$

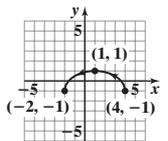

31.  $\frac{x^2}{4} + \frac{y^2}{9} = 1$

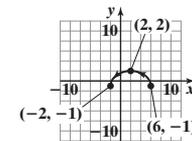

32.  $\frac{x^2}{9} + \frac{y^2}{25} = 1$

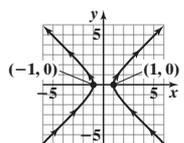

33.  $\frac{(x-1)^2}{9} + \frac{(y+1)^2}{4} = 1, -2 \leq x \leq 4, -1 \leq y \leq 1$

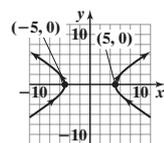

34.  $\frac{(x-2)^2}{16} + \frac{(y+1)^2}{9} = 1, -2 \leq x \leq 6, -1 \leq y \leq 2$

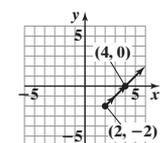

35.  $x^2 - y^2 = 1$

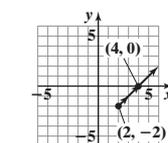

36.  $\frac{x^2}{25} - \frac{y^2}{9} = 1$

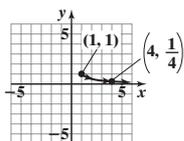

37.  $y = x - 4, x \geq 2, y \geq -2$

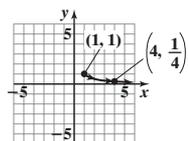

38.  $y = x - 4, x \geq 2, y \geq -2$

39.  $y = \frac{1}{x}, x \geq 1, y \geq 0$

40.  $y = \frac{1}{x}, x \geq 1, y \geq 0$

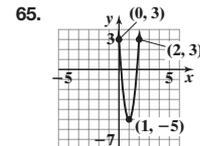

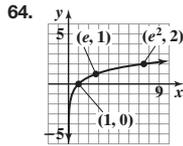

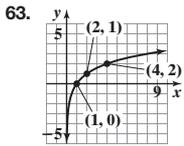

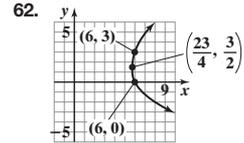

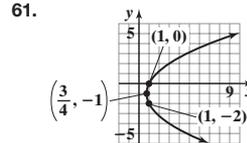

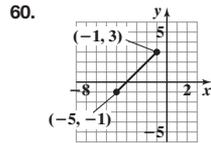

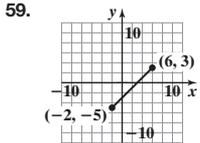

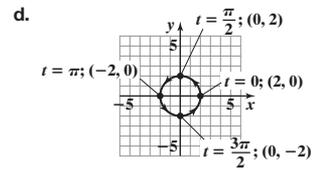

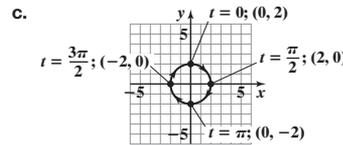

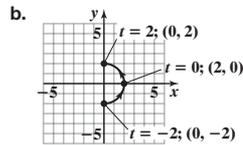

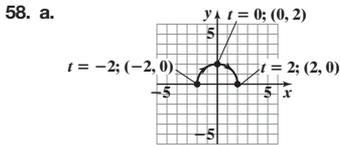

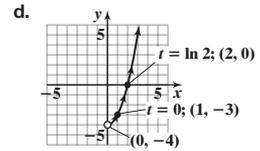

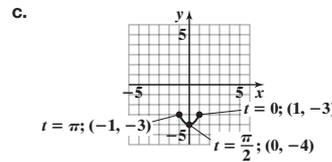

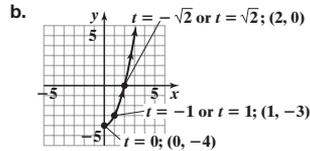

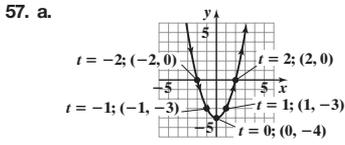

41.  $(x-h)^2 + (y-k)^2 = r^2$

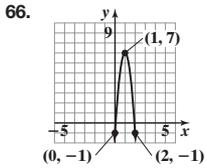

42.  $\frac{(x-h)^2}{a^2} + \frac{(y-k)^2}{b^2} = 1$

43.  $\frac{(x-h)^2}{a^2} - \frac{(y-k)^2}{b^2} = 1$

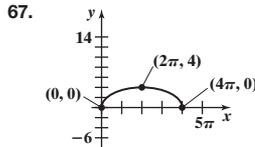

44.  $y - y_1 = \frac{y_2 - y_1}{x_2 - x_1}(x - x_1)$

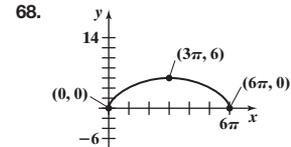

a. decreasing:  $(-\infty, 1)$ ; increasing:  $(1, \infty)$

a. increasing:  $(-\infty, 1)$ ; decreasing:  $(1, \infty)$

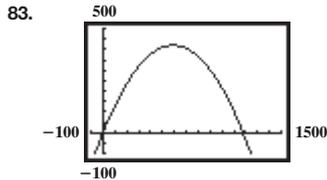

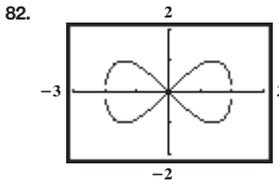

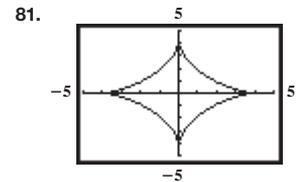

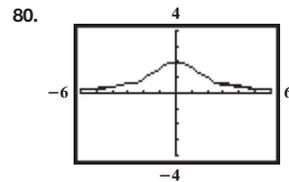

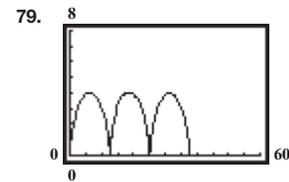

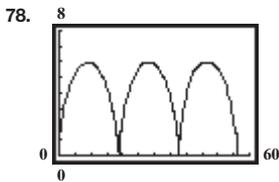

a. increasing:  $(0, 2\pi)$ ; decreasing:  $(2\pi, 4\pi)$   
 b. maximum of 4 at  $x = 2\pi$   
 minimum of 0 at  $x = 0$  and  $x = 4\pi$

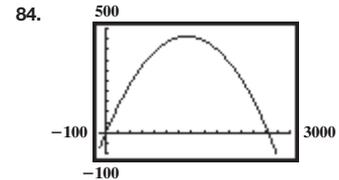

a. increasing:  $(0, 3\pi)$ ; decreasing:  $(3\pi, 6\pi)$   
 b. maximum of 6 at  $x = 3\pi$   
 minimum of 0 at  $x = 0$  and  $x = 6\pi$

69. a.  $x = (180 \cos 40^\circ)t$ ;  $y = 3 + (180 \sin 40^\circ)t - 16t^2$   
 b. After 1 second: 137.9 feet in distance, 102.7 feet in height;  
 After 2 seconds: 275.8 feet in distance, 170.4 feet in height;  
 After 3 seconds: 413.7 feet in distance, 206.1 feet in height

70. a.  $x = (150 \cos 35^\circ)t$ ;  $y = 3 + (150 \sin 35^\circ)t - 16t^2$   
 b. After 1 second; 122.9 feet in distance, 73.0 feet in height;  
 After 2 seconds; 245.7 feet in distance, 111.1 feet in height;  
 After 3 seconds; 368.6 feet in distance, 117.1 feet in height

Window:  $[-100, 1500] \times [-100, 500]$ ;  
 The maximum height is 419.4 feet at a time of 5.1 seconds.  
 The range of the projectile is 1174.6 feet horizontally.  
 It hits the ground at 10.2 seconds.

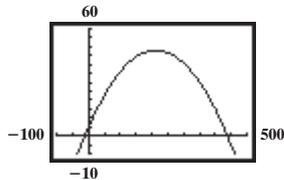

Window:  $[-100, 3000] \times [-100, 500]$ ;  
 The maximum height is 462.6 feet at a time of 5.4 seconds.  
 The range of the projectile is 2642.9 feet horizontally.  
 It hits the ground at 10.8 seconds.

## AA104 Answers to Selected Exercises

85. a.  $x = (140 \cos 22^\circ)t$ ;  $y = 5 + (140 \sin 22^\circ)t - 16t^2$

b.

Window:  $[-100, 500] \times [-10, 60]$

90.  $\sqrt[3]{x^2} + \sqrt[3]{y^2} = 1$

92. a.  $\sin t = \frac{PB}{a} \Rightarrow \sin t = \frac{XA}{a} \Rightarrow a \sin t = XA$

$OA$  is the same as the length of arc  $PA$ . Since the radius is  $a$ , and the central angle is  $t$ , the length of the arc is  $at$ .

So  $OA = at$ . Therefore,

$$x = OA - XA$$

$$x = at - a \sin t$$

$$x = a(t - \sin t)$$

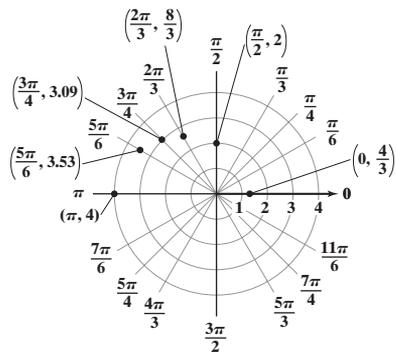

b.  $\cos t = \frac{BC}{a} \Rightarrow a \cos t = BC$  and  $AC = a$ , since  $a$  is the radius of the circle. So,

$$y = AC - BC$$

$$y = a - a \cos t$$

$$y = a(1 - \cos t)$$

93.  $r = \frac{2}{1 + \frac{1}{2} \cos \theta}$     94.  $\frac{4}{3} \approx 1.33$ ;  $2$ ;  $\frac{8}{3} \approx 2.67$ ;  $3.09$ ;  $3.53$ ;  $4$ ;

95. a.  $r = \frac{1}{3 - 3 \cos \theta}$     b.  $9y^2 = 1 + 6x$ ; parabola

$$r(3 - 3 \cos \theta) = 1$$

$$3r - 3r \cos \theta = 1$$

$$3r = 1 + 3r \cos \theta$$

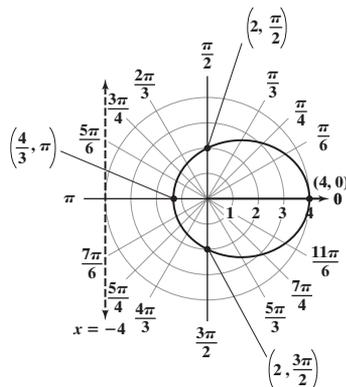

$$(3r)^2 = (1 + 3r \cos \theta)^2$$

$$9r^2 = (1 + 3r \cos \theta)^2$$

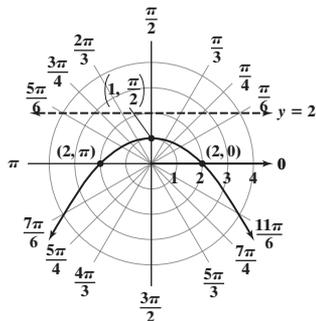

## Section 9.6

## Exercise Set 10.2

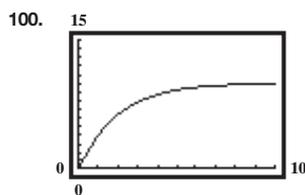

1. 200, 220, 240, 260, 280, 300    2. 300, 350, 400, 450, 500, 550    3.  $-7, -3, 1, 5, 9, 13$     4.  $-8, -3, 2, 7, 12, 17$     5. 300, 210, 120, 30,  $-60, -150$   
6. 200, 140, 80, 20,  $-40, -100$     7.  $\frac{5}{2}, 2, \frac{3}{2}, 1, \frac{1}{2}, 0$     8.  $\frac{3}{4}, \frac{1}{2}, \frac{1}{4}, 0, -\frac{1}{4}, -\frac{1}{2}$     9.  $-9, -3, 3, 9, 15, 21$     10.  $-7, -3, 1, 5, 9, 13$   
11. 30, 20, 10, 0,  $-10, -20$     12. 50, 30, 10,  $-10, -30, -50$     23.  $a_n = 4n - 3; a_{20} = 77$     24.  $a_n = 5n - 3; a_{20} = 97$   
25.  $a_n = 11 - 4n; a_{20} = -69$     26.  $a_n = 11 - 5n; a_{20} = -89$     27.  $a_n = 7 + 2n; a_{20} = 47$     28.  $a_n = 3n + 3; a_{20} = 63$   
29.  $a_n = -16 - 4n; a_{20} = -96$     30.  $a_n = -65 - 5n; a_{20} = -165$     31.  $a_n = 1 + 3n; a_{20} = 61$     32.  $a_n = 5n + 1; a_{20} = 101$   
33.  $a_n = 40 - 10n; a_{20} = -160$     34.  $a_n = 36 - 12n; a_{20} = -204$     45.  $8 + 13 + 18 + \dots + 88; 816$     46.  $2 + 8 + 14 + \dots + 116; 1180$   
47.  $2 - 1 - 4 - \dots - 85; -1245$     48.  $4 + 2 + 0 - \dots - 74; -1400$     49.  $4 + 8 + 12 + \dots + 400; 20,200$   
50.  $-4 - 8 - 12 - \dots - 200; -5100$     69. Company A: \$307,000; Company B: \$324,000; Company B pays the greater total amount.  
79. makes sense    85.  $-2; -2; -2; -2$ ; The ratio of a term to the term that directly precedes it is always  $-2$ .  
86.  $5; 5; 5; 5$ ; The ratio of a term to the term that directly precedes it is always 5.

## Exercise Set 10.3

1. 5, 15, 45, 135, 405    2. 4, 12, 36, 108, 324    3. 20, 10, 5,  $\frac{5}{2}, \frac{5}{4}$     4. 24, 8,  $\frac{8}{3}, \frac{8}{9}, \frac{8}{27}$     5. 10,  $-40, 160, -640, 2560$     6. 10,  $-30, 90, -270, 810$   
7.  $-6, 30, -150, 750, -3750$     8.  $-2, 12, -72, 432, -2592$     17.  $a_n = 3(4)^{n-1}; a_7 = 12,288$     18.  $a_n = 3(5)^{n-1}; a_7 = 46,875$   
19.  $a_n = 18\left(\frac{1}{3}\right)^{n-1}; a_7 = \frac{2}{81}$     20.  $a_n = 12\left(\frac{1}{2}\right)^{n-1}; a_7 = \frac{3}{16}$     21.  $a_n = 1.5(-2)^{n-1}; a_7 = 96$     22.  $a_n = 5\left(-\frac{1}{5}\right)^{n-1}; a_7 = \frac{1}{3125}$   
72. \$1,073,741,823    77. a. \$11,617    78. a. \$14,163    86. \$15 billion

horizontal asymptote:  $y = 3$ ; sum of series: 3

horizontal asymptote:  $y = 10$ ; sum of series: 10

## Mid-Chapter 10 Check Point

1.  $1, -2, \frac{3}{2}, -\frac{2}{3}, \frac{5}{24}$     2.  $5, 2, -1, -4, -7$     3.  $5, -15, 45, -135, 405$     4.  $3, 1, 3, 1, 3$     5.  $a_n = 4n - 2; a_{20} = 78$     6.  $a_n = 3(2)^{n-1}; a_{10} = 1536$   
18. 464 ft; 3600 ft

## Section 10.4

## Check Point Exercises

1. a.  $S_1: 2 = 1(1 + 1)$ ;  $S_k: 2 + 4 + 6 + \cdots + 2k = k(k + 1)$ ;  $S_{k+1}: 2 + 4 + 6 + \cdots + 2(k + 1) = (k + 1)(k + 2)$   
 b.  $S_1: 1^3 = \frac{1^2(1 + 1)^2}{4}$ ;  $S_k: 1^3 + 2^3 + 3^3 + \cdots + k^3 = \frac{k^2(k + 1)^2}{4}$ ;  $S_{k+1}: 1^3 + 2^3 + 3^3 + \cdots + (k + 1)^3 = \frac{(k + 1)^2(k + 2)^2}{4}$
2.  $S_1: 2 = 1(1 + 1)$ ;  $S_k: 2 + 4 + 6 + \cdots + 2k = k(k + 1)$ ;  $S_{k+1}: 2 + 4 + 6 + \cdots + 2k + 2(k + 1) = (k + 1)(k + 2)$ ;  $S_{k+1}$  can be obtained by adding  $2k + 2$  to both sides of  $S_k$ .
3.  $S_1: 1^3 = \frac{1^2(1 + 1)^2}{4}$ ;  $S_k: 1^3 + 2^3 + 3^3 + \cdots + k^3 = \frac{k^2(k + 1)^2}{4}$ ;  $S_{k+1}: 1^3 + 2^3 + 3^3 + \cdots + k^3 + (k + 1)^3 = \frac{(k + 1)^2(k + 2)^2}{4}$ ;  $S_{k+1}$  can be obtained by adding  $k^3 + 3k^2 + 3k + 1$  to both sides of  $S_k$ .
4.  $S_1: 2$  is a factor of  $1^2 + 1$ ;  $S_k: 2$  is a factor of  $k^2 + k$ ;  $S_{k+1}: 2$  is a factor of  $(k + 1)^2 + (k + 1) = k^2 + 3k + 2$ ;  $S_{k+1}$  can be obtained from  $S_k$  by writing  $k^2 + 3k + 2$  as  $(k^2 + k) + 2(k + 1)$ .

## Exercise Set 10.4

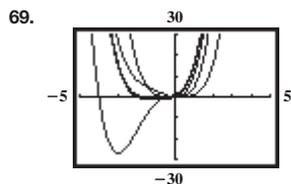

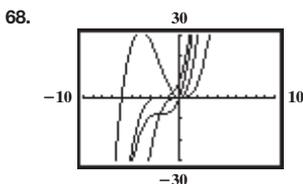

1.  $S_1: 1 = 1^2$ ;  $S_2: 1 + 3 = 2^2$ ;  $S_3: 1 + 3 + 5 = 3^2$
2.  $S_1: 3 = \frac{1(6)}{2}$ ;  $S_2: 3 + 4 = \frac{2(7)}{2}$ ;  $S_3: 3 + 4 + 5 = \frac{3(8)}{2}$
3.  $S_1: 2$  is a factor of  $1 - 1 = 0$ ;  $S_2: 2$  is a factor of  $2^2 - 2 = 2$ ;  $S_3: 2$  is a factor of  $3^2 - 3 = 6$ .
4.  $S_1: 3$  is a factor of  $1^3 - 1 = 0$ ;  $S_2: 3$  is a factor of  $2^3 - 2 = 6$ ;  $S_3: 3$  is a factor of  $3^3 - 3 = 24$ .
5.  $S_k: 4 + 8 + 12 + \cdots + 4k = 2k(k + 1)$ ;  $S_{k+1}: 4 + 8 + 12 + \cdots + (4k + 4) = 2(k + 1)(k + 2)$
6.  $S_k: 3 + 4 + 5 + \cdots + (k + 2) = \frac{k(k + 5)}{2}$ ;  $S_{k+1}: 3 + 4 + 5 + \cdots + (k + 3) = \frac{(k + 1)(k + 6)}{2}$
7.  $S_k: 3 + 7 + 11 + \cdots + (4k - 1) = k(2k + 1)$ ;  $S_{k+1}: 3 + 7 + 11 + \cdots + (4k + 3) = (k + 1)(2k + 3)$
8.  $S_k: 2 + 7 + 12 + \cdots + (5k - 3) = \frac{k(5k - 1)}{2}$ ;  $S_{k+1}: 2 + 7 + 12 + \cdots + (5k + 2) = \frac{(k + 1)(5k + 4)}{2}$
9.  $S_k: 2$  is a factor of  $k^2 - k + 2$ ;  $S_{k+1}: 2$  is a factor of  $k^2 + k + 2$ . 10.  $S_k: 2$  is a factor of  $k^2 - k$ ;  $S_{k+1}: 2$  is a factor of  $k^2 + k$ .
11.  $S_1: 4 = 2(1)(1 + 1)$ ;  $S_k: 4 + 8 + 12 + \cdots + 4k = 2k(k + 1)$ ;  $S_{k+1}: 4 + 8 + 12 + \cdots + 4(k + 1) = 2(k + 1)(k + 2)$ ;  $S_{k+1}$  can be obtained by adding  $4k + 4$  to both sides of  $S_k$ .
12.  $S_1: 3 = \frac{1(1 + 5)}{2}$ ;  $S_k: 3 + 4 + 5 + \cdots + (k + 2) = \frac{k(k + 5)}{2}$ ;  $S_{k+1}: 3 + 4 + 5 + \cdots + (k + 3) = \frac{(k + 1)(k + 6)}{2}$ ;  $S_{k+1}$  can be obtained by adding  $k + 3$  to both sides of  $S_k$ .
13.  $S_1: 1 = 1^2$ ;  $S_k: 1 + 3 + 5 + \cdots + (2k - 1) = k^2$ ;  $S_{k+1}: 1 + 3 + 5 + \cdots + (2k + 1) = (k + 1)^2$ ;  $S_{k+1}$  can be obtained by adding  $2k + 1$  to both sides of  $S_k$ .
14.  $S_1: 3 = \frac{3(1)(1 + 1)}{2}$ ;  $S_k: 3 + 6 + 9 + \cdots + 3k = \frac{3k(k + 1)}{2}$ ;  $S_{k+1}: 3 + 6 + 9 + \cdots + 3(k + 1) = \frac{3(k + 1)(k + 2)}{2}$ ;  $S_{k+1}$  can be obtained by adding  $3k + 3$  to both sides of  $S_k$ .
15.  $S_1: 3 = 1[2(1) + 1]$ ;  $S_k: 3 + 7 + 11 + \cdots + (4k - 1) = k(2k + 1)$ ;  $S_{k+1}: 3 + 7 + 11 + \cdots + (4k + 3) = (k + 1)(2k + 3)$ ;  $S_{k+1}$  can be obtained by adding  $4k + 3$  to both sides of  $S_k$ .
16.  $S_1: 2 = \frac{1[5(1) - 1]}{2}$ ;  $S_k: 2 + 7 + 12 + \cdots + (5k - 3) = \frac{k(5k - 1)}{2}$ ;  $S_{k+1}: 2 + 7 + 12 + \cdots + (5k + 2) = \frac{(k + 1)(5k + 4)}{2}$ ;  $S_{k+1}$  can be obtained by adding  $5k + 2$  to both sides of  $S_k$ .
17.  $S_1: 1 = 2^1 - 1$ ;  $S_k: 1 + 2 + 2^2 + \cdots + 2^{k-1} = 2^k - 1$ ;  $S_{k+1}: 1 + 2 + 2^2 + \cdots + 2^k = 2^{k+1} - 1$ ;  $S_{k+1}$  can be obtained by adding  $2^k$  to both sides of  $S_k$ .
18.  $S_1: 1 = \frac{3^1 - 1}{2}$ ;  $S_k: 1 + 3 + 3^2 + \cdots + 3^{k-1} = \frac{3^k - 1}{2}$ ;  $S_{k+1}: 1 + 3 + 3^2 + \cdots + 3^k = \frac{3^{k+1} - 1}{2}$ ;  $S_{k+1}$  can be obtained by adding  $3^k$  to both sides of  $S_k$ .
19.  $S_1: 2 = 2^{1+1} - 2$ ;  $S_k: 2 + 4 + 8 + \cdots + 2^k = 2^{k+1} - 2$ ;  $S_{k+1}: 2 + 4 + 8 + \cdots + 2^{k+1} = 2^{k+2} - 2$ ;  $S_{k+1}$  can be obtained by adding  $2^{k+1}$  to both sides of  $S_k$ .
20.  $S_1: \frac{1}{2} = 1 - \frac{1}{2^1}$ ;  $S_k: \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \cdots + \frac{1}{2^k} = 1 - \frac{1}{2^k}$ ;  $S_{k+1}: \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \cdots + \frac{1}{2^{k+1}} = 1 - \frac{1}{2^{k+1}}$ ;  $S_{k+1}$  can be obtained by adding  $\frac{1}{2^{k+1}}$  to both sides of  $S_k$ .
21.  $S_1: 1 \cdot 2 = \frac{1(1 + 1)(1 + 2)}{3}$ ;  $S_k: 1 \cdot 2 + 2 \cdot 3 + 3 \cdot 4 + \cdots + k(k + 1) = \frac{k(k + 1)(k + 2)}{3}$ ;  
 $S_{k+1}: 1 \cdot 2 + 2 \cdot 3 + 3 \cdot 4 + \cdots + (k + 1)(k + 2) = \frac{(k + 1)(k + 2)(k + 3)}{3}$ ;  $S_{k+1}$  can be obtained by adding  $(k + 1)(k + 2)$  to both sides of  $S_k$ .
22.  $S_1: 1 \cdot 3 = \frac{1(1 + 1)[2(1) + 7]}{6}$ ;  $S_k: 1 \cdot 3 + 2 \cdot 4 + 3 \cdot 5 + \cdots + k(k + 2) = \frac{k(k + 1)(2k + 7)}{6}$ ;  
 $S_{k+1}: 1 \cdot 3 + 2 \cdot 4 + 3 \cdot 5 + \cdots + (k + 1)(k + 3) = \frac{(k + 1)(k + 2)(2k + 9)}{6}$ ;  $S_{k+1}$  can be obtained by adding  $(k + 1)(k + 3)$  to both sides of  $S_k$ .

**AA112** Answers to Selected Exercises

23.  $S_1: \frac{1}{1 \cdot 2} = \frac{1}{1+1}; S_k: \frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \cdots + \frac{1}{k(k+1)} = \frac{k}{k+1}; S_{k+1}: \frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \cdots + \frac{1}{(k+1)(k+2)} = \frac{k+1}{k+2}$ ,  $S_{k+1}$  can be obtained by adding  $\frac{1}{(k+1)(k+2)}$  to both sides of  $S_k$ .
24.  $S_1: \frac{1}{2 \cdot 3} = \frac{1}{2(1)+4}; S_k: \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \frac{1}{4 \cdot 5} + \cdots + \frac{1}{(k+1)(k+2)} = \frac{k}{2k+4}; S_{k+1}: \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \frac{1}{4 \cdot 5} + \cdots + \frac{1}{(k+2)(k+3)} = \frac{k+1}{2k+6}$ ;  $S_{k+1}$  can be obtained by adding  $\frac{1}{(k+2)(k+3)}$  to both sides of  $S_k$ .
25.  $S_1: 2$  is a factor of 0;  $S_k: 2$  is a factor of  $k^2 - k$ ;  $S_{k+1}: 2$  is a factor of  $k^2 + k$ ;  $S_{k+1}$  can be obtained from  $S_k$  by rewriting  $k^2 + k$  as  $(k^2 - k) + 2k$ .
26.  $S_1: 2$  is a factor of 4;  $S_k: 2$  is a factor of  $k^2 + 3k$ ;  $S_{k+1}: 2$  is a factor of  $k^2 + 5k + 4$ ;  $S_{k+1}$  can be obtained from  $S_k$  by rewriting  $k^2 + 5k + 4$  as  $(k^2 + 3k) + 2(k + 2)$ .
27.  $S_1: 6$  is a factor of 6;  $S_k: 6$  is a factor of  $k(k+1)(k+2)$ ;  $S_{k+1}: 6$  is a factor of  $(k+1)(k+2)(k+3)$ ;  $S_{k+1}$  can be obtained from  $S_k$  by rewriting  $(k+1)(k+2)(k+3)$  as  $k(k+1)(k+2) + 3(k+1)(k+2)$  and noting that either  $k+1$  or  $k+2$  is even, so 6 is a factor of  $3(k+1)(k+2)$ .
28.  $S_1: 3$  is a factor of 0;  $S_k: 3$  is a factor of  $k(k+1)(k-1)$  or  $k^3 - k$ ;  $S_{k+1}: 3$  is a factor of  $(k+1)(k+2)k$  or  $k^3 + 3k^2 + 2k$ ;  $S_{k+1}$  can be obtained from  $S_k$  by rewriting  $k^3 + 3k^2 + 2k$  as  $(k^3 - k) + 3(k^2 + k)$ .
29.  $S_1: 5 \cdot 6^1 = 6(6^1 - 1); S_k: \sum_{i=1}^k 5 \cdot 6^i = 6(6^k - 1); S_{k+1}: \sum_{i=1}^{k+1} 5 \cdot 6^i = 6(6^{k+1} - 1); S_{k+1}$  can be obtained by adding  $5 \cdot 6^{k+1}$  to both sides of  $S_k$ .
30.  $S_1: 7 \cdot 8^1 = 8(8^1 - 1); S_k: \sum_{i=1}^k 7 \cdot 8^i = 8(8^k - 1); S_{k+1}: \sum_{i=1}^{k+1} 7 \cdot 8^i = 8(8^{k+1} - 1); S_{k+1}$  can be obtained by adding  $7 \cdot 8^{k+1}$  to both sides of  $S_k$ .
31.  $S_1: 1 + 2 > 1; S_k: k + 2 > k; S_{k+1}: k + 3 > k + 1; S_{k+1}$  can be obtained by adding 1 to both sides of  $S_k$ .
32.  $S_1: \text{If } 0 < x < 1, \text{ then } 0 < x^1 < 1; S_k: \text{If } 0 < x < 1, \text{ then } 0 < x^k < 1; S_{k+1}: \text{If } 0 < x < 1, \text{ then } 0 < x^{k+1} < 1; S_{k+1}$  can be obtained by multiplying the respective parts of  $0 < x < 1$  and  $0 < x^k < 1$ .
33.  $S_1: (ab)^1 = a^1b^1; S_k: (ab)^k = a^kb^k; S_{k+1}: (ab)^{k+1} = a^{k+1}b^{k+1}; S_{k+1}$  can be obtained by multiplying both sides of  $S_k$  by  $(ab)$ .
34.  $S_1: \left(\frac{a}{b}\right)^1 = \frac{a^1}{b^1}; S_k: \left(\frac{a}{b}\right)^k = \frac{a^k}{b^k}; S_{k+1}: \left(\frac{a}{b}\right)^{k+1} = \frac{a^{k+1}}{b^{k+1}}; S_{k+1}$  can be obtained by multiplying both sides of  $S_k$  by  $\left(\frac{a}{b}\right)$ .
41.  $S_3: 3^2 > 2(3) + 1; S_k: k^2 > 2k + 1$  for  $k \geq 3; S_{k+1}: (k+1)^2 > 2(k+1) + 1$  or  $k^2 + 2k + 1 > 2k + 3; S_{k+1}$  can be obtained from  $S_k$  by noting that  $S_{k+1}$  is the same as  $k^2 > 2$  which is true for  $k \geq 3$ .
42.  $S_5: 2^5 > 5^2; S_k: 2^k > k^2$  for  $k \geq 5; S_{k+1}: 2^{k+1} > (k+1)^2$  or  $2(2^k) > k^2 + 2k + 1; S_{k+1}$  can be obtained from  $S_k$  by multiplying both sides of  $S_k$  by 2 and noting that  $k^2 > 2k + 1$  for  $k \geq 5$ .
43.  $S_1: \frac{1}{4}; S_2: \frac{1}{3}; S_3: \frac{3}{8}; S_4: \frac{2}{5}; S_5: \frac{5}{12}; S_n: \frac{n}{2n+2}$ ; Use  $S_k$  to obtain the conjectured formula.
44.  $S_1: \frac{1}{2}; S_2: \frac{1}{3}; S_3: \frac{1}{4}; S_4: \frac{1}{5}; S_5: \frac{1}{6}; S_n: \frac{1}{n+1}$ ; Use  $S_k$  to obtain the conjectured formula.
46. The exponents begin with the exponent on  $a + b$  and decrease by 1 in each successive term.      47. The exponents begin with 0, increase by 1 in each successive term, and end with the exponent on  $a + b$ .

**Exercise Set 10.5**

9.  $x^3 + 6x^2 + 12x + 8$     10.  $x^3 + 12x^2 + 48x + 64$     11.  $27x^3 + 27x^2y + 9xy^2 + y^3$     12.  $x^3 + 9x^2y + 27xy^2 + 27y^3$

- e.  $(a + b)^{k+1} = \binom{k+1}{0}a^{k+1} + \binom{k+1}{1}a^k b + \binom{k+1}{2}a^{k-1}b^2 + \binom{k+1}{3}a^{k-2}b^3 + \dots + \binom{k+1}{k}ab^k + \binom{k+1}{k+1}b^{k+1}$
- f.  $(a + b)^{k+1} = \binom{k+1}{0}a^{k+1} + \binom{k+1}{1}a^k b + \binom{k+1}{2}a^{k-1}b^2 + \binom{k+1}{3}a^{k-2}b^3 + \dots + \binom{k+1}{k}ab^k + \binom{k+1}{k+1}b^{k+1}$

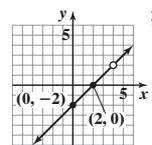

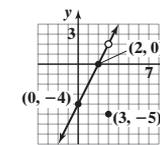

### Exercise Set 10.6

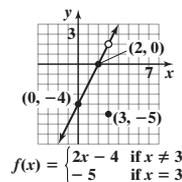

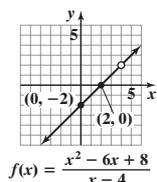

17. combinations

### Exercise Set 10.7

27.  $\frac{1}{18,009,460}$ ;  $\frac{5}{900,473}$     28.  $\frac{1}{593,775}$ ;  $\frac{4}{23,751}$     29. a. 2,598,960    b. 1287    c.  $\frac{1287}{2,598,960} \approx 0.0005$     30.  $\frac{11}{1105} \approx 0.00995$
53. c.  $\left(\frac{15}{16}\right)^{10} \approx 0.524$     d.  $1 - \left(\frac{15}{16}\right)^{10} \approx 0.476$     66. does not make sense

73. a. The first person can have any birthday in the year. The second person can have all but one birthday.

76. ; The two pieces of the graph approach the point (4, 2)    77. 

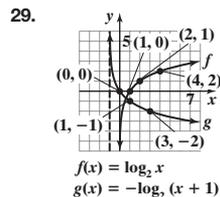

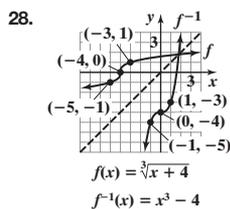

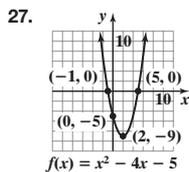

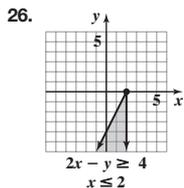

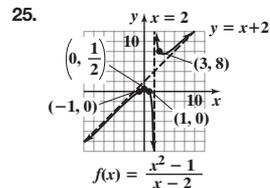

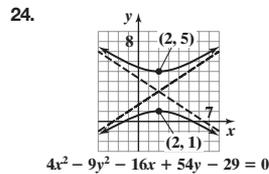

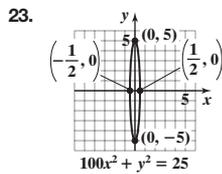

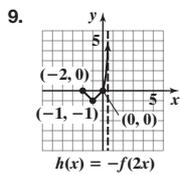

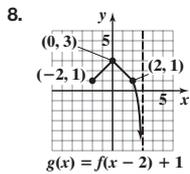

### Chapter 10 Review Exercises

10.  $\sum_{i=1}^{15} \frac{i}{i+2}$     11.  $\sum_{i=4}^{13} i^3$  or  $\sum_{i=1}^{10} (i+3)^3$     12. 7, 11, 15, 19, 23, 27    13. -4, -9, -14, -19, -24, -29    14.  $\frac{3}{2}, 1, \frac{1}{2}, 0, -\frac{1}{2}, -1$     15. -2, 3, 8, 13, 18, 23
33. 16, -8, 4, -2, 1    34. -1, 5, -25, 125, -625    38.  $a_n = 2^{n-1}$ ;  $a_8 = 128$     39.  $a_n = 100\left(\frac{1}{10}\right)^{n-1}$ ;  $a_8 = \frac{1}{100,000}$     55. a. \$91,361
57.  $S_1: 5 = \frac{5(1)(1+1)}{2}$ ;  $S_k: 5 + 10 + 15 + \dots + 5k = \frac{5k(k+1)}{2}$ ;  $S_{k+1}: 5 + 10 + 15 + \dots + 5(k+1) = \frac{5(k+1)(k+2)}{2}$ ;  $S_{k+1}$  can be obtained by adding  $5(k+1)$  to both sides of  $S_k$ .
58.  $S_1: 1 = \frac{4^1 - 1}{3}$ ;  $S_k: 1 + 4 + 4^2 + \dots + 4^{k-1} = \frac{4^k - 1}{3}$ ;  $S_{k+1}: 1 + 4 + 4^2 + \dots + 4^k = \frac{4^{k+1} - 1}{3}$ ;  $S_{k+1}$  can be obtained by adding  $4^k$  to both sides of  $S_k$ .
59.  $S_1: 2 = 2(1)^2$ ;  $S_k: 2 + 6 + 10 + \dots + (4k - 2) = 2k^2$ ;  $S_{k+1}: 2 + 6 + 10 + \dots + (4k + 2) = 2(k+1)^2$ ;  $S_{k+1}$  can be obtained by adding  $4k + 2$  to both sides of  $S_k$ .
60.  $S_1: 1 \cdot 3 = \frac{1(1+1)[2(1)+7]}{6}$ ;  $S_k: 1 \cdot 3 + 2 \cdot 4 + 3 \cdot 5 + \dots + k(k+2) = \frac{k(k+1)(2k+7)}{6}$ ;  $S_{k+1}: 1 \cdot 3 + 2 \cdot 4 + 3 \cdot 5 + \dots + (k+1)(k+3) = \frac{(k+1)(k+2)(2k+9)}{6}$ ;  $S_{k+1}$  can be obtained by adding  $(k+1)(k+3)$  to both sides of  $S_k$ .
61.  $S_1: 2$  is a factor of 6;  $S_k: 2$  is a factor of  $k^2 + 5k$ ;  $S_{k+1}: 2$  is a factor of  $k^2 + 7k + 6$ ;  $S_{k+1}$  can be obtained from  $S_k$  by rewriting  $k^2 + 7k + 6$  as  $(k^2 + 5k) + 2(k+3)$ .
64.  $8x^3 + 12x^2 + 6x + 1$     65.  $x^8 - 4x^6 + 6x^4 - 4x^2 + 1$     66.  $x^5 + 10x^4y + 40x^3y^2 + 80x^2y^3 + 80xy^4 + 32y^5$
67.  $x^6 - 12x^5 + 60x^4 - 160x^3 + 240x^2 - 192x + 64$     68.  $x^{16} + 24x^{14} + 252x^{12} + \dots$     69.  $x^9 - 27x^8 + 324x^7 - \dots$

### Chapter 10 Test

9.  $a_n = 5n - 1$ ;  $a_{12} = 59$     10.  $a_n = 16\left(\frac{1}{4}\right)^{n-1}$ ;  $a_{12} = \frac{1}{262,144}$
16.  $S_1: 1 = \frac{1[3(1)-1]}{2}$ ;  $S_k: 1 + 4 + 7 + \dots + (3k - 2) = \frac{k(3k - 1)}{2}$ ;  $S_{k+1}: 1 + 4 + 7 + \dots + (3k + 1) = \frac{(k+1)(3k+2)}{2}$ ;  $S_{k+1}$  can be obtained by adding  $3k + 1$  to both sides of  $S_k$ .

Cumulative Review Exercises (Chapters P-10)

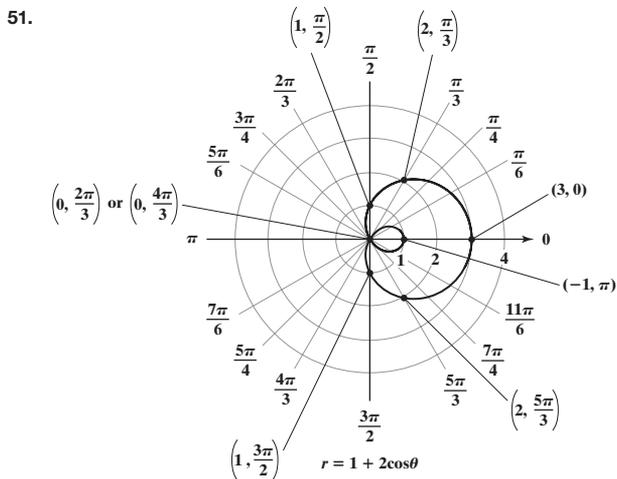

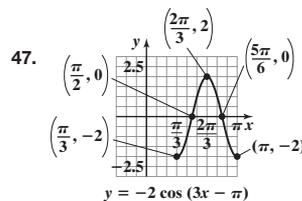

30.  $(f \circ g)(x) = -x^2 + 2$ ;  $(g \circ f)(x) = -x^2 - 2x$     32.  $\begin{bmatrix} -2 & 10 \\ -5 & 7 \\ 15 & -15 \end{bmatrix}$

33.  $\frac{-1}{x-2} + \frac{3x-2}{x^2+2x+2}$

34.  $x^{15} + 10x^{12}y + 40x^9y^2 + 80x^6y^3 + 80x^3y^4 + 32y^5$     41. a. 6 sec    44. a. 10 in.    b.  $\frac{3}{8}$  cycles/sec    c.  $\frac{8}{3}$  sec

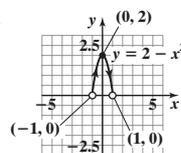

45.  $\tan x + \frac{1}{\tan x} = \frac{\sin x}{\cos x} + \frac{1}{\frac{\sin x}{\cos x}} = \frac{\sin x}{\cos x} + \frac{\cos x}{\sin x} = \frac{\sin^2 x + \cos^2 x}{\cos x \sin x} = \frac{1}{\cos x \sin x}$

46.  $\frac{1 - \tan^2 x}{1 + \tan^2 x} = \frac{1 - \frac{\sin^2 x}{\cos^2 x}}{1 + \frac{\sin^2 x}{\cos^2 x}} \cdot \frac{\cos^2 x}{\cos^2 x} = \frac{\cos^2 x - \sin^2 x}{\cos^2 x + \sin^2 x} = \frac{\cos 2x}{1} = \cos 2x$

52.  $B \approx 54^\circ, C \approx 92^\circ, c \approx 39.3$   
 $B \approx 126^\circ, C \approx 20^\circ, c \approx 13.5$

53.  $y = 2 - x^2$

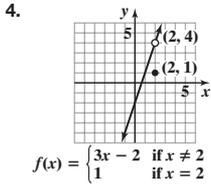

**CHAPTER 11**

**Section 11.1**

**Check Point Exercises**

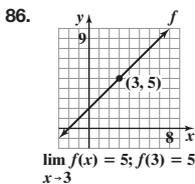

**Exercise Set 11.1**

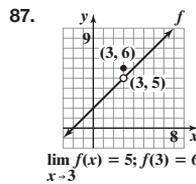

42. 20    67. a. 8; As your nose approaches the fan, the speed of the breeze that your nose feels approaches 8 miles per hour.  
 b. Answers may vary.    68. 124; This means that the recommended safe distance between cars traveling at 60 miles per hour is 124 feet.  
 71. a. 30; The cost to rent the car one day and drive it 100 miles is \$30.    72. b. 450; Yes, the same limit is obtained. The graph shows that the limit is the maximum area.    85. 0.69315; 0.693147    86. 0.250000; 0.250000    87. 1.50000; 1.50000    88. 0.500000; 0.50000017  
 94. values of  $x$  in the interval  $(\frac{29}{30}, \frac{31}{30})$ ; values of  $x$  in the interval  $(\frac{299}{300}, \frac{301}{300})$     95. 31.544281  
 96. a.   
 $f(x) = \begin{cases} x^2 + 5 & \text{if } x < 2 \\ 3x + 1 & \text{if } x \geq 2 \end{cases}$     b.  $\lim_{x \rightarrow 2^-} f(x) = 9$ ;  $\lim_{x \rightarrow 2^+} f(x) = 7$ ;  $\lim_{x \rightarrow 2} f(x)$  does not exist.

**Exercise Set 11.2**

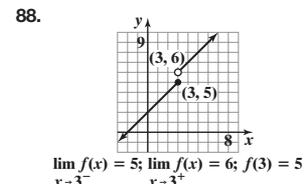

59. b. The length of the starship appears to approach 0.    c. It is not possible to exceed the speed of light.    60. b. Relative to a friend on Earth, you will barely grow older.    c. It is not possible to exceed the speed of light.    80. 4

No, it is not necessary to lift your pencil off the paper.

Yes, it is necessary to lift your pencil off the paper.

Yes, it is necessary to lift your pencil off the paper.

**Exercise Set 11.3**

19. continuous for every number  $x$     20. continuous for every number  $x$     21. -1 and 4    22. -2 and 5    25. continuous for every number  $x$   
 26. continuous for every number  $x$     43. h. As the end of the course approached, the percentage of material learned by the student approached 100%.    44. c.  $\lim_{x \rightarrow 3} f(x)$  does not exist; the graph shows a discontinuity at  $x = 3$ .    d. The graph jumps at its discontinuities due to per-ounce charges.    53. 2.7183; 2.71828    55. does not make sense    56. does not make sense    57. makes sense  
 59. No. In Exercise 58,  $\lim_{x \rightarrow 9} f(x)$  exists. In this exercise, however,  $\lim_{x \rightarrow 9} \frac{1}{x - 9}$  does not exist.    64.  $-32a - 16h + 48$

**Mid-Chapter 11 Check Point**

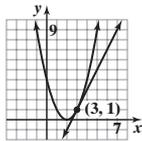

17. does not exist    18. c. does not exist

**Exercise Set 11.4**

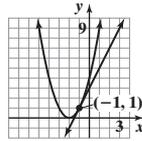

1. a. 2    b.  $y = 2x + 3$     2. a. 4    b.  $y = 4x + 2$     3. a. -2    b.  $y = -2x + 3$     4. a. -2    b.  $y = -2x + 6$   
 5. a. -20    b.  $y = -20x - 20$     6. a. -16    b.  $y = -16x - 16$     7. a. 7    b.  $y = 7x - 8$     8. a. 7    b.  $y = 7x - 3$   
 11. a.  $\frac{1}{6}$     b.  $y = \frac{1}{6}x + \frac{3}{2}$     12. a.  $\frac{1}{8}$     b.  $y = \frac{1}{8}x + 2$     13. a. -1    b.  $y = -x + 2$     14. a. -2    b.  $y = -2x + 4$

**AA16** Answers to Selected Exercises

49.  $(f + g)(x) = \sqrt{x - 2} + \sqrt{2 - x}$ ; domain:  $\{2\}$ ;  $(f - g)(x) = \sqrt{x - 2} - \sqrt{2 - x}$ ; domain:  $\{2\}$ ;  $(fg)(x) = \sqrt{x - 2} \cdot \sqrt{2 - x}$ ; domain:  $\{2\}$ ;  $\left(\frac{f}{g}\right)(x) = \frac{\sqrt{x - 2}}{\sqrt{2 - x}}$ ; domain:  $\emptyset$

51. a.  $(f \circ g)(x) = 2x + 14$     b.  $(g \circ f)(x) = 2x + 7$     c.  $(f \circ g)(2) = 18$     d.  $(g \circ f)(2) = 11$

53. a.  $(f \circ g)(x) = 2x + 5$     b.  $(g \circ f)(x) = 2x + 9$     c.  $(f \circ g)(2) = 9$     d.  $(g \circ f)(2) = 13$     55. a.  $(f \circ g)(x) = 20x^2 - 11$   
 b.  $(g \circ f)(x) = 80x^2 - 120x + 43$     c.  $(f \circ g)(2) = 69$     d.  $(g \circ f)(2) = 123$     57. a.  $(f \circ g)(x) = x^4 - 4x^2 + 6$     b.  $(g \circ f)(x) = x^4 + 4x^2 + 2$   
 c.  $(f \circ g)(2) = 6$     d.  $(g \circ f)(2) = 34$     59. a.  $(f \circ g)(x) = -2x^2 - x - 1$     b.  $(g \circ f)(x) = 2x^2 - 17x + 41$     c.  $(f \circ g)(2) = -11$     d.  $(g \circ f)(2) = 15$

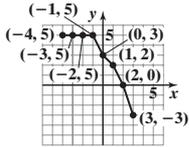

61. a.  $(f \circ g)(x) = \sqrt{x - 1}$     b.  $(g \circ f)(x) = \sqrt{x - 1}$     c.  $(f \circ g)(2) = 1$     d.  $(g \circ f)(2) = \sqrt{2} - 1$     63. a.  $(f \circ g)(x) = x$     b.  $(g \circ f)(x) = x$   
 c.  $(f \circ g)(2) = 2$     d.  $(g \circ f)(2) = 2$     65. a.  $(f \circ g)(x) = x$     b.  $(g \circ f)(x) = x$     c. 2    d.  $(g \circ f)(2) = 2$     67. a.  $(f \circ g)(x) = \frac{2x}{1 + 3x}$

b.  $\left(-\infty, -\frac{1}{3}\right) \cup \left(-\frac{1}{3}, 0\right) \cup (0, \infty)$     69. a.  $(f \circ g)(x) = \frac{4}{4 + x}$     b.  $(-\infty, -4) \cup (-4, 0) \cup (0, \infty)$     71. a.  $(f \circ g)(x) = \sqrt{x - 2}$     b.  $[2, \infty)$

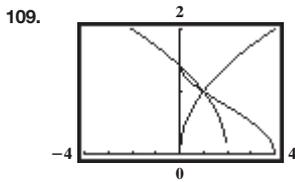

73. a.  $(f \circ g)(x) = 5 - x$     b.  $(-\infty, 1]$     75.  $f(x) = x^4, g(x) = 3x - 1$     77.  $f(x) = \sqrt[3]{x}, g(x) = x^2 - 9$     79.  $f(x) = |x|, g(x) = 2x - 5$

81.  $f(x) = \frac{1}{x}, g(x) = 2x - 3$     83. 5    85. -1    87.  $[-4, 3]$

89.  $(-1, 5)$     91. 1    93. -6    95. 1 and 2    97. a.  $(M + F)(x) = 2.99x + 235.5$     b. 295.3 million    c. underestimates by 2.7 million

99.  $(R - C)(20,000) = -200,000$ ; The company loses \$200,000 when 20,000 radios are sold.;  $(R - C)(30,000) = 0$ ; The company breaks even when 30,000 radios are sold.;  $(R - C)(40,000) = 200,000$ ; The company makes a profit of \$200,000 when 40,000 radios are sold.    101. a.  $f$  gives the price of the computer after a \$400 discount.  $g$  gives the price of the computer after a 25% discount.    b.  $(f \circ g)(x) = 0.75x - 400$ ; This models the price of a computer after first a 25% discount and then a \$400 discount.    c.  $(g \circ f)(x) = 0.75(x - 400)$ ; This models the price of a computer after first a \$400 discount and then a 25% discount.    d.  $f \circ g$  because  $0.75x - 400 < 0.75(x - 400)$

Domain:  $[0, 4]$

111. makes sense    113. does not make sense    115. false    117. true

119. Answers will vary; One possible answer is  $f(x) = x + 1$  and  $g(x) = x - 1$ .

120.  $\{(4, -2), (1, -1), (1, 1), (4, 2)\}$ ; no    121.  $y = \frac{5}{x - 4}$     122.  $y = \sqrt{x + 1}$

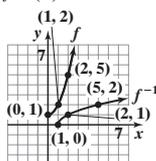

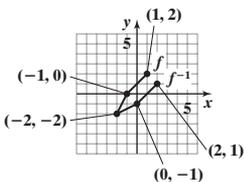

**Section 1.8**

**Check Point Exercises**

1.  $f(g(x)) = 4\left(\frac{x + 7}{4}\right) - 7 = x + 7 - 7 = x$ ;  $g(f(x)) = \frac{(4x - 7) + 7}{4} = \frac{4x}{4} = x$     2.  $f^{-1}(x) = \frac{x - 7}{2}$     3.  $f^{-1}(x) = \sqrt[3]{\frac{x + 1}{4}}$

4.  $f^{-1}(x) = \frac{3}{x + 1}$     5. (b) and (c)

6.    7.  $f^{-1}(x) = \sqrt{x - 1}$

**Concept and Vocabulary Check**

1. inverse    2.  $x; x$     3. horizontal; one-to-one    4.  $y = x$

**Exercise Set 1.8**

1.  $f(g(x)) = x$ ;  $g(f(x)) = x$ ;  $f$  and  $g$  are inverses.    3.  $f(g(x)) = x$ ;  $g(f(x)) = x$ ;  $f$  and  $g$  are inverses.

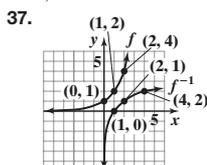

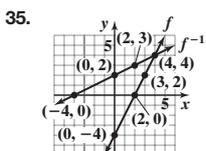

5.  $f(g(x)) = \frac{5x - 56}{9}$ ;  $g(f(x)) = \frac{5x - 4}{9}$ ;  $f$  and  $g$  are not inverses.    7.  $f(g(x)) = x$ ;  $g(f(x)) = x$ ;  $f$  and  $g$  are inverses.

9.  $f(g(x)) = x$ ;  $g(f(x)) = x$ ;  $f$  and  $g$  are inverses.    11.  $f^{-1}(x) = x - 3$     13.  $f^{-1}(x) = \frac{x}{2}$     15.  $f^{-1}(x) = \frac{x - 3}{2}$     17.  $f^{-1}(x) = \sqrt[3]{x - 2}$

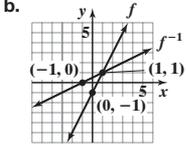

19.  $f^{-1}(x) = \sqrt[3]{x} - 2$     21.  $f^{-1}(x) = \frac{1}{x}$     23.  $f^{-1}(x) = x^2, x \geq 0$     25.  $f^{-1}(x) = \frac{7}{x + 3}$     27.  $f^{-1}(x) = \frac{3x + 1}{x - 2}; x \neq 2$

29. The function is not one-to-one, so it does not have an inverse function.    31. The function is not one-to-one, so it does not have an inverse function.

33. The function is one-to-one, so it does have an inverse function.

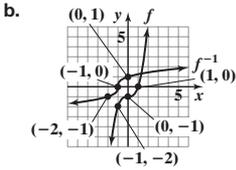

39. a.  $f^{-1}(x) = \frac{x+1}{2}$

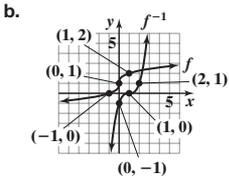

c. domain of  $f = \text{range of } f^{-1} = (-\infty, \infty)$ ;  
range of  $f = \text{domain of } f^{-1} = (-\infty, \infty)$

45. a.  $f^{-1}(x) = \sqrt[3]{x+1}$

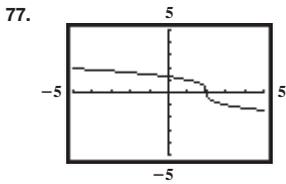

c. domain of  $f = \text{range of } f^{-1} = (-\infty, \infty)$ ;  
range of  $f = \text{domain of } f^{-1} = (-\infty, \infty)$

51. a.  $f^{-1}(x) = (x-1)^3$

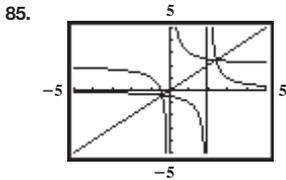

c. domain of  $f = \text{range of } f^{-1} = (-\infty, \infty)$ ;  
range of  $f = \text{domain of } f^{-1} = (-\infty, \infty)$

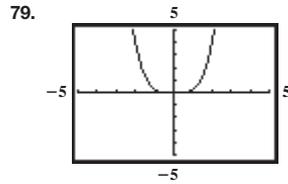

69.  $f(g(x)) = \frac{9}{5} \left[ \frac{5}{9}(x-32) \right] + 32 = x$  and  $g(f(x)) = \frac{5}{9} \left[ \left( \frac{9}{5}x + 32 \right) - 32 \right] = x$

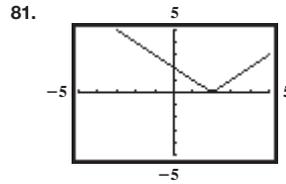

one-to-one

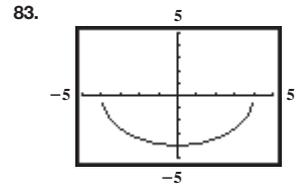

$f$  and  $g$  are inverses.

not one-to-one

not one-to-one

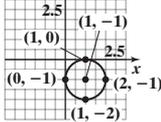

not one-to-one

77. makes sense 79. makes sense 81. false 83. false

95.  $(f \circ g)^{-1}(x) = \frac{x-15}{3}$ ;  $(g^{-1} \circ f^{-1})(x) = \frac{x}{3} - 5 = \frac{x-15}{3}$

97. No; The spacecraft was at the same height,  $s(t)$ , for two different values of  $t$ —once during the ascent and once again during the descent.

100.  $3\sqrt{5}$  101.  $\{3 \pm \sqrt{13}\}$

Section 1.9

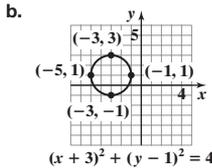

Check Point Exercises

1.  $3\sqrt{5} \approx 6.71$  2.  $\left(4, -\frac{1}{2}\right)$

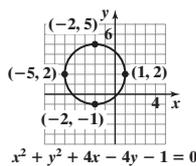

3.  $x^2 + y^2 = 16$  4.  $x^2 + (y+6)^2 = 100$

5. a. center:  $(-3, 1)$ ; radius: 2

6.  $(x+2)^2 + (y-2)^2 = 9$

c. domain:  $[-5, -1]$   
range:  $[-1, 3]$

$x^2 + y^2 + 4x - 4y - 1 = 0$

Concept and Vocabulary Check

1.  $\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$  2.  $\frac{x_1 + x_2}{2}; \frac{y_1 + y_2}{2}$  3. circle; center; radius 4.  $(x-h)^2 + (y-k)^2 = r^2$  5. general 6. 4; 16

**Exercise Set 1.10**

1. a.  $f(x) = 200 + 0.15x$     b. 800 mi    3. a.  $M(x) = 239.4 - 0.3x$     b. 2152    5. a.  $f(x) = 1.25x$     b.  $g(x) = 21 + 0.5x$     c. 28 times; \$35  
 7. a.  $f(x) = 100 + 0.8x$     b.  $g(x) = 40 + 0.9x$     c. \$600; \$580    9. a.  $N(x) = -500x + 40,000$     b.  $R(x) = -500x^2 + 40,000x$   
 11. a.  $N(x) = -50x + 16,500$     b.  $R(x) = -50x^2 + 16,500x$     13. a.  $Y(x) = -4x + 520$     b.  $T(x) = -4x^2 + 520x$   
 15. a.  $V(x) = x(24 - 2x)^2$     b.  $V(2) = 800$ ; If a 2-in. square is cut from each corner, the volume is 800 cubic in.;  $V(3) = 972$ ; if a 3-in. square is cut from each corner, the volume is 972 cubic in.;  $V(4) = 1024$ ; if a 4-in. square is cut from each corner, the volume is 1024 cubic in.;  $V(5) = 980$ ; if a 5-in. square is cut from each corner, the volume is 980 cubic in.;  $V(6) = 864$ ; if a 6-in. square is cut from each corner, the volume is 864 cubic in. Initially, as  $x$  increases,  $V$  increases. When  $x = 4$ ,  $V$  is a maximum. As  $x$  increases beyond 4,  $V$  decreases.    c.  $(0, 12)$     17.  $A(x) = x(20 - 2x)$   
 19.  $P(x) = x(66 - x)$     21.  $A(x) = x(400 - x)$     23. Let  $x$  be the length of the side perpendicular to the canal.  $A(x) = x(800 - 2x)$   
 25.  $A(x) = \frac{x(1000 - 2x)}{3}$     27.  $A(r) = r(440 - \pi r)$     29. Let  $x$  be the length of the interior wall.  $C(x) = 475x + \frac{1,400,000}{x}$   
 31.  $A(x) = \frac{40}{x} + x^2$     33.  $V(x) = 300x^2 - 4x^3$     35. a.  $I(x) = 0.15x + 0.07(50,000 - x)$     b. \$31,250 at 15%, \$18,750 at 7%  
 37.  $I(x) = 0.12x - 0.05(8000 - x)$     39.  $d(x) = \sqrt{x^4 - 7x^2 + 16}$     41.  $d(x) = \sqrt{x^2 - x + 1}$     43. a.  $A(x) = 2x\sqrt{4 - x^2}$   
 b.  $P(x) = 4x + 2\sqrt{4 - x^2}$     45.  $f(x) = \sqrt{x^2 + 36} + \sqrt{x^2 - 20x + 164}$     47.  $A(x) = 3x^2 + x - 4$     49.  $V(x) = 2x^3 + 12x^2 + 12x + 10$   
 63. does not make sense    65. does not make sense    67.  $T(x) = \frac{\sqrt{x^2 + 4}}{2} + \frac{6 - x}{5}$     69.  $A(r) = 12r - \frac{4 + \pi}{2}r^2$     71.  $15x^2 - 29x - 14$   
 72.  $\sqrt{2}$     73.  $-\frac{54 + 43\sqrt{2}}{46}$

**Chapter 1 Review Exercises**

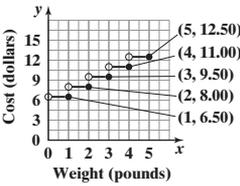

6. x-intercept: -2; y-intercept: 2    7. x-intercepts: -2, 2; y-intercept: -4    8. x-intercept: 5; no y-intercept  
 9.  $(20, 8)$ ; 8% of college students anticipated a starting salary of \$20 thousand.    10. \$30 thousand; 22%    11. \$70 thousand; 2%  
 12. \$25 thousand and \$30 thousand    13. 14%    14. 19.7%; It's greater than the estimate.    15. function; domain:  $\{2, 3, 5\}$ ; range:  $\{7\}$   
 16. function; domain:  $\{1, 2, 13\}$ ; range:  $\{10, 500, \pi\}$     17. not a function; domain:  $\{12, 14\}$ ; range:  $\{13, 15, 19\}$     18.  $y$  is a function of  $x$ .  
 19.  $y$  is a function of  $x$ .    20.  $y$  is not a function of  $x$ .    21. a.  $f(4) = -23$     b.  $f(x + 3) = -7x - 16$     c.  $f(-x) = 5 + 7x$   
 22. a.  $g(0) = 2$     b.  $g(-2) = 24$     c.  $g(x - 1) = 3x^2 - 11x + 10$     d.  $g(-x) = 3x^2 + 5x + 2$     23. a.  $g(13) = 3$   
 b.  $g(0) = 4$     c.  $g(-3) = 7$     24. a. -1    b. 12    c. 3    25. not a function    26. function    27. function    28. not a function  
 29. not a function    30. function    31. a.  $[-3, 5)$     b.  $[-5, 0]$     c. -3    d. -2    e. increasing:  $(-2, 0)$  or  $(3, 5)$ ; decreasing:  $(-3, -2)$  or  $(0, 3)$     f.  $f(-2) = -3$  and  $f(3) = -5$     32. a.  $(-\infty, \infty)$     b.  $(-\infty, 3]$     c. -2 and 3    d. 3    e. increasing:  $(-\infty, 0)$ ; decreasing:  $(0, \infty)$     f.  $f(-2) = 0$  and  $f(6) = -3$     33. a.  $(-\infty, \infty)$     b.  $[-2, 2]$     c. 0    d. 0    e. increasing:  $(-2, 2)$ ; constant:  $(-\infty, -2)$  or  $(2, \infty)$     f.  $f(-9) = -2$  and  $f(14) = 2$     34. a. 0;  $f(0) = -2$     b. -2, 3;  $f(-2) = -3, f(3) = -5$   
 35. a. 0;  $f(0) = 3$     b. none    36. odd; symmetric with respect to the origin    37. even; symmetric with respect to the y-axis  
 38. odd; symmetric with respect to the origin  
 39.  $(-4, 5)$ ;  $\{-3, 5\}$     40.  $(-\infty, 0]$

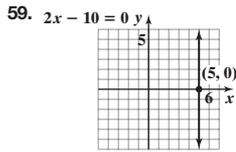

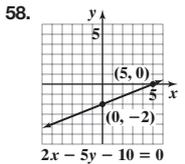

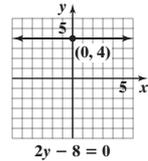

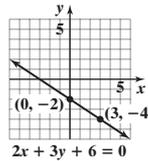

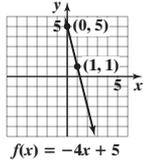

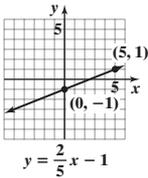

**AA20** Answers to Selected Exercises

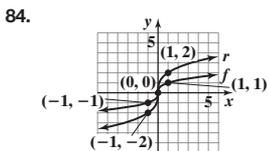

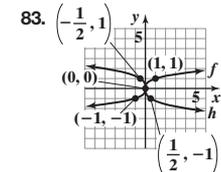

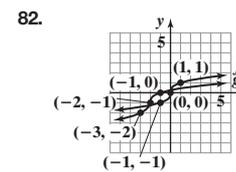

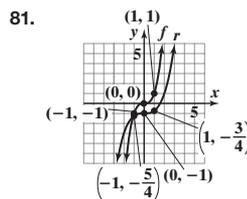

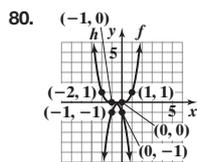

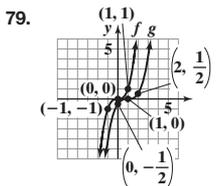

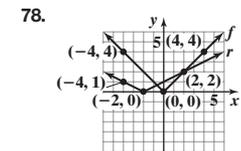

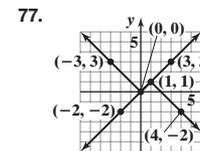

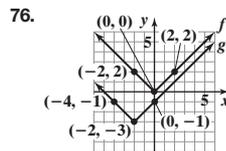

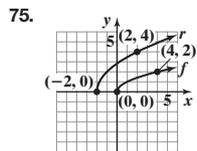

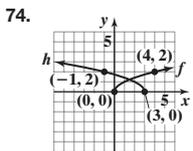

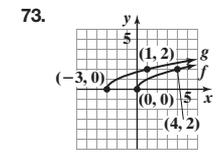

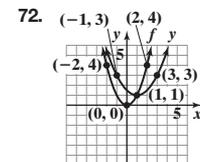

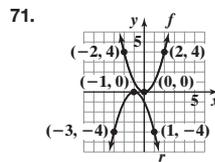

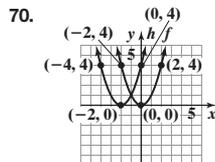

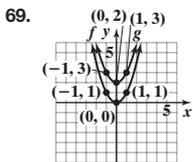

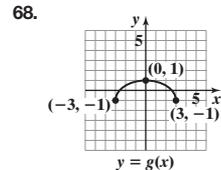

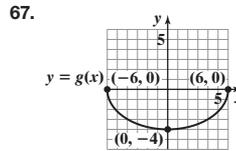

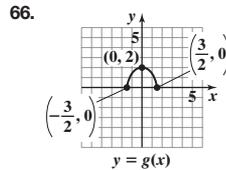

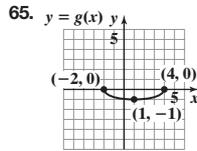

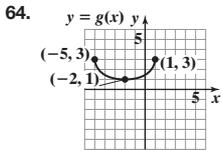

41. 8    42.  $-4x - 2h + 1$     43. a. yes; The graph passes the vertical line test.    b. (3, 12); The eagle descended.  
 c. (0, 3) and (12, 17); The eagle's height held steady during the first 3 seconds and the eagle was on the ground for 5 seconds.  
 d. (17, 30); The eagle was ascending.

44.     45.  $-\frac{1}{2}$ ; falls    46. 1; rises    47. 0; horizontal    48. undefined; vertical  
 49.  $y - 2 = -6(x + 3)$ ;  $y = -6x - 16$     50. using (1, 6),  $y - 6 = 2(x - 1)$ ;  $y = 2x + 4$   
 51.  $y + 7 = -3(x - 4)$ ;  $y = -3x + 5$     52.  $y - 6 = -3(x + 3)$ ;  $y = -3x - 3$     53.  $x + 6y + 18 = 0$

54. Slope:  $\frac{2}{5}$ ; y-intercept: -1    55. Slope: -4; y-intercept: 5    56. Slope:  $-\frac{2}{3}$ ; y-intercept: -2    57. Slope: 0; y-intercept: 4

60. a.  $y - 2.3 = 0.116(x - 15)$  or  $y - 11 = 0.116(x - 90)$     b.  $f(x) = 0.116x + 0.56$     c. approximately 5 deaths per 100,000 persons  
 d. 4.3 deaths per 100,000 persons; underestimates by 0.7 death per 100,000 persons; The line passes below the point for France.  
 61. a. -0.48    b. 0.48; -0.48%; year    62. 10    63. a. 32 ft/sec    b. -32 ft/sec    c. The positive sign means the ball is moving up on (0, 2). The negative sign means the ball is moving down on (2, 4).

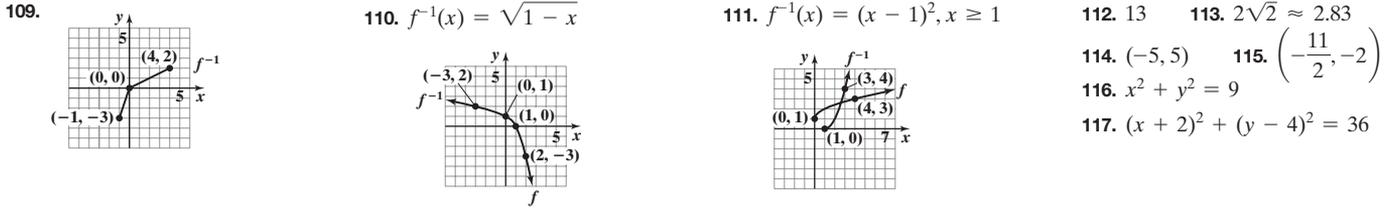

85.  $(-\infty, \infty)$     86.  $(-\infty, 7) \cup (7, \infty)$     87.  $(-\infty, 4]$     88.  $(-\infty, -7) \cup (-7, 3) \cup (3, \infty)$   
 89.  $[2, 5) \cup (5, \infty)$     90.  $[1, \infty)$     91.  $(f + g)(x) = 4x - 6$ ; domain:  $(-\infty, \infty)$ ;  $(f - g)(x) = 2x + 4$ ;  
 domain:  $(-\infty, \infty)$ ;  $(fg)(x) = 3x^2 - 16x + 5$ ; domain:  $(-\infty, \infty)$ ;  $\left(\frac{f}{g}\right)(x) = \frac{3x - 1}{x - 5}$ ; domain:  $(-\infty, 5) \cup (5, \infty)$   
 92.  $(f + g)(x) = 2x^2 + x$ ; domain:  $(-\infty, \infty)$ ;  $(f - g)(x) = x + 2$ ; domain:  $(-\infty, \infty)$ ;  $(fg)(x) = x^4 + x^3 - x - 1$ ;  
 domain:  $(-\infty, \infty)$ ;  $\left(\frac{f}{g}\right)(x) = \frac{x^2 + x + 1}{x^2 - 1}$ ; domain:  $(-\infty, -1) \cup (-1, 1) \cup (1, \infty)$

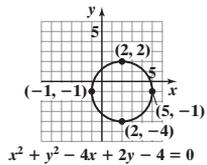

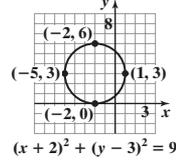

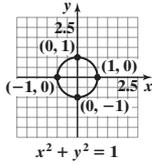

93.  $(f + g)(x) = \sqrt{x + 7} + \sqrt{x - 2}$ ; domain:  $[2, \infty)$ ;  $(f - g)(x) = \sqrt{x + 7} - \sqrt{x - 2}$ ; domain:  $[2, \infty)$ ;  $(fg)(x) = \sqrt{x^2 + 5x - 14}$ ; domain:  $[2, \infty)$ ;  $\left(\frac{f}{g}\right)(x) = \frac{\sqrt{x + 7}}{\sqrt{x - 2}}$ ; domain:  $(2, \infty)$
94. a.  $(f \circ g)(x) = 16x^2 - 8x + 4$     b.  $(g \circ f)(x) = 4x^2 + 11$     c.  $(f \circ g)(3) = 124$
95. a.  $(f \circ g)(x) = \sqrt{x + 1}$     b.  $(g \circ f)(x) = \sqrt{x} + 1$     c.  $(f \circ g)(3) = 2$     96. a.  $(f \circ g)(x) = \frac{1 + x}{1 - 2x}$     b.  $(-\infty, 0) \cup \left(0, \frac{1}{2}\right) \cup \left(\frac{1}{2}, \infty\right)$
97. a.  $(f \circ g)(x) = \sqrt{x + 2}$     b.  $[-2, \infty)$     98.  $f(x) = x^4, g(x) = x^2 + 2x - 1$     99.  $f(x) = \sqrt[3]{x}, g(x) = 7x + 4$     100.  $f(g(x)) = x - \frac{7}{10}$ ;  $g(f(x)) = x - \frac{7}{6}$ ;  $f$  and  $g$  are not inverses of each other.    101.  $f(g(x)) = x; g(f(x)) = x$ ;  $f$  and  $g$  are inverses of each other.    102.  $f^{-1}(x) = \frac{x + 3}{4}$
103.  $f^{-1}(x) = \sqrt[3]{\frac{x - 1}{8}}$  or  $\frac{\sqrt[3]{x - 1}}{2}$     104.  $f^{-1}(x) = \frac{2}{x - 5}$     105. Inverse function exists.    106. Inverse function does not exist.

107. Inverse function exists.    108. Inverse function does not exist.

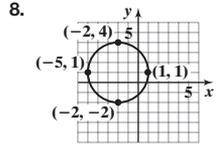

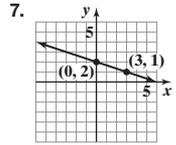

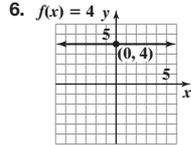

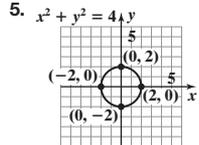

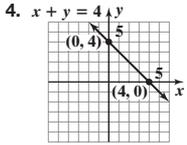

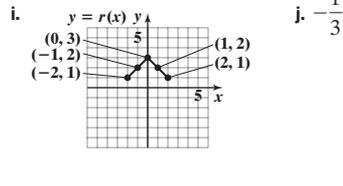

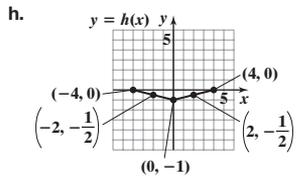

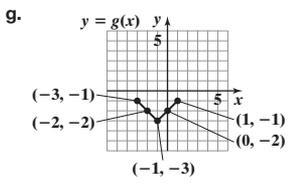

118. center:  $(0, 0)$ ; radius: 1  
domain:  $[-1, 1]$ ; range:  $[-1, 1]$

 range:  $\left[-\frac{49}{4}, \infty\right)$   
 axis of symmetry:  $x = -\frac{3}{2}$

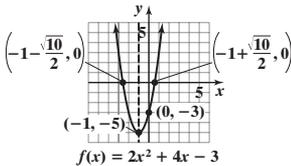

31. domain:  $(-\infty, \infty)$   
 range:  $(-\infty, 4]$   
 axis of symmetry:  $x = 1$

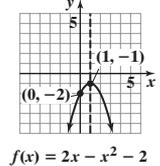

33. domain:  $(-\infty, \infty)$   
 range:  $[-6, \infty)$   
 axis of symmetry:  $x = -3$

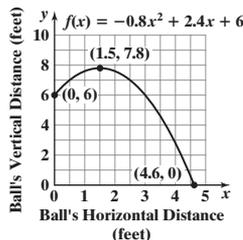

35. domain:  $(-\infty, \infty)$   
 range:  $[-5, \infty)$   
 axis of symmetry:  $x = -1$

37. domain:  $(-\infty, \infty)$   
 range:  $(-\infty, -1]$   
 axis of symmetry:  $x = 1$

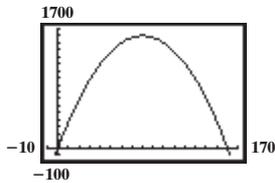

39. a. minimum    b. Minimum is  $-13$  at  $x = 2$ .    c. domain:  $(-\infty, \infty)$ ; range:  $[-13, \infty)$     41. a. maximum    b. Maximum is  $1$  at  $x = 1$ .  
 c. domain:  $(-\infty, \infty)$ ; range:  $(-\infty, 1]$     43. a. minimum    b. Minimum is  $-\frac{5}{4}$  at  $x = \frac{1}{2}$ .    c. domain:  $(-\infty, \infty)$ ; range:  $\left[-\frac{5}{4}, \infty\right)$   
 45. domain:  $(-\infty, \infty)$ ; range:  $[-2, \infty)$     47. domain:  $(-\infty, \infty)$ ; range:  $(-\infty, -6]$     49.  $f(x) = 2(x - 5)^2 + 3$     51.  $f(x) = 2(x + 10)^2 - 5$   
 53.  $f(x) = -3(x + 2)^2 + 4$     55.  $f(x) = 3(x - 11)^2$     57. a. 18.35 ft; 35 ft    b. 77.8 ft    c. 6.1 ft  
 59. a. 7.8 ft; 1.5 ft    b. 4.6 ft    c.  $f(x) = -0.8x^2 + 2.4x + 6$     61. 8 and 8; 64    63. 8,  $-8$ ;  $-64$

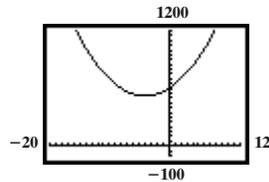

65. length: 300 ft; width: 150 ft; maximum area: 45,000 sq ft    67. 12.5 yd by 12.5 yd; 156.25 sq yd    69. 150 ft by 100 ft; 15,000 sq ft  
 71. 5 in.; 50 sq in.    73. \$65; \$422,500    75. 25; 1250 lb

## AA24 Answers to Selected Exercises

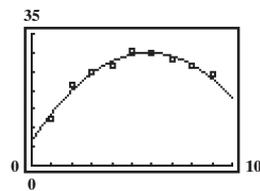

85. (80, 1600)

87.  $(-4, 520)$

89. a & e.

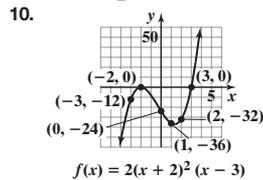

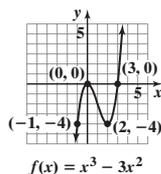

- b.  $f(x) = -0.68x^2 + 7.94x + 6.78$   
 c. 6; 29.9 million  
 d. The greatest number of viewers actually occurred in Season 5, not Season 6, and the model underestimates the greatest number by 0.5 million.

91. makes sense    93. does not make sense    95. false    97. false    99.  $x = 3; (0, 11)$     101.  $f(x) = -2(x + 3)^2 - 1$   
 103. \$95; \$21,675    106.  $(x + 3)(x + 1)(x - 1)$     107.  $f(2) = -1; f(3) = 16$ ; The graph passes through  $(2, -1)$ , which is below the  $x$ -axis, and  $(3, 16)$ , which is above the  $x$ -axis. Since the graph of  $f$  is continuous, it must cross the  $x$ -axis somewhere between 2 and 3 to get from one of these points to the other.    108. even; symmetric with respect to the  $y$ -axis

### Section 2.3

#### Check Point Exercises

1. The graph rises to the left and to the right.    2. The graph falls to the left and rises to the right.    3. Since  $n$  is odd and the leading coefficient is negative, the graph falls to the right. Since the ratio cannot be negative, the model won't be appropriate.    4. No; the graph should fall to the left but doesn't appear to do so.    5.  $-2$  and  $2$     6.  $-2, 0$ , and  $2$     7.  $-\frac{1}{2}$  with multiplicity 2 and  $5$  with multiplicity 3; touches and turns at  $-\frac{1}{2}$  and crosses at  $5$   
 8.  $f(-3) = -42; f(-2) = 5$     9.

#### Concept and Vocabulary Check

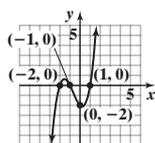

1. 5;  $-2$     2. false    3. end; leading    4. falls; rises    5. rises; falls    6. rises; rises    7. falls; falls    8. true    9. true  
 10.  $x$ -intercept    11. turns around; crosses    12. 0; Intermediate Value    13.  $n - 1$

#### Exercise Set 2.3

1. polynomial function; degree: 3    3. polynomial function; degree: 5    5. not a polynomial function    7. not a polynomial function  
 9. not a polynomial function    11. could be polynomial function    13. not a polynomial function    15. b    17. a  
 19. falls to the left and rises to the right    21. rises to the left and to the right    23. falls to the left and to the right  
 25.  $x = 5$  has multiplicity 1; The graph crosses the  $x$ -axis;  $x = -4$  has multiplicity 2; The graph touches the  $x$ -axis and turns around.  
 27.  $x = 3$  has multiplicity 1; The graph crosses the  $x$ -axis;  $x = -6$  has multiplicity 3; The graph crosses the  $x$ -axis.  
 29.  $x = 0$  has multiplicity 1; The graph crosses the  $x$ -axis;  $x = 1$  has multiplicity 2; The graph touches the  $x$ -axis and turns around.  
 31.  $x = 2, x = -2$  and  $x = -7$  have multiplicity 1; The graph crosses the  $x$ -axis.    33.  $f(1) = -1; f(2) = 5$     35.  $f(-1) = -1; f(0) = 1$   
 37.  $f(-3) = -11; f(-2) = 1$     39.  $f(-3) = -42; f(-2) = 5$

41. a.  $f(x)$  rises to the right and falls to the left.

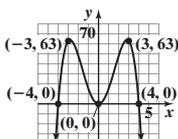

- b.  $x = -2, x = 1, x = -1$ ;  
 $f(x)$  crosses the  $x$ -axis at each.  
 c. The  $y$ -intercept is  $-2$ .  
 d. neither

$f(x) = x^3 + 2x^2 - x - 2$

45. a.  $f(x)$  falls to the left and the right.

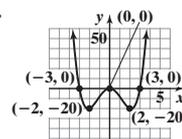

- b.  $x = 0, x = 4, x = -4$ ;  
 $f(x)$  crosses the  $x$ -axis at  $-4$  and  $4$ ;  
 $f(x)$  touches the  $x$ -axis at  $0$ .  
 c. The  $y$ -intercept is  $0$ .  
 d.  $y$ -axis symmetry

$f(x) = -x^4 + 16x^2$

43. a.  $f(x)$  rises to the left and the right.

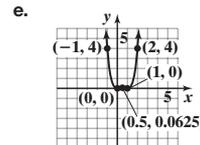

- b.  $x = 0, x = 3, x = -3$ ;  
 $f(x)$  crosses the  $x$ -axis at  $-3$  and  $3$ ;  
 $f(x)$  touches the  $x$ -axis at  $0$ .  
 c. The  $y$ -intercept is  $0$ .  
 d.  $y$ -axis symmetry

$f(x) = x^4 - 9x^2$

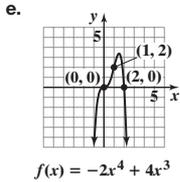

47. a.  $f(x)$  rises to the left and the right.

- b.  $x = 0, x = 1$ ;  
 $f(x)$  touches the  $x$ -axis at  $0$  and  $1$ .  
 c. The  $y$ -intercept is  $0$ .  
 d. neither

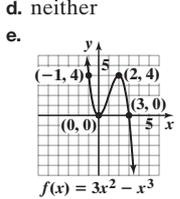

$f(x) = x^4 - 2x^3 + x^2$

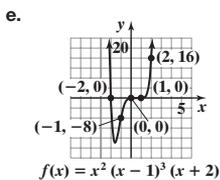

49. a.  $f(x)$  falls to the left and the right.  
 b.  $x = 0, x = 2$ ;  
 $f(x)$  crosses the  $x$ -axis at 0 and 2.  
 c. The  $y$ -intercept is 0.  
 d. neither

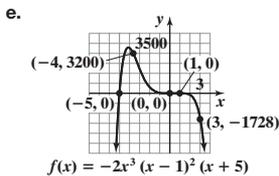

53. a.  $f(x)$  rises to the left and falls to the right.  
 b.  $x = 0, x = 3$ ;  
 $f(x)$  crosses the  $x$ -axis at 3;  
 $f(x)$  touches the  $x$ -axis at 0.  
 c. The  $y$ -intercept is 0.  
 d. neither

57. a.  $f(x)$  rises to the left and the right.  
 b.  $x = -2, x = 0, x = 1$ ;  
 $f(x)$  crosses the  $x$ -axis at  $-2$  and  $1$ ;  
 $f(x)$  touches the  $x$ -axis at  $0$ .  
 c. The  $y$ -intercept is  $0$ .  
 d. neither

61. a.  $f(x)$  falls to the left and the right.  
 b.  $x = -5, x = 0, x = 1$ ;  
 $f(x)$  crosses the  $x$ -axis at  $-5$  and  $0$ ;  
 $f(x)$  touches the  $x$ -axis at  $1$ .  
 c. The  $y$ -intercept is  $0$ .  
 d. neither

65. a.  $-2$ , odd;  $1$ , odd;  $4$ , odd

b.  $f(x) = (x+2)(x-1)(x-4)$

c. 8

67. a.  $-1$ , odd;  $3$ , even

b.  $f(x) = (x+1)(x-3)^2$

c. 9

69. a.  $-3$ , even;  $2$ , even

b.  $f(x) = -(x+3)^2(x-2)^2$

c.  $-36$

71. a.  $-2$ , even;  $-1$ , odd;  $1$ , odd

b.  $f(x) = (x+2)^2(x+1)(x-1)^3$

c.  $-4$  73. a. 3167; The world tiger population in 2010 was approximately 3167.: (40, 3167) b. underestimates by 33 c. rises to the right; no; The model indicates an increasing world tiger population that will actually decrease without conservation efforts.

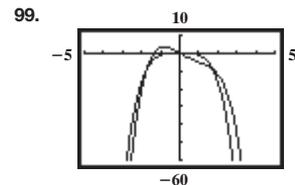

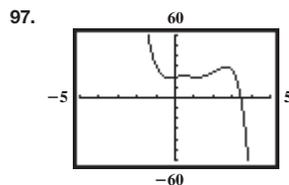

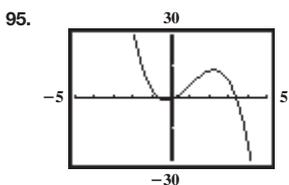

75. a. from 1 through 4 min and from 8 through 10 min

b. from 4 through 8 min and from 10 through 12 min

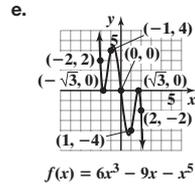

c. 3

d. 4

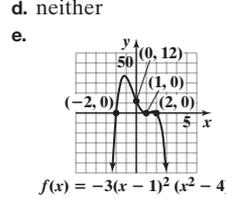

e. negative; The graph falls to the left and falls to the right.

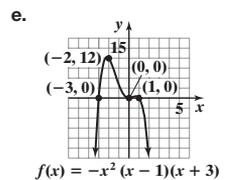

51. a.  $f(x)$  rises to the left and falls to the right.  
 b.  $x = 0, x = \pm\sqrt{3}$ ;  
 $f(x)$  crosses the  $x$ -axis at  $0$ ;  
 $f(x)$  touches the  $x$ -axis at  $\sqrt{3}$  and  $-\sqrt{3}$ .  
 c. The  $y$ -intercept is  $0$ .  
 d. origin symmetry

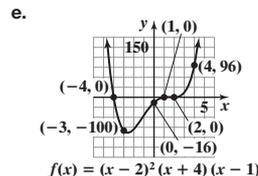

55. a.  $f(x)$  falls to the left and the right.  
 b.  $x = 1, x = -2, x = 2$ ;  
 $f(x)$  crosses the  $x$ -axis at  $-2$  and  $2$ ;  
 $f(x)$  touches the  $x$ -axis at  $1$ .  
 c. The  $y$ -intercept is  $12$ .  
 d. neither

59. a.  $f(x)$  falls to the left and the right.  
 b.  $x = -3, x = 0, x = 1$ ;  
 $f(x)$  crosses the  $x$ -axis at  $-3$  and  $1$ ;  
 $f(x)$  touches the  $x$ -axis at  $0$ .  
 c. The  $y$ -intercept is  $0$ .  
 d. neither

63. a.  $f(x)$  rises to the left and the right.  
 b.  $x = -4, x = 1, x = 2$ ;  
 $f(x)$  crosses the  $x$ -axis at  $-4$  and  $1$ ;  
 $f(x)$  touches the  $x$ -axis at  $2$ .  
 c. The  $y$ -intercept is  $-16$ .  
 d. neither

**AA26** Answers to Selected Exercises

101. does not make sense    103. makes sense    105. false    107. false    109.  $f(x) = x^3 - 2x^2$

110.  $35\frac{2}{21}$     111.  $6x^3 - x^2 - 5x + 4$     112.  $(x - 3)(2x - 1)(x + 2)$

**Section 2.4**

**Check Point Exercises**

1.  $x + 5$     2.  $2x^2 + 3x - 2 + \frac{1}{x - 3}$     3.  $2x^2 + 7x + 14 + \frac{21x - 10}{x^2 - 2x}$     4.  $x^2 - 2x - 3$     5.  $-105$     6.  $\left\{-1, -\frac{1}{3}, \frac{2}{5}\right\}$

30.  $2x^2 - x - 3 + \frac{x + 1}{3x^2 - 1}$     31.  $2x^3 - 5x^2 - 3x + 6$     32.  $f(x) = -2x^3 + 2x^2 - 2x + 2$

33.  $f(x) = x^4 - 4x^3 + 13x^2 - 36x + 36$     34. yes

**Section 2.6**

**Check Point Exercises**

1. a.  $\{x | x \neq 5\}$  or  $(-\infty, 5) \cup (5, \infty)$     b.  $\{x | x \neq -5, x \neq 5\}$  or  $(-\infty, -5) \cup (-5, 5) \cup (5, \infty)$     c. all real numbers or  $(-\infty, \infty)$   
 2. a.  $x = 1, x = -1$     b.  $x = -1$     c. none    3. a.  $y = 3$     b.  $y = 0$     c. none

## AA28 Answers to Selected Exercises

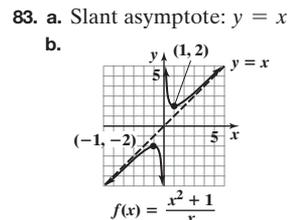

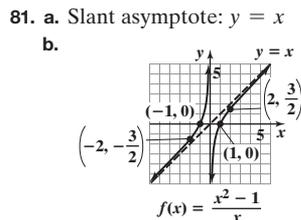

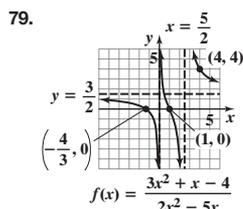

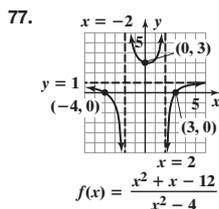

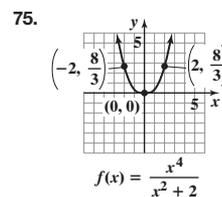

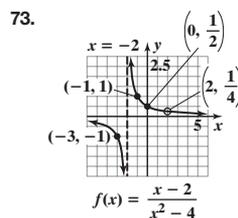

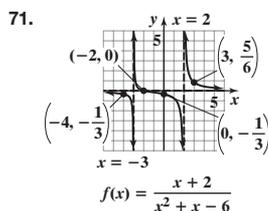

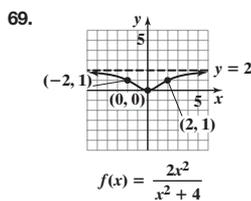

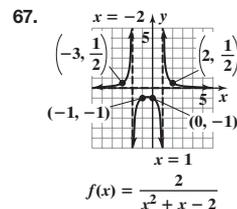

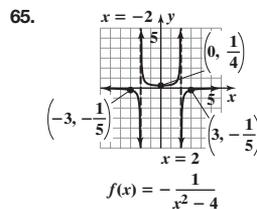

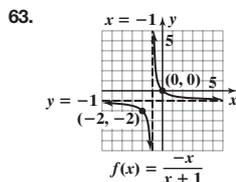

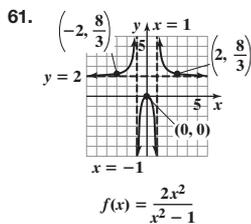

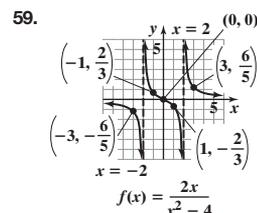

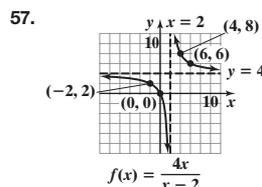

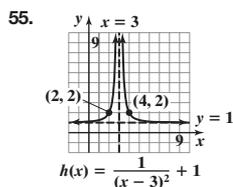

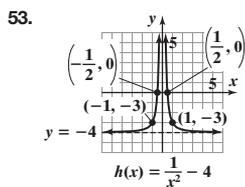

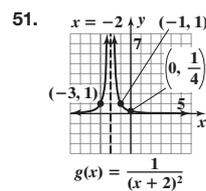

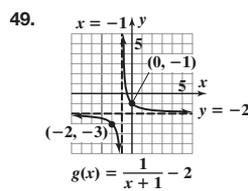

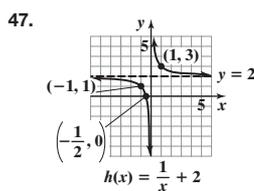

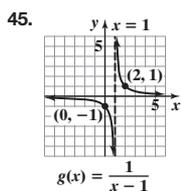

8.  $y = 2x - 1$     9. a.  $C(x) = 500,000 + 400x$     b.  $\bar{C}(x) = \frac{500,000 + 400x}{x}$     c.  $\bar{C}(1000) = 900$ : The average cost per wheelchair of producing 1000 wheelchairs per month is \$900.;  $\bar{C}(10,000) = 450$ : The average cost per wheelchair of producing 10,000 wheelchairs per month is \$450.;  $\bar{C}(100,000) = 405$ : The average cost per wheelchair of producing 100,000 wheelchairs per month is \$405.    d.  $y = 400$ ; The cost per wheelchair approaches \$400 as more wheelchairs are produced.    10.  $T(x) = \frac{20}{x} + \frac{20}{x-10}$

### Concept and Vocabulary Check

1. polynomial    2. false    3. true    4. vertical asymptote;  $x = -5$     5. horizontal asymptote;  $y = 0$ ;  $y = \frac{1}{3}$     6. true  
7. left; down    8. one more than    9.  $y = 3x + 5$     10.  $x - 20$ ;  $\frac{30}{x-20}$

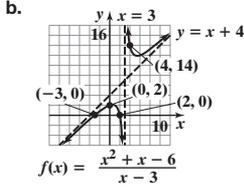

### Exercise Set 2.6

1.  $\{x|x \neq 4\}$     3.  $\{x|x \neq 5, x \neq -4\}$     5.  $\{x|x \neq 7, x \neq -7\}$     7. all real numbers    9.  $-\infty$     11.  $-\infty$     13. 0    15.  $+\infty$   
17.  $-\infty$     19. 1    21. vertical asymptote:  $x = -4$ ; no holes    23. vertical asymptotes:  $x = -4, x = 0$ ; no holes    25. vertical asymptote:  $x = -4$ ; hole at  $x = 0$     27. no vertical asymptotes; no holes    29. no vertical asymptotes; hole at  $x = 3$     31. vertical asymptote:  $x = -3$ ; hole at  $x = 3$   
33. vertical asymptote:  $x = 3$ ; hole at  $x = -7$     35. no vertical asymptotes; hole at  $x = -7$     37.  $y = 0$     39.  $y = 4$   
41. no horizontal asymptote    43.  $y = -\frac{2}{3}$

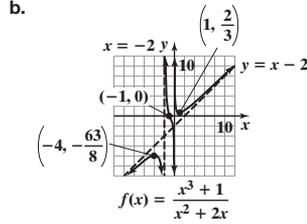

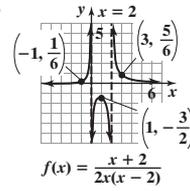

85. a. Slant asymptote:  $y = x + 4$

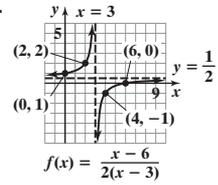

87. a. Slant asymptote:  $y = x - 2$

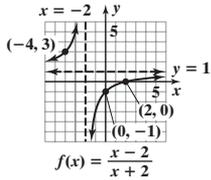

89.

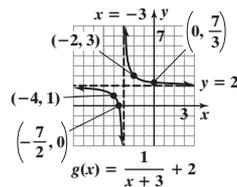

91.

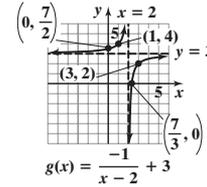

93.

95.  $g(x) = \frac{1}{x + 3} + 2$

97.  $g(x) = \frac{-1}{x - 2} + 3$

99. a.  $C(x) = 100x + 100,000$

b.  $\bar{C}(x) = \frac{100x + 100,000}{x}$

c.  $\bar{C}(500) = 300$ , when 500 bicycles are produced, it costs \$300 to produce each

bicycle;  $\bar{C}(1000) = 200$ , when 1000 bicycles are produced, it costs \$200 to produce each bicycle;  $\bar{C}(2000) = 150$ , when 2000 bicycles are produced, it costs \$150 to produce each bicycle;  $\bar{C}(4000) = 125$ , when 4000 bicycles are produced, it costs \$125 to produce each bicycle. d.  $y = 100$ ; The cost per bicycle approaches \$100 as more bicycles are produced.

101. a. 6.0

b. after 6 minutes; about 4.8

c. 6.5

d.  $y = 6.5$ ; Over time, the pH level rises back to normal.

e. It quickly drops below normal and then slowly begins to approach the normal level.

103. 90; An incidence ratio of 10 means 90% of the deaths are smoking related.

105.  $y = 100$ ; The percentage of deaths cannot exceed 100% as

the incidence ratios increase.

107. a.  $f(x) = \frac{1.75x^2 - 15.9x + 160}{2.1x^2 - 3.5x + 296}$

b. 67%

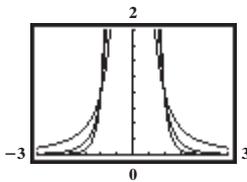

c. 66%; underestimates by 1%

d.  $y = \frac{1.75}{2.1}$ ; 83%

109.  $T(x) = \frac{10}{x} + \frac{5}{x}$

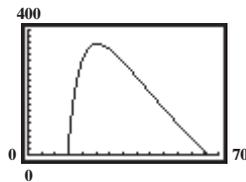

111.  $A(x) = 2x + \frac{50}{x} + 52$

123.

The graph approaches the horizontal asymptote faster and the vertical asymptote slower as  $n$  increases.

125. a.

- b. The graph increases and reaches a maximum of about 356 arrests per 100,000 drivers at age 25.  
c. at age 25, about 356 arrests

127. does not make sense

129. does not make sense

131. true

133. true

138.  $\left\{-3, \frac{5}{2}\right\}$

139.  $\{-2, -1, 2\}$

140.  $\frac{-x - 5}{x + 3}$  or  $\frac{-x + 5}{x + 3}$

### Section 2.7

#### Check Point Exercises

1.  $\{x | x < -4 \text{ or } x > 5\}$  or  $(-\infty, -4) \cup (5, \infty)$

2.  $\left\{x \mid \frac{-3 - \sqrt{7}}{2} \leq x \leq \frac{-3 + \sqrt{7}}{2}\right\}$  or  $\left[\frac{-3 - \sqrt{7}}{2}, \frac{-3 + \sqrt{7}}{2}\right]$

3.  $\{x | x \leq -3 \text{ or } -1 \leq x \leq 1\}$  or  $(-\infty, -3] \cup [-1, 1]$

4.  $\{x | x < -1 \text{ or } x \geq 1\}$  or  $(-\infty, -1) \cup [1, \infty)$

5. between 1 and 4 seconds, excluding  $t = 1$  and  $t = 4$

#### Concept and Vocabulary Check

1.  $x^2 + 8x + 15 = 0$ ; boundary

2.  $(-\infty, -5); (-5, -3); (-3, \infty)$

3. true

4. true

5.  $(-\infty, -2) \cup [1, \infty)$

#### Exercise Set 2.7

1.  $(-\infty, -2) \cup (4, \infty)$

3.  $[-3, 7]$

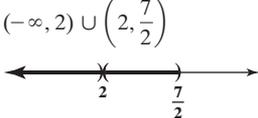

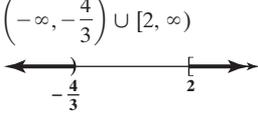

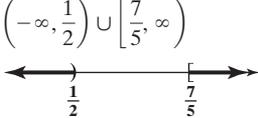

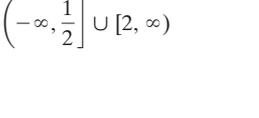

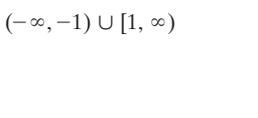

5.  $(-\infty, 1) \cup (4, \infty)$

7.  $(-\infty, -4) \cup (-1, \infty)$

67.  $(-3, 2)$  
69.  $(-\infty, -1) \cup (1, 2) \cup (3, \infty)$  
71.  $\left[-6, -\frac{1}{2}\right] \cup [1, \infty)$     73.  $(-\infty, -2) \cup [-1, 2)$     75. between 0 and  $\frac{1}{2}$  second    77. a. dry: 160 ft; wet: 185 ft    b. dry pavement: graph (b); wet pavement: graph (a)    c. extremely well; Function values and data are identical.    d. speeds exceeding 76 miles per hour; points on (b) to the right of (76, 540)    79. The sides (in feet) are in  $(0, 6]$  or  $[19, 25)$ .    87.  $\left[-3, \frac{1}{2}\right]$     89.  $(1, 4]$     91.  $(-4, -1) \cup [2, \infty)$
93. a.  $f(x) = 0.1375x^2 + 0.7x + 37.8$     b. speeds exceeding 52 miles per hour    95. does not make sense    97. does not make sense
99. false    101. true    103. Answers may vary. One possible solution is  $\frac{x-3}{x+4} \geq 0$ .    105.  $\{2\}$     107.  $(-\infty, 2) \cup (2, \infty)$
109.  $27 - 3x^2 \geq 0$   
 $3x^2 \leq 27$   
 $x^2 \leq 9$   
 $-3 \leq x \leq 3$
110. a. 16    b.  $y = 16x^2$     c. 400    111. a. 96    b.  $y = \frac{96}{x}$     c. 32    112. 8

### Section 2.8

#### Check Point Exercises

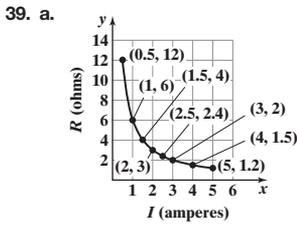

1. 66 gal    2. 9375 lb    3. 512 cycles per second    4. 24 min    5.  $96\pi$  cubic feet

#### Concept and Vocabulary Check

1.  $y = kx$ ; constant of variation    2.  $y = kx^n$     3.  $y = \frac{k}{x}$     4.  $y = \frac{kx}{z}$     5.  $y = kxz$     6. directly; inversely    7. jointly; inversely

#### Exercise Set 2.8

1. 156    3. 30    5.  $\frac{5}{6}$     7. 240    9. 50    11.  $x = kyz; y = \frac{x}{kz}$     13.  $x = \frac{kz^3}{y}; y = \frac{kz^3}{x}$     15.  $x = \frac{k y z}{\sqrt{w}}; y = \frac{x \sqrt{w}}{k z}$
17.  $x = kz(y + w); y = \frac{x - kz w}{kz}$     19.  $x = \frac{kz}{y - w}; y = \frac{xw + kz}{x}$     21. 5.4 ft    23. 80 in.    25. about 607 lb    27.  $32^\circ$
29. 90 milliroentgens per hour    31. This person has a BMI of 24.4 and is not overweight.    33. 1800 Btu per hour
35.  $\frac{1}{4}$  of what it was originally    37. a.  $C = \frac{kP_1P_2}{d^2}$     b.  $k \approx 0.02; C = \frac{0.02 P_1 P_2}{d^2}$     c. 39,813 daily phone calls

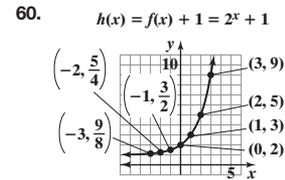

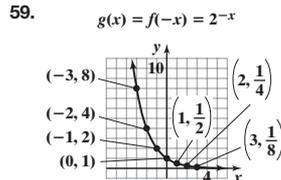

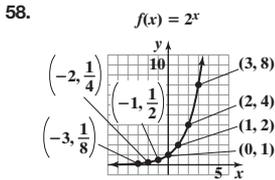

b. Current varies inversely as resistance. c.  $R = \frac{6}{I}$

49. does not make sense

51. makes sense

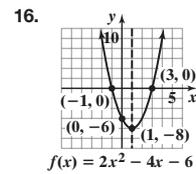

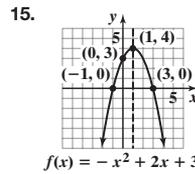

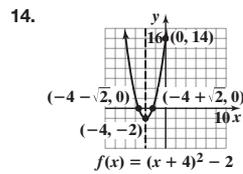

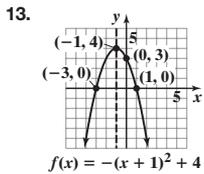

53. The destructive power is four times as much.

55. Reduce the resistance by a factor of  $\frac{1}{3}$ .

Chapter 2 Review Exercises

1.  $-9 + 4i$    2.  $-12 - 8i$    3.  $17 + 19i$    4.  $-7 - 24i$    5. 113   6.  $\frac{15}{13} - \frac{3}{13}i$    7.  $\frac{1}{5} + \frac{11}{10}i$    8.  $i\sqrt{2}$    9.  $-96 - 40i$   
 10.  $2 + i\sqrt{2}$    11.  $\{1 + i\sqrt{3}, 1 - i\sqrt{3}\}$    12.  $\left\{\frac{3}{2} + \frac{1}{2}i, \frac{3}{2} - \frac{1}{2}i\right\}$

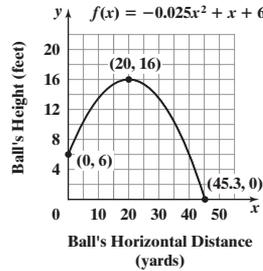

axis of symmetry;  $x = -1$   
 domain:  $(-\infty, \infty)$ ; range:  $(-\infty, 4]$

axis of symmetry;  $x = -4$   
 domain:  $(-\infty, \infty)$ ; range:  $[-2, \infty)$

axis of symmetry;  $x = 1$   
 domain:  $(-\infty, \infty)$ ; range:  $(-\infty, 4]$

axis of symmetry;  $x = 1$   
 domain:  $(-\infty, \infty)$ ; range:  $[-8, \infty)$

17. a. maximum is  $-57$  at  $x = 7$    b. domain:  $(-\infty, \infty)$ ; range:  $(-\infty, -57]$    18. a. minimum is 685 at  $x = -3$    b. domain:  $(-\infty, \infty)$ ; range:  $[685, \infty)$   
 19. a. 16 ft; 20 yd   b. 6 ft   c. 45.3 yd   d. 20. 250 yd by 500 yd; 125,000 sq yard   21.  $-7$  and  $7$ ;  $-49$

22.  $x = 166\frac{2}{3}$  ft by  $y = 125$  ft   23. 36; 5256 lb   24. c   25. b   26. a   27. d   28. a. rises to the right   b. no; The model indicates

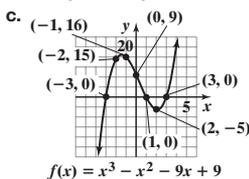

increasing deforestation despite a declining rate in which the forest is being cut down.   c. falls to the right   d. no; The model indicates the amount of forest cleared, in square kilometers, will eventually be negative, which is not possible.   29. No; the graph falls to the right, so eventually there would be a negative number of thefts, which is not possible.

30.  $x = 1$ , multiplicity 1, crosses;  $x = -2$ , multiplicity 2, touches;  $x = -5$ , multiplicity 3, crosses

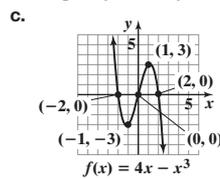

31.  $x = -5$ , multiplicity 1, crosses;  $x = 5$ , multiplicity 2, touches

32.  $f(1)$  is negative and  $f(2)$  is positive, so by the Intermediate Value Theorem,  $f$  has a real zero between 1 and 2.

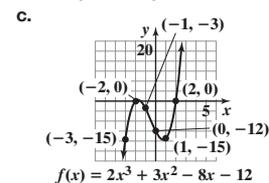

33. a. The graph falls to the left and rises to the right.  
 b. no symmetry

34. a. The graph rises to the left and falls to the right.  
 b. origin symmetry

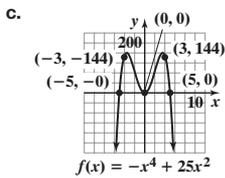

35. a. The graph falls to the left and rises to the right.  
 b. no symmetry

**AA32** Answers to Selected Exercises

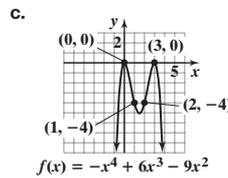

36. a. The graph falls to the left and to the right.

b. y-axis symmetry

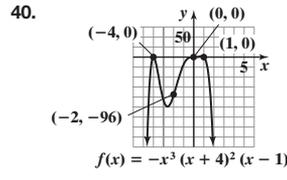

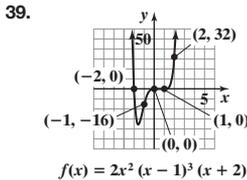

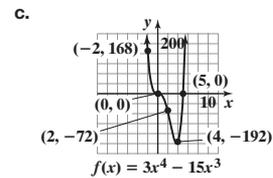

37. a. The graph falls to the left and to the right.

b. no symmetry

38. a. The graph rises to the left and to the right.

b. no symmetry

41.  $4x^2 - 7x + 5 - \frac{4}{x+1}$

42.  $2x^2 - 4x + 1 - \frac{10}{5x-3}$

43.  $2x^2 + 3x - 1$     44.  $3x^3 - 4x^2 + 7$

45.  $3x^3 + 6x^2 + 10x + 10 + \frac{20}{x-2}$     46.  $-5697$

52. 3 or 1 positive real zeros; 2 or 0 negative real zeros    53. No sign variations exist for either  $f(x)$  or  $f(-x)$ , so no real roots exist.

54. a.  $\pm 1, \pm 2, \pm 4$     b. 1 positive real zero; 2 or no negative real zeros    c.  $-2$  or  $1$     d.  $-2, 1$

55. a.  $\pm 1, \pm \frac{1}{2}, \pm \frac{1}{3}, \pm \frac{1}{6}$     b. 2 or 0 positive real zeros; 1 negative real zero    c.  $-1, \frac{1}{3}$ , or  $\frac{1}{2}$     d.  $-1, \frac{1}{3}, \frac{1}{2}$

56. a.  $\pm 1, \pm 3, \pm 5, \pm 15, \pm \frac{1}{2}, \pm \frac{1}{4}, \pm \frac{1}{8}, \pm \frac{3}{2}, \pm \frac{3}{4}, \pm \frac{3}{8}, \pm \frac{5}{2}, \pm \frac{5}{4}, \pm \frac{5}{8}, \pm \frac{15}{2}, \pm \frac{15}{4}, \pm \frac{15}{8}$     b. 3 or 1 positive real solutions; no negative real solutions

c.  $\frac{1}{2}, \frac{3}{2}$ , or  $\frac{5}{2}$     d.  $\left\{\frac{1}{2}, \frac{3}{2}, \frac{5}{2}\right\}$     57. a.  $\pm 1, \pm \frac{1}{2}$     b. 2 or 0 positive real solutions; 1 negative solution    c.  $\frac{1}{2}$     d.  $\left\{\frac{1}{2}, \frac{-5 - \sqrt{29}}{2}, \frac{-5 + \sqrt{29}}{2}\right\}$

58. a.  $\pm 1, \pm 2, \pm 3, \pm 6$     b. 2 or zero positive real solutions; 2 or zero negative real solutions    c.  $-2, -1, 1$ , or  $3$     d.  $\{-2, -1, 1, 3\}$

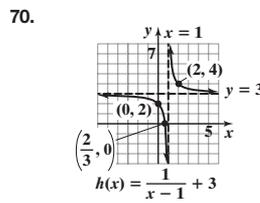

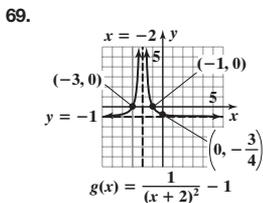

59. a.  $\pm 1, \pm 2, \pm \frac{1}{2}, \pm \frac{1}{4}$     b. 1 positive real root; 1 negative real root    c.  $-\frac{1}{2}$  or  $\frac{1}{2}$     d.  $\left\{-\frac{1}{2}, \frac{1}{2}, i\sqrt{2}, -i\sqrt{2}\right\}$

60. a.  $\pm 1, \pm 2, \pm 4, \pm \frac{1}{2}$     b. 2 or no positive zeros; 2 or no negative zeros    c.  $-2, -1, \frac{1}{2}$ , or  $2$     d.  $-2, -1, \frac{1}{2}, 2$

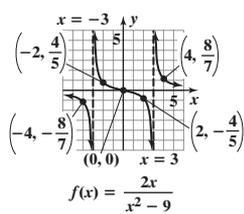

61.  $f(x) = x^3 - 6x^2 + 21x - 26$     62.  $f(x) = 2x^4 + 12x^3 + 20x^2 + 12x + 18$     63.  $-2, \frac{1}{2}, \pm i; f(x) = (x-i)(x+i)(x+2)(2x-1)$

64.  $-1, 4; g(x) = (x+1)^2(x-4)^2$     65. 4 real zeros, one with multiplicity two    66. 3 real zeros; 2 nonreal complex zeros

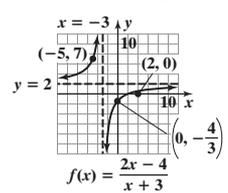

67. 2 real zeros, one with multiplicity two; 2 nonreal complex zeros    68. 1 real zero; 4 nonreal complex zeros

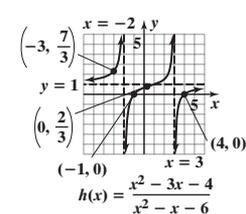

71. Vertical asymptotes:  $x = 3$  and  $x = -3$   
horizontal asymptote:  $y = 0$

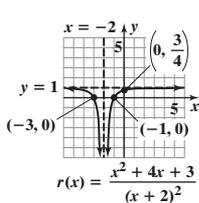

72. Vertical asymptote:  $x = -3$   
horizontal asymptote:  $y = 2$

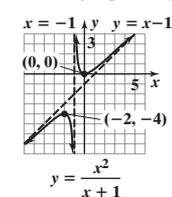

73. Vertical asymptotes:  $x = 3$  and  $x = -2$   
horizontal asymptote:  $y = 1$

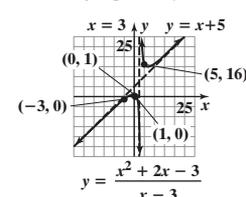

74. Vertical asymptote:  $x = -2$   
horizontal asymptote:  $y = 1$

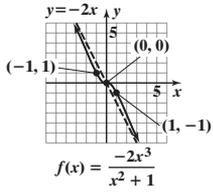

75. Vertical asymptote:  $x = -1$   
no horizontal asymptote  
slant asymptote:  $y = x - 1$

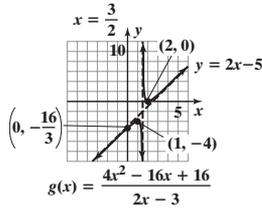

76. Vertical asymptote:  $x = 3$   
no horizontal asymptote  
slant asymptote:  $y = x + 5$

77. No vertical asymptote  
no horizontal asymptote  
slant asymptote:  $y = -2x$

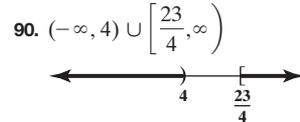

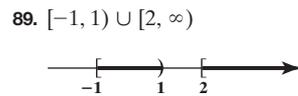

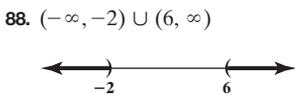

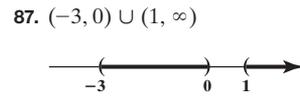

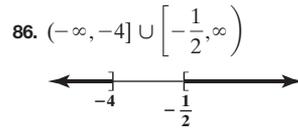

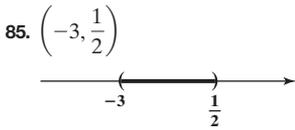

78. Vertical asymptote:  $x = \frac{3}{2}$   
no horizontal asymptote  
slant asymptote:  $y = 2x - 5$

79. a.  $C(x) = 25x + 50,000$   
b.  $\bar{C}(x) = \frac{25x + 50,000}{x}$   
c.  $\bar{C}(50) = 1025$ , when 50 calculators are manufactured, it costs \$1025 to manufacture each;  
 $\bar{C}(100) = 525$ , when 100 calculators are manufactured, it costs \$525 to manufacture each;  
 $\bar{C}(1000) = 75$ , when 1000 calculators are manufactured, it costs \$75 to manufacture each;  
 $\bar{C}(100,000) = 25.5$ , when 100,000 calculators are manufactured, it costs \$25.50 to manufacture each.  
d.  $y = 25$ ; costs will approach \$25.

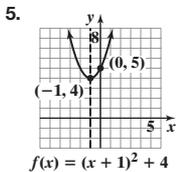

80.  $y = 3000$ ; The number of fish in the pond approaches 3000.  
81.  $y = 0$ ; As the number of years of education increases the percentage rate of unemployment approaches zero.  
82. a.  $P(x) = 2.99x + 235.5$     b.  $R(x) = \frac{1.53x + 114.8}{2.99x + 235.5}$     c.  $y = 0.51$ ; Over time the percentage of men in the U.S. population will approach 51%.  
83.  $T(x) = \frac{4}{x+3} + \frac{2}{x}$     84.  $P(x) = 2x + \frac{2000}{x}$

91. a. 261 ft; overestimates by 1 ft    b. speeds exceeding 40 miles per hour    92. from 1 to 2 sec    93.  $134.4 \text{ cm}^3$     94. 1600 ft  
95. 440 vibrations per second    96. 112 decibels    97. 16 hr    98.  $800 \text{ ft}^3$     99. a.  $L = \frac{1890}{R}$     b. an approximate model    c. 70 yr

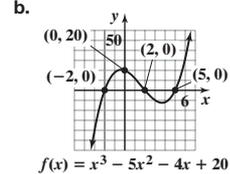

**Chapter 2 Test**

1.  $47 + 16i$     2.  $2 + i$     3.  $38i$     4.  $\{2 \pm i\}$

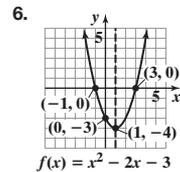

axis of symmetry:  $x = -1$   
domain:  $(-\infty, \infty)$ ; range:  $[4, \infty)$

10. a. 5, 2, -2

15.  $\{-3, -3 - \sqrt{11}, -3 + \sqrt{11}\}$

18.  $f(x) = 2x^4 - 2$

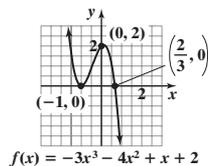

axis of symmetry:  $x = 1$   
domain:  $(-\infty, \infty)$ ; range:  $[-4, \infty)$

11. Since the degree of the polynomial is odd and the leading coefficient is positive, the graph of  $f$  should fall to the left and rise to the right. The  $x$ -intercepts should be  $-1, 0,$  and  $1$ .

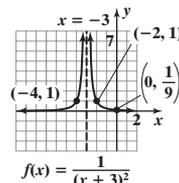

12. a. 2    b.  $\frac{1}{2}, \frac{2}{3}$     13.  $\pm 1, \pm 2, \pm 3, \pm 6, \pm \frac{1}{2}, \pm \frac{3}{2}$   
14. 3 or 1 positive real zeros; no negative real zeros

16. a.  $\pm 1, \pm 3, \pm 5, \pm 15, \pm \frac{1}{2}, \pm \frac{3}{2}, \pm \frac{5}{2}, \pm \frac{15}{2}$     b.  $-\sqrt{5}, -1, \frac{3}{2},$  and  $\sqrt{5}$

19.  $-1$  and  $\frac{2}{3}$

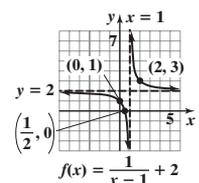

20. domain:  $\{x|x \neq -3\}$

7. a. maximum of 2 at  $x = 3$ ;  
b. domain:  $(-\infty, \infty)$ ; range:  $(-\infty, 2]$   
8. 23 computers;  
maximum daily profit = \$16,900  
9. 7 and 7; 49

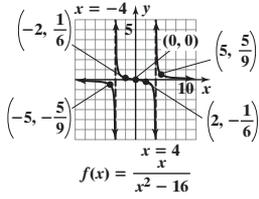

17.  $(x-1)(x+2)^2$

21. domain:  $\{x|x \neq 1\}$

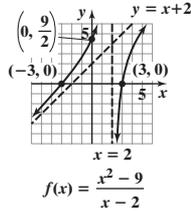

**AA34** Answers to Selected Exercises

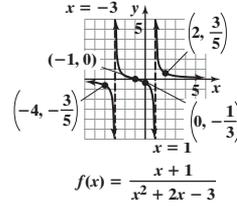

22. domain:  $\{x|x \neq 4, x \neq -4\}$

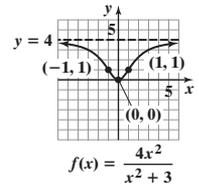

23. domain:  $\{x|x \neq 2\}$

24. domain:  $\{x|x \neq -3, x \neq 1\}$

25. domain: all real numbers

26. a.  $\bar{C}(x) = \frac{300,000 + 10x}{x}$

b.  $y = 10$ ; As the number of satellite radio players increases, the average cost approaches \$10.

27.  $(-3, 4)$

28.  $(-\infty, 3) \cup [10, \infty)$

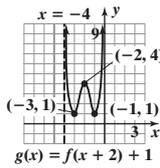

29. 45 foot-candles

4. a.  $\sqrt{2}$

b.  $-\frac{\sqrt{2}}{2}$

5.  $\tan t = \frac{2\sqrt{5}}{5}$ ;  $\csc t = \frac{3}{2}$ ;  $\sec t = \frac{3\sqrt{5}}{5}$ ;  $\cot t = \frac{\sqrt{5}}{2}$

6.  $\frac{\sqrt{3}}{2}$

7. a. 1

b.  $\frac{\sqrt{2}}{2}$

8. a. 0.7071

b. 1.0025

#### Concept and Vocabulary Check

1. intercepted arc

2. cosine; sine

3. sine; cosine;  $(-\infty, \infty)$

4. 1; -1;  $[-1, 1]$

5.  $\frac{\sqrt{2}}{2}$ ;  $\frac{\sqrt{2}}{2}$ ; 1

6.  $\cos t$ ;  $\sec t$ ; even

7.  $-\sin t$ ;  $-\csc t$ ;  $-\tan t$ ;  $-\cot t$ ; odd

8.  $\sin t$ ;  $\cos t$ ;  $\tan t$

9.  $\tan t$ ;  $\cot t$

10. 1;  $\sec^2 t$ ;  $\csc^2 t$

11. periodic; period

12.  $\sin t$ ;  $\cos t$ ; periodic;  $2\pi$

13.  $\tan t$ ;  $\cot t$ ; periodic;  $\pi$

#### Exercise Set 4.2

1.  $\sin t = \frac{8}{17}$ ;  $\cos t = -\frac{15}{17}$ ;  $\tan t = -\frac{8}{15}$ ;  $\csc t = \frac{17}{8}$ ;  $\sec t = -\frac{17}{15}$ ;  $\cot t = -\frac{15}{8}$

3.  $\sin t = -\frac{\sqrt{2}}{2}$ ;  $\cos t = \frac{\sqrt{2}}{2}$ ;  $\tan t = -1$ ;  $\csc t = -\sqrt{2}$ ;  $\sec t = \sqrt{2}$ ;  $\cot t = -1$

5.  $\frac{1}{2}$

7.  $-\frac{\sqrt{3}}{2}$

9. 0

11. -2

13.  $\frac{2\sqrt{3}}{3}$

15. -1

17. undefined

19. a.  $\frac{\sqrt{3}}{2}$

b.  $\frac{\sqrt{3}}{2}$

21. a.  $\frac{1}{2}$

b.  $-\frac{1}{2}$

23. a.  $-\sqrt{3}$

b.  $\sqrt{3}$

25.  $\tan t = \frac{8}{15}$ ;  $\csc t = \frac{17}{8}$ ;  $\sec t = \frac{17}{15}$ ;  $\cot t = \frac{15}{8}$

27.  $\tan t = \frac{\sqrt{2}}{4}$ ;  $\csc t = 3$ ;  $\sec t = \frac{3\sqrt{2}}{4}$ ;  $\cot t = 2\sqrt{2}$

29.  $\frac{\sqrt{13}}{7}$

31.  $\frac{5}{8}$

33. 1

35. 1

37. 1

39.  $\frac{\sqrt{2}}{2}$

41.  $-\frac{\sqrt{2}}{2}$

43. 1

45. -1

47. -1

49.  $-\frac{\sqrt{2}}{2}$

51.  $\frac{\sqrt{2}}{2}$

53. a.  $\frac{\sqrt{2}}{2}$

b.  $\frac{\sqrt{2}}{2}$

55. a. 0

b. 0

57. a. 0

b. 0

59. a.  $-\frac{\sqrt{2}}{2}$

b.  $-\frac{\sqrt{2}}{2}$

61. 0.7174

63. 0.2643

65. 1.1884

67. 0.9511

69. 3.7321

71.  $-2a$

73.  $3b$

75.  $a - b + c$

77.  $-a - b + c$

79.  $3a + 2b - 2c$

81. a. 12 hr

b. 20.3 hr

c. 3.7 hr

83. a. 1; 0; -1; 0; 1

b. 28 days

97. makes sense

99. does not make sense

101. c

103.  $-\frac{1}{4}$

105.  $\frac{5}{13}$

106.  $\frac{\sqrt{2}}{2}$

107. 1

### Section 4.3

#### Check Point Exercises

1.  $\sin \theta = \frac{3}{5}$ ;  $\cos \theta = \frac{4}{5}$ ;  $\tan \theta = \frac{3}{4}$ ;  $\csc \theta = \frac{5}{3}$ ;  $\sec \theta = \frac{5}{4}$ ;  $\cot \theta = \frac{4}{3}$

2.  $\sin \theta = \frac{1}{5}$ ;  $\cos \theta = \frac{2\sqrt{6}}{5}$ ;  $\tan \theta = \frac{\sqrt{6}}{12}$ ;  $\csc \theta = 5$ ;  $\sec \theta = \frac{5\sqrt{6}}{12}$ ;  $\cot \theta = 2\sqrt{6}$

3.  $\sqrt{2}$ ;  $\sqrt{2}$ ; 1

4.  $\sqrt{3}$ ;  $\frac{\sqrt{3}}{3}$

5. a.  $\cos 44^\circ$

b.  $\tan \frac{5\pi}{12}$

6. 333.9 yd

7.  $54^\circ$

#### Concept and Vocabulary Check

1.  $\sin \theta = \frac{a}{c}$ ;  $\cos \theta = \frac{b}{c}$ ;  $\tan \theta = \frac{a}{b}$ ;  $\csc \theta = \frac{c}{a}$ ;  $\sec \theta = \frac{c}{b}$ ;  $\cot \theta = \frac{b}{a}$

2. opposite; adjacent to; hypotenuse

3. true

4.  $\sin \theta$ ;  $\tan \theta$ ;  $\sec \theta$

### Check Point Exercises

1.  $\frac{\sqrt{3}}{2}$     2.  $\frac{\sqrt{3}}{2}$     3.  $\frac{\cos(\alpha - \beta)}{\cos \alpha \cos \beta} = \frac{\cos \alpha \cos \beta + \sin \alpha \sin \beta}{\cos \alpha \cos \beta} = \frac{\cos \alpha}{\cos \alpha} \cdot \frac{\cos \beta}{\cos \beta} + \frac{\sin \alpha}{\cos \alpha} \cdot \frac{\sin \beta}{\cos \beta} = 1 + \tan \alpha \tan \beta$

4.  $\frac{\sqrt{2} + \sqrt{6}}{4}$     5. a.  $\cos \alpha = -\frac{3}{5}$     b.  $\cos \beta = \frac{\sqrt{3}}{2}$     c.  $\frac{-3\sqrt{3} - 4}{10}$     d.  $\frac{4\sqrt{3} - 3}{10}$     6. a.  $y = \sin x$

b.  $\cos\left(x + \frac{3\pi}{2}\right) = \cos x \cos \frac{3\pi}{2} - \sin x \sin \frac{3\pi}{2} = \cos x \cdot 0 - \sin x \cdot (-1) = \sin x$

7.  $\tan(x + \pi) = \frac{\tan x + \tan \pi}{1 - \tan x \tan \pi} = \frac{\tan x + 0}{1 - \tan x \cdot 0} = \frac{\tan x}{1} = \tan x$

### Concept and Vocabulary Check

1.  $\cos x \cos y - \sin x \sin y$     2.  $\cos x \cos y + \sin x \sin y$     3.  $\sin C \cos D + \cos C \sin D$     4.  $\sin C \cos D - \cos C \sin D$

5.  $\frac{\tan \theta + \tan \phi}{1 - \tan \theta \tan \phi}$     6.  $\frac{\tan \theta - \tan \phi}{1 + \tan \theta \tan \phi}$     7. false    8. false

### Exercise Set 5.2

1.  $\frac{\sqrt{6} + \sqrt{2}}{4}$     3.  $\frac{\sqrt{2} - \sqrt{6}}{4}$     5. a.  $\alpha = 50^\circ, \beta = 20^\circ$     b.  $\cos 30^\circ$     c.  $\frac{\sqrt{3}}{2}$     7. a.  $\alpha = \frac{5\pi}{12}, \beta = \frac{\pi}{12}$     b.  $\cos \frac{\pi}{3}$     c.  $\frac{1}{2}$

For Exercises 9 and 11, proofs may vary.    13.  $\frac{\sqrt{6} - \sqrt{2}}{4}$     15.  $\frac{\sqrt{6} + \sqrt{2}}{4}$     17.  $-\frac{\sqrt{6} + \sqrt{2}}{4}$     19.  $\frac{\sqrt{6} - \sqrt{2}}{4}$     21.  $\frac{\sqrt{3} + 1}{\sqrt{3} - 1}$     23.  $\frac{\sqrt{3} - 1}{\sqrt{3} + 1}$

25.  $\sin 30^\circ; \frac{1}{2}$     27.  $\tan 45^\circ; 1$     29.  $\sin \frac{\pi}{6}; \frac{1}{2}$     31.  $\tan \frac{\pi}{6}; \frac{\sqrt{3}}{3}$

For Exercises 33–55, proofs may vary.

57. a.  $\frac{63}{65}$     b.  $-\frac{16}{65}$     c.  $\frac{16}{63}$     59. a.  $-\frac{4 + 6\sqrt{2}}{15}$     b.  $\frac{3 - 8\sqrt{2}}{15}$     c.  $\frac{54 - 25\sqrt{2}}{28}$

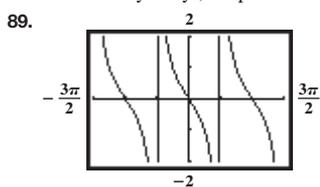

61. a.  $-\frac{8\sqrt{3} + 15}{34}$     b.  $\frac{15\sqrt{3} - 8}{34}$     c.  $\frac{480 - 289\sqrt{3}}{33}$     63. a.  $-\frac{4 + 3\sqrt{15}}{20}$     b.  $\frac{-3 + 4\sqrt{15}}{20}$     c.  $\frac{3 - 4\sqrt{15}}{4 + 3\sqrt{15}}$

65. a.  $y = \sin x$     b.  $\sin(\pi - x) = \sin \pi \cos x - \cos \pi \sin x = 0 \cdot \cos x - (-1) \sin x = \sin x$     67. a.  $y = 2 \cos x$

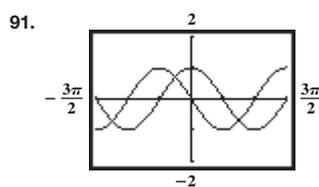

b.  $\sin\left(x + \frac{\pi}{2}\right) + \sin\left(\frac{\pi}{2} - x\right) = \sin x \cos \frac{\pi}{2} + \cos x \sin \frac{\pi}{2} + \sin \frac{\pi}{2} \cos x - \cos \frac{\pi}{2} \sin x = \sin x \cdot 0 + \cos x \cdot 1 + 1 \cdot \cos x - 0 \cdot \sin x$

$= \cos x + \cos x = 2 \cos x$     69.  $\cos \alpha$     71.  $\tan \beta$     73.  $\cos \frac{\pi}{3} = \frac{1}{2}$     75.  $\cos 3x$ ; Proofs may vary.    77.  $\sin \frac{x}{2}$ ; Proofs may vary.

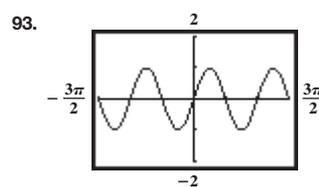

79. Proofs may vary.; amplitude is  $\sqrt{13}$ ; period is  $2\pi$

Proofs may vary.

Values for  $x$  may vary.

Proofs may vary.

95. makes sense    97. makes sense.    99.  $\frac{4\sqrt{3} + 3}{10}$     101.  $-\frac{33}{65}$     103.  $y\sqrt{1-x^2} + x\sqrt{1-y^2}$     105.  $\frac{xy + (\sqrt{1-x^2})(\sqrt{1-y^2})}{y\sqrt{1-x^2} - x\sqrt{1-y^2}}$

107.  $\sin 30^\circ = \frac{1}{2}; \cos 30^\circ = \frac{\sqrt{3}}{2}; \sin 60^\circ = \frac{\sqrt{3}}{2}; \cos 60^\circ = \frac{1}{2}$     108. a. no    b. yes    109. a. no    b. yes

## Section 5.3

### Check Point Exercises

1. a.  $-\frac{24}{25}$     b.  $-\frac{7}{25}$     c.  $\frac{24}{7}$     2.  $\frac{\sqrt{3}}{2}$     3.  $\sin 3\theta = \sin(2\theta + \theta) = \sin 2\theta \cos \theta + \cos 2\theta \sin \theta = 2 \sin \theta \cos \theta \cos \theta$

$+ (2 \cos^2 \theta - 1) \sin \theta = 2 \sin \theta \cos^2 \theta + 2 \sin \theta \cos^2 \theta - \sin \theta = 4 \sin \theta \cos^2 \theta - \sin \theta = 4 \sin \theta (1 - \sin^2 \theta) - \sin \theta = 4 \sin \theta - 4 \sin^3 \theta - \sin \theta = 3 \sin \theta - 4 \sin^3 \theta$

$$4. \sin^4 x = (\sin^2 x)^2 = \left(\frac{1 - \cos 2x}{2}\right)^2 = \frac{1 - 2 \cos 2x + \cos^2 2x}{4} = \frac{1}{4} - \frac{1}{2} \cos 2x + \frac{1}{4} \cos^2 2x = \frac{1}{4} - \frac{1}{2} \cos 2x + \frac{1}{4} \left(\frac{1 + \cos 2(2x)}{2}\right)$$

$$= \frac{1}{4} - \frac{1}{2} \cos 2x + \frac{1}{8} + \frac{1}{8} \cos 4x = \frac{3}{8} - \frac{1}{2} \cos 2x + \frac{1}{8} \cos 4x \quad 5. -\frac{\sqrt{2 - \sqrt{3}}}{2}$$

$$6. \frac{\sin 2\theta}{1 + \cos 2\theta} = \frac{2 \sin \theta \cos \theta}{1 + (1 - 2 \sin^2 \theta)} = \frac{2 \sin \theta \cos \theta}{2 - 2 \sin^2 \theta} = \frac{2 \sin \theta \cos \theta}{2(1 - \sin^2 \theta)} = \frac{2 \sin \theta \cos \theta}{2 \cos^2 \theta} = \frac{\sin \theta}{\cos \theta} = \tan \theta$$

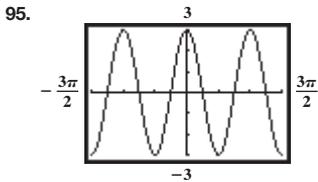

$$7. \frac{\sec \alpha}{\sec \alpha \csc \alpha + \csc \alpha} = \frac{\frac{1}{\cos \alpha}}{\frac{1}{\cos \alpha} \cdot \frac{1}{\sin \alpha} + \frac{1}{\sin \alpha}} = \frac{\frac{1}{\cos \alpha}}{\frac{1}{\cos \alpha \sin \alpha} + \frac{\cos \alpha}{\cos \alpha \sin \alpha}} = \frac{\frac{1}{\cos \alpha}}{\frac{1 + \cos \alpha}{\cos \alpha \sin \alpha}} = \frac{1}{\cos \alpha} \cdot \frac{\cos \alpha \sin \alpha}{1 + \cos \alpha} = \frac{\sin \alpha}{1 + \cos \alpha} = \tan \frac{\alpha}{2}$$

**Concept and Vocabulary Check**

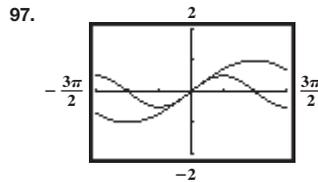

1.  $2 \sin x \cos x$     2.  $\sin^2 A; 2 \cos^2 A; 2 \sin^2 A$     3.  $\frac{2 \tan B}{1 - \tan^2 B}$     4.  $1 - \cos 2\alpha$     5.  $1 + \cos 2\alpha$     6.  $1 - \cos 2y$     7.  $1 - \cos x$   
 8.  $1 + \cos y$     9.  $1 - \cos \alpha; 1 - \cos \alpha; 1 + \cos \alpha$     10. false    11. false    12. false    13. +    14. -    15. +

**Exercise Set 5.3**

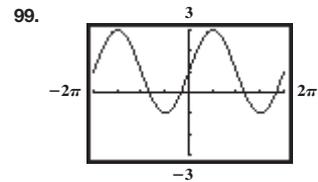

1.  $\frac{24}{25}$     3.  $\frac{24}{7}$     5.  $\frac{527}{625}$     7. a.  $-\frac{240}{289}$     b.  $-\frac{161}{289}$     c.  $\frac{240}{161}$     9. a.  $-\frac{336}{625}$     b.  $\frac{527}{625}$     c.  $-\frac{336}{527}$   
 11. a.  $\frac{4}{5}$     b.  $\frac{3}{5}$     c.  $\frac{4}{3}$     13. a.  $\frac{720}{1681}$     b.  $\frac{1519}{1681}$     c.  $\frac{720}{1519}$     15.  $\frac{1}{2}$     17.  $-\frac{\sqrt{3}}{2}$     19.  $\frac{\sqrt{2}}{2}$     21.  $\frac{\sqrt{3}}{3}$   
 For Exercises 23–33, proofs may vary.    35.  $\frac{9}{4} - 3 \cos 2x + \frac{3}{4} \cos 4x$     37.  $\frac{1}{8} - \frac{1}{8} \cos 4x$     39.  $\frac{\sqrt{2 - \sqrt{3}}}{2}$     41.  $-\frac{\sqrt{2 + \sqrt{2}}}{2}$   
 43.  $2 + \sqrt{3}$     45.  $-\sqrt{2} + 1$     47.  $\frac{\sqrt{10}}{10}$     49.  $\frac{1}{3}$     51.  $\frac{7\sqrt{2}}{10}$     53.  $\frac{3}{5}$     55. a.  $\frac{2\sqrt{5}}{5}$     b.  $-\frac{\sqrt{5}}{5}$     c.  $-2$     57. a.  $\frac{3\sqrt{13}}{13}$     b.  $\frac{2\sqrt{13}}{13}$     c.  $\frac{3}{2}$   
 For Exercises 59–67, proofs may vary.  
 69.  $\cos 2x$ ; Proofs may vary.    71.  $1 + \sin x$ ; Proofs may vary.    73.  $\sec x$ ; Proofs may vary.    75.  $2 \csc 2x$ ; Proofs may vary.  
 77.  $\sin 3x$ ; Proofs may vary.    79. a.  $d = \frac{v_0^2}{32} \cdot \sin 2\theta$     b.  $\theta = \frac{\pi}{4}$     81.  $\sqrt{2 - \sqrt{2}} \cdot (2 + \sqrt{2}) \approx 2.6$

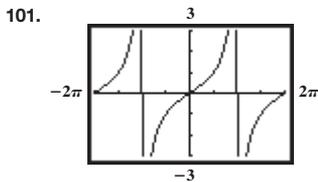

Proofs may vary.

Values for  $x$  may vary.

- a.  $y = 1 + 2 \sin x$   
 b. Proofs may vary.

- a.  $y = \tan \frac{x}{2}$     b. Proofs may vary.    103. does not make sense    105. does not makes sense  
 107.  $\frac{\sqrt{3}}{2}$     109.  $\frac{9}{10}$     111.  $2x\sqrt{1 - x^2}$     113. Both sides equal  $\frac{\sqrt{3}}{4}$ .    114. Both sides equal 0.  
 115. Both sides equal 0.

**Mid-Chapter 5 Check Point**

- For Exercises 1–18, proofs may vary.  
 19.  $\frac{33}{65}$     20.  $\frac{16}{63}$     21.  $\frac{24}{25}$     22.  $-\frac{\sqrt{26}}{26}$     23.  $-\frac{\sqrt{6} + \sqrt{2}}{4}$     24.  $\frac{\sqrt{3}}{2}$     25.  $\frac{1}{2}$     26.  $\frac{\sqrt{\sqrt{2} - 1}}{\sqrt{\sqrt{2} + 1}}$

**Section 5.4**

**Check Point Exercises**

1. a.  $\frac{1}{2}[\cos 3x - \cos 7x]$     b.  $\frac{1}{2}[\cos 6x + \cos 8x]$     2. a.  $2 \sin 5x \cos 2x$     b.  $2 \cos \frac{5x}{2} \cos \frac{x}{2}$   
 3.  $\frac{\cos 3x - \cos x}{\sin 3x + \sin x} = \frac{-2 \sin \left(\frac{3x+x}{2}\right) \sin \left(\frac{3x-x}{2}\right)}{2 \sin \left(\frac{3x+x}{2}\right) \cos \left(\frac{3x-x}{2}\right)} = \frac{-2 \sin \left(\frac{4x}{2}\right) \sin \left(\frac{2x}{2}\right)}{2 \sin \left(\frac{4x}{2}\right) \cos \left(\frac{2x}{2}\right)} = \frac{-2 \sin 2x \sin x}{2 \sin 2x \cos x} = -\frac{\sin x}{\cos x} = -\tan x$

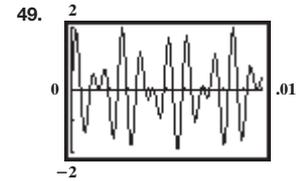

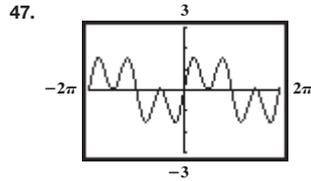

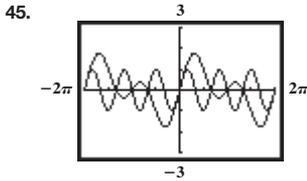

**Concept and Vocabulary Check**

1. product; difference    2. product; sum    3. product; sum    4. product; difference  
 5. sum; product    6. difference; product    7. sum; product    8. difference; product

**AA56** Answers to Selected Exercises

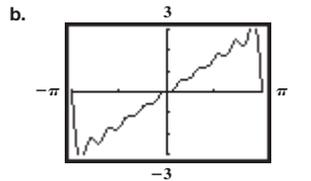

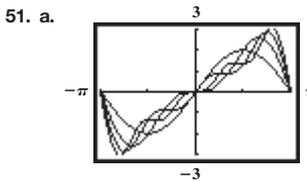

**Exercise Set 5.4**

1.  $\frac{1}{2}[\cos 4x - \cos 8x]$     3.  $\frac{1}{2}[\cos 4x + \cos 10x]$     5.  $\frac{1}{2}[\sin 3x - \sin x]$     7.  $\frac{1}{2}[\sin 2x - \sin x]$     9.  $2 \sin 4x \cos 2x$   
 11.  $2 \sin 2x \cos 5x$     13.  $2 \cos 3x \cos x$     15.  $2 \sin \frac{3x}{2} \cos \frac{x}{2}$     17.  $2 \cos x \cos \frac{x}{2}$     19.  $\frac{\sqrt{6}}{2}$     21.  $-\frac{\sqrt{2}}{2}$     For Exercises 23–29, proofs may vary.  
 31. a.  $y = \cos x$     b. Proofs may vary.    33. a.  $y = \tan 2x$     b. Proofs may vary.    35. a.  $y = -\cot 2x$     b. Proofs may vary.  
 37. a.  $y = \sin 1704\pi t + \sin 2418\pi t$     b.  $2 \sin 2061\pi t \cdot \cos 357\pi t$

Values for  $x$  may vary.

Proofs may vary.

c.  $\pi = 4 - \frac{4}{3} + \frac{4}{5} - \frac{4}{7} + \dots$

53. makes sense    55. makes sense

- For Exercises 57–61, proofs may vary.    63.  $\left\{-\frac{1}{2}, 2\right\}$     64.  $\{-\sqrt{3}, 0, \sqrt{3}\}$     65.  $\left\{\frac{1-\sqrt{5}}{2}, \frac{1+\sqrt{5}}{2}\right\}$

**Section 5.5**

**Check Point Exercises**

1.  $x = \frac{\pi}{3} + 2n\pi$  or  $x = \frac{2\pi}{3} + 2n\pi$ , where  $n$  is any integer.    2.  $\frac{\pi}{6}, \frac{2\pi}{3}, \frac{7\pi}{6}, \frac{5\pi}{3}$     3.  $\frac{\pi}{2}$     4.  $\frac{\pi}{6}, \frac{\pi}{2}, \frac{5\pi}{6}$     5.  $\frac{\pi}{6}, \frac{5\pi}{6}, \frac{7\pi}{6}, \frac{11\pi}{6}$     6.  $0, \frac{\pi}{4}, \pi, \frac{5\pi}{4}$   
 7.  $\frac{\pi}{3}, \frac{5\pi}{3}$     8.  $\frac{\pi}{2}, \frac{7\pi}{6}, \frac{11\pi}{6}$     9.  $\frac{3\pi}{4}, \frac{7\pi}{4}$     10.  $\frac{\pi}{2}, \pi$     11. a. 1.2592, 4.4008    b. 3.3752, 6.0496    12. 2.3423, 3.9409

159. false

161.  $\frac{\pi}{2}, \frac{3\pi}{2}, \frac{7\pi}{12}, \frac{11\pi}{12}, \frac{19\pi}{12}, \frac{23\pi}{12}$

163.  $a \approx 45.2$

164.  $B \approx 31.5^\circ$

165. no solution or  $\emptyset$

### Chapter 5 Review Exercises

For Exercises 1–13, proofs may vary.

14.  $\frac{\sqrt{6} - \sqrt{2}}{4}$  15.  $\frac{\sqrt{2} - \sqrt{6}}{4}$  16.  $2 - \sqrt{3}$  17.  $\sqrt{3} + 2$  18.  $\frac{1}{2}$  19.  $\frac{1}{2}$

For Exercises 20–31, proofs may vary.

32. a.  $y = \cos x$  b.  $\sin(x - \frac{3\pi}{2}) = \sin x \cos \frac{3\pi}{2} - \cos x \sin \frac{3\pi}{2} = \sin x \cdot 0 - \cos x \cdot -1 = \cos x$

33. a.  $y = -\sin x$  b.  $\cos(x + \frac{\pi}{2}) = \cos x \cos \frac{\pi}{2} - \sin x \sin \frac{\pi}{2} = \cos x \cdot 0 - \sin x \cdot 1 = -\sin x$

34. a.  $y = \tan x$  b.  $y = \frac{\tan x - 1}{1 - \cot x} = \frac{\frac{\sin x}{\cos x} - 1}{1 - \frac{\cos x}{\sin x}} = \frac{\frac{\sin x - \cos x}{\cos x}}{\frac{\sin x - \cos x}{\sin x}} = \frac{\sin x - \cos x}{\cos x} \cdot \frac{\sin x}{\sin x - \cos x} = \frac{\sin x}{\cos x} = \tan x$

35. a.  $\frac{33}{65}$  b.  $\frac{16}{65}$  c.  $-\frac{33}{56}$  d.  $\frac{24}{25}$  e.  $\frac{2\sqrt{13}}{13}$  36. a.  $-\frac{63}{65}$  b.  $-\frac{56}{65}$  c.  $\frac{63}{16}$  d.  $\frac{24}{25}$  e.  $\frac{5\sqrt{26}}{26}$

37. a. 1 b.  $-\frac{3}{5}$  c. undefined d.  $-\frac{3}{5}$  e.  $\frac{\sqrt{10 + 3\sqrt{10}}}{2\sqrt{5}}$  38. a. 1 b.  $\frac{4\sqrt{2}}{9}$  c. undefined d.  $\frac{4\sqrt{2}}{9}$  e.  $-\frac{\sqrt{3}}{3}$

39.  $\frac{\sqrt{3}}{2}$  40.  $-\frac{\sqrt{3}}{3}$  41.  $\frac{\sqrt{2 - \sqrt{2}}}{2}$  42.  $2 - \sqrt{3}$  43.  $\frac{1}{2}[\cos 2x - \cos 10x]$  44.  $\frac{1}{2}[\sin 10x + \sin 4x]$  45.  $-2 \sin x \cos 3x$

46.  $\frac{\sqrt{6}}{2}$  47. Proofs may vary. 48. Proofs may vary. 49. a.  $y = \cot x$  b. Proofs may vary.

50.  $x = \frac{2\pi}{3} + 2n\pi$  or  $x = \frac{4\pi}{3} + 2n\pi$ , where  $n$  is any integer. 51.  $x = \frac{\pi}{4} + 2n\pi$  or  $x = \frac{3\pi}{4} + 2n\pi$ , where  $n$  is any integer.

52.  $x = \frac{7\pi}{6} + 2n\pi$  or  $x = \frac{11\pi}{6} + 2n\pi$ , where  $n$  is any integer. 53.  $x = \frac{\pi}{6} + n\pi$ , where  $n$  is any integer. 54.  $\frac{\pi}{2}, \frac{3\pi}{2}$  55.  $\frac{\pi}{6}, \frac{5\pi}{6}, \frac{9\pi}{6}$

56.  $\frac{3\pi}{2}$  57.  $0, \frac{\pi}{3}, \pi, \frac{5\pi}{3}$  58.  $\pi$  59.  $\frac{\pi}{6}, \frac{5\pi}{6}, \frac{3\pi}{2}$  60.  $\frac{\pi}{6}, \frac{5\pi}{6}, \frac{7\pi}{6}, \frac{11\pi}{6}$  61.  $0, \pi, \frac{7\pi}{6}, \frac{11\pi}{6}$  62.  $0, \frac{\pi}{6}, \pi, \frac{11\pi}{6}$  63.  $0, \pi$

64. 3.7890, 5.6358 65. 0.6847, 2.4569, 3.8263, 5.5985 66.  $\frac{\pi}{4}, 1.2490, \frac{5\pi}{4}, 4.3906$  67. 0.8959, 2.2457

68.  $t = \frac{2}{3} + 4n$  or  $t = \frac{10}{3} + 4n$ , where  $n$  is any integer. 69.  $12^\circ$  or  $78^\circ$

### Chapter 5 Test

1.  $-\frac{63}{65}$  2.  $\frac{56}{33}$  3.  $-\frac{24}{25}$  4.  $\frac{3\sqrt{13}}{13}$  5.  $\frac{\sqrt{6} + \sqrt{2}}{4}$  6.  $\cos x \csc x = \cos x \cdot \frac{1}{\sin x} = \frac{\cos x}{\sin x} = \cot x$

7.  $\frac{\sec x}{\cot x + \tan x} = \frac{\frac{1}{\cos x}}{\frac{\cos x}{\sin x} + \frac{\sin x}{\cos x}} = \frac{\frac{1}{\cos x}}{\frac{\cos^2 x + \sin^2 x}{\sin x \cos x}} = \frac{1}{\cos x} \cdot \frac{\sin x \cos x}{1} = \sin x$

**AA58** Answers to Selected Exercises

8.  $1 - \frac{\cos^2 x}{1 + \sin x} = 1 - \frac{(1 - \sin^2 x)}{1 + \sin x} = 1 - \frac{(1 + \sin x)(1 - \sin x)}{1 + \sin x} = 1 - (1 - \sin x) = \sin x$   
 9.  $\cos\left(\theta + \frac{\pi}{2}\right) = \cos \theta \cos \frac{\pi}{2} - \sin \theta \sin \frac{\pi}{2} = \cos \theta \cdot 0 - \sin \theta \cdot 1 = -\sin \theta$   
 10.  $\frac{\sin(\alpha - \beta)}{\sin \alpha \cos \beta} = \frac{\sin \alpha \cos \beta - \cos \alpha \sin \beta}{\sin \alpha \cos \beta} = \frac{\sin \alpha \cos \beta}{\sin \alpha \cos \beta} - \frac{\cos \alpha \sin \beta}{\sin \alpha \cos \beta} = 1 - \cot \alpha \tan \beta$   
 11.  $\sin t \cos t(\tan t + \cot t) = \sin t \cos t \left(\frac{\sin t}{\cos t} + \frac{\cos t}{\sin t}\right) = \sin^2 t + \cos^2 t = 1$     12.  $\frac{7\pi}{18}, \frac{11\pi}{18}, \frac{19\pi}{18}, \frac{23\pi}{18}, \frac{31\pi}{18}$ , and  $\frac{35\pi}{18}$   
 13.  $\frac{\pi}{2}, \frac{7\pi}{6}, \frac{3\pi}{2}, \frac{11\pi}{6}$     14.  $0, \frac{\pi}{3}, \frac{5\pi}{3}$     15.  $0, \frac{2\pi}{3}, \frac{4\pi}{3}$     16. 2.5136, 3.7696    17. 1.2310,  $\frac{\pi}{2}, \frac{3\pi}{2}, 5.0522$     18. 1.2971, 2.6299, 4.4387, 5.7715

**Cumulative Review Exercises (Chapters P–5)**

1.  $-3, 1 + 2i$ , and  $1 - 2i$     2.  $x = \frac{\log 125}{\log 11} + 1$  or  $x \approx 3.01$     3.  $(-\infty, -4] \cup [2, \infty)$     4.  $\frac{\pi}{3}, \frac{5\pi}{3}$     5.  $\frac{\pi}{4}, 2.0345, \frac{5\pi}{4}, 5.1761$

6.  $y = \sqrt{x+2} - 1$

7.  $(x - 1)^2 + (y + 2)^2 = 9$

8.  $y + 2 = \frac{1}{3}(x - 1)$

9.  $y = 3 \cos 2x$

10.  $y = 2 \sin \frac{x}{2} + 1$

11.  $f(x) = (x - 1)^2(x - 3)$

12.  $2a + h + 3$     13.  $-\frac{\sqrt{2}}{2}$     14. Proofs may vary.  
 15.  $\frac{16\pi}{9}$  radians    16.  $t \approx 19.1$  yr  
 17.  $f^{-1}(x) = \frac{3x + 1}{x - 2}$     18.  $B = 67^\circ, b = 28.27, c = 30.71$   
 19. 106 mg    20.  $h \approx 15.9$  ft

**CHAPTER 6**

**Section 6.1**

**Check Point Exercises**

1.  $B = 34^\circ, a \approx 12.7$  cm,  $b \approx 7.9$  cm    2.  $B = 117.5^\circ, a \approx 8.7, c \approx 5.2$     3.  $B \approx 41^\circ, C \approx 82^\circ, c \approx 39.0$     4. no triangle  
 5. two triangles;  $B_1 \approx 50^\circ, C_1 \approx 95^\circ, c_1 \approx 20.8; B_2 \approx 130^\circ, C_2 \approx 15^\circ, c_2 \approx 5.4$     6. approximately 34 sq m    7. approximately 11 mi

**Concept and Vocabulary Check**

1. oblique; sides; angles    2.  $\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$     3. side; angles    4. false    5.  $\frac{1}{2}ab \sin C$

**Exercise Set 6.1**

1.  $B = 42^\circ, a \approx 8.1, b \approx 8.1$     3.  $A = 44^\circ, b \approx 18.6, c \approx 22.8$     5.  $C = 95^\circ, b \approx 81.0, c \approx 134.1$     7.  $B = 40^\circ, b \approx 20.9, c \approx 31.8$   
 9.  $C = 111^\circ, b \approx 7.3, c \approx 16.1$     11.  $A = 80^\circ, a \approx 39.5, c \approx 10.4$     13.  $B = 30^\circ, a \approx 316.0, b \approx 174.3$     15.  $C = 50^\circ, a \approx 7.1, b \approx 7.1$   
 17. one triangle;  $B \approx 29^\circ, c \approx 111^\circ, c \approx 29.0$     19. one triangle;  $C \approx 52^\circ, B \approx 65^\circ, b \approx 10.2$     21. one triangle;  $C \approx 55^\circ, B \approx 13^\circ, b \approx 10.2$   
 23. no triangle    25. two triangles;  $B_1 \approx 77^\circ, C_1 \approx 43^\circ, c_1 \approx 12.6; B_2 \approx 103^\circ, C_2 \approx 17^\circ, c_2 \approx 5.4$   
 27. two triangles;  $B_1 \approx 54^\circ, C_1 \approx 89^\circ, c_1 \approx 19.9; B_2 \approx 126^\circ, C_2 \approx 17^\circ, c_2 \approx 5.8$   
 29. two triangles;  $C_1 \approx 68^\circ, B_1 \approx 54^\circ, b_1 \approx 21.0; C_2 \approx 112^\circ, B_2 \approx 10^\circ, b_2 \approx 4.5$     31. no triangle    33. 297 sq ft    35. 5 sq yd    37. 10 sq m

## Check Point Exercises

1. a. solution    b. not a solution    2.  $\{(-2, 5)\}$     3.  $\{(2, -1)\}$     4.  $\left\{\left(\frac{60}{17}, -\frac{11}{17}\right)\right\}$     5. no solution or  $\emptyset$   
 6.  $\{(x, y) \mid x = 4y - 8\}$  or  $\{(x, y) \mid 5x - 20y = -40\}$     7. 4 liters of 18% solution; 8 liters of 45% solution    8. boat: 35 mph; current: 7 mph  
 9. a.  $C(x) = 300,000 + 30x$     b.  $R(x) = 80x$     c. (6000, 480,000); The company will break even if it produces and sells 6000 pairs of shoes.

## Concept and Vocabulary Check

1. satisfies both equations in the system    2. the intersection point    3.  $\left\{\left(\frac{1}{3}, -2\right)\right\}$     4. -2    5. -3    6.  $\emptyset$ ; inconsistent; parallel  
 7.  $\{(x, y) \mid x = 3y + 2\}$  or  $\{(x, y) \mid 5x - 15y = 10\}$ ; dependent; are identical or coincide    8.  $0.09x + 0.6y$     9.  $x + y; x - y$     10.  $4(x + y)$   
 11. revenue; profit    12. break-even point

## Exercise Set 7.1

1. solution    3. not a solution    5.  $\{(1, 3)\}$     7.  $\{(5, 1)\}$     9.  $\{(-22, -5)\}$     11.  $\{(0, 0)\}$     13.  $\{(3, -2)\}$     15.  $\{(5, 4)\}$     17.  $\{(7, 3)\}$   
 19.  $\{(2, -1)\}$     21.  $\{(3, 0)\}$     23.  $\{(-4, 3)\}$     25.  $\{(3, 1)\}$     27.  $\{(1, -2)\}$     29.  $\left\{\left(\frac{7}{25}, -\frac{1}{25}\right)\right\}$     31.  $\emptyset$     33.  $\{(x, y) \mid y = 3x - 5\}$   
 35.  $\{(1, 4)\}$     37.  $\{(x, y) \mid x + 3y = 2\}$     39.  $\{(-5, -1)\}$     41.  $\left\{\left(\frac{29}{22}, -\frac{5}{11}\right)\right\}$     43.  $x + y = 7; x - y = -1; 3$  and  $4$   
 45.  $3x - y = 1; x + 2y = 12; 2$  and  $5$     47.  $\{(6, -1)\}$     49.  $\left\{\left(\frac{1}{a}, 3\right)\right\}$     51.  $m = -4, b = 3$     53.  $y = x - 4; y = -\frac{1}{3}x + 4$   
 55. California: 100 gal; French: 100 gal    57. 18-karat gold: 96 g; 12-karat gold: 204 g    59. cheaper candy: 30 lb; more expensive candy: 45 lb  
 61. plane: 130 mph; wind: 30 mph    63. crew: 6 km/hr; current: 2 km/hr    65. velocity in still water: 4.5 mph; current: 1.5 mph    67. 500 radios  
 69. -6000; When the company produces and sells 200 radios, the loss is \$6000.    71. a.  $P(x) = 20x - 10,000$     b. \$190,000  
 73. a.  $C(x) = 18,000 + 20x$     b.  $R(x) = 80x$     c. (300, 24,000); When 300 canoes are produced and sold, both revenue and cost are \$24,000.  
 75. a.  $C(x) = 30,000 + 2500x$     b.  $R(x) = 3125x$     c. (48, 150,000); For 48 sold-out performances, both cost and revenue are \$150,000.  
 77. a. 4 million workers; \$4.50 per hour    b. \$4.50; 4; 4    c. 2 million    d. 5.7 million    e. 3.7 million    79. a. 2039; 37%  
 b. by the intersection point (69, 37)    81. a.  $y = 0.45x + 0.8$     b.  $y = 0.15x + 2.6$     c. week 6; 3.5 symptoms; by the intersection point (6, 3.5)  
 83. a.  $y = 0.2x + 5$     b.  $y = -0.4x + 47$     c. 2030; 19%    85. Mr. Goodbar: 264 cal; Mounds: 258 cal    87. 3 Mr. Goodbars and 2 Mounds bars  
 89. 50 rooms with kitchen facilities, 150 rooms without kitchen facilities    91. 100 ft long by 80 ft wide    93.  $80^\circ, 50^\circ, 50^\circ$   
 105. does not make sense    107. makes sense    109.  $y = \frac{a_1c_2 - a_2c_1}{a_1b_2 - a_2b_1}; x = \frac{b_2c_1 - b_1c_2}{a_1b_2 - a_2b_1}$     111. Yes; 8 hexagons and 4 squares    113. yes  
 114.  $11x + 4y = -3$     115.  $1682 = 16a + 4b + c$

## Section 7.2

## Check Point Exercises

1.  $(-1) - 2(-4) + 3(5) = 22; 2(-1) - 3(-4) - 5 = 5; 3(-1) + (-4) - 5(5) = -32$     2.  $\{(1, 4, -3)\}$     3.  $\{(4, 5, 3)\}$     4.  $y = 3x^2 - 12x + 13$

## Concept and Vocabulary Check

1. triple; all    2. -2; -4    3. z; add Equations 1 and 3

## Exercise Set 7.2

1. solution    3. solution    5.  $\{(2, 3, 3)\}$     7.  $\{(2, -1, 1)\}$     9.  $\{(1, 2, 3)\}$     11.  $\{(3, 1, 5)\}$     13.  $\{(1, 0, -3)\}$     15.  $\{(1, -5, -6)\}$   
 17.  $\left\{\left(\frac{1}{2}, \frac{1}{3}, -1\right)\right\}$     19.  $y = 2x^2 - x + 3$     21.  $y = 2x^2 + x - 5$     23. 7, 4, and 5    25.  $\{(4, 8, 6)\}$     27.  $y = -\frac{3}{4}x^2 + 6x - 11$   
 29.  $\left\{\left(\frac{8}{a}, -\frac{3}{b}, -\frac{5}{c}\right)\right\}$     31. a.  $y = -16x^2 + 40x + 200$     b.  $y = 0$  when  $x = 5$ ; The ball hits the ground after 5 seconds.  
 33. housing: \$6133; vehicles/gas: \$2269; health care: \$5438    35. milk: \$3.50; water: \$1.50; chips: \$0.75    37. 200 \$8 tickets; 150 \$10 tickets; 50 \$12 tickets  
 39. \$1200 at 8%, \$2000 at 10%, and \$3500 at 12%    41.  $x = 60, y = 55, z = 65$     49. does not make sense    51. makes sense  
 53. 13 triangles, 21 rectangles, and 6 pentagons    55.  $\frac{x + 14}{(x - 4)(x + 2)}$     56.  $\frac{5x^3 - 3x^2 + 7x - 3}{(x^2 + 1)^2}$     57.  $\{(5, -2, 3)\}$

## Section 7.3

## Check Point Exercises

1.  $\frac{2}{x-3} + \frac{3}{x+4}$     2.  $\frac{2}{x} - \frac{2}{x-1} + \frac{3}{(x-1)^2}$     3.  $\frac{2}{x+3} + \frac{6x-8}{x^2+x+2}$     4.  $\frac{2x}{x^2+1} + \frac{-x+3}{(x^2+1)^2}$

## Concept and Vocabulary Check

1. correct    2. incorrect    3. incorrect    4. correct

**Exercise Set 7.3**

1.  $\frac{A}{x-2} + \frac{B}{x+1}$     3.  $\frac{A}{x+2} + \frac{B}{x-3} + \frac{C}{(x-3)^2}$     5.  $\frac{A}{x-1} + \frac{Bx+C}{x^2+1}$     7.  $\frac{Ax+B}{x^2+4} + \frac{Cx+D}{(x^2+4)^2}$     9.  $\frac{3}{x-3} - \frac{2}{x-2}$   
 11.  $\frac{7}{x-9} - \frac{4}{x+2}$     13.  $\frac{24}{7(x-4)} + \frac{25}{7(x+3)}$     15.  $\frac{3}{7(x-3)} - \frac{1}{7(2x+1)}$     17.  $\frac{3}{x} + \frac{2}{x-1} - \frac{1}{x+3}$     19.  $\frac{3}{x} + \frac{4}{x+1} - \frac{3}{x-1}$   
 21.  $\frac{6}{x-1} - \frac{5}{(x-1)^2}$     23.  $\frac{1}{x-2} - \frac{2}{(x-2)^2} - \frac{5}{(x-2)^3}$     25.  $\frac{7}{x} - \frac{6}{x-1} + \frac{10}{(x-1)^2}$     27.  $\frac{1}{4(x+1)} + \frac{3}{4(x-1)} + \frac{1}{2(x-1)^2}$   
 29.  $\frac{3}{x-1} + \frac{2x-4}{x^2+1}$     31.  $\frac{2}{x+1} + \frac{3x-1}{x^2+2x+2}$     33.  $\frac{1}{4x} + \frac{1}{x^2} - \frac{x+4}{4(x^2+4)}$     35.  $\frac{4}{x+1} + \frac{2x-3}{x^2+1}$     37.  $\frac{x+1}{x^2+2} - \frac{2x}{(x^2+2)^2}$   
 39.  $\frac{x-2}{x^2-2x+3} + \frac{2x+1}{(x^2-2x+3)^2}$     41.  $\frac{3}{x-2} + \frac{x-1}{x^2+2x+4}$     43.  $x^3 + x - \frac{1}{2(x+1)} + \frac{3}{2(x-1)}$     45.  $x+1 - \frac{2}{x} - \frac{2}{x^2} + \frac{2}{x-1}$   
 47.  $\frac{\frac{1}{2c}}{x-c} - \frac{\frac{1}{2c}}{x+c}$     49.  $\frac{a}{x-c} + \frac{ac+b}{(x-c)^2}$     51.  $\frac{1}{x} - \frac{1}{x+1} = \frac{99}{100}$     61. does not make sense    63. does not make sense  
 65.  $\frac{2}{x-3} + \frac{2x+5}{x^2+3x+3}$     66.  $\{(2.5, -2)\}$     67.  $\{(4, -3)\}$   
 68. ;  $(0, -3)$  and  $(2, -1)$ ;  $0 - (-3) = 3$  and  $(0 - 2)^2 + (-3 + 3)^2 = 4$  are true;  
 $2 - (-1) = 3$  and  $(2 - 2)^2 + (-1 + 3)^2 = 4$  are true.

**Section 7.4**

**Check Point Exercises**

1.  $\{(0, 1), (4, 17)\}$     2.  $\left\{\left(-\frac{6}{5}, \frac{3}{5}\right), (2, -1)\right\}$     3.  $\{(3, 2), (3, -2), (-3, 2), (-3, -2)\}$     4.  $\{(0, 5)\}$     5. length: 7 ft; width: 3 ft or length: 3 ft; width: 7 ft

**Concept and Vocabulary Check**

1. nonlinear    2.  $\{(-4, 3), (0, 1)\}$     3. 3    4.  $\{(2, \sqrt{3}), (2, -\sqrt{3}), (-2, \sqrt{3}), (-2, -\sqrt{3})\}$     5.  $-1; y^2 + y = 6$     6.  $\frac{4}{x}; \frac{4}{x}; y$

**Exercise Set 7.4**

1.  $\{(-3, 5), (2, 0)\}$     3.  $\{(1, 1), (2, 0)\}$     5.  $\{(4, -10), (-3, 11)\}$     7.  $\{(4, 3), (-3, -4)\}$     9.  $\left\{\left(-\frac{3}{2}, -4\right), (2, 3)\right\}$     11.  $\{(-5, -4), (3, 0)\}$   
 13.  $\{(3, 1), (-3, -1), (1, 3), (-1, -3)\}$     15.  $\{(4, -3), (-1, 2)\}$     17.  $\{(0, 1), (4, -3)\}$     19.  $\{(3, 2), (3, -2), (-3, 2), (-3, -2)\}$   
 21.  $\{(3, 2), (3, -2), (-3, 2), (-3, -2)\}$     23.  $\{(2, 1), (2, -1), (-2, 1), (-2, -1)\}$     25.  $\{(3, 4), (3, -4)\}$

 61.  $x = 5$  m,  $y = 2$  m

63. a. between the 1940s and the 1960s    b. 1949; 43%; 43%    c. 1920; 28%    d. 1919; white collar: 27.5%; farmers: 27.4%; fairly well, although answers may vary.    69. makes sense    71. makes sense    73. false    75. false    77. 18 sq units    79.  $\{(8, 2)\}$

81.    82.    83.

**Mid-Chapter 7 Check Point**

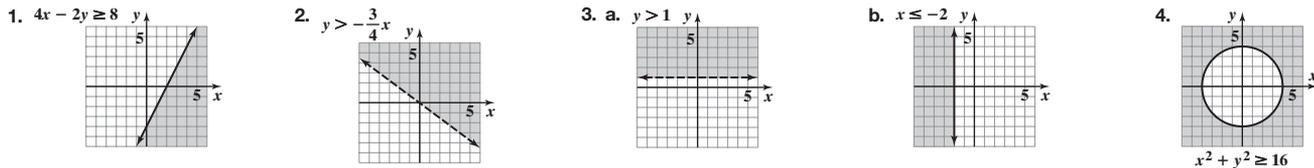

1.  $\{(-1, 2)\}$     2.  $\{(1, -2)\}$     3.  $\{(6, 10)\}$     4.  $\{(x, y) | y = 4x - 5\}$  or  $\{(x, y) | 8x - 2y = 10\}$     5.  $\left\{\left(\frac{11}{19}, \frac{7}{19}\right)\right\}$     6.  $\emptyset$     7.  $\{(-1, 2, -2)\}$

# AA74 Answers to Selected Exercises

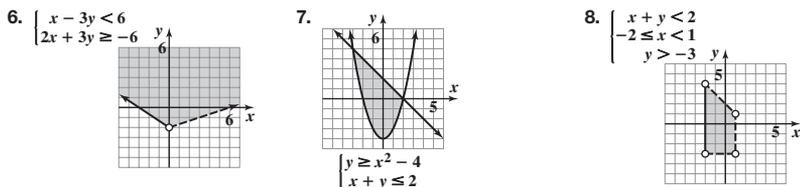

8.  $\{(4, -2, 3)\}$  9.  $\left\{\left(-\frac{9}{5}, \frac{12}{5}\right), (3, 0)\right\}$  10.  $\{(-2, -1), (-2, 1), (2, -1), (2, 1)\}$  11.  $\{(-\sqrt{7}, 1), (-2, -2), (2, -2), (\sqrt{7}, 1)\}$
12.  $\{(0, -2), (6, 1)\}$  13.  $\frac{1}{x-2} - \frac{2}{(x-2)^2} - \frac{5}{(x-2)^3}$  14.  $\frac{5}{x+2} + \frac{3}{x+1} + \frac{2}{x-1}$  15.  $-\frac{2}{x+3} + \frac{3x-5}{x^2+4}$  16.  $\frac{x}{x^2+4} - \frac{4x}{(x^2+4)^2}$
17. a.  $C(x) = 400,000 + 20x$  b.  $R(x) = 100x$  c.  $P(x) = 80x - 400,000$  d. (5000, 500,000); The company will break even when it produces and sells 5000 PDAs. At this level, both revenue and cost are \$500,000. 18. 6 roses and 14 carnations 19. north campus: 300 students; south campus: 900 students 20. rate in still water: 3 mph current: 1.5 mph 21.  $x = 55^\circ, y = 35^\circ$  22.  $y = -x^2 + 2x + 3$  23. length: 8 m; width: 2.5 m

## Section 7.5

### Check Point Exercises

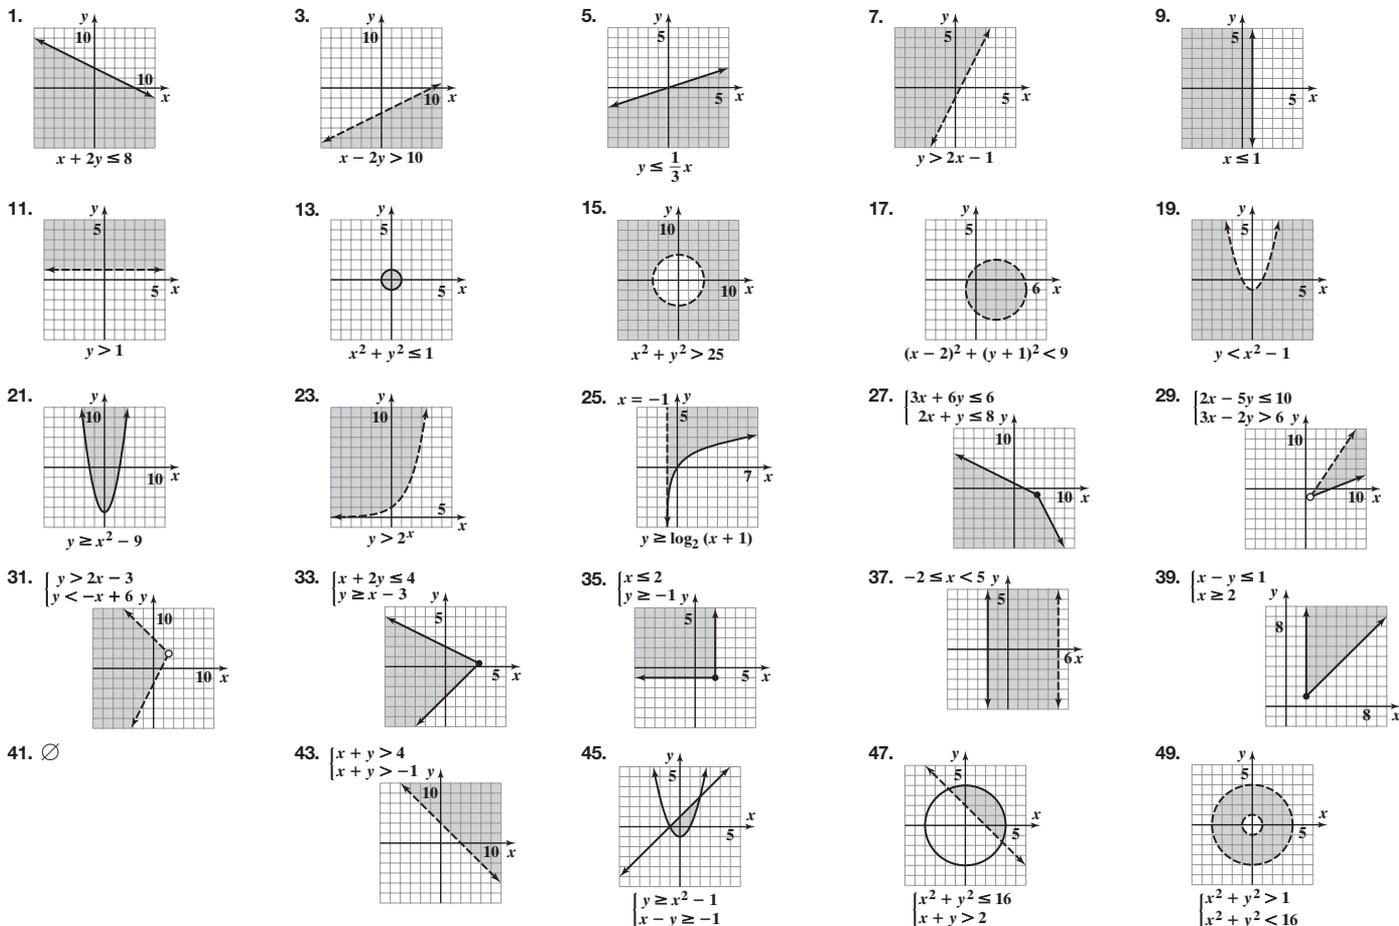

5. Point  $B = (66, 130)$ ;  $4.9(66) - 130 \geq 165$ , or  $193.4 \geq 165$ , is true;  $3.7(66) - 130 \leq 125$ , or  $114.2 \leq 125$ , is true.

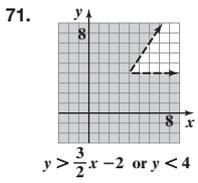

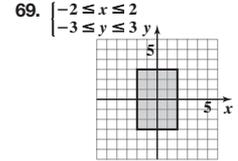

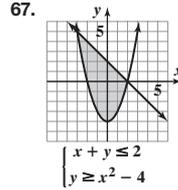

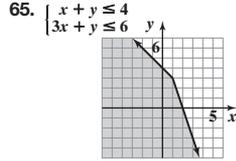

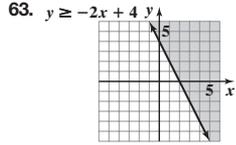

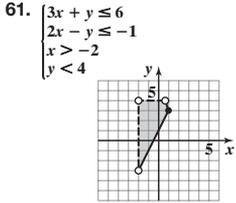

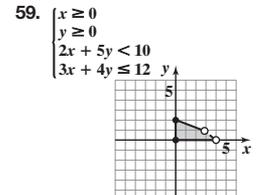

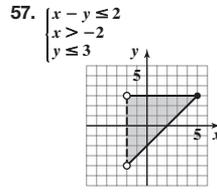

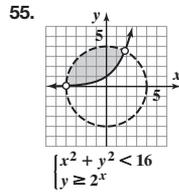

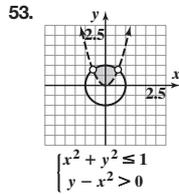

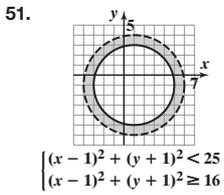

### Concept and Vocabulary Check

1. solution;  $x$ ;  $y$ ;  $5 > 1$  2. graph 3. half-plane 4. false 5. true 6. false 7.  $(0, 0)$ , although answers will vary  
8.  $x - y < 1$ ;  $2x + 3y \geq 12$  9. false

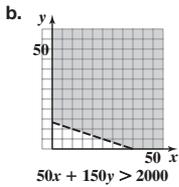

### Exercise Set 7.5

73. no solution  
 75. infinitely many solutions  
 77. Point A = (66, 160);  $5.3(66) - 160 \geq 180$ , or  $189.8 \geq 180$ , is true;  $4.1(66) - 160 \leq 140$ , or  $110.6 \leq 140$ , is true.  
 79. no

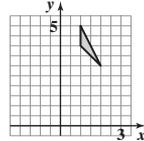

81. a.  $50x + 150y > 2000$

c. Answers may vary. Example: (20, 20): 20 children and 20 adults will cause the elevator to be overloaded.

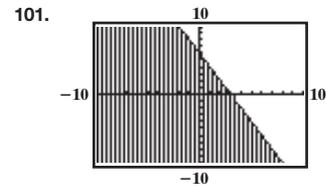

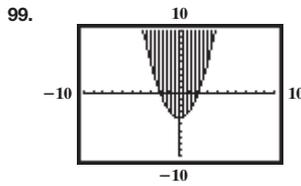

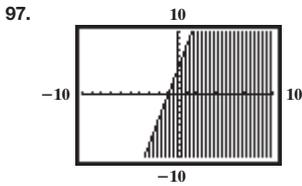

83. a. 
$$\begin{cases} y \geq 0 \\ x + y \geq 5 \\ x \geq 1 \\ 200x + 100y \leq 700 \end{cases}$$

b. 
$$\begin{cases} y \geq 0 \\ x + y \geq 5 \\ x \geq 1 \\ 200x + 100y \leq 700 \end{cases}$$

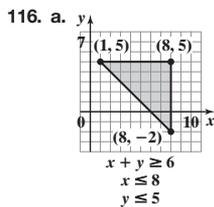

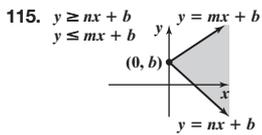

85. a. 27.1    b. overweight

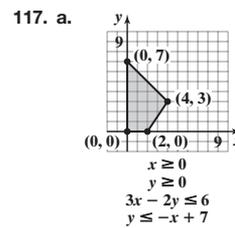

c. 2 nights

107. does not make sense    109. makes sense    111. 
$$\begin{cases} y > x - 3 \\ y \leq x \end{cases}$$
    113.  $x + 2y \leq 6$  or  $2x + y \leq 6$

b. (1, 5), (8, 5), (8, -2)

b. (0, 0), (2, 0), (4, 3), (0, 7)

c. at (1, 5): 13; at (8, 5): 34; at (8, -2): 20

c. at (0, 0): 0; at (2, 0): 4; at (4, 3): 23; (0, 7): 35

118.  $20x + 10y \leq 80,000$

Section 7.6

Check Point Exercises

1.  $z = 25x + 55y$     2.  $x + y \leq 80$     3.  $30 \leq x \leq 80$ ;  $10 \leq y \leq 30$ ; objective function:  $z = 25x + 55y$ ; constraints: 
$$\begin{cases} x + y \leq 80 \\ 30 \leq x \leq 80 \\ 10 \leq y \leq 30 \end{cases}$$

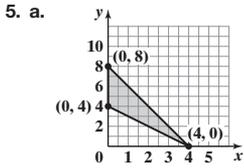

4. 50 bookshelves and 30 desks; \$2900    5. 30

Concept and Vocabulary Check

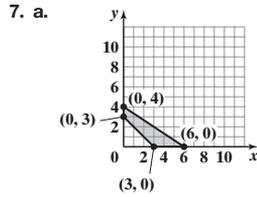

1. linear programming    2. objective    3. constraints; corner

Exercise Set 7.6

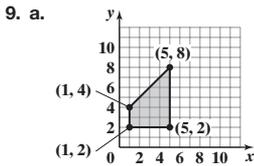

1. (1, 2): 17; (2, 10): 70; (7, 5): 65; (8, 3): 58; maximum:  $z = 70$ ; minimum:  $z = 17$   
 3. (0, 0): 0; (0, 8): 400; (4, 9): 610; (8, 0): 320; maximum:  $z = 610$ ; minimum:  $z = 0$

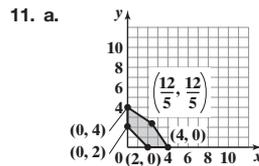

- b. (0, 8): 16; (0, 4): 8; (4, 0): 12  
 c. maximum value: 16 at  $x = 0$  and  $y = 8$

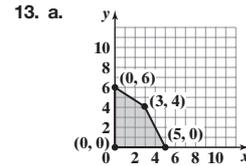

- b. (0, 4): 4; (0, 3): 3; (3, 0): 12; (6, 0): 24  
 c. maximum value: 24 at  $x = 6$  and  $y = 0$

- b. (1, 2): -1; (1, 4): -5; (5, 8): -1; (5, 2): 11  
 c. maximum value: 11 at  $x = 5$  and  $y = 2$

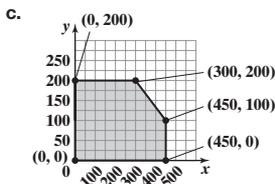

- b. (0, 4): 8; (0, 2): 4; (2, 0): 8; (4, 0): 16;  
 $\left(\frac{12}{5}, \frac{12}{5}\right): \frac{72}{5}$   
 c. maximum value: 16 at  $x = 4$  and  $y = 0$

- b. (0, 6): 72; (0, 0): 0; (5, 0): 50; (3, 4): 78  
 c. maximum value: 78 at  $x = 3$  and  $y = 4$

15. a.  $z = 125x + 200y$

b. 
$$\begin{cases} x \leq 450 \\ y \leq 200 \\ 600x + 900y \leq 360,000 \end{cases}$$

- d. (0, 0): 0; (0, 200): 40,000;  
 (300, 200): 77,500; (450, 100): 76,250;  
 (450, 0): 56,250  
 e. 300; 200; \$77,500

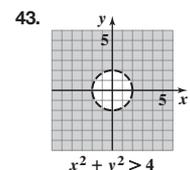

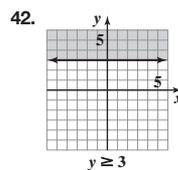

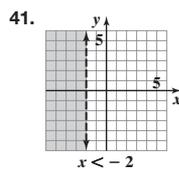

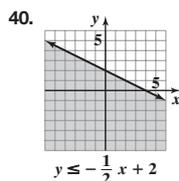

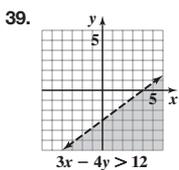

17. 40 model A bicycles and no model B bicycles  
 19. 300 cartons of food and 200 cartons of clothing  
 21. 50 students and 100 parents  
 23. 10 Boeing 727s and 42 Falcon 20s

29. does not make sense    31. makes sense    33. \$5000 in stocks and \$5000 in bonds    37.  $\{(6, 3, 5)\}$ ; Answers may vary.

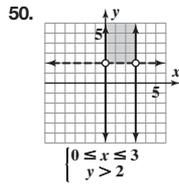

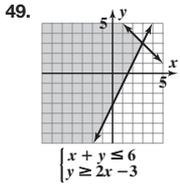

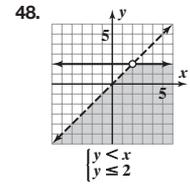

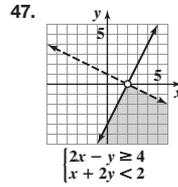

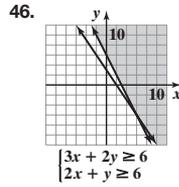

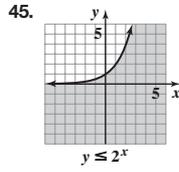

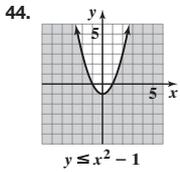

38.  $\{(-2, 1, 4, 3)\}$ ; Answers may vary.    39.  $\begin{bmatrix} 1 & 2 & -1 \\ 0 & -11 & -11 \end{bmatrix}$

Chapter 7 Review Exercises

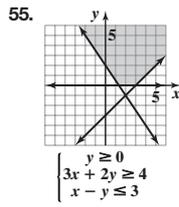

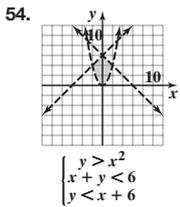

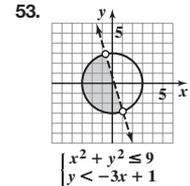

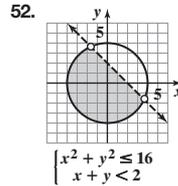

1.  $\{(1, 5)\}$     2.  $\{(2, 3)\}$     3.  $\{(2, -3)\}$     4.  $\emptyset$     5.  $\{(x, y) | 3x - 6y = 12\}$     6. a.  $C(x) = 60,000 + 200x$     b.  $R(x) = 450x$   
 c. (240, 108,000); This means the company will break even if it produces and sells 240 desks.    7. Klimt: \$135 million; Picasso: \$104 million  
 8. a.  $y = 219x + 142$     b. 2006; 580 million of each    9. \$80 per day for the room, \$60 per day for the car    10. 10 ml of 34%; 90 ml of 4%  
 11. plane: 630 mph; wind: 90 mph    12.  $\{(0, 1, 2)\}$     13.  $\{(2, 1, -1)\}$     14.  $y = 3x^2 - 4x + 5$     15. war: 124 million; famine: 111 million; tobacco: 71 million  
 16.  $\frac{3}{5(x-3)} + \frac{2}{5(x+2)}$     17.  $\frac{6}{x-4} + \frac{5}{x+3}$     18.  $\frac{2}{x} + \frac{3}{x+2} - \frac{1}{x-1}$     19.  $\frac{2}{x-2} + \frac{5}{(x-2)^2}$     20.  $-\frac{4}{x-1} + \frac{4}{x-2} - \frac{2}{(x-2)^2}$   
 21.  $\frac{6}{5(x-2)} + \frac{-6x+3}{5(x^2+1)}$     22.  $\frac{5}{x-3} + \frac{2x-1}{x^2+4}$     23.  $\frac{x}{x^2+4} - \frac{4x}{(x^2+4)^2}$     24.  $\frac{4x+1}{x^2+x+1} + \frac{2x-2}{(x^2+x+1)^2}$     25.  $\{(4, 3), (1, 0)\}$   
 26.  $\{(0, 1), (-3, 4)\}$     27.  $\{(1, -1), (-1, 1)\}$     28.  $\{(3, \sqrt{6}), (3, -\sqrt{6}), (-3, \sqrt{6}), (-3, -\sqrt{6})\}$     29.  $\{(2, 2), (-2, -2)\}$     30.  $\{(9, 6), (1, 2)\}$   
 31.  $\{(-3, -1), (1, 3)\}$     32.  $\left\{\left(\frac{1}{2}, 2\right), (-1, -1)\right\}$     33.  $\left\{\left(\frac{5}{2}, -\frac{7}{2}\right), (0, -1)\right\}$     34.  $\{(2, -3), (-2, -3), (3, 2), (-3, 2)\}$   
 35.  $\{(3, 1), (3, -1), (-3, 1), (-3, -1)\}$     36. 8 m and 5 m    37. (1, 6), (3, 2)    38.  $x = 46$  and  $y = 28$  or  $x = 50$  and  $y = 20$

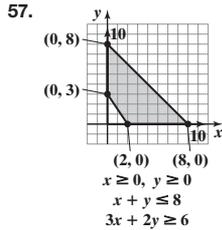

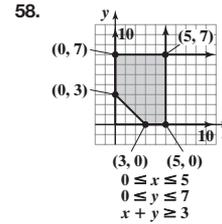

51. no solution

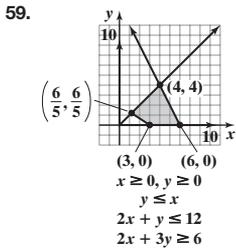

56. (2, 2); 10; (4, 0); 8;  $(\frac{1}{2}, \frac{1}{2})$ ;  $\frac{5}{2}$ ; (1, 0); 2; maximum value: 10; minimum value: 2

Maximum is 24 at  $x = 0, y = 8$ .

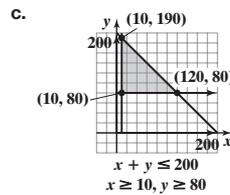

Maximum is 33 at  $x = 5, y = 7$ .

Maximum is 44 at  $x = y = 4$ .

60. a.  $z = 500x + 350y$

b.  $\begin{cases} x + y \leq 200 \\ x \geq 10 \\ y \geq 80 \end{cases}$

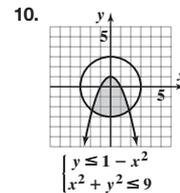

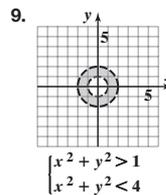

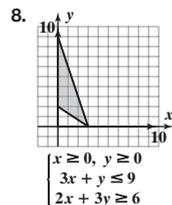

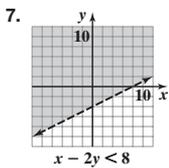

d. (10, 80): 33,000; (10, 190): 71,500; (120, 80): 88,000  
e. 120; 80; 88,000

61. 480 of model A and 240 of model B

Chapter 7 Test

1.  $\{(1, -3)\}$    2.  $\{(4, -2)\}$    3.  $\{(1, 3, 2)\}$    4.  $\{(4, -3), (-3, 4)\}$    5.  $\{(3, 2), (3, -2), (-3, 2), (-3, -2)\}$

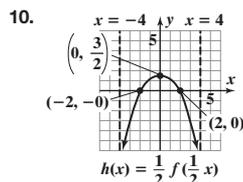

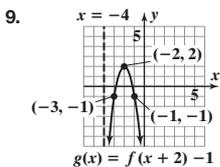

6.  $\frac{-1}{10(x+1)} + \frac{x+9}{10(x^2+9)}$

11. 26   12. shrimp: 42 mg; scallops: 15 mg   13. a.  $C(x) = 360,000 + 850x$    b.  $R(x) = 1150x$    c. (1200, 1,380,000); The company will break even if it produces and sells 1200 computers.   14. 40 oz of 20%; 20 oz of 50%   15. plane: 725 km/hr; wind: 75 km/hr  
16.  $y = x^2 - 3$    17.  $x = 7.5$  ft and  $y = 24$  ft or  $x = 12$  ft and  $y = 15$  ft   18. 50 regular and 100 deluxe jet skis; \$35,000

Cumulative Review Exercises (Chapters P-7)

1. domain:  $(-2, 2)$ ; range:  $(-\infty, 3]$    2. -1 and 1   3. maximum of 3 at  $x = 0$    4. (0, 2)  
5. positive   6. 3   7.  $x \rightarrow -2^+$ ;  $x \rightarrow 2^-$    8. even

11.  $\{3, 4\}$    12.  $\left\{\frac{2+i\sqrt{3}}{2}, \frac{2-i\sqrt{3}}{2}\right\}$

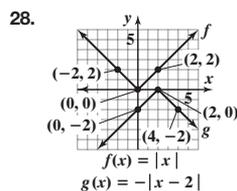

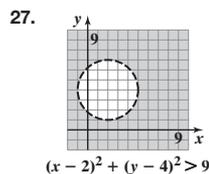

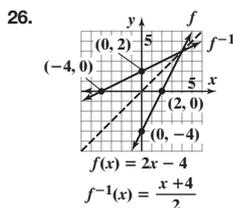

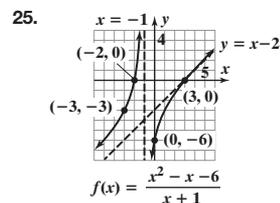

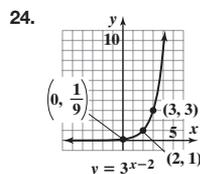

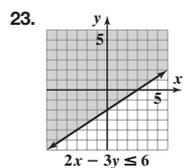

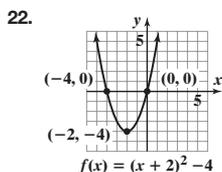

13.  $(-18, 6)$    14. (1, 7)

15.  $\left\{-3, \frac{1}{2}, 2\right\}$    16.  $\{-2\}$

17.  $\{2\}$    18.  $\{-2 + \log_3 11\}$

19.  $\{625\}$    20.  $\left\{\left(-\frac{1}{2}, \frac{1}{2}\right), (2, 8)\right\}$    21.  $\{(8, -2, -2)\}$

## AA78 Answers to Selected Exercises

29.  $(f \circ g)(x) = 2x^2 - 3x$ ;  
 $(g \circ f)(x) = -2x^2 + x + 2$   
30.  $4x + 2h - 1$   
31.  $y = -3x + 10$   
32.  $y = 3x + 3$   
33. \$2600 at 12%; \$1400 at 14%  
34. 4 m by 9 m  
35. 10.99%

36.  $\sec \theta - \cos \theta = \frac{1}{\cos \theta} - \cos \theta = \frac{1 - \cos^2 \theta}{\cos \theta} = \frac{\sin^2 \theta}{\cos \theta} = \frac{\sin \theta}{\cos \theta} \sin \theta = \tan \theta \sin \theta$

37.  $\tan x + \tan y = \frac{\sin x}{\cos x} + \frac{\sin y}{\cos y} = \frac{\sin x \cos y + \sin y \cos x}{\cos x \cos y} = \frac{\sin(x + y)}{\cos x \cos y}$

38.  $\{0, \pi\}$     39.  $\left\{0, \frac{\pi}{3}, \frac{5\pi}{3}\right\}$

40. 92.9

## CHAPTER 8

### Section 8.1

#### Check Point Exercises

1. a.  $\begin{bmatrix} 1 & 6 & -3 & | & 7 \\ 4 & 12 & -20 & | & 8 \\ -3 & -2 & 1 & | & -9 \end{bmatrix}$     b.  $\begin{bmatrix} 1 & 3 & -5 & | & 2 \\ 1 & 6 & -3 & | & 7 \\ -3 & -2 & 1 & | & -9 \end{bmatrix}$     c.  $\begin{bmatrix} 4 & 12 & -20 & | & 8 \\ 1 & 6 & -3 & | & 7 \\ 0 & 16 & -8 & | & 12 \end{bmatrix}$     2.  $\{(5, 2, 3)\}$     3.  $\{(1, -1, 2, -3)\}$     4.  $\{(5, 2, 3)\}$

#### Concept and Vocabulary Check

1. matrix; elements    2. 3; second; -2; third    3.  $\begin{bmatrix} 2 & 1 & 4 & | & -4 \\ 3 & 0 & 1 & | & 1 \\ 4 & 3 & 1 & | & 8 \end{bmatrix}$     4.  $\{(1, 3, -2)\}$     5. true    6. false

#### Exercise Set 8.1

1.  $\begin{bmatrix} 2 & 1 & 2 & | & 2 \\ 3 & -5 & -1 & | & 4 \\ 1 & -2 & -3 & | & -6 \end{bmatrix}$     3.  $\begin{bmatrix} 1 & -1 & 1 & | & 8 \\ 0 & 1 & -12 & | & -15 \\ 0 & 0 & 1 & | & 1 \end{bmatrix}$     5.  $\begin{bmatrix} 5 & -2 & -3 & | & 0 \\ 1 & 1 & 0 & | & 5 \\ 2 & 0 & -3 & | & 4 \end{bmatrix}$     7.  $\begin{bmatrix} 2 & 5 & -3 & | & 2 \\ 0 & 3 & 1 & | & 4 \\ 1 & -1 & 5 & | & 9 \\ 5 & -5 & -2 & | & 1 \end{bmatrix}$     9.  $\begin{cases} 5x + 3z = -11 \\ y - 4z = 12 \\ 7x + 2y = 3 \end{cases}$

11.  $\begin{cases} w + x + 4y + z = 3 \\ -w + x - y = 7 \\ 2w + 5z = 11 \\ 12y + 4z = 5 \end{cases}$     13.  $\begin{bmatrix} 1 & -3 & 2 & | & 5 \\ 1 & 5 & -5 & | & 0 \\ 3 & 0 & 4 & | & 7 \end{bmatrix}$     15.  $\begin{bmatrix} 1 & -3 & 2 & | & 0 \\ 0 & 10 & -7 & | & 7 \\ 2 & -2 & 1 & | & 3 \end{bmatrix}$     17.  $\begin{bmatrix} 1 & -1 & 1 & | & 3 \\ 0 & 1 & -2 & | & 0 \\ 0 & 2 & 1 & | & 5 \\ 0 & 6 & -3 & | & -9 \end{bmatrix}$

19.  $R_2: -3, -18; R_3: -12, -15; R_2: -\frac{3}{5}, -\frac{18}{5}; R_3: -12, -15$     21.  $\{(1, -1, 2)\}$     23.  $\{(3, -1, -1)\}$     25.  $\{(2, -1, 1)\}$     27.  $\{(2, 1, 1)\}$   
29.  $\{(2, -1, 1)\}$     31.  $\{(-1, 2, -2)\}$     33.  $\{(1, 2, -1)\}$     35.  $\{(1, 2, 3, -2)\}$     37.  $\{(0, -3, 0, -3)\}$     39.  $f(x) = -x^2 + x + 2$   
41.  $f(x) = x^3 - 2x^2 + 3$     43.  $\{(e^{-1}, e, e^{-3}, e^{-2})\}$     45. a.  $a = -32, v_0 = 56, s_0 = 0$     b. 0; The ball hits the ground 3.5 seconds after it is thrown; (3.5, 0).  
c. 1.75 sec; 49 ft    47. 4 oz of Food A;  $\frac{1}{2}$  oz of Food B; 1 oz of Food C    49. Asians: 122; Africans: 28; Europeans: 24; Americans: 9    59. makes sense  
61. makes sense    63. false    65. false    67. 60 units; \$7700  
68. For  $z = 0$ ,  $(12z + 1, 10z - 1, z)$  is  $(1, -1, 0)$ ;  $3(1) - 4(-1) + 4(0) = 7$  is true;  $1 - (-1) - 2(0) = 2$  is true;  $2(1) - 3(-1) + 6(0) = 5$  is true.  
69. For  $z = 1$ ,  $(12z + 1, 10z - 1, z)$  is  $(13, 9, 1)$ ;  $3(13) - 4(9) + 4(1) = 7$  is true;  $13 - 9 - 2(1) = 2$  is true;  $2(13) - 3(9) + 6(1) = 5$  is true.  
70. a. Answers may vary.    b. This system has more than one solution.

**Section 8.2**

**Check Point Exercises**

1.  $\emptyset$     2.  $\{(11t + 13, 5t + 4, t)\}$     3.  $\{(t + 50, -2t + 10, t)\}$   
 4. a.  $\begin{cases} w + z = 15 \\ w + x = 30 \\ x + y = 45 \\ y + z = 30 \end{cases}$     b.  $\{(-t + 15, t + 15, -t + 30, t)\}$     c.  $w = 5; x = 25; y = 20$

**Concept and Vocabulary Check**

1. no solution    2. one solution    3. infinitely many solutions    4. true  
 5.  $\begin{cases} x - y + z = 5 \\ y - z = -3 \end{cases}; z = -3; 2; \{(2, z - 3, z)\}$

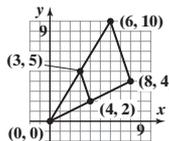

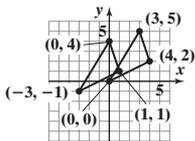

**Exercise Set 8.2**

1.  $\emptyset$     3.  $\left\{\left(-2t + 2, 2t + \frac{1}{2}, t\right)\right\}$     5.  $\{(-3, 4, -2)\}$     7.  $\{(5 - 2t, -2 + t, t)\}$     9.  $\{(-1, 2, 1, 1)\}$     11.  $\{(1, 3, 2, 1)\}$   
 13.  $\{(1, -2, 1, 1)\}$     15.  $\left\{\left(1 + \frac{1}{3}t, \frac{1}{3}t, t\right)\right\}$     17.  $\{(-13t + 5, 5t, t)\}$     19.  $\left\{\left(2t - \frac{5}{4}, \frac{13}{4}, t\right)\right\}$     21.  $\{(1, -t - 1, 2, t)\}$   
 23.  $\left\{\left(-\frac{2}{11}t + \frac{81}{11}, \frac{1}{22}t + \frac{10}{11}, \frac{4}{11}t - \frac{8}{11}, t\right)\right\}$   
 25. a.  $4w - 2x + 2y - 3z = 0; 7w - x - y - 3z = 0; w + x + y - z = 0$     b.  $\{(0.5t, 0, 0.5t, t)\}$   
 27. a.  $w + 2x + 5y + 5z = -3; w + x + 3y + 4z = -1; w - x - y + 2z = 3$     b.  $\{(1 - 3s - t, -2 - s - 2t, t, s)\}$   
 29.  $z + 12 = x + 6$     31.  $\{(t + 6, t + 2, t)\}$   
 33. a.  $\begin{cases} w + z = 380 \\ w + x = 600 \\ x - y = 170 \\ y - z = 50 \end{cases}$     b.  $\{(380 - t, 220 + t, 50 + t, t)\}$     c.  $w = 330, x = 270, y = 100$   
 35. a. The system has no solution, so there is no way to satisfy these dietary requirements with no Food 1 available.  
       b. 4 oz of Food 1, 0 oz of Food 2, 10 oz of Food 3; 2 oz of Food 1, 5 oz of Food 2, 9 oz of Food 3 (other answers are possible).  
 41. does not make sense    43. does not make sense    45.  $a = 1$  or  $a = 3$     47.  $-1$     48.  $-12$     49. 8

**Section 8.3**

**Check Point Exercises**

1. a.  $3 \times 2$     b.  $a_{12} = -2; a_{31} = 1$     2. a.  $\begin{bmatrix} 2 & 0 \\ 9 & -10 \end{bmatrix}$     b.  $\begin{bmatrix} 9 & -4 \\ -9 & 7 \\ 5 & -2 \end{bmatrix}$     3. a.  $\begin{bmatrix} 6 & 12 \\ -48 & -30 \end{bmatrix}$     b.  $\begin{bmatrix} -14 & -1 \\ 25 & 10 \end{bmatrix}$     4.  $\begin{bmatrix} -4 & 3 \\ -3 & \frac{13}{3} \end{bmatrix}$   
 5.  $\begin{bmatrix} 7 & 6 \\ 13 & 12 \end{bmatrix}$     6.  $[30]; \begin{bmatrix} 2 & 0 & 4 \\ 6 & 0 & 12 \\ 14 & 0 & 28 \end{bmatrix}$     7. a.  $\begin{bmatrix} 2 & 18 & 11 & 9 \\ 0 & 10 & 8 & 2 \end{bmatrix}$     b. The product is undefined.  
 8.  $\begin{bmatrix} 2 & 1 & 1 \\ 2 & 1 & 1 \\ 2 & 2 & 1 \end{bmatrix} + \begin{bmatrix} -1 & 2 & 2 \\ -1 & 2 & 2 \\ -1 & -1 & 2 \end{bmatrix} = \begin{bmatrix} 1 & 3 & 3 \\ 1 & 3 & 3 \\ 1 & 1 & 3 \end{bmatrix}$   
 9. a.  $\begin{bmatrix} 0 & 3 & 4 \\ 0 & 5 & 2 \end{bmatrix} + \begin{bmatrix} -3 & -3 & -3 \\ -1 & -1 & -1 \end{bmatrix} = \begin{bmatrix} -3 & 0 & 1 \\ -1 & 4 & 1 \end{bmatrix}$     b.  $2 \begin{bmatrix} 0 & 3 & 4 \\ 0 & 5 & 2 \end{bmatrix} = \begin{bmatrix} 0 & 6 & 8 \\ 0 & 10 & 4 \end{bmatrix}$

- c.  $\begin{bmatrix} 0 & 3 & 4 \\ 0 & -5 & -2 \end{bmatrix}$ ; Multiplying by  $B$  reflects the triangle over the  $x$ -axis.

**Concept and Vocabulary Check**

1. third; fourth    2.  $1 \times 3$     3. square    4.  $-10; 6$     5. true    6. false    7. true    8.  $m; p$ ; columns; rows    9. true    10. false

**Exercise Set 8.3**

1. a.  $2 \times 3$     b.  $a_{32}$  does not exist;  $a_{23} = -1$     3. a.  $3 \times 4$     b.  $a_{32} = \frac{1}{2}; a_{23} = -6$     5.  $x = 6; y = 4$     7.  $x = 4; y = 6; z = 3$   
 9. a.  $\begin{bmatrix} 9 & 10 \\ 3 & 9 \end{bmatrix}$     b.  $\begin{bmatrix} -1 & -8 \\ 3 & -5 \end{bmatrix}$     c.  $\begin{bmatrix} -16 & -4 \\ -12 & -8 \end{bmatrix}$     d.  $\begin{bmatrix} 22 & 21 \\ 9 & 20 \end{bmatrix}$     11. a.  $\begin{bmatrix} 3 & 2 \\ 6 & 2 \\ 5 & 7 \end{bmatrix}$     b.  $\begin{bmatrix} -1 & 4 \\ 0 & 6 \\ 5 & 5 \end{bmatrix}$     c.  $\begin{bmatrix} -4 & -12 \\ -12 & -16 \\ -20 & -24 \end{bmatrix}$     d.  $\begin{bmatrix} 7 & 7 \\ 15 & 8 \\ 15 & 20 \end{bmatrix}$

**AA80** Answers to Selected Exercises

13. a.  $\begin{bmatrix} -3 \\ -1 \\ 0 \end{bmatrix}$  b.  $\begin{bmatrix} 7 \\ -7 \\ 2 \end{bmatrix}$  c.  $\begin{bmatrix} -8 \\ 16 \\ -4 \end{bmatrix}$  d.  $\begin{bmatrix} -4 \\ -6 \\ 1 \end{bmatrix}$  15. a.  $\begin{bmatrix} 8 & 0 & -4 \\ 14 & 0 & 6 \\ -1 & 0 & 0 \end{bmatrix}$  b.  $\begin{bmatrix} -4 & -20 & 0 \\ 14 & 24 & 14 \\ 9 & -4 & 4 \end{bmatrix}$  c.  $\begin{bmatrix} -8 & 40 & 8 \\ -56 & -48 & -40 \\ -16 & 8 & -8 \end{bmatrix}$  d.  $\begin{bmatrix} 18 & -10 & -10 \\ 42 & 12 & 22 \\ 2 & -2 & 2 \end{bmatrix}$

17.  $\begin{bmatrix} -8 & -8 \\ 2 & -9 \\ 8 & -4 \end{bmatrix}$  19.  $\begin{bmatrix} -1 & 3 \\ -1 & \frac{9}{2} \\ -1 & -2 \end{bmatrix}$  21.  $\begin{bmatrix} \frac{1}{3} & \frac{13}{3} \\ -\frac{4}{3} & 6 \\ -\frac{7}{3} & -\frac{4}{3} \end{bmatrix}$  23.  $\begin{bmatrix} 7 & 27 \\ -8 & 36 \\ -17 & -4 \end{bmatrix}$  25.  $\begin{bmatrix} \frac{27}{2} & \frac{31}{2} \\ -4 & 18 \\ -\frac{29}{2} & 6 \end{bmatrix}$  27. a.  $\begin{bmatrix} 0 & 16 \\ 12 & 8 \end{bmatrix}$  b.  $\begin{bmatrix} -7 & 3 \\ 29 & 15 \end{bmatrix}$

29. a. [30] b.  $\begin{bmatrix} 1 & 2 & 3 & 4 \\ 2 & 4 & 6 & 8 \\ 3 & 6 & 9 & 12 \\ 4 & 8 & 12 & 16 \end{bmatrix}$  31. a.  $\begin{bmatrix} 4 & -5 & 8 \\ 6 & -1 & 5 \\ 0 & 4 & -6 \end{bmatrix}$  b.  $\begin{bmatrix} 5 & -2 & 7 \\ 17 & -3 & 2 \\ 3 & 0 & -5 \end{bmatrix}$  33. a.  $\begin{bmatrix} 6 & 8 & 16 \\ 11 & 16 & 24 \\ 1 & -1 & 12 \end{bmatrix}$  b.  $\begin{bmatrix} 38 & 27 \\ -16 & -4 \end{bmatrix}$

35. a.  $\begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$  b.  $\begin{bmatrix} 4 & -1 & -3 & 1 \\ -1 & 4 & -3 & 2 \\ 14 & -11 & -3 & -1 \\ 25 & -25 & 0 & -5 \end{bmatrix}$  37.  $\begin{bmatrix} 17 & 7 \\ -5 & -11 \end{bmatrix}$  39.  $\begin{bmatrix} 11 & -1 \\ -7 & -3 \end{bmatrix}$

41.  $A - C$  is not defined because  $A$  is  $3 \times 2$  and  $C$  is  $2 \times 2$ . 43.  $\begin{bmatrix} 16 & -16 \\ -12 & 12 \\ 0 & 0 \end{bmatrix}$  45.  $\begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$

47. Answers will vary.; Example:

$$A(B + C) = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \left( \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} + \begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} \right) = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$$

$$AB + AC = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} + \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} + \begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$$

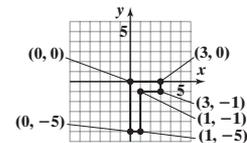

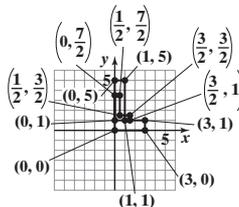

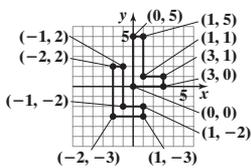

So,  $A(B + C) = AB + AC$ .

49.  $\begin{bmatrix} x \\ -y \end{bmatrix}$ ; It changes the sign of the  $y$ -coordinate.

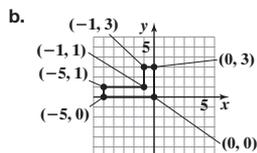

51. a.  $\begin{bmatrix} 1 & 3 & 1 \\ 3 & 3 & 3 \\ 1 & 3 & 1 \end{bmatrix}$  b.  $\begin{bmatrix} 1 & 3 & 1 \\ 3 & 3 & 3 \\ 1 & 3 & 1 \end{bmatrix} + \begin{bmatrix} -1 & -1 & -1 \\ -1 & -1 & -1 \\ -1 & -1 & -1 \end{bmatrix} = \begin{bmatrix} 0 & 2 & 0 \\ 2 & 2 & 2 \\ 0 & 2 & 0 \end{bmatrix}$  c.  $\begin{bmatrix} 1 & 3 & 1 \\ 3 & 3 & 3 \\ 1 & 3 & 1 \end{bmatrix} + \begin{bmatrix} 1 & -2 & 1 \\ -2 & -2 & -2 \\ 1 & -2 & 1 \end{bmatrix} = \begin{bmatrix} 2 & 1 & 2 \\ 1 & 1 & 1 \\ 2 & 1 & 2 \end{bmatrix}$

53.  $\begin{bmatrix} -2 & 1 & 1 & -1 & -1 & -2 \\ -3 & -3 & -2 & -2 & 2 & 2 \end{bmatrix}$  55.  $\begin{bmatrix} 0 & \frac{3}{2} & \frac{3}{2} & \frac{1}{2} & \frac{1}{2} & 0 \\ 1 & 1 & \frac{3}{2} & \frac{3}{2} & \frac{7}{2} & \frac{7}{2} \end{bmatrix}$

57. a.  $\begin{bmatrix} 0 & 3 & 3 & 1 & 1 & 0 \\ 0 & 0 & -1 & -1 & -5 & -5 \end{bmatrix}$   
 b. The effect is a reflection across the  $x$ -axis.

59. a.  $\begin{bmatrix} 0 & 0 & -1 & -1 & -5 & -5 \\ 0 & 3 & 3 & 1 & 1 & 0 \end{bmatrix}$

The effect is a  $90^\circ$  counterclockwise rotation about the origin.

61. a.  $A = \begin{bmatrix} 2 & 6 \\ 31 & 46 \end{bmatrix}$  b.  $B = \begin{bmatrix} 9 & 29 \\ 65 & 77 \end{bmatrix}$

c.  $B - A = \begin{bmatrix} 7 & 23 \\ 34 & 31 \end{bmatrix}$

The difference between the percentage of people completing the transition to adulthood in 1960 and 2000 by age and gender

63. a. System 1: The midterm and final both count for 50% of the course grade. System 2: The midterm counts for 30% of the course grade and the final counts for 70%.

b.  $\begin{bmatrix} 84 & 87.2 \\ 79 & 81 \\ 90 & 88.4 \\ 73 & 68.6 \\ 69 & 73.4 \end{bmatrix}$

System 1 grades are listed first (if different). Student 1: Student 2: C or B; Student 3: A or B; Student 4: C or D; Student 5: D or C

77. makes sense 79. makes sense 83.  $AB = -BA$  so they are anticommutative.

85.  $\begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}$ ; Nothing happens to the elements in the first matrix.    86.  $\{(15, -12, -4)\}$     87.  $\begin{cases} a_1x + b_1y + c_1z = d_1 \\ a_2x + b_2y + c_2z = d_2 \\ a_3x + b_3y + c_3z = d_3 \end{cases}$

**Mid-Chapter 8 Check Point**

1.  $\{(1, -1, 2)\}$     2.  $\emptyset$     3.  $\left\{\left(-\frac{4}{7} - \frac{4}{7}t, \frac{5}{7} + \frac{5}{7}t, t\right)\right\}$     4.  $\{(3, 6, -4, 1)\}$     5.  $\emptyset$     6.  $\begin{bmatrix} -4 & -1 \\ 3 & 3 \end{bmatrix}$     7.  $\begin{bmatrix} -12 & -2 \\ -21 & -4 \\ 3 & 1 \end{bmatrix}$     8.  $\begin{bmatrix} 12 & -4 \\ 22 & -7 \\ -4 & 1 \end{bmatrix}$

9.  $A + C$  does not exist because  $A$  is  $3 \times 2$  and  $C$  is  $2 \times 2$ .    10.  $\begin{bmatrix} \frac{1}{2} & \frac{1}{2} \\ -3 & \frac{1}{2} \end{bmatrix}$

**Section 8.4**

**Check Point Exercises**

1.  $AB = I_2; BA = I_2$     2.  $\begin{bmatrix} 3 & -7 \\ -2 & 5 \end{bmatrix}$     3.  $\begin{bmatrix} 1 & 2 \\ 1 & 3 \end{bmatrix}$     4.  $\begin{bmatrix} 3 & -2 & -4 \\ 3 & -2 & -5 \\ -1 & 1 & 2 \end{bmatrix}$     5.  $\{(4, -2, 1)\}$     6. The encoded message is  $-7, 10, -53, 77$ .

7. The decoded message is 2, 1, 19, 5 or BASE.

**Concept and Vocabulary Check**

1.  $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$     2.  $\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$     3. multiplicative inverse    4. true    5.  $ad - bc \neq 0$

6. singular    7. false    8.  $A^{-1}$     9.  $A^{-1}B$

**Exercise Set 8.4**

1.  $AB = I_2; BA = I_2; B = A^{-1}$     3.  $AB = \begin{bmatrix} 8 & -16 \\ -2 & 7 \end{bmatrix}; BA = \begin{bmatrix} 12 & 12 \\ 1 & 3 \end{bmatrix}; B \neq A^{-1}$     5.  $AB = I_2; BA = I_2; B = A^{-1}$

7.  $AB = I_3; BA = I_3; B = A^{-1}$     9.  $AB = I_3; BA = I_3; B = A^{-1}$     11.  $AB = I_4; BA = I_4; B = A^{-1}$

13.  $\begin{bmatrix} \frac{2}{7} & -\frac{3}{7} \\ \frac{1}{7} & \frac{2}{7} \end{bmatrix}$     15.  $\begin{bmatrix} 1 & \frac{1}{2} \\ 2 & \frac{3}{2} \end{bmatrix}$     17.  $A$  does not have an inverse.    19.  $\begin{bmatrix} \frac{1}{2} & 0 & 0 \\ 0 & \frac{1}{4} & 0 \\ 0 & 0 & \frac{1}{6} \end{bmatrix}$     21.  $\begin{bmatrix} 1 & 1 & 2 \\ 1 & 1 & 1 \\ 2 & 3 & 4 \end{bmatrix}$     23.  $\begin{bmatrix} 1 & 0 & 1 \\ 1 & 1 & 2 \\ 3 & 2 & 6 \end{bmatrix}$

25.  $\begin{bmatrix} -3 & 2 & -4 \\ -1 & 1 & -1 \\ 8 & -5 & 10 \end{bmatrix}$     27.  $\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & -1 & 0 & 0 \\ 0 & 0 & \frac{1}{3} & 0 \\ -1 & 0 & 0 & 1 \end{bmatrix}$     29.  $\begin{bmatrix} 6 & 5 \\ 5 & 4 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 13 \\ 10 \end{bmatrix}$     31.  $\begin{bmatrix} 1 & 3 & 4 \\ 1 & 2 & 3 \\ 1 & 4 & 3 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} -3 \\ -2 \\ -6 \end{bmatrix}$     33.  $\begin{cases} 4x - 7y = -3 \\ 2x - 3y = 1 \end{cases}$

35.  $\begin{cases} 2x - z = 6 \\ 3y = 9 \\ x + y = 5 \end{cases}$     37. a.  $\begin{bmatrix} 2 & 6 & 6 \\ 2 & 7 & 6 \\ 2 & 7 & 7 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 8 \\ 10 \\ 9 \end{bmatrix}$     b.  $\{(1, 2, -1)\}$     39. a.  $\begin{bmatrix} 1 & -1 & 1 \\ 0 & 2 & -1 \\ 2 & 3 & 0 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 8 \\ -7 \\ 1 \end{bmatrix}$     b.  $\{(2, -1, 5)\}$

41. a.  $\begin{bmatrix} 1 & -1 & 2 & 0 \\ 0 & 1 & -1 & 1 \\ -1 & 1 & -1 & 2 \\ 0 & -1 & 1 & -2 \end{bmatrix} \begin{bmatrix} w \\ x \\ y \\ z \end{bmatrix} = \begin{bmatrix} -3 \\ 4 \\ 2 \\ -4 \end{bmatrix}$     b.  $\{(2, 3, -1, 0)\}$     43.  $\begin{bmatrix} \frac{1}{2}e^{-x} & -\frac{1}{2}e^{-3x} \\ \frac{1}{2}e^{-3x} & \frac{1}{2}e^{-5x} \end{bmatrix}$     45.  $\begin{bmatrix} \frac{1}{8} & \frac{5}{8} \\ \frac{3}{8} & \frac{7}{8} \end{bmatrix}$

47.  $(AB)^{-1} = \begin{bmatrix} -23 & 16 \\ 13 & -9 \end{bmatrix}; A^{-1}B^{-1} = \begin{bmatrix} -3 & 11 \\ 8 & -29 \end{bmatrix}; B^{-1}A^{-1} = \begin{bmatrix} -23 & 16 \\ 13 & -9 \end{bmatrix}; (AB)^{-1} = B^{-1}A^{-1}$     49.  $AA^{-1} = I_3$  and  $A^{-1}A = I_3$

51. The encoded message is 27, -19, 32, -20; The decoded message is 8, 5, 12, 16 or HELP.

53. The encoded message is 14, 85, -33, 4, 18, -7, -18, 19, -9.

65.  $\begin{bmatrix} 1 & 1 \\ 2 & 3 \end{bmatrix}$     67.  $\begin{bmatrix} 1 & 0 & 1 \\ 2 & 1 & 3 \\ -1 & 1 & 1 \end{bmatrix}$     69.  $\begin{bmatrix} 0 & -1 & 0 & 1 \\ -1 & -5 & 0 & 3 \\ -2 & -4 & 1 & -2 \\ -1 & -4 & 0 & 1 \end{bmatrix}$     71.  $\{(2, 3, -5)\}$     73.  $\{(1, 2, -1)\}$     75.  $\{(2, 1, 3, -2, 4)\}$

79. does not make sense    81. makes sense    83. false    85. false    87. false    91.  $a = 3$  or  $a = -2$     93. 2    94. 6    95. -31

**Section 8.5**

**Check Point Exercises**

1. a. -4    b. -17    2.  $\{(4, -2)\}$     3. 80    4. -24    5.  $\{(2, -3, 4)\}$     6. -250

Concept and Vocabulary Check

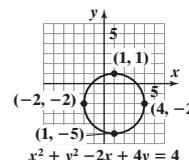

1.  $5 \cdot 3 - 2 \cdot 4 = 15 - 8 = 7$ ; determinant; 7    2.  $x = \frac{\begin{vmatrix} 8 & 1 \\ -2 & -1 \end{vmatrix}}{\begin{vmatrix} 1 & 1 \\ 1 & -1 \end{vmatrix}}$ ;  $y = \frac{\begin{vmatrix} 1 & 8 \\ 1 & -2 \end{vmatrix}}{\begin{vmatrix} 1 & 1 \\ 1 & -1 \end{vmatrix}}$     3.  $3 \begin{vmatrix} 3 & 1 \\ 1 & 1 \end{vmatrix} - 4 \begin{vmatrix} 2 & 1 \\ 1 & 1 \end{vmatrix} + 5 \begin{vmatrix} 2 & 1 \\ 3 & 1 \end{vmatrix}$

4.  $\begin{vmatrix} 3 & -8 & 4 \\ 2 & 11 & -2 \\ 1 & 4 & -2 \end{vmatrix}$     5. column 3/the last column

6.  $\begin{vmatrix} 3 & 1 & 4 \\ 2 & 3 & -2 \\ 1 & -3 & -2 \end{vmatrix}$

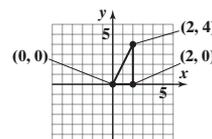

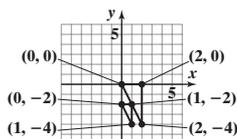

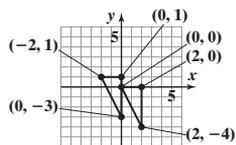

Exercise Set 8.5

1. 1    3. -29    5. 0    7. 33    9.  $-\frac{7}{16}$     11.  $\{(5, 2)\}$     13.  $\{(2, -3)\}$     15.  $\{(3, -1)\}$     17.  $\left\{\left(2, \frac{1}{2}\right)\right\}$     19.  $\{(4, 2)\}$   
 21.  $\{(7, 4)\}$     23. 72    25. -75    27. 0    29.  $\{(-5, -2, 7)\}$     31.  $\{(2, -3, 4)\}$     33.  $\{(3, -1, 2)\}$     35.  $\{(2, 3, 1)\}$     37. -200    39. 195  
 41. -42    43.  $2x - 4y = 8$ ;  $3x + 5y = -10$     45. -11    47. 4    49. 28 sq units    51. yes    53. The equation of the line is  $y = -\frac{11}{5}x + \frac{8}{5}$ .  
 65. 13,200    67. does not make sense    69. does not make sense    71. a.  $a^2$     b.  $a^3$     c.  $a^4$     d. Each determinant has zeros below the main diagonal and  $a$ 's everywhere else.    e. Each determinant equals  $a$  raised to the power equal to the order of the determinant.  
 73. The sign of the value is changed when 2 columns are interchanged in a 2nd order determinant.  
 75.  $\begin{vmatrix} x & y & 1 \\ x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \end{vmatrix} = x(y_1 - y_2) - y(x_1 - x_2) + (x_1y_2 - x_2y_1) = 0$ ; solving for  $y$ ,  $y = \frac{y_1 - y_2}{x_1 - x_2}x + \frac{x_1y_2 - x_2y_1}{x_1 - x_2}$ , and  $m = \frac{y_1 - y_2}{x_1 - x_2}$  and  $b = \frac{x_1y_2 - x_2y_1}{x_1 - x_2}$ .  
 77. a. -3 and 3    b. -2 and 2    78.  $\frac{x^2}{16} + \frac{y^2}{25} = 1$     79.  $(x - 1)^2 + (y + 2)^2 = 9$ ; center:  $(1, -2)$ ; radius: 3;

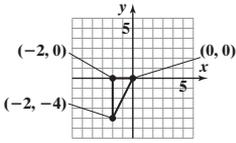

Chapter 8 Review Exercises

1.  $\begin{bmatrix} 1 & 2 & 2 & 2 \\ 0 & 1 & -1 & 2 \\ 0 & 0 & 9 & -9 \end{bmatrix}$     2.  $\begin{bmatrix} 1 & -1 & \frac{1}{2} & -\frac{1}{2} \\ 1 & 2 & -1 & 2 \\ 6 & 4 & 3 & 5 \end{bmatrix}$     3.  $\{(1, 3, -4)\}$     4.  $\{(-2, -1, 0)\}$     5.  $\{(2, -2, 3, 4)\}$   
 6. a.  $a = -2$ ;  $b = 32$ ;  $c = 42$     b. 2:00 p.m.; 170 parts per million    7. capitalist: 1%; upper middle: 15%; lower middle: 34%; working: 30%  
 8.  $\emptyset$     9.  $\{(2t + 4, t + 1, t)\}$     10.  $\{(-37t + 2, 16t, -7t + 1, t)\}$     11.  $\{(7t + 18, -3t - 7, t)\}$   
 12. a.  $\begin{cases} x + z = 750 \\ y - z = -250 \\ x + y = 500 \end{cases}$     b.  $\{(-t + 750, t - 250, t)\}$     c.  $x = 350$ ;  $y = 150$     13.  $x = -5$ ;  $y = 6$ ;  $z = 6$     14.  $\begin{bmatrix} 0 & 2 & 3 \\ 8 & 1 & 3 \end{bmatrix}$     15.  $\begin{bmatrix} 0 & -4 \\ 6 & 4 \\ 2 & -10 \end{bmatrix}$   
 16.  $\begin{bmatrix} -4 & 4 & -1 \\ -2 & -5 & 5 \end{bmatrix}$     17. Not possible since  $B$  is  $3 \times 2$  and  $C$  is  $3 \times 3$ .    18.  $\begin{bmatrix} 2 & 3 & 8 \\ 21 & 5 & 5 \end{bmatrix}$     19.  $\begin{bmatrix} -12 & 14 & 0 \\ 2 & -14 & 18 \end{bmatrix}$     20.  $\begin{bmatrix} 0 & -10 & -15 \\ -40 & -5 & -15 \end{bmatrix}$   
 21.  $\begin{bmatrix} -1 & -16 \\ 8 & 1 \end{bmatrix}$     22.  $\begin{bmatrix} -10 & -6 & 2 \\ 16 & 3 & 4 \\ -23 & -16 & 7 \end{bmatrix}$     23.  $\begin{bmatrix} -6 & 4 & -8 \\ 0 & 5 & 11 \\ -17 & 13 & -19 \end{bmatrix}$     24.  $\begin{bmatrix} 10 & 5 \\ -2 & -30 \end{bmatrix}$     25. Not possible since  $AB$  is  $2 \times 2$  and  $BA$  is  $3 \times 3$ .  
 26.  $\begin{bmatrix} 7 & 6 & 5 \\ 2 & -1 & 11 \end{bmatrix}$     27.  $\begin{bmatrix} -6 & -22 & -40 \\ 9 & 43 & 58 \\ -14 & -48 & -94 \end{bmatrix}$     28.  $\begin{bmatrix} -2 & -6 \\ 3 & \frac{1}{3} \end{bmatrix}$     29.  $\begin{bmatrix} 2 & 2 & 2 \\ 1 & 2 & 1 \\ 1 & 2 & 1 \end{bmatrix}$     30.  $\begin{bmatrix} 1 & 1 & 1 \\ -1 & 1 & -1 \\ -1 & 1 & -1 \end{bmatrix}$   
 31.  $\begin{bmatrix} -2 & 0 & 0 \\ 1 & 1 & -3 \end{bmatrix}$     32.  $\begin{bmatrix} 0 & 1 & 1 \\ -2 & -2 & -4 \end{bmatrix}$     33.  $\begin{bmatrix} 0 & 2 & 2 \\ 0 & 0 & 4 \end{bmatrix}$

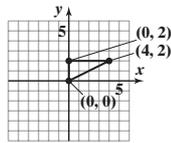

The effect is a reflection over the  $x$ -axis

34.  $\begin{bmatrix} 0 & -2 & -2 \\ 0 & 0 & -4 \end{bmatrix}$

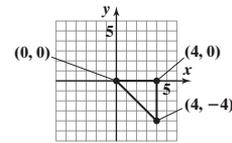

The effect is a reflection over the y-axis.

35.  $\begin{bmatrix} 0 & 0 & 4 \\ 0 & 2 & 2 \end{bmatrix}$

The effect is a 90° counterclockwise rotation about the origin.

36.  $\begin{bmatrix} 0 & 4 & 4 \\ 0 & 0 & -4 \end{bmatrix}$

The effect is a horizontal stretch by a factor of 2.

37.  $AB = \begin{bmatrix} 1 & 7 \\ 0 & 5 \end{bmatrix}; BA = \begin{bmatrix} 1 & 0 \\ 1 & 5 \end{bmatrix}; B \neq A^{-1}$

38.  $AB = I_3; BA = I_3; B = A^{-1}$

39.  $\begin{bmatrix} 3 & 1 \\ 2 & 1 \end{bmatrix}$

40.  $\begin{bmatrix} -\frac{3}{5} & \frac{1}{5} \\ 1 & 0 \end{bmatrix}$       41.  $\begin{bmatrix} 3 & 0 & -2 \\ -6 & 1 & 4 \\ 1 & 0 & -1 \end{bmatrix}$

42.  $\begin{bmatrix} 8 & -8 & 5 \\ -3 & 2 & -1 \\ -1 & -1 & 1 \end{bmatrix}$

43. a.  $\begin{bmatrix} 1 & 1 & 2 \\ 0 & 1 & 3 \\ 3 & 0 & -2 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 7 \\ -2 \\ 0 \end{bmatrix}$

b.  $\{(-18, 79, -27)\}$

44. a.  $\begin{bmatrix} 1 & -1 & 2 \\ 0 & 1 & -1 \\ 1 & 0 & 2 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 12 \\ -5 \\ 10 \end{bmatrix}$

b.  $\{(4, -2, 3)\}$

45. The encoded message is 96, 135, 46, 63; The decoded message is 18, 21, 12, 5 or RULE.

46. 17      47. 4

48. -86      49. -236      50. 4      51. 16      52.  $\left\{\left(\frac{7}{4}, -\frac{25}{8}\right)\right\}$       53.  $\{(2, -7)\}$       54.  $\{(23, -12, 3)\}$       55.  $\{(-3, 2, 1)\}$

56.  $a = \frac{5}{8}; b = -50; c = 1150$ ; 30- and 50-year-olds are involved in an average of 212.5 automobile accidents per day.

**Chapter 8 Test**

1.  $\left\{\left(-3, \frac{1}{2}, 1\right)\right\}$       2.  $\{(t, t - 1, t)\}$       3.  $\begin{bmatrix} 5 & 4 \\ 1 & 11 \end{bmatrix}$       4.  $\begin{bmatrix} 5 & -2 \\ 1 & -1 \\ 4 & -1 \end{bmatrix}$       5.  $\begin{bmatrix} \frac{3}{5} & -\frac{2}{5} \\ \frac{1}{5} & \frac{1}{5} \end{bmatrix}$       6.  $\begin{bmatrix} -1 & 2 \\ -5 & 4 \end{bmatrix}$       7.  $AB = I_3; BA = I_3$

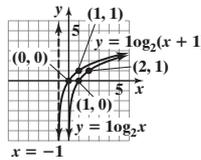

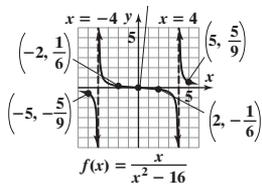

8. a.  $\begin{bmatrix} 3 & 5 \\ 2 & -3 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 9 \\ -13 \end{bmatrix}$       b.  $\begin{bmatrix} \frac{3}{19} & \frac{5}{19} \\ \frac{2}{19} & -\frac{3}{19} \end{bmatrix}$       c.  $\{(-2, 3)\}$       9. 18      10.  $x = 2$

**Cumulative Review Exercises (Chapters P-8)**

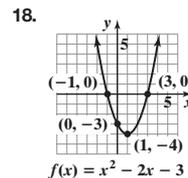

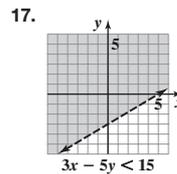

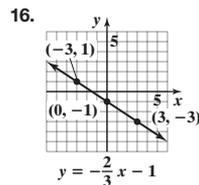

1.  $\left\{\frac{-1 + \sqrt{33}}{4}, \frac{-1 - \sqrt{33}}{4}\right\}$       2.  $\left[\frac{1}{2}, \infty\right)$       3.  $\{5\}$       4.  $\left\{-4, \frac{1}{3}, 1\right\}$       5.  $\{\ln 5, \ln 9\}$       6.  $\{1\}$       7.  $\{(7, -4, 6)\}$

8.  $y = -1$       9.  $f^{-1}(x) = \frac{x^2 + 7}{4} (x \geq 0)$

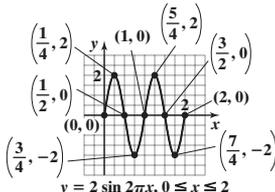

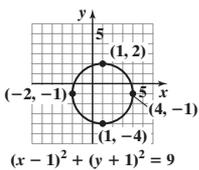

10.  $(0, 0)$       11.  $f(x) = (x + 2)(x - 3)(2x + 1)(2x - 1)$       12.  $\begin{matrix} (1, 1) \\ (2, 1) \\ (1, 0) \end{matrix}$       13. a.  $A = 900e^{-0.017t}$       b. 759.30 g

14.  $\begin{bmatrix} 2 & -1 \\ 13 & 1 \end{bmatrix}$       15.  $\frac{8}{x-3} + \frac{-2}{x-2} + \frac{-3}{x+2}$

19.  $(x - 1)^2 + (y + 1)^2 = 9$       20.  $x^2 + 2x - 2$       21.

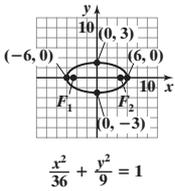

22.  $\frac{3}{5}$       23.  $\frac{\cos 2x}{\cos x - \sin x} = \frac{\cos^2 x - \sin^2 x}{\cos x - \sin x} = \frac{(\cos x + \sin x)(\cos x - \sin x)}{\cos x - \sin x} = \cos x + \sin x$       24.  $\frac{3\pi}{2}$       25.  $2i - 13j$

CHAPTER 9

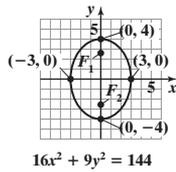

Section 9.1

Check Point Exercises

1. foci at  $(-3\sqrt{3}, 0)$  and  $(3\sqrt{3}, 0)$

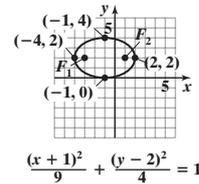

2. foci at  $(0, -\sqrt{7})$  and  $(0, \sqrt{7})$

3.  $\frac{x^2}{9} + \frac{y^2}{5} = 1$

4. foci at  $(-1 - \sqrt{5}, 2)$  and  $(-1 + \sqrt{5}, 2)$

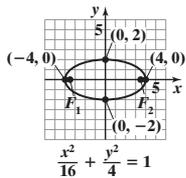

5. Yes

Concept and Vocabulary Check

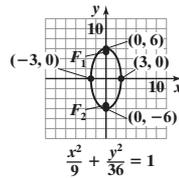

1. ellipse; foci; center    2. 25; -5; 5; (-5, 0); (5, 0); 9; -3; 3; (0, -3); (0, 3)    3. 25; -5; 5; (0, -5); (0, 5); 9; -3; 3; (-3, 0); (3, 0)  
 4. 5; (0, -\sqrt{5}); (0, \sqrt{5})    5. (-1, 4)    6. (-2, -2); (8, -2)    7. (1, 9)    8. 4; 1; 16

Exercise Set 9.1

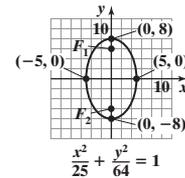

1. foci at  $(-2\sqrt{3}, 0)$  and  $(2\sqrt{3}, 0)$

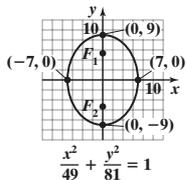

3. foci at  $(0, -3\sqrt{3})$  and  $(0, 3\sqrt{3})$

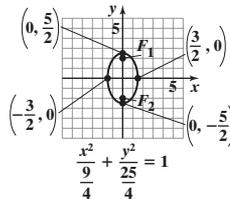

5. foci at  $(0, -\sqrt{39})$  and  $(0, \sqrt{39})$

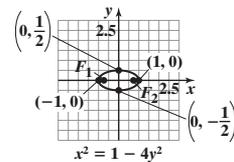

7. foci at  $(0, -4\sqrt{2})$  and  $(0, 4\sqrt{2})$

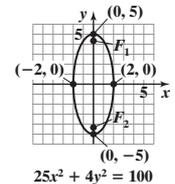

9. foci at  $(0, -2)$  and  $(0, 2)$

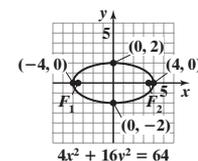

11. foci at  $(-\frac{\sqrt{3}}{2}, 0)$  and  $(\frac{\sqrt{3}}{2}, 0)$

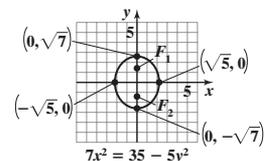

13. foci at  $(0, -\sqrt{21})$  and  $(0, \sqrt{21})$

15. foci at  $(-2\sqrt{3}, 0)$  and  $(2\sqrt{3}, 0)$

17. foci at  $(0, -\sqrt{2})$  and  $(0, \sqrt{2})$

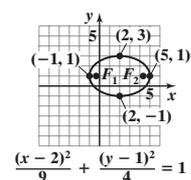

19.  $\frac{x^2}{4} + \frac{y^2}{1} = 1$ ; foci at  $(-\sqrt{3}, 0)$  and  $(\sqrt{3}, 0)$     21.  $\frac{x^2}{1} + \frac{y^2}{4} = 1$ ; foci at  $(0, \sqrt{3})$  and  $(0, -\sqrt{3})$

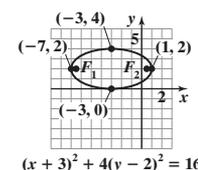

23.  $\frac{(x+1)^2}{4} + \frac{(y-1)^2}{1} = 1$ ; foci at  $(-1 - \sqrt{3}, 1)$  and  $(-1 + \sqrt{3}, 1)$     25.  $\frac{x^2}{64} + \frac{y^2}{39} = 1$     27.  $\frac{x^2}{33} + \frac{y^2}{49} = 1$

29.  $\frac{x^2}{13} + \frac{y^2}{9} = 1$     31.  $\frac{x^2}{16} + \frac{y^2}{4} = 1$     33.  $\frac{(x+2)^2}{4} + \frac{(y-3)^2}{25} = 1$     35.  $\frac{(x-7)^2}{4} + \frac{(y-6)^2}{9} = 1$

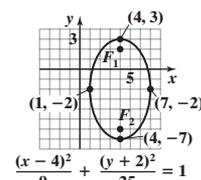

37. foci at  $(2 - \sqrt{5}, 1)$  and  $(2 + \sqrt{5}, 1)$

39. foci at  $(-3 - 2\sqrt{3}, 2)$  and  $(-3 + 2\sqrt{3}, 2)$

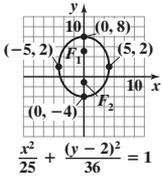

41. foci at  $(4, 2)$  and  $(4, -6)$

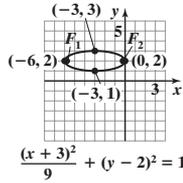

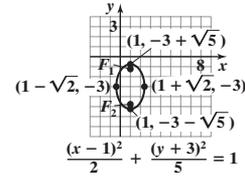

43. foci at  $(0, 2 + \sqrt{11})$ ,  $(0, 2 - \sqrt{11})$

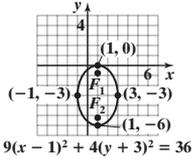

45. foci at  $(-3 - 2\sqrt{2}, 2)$  and  $(-3 + 2\sqrt{2}, 2)$

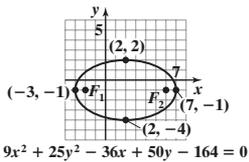

47. foci at  $(1, -3 + \sqrt{3})$  and  $(1, -3 - \sqrt{3})$

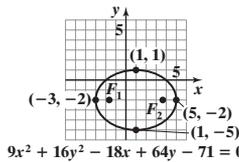

49. foci at  $(1, -3 + \sqrt{5})$  and  $(1, -3 - \sqrt{5})$

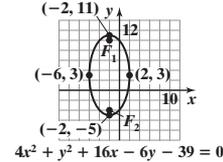

51.  $\frac{(x-2)^2}{25} + \frac{(y+1)^2}{9} = 1$   
foci at  $(-2, -1)$  and  $(6, -1)$

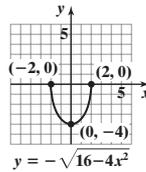

53.  $\frac{(x-1)^2}{16} + \frac{(y+2)^2}{9} = 1$   
foci at  $(1 - \sqrt{7}, -2)$  and  $(1 + \sqrt{7}, -2)$

55.  $\frac{(x+2)^2}{16} + \frac{(y-3)^2}{64} = 1$   
foci at  $(-2, 3 + 4\sqrt{3})$  and  $(-2, 3 - 4\sqrt{3})$

57.  $\{(0, -1), (0, 1)\}$     59.  $\{(0, 3)\}$     61.  $\{(0, -2), (1, 0)\}$     63.

65. Yes    67. a.  $\frac{x^2}{2304} + \frac{y^2}{529} = 1$     b. about 42 feet

79. does not make sense    81. does not make sense    83.  $\frac{x^2}{\frac{36}{5}} + \frac{y^2}{36} = 1$

85. large circle:  $x^2 + y^2 = 25$ ; small circle:  $x^2 + y^2 = 9$     87.  $\frac{x^2}{9} - \frac{y^2}{4} = 1$ ; Terms are separated by subtraction rather than addition.

88. a. -4 and 4    b. The equation  $y^2 = -9$  has no real solutions.    89. a. -3 and 3    b. The equation  $x^2 = -16$  has no real solutions.

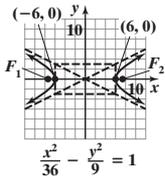

### Section 9.2

#### Check Point Exercises

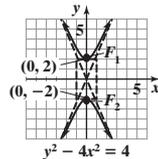

1. a. vertices at  $(5, 0)$  and  $(-5, 0)$ ; foci at  $(\sqrt{41}, 0)$  and  $(-\sqrt{41}, 0)$     b. vertices at  $(0, 5)$  and  $(0, -5)$ ; foci at  $(0, \sqrt{41})$  and  $(0, -\sqrt{41})$

2.  $\frac{y^2}{9} - \frac{x^2}{16} = 1$

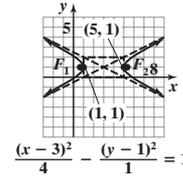

3. foci at  $(-3\sqrt{5}, 0)$  and  $(3\sqrt{5}, 0)$   
asymptotes:  $y = \pm \frac{1}{2}x$

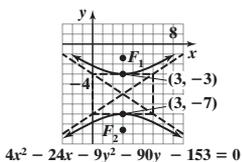

4. foci at  $(0, \sqrt{5})$  and  $(0, -\sqrt{5})$   
asymptotes:  $y = \pm 2x$

5. foci at  $(3 - \sqrt{5}, 1)$  and  $(3 + \sqrt{5}, 1)$   
asymptotes:  $(y - 1) = \pm \frac{1}{2}(x - 3)$

6. foci at  $(3, -5 + \sqrt{13})$  and  $(3, -5 - \sqrt{13})$   
asymptotes:  $(y + 5) = \pm \frac{2}{3}(x - 3)$

7.  $\frac{x^2}{2,722,500} - \frac{y^2}{25,155,900} = 1$

**Concept and Vocabulary Check**

1. hyperbola; foci; vertices; transverse    2.  $(-5, 0); (5, 0); (-\sqrt{34}, 0); (\sqrt{34}, 0)$     3.  $(0, -5); (0, 5); (0, -\sqrt{34}); (0, \sqrt{34})$   
 4. asymptotes; center    5. dividing; 36    6.  $y = -\frac{3}{2}x; y = \frac{3}{2}x$     7.  $y = -2x; y = 2x$     8.  $(-3, 3); (7, 3)$     9.  $(7, -2)$     10. 16; 1; 128

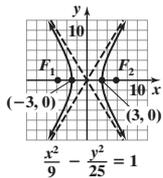

**Exercise Set 9.2**

1. vertices at  $(2, 0)$  and  $(-2, 0)$ ; foci at  $(\sqrt{5}, 0)$  and  $(-\sqrt{5}, 0)$ ; graph (b)    3. vertices at  $(0, 2)$  and  $(0, -2)$ ; foci at  $(0, \sqrt{5})$  and  $(0, -\sqrt{5})$ ; graph (a)

5.  $y^2 - \frac{x^2}{8} = 1$     7.  $\frac{x^2}{9} - \frac{y^2}{7} = 1$     9.  $\frac{y^2}{36} - \frac{x^2}{9} = 1$     11.  $\frac{(x-4)^2}{4} - \frac{(y+2)^2}{5} = 1$

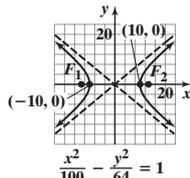

13. foci:  $(\pm\sqrt{34}, 0)$

asymptotes:  $y = \pm\frac{5}{3}x$

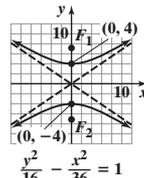

15. foci:  $(\pm 2\sqrt{41}, 0)$

asymptotes:  $y = \pm\frac{4}{5}x$

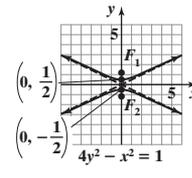

17. foci:  $(0, \pm 2\sqrt{13})$

asymptotes:  $y = \pm\frac{2}{3}x$

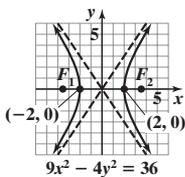

19. foci:  $(0, \pm\frac{\sqrt{5}}{2})$

asymptotes:  $y = \pm\frac{1}{2}x$

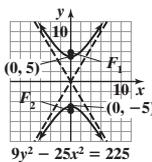

21. foci:  $(\pm\sqrt{13}, 0)$

asymptotes:  $y = \pm\frac{3}{2}x$

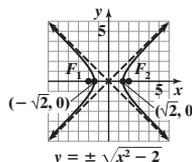

23. foci:  $(0, \pm\sqrt{34})$

asymptotes:  $y = \pm\frac{5}{3}x$

25. foci:  $(\pm 2, 0)$

asymptotes:  $y = \pm x$

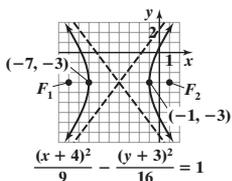

27.  $\frac{x^2}{9} - \frac{y^2}{25} = 1$

29.  $\frac{y^2}{4} - \frac{x^2}{9} = 1$

31.  $\frac{(x-2)^2}{4} - \frac{(y+3)^2}{9} = 1$

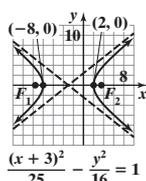

33. foci:  $(-9, -3), (1, -3)$

asymptotes:  $(y+3) = \pm\frac{4}{3}(x+4)$

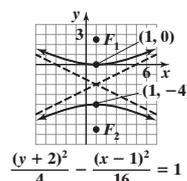

35. foci:  $(-3 \pm \sqrt{41}, 0)$

asymptotes:  $y = \pm\frac{4}{5}(x+3)$

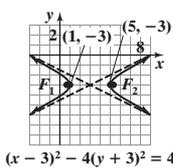

37. foci:  $(1, -2 \pm 2\sqrt{5})$

asymptotes:  $(y+2) = \pm\frac{1}{2}(x-1)$

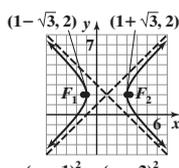

39. foci:  $(3 \pm \sqrt{5}, -3)$

asymptotes:  $(y+3) = \pm\frac{1}{2}(x-3)$

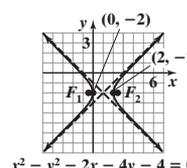

41. foci:  $(1 \pm \sqrt{6}, 2)$

asymptotes:  $(y-2) = \pm(x-1)$

43.  $(x-1)^2 - (y+2)^2 = 1$

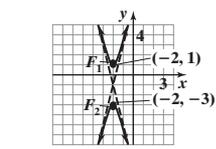

foci:  $(1 \pm \sqrt{2}, -2)$   
asymptotes:  $(y+2) = \pm(x-1)$

45.  $\frac{(y+1)^2}{4} - \frac{(x+2)^2}{0.25} = 1$

foci:  $(-2, -1 \pm \sqrt{4.25})$

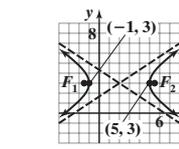

asymptotes:  $(y+1) = \pm 4(x+2)$

47.  $\frac{(x-2)^2}{9} - \frac{(y-3)^2}{4} = 1$

foci:  $(2 \pm \sqrt{13}, 3)$

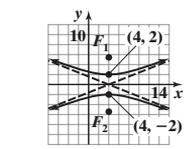

asymptotes:  $(y-3) = \pm\frac{2}{3}(x-2)$

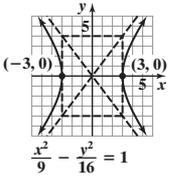

49.  $\frac{y^2}{4} - \frac{(x-4)^2}{25} = 1$

foci:  $(4, \pm\sqrt{29})$

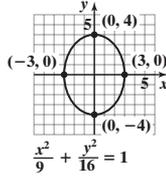

asymptotes:  $y = \pm\frac{2}{5}(x-4)$

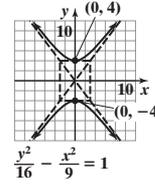

51. domain:  $(-\infty, -3] \cup [3, \infty)$   
range:  $(-\infty, \infty)$

53. domain:  $[-3, 3]$   
range:  $[-4, 4]$

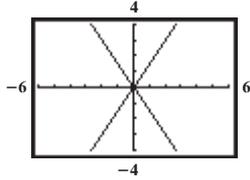

55. domain:  $(-\infty, \infty)$   
range:  $(-\infty, -4] \cup [4, \infty)$

57.  $\{(-2, 0), (2, 0)\}$     59.  $\{(0, -3), (0, 3)\}$

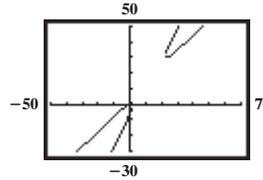

61. If  $M_1$  is located 2640 feet to the right of the origin on the  $x$ -axis, the explosion is located on the right branch of the hyperbola given by the equation  $\frac{x^2}{1,210,000} - \frac{y^2}{5,759,600} = 1$ .    63. 40 yd    65. a. ellipse    b.  $x^2 + 4y^2 = 4$

77. ; no; two intersecting lines

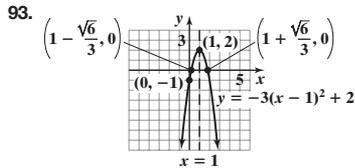

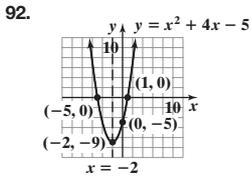

79.  $2y^2 + (10 - 6x)y + (4x^2 - 3x - 6) = 0$

$$y = \frac{3x - 5 \pm \sqrt{x^2 - 24x + 37}}{2}$$

The  $xy$ -term rotates the hyperbola.

81. does not make sense    83. makes sense    85. false    87. true    89.  $\frac{c}{a}$  will be large when  $a$  is small. When this happens, the asymptotes will be nearly vertical.    91. Any hyperbola where  $a = b$ , such as  $\frac{x^2}{4} - \frac{y^2}{4} = 1$ , has perpendicular asymptotes.

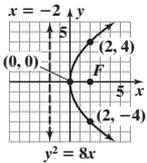

94.  $(y + 1)^2 = -12x + 24$

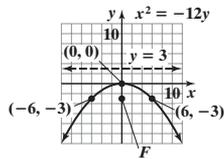

### Section 9.3

#### Check Point Exercises

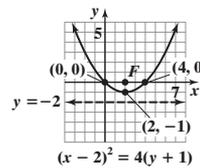

1. focus:  $(2, 0)$   
directrix:  $x = -2$

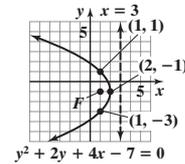

2. focus:  $(0, -3)$   
directrix:  $y = 3$

3.  $y^2 = 32x$   
4. vertex:  $(2, -1)$ ; focus:  $(2, 0)$   
directrix:  $y = -2$

5. vertex:  $(2, -1)$ ; focus:  $(1, -1)$   
directrix:  $x = 3$

6.  $x^2 = \frac{9}{4}y$ ; The light should be placed at  $(0, \frac{9}{16})$ , or  $\frac{9}{16}$  inch above the vertex.

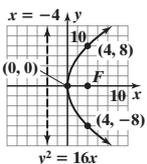

#### Concept and Vocabulary Check

1. parabola; directrix; focus    2. a    3.  $(-7, 0)$     4.  $x = 7$     5. 28;  $(-7, -14)$ ;  $(-7, 14)$     6. d    7.  $(-2, 0)$     8.  $y = -2$     9. 4;  $(-4, 0)$ ;  $(0, 0)$

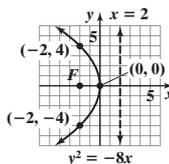

#### Exercise Set 9.3

1. focus:  $(1, 0)$ ; directrix:  $x = -1$ ; graph (c)    3. focus:  $(0, -1)$ , directrix:  $y = 1$ ; graph (b)

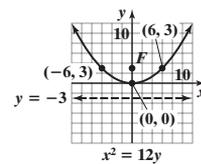

5. focus:  $(4, 0)$ ; directrix:  $x = -4$

7. focus:  $(-2, 0)$ ; directrix:  $x = 2$

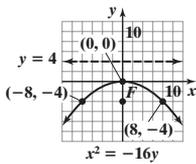

9. focus:  $(0, 3)$ ; directrix:  $y = -3$

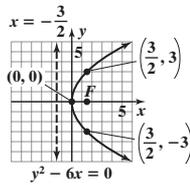

**AA88** Answers to Selected Exercises

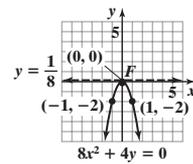

11. focus:  $(0, -4)$ ; directrix:  $y = 4$

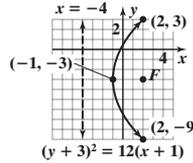

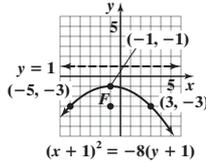

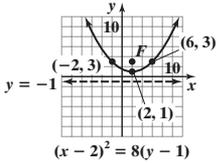

13. focus:  $(\frac{3}{2}, 0)$ ; directrix:  $x = -\frac{3}{2}$

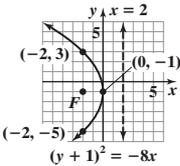

15. focus:  $(0, -\frac{1}{8})$ ; directrix:  $y = \frac{1}{8}$

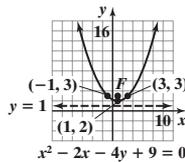

17.  $y^2 = 28x$     19.  $y^2 = -20x$     21.  $x^2 = 60y$     23.  $x^2 = -100y$     25.  $(x - 2)^2 = -8(y + 3)$     27.  $(y - 2)^2 = 8(x - 1)$   
 29.  $(x + 3)^2 = 4(y - 3)$     31. vertex:  $(1, 1)$ ; focus:  $(2, 1)$ ; directrix:  $x = 0$ ; graph (c)    33. vertex:  $(-1, -1)$ ; focus:  $(-1, -2)$ ; directrix:  $y = 0$ ; graph (d)  
 35. vertex:  $(2, 1)$ ; focus:  $(2, 3)$     37. vertex:  $(-1, -1)$ ; focus:  $(-1, -3)$     39. vertex:  $(-1, -3)$ ; focus:  $(2, -3)$   
 directrix:  $y = -1$     directrix:  $y = 1$     directrix:  $x = -4$

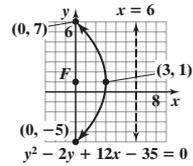

41. vertex:  $(0, -1)$ ; focus:  $(-2, -1)$   
 directrix:  $x = 2$

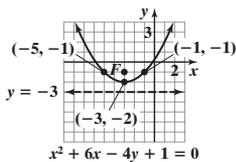

43.  $(x - 1)^2 = 4(y - 2)$ ; vertex:  $(1, 2)$   
 focus:  $(1, 3)$ ; directrix:  $y = 1$

45.  $(y - 1)^2 = -12(x - 3)$   
 vertex:  $(3, 1)$ ; focus:  $(0, 1)$   
 directrix:  $x = 6$

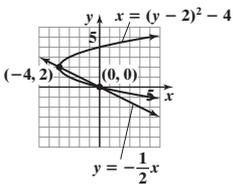

47.  $(x + 3)^2 = 4(y + 2)$   
 vertex:  $(-3, -2)$ ; focus:  $(-3, -1)$   
 directrix:  $y = -3$

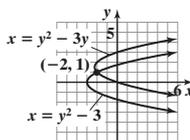

49. domain:  $[-4, \infty)$   
 range:  $(-\infty, \infty)$ ; not a function  
 51. domain:  $(-\infty, \infty)$   
 range:  $(-\infty, 1]$ ; function  
 53. domain:  $(-\infty, 3]$   
 range:  $(-\infty, \infty)$ ; not a function

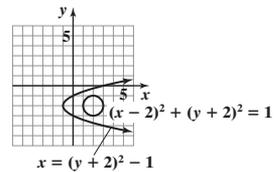

55.  $\{(-4, 2), (0, 0)\}$

57.  $\{(-2, 1)\}$

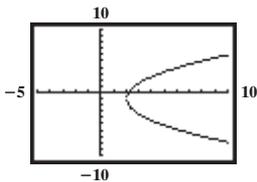

59.  $\emptyset$

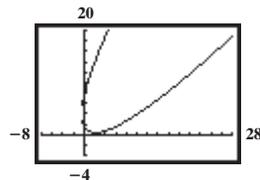

61. 1 inch above the vertex    63. 4.5 feet from the base of the dish    65. 76 m    67. yes

77.  $y = -1 \pm \sqrt{6x - 12}$

79.  $9y^2 + (-24x - 80)y + 16x^2 - 60x + 100 = 0$

$$y = \frac{12x + 40 \pm 10\sqrt{15x + 7}}{9}$$

81. does not make sense

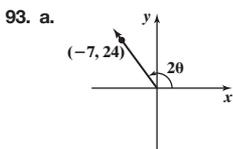

83. makes sense

85. false

87. false

89. focus:  $(0, -\frac{E}{4A})$ ; directrix:  $y = \frac{E}{4A}$

92.  $(x')^2 + (y')^2 = 2$

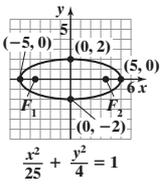

b.  $-\frac{7}{25}$     c.  $\sin \theta = \frac{4}{5} = 0.8$ ;  $\cos \theta = \frac{3}{5} = 0.6$

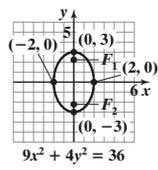

d. Since  $90^\circ < 2\theta < 180^\circ$ , we have  $45^\circ < \theta < 90^\circ$ . Both  $\cos \theta$  and  $\sin \theta$  are positive when  $45^\circ < \theta < 90^\circ$ .    94. 0

**Mid-Chapter 9 Check Point**

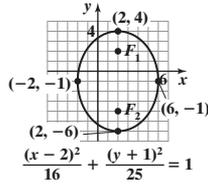

1. foci:  $(\pm\sqrt{21}, 0)$

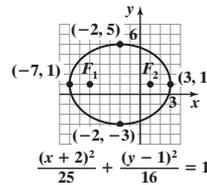

2. foci:  $(0, \pm\sqrt{5})$

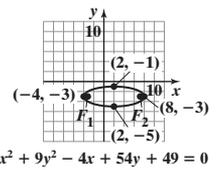

3. foci:  $(2, 2), (2, -4)$

4. foci:  $(-5, 1), (1, 1)$

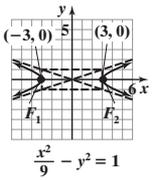

5. foci:  $(2 \pm 4\sqrt{2}, -3)$

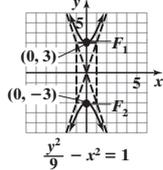

6. foci:  $(\pm\sqrt{10}, 0)$

asymptotes:  $y = \pm\frac{1}{3}x$

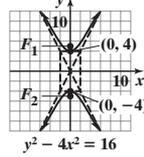

7. foci:  $(0, \pm\sqrt{10})$

asymptotes:  $y = \pm 3x$

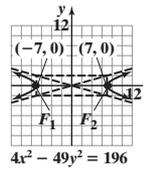

8. foci:  $(0, \pm 2\sqrt{5})$

asymptotes:  $y = \pm 2x$

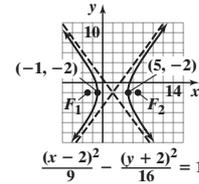

9. foci:  $(\pm\sqrt{53}, 0)$

asymptotes:  $y = \pm\frac{2}{7}x$

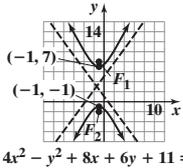

10. foci:  $(-3, -2), (7, -2)$

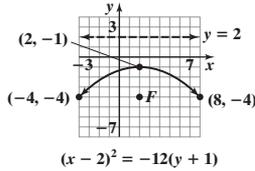

asymptotes:  $(y + 2) = \pm\frac{4}{3}(x - 2)$

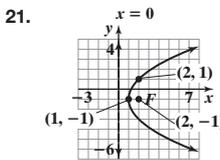

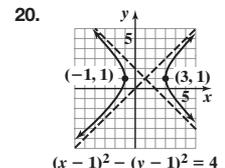

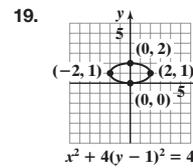

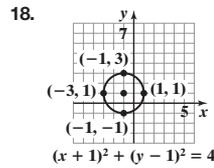

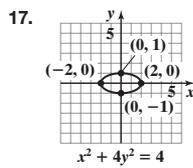

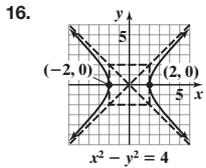

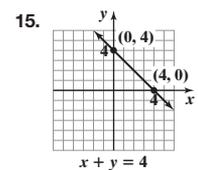

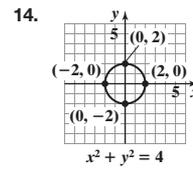

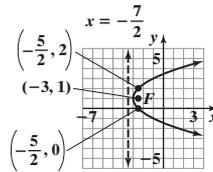

11. foci:  $(-1, 3 \pm 2\sqrt{5})$   
asymptotes:  
 $(y - 3) = \pm 2(x + 1)$

12. focus:  $(2, -4)$ ;  
directrix:  $y = 2$ ;

13. focus:  $(-\frac{5}{2}, 1)$ ;  
directrix:  $x = -\frac{7}{2}$ ;

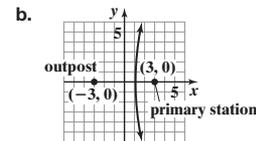

22.  $\frac{x^2}{25} + \frac{y^2}{9} = 1$     23.  $\frac{(x-1)^2}{81} + \frac{(y-2)^2}{56} = 1$

24.  $\frac{y^2}{4} - \frac{x^2}{5} = 1$     25.  $\frac{(x+1)^2}{4} - \frac{(y-5)^2}{5} = 1$

26.  $(x - 4)^2 = 12(y - 2)$     27.  $(y - 6)^2 = -20(x - 3)$     28. no    29.  $20\sqrt{3}$  cm

30. a.  $\frac{x^2}{1.1025} - \frac{y^2}{7.8975} = 1$

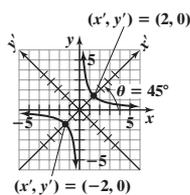

31. 1.4 m

**Section 9.4**

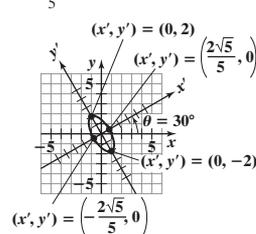

**Check Point Exercises**

1. a. ellipse    b. circle    c. parabola    d. hyperbola

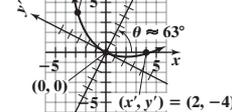

2.  $\frac{x'^2}{4} - \frac{y'^2}{4} = 1$

3.  $\frac{x'^2}{\frac{4}{5}} + \frac{y'^2}{4} = 1$

4.  $(x', y') = (2, 4)$

5. parabola

Concept and Vocabulary Check

1. circle; parabola; ellipse; hyperbola    2.  $\cot 2\theta = \frac{A - C}{B}$     3. parabola; ellipse; circle; hyperbola

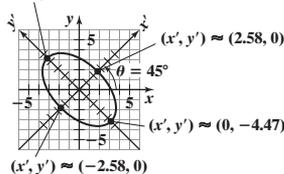

Exercise Set 9.4

1. parabola    3. hyperbola    5. circle    7. hyperbola    9.  $\frac{y'^2}{2} - \frac{x'^2}{2} = 1$     11.  $\frac{y'^2}{1} - \frac{x'^2}{3} = 1$     13.  $\frac{x'^2}{4} - \frac{y'^2}{9} = 1$   
 15.  $x = \frac{\sqrt{2}}{2}(x' - y')$ ;  $y = \frac{\sqrt{2}}{2}(x' + y')$     17.  $x = \frac{\sqrt{2}}{2}(x' - y')$ ;  $y = \frac{\sqrt{2}}{2}(x' + y')$     19.  $x = \frac{\sqrt{3}x' - y'}{2}$ ;  $y = \frac{x' + \sqrt{3}y'}{2}$   
 21.  $x = \frac{3x' - 4y'}{5}$ ;  $y = \frac{4x' + 3y'}{5}$     23.  $x = \sqrt{5}\left(\frac{2x' - y'}{5}\right)$ ;  $y = \sqrt{5}\left(\frac{x' + 2y'}{5}\right)$     25.  $x = \frac{4x' - 3y'}{5}$ ;  $y = \frac{3x' + 4y'}{5}$

27. a.  $3x'^2 + y'^2 = 20$

b.  $\frac{x'^2}{\frac{20}{3}} + \frac{y'^2}{20} = 1$

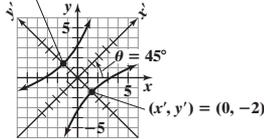

c.  $(x', y') \approx (0, 4.47)$

29. a.  $-4x'^2 + 16y'^2 = 64$

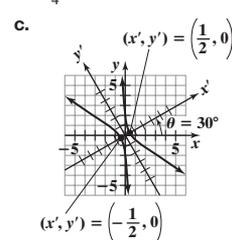

b.  $\frac{y'^2}{4} - \frac{x'^2}{16} = 1$

c.  $(x', y') = (0, 2)$

31. a.  $64x'^2 - 16y'^2 = 16$

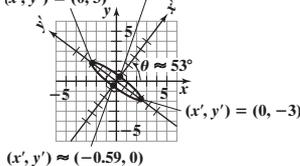

b.  $\frac{x'^2}{\frac{1}{4}} - \frac{y'^2}{1} = 1$

33. a.  $650x'^2 + 25y'^2 = 225$

b.  $\frac{x'^2}{\frac{9}{26}} + \frac{y'^2}{9} = 1$

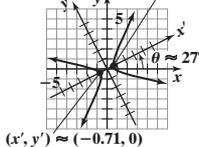

c.  $(x', y') = (0, 3)$      $(x', y') \approx (0.59, 0)$

35. a.  $50x'^2 - 75y'^2 = 25$

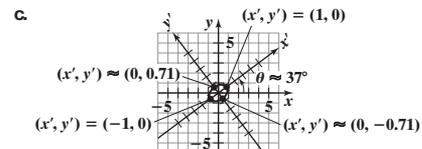

b.  $\frac{x'^2}{\frac{1}{2}} - \frac{y'^2}{\frac{1}{3}} = 1$

c.  $(x', y') \approx (0.71, 0)$

37. a.  $625x'^2 + 1250y'^2 = 625$

b.  $\frac{x'^2}{1} + \frac{y'^2}{\frac{1}{2}} = 1$

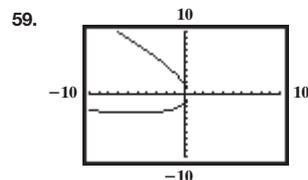

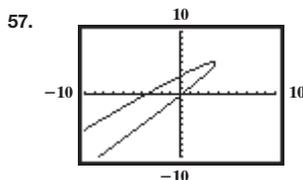

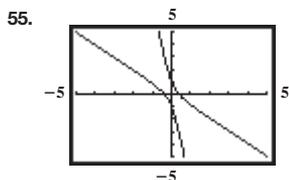

39. ellipse or circle

41. parabola

43. hyperbola

45. ellipse;  $(0, 1)$ ,  $(0, -1)$

47. parabola;  $(3, -1)$

61. does not make sense

63. makes sense

65. There are no solutions to this equation just as there is no such sound.

67.  $A' = A \cos^2 \theta + B \sin \theta \cos \theta + C \sin^2 \theta$

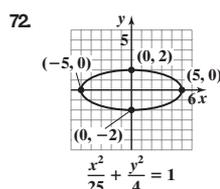

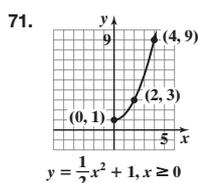

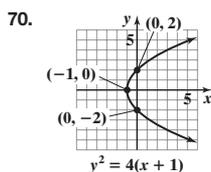

$C' = A \sin^2 \theta - B \sin \theta \cos \theta + C \cos^2 \theta$

$A' + C' = A \cos^2 \theta + B \sin \theta \cos \theta + C \sin^2 \theta + A \sin^2 \theta - B \sin \theta \cos \theta + C \cos^2 \theta$

$= A(\cos^2 \theta + \sin^2 \theta) + B(\sin \theta \cos \theta - \sin \theta \cos \theta) + C(\sin^2 \theta + \cos^2 \theta)$

$= A(1) + B(0) + C(1)$

$= A + C$

Section 9.5

Check Point Exercises

1. 2. 3. 4.  $x = t$  and  $y = t^2 - 25$

Concept and Vocabulary Check

1. parametric; parameter; plane curve    2.  $t$ ;  $x$ ;  $y$     3.  $\sin t$ ;  $\cos t$ ;  $\sin^2 t + \cos^2 t = 1$     4. true

Exercise Set 9.5

1.  $(-2, 6)$     3.  $(5, -3)$     5.  $(4, 8)$     7.  $(60\sqrt{3}, 1)$

9. 11. 13. 15.

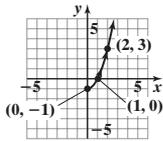

- 17.

- 19.

21.  $y = 2x$

23.  $y = (x + 4)^2$

25.  $y = x^2 - 1, x \geq 0$

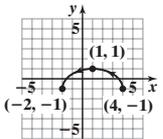

27.  $\frac{x^2}{4} + \frac{y^2}{4} = 1$

29.  $\frac{(x-1)^2}{9} + \frac{(y-2)^2}{9} = 1$

31.  $\frac{x^2}{4} + \frac{y^2}{9} = 1$

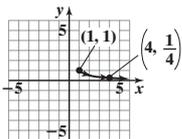

33.  $\frac{(x-1)^2}{9} + \frac{(y+1)^2}{4} = 1, -2 \leq x \leq 4, -1 \leq y \leq 1$

35.  $x^2 - y^2 = 1$

37.  $y = x - 4, x \geq 2, y \geq -2$

39.  $y = \frac{1}{x}, x \geq 1, y \geq 0$

41.  $(x-h)^2 + (y-k)^2 = r^2$     43.  $\frac{(x-h)^2}{a^2} - \frac{(y-k)^2}{b^2} = 1$     45.  $x = 3 + 6 \cos t; y = 5 + 6 \sin t$

47.  $x = -2 + 5 \cos t; y = 3 + 2 \sin t$     49.  $x = 4 \sec t; y = 2\sqrt{5} \tan t$     51.  $x = -2 + 3t; y = 4 + 3t$

53. Answers may vary. Sample answer:  $x = t$  and  $y = 4t - 3$ ;  $x = t + 1$  and  $y = 4t + 1$

55. Answers may vary. Sample answer:  $x = t$  and  $y = t^2 + 4$ ;  $x = t + 1$  and  $y = t^2 + 2t + 5$

57. a.

- b.

- c.

- d.

- 59.

domain:  $[-2, 6]$   
range:  $[-5, 3]$

- 61.

domain:  $[\frac{3}{4}, \infty)$   
range:  $(-\infty, \infty)$

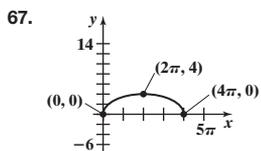

- 63.

a. increasing:  $(-\infty, \infty)$   
b. no maximum or minimum

- 65.

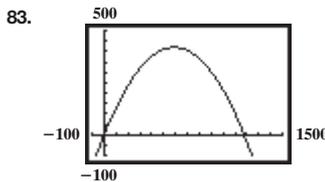

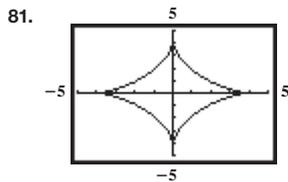

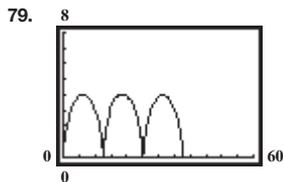

a. decreasing:  $(-\infty, 1)$ ; increasing:  $(1, \infty)$   
b. minimum of  $-5$  at  $x = 1$

# AA92 Answers to Selected Exercises

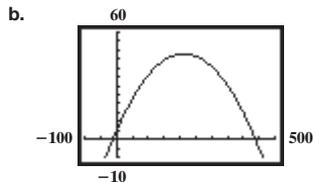

- a. increasing:  $(0, 2\pi)$ ; decreasing:  $(2\pi, 4\pi)$   
 b. maximum of 4 at  $x = 2\pi$   
 minimum of 0 at  $x = 0$  and  $x = 4\pi$

69. a.  $x = (180 \cos 40^\circ)t$ ;  $y = 3 + (180 \sin 40^\circ)t - 16t^2$   
 b. After 1 second: 137.9 feet in distance, 102.7 feet in height;  
 After 2 seconds: 275.8 feet in distance, 170.4 feet in height;  
 After 3 seconds: 413.7 feet in distance, 206.1 feet in height  
 c.  $t = 7.3$  sec; total horizontal distance: 1006.6 ft; yes

Window:  $[-100, 1500] \times [-100, 500]$ ;  
 The maximum height is 419.4 feet at a time of 5.1 seconds.  
 The range of the projectile is 1174.6 feet horizontally.  
 It hits the ground at 10.2 seconds.

85. a.  $x = (140 \cos 22^\circ)t$ ;  $y = 5 + (140 \sin 22^\circ)t - 16t^2$

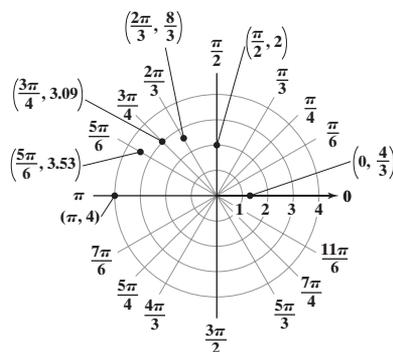

Window:  $[-100, 500] \times [-10, 60]$

- c. The maximum height is 48.0 feet. It occurs at 1.6 seconds.  
 d. 3.4 sec  
 e. 437.5 ft

87. makes sense  
 89. makes sense  
 91.  $x = 3 \sin t$ ;  $y = 3 \cos t$   
 93.  $r = \frac{2}{1 + \frac{1}{2} \cos \theta}$

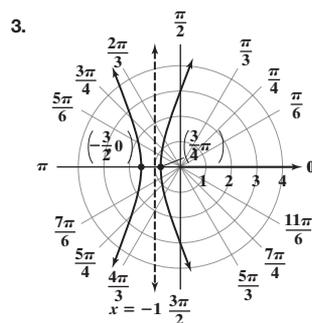

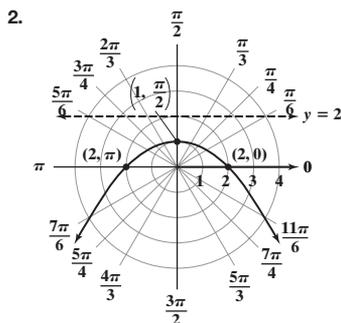

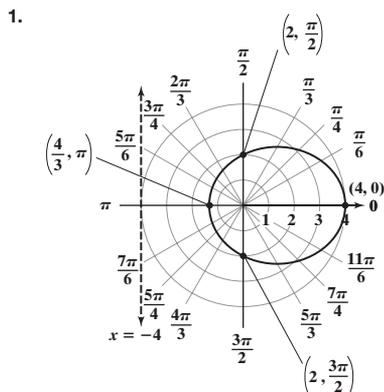

94.  $\frac{4}{3} \approx 1.33$ ;  $2; \frac{8}{3} \approx 2.67$ ; 3.09; 3.53; 4;

95. a.  $r = \frac{1}{3 - 3 \cos \theta}$       b.  $9y^2 = 1 + 6x$ ; parabola  
 $r(3 - 3 \cos \theta) = 1$   
 $3r - 3r \cos \theta = 1$   
 $3r = 1 + 3r \cos \theta$   
 $(3r)^2 = (1 + 3r \cos \theta)^2$   
 $9r^2 = (1 + 3r \cos \theta)^2$

## Section 9.6

### Check Point Exercises

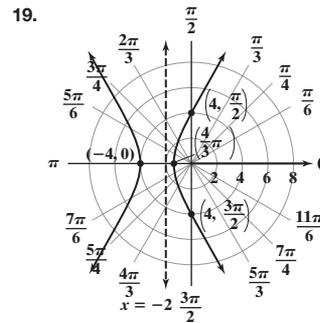

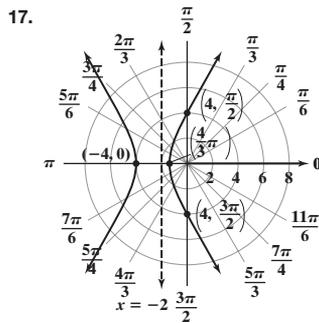

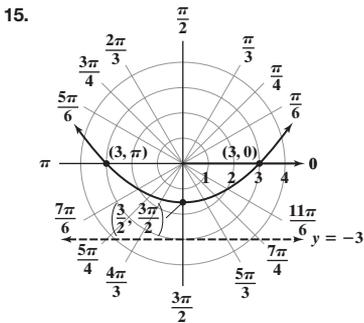

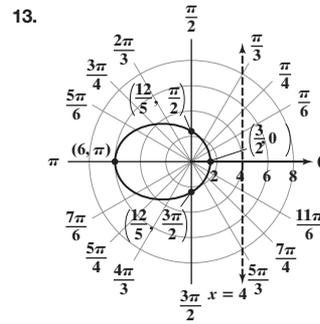

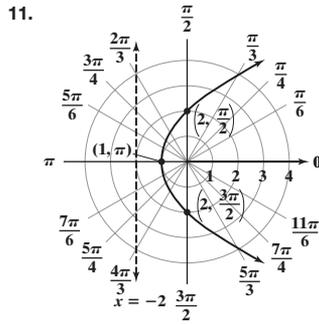

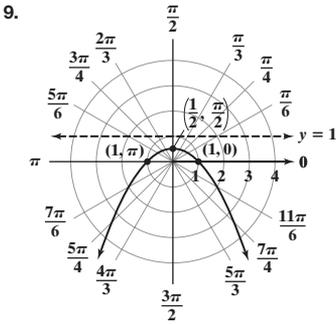

**Concept and Vocabulary Check**

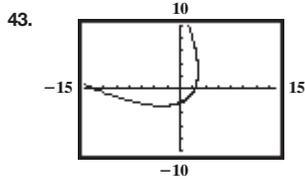

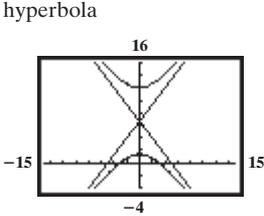

1. focus; directrix; eccentricity; parabola; ellipse    2. pole; eccentricity    3. 3; hyperbola; 1; perpendicular; 1; right  
 4. 1; parabola; 2; parallel; 2; below    5. 1; dividing the numerator and denominator by 4

**Exercise Set 9.6**

1. a. parabola    b. The directrix is 3 units above the pole, at  $y = 3$ .    3. a. ellipse    b. The directrix is 3 units to the left of the pole, at  $x = -3$ .  
 5. a. parabola    b. The directrix is 4 units above the pole, at  $y = 4$ .    7. a. hyperbola    b. The directrix is 3 units to the left of the pole, at  $x = -3$ .

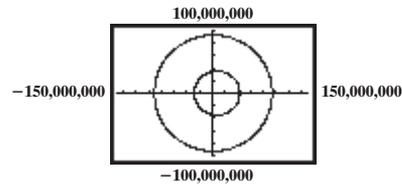

21.  $[-3, 15, 1]$  by  $[-7, 7, 1]$     23.  $[-4, 2, 1]$  by  $[-10, 10, 1]$     25.  $[-2, 5, 1]$  by  $[-10, 10, 1]$     27.  $[-4, 4, 1]$  by  $[-10, 0.4, 1]$   
 29. 0.54 astronomical units or 51 million miles    31. 4122 miles from the center of the Earth; 162 miles from the surface of the Earth  
 41. hyperbola

The graph appears to be rotated counterclockwise through an angle of  $\frac{\pi}{4}$  radians.

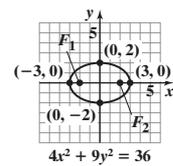

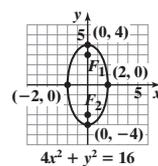

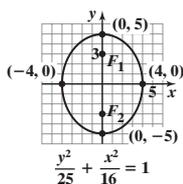

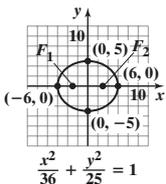

45. Mercury:  $r = \frac{(1 - 0.2056^2)(36.0 \times 10^6)}{1 - 0.2056 \cos \theta}$   
 Earth:  $r = \frac{(1 - 0.0167^2)(92.96 \times 10^6)}{1 - 0.0167 \cos \theta}$

47. does not make sense    49. does not make sense    51.  $r = \frac{2}{1 - \frac{1}{2} \cos \theta}$  or  $r = \frac{6}{1 + \frac{1}{2} \cos \theta}$     53. parabola; using the relationships between rectangular and polar coordinates,  $x^2 + y^2 = r^2$  and  $x = r \cos \theta$ :  $y^2 = x + \frac{1}{4}$     55.  $-\frac{1}{2}, \frac{1}{8}, -\frac{1}{26}, \frac{1}{80}$     56. 120    57. 2; 5; 10; 17; 26; 37; Sum is 97.

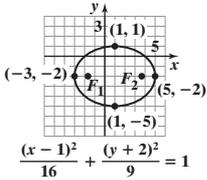

**Chapter 9 Review Exercises**

1. foci:  $(\pm \sqrt{11}, 0)$     2. foci:  $(0, \pm 3)$     3. foci:  $(0, \pm 2\sqrt{3})$     4. foci:  $(\pm \sqrt{5}, 0)$

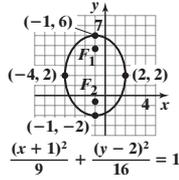

**AA94** Answers to Selected Exercises

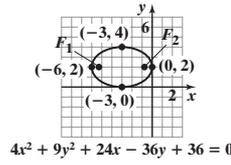

5. foci:  $(1 \pm \sqrt{7}, -2)$

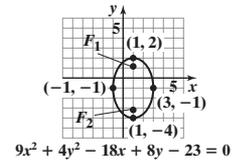

6. foci:  $(-1, 2 \pm \sqrt{7})$

7. foci:  $(-3 \pm \sqrt{5}, 2)$

8. foci:  $(1, -1 \pm \sqrt{5})$

9.  $\frac{x^2}{25} + \frac{y^2}{9} = 1$

10.  $\frac{x^2}{27} + \frac{y^2}{36} = 1$

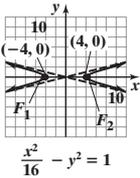

11.  $\frac{(x+3)^2}{36} + \frac{(y-5)^2}{4} = 1$

12.  $\frac{x^2}{100} + \frac{y^2}{36} = 1$

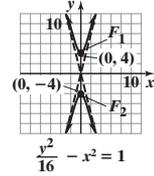

13. yes

14. The hit ball will collide with the other ball.

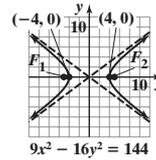

15. foci:  $(\pm \sqrt{17}, 0)$ ;  $y = \pm \frac{1}{4}x$

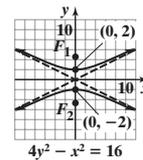

16. foci:  $(0, \pm \sqrt{17})$ ;  $y = \pm 4x$

17. foci:  $(\pm 5, 0)$ ;  $y = \pm \frac{3}{4}x$

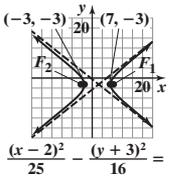

18. foci:  $(0, \pm 2\sqrt{5})$ ;  $y = \pm \frac{1}{2}x$

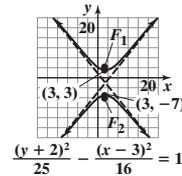

19. foci:  $(2 \pm \sqrt{41}, -3)$

$y + 3 = \pm \frac{4}{5}(x - 2)$

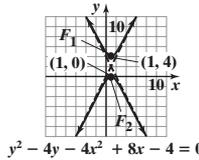

20. foci:  $(3, -2 \pm \sqrt{41})$

$y + 2 = \pm \frac{5}{4}(x - 3)$

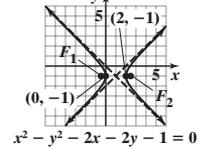

21. foci:  $(1, 2 \pm \sqrt{5})$

$y - 2 = \pm 2(x - 1)$

22. foci:  $(1 \pm \sqrt{2}, -1)$

$y + 1 = \pm (x - 1)$

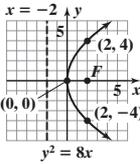

23.  $\frac{y^2}{4} - \frac{x^2}{12} = 1$

24.  $\frac{x^2}{9} - \frac{y^2}{55} = 1$

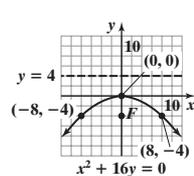

25.  $c$  must be greater than  $a$ .

26.  $\frac{x^2}{2162.25} - \frac{y^2}{7837.75} = 1$

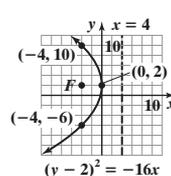

27. vertex:  $(0, 0)$ ; focus:  $(2, 0)$   
directrix:  $x = -2$

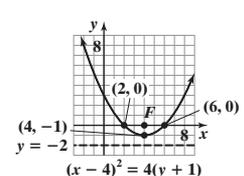

28. vertex:  $(0, 0)$ ; focus:  $(0, -4)$   
directrix:  $y = 4$

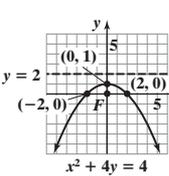

29. vertex:  $(0, 2)$ ; focus:  $(-4, 2)$   
directrix:  $x = 4$

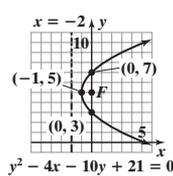

30. vertex:  $(4, -1)$ ; focus:  $(4, 0)$   
directrix:  $y = -2$

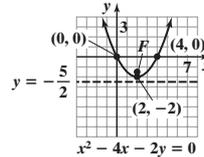

31. vertex:  $(0, 1)$ ; focus:  $(0, 0)$   
directrix:  $y = 2$

32. vertex:  $(-1, 5)$ ; focus:  $(0, 5)$   
directrix:  $x = -2$

33. vertex:  $(2, -2)$ ; focus:  $(2, -\frac{3}{2})$ ; directrix:  $y = -\frac{5}{2}$

34.  $y^2 = 48x$

35.  $x^2 = -44y$

36.  $x^2 = 12y$ ; Place the light 3 inches from the vertex at  $(0, 3)$ .

37. approximately 58 ft

38. approximately 128 ft

39. parabola

40. ellipse

41. ellipse

42. hyperbola

43. ellipse or circle

44. ellipse or circle

45. parabola

46. ellipse or circle

47. a.  $x'^2 - y'^2 = 8$

48. a.  $3x'^2 + y'^2 = 2$

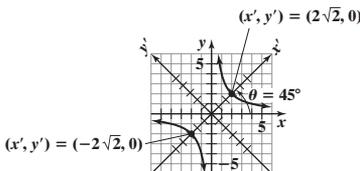

49. a.  $18x'^2 - 2y'^2 = 18$

b.  $\frac{x'^2}{8} - \frac{y'^2}{8} = 1$

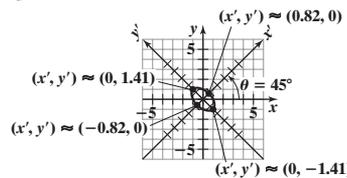

b.  $\frac{x'^2}{\frac{2}{3}} + \frac{y'^2}{2} = 1$

b.  $\frac{x'^2}{1} - \frac{y'^2}{9} = 1$

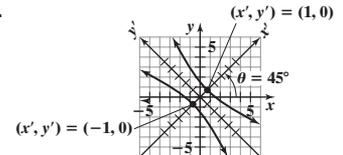

c.

c.

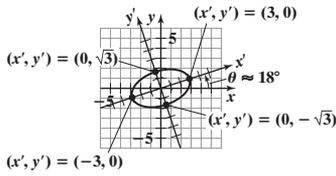

c.

50. a.  $50x'^2 + 150y'^2 = 450$

b.  $\frac{x'^2}{9} + \frac{y'^2}{3} = 1$

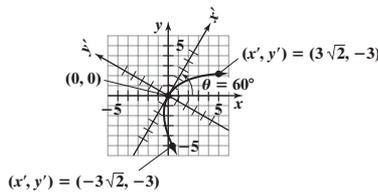

c.

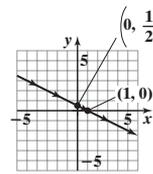

51. a.  $16x'^2 + 96y' = 0$

b.  $x'^2 = -6y'$

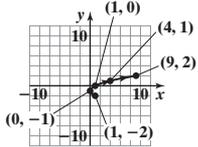

c.

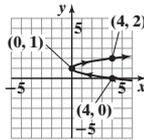

52.  $y = -\frac{1}{2}x + \frac{1}{2}$

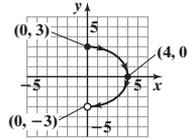

53.  $(y + 1)^2 = x, 0 \leq x \leq 9, -2 \leq y \leq 2$

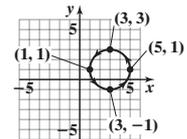

54.  $(y - 1)^2 = \frac{1}{4}x$

55.  $\frac{x^2}{16} + \frac{y^2}{9} = 1, 0 \leq x \leq 4, -3 < y \leq 3$

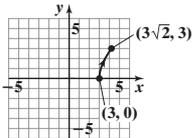

56.  $\frac{(x - 3)^2}{4} + \frac{(y - 1)^2}{4} = 1$   
or  $(x - 3)^2 + (y - 1)^2 = 4$

57.  $\frac{x^2}{9} - \frac{y^2}{9} = 1,$

$3 \leq x \leq 3\sqrt{2}, 0 \leq y \leq 3$

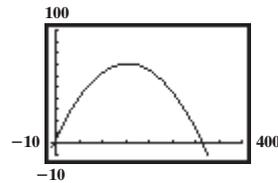

58. Answers may vary. Sample answer:  $x = t$  and  $y = t^2 + 6$ ;  $x = t + 1$  and  $y = t^2 + 2t + 7$

59. a.  $x = (100 \cos 40^\circ)t$ ;  $y = 6 + (100 \sin 40^\circ)t - 16t^2$

b. After 1 second: 76.6 feet in distance, 54.3 feet in height; after 2 seconds: 153.2 feet in distance, 70.6 feet in height; after 3 seconds: 229.8 feet in distance, 54.8 feet in height.

c. 4.1 sec; 314.1 ft

d.

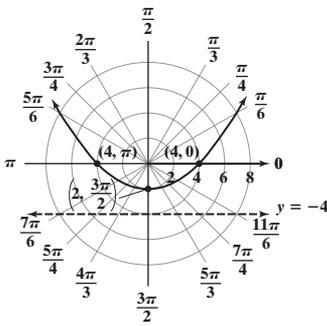

The ball is at its maximum height at 2.0 seconds. The maximum height is 70.6 feet.

60. a.  $r = \frac{4}{1 - \sin \theta}$

b.  $e = 1; p = 4$ ; parabola

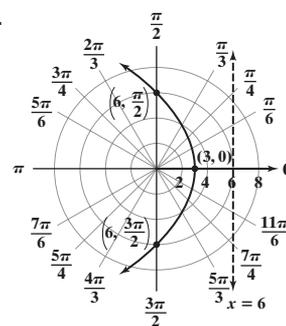

c.

61. a.  $r = \frac{6}{1 + \cos \theta}$

b.  $e = 1; p = 6$ ; parabola

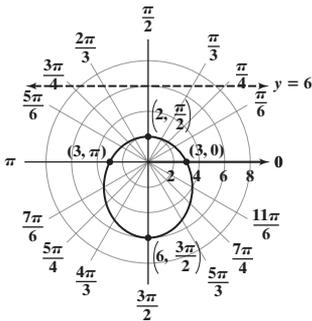

c.

62. a.  $r = \frac{3}{1 + \frac{1}{2} \sin \theta}$

b.  $e = \frac{1}{2}; p = 6$ ; ellipse

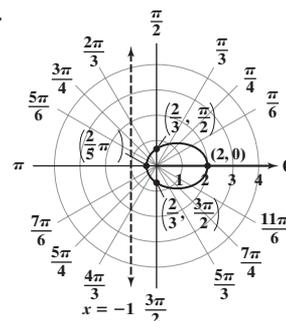

c.

63. a.  $r = \frac{2}{1 - \frac{2}{3} \cos \theta}$

b.  $e = \frac{2}{3}; p = 1$ ; ellipse

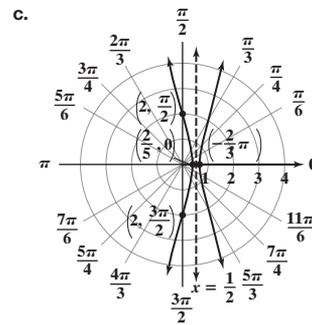

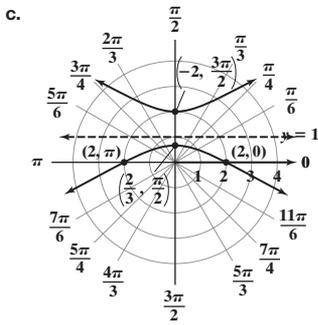

c.

**AA96** Answers to Selected Exercises

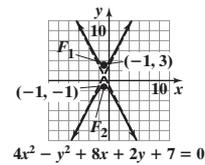

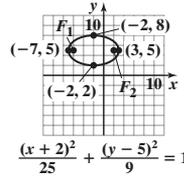

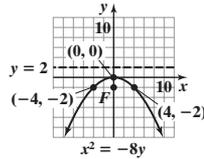

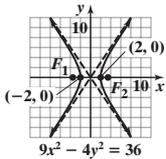

64. a.  $r = \frac{2}{1 + 2 \sin \theta}$     b.  $e = 2; p = 1$ ; hyperbola

65. a.  $r = \frac{2}{1 + 4 \cos \theta}$     b.  $e = 4; p = \frac{1}{2}$ ; hyperbola

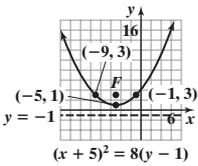

**Chapter 9 Test**

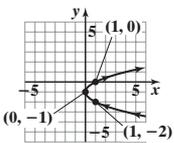

1. foci:  $(\pm \sqrt{13}, 0)$   
asymptotes:  $y = \pm \frac{3}{2}x$
2. vertex:  $(0, 0)$ ; focus:  $(0, -2)$   
directrix:  $y = 2$
3. foci:  $(-6, 5), (2, 5)$
4. foci:  $(-1, 1 \pm \sqrt{5})$   
asymptotes:  $y - 1 = \pm 2(x + 1)$

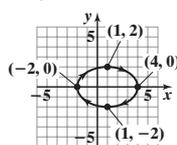

5. vertex:  $(-5, 1)$ ; focus:  $(-5, 3)$   
directrix:  $y = -1$
6.  $\frac{x^2}{100} + \frac{y^2}{51} = 1$     7.  $\frac{y^2}{49} - \frac{x^2}{51} = 1$     8.  $y^2 = 200x$     9. 32 ft
10. a.  $x^2 = 3y$     b. Light is placed  $\frac{3}{4}$  inch above the vertex.    11. ellipse    12. ellipse or circle    13.  $\theta = 30^\circ$

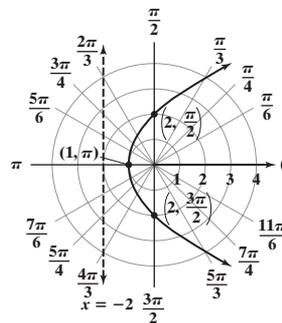

14.  $(y + 1)^2 = x$

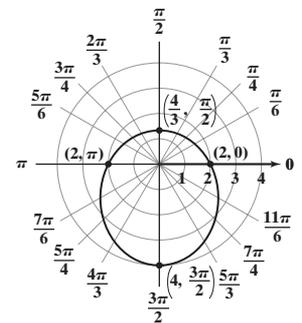

15.  $\frac{(x-1)^2}{9} + \frac{y^2}{4} = 1$

16. parabola

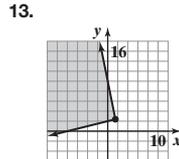

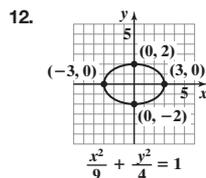

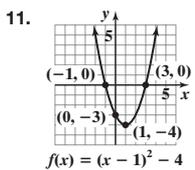

17. ellipse

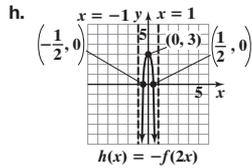

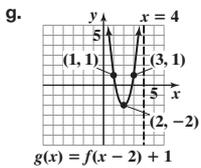

**Cumulative Review Exercises (Chapters P-9)**

1.  $\{2\}$     2.  $\{x | x < 2\}$  or  $(-\infty, 2)$     3.  $\{9\}$     4.  $\{2 + 2\sqrt{5}, 2 - 2\sqrt{5}\}$     5.  $\{x | x \geq 4 \text{ or } x \leq -3\}$  or  $(-\infty, -3] \cup [4, \infty)$     6.  $\left\{\frac{2}{3}, -1 \pm \sqrt{2}\right\}$
7.  $\{3\}$     8.  $\{(2, -1)\}$     9.  $\{(2, -4), (-14, -20)\}$     10.  $\{(7, -4), 6\}$

14. a.  $\pm 1, \pm 3, \pm \frac{1}{2}, \pm \frac{3}{2}, \pm \frac{1}{4}, \pm \frac{3}{4}, \pm \frac{1}{8}, \pm \frac{3}{8}, \pm \frac{1}{16}, \pm \frac{3}{16}, \pm \frac{1}{32}, \pm \frac{3}{32}$   
b.  $\left\{-\frac{1}{8}, \frac{3}{4}, 1\right\}$

15. a. domain:  $(-2, 2)$ ; range:  $[-3, \infty)$     b. minimum of  $-3$  at  $x = 0$     c.  $(0, 2)$     d. 3    e.  $-3$     f.  $x \rightarrow -2^+$ ;  $x \rightarrow 2^-$

16.  $(g \circ f)(x) = x^2 - 2$     17.  $3 \log_5 x + \frac{1}{2} \log_5 y - 3$     18.  $y = -2x - 2$

19. The costs will be the same when the number of miles driven is 175 miles. The cost will be \$67.

20. \$25 for basic cable service and \$10 for each movie channel

21.  $\frac{\csc \theta - \sin \theta}{\sin \theta} = \frac{\csc \theta}{\sin \theta} - \frac{\sin \theta}{\sin \theta} = \frac{1}{\sin \theta} - 1 = \frac{1}{\sin^2 \theta} - 1 = \frac{1 - \sin^2 \theta}{\sin^2 \theta} = \frac{\cos^2 \theta}{\sin^2 \theta} = \cot^2 \theta$

- 22.
23.  $-3i - 3j$     24.  $\theta = 0, \theta = \pi, \theta = \frac{\pi}{3},$  or  $\theta = \frac{5\pi}{3}$     25.  $b \approx 14.4, C = 44^\circ, c \approx 10.5$

## CHAPTER 10

### Section 10.1

#### Check Point Exercises

1. a. 7, 9, 11, 13    b.  $-\frac{1}{3}, \frac{1}{5}, -\frac{1}{9}, \frac{1}{17}$     2. 3, 11, 27, 59    3.  $10, \frac{10}{3}, \frac{5}{6}, \frac{1}{6}$     4. a. 91    b.  $n$     5. a. 182    b. 47    c. 20

6. a.  $\sum_{i=1}^9 i^2$     b.  $\sum_{i=1}^n \frac{1}{2^{i-1}}$

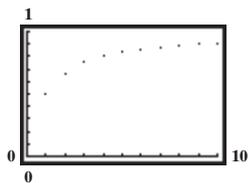

#### Concept and Vocabulary Check

1. sequence; integers; terms    2. general    3. 4    4.  $\frac{1}{15}$     5. 2    6. factorial; 5; 1; 1    7.  $n + 3$     8.  $a_1 + a_2 + a_3 + \cdots + a_n$ ; index; upper limit; lower limit

#### Exercise Set 10.1

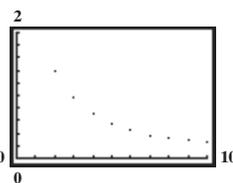

1. 5, 8, 11, 14    3. 3, 9, 27, 81    5.  $-3, 9, -27, 81$     7.  $-4, 5, -6, 7$     9.  $\frac{2}{5}, \frac{2}{3}, \frac{6}{7}, 1$     11.  $1, -\frac{1}{3}, \frac{1}{7}, -\frac{1}{15}$     13. 7, 12, 17, 22    15. 3, 12, 48, 192
17. 4, 11, 25, 53    19.  $1, 2, \frac{3}{2}, \frac{2}{3}$     21. 4, 12, 48, 240    23. 272    25. 120    27.  $(n + 2)(n + 1)$     29. 105    31. 60    33. 115    35.  $-\frac{5}{16}$
37. 55    39.  $\frac{3}{8}$     41. 15    43.  $\sum_{i=1}^{15} i^2$     45.  $\sum_{i=1}^{11} 2^i$     47.  $\sum_{i=1}^{30} i$     49.  $\sum_{i=1}^{14} \frac{i}{i+1}$     51.  $\sum_{i=1}^n \frac{4^i}{i}$     53.  $\sum_{i=1}^n (2i - 1)$     55.  $\sum_{k=1}^{14} (2k + 3)$     57.  $\sum_{k=0}^{12} ar^k$
59.  $\sum_{k=0}^n (a + kd)$     61. 45    63. 0    65. 2    67. 80    69. a. 1515; A total of 1515 thousand, or 1,515,000, autism cases were diagnosed in the United States from 2001 through 2008.    b. 1512; underestimates by 3 thousand    71. \$8081.13    81. 39,800    83. 8.109673361 E15

85. 24,804    89.

As  $n$  gets larger,  $a_n$  approaches 1.

91.

As  $n$  gets larger,  $a_n$  approaches 0.

93. does not make sense    95. makes sense    97. false  
99. false    101. 9, 32, 16, 8, 4    103.  $-5; -5; -5; -5$ ; The difference between consecutive terms is always  $-5$ .  
104. 4; 4; 4; 4; The difference between consecutive terms is always 4.    105.  $-45$

### Section 10.2

#### Check Point Exercises

1. 100, 70, 40, 10,  $-20, -50$     2.  $-34$     3. a.  $a_n = 0.35n + 15.65$     b. 23%    4. 360    5. 2460    6. \$740,300

#### Concept and Vocabulary Check

1. arithmetic; common difference    2.  $a_1 + (n - 1)d$ ; first term; common difference    3.  $\frac{n}{2}(a_1 + a_n)$ ; first term;  $n$ th term    4. 2; 116  
5. 8; 13; 18; 5

## AA98 Answers to Selected Exercises

### Exercise Set 10.2

1. 200, 220, 240, 260, 280, 300    3.  $-7, -3, 1, 5, 9, 13$     5. 300, 210, 120, 30,  $-60, -150$     7.  $\frac{5}{2}, 2, \frac{3}{2}, 1, \frac{1}{2}, 0$     9.  $-9, -3, 3, 9, 15, 21$   
 11. 30, 20, 10, 0,  $-10, -20$     13. 1.6, 1.2, 0.8, 0.4, 0,  $-0.4$     15. 33    17. 252    19. 955    21.  $-142$     23.  $a_n = 4n - 3; a_{20} = 77$   
 25.  $a_n = 11 - 4n; a_{20} = -69$     27.  $a_n = 7 + 2n; a_{20} = 47$     29.  $a_n = -16 - 4n; a_{20} = -96$     31.  $a_n = 1 + 3n; a_{20} = 61$   
 33.  $a_n = 40 - 10n; a_{20} = -160$     35. 1220    37. 4400    39. 5050    41. 3660    43. 396    45.  $8 + 13 + 18 + \dots + 88; 816$   
 47.  $2 - 1 - 4 - \dots - 85; -1245$     49.  $4 + 8 + 12 + \dots + 400; 20,200$     51. 7    53. 22    55. 847    57.  $f(x) = -4x + 5$   
 59.  $a_n = 3n - 2$     61. a.  $a_n = 0.5n + 10.5$     b. 35.5%    63. Company A will pay \$1400 more in year 10.    65. a. \$25,626  
 b. \$25,626; It's the same.    69. Company A: \$307,000; Company B: \$324,000; Company B pays the greater total amount.    71. 2869 seats  
 79. makes sense    81. makes sense    83. 320 degree-days    85.  $-2; -2; -2; -2$ ; The ratio of a term to the term that directly precedes it is always  $-2$ .    86. 5; 5; 5; 5; The ratio of a term to the term that directly precedes it is always 5.    87. 8019

### Section 10.3

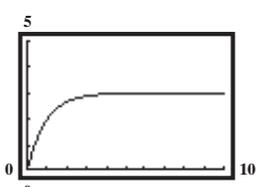

#### Check Point Exercises

1. 12, 6, 3,  $\frac{3}{2}, \frac{3}{4}, \frac{3}{8}$     2. 3645    3.  $a_n = 3(2)^{n-1}; a_8 = 384$     4. 9842    5. 19,680    6. \$2,371,746    7. a. \$333,946    b. \$291,946  
 8. 9    9. 1    10. \$4000

#### Concept and Vocabulary Check

1. geometric; common ratio    2.  $a_1 r^{n-1}$ ; first term; common ratio    3.  $\frac{a_1(1-r^n)}{1-r}$ ; first term; common ratio    4. annuity;  $P; r; n$   
 5. infinite geometric series;  $1; \frac{a_1}{1-r}; |r| \geq 1$     6. 2; 4; 8; 16; 2    7. arithmetic    8. geometric    9. geometric    10. arithmetic

### Section 10.4

#### Check Point Exercises

1. a.  $S_1: 2 = 1(1+1); S_k: 2 + 4 + 6 + \dots + 2k = k(k+1); S_{k+1}: 2 + 4 + 6 + \dots + 2(k+1) = (k+1)(k+2)$   
 b.  $S_1: 1^3 = \frac{1^2(1+1)^2}{4}; S_k: 1^3 + 2^3 + 3^3 + \dots + k^3 = \frac{k^2(k+1)^2}{4}; S_{k+1}: 1^3 + 2^3 + 3^3 + \dots + (k+1)^3 = \frac{(k+1)^2(k+2)^2}{4}$   
 2.  $S_1: 2 = 1(1+1); S_k: 2 + 4 + 6 + \dots + 2k = k(k+1); S_{k+1}: 2 + 4 + 6 + \dots + 2k + 2(k+1) = (k+1)(k+2); S_{k+1}$  can be obtained by adding  $2k + 2$  to both sides of  $S_k$ .

3.  $S_1: 1^3 = \frac{1^2(1+1)^2}{4}$ ;  $S_k: 1^3 + 2^3 + 3^3 + \dots + k^3 = \frac{k^2(k+1)^2}{4}$ ;  $S_{k+1}: 1^3 + 2^3 + 3^3 + \dots + k^3 + (k+1)^3 = \frac{(k+1)^2(k+2)^2}{4}$ ;  $S_{k+1}$  can be obtained by adding  $k^3 + 3k^2 + 3k + 1$  to both sides of  $S_k$ .
4.  $S_1: 2$  is a factor of  $1^2 + 1$ ;  $S_k: 2$  is a factor of  $k^2 + k$ ;  $S_{k+1}: 2$  is a factor of  $(k+1)^2 + (k+1) = k^2 + 3k + 2$ ;  $S_{k+1}$  can be obtained from  $S_k$  by writing  $k^2 + 3k + 2$  as  $(k^2 + k) + 2(k+1)$ .

**Concept and Vocabulary Check**

1. induction;  $1; k+1$     2.  $2 + 4 + 6 = 3(3+1); 2 + 4 + 6 + \dots + 2(k+1) = (k+1)(k+2)$   
 3.  $3 + 7 + 11 = 3(6+1); 3 + 7 + 11 + \dots + [4(k+1) - 1] = (k+1)[2(k+1) + 1]; 3 + 7 + 11 + \dots + (4k+3) = (k+1)(2k+3)$   
 4.  $4; 10; 18; (k+1)^2 + 3(k+1); k^2 + 5k + 4$     5.  $(k+1)$

**Exercise Set 10.4**

1.  $S_1: 1 = 1^2; S_2: 1 + 3 = 2^2; S_3: 1 + 3 + 5 = 3^2$     3.  $S_1: 2$  is a factor of  $1 - 1 = 0; S_2: 2$  is a factor of  $2^2 - 2 = 2; S_3: 2$  is a factor of  $3^2 - 3 = 6$ .
5.  $S_k: 4 + 8 + 12 + \dots + 4k = 2k(k+1); S_{k+1}: 4 + 8 + 12 + \dots + (4k+4) = 2(k+1)(k+2)$
7.  $S_k: 3 + 7 + 11 + \dots + (4k-1) = k(2k+1); S_{k+1}: 3 + 7 + 11 + \dots + (4k+3) = (k+1)(2k+3)$
9.  $S_k: 2$  is a factor of  $k^2 - k + 2; S_{k+1}: 2$  is a factor of  $k^2 + k + 2$ .
11.  $S_1: 4 = 2(1)(1+1); S_k: 4 + 8 + 12 + \dots + 4k = 2k(k+1); S_{k+1}: 4 + 8 + 12 + \dots + 4(k+1) = 2(k+1)(k+2); S_{k+1}$  can be obtained by adding  $4k + 4$  to both sides of  $S_k$ .
13.  $S_1: 1 = 1^2; S_k: 1 + 3 + 5 + \dots + (2k-1) = k^2; S_{k+1}: 1 + 3 + 5 + \dots + (2k+1) = (k+1)^2; S_{k+1}$  can be obtained by adding  $2k + 1$  to both sides of  $S_k$ .
15.  $S_1: 3 = 1[2(1) + 1]; S_k: 3 + 7 + 11 + \dots + (4k-1) = k(2k+1); S_{k+1}: 3 + 7 + 11 + \dots + (4k+3) = (k+1)(2k+3); S_{k+1}$  can be obtained by adding  $4k + 3$  to both sides of  $S_k$ .
17.  $S_1: 1 = 2^1 - 1; S_k: 1 + 2 + 2^2 + \dots + 2^{k-1} = 2^k - 1; S_{k+1}: 1 + 2 + 2^2 + \dots + 2^k = 2^{k+1} - 1; S_{k+1}$  can be obtained by adding  $2^k$  to both sides of  $S_k$ .
19.  $S_1: 2 = 2^{1+1} - 2; S_k: 2 + 4 + 8 + \dots + 2^k = 2^{k+1} - 2; S_{k+1}: 2 + 4 + 8 + \dots + 2^{k+1} = 2^{k+2} - 2; S_{k+1}$  can be obtained by adding  $2^{k+1}$  to both sides of  $S_k$ .
21.  $S_1: 1 \cdot 2 = \frac{1(1+1)(1+2)}{3}; S_k: 1 \cdot 2 + 2 \cdot 3 + 3 \cdot 4 + \dots + k(k+1) = \frac{k(k+1)(k+2)}{3}$ ;  
 $S_{k+1}: 1 \cdot 2 + 2 \cdot 3 + 3 \cdot 4 + \dots + (k+1)(k+2) = \frac{(k+1)(k+2)(k+3)}{3}$ ;  $S_{k+1}$  can be obtained by adding  $(k+1)(k+2)$  to both sides of  $S_k$ .
23.  $S_1: \frac{1}{1 \cdot 2} = \frac{1}{1+1}; S_k: \frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \dots + \frac{1}{k(k+1)} = \frac{k}{k+1}; S_{k+1}: \frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \dots + \frac{1}{(k+1)(k+2)} = \frac{k+1}{k+2}$ ;  $S_{k+1}$  can be obtained by adding  $\frac{1}{(k+1)(k+2)}$  to both sides of  $S_k$ .
25.  $S_1: 2$  is a factor of 0;  $S_k: 2$  is a factor of  $k^2 - k; S_{k+1}: 2$  is a factor of  $k^2 + k; S_{k+1}$  can be obtained from  $S_k$  by rewriting  $k^2 + k$  as  $(k^2 - k) + 2k$ .
27.  $S_1: 6$  is a factor of 6;  $S_k: 6$  is a factor of  $k(k+1)(k+2); S_{k+1}: 6$  is a factor of  $(k+1)(k+2)(k+3); S_{k+1}$  can be obtained from  $S_k$  by rewriting  $(k+1)(k+2)(k+3)$  as  $k(k+1)(k+2) + 3(k+1)(k+2)$  and noting that either  $k+1$  or  $k+2$  is even, so 6 is a factor of  $3(k+1)(k+2)$ .
29.  $S_1: 5 \cdot 6^1 = 6(6^1 - 1); S_k: \sum_{i=1}^k 5 \cdot 6^i = 6(6^k - 1); S_{k+1}: \sum_{i=1}^{k+1} 5 \cdot 6^i = 6(6^{k+1} - 1); S_{k+1}$  can be obtained by adding  $5 \cdot 6^{k+1}$  to both sides of  $S_k$ .
31.  $S_1: 1 + 2 > 1; S_k: k + 2 > k; S_{k+1}: k + 3 > k + 1; S_{k+1}$  can be obtained by adding 1 to both sides of  $S_k$ .
33.  $S_1: (ab)^1 = a^1b^1; S_k: (ab)^k = a^kb^k; S_{k+1}: (ab)^{k+1} = a^{k+1}b^{k+1}; S_{k+1}$  can be obtained by multiplying both sides of  $S_k$  by  $(ab)$ .
37. does not make sense    39. does not make sense
41.  $S_3: 3^2 > 2(3) + 1; S_k: k^2 > 2k + 1$  for  $k \geq 3; S_{k+1}: (k+1)^2 > 2(k+1) + 1$  or  $k^2 + 2k + 1 > 2k + 3; S_{k+1}$  can be obtained from  $S_k$  by noting that  $S_{k+1}$  is the same as  $k^2 > 2$  which is true for  $k \geq 3$ .
43.  $S_1: \frac{1}{4}; S_2: \frac{1}{3}; S_3: \frac{3}{8}; S_4: \frac{2}{5}; S_5: \frac{5}{12}; S_n: \frac{n}{2n+2}$ ; Use  $S_k$  to obtain the conjectured formula.
46. The exponents begin with the exponent on  $a + b$  and decrease by 1 in each successive term.    47. The exponents begin with 0, increase by 1 in each successive term, and end with the exponent on  $a + b$ .    48. The sum of the exponents is the exponent on  $a + b$ .

**Section 10.5**

#### Check Point Exercises

1. a.  $\frac{7664}{100,000}$  or  $\frac{479}{6250} \approx 0.077$     b.  $\frac{720}{800}$  or  $\frac{9}{10} = 0.9$     c.  $\frac{720}{7664}$  or  $\frac{45}{479} \approx 0.094$     2.  $\frac{1}{3}$     3.  $\frac{1}{9}$     4.  $\frac{1}{13}$     5.  $\frac{1}{13,983,816} \approx 0.0000000715$   
 6.  $\frac{129}{140} \approx 0.921$     7.  $\frac{1}{3}$     8.  $\frac{3}{4}$     9. a.  $\frac{189}{242} \approx 0.78$     b.  $\frac{19}{121} \approx 0.16$     10.  $\frac{1}{361} \approx 0.00277$     11.  $\frac{1}{16}$

#### Concept and Vocabulary Check

1. empirical    2. sample space    3.  $P(E)$ ; number of outcomes in  $E$ ; total number of possible outcomes    4. 52; hearts; diamonds; clubs; spades  
 5. 1; combinations    6.  $1 - P(E)$ ;  $1 - P(\text{not } E)$     7. mutually exclusive;  $P(A) + P(B)$     8.  $P(A) + P(B) - P(A \text{ and } B)$   
 9. independent;  $P(A) \cdot P(B)$

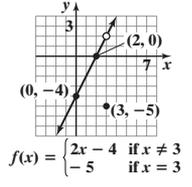

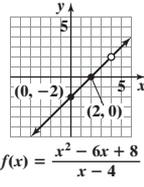

**Exercise Set 10.7**

1.  $\frac{12}{121} \approx 0.10$     3.  $\frac{62}{121} \approx 0.51$     5.  $\frac{3}{242} \approx 0.01$     7.  $\frac{7}{12} \approx 0.58$     9.  $\frac{65}{118} \approx 0.55$     11.  $\frac{1}{6}$     13.  $\frac{1}{2}$     15.  $\frac{1}{3}$     17.  $\frac{1}{13}$     19.  $\frac{3}{13}$   
 21.  $\frac{1}{4}$     23.  $\frac{7}{8}$     25.  $\frac{1}{12}$     27.  $\frac{1}{18,009,460}, \frac{5}{900,473}$     29. a. 2,598,960    b. 1287    c.  $\frac{1287}{2,598,960} \approx 0.0005$     31.  $\frac{43}{58}$     33.  $\frac{50}{87}$     35.  $\frac{113}{174}$   
 37.  $\frac{12}{13}$     39.  $\frac{2}{13}$     41.  $\frac{7}{13}$     43.  $\frac{3}{4}$     45.  $\frac{33}{40}$     47.  $\frac{1}{36}$     49.  $\frac{1}{3}$     51.  $\frac{1}{64}$     53. a.  $\frac{1}{256}$     b.  $\frac{1}{4096}$     c.  $\left(\frac{15}{16}\right)^{10} \approx 0.524$   
 d.  $1 - \left(\frac{15}{16}\right)^{10} \approx 0.476$     65. does not make sense    67. makes sense    71. a.  $\frac{12}{25}$     b.  $\frac{3}{10}$     73. a. The first person can have any birthday in

the year. The second person can have all but one birthday.    b.  $\frac{365}{365} \cdot \frac{364}{365} \cdot \frac{363}{365} \approx 0.99$     c.  $\approx 0.01$     d.  $\approx 0.41$     e. 23 people

75. a. The denominator is zero when  $x = 4$ .    b. 2    c. 2    76. ; The two pieces of the graph approach the point (4, 2)    77.

**Chapter 10 Review Exercises**

1.  $a_1 = 3; a_2 = 10; a_3 = 17; a_4 = 24$     2.  $a_1 = -\frac{3}{2}; a_2 = \frac{4}{3}; a_3 = -\frac{5}{4}; a_4 = \frac{6}{5}$     3.  $a_1 = 1; a_2 = 1; a_3 = \frac{1}{2}; a_4 = \frac{1}{6}$   
 4.  $a_1 = \frac{1}{2}; a_2 = -\frac{1}{4}; a_3 = \frac{1}{8}; a_4 = -\frac{1}{16}$     5.  $a_1 = 9; a_2 = \frac{2}{27}; a_3 = 9; a_4 = \frac{2}{27}$     6.  $a_1 = 4; a_2 = 11; a_3 = 25; a_4 = 53$     7. 65    8. 95  
 9. -20    10.  $\sum_{i=1}^{15} \frac{i}{i+2}$     11.  $\sum_{i=4}^{13} i^3$  or  $\sum_{i=1}^{10} (i+3)^3$     12. 7, 11, 15, 19, 23, 27    13. -4, -9, -14, -19, -24, -29    14.  $\frac{3}{2}, 1, \frac{1}{2}, 0, -\frac{1}{2}, -1$   
 15. -2, 3, 8, 13, 18, 23    16.  $a_6 = 20$     17.  $a_{12} = -30$     18.  $a_{14} = -38$     19.  $a_n = 4n - 11; a_{20} = 69$     20.  $a_n = 220 - 20n; a_{20} = -180$   
 21.  $a_n = 8 - 5n; a_{20} = -92$     22. 1727    23. 225    24. 15,150    25. 440    26. -500    27. -2325    28. a.  $a_n = 34.8 - 0.3n$   
 b. 18 hours per week    29. \$418,500    30. 1470 seats    31. 3, 6, 12, 24, 48    32.  $\frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \frac{1}{16}, \frac{1}{32}$     33. 16, -8, 4, -2, 1    34. -1, 5, -25, 125, -625  
 35.  $a_7 = 1458$     36.  $a_6 = \frac{1}{2}$     37.  $a_5 = -48$     38.  $a_n = 2^{n-1}; a_8 = 128$     39.  $a_n = 100\left(\frac{1}{10}\right)^{n-1}; a_8 = \frac{1}{100,000}$   
 40.  $a_n = 12\left(-\frac{1}{3}\right)^{n-1}; a_8 = -\frac{4}{729}$     41. 17,936,135    42.  $\frac{127}{8}$     43. 19,530    44. -258    45.  $\frac{341}{128}$     46.  $\frac{27}{2}$     47.  $\frac{4}{3}$     48.  $-\frac{18}{5}$     49. 20  
 50.  $\frac{2}{3}$     51.  $\frac{47}{99}$     52. a. approximately 1.02 for each division    b.  $a_n = 15.98(1.02)^{n-1}$     c. 28.95 million    53. \$42,823; \$223,210  
 54. a. \$19,129    b. \$8729    55. a. \$91,361    b. \$55,361    56. \$9 $\frac{1}{3}$  million  
 57.  $S_1: 5 = \frac{5(1)(1+1)}{2}; S_k: 5 + 10 + 15 + \dots + 5k = \frac{5k(k+1)}{2}; S_{k+1}: 5 + 10 + 15 + \dots + 5(k+1) = \frac{5(k+1)(k+2)}{2}; S_{k+1}$   
 can be obtained by adding  $5(k+1)$  to both sides of  $S_k$ .  
 58.  $S_1: 1 = \frac{4^1 - 1}{3}; S_k: 1 + 4 + 4^2 + \dots + 4^{k-1} = \frac{4^k - 1}{3}; S_{k+1}: 1 + 4 + 4^2 + \dots + 4^k = \frac{4^{k+1} - 1}{3}; S_{k+1}$  can be obtained by adding  $4^k$   
 to both sides of  $S_k$ .  
 59.  $S_1: 2 = 2(1)^2; S_k: 2 + 6 + 10 + \dots + (4k - 2) = 2k^2; S_{k+1}: 2 + 6 + 10 + \dots + (4k + 2) = 2k^2 + 4k + 2; S_{k+1}$  can be obtained  
 by adding  $4k + 2$  to both sides of  $S_k$ .  
 60.  $S_1: 1 \cdot 3 = \frac{1(1+1)[2(1)+7]}{6}; S_k: 1 \cdot 3 + 2 \cdot 4 + 3 \cdot 5 + \dots + k(k+2) = \frac{k(k+1)(2k+7)}{6};$   
 $S_{k+1}: 1 \cdot 3 + 2 \cdot 4 + 3 \cdot 5 + \dots + (k+1)(k+3) = \frac{(k+1)(k+2)(2k+9)}{6}; S_{k+1}$  can be obtained by adding  $(k+1)(k+3)$  to both sides of  $S_k$ .  
 61.  $S_1: 2$  is a factor of 6;  $S_k: 2$  is a factor of  $k^2 + 5k$ ;  $S_{k+1}: 2$  is a factor of  $k^2 + 7k + 6$ ;  $S_{k+1}$  can be obtained from  $S_k$  by rewriting  $k^2 + 7k + 6$   
 as  $(k^2 + 5k) + 2(k+3)$ .  
 62. 165    63. 4005    64.  $8x^3 + 12x^2 + 6x + 1$     65.  $x^8 - 4x^6 + 6x^4 - 4x^2 + 1$     66.  $x^5 + 10x^4y + 40x^3y^2 + 80x^2y^3 + 80xy^4 + 32y^5$   
 67.  $x^6 - 12x^5 + 60x^4 - 160x^3 + 240x^2 - 192x + 64$     68.  $x^{16} + 24x^{14} + 252x^{12} + \dots$     69.  $x^9 - 27x^8 + 324x^7 - \dots$     70.  $80x^2$     71.  $4860x^2$

 94.  $\frac{5}{6}$     95.  $\frac{1}{6}$     96. a.  $\frac{1}{15,504}$     b.  $\frac{25}{3876}$     97.  $\frac{1}{32}$     98. a. 0.04    b. 0.008    c. 0.4096

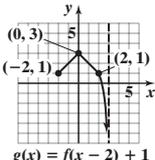

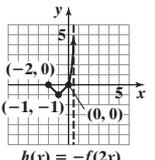

# AA102 Answers to Selected Exercises

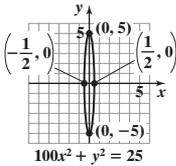

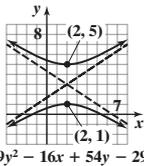

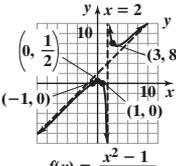

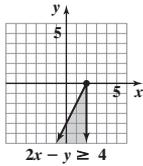

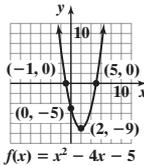

## Chapter 10 Test

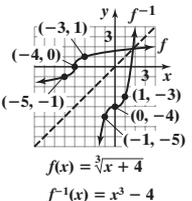

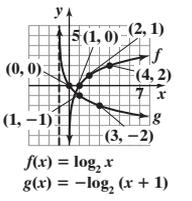

1.  $a_1 = 1; a_2 = -\frac{1}{4}; a_3 = \frac{1}{9}; a_4 = -\frac{1}{16}; a_5 = \frac{1}{25}$     2. 105    3. 550    4. -21,846    5. 36    6. 720    7. 120    8.  $\sum_{i=1}^{20} \frac{i+1}{i+2}$   
 9.  $a_n = 5n - 1; a_{12} = 59$     10.  $a_n = 16\left(\frac{1}{4}\right)^{n-1}; a_{12} = \frac{1}{262,144}$     11. -2387    12. -385    13. 8    14.  $\frac{73}{99}$     15. \$276,427  
 16.  $S_i: 1 = \frac{1[3(1) - 1]}{2}; S_k: 1 + 4 + 7 + \dots + (3k - 2) = \frac{k(3k - 1)}{2}; S_{k+1}: 1 + 4 + 7 + \dots + (3k + 1) = \frac{(k + 1)(3k + 2)}{2}; S_{k+1}$   
 can be obtained by adding  $3k + 1$  to both sides of  $S_k$ .  
 17.  $x^{10} - 5x^8 + 10x^6 - 10x^4 + 5x^2 - 1$     18.  $x^8 + 8x^7y^2 + 28x^6y^4$     19. 990 ways    20. 210 sets    21.  $10^4 = 10,000$     22.  $\frac{3}{5}$     23.  $\frac{39}{50}$   
 24.  $\frac{3}{5}$     25.  $\frac{9}{19}$     26.  $\frac{10}{1001}$     27.  $\frac{8}{13}$     28.  $\frac{3}{5}$     29.  $\frac{1}{256}$     30.  $\frac{1}{16}$

## Cumulative Review Exercises (Chapters P-10)

1. domain:  $[-4, 1)$ ; range:  $(-\infty, 2]$     2. maximum of 2 at  $x = -2$     3.  $(-2, 1)$     4. neither    5. -3 and -1    6. 0    7.  $x \rightarrow 1^-$

8.   $g(x) = f(x - 2) + 1$     9.   $h(x) = -f(2x)$     10.  $\left\{\frac{14}{5}\right\}$     11.  $\left\{\frac{3 + \sqrt{3}}{3}, \frac{3 - \sqrt{3}}{3}\right\}$     12.  $\{2\}$   
 13.  $\{16, 256\}$     14.  $\{\ln 2, \ln 4\}$     15.  $-1 \leq x \leq 0$  or  $[-1, 0]$   
 16.  $\left(-\frac{2}{3}, \frac{3}{2}\right)$     17.  $(-3, 1]$     18.  $\{2.9706\}$     19.  $\left\{1, \frac{1}{2}, -3\right\}$   
 20.  $\{(3, 2), (3, -2), (-3, 2), (-3, -2)\}$     21.  $\{(6, -4, 2)\}$     22.  $\{(0, -1), (2, 1)\}$

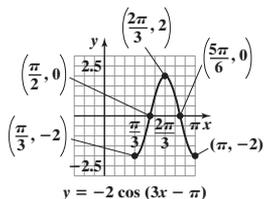

23.   $100x^2 + y^2 = 25$     24.   $4x^2 - 9y^2 - 16x + 54y - 29 = 0$     25.   $f(x) = \frac{x^2 - 1}{x - 2}$     26.   $2x - y \geq 4$   
 $x \leq 2$     27.   $f(x) = x^2 - 4x - 5$

28.   $f(x) = \sqrt[3]{x + 4}$   
 $f^{-1}(x) = x^3 - 4$     29.   $f(x) = \log_2 x$   
 $g(x) = -\log_2(x + 1)$     30.  $(f \circ g)(x) = -x^2 + 2; (g \circ f)(x) = -x^2 - 2x$     31.  $-2x - h - 2$   
 32.  $\begin{bmatrix} -2 & 10 \\ -5 & 7 \\ 15 & -15 \end{bmatrix}$     33.  $\frac{-1}{x - 2} + \frac{3x - 2}{x^2 + 2x + 2}$   
 34.  $x^{15} + 10x^{12}y + 40x^9y^2 + 80x^6y^3 + 80x^3y^4 + 32y^5$     35. 3850

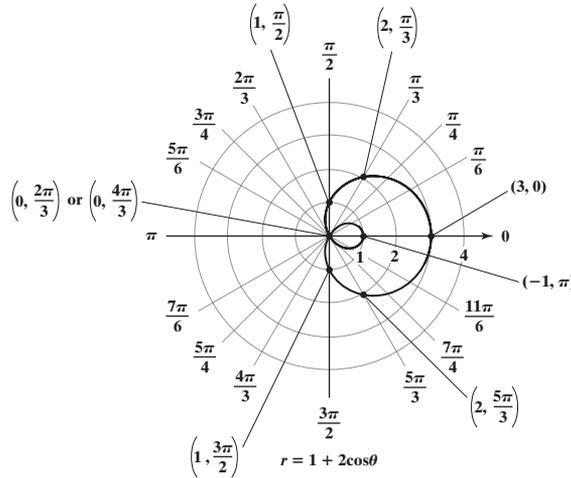

36.  $f(x) = \frac{1}{4}x + \frac{3}{2}$     37.  $g(x) = -5x - 2$     38. \$2000    39. length: 100 yd; width: 50 yd    40. pen: \$1.80; pad: \$2    41. a. 6 sec  
 b. 2.5 sec; 196 ft    42. 11 amps    43. Answers will vary. An example is:  $f(x) = 11.8x + 68.4$  where  $x$  is the number of years after 2010.

44. a. 10 in.    b.  $\frac{3}{8}$  cycles/sec    c.  $\frac{8}{3}$  sec    45.  $\tan x + \frac{1}{\tan x} = \frac{\sin x}{\cos x} + \frac{1}{\frac{\sin x}{\cos x}} = \frac{\sin x}{\cos x} + \frac{\cos x}{\sin x} = \frac{\sin^2 x + \cos^2 x}{\cos x \sin x} = \frac{1}{\cos x \sin x}$

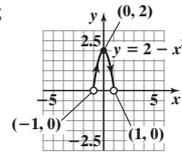

46.  $\frac{1 - \tan^2 x}{1 + \tan^2 x} = \frac{1 - \frac{\sin^2 x}{\cos^2 x}}{1 + \frac{\sin^2 x}{\cos^2 x}} \cdot \frac{\cos^2 x}{\cos^2 x} = \frac{\cos^2 x - \sin^2 x}{\cos^2 x + \sin^2 x} = \frac{\cos 2x}{1} = \cos 2x$

47.   $y = -2 \cos(3x - \pi)$     48.  $\frac{\pi}{6}, \frac{5\pi}{6}, \frac{7\pi}{6}, \frac{11\pi}{6}$

49.  $0, \frac{\pi}{3}, \frac{5\pi}{3}$     50.  $-\frac{5\sqrt{11}}{11}$     51.

52.  $B \approx 54^\circ, C \approx 92^\circ, c \approx 39.3$  or  $B \approx 126^\circ, C \approx 20^\circ, c \approx 13.5$     53.  $y = 2 - x^2$ ;

1. 8   3. 2   5. 14   7. 28   9. 6   11. 8   13. 16   15. 5   17.  $\frac{5}{6}$    19. 3   21. 2   23. 2   25. 2   27.  $\frac{8}{9}$    29.  $\frac{1}{2}$   
 31. 1125   33.  $\frac{1}{4}$    35.  $-\frac{1}{4}$    37.  $-7$    39.  $-\frac{1}{9}$    41.  $\frac{1}{3}$    43. a. 6   b. 8   c. does not exist   45. a. 9   b. 9   c. 9  
 47. a. 6   b. 6   c. 6   49. a. 0   b. 0   c. 0   51. 13; 2   53. 0; 3   55. 2   57.  $\frac{5}{2}$    59. a. 0   b. The length of the starship appears to approach 0.   c. It is not possible to exceed the speed of light.   75. makes sense   77. makes sense   79.  $-\frac{1}{16}$    81.  $\frac{1}{2}$

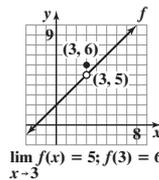

83.  $\frac{2}{3}$

86.

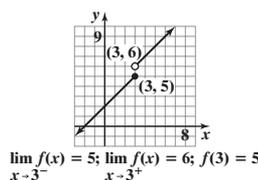

No, it is not necessary to lift your pencil off the paper.

87.

Yes, it is necessary to lift your pencil off the paper.

88.

Yes, it is necessary to lift your pencil off the paper.

### Section 11.3

#### Check Point Exercises

1. a. continuous   b. discontinuous   2. discontinuous at 0

#### Concept and Vocabulary Check

1.  $f$  is defined at  $a$ , so that  $f(a)$  is a real number;  $\lim_{x \rightarrow a} f(x)$  exists;  $\lim_{x \rightarrow a} f(x) = f(a)$ .   2. true   3. false   4.  $1 - x; x^2 - 1; 0$ ;  $f$  is continuous at 1  
 5. true   6. false

### Exercise Set 11.3

1. continuous   3. continuous   5. continuous   7. discontinuous   9. continuous   11. discontinuous   13. discontinuous  
 15. continuous   17. continuous   19. continuous for every number  $x$    21.  $-1$  and  $4$    23. 0   25. continuous for every number  $x$   
 27. 1   29. continuous for every number  $x$    31. 2   33. 4   35. discontinuous at  $\pi$    37. discontinuous at each integer  
 39. continuous for every number  $x$    41. discontinuous at  $\frac{\pi}{2}$    43. a. 20; 20   b. yes   c. 40; 10   d. no   e. does not exist; 70   f. no  
 g. 100   h. As the end of the course approached, the percentage of material learned by the student approached 100%   45. a. continuous  
 b. continuous   c. Answers may vary.   53. 2.7183; 2.71828   55. does not make sense   57. makes sense   59. No. In Exercise 58,  $\lim_{x \rightarrow 9} f(x)$  exists. In this exercise, however,  $\lim_{x \rightarrow 9} \frac{1}{x - 9}$  does not exist.   62.  $5 + h$    63.  $3x^2 + 3xh + h^2$    64.  $-32a - 16h + 48$

### Mid-Chapter 11 Check Point

1. 2   2. 1   3. does not exist   4.  $-2$    5.  $-1$    6.  $-3$    7. 3   8. discontinuous at  $-1$  and  $0$    9.  $-1$    10. 1   11. 4   12.  $-1$   
 13. 2   14.  $\frac{49}{4}$    15. 13   16.  $\frac{1}{6}$    17. does not exist   18. a. 1   b. 0   c. does not exist   19. a. 32   b. 32   c. 32   20. yes  
 21. yes   22. discontinuous at 5

### Section 11.4

#### Check Point Exercises

1. 7   2.  $y = \frac{1}{2}x + \frac{1}{2}$    3. a.  $2x - 5$    b.  $-7; 1$    4. a. 49.21 cubic inches per inch; 48.1201 cubic inches per inch  
 b. 48 cubic inches per inch   5. a.  $-32$  ft/sec   b.  $-96$  ft/sec

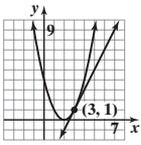

#### Concept and Vocabulary Check

1.  $\frac{f(a+h) - f(a)}{h}$ ; instantaneous;  $f; x$    2.  $y - 4 = 7(x - 1)$    3.  $f'(x); \frac{f(x+h) - f(x)}{h}$    4. true   5.  $y - 23 = 9(x - 6)$    6. 32; upward

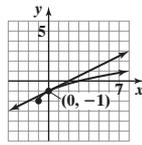

### Exercise Set 11.4

1. a. 2   b.  $y = 2x + 3$    3. a.  $-2$    b.  $y = -2x + 3$    5. a.  $-20$    b.  $y = -20x - 20$    7. a. 7   b.  $y = 7x - 8$    9. a. 1  
 b.  $y = x - 3$    11. a.  $\frac{1}{6}$    b.  $y = \frac{1}{6}x + \frac{3}{2}$    13. a.  $-1$    b.  $y = -x + 2$    15. a.  $-3$    b.  $-3; -3$    17. a.  $2x$    b.  $-2; 6$   
 19. a.  $2x - 3$    b. 0; 1   21. a.  $3x^2$    b. 3; 3   23. a.  $\frac{1}{2\sqrt{x}}$    b.  $\frac{1}{2}; \frac{1}{4}$    25. a.  $-\frac{4}{x^2}$    b.  $-1; -4$    27. a.  $6.4x + 2.1$    b. 2.1; 27.7

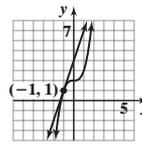

29. a. & c.    b.  $y = 2x - 5$

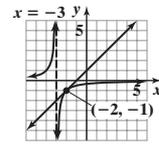

31. a. & c.    b.  $y = \frac{1}{2}x - 1$

33. a. & c.    b.  $y = 3x + 4$

35. a. & c.    b.  $y = x + 1$

37. a. 12.1 square inches per inch; 12.01 square inches per inch    b. 12 square inches per inch    39. a.  $4.1\pi$  square inches per inch;  $4.01\pi$  square inches per inch    b.  $4\pi$  square inches per inch    41.  $48\pi$  square inches per inch    43. a. 32 feet per second;  $-32$  feet per second    b.  $-64$  feet per second    45. a. 32 feet per second;  $-32$  feet per second    b. 3 sec; 148 ft    63.  $-0.33$     65. 3.64    67. makes sense    69. makes sense

71. e    73. d    75. b

$$\begin{aligned} 77. A'(r) &= \lim_{h \rightarrow 0} \frac{A(r+h) - A(r)}{h} \\ &= \lim_{h \rightarrow 0} \frac{\pi(r+h)^2 - \pi r^2}{h} \\ &= \lim_{h \rightarrow 0} \frac{\pi(r^2 + 2rh + h^2) - \pi r^2}{h} \\ &= \lim_{h \rightarrow 0} \frac{\pi r^2 + 2\pi rh + \pi h^2 - \pi r^2}{h} \\ &= \lim_{h \rightarrow 0} \frac{h(2\pi r + \pi h)}{h} \\ &= \lim_{h \rightarrow 0} (2\pi r + \pi h) = 2\pi r + 0 = 2\pi r \end{aligned}$$

**Chapter 11 Review Exercises**

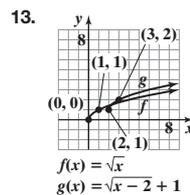

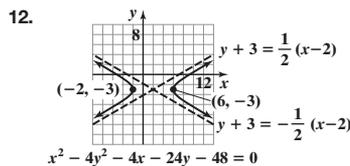

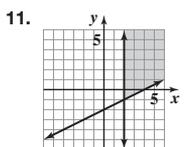

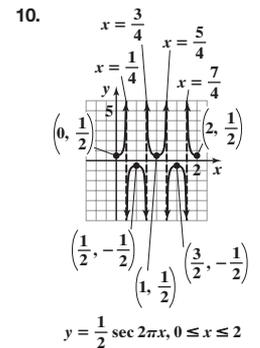

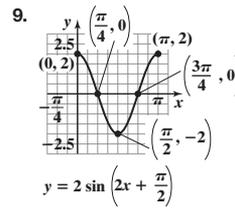

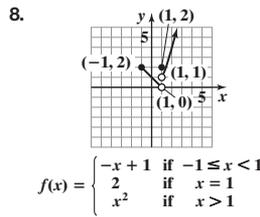

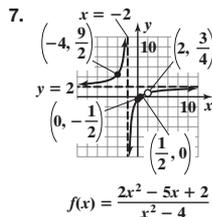

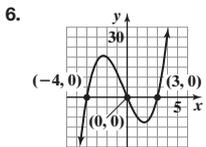

1. 3    2.  $\frac{1}{2}$     3. 2    4. 0    5. 1    6. 3    7. 2    8. 3    9. 3    10. 5    11.  $-3$     12. does not exist    13. 1    14. 3    15.  $-3$   
 16. does not exist    17. 3    18. does not exist    19. 5    20. 5    21. 5    22. 0    23. 0    24. 6    25.  $-1$     26. 1    27. 15    28. 8  
 29. 1000    30. 5    31. 2    32.  $-8$     33. 5    34.  $\frac{1}{20}$     35. 2    36.  $\frac{1}{20}$     37.  $-\frac{1}{25}$     38. a. 5    b. 7    c. does not exist  
 39. a. 2    b. 4    c. does not exist    40. a.  $-10$     b.  $-10$     c.  $-10$     41. continuous    42. discontinuous    43. discontinuous  
 44. continuous    45. discontinuous    46. continuous for every number  $x$     47. 1 and  $-3$     48. 0    49. continuous for every number  $x$   
 50.  $-2$     51. 11    52. a. 9    b.  $y = 9x - 2$     53. a.  $-9$     b.  $y = -9x - 5$     54. a.  $6x + 12$     b. 0; 18    55. a.  $6x^2 - 1$     b. 5; 5  
 56. a.  $-\frac{1}{x^2}$     b.  $-\frac{1}{4}$ ;  $-\frac{1}{4}$     57. a.  $\frac{1}{2\sqrt{x}}$     b.  $\frac{1}{12}$ ;  $\frac{1}{18}$     58. a. 20.5 cubic inches per inch; 20.05 cubic inches per inch  
 b. 20 cubic inches per inch    59.  $100\pi$  cubic inches per inch    60. a. 16 feet per second;  $-48$  feet per second    b. 2.5 sec; 105 ft

**Chapter 11 Test**

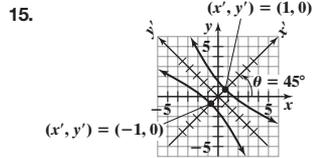

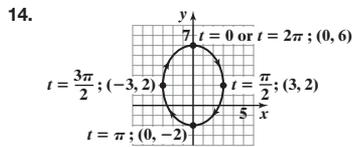

1. 6    2.  $-3$     3.  $-5$     4. 4    5. 6    6. does not exist    7. 4    8. 81    9.  $-3$     10.  $\frac{1}{6}$     11. discontinuous    12. continuous  
 13.  $2x - 5$     14.  $-\frac{10}{x^2}$     15.  $y = -6x - 9$     16.  $-24$  feet per second

**Cumulative Review Exercises (Chapters P-11)**

1.  $(-\infty, -\frac{5}{2}) \cup (-2, -1)$     2.  $\{1, -\frac{1}{2}, -6\}$     3.  $(-\infty, -\frac{7}{2}) \cup (-\frac{1}{2}, \infty)$     4.  $\{\frac{3\pi}{2}\}$     5.  $\{67\}$

AA106 Answers to Selected Exercises

16.  $-4x + 7$     17.  $\frac{1}{7}x + \frac{1}{7}$     18.  $\frac{5}{4}$

19.  $x^8 - 12x^6y + 54x^4y^2 - 108x^2y^3 + 81y^4$

20.  $y = -2x + 1$

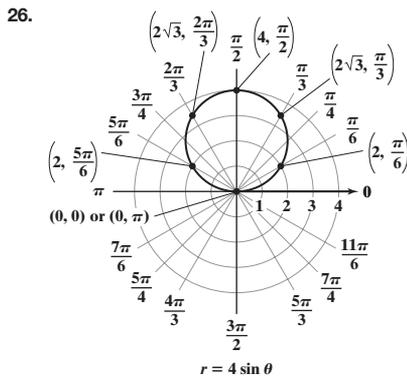

21.  $-11; 170^\circ$

22.  $\frac{1}{x} - \frac{x+1}{x^2+x+1}$

23. 
$$\begin{aligned} \tan \theta + \cot \theta &= \frac{\sin \theta}{\cos \theta} + \frac{\cos \theta}{\sin \theta} \\ &= \frac{\sin^2 \theta + \cos^2 \theta}{\cos \theta \sin \theta} \\ &= \frac{1}{\cos \theta \sin \theta} \\ &= \sec \theta \csc \theta \end{aligned}$$

24. 
$$\begin{aligned} \tan(\theta + \pi) &= \frac{\tan \theta + \tan \pi}{1 - \tan \theta \tan \pi} \\ &= \frac{\tan \theta + 0}{1 - \tan \theta(0)} \\ &= \tan \theta \end{aligned}$$

25. 
$$\begin{bmatrix} 2 & 1 & 3 \\ 8 & 1 & 9 \\ 5 & 1 & 6 \end{bmatrix}$$

27.  $f(x) = x^9; g(x) = x^2 - 3x + 7$     28.  $\left\{ \left( \frac{1}{2}, -1, \frac{3}{2} \right) \right\}$

29. 168    30.  $2 + 2\sqrt{3}i$

31. a.  $I(x) = 21,600 - 0.1x$

b. \$116,000 at 8%; \$4000 at 18%

32. 23 cm  $\times$  23 cm

33. 100 ft by 50 ft; 5000 sq ft

34. a.  $T = 72 + 303e^{-0.0769t}$

b. after 6.9 min

35.  $C(x) = 25x + \frac{600,000}{x}$     36. 71.7 mi

37.  $29\frac{1}{3}$  cu in.    38.  $-24$  feet per second

39.  $A(x) = x^2 + \frac{16}{x}$     40. 15.6 years old

# SUBJECT INDEX

- A**
- Absolute value, 9–11
    - of complex number, 727–728
    - definition of, 10
    - evaluating, 10
    - to find distance between two points, 11
    - properties of, 11
  - Absolute value bars
    - rewriting absolute value equation without, 92
    - rewriting inequalities without, 127
  - Absolute value equations, solving, 92–93
  - Absolute value function, graph of, 216
  - Absolute value inequalities, solving, 127–129
  - Abstract algebra, 880
  - Acute angle, 493
    - in right triangle, 523–524, 528
  - Adams, John Quincy, 928, 932
  - Addition
    - associative property of, 12
    - commutative property of, 11–12
    - of complex numbers, 293–294
    - distributive property of
      - multiplication over, 12
    - of functions, 234, 235
    - identity property of, 12
    - inverse property of, 12
    - of like radicals, 36
    - matrix, 873–874
    - of polynomial in two variables, 53
    - of polynomials, 50
    - of rational expressions with different denominators, 75–78
    - of rational expressions with same denominators, 75
    - of real numbers, 11–12
    - of square roots, 36–37
    - vector, 744–745, 746
  - Addition method
    - nonlinear systems solved by, 814–817
    - systems of linear equations in three variables solved by, 793–794
    - systems of linear equations in two variables solved by, 775–778
    - variables eliminated using, 775–778, 793–796, 814–817
  - Addition property of inequality, 124
  - Additive identity, 12
    - for matrices, 874
  - Additive inverses, 13
    - for matrices, 874
  - Aging rate of astronaut, 44
  - Alcohol, in a person's blood, 15–16
  - Algebra, Fundamental Theorem of, 352–353
  - Algebraic expressions, 2–3
    - containing fractional and negative exponents, factoring, 67
    - defined, 2
    - evaluating, 3
    - properties of negatives applied to, 14–15
    - simplifying, 13–14, 15, 87
    - terms of, 13
  - Algebra of functions, 233–237
    - applying, 236–237
    - difference, 234
    - product, 234, 235
    - quotient, 234, 235
    - sum, 234, 235
    - using, 233–234
  - Allen, Woody, 1067
  - Ambiguous case, triangle in, 685
    - solving, using Law of Sines, 685–688
  - Amount of rotation formula, 966
  - Amplitude
    - of cosine function, 561–563
    - of simple harmonic motion, 606, 608
    - of sine function, 553–558
    - of sine wave, 660
  - Amusia, sound quality and, 633, 635
  - Analytic geometry, 142
  - Analytic trigonometry, 621–680
    - double-angle formulas, 644–647, 651
    - half-angle formulas, 648–650, 651
    - power-reducing formulas, 647–648, 651
    - product-to-sum formulas, 657
    - sum and difference formulas, 633–644, 651
    - sum-to-product formulas, 658–659
    - trigonometric equations, 664–677
    - verifying trigonometric identities, 622–633
  - And probabilities with independent events, 1077–1079
  - Angle(s), 492–507
    - acute, 493, 523–524, 528
    - central, 494, 495
    - conversion between degrees and radians, 495–496
    - coterminal, 500–502, 542–543
    - of depression, 530
    - direction, 747, 748–749
    - of elevation, 530–532
    - equations involving multiple, 666–667
    - formed by revolutions of
      - terminal sides, 497–499
    - initial side of, 492–493
    - lying in quadrant, 493
    - measuring, using degrees, 493–494, 499, 547
    - measuring, using radians, 494–495, 499, 547
    - naming, 492
    - negative, 493, 499
    - notation, 493
  - obtuse, 493
  - positive, 492, 493, 499
  - quadrantal, 493, 537–538, 547
  - reference, 541–547
  - right, 493
  - in standard position, 492, 493, 497–499
  - straight, 493
  - terminal side of, 492–493
    - between two vectors, 756
    - vertex of, 492
- Angular speed, 503, 504
- Annuities, 1030–1032
- Architecture
  - angles in, 492
  - hyperbolas in, 943
- Area
  - formulas for, 111
  - maximizing, 311–312
  - of oblique triangle, 688
  - of a rectangle with fixed perimeter, modeling, 271–273
  - of a triangle, 698
- Argument of complex number, 728
- Arithmetic sequences, 1013–1023
  - applications with, 1019–1020
  - common difference of, 1013–1014
  - defined, 1014
  - general term of, 1015–1017, 1018
  - sum of first  $n$  terms of, 1017–1020
  - writing terms of, 1015
- Armstrong, Neil, 402
- Arrow notation, 362–364
- Arrows
  - in graph, 163
  - in limit notation, 1093
  - showing orientation of curve, 976
- Ars Magna* (Cardano), 346
- Associative property
  - of addition, 12
  - and English language, 12
  - of matrix addition, 874
  - of matrix multiplication, 881
  - of multiplication, 12
  - of scalar multiplication, 876, 881
- Asteroids, 811
- Asymptotes, 363
  - of graph, horizontal and vertical, 416, 417, 431–432
  - horizontal, in graph of logistic growth model, 470
  - horizontal, of rational functions, 366–368
  - of hyperbola, 936–937, 938–939, 941, 943, 965
  - of rational functions, 372–373
  - vertical, of rational functions, 364–366
- Augmented matrix, 850–858, 862–863, 864, 866, 867, 893, 894
- Average cost, business problems involving, 374–375
- Average cost function, 374–375
- Average rate of change, 207, 1125, 1131–1133
  - of a function, 207–209
  - slope as, 207–209
- Average velocity, 210–211, 1133
  - time involved in uniform motion and, 375–376
- Axis
  - conjugate, 937
  - imaginary, 726
  - polar, 702–703
  - real, 726
  - of symmetry, 300, 989
    - of parabola, 301, 949, 950, 953
    - polar axis as, 986, 988, 989
- B**
- Babbage, Charles, 902
- Back-substitution, 793–795
  - Gaussian elimination with, 852–857
- Base
  - change-of-base property, 446–448
  - natural ( $e$ ), 420–421, 437, 477
- Bearings
  - defined, 604
  - solving problems involving, 604–605
- Berlin Airlift, 835
- Binomial(s), 49
  - common binomial factor, factoring out, 59
  - cubing, 53
  - multiplying trinomial and, 50–51
  - product of two, 51–52
  - squaring, 53
- Binomial coefficients, 1049
- Binomial expansions, 1049–1052
  - finding particular term in, 1052
  - patterns in, 1049–1050
- Binomial Theorem, 1049–1052
- Biorhythms, 491
- Blood-alcohol concentration (BAC), 15–16, 458–459
- Boundary points, 382–383
  - locating on number line, 383, 385, 386, 388
- Braces, 5
- Brackets, 121
- Branches, of hyperbola, 933, 943
- Break-even analysis, 783–785
- Break-even point, 783–784
- Breathing cycle, modeling air flow in, 566
- Burrows, Christopher J., 956
- Business
  - average cost for, 374–375
  - functions, 783–785
- C**
- Calculator. *See also* Graphing calculators/graphing utilities; Scientific calculators
  - changing angle from degree, minute, second notation to decimal form, 494

## 12 Subject Index

- Calculator (*cont.*)  
degree vs. radian mode, setting, 518  
evaluating inverse trigonometric functions with, 593  
evaluating trigonometric functions using, 518–519  
inverse trigonometric function keys on, 672  
radian mode on, 672  
solving trigonometric equation using, 672–673
- Calculus, 1091–1142. *See also* Limits and change studies, 210  
derivatives, 1125–1137  
fractional expressions in, 80–81  
instantaneous velocity in, 211, 1133–1134  
in Japan, 1109  
motion and change analyzed in, 1092, 1125  
partial fraction decomposition in, 800–810
- Carbon dating, 469
- Carbon dioxide concentration, global temperature and atmospheric, 141, 196–197
- Cardano, Girolamo, 299, 346
- Cardioids, 718
- Carlin, George, 1066
- Cartesian coordinate system, 142.  
*See also* Rectangular coordinate system
- Cayley, Arthur, 880
- Centaurus galaxy, 1048
- Center  
of circle, 258, 259, 261–262  
of ellipse, 921  
of hyperbola, 933
- Central angle, 494, 495  
length of circular arc intercepted by, 502–503
- Centrifugal force, modeling, 400–401
- Change-of-base property, 446–448

## 14 Subject Index

- Ellipse(s) (*cont.*)  
horizontal and vertical  
    elongations of, 921  
identifying, 963, 972  
parametric vs. rectangular  
    representation of, 980  
polar equation of, graphing,  
    987–988  
rotated, transforming to standard  
    form, 968–969  
standard form of equation of,  
    921–925
- Ellipsis, 5
- Empirical probability, 1068–1069  
    formula, 1068  
    with real-world data, 1068–1070
- Empty set, 6, 91
- $e$  (natural base), 437  
    evaluating functions with,  
        420–421  
    expressing exponential model  
        in, 477
- End behavior, 319–322  
    determining, 326–327
- Endeavor space shuttle, 956
- English language  
    associative property and, 12
- English sentences, and inequalities,  
    123
- Equal and unequal one-sided limits,  
    1098–1099
- Equality of complex numbers, 293
- Equal matrices, 873
- Equals sign, 3, 823
- Equal vectors, 740–741
- Equation(s), 3. *See also* Linear  
    equations; Polynomial equations  
    absolute value, 92–93  
    dependent, 779, 796, 864, 865  
    equivalent, 86–87  
    exponential, 451–455, 458–461  
    functions as, 158–159  
    graphing, 143–149  
    graphing, using point-plotting  
        method, 143–144  
    of the inverse, finding, 248–250  
    inverse variation, 398  
    logarithmic, 455–461  
    matrix, solving, 876–877, 896–897  
    modeling with, 106–119  
    polar, 708–709, 714  
    rational, 89–91  
    trigonometric, 664–677  
    in two variables, 143  
    of variation, 394  
    word problems solved using,  
        107–116
- Equation of line  
    general form, 194–195, 196, 206  
    horizontal lines, 194, 196  
    parallel to given line, 203–204  
    point-slope form of, 190–191,  
        196, 203–204, 205–206, 1128,  
        1129  
    slope-intercept form of, 192–193,  
        195, 196, 205, 1128  
    tangent lines, 1127–1128  
    various forms of, finding, 196  
    vertical lines, 194, 196
- Equilibrium, 752
- Equilibrium position, 606
- Equivalent equations, 86–87
- Equivalent inequalities, 123, 124
- Euler, Leonhard, 437
- Evaluating an algebraic  
    expression, 3
- Evaluating the function, 160–161  
    piecewise function, 178–180
- Even function, 176–178  
    cosine function as, 561  
    definition of, 176  
    secant function as, 578  
    y-axis symmetry and, 178
- Even multiplicity, zero of, 324
- Even-odd identities, 622
- Even roots, 40
- Event(s)  
    defined, 1070  
    empirical probabilities assigned  
        to, 1068  
    independent, 1077–1079  
    mutually exclusive, 1074–1075  
    non-mutually exclusive,  
        1075–1077  
    theoretical probability of,  
        1070–1073
- Even trigonometric function,  
    513–514  
    to find exact values, 514
- Exact value(s)  
    of composite functions with  
        inverse trigonometric  
        functions, 593–597  
    of  $\cos^{-1} x$ , 589–590  
    cosine of sum to find, using, 638  
    difference formula for cosines to  
        find, 635  
    double-angle formulas to find,  
        645–646  
    half-angle formula to find, 649  
    of  $\sin^{-1} x$ , 587–588  
    sine of sum to find, using, 637,  
        639  
    of  $\tan^{-1} x$ , 591–592  
    of trigonometric functions at  
         $t = \pi/4$ , 512–513  
    using even and odd functions to  
        find, 514
- Expanding a logarithmic expression,  
    441–445  
    and power rule, 443–444  
    and product rule, 441–442  
    properties for, 444  
    and quotient rule, 442–443
- Expanding binomials, 1049–1052
- Expanding the summation notation,  
    1007–1008
- Expansion by minors, 906, 908
- Experiment, 1070
- Exponential equations  
    applications of, 458–461  
    defined, 451  
    logarithms used in solving,  
        453–455  
    solving, 452–455
- Exponential expression, 2  
    simplifying, 22–24, 43–44
- Exponential form, 428  
    changing from, to logarithmic  
        form, 429  
    changing from logarithmic form  
        to, 428  
    location of base and exponent  
        in, 428
- Exponential functions, 414–427  
    characteristics of, 417  
    defined, 414  
    evaluating, 415  
    examples of, 414  
    exponential growth, 418  
    expressing model in base  $e$ , 477  
    graphing, 415–417, 430–433  
    modeling data with, 471–477  
    natural, 420  
    transformations involving,  
        418–419
- Exponential growth, 1025–1028
- Exponential growth and decay  
    models, 466–470
- Exponential notation, 2
- Exponents, 2–3, 20–21  
    fractional, factoring involving, 67  
    and large numbers, 24  
    negative, 24, 25, 67  
    properties of, 43  
    rational, 41–44
- Extraneous solutions, 101
- F**
- Face cards, 1071
- Factorial notation, 1005–1006
- Factorials, from 0 through 20, 1005
- Factoring  
    algebraic expressions containing  
        fractional and negative  
        exponents, 67  
    difference of two squares, 63–64  
    to find limits, 1112–1113  
    perfect square trinomials, 64  
    polynomials, 58–70  
    polynomials, strategy for, 65–67  
    quadratic equations solved by,  
        93–94, 100  
    separating different functions in  
        trigonometric equation using,  
        668–669  
    over the set of integers, 58  
    sum and difference of two cubes,  
        65  
    trinomial in two variables, 62–63  
    trinomial whose leading  
        coefficient is not 1, 61–62  
    trinomial with leading coefficient  
        of 1, 60–61  
    verifying an identity using,  
        625–626
- Factoring by grouping, 59
- Factoring completely, 58, 63
- Factoring out Greatest Common  
    Factor, 58–59, 67
- Factors  
    in denominator, partial fraction  
        decomposition and, 801–809  
    of polynomials, 337  
    of term, 13
- Factor Theorem, 341–343
- Fermat, Pierre de, 142, 1040, 1048
- Fermat's Last Theorem, 1040, 1048
- Ferrari, 346
- Fibonacci (Leonardo of Pisa), 1002
- Fibonacci numbers, on piano  
    keyboard, 1002
- Fibonacci sequence, 1002
- Finite sequences, 1003
- First terms, in binomial, 52
- Fixed cost, 783–784
- Focus-directrix definitions of conic  
    sections, 985
- Focus (foci)  
    of ellipse, 921  
    of hyperbola, 933, 934, 935–936,  
        938, 939  
    of parabola, 949–955
- FOIL method  
    and factoring by grouping, 59  
    and factoring trinomials, 60,  
        62–63  
    for multiplying complex  
        numbers, 294, 730  
    for multiplying polynomials,  
        51–52  
    for multiplying polynomials in  
        two variables, 54
- Forces, computing work done by,  
    760–761
- Force vector, 748–749
- Formula(s), 3  
    amount of rotation, 966  
    for the angle between two  
        vectors, 756  
    for area, perimeter, and volume,  
        111  
    Binomial Theorem, 1050  
    for combinations, 1062–1064  
    compound interest, 422, 459–460,  
        466–467, 1030  
    distance, 257–258, 259, 275, 921  
    double-angle, 644–647, 651  
    empirical probability, 1068  
    exponential growth and decay,  
        467  
    for finding limits, 1105, 1111  
    functions from, 270–275  
    for general term of arithmetic  
        sequence, 1015, 1018  
    for general term of geometric  
        sequence, 1024–1027  
    half-angle, 648–650, 651  
    linear speed, 503  
    and mathematical models, 3–5  
    midpoint, 258–259  
    permutations, 1058–1060  
    power-reducing, 647–648, 651  
    product-to-sum, 657  
    quadratic, 97–98  
    radian measure, 495  
    recursion, 1004–1005  
    rotation of axes, 963–965  
    simple interest, 274  
    slope of the tangent line, 1127  
    solving for variable in, 91–92  
    special-product, 52–53  
    sum and difference, 633–644, 651  
    sum of first  $n$  terms of an  
        arithmetic sequence,  
            1017–1020  
    sum of first  $n$  terms of geometric  
        sequence, 1027–1030  
    sum-to-product, 658–659  
    for surface area, 273  
    Tartaglia's secret, 346  
    uniform motion, 375, 782  
    value of an annuity, 1030, 1031  
    variation, 394
- Fourier, John, 607, 662
- Fraction(s)  
    complex. *See* Complex rational  
        expressions

- with factorials, evaluating, 1006
- linear equations with, 88–89
- partial, 800–811
- partial fraction decomposition, 800–810
- writing repeating decimal as, 1033–1034
- Fractional equation (rational equations), 89–91
- Fractional exponents, factoring algebraic expressions containing, 67
- Fractional expressions
  - in calculus, 80–81
  - verifying an identity by combining, 626–627
- Free-falling object, modeling position of, 389–390
- Frequency, 607
  - of object in simple harmonic motion, 607, 608
  - of sine wave, 660
- Function(s), 141, 154–202. *See also* Exponential functions; Logarithmic functions; Polynomial functions; Quadratic functions; Rational functions
  - algebra of, 233–237
  - analyzing graphs of, 163–164
  - average cost, 374–375
  - average rate of change, 207–209
  - business, 783–785
  - combinations of, 231–237
  - composite, 237–240
  - constant, 174–175, 194, 319, 1104–1105
  - continuous, 1117, 1118–1119
  - cost, 374–375, 783–784
  - decomposing, 241–242
  - defined, 157
  - derivative of, 1129–1134
  - determining domain, 235
  - difference quotients of, 180–181
  - discontinuous, at a number, 1118, 1119–1121
  - domain of, 165–167, 231–233
  - as equations, 158–159
  - evaluating, 160–161
  - even, 176–178
  - even trigonometric, 513–514
  - finding a limit by graphing, 1096
  - from formulas, 270–275
  - graphing, 161–167, 173–187, 216
  - graphs of common, recognizing, 216
  - greatest integer, 180
  - identifying intercepts from graph of, 167
  - identity, 1104–1105
  - increasing and decreasing, 173–175
  - inverse, 245–256, 428
  - linear, 161, 188–202
  - modeling with, 266–281
  - objective, 835–836, 838
  - odd, 176–178, 513–514
  - one-to-one, 252
  - parametric equations for, finding, 979–980
  - periodic, 516–518
  - piecewise, 178–180, 1096, 1112, 1119–1121

  - of complex numbers, 726–727
  - continuous, 319
  - of continuous function, 1117
  - of cosecant function, 577–579, 580
  - of cosine function, 560–564, 580

## 16 Subject Index

- Graphs/graphing (*cont.*)  
of cotangent function, 575–577, 580  
ellipse, 923–927  
equations, 143–149  
even functions, 177–178  
exponential functions, 415–417, 430–433  
finding limits using, 1095–1096, 1098–1099  
functions, 161–167, 173–187, 216  
general second-degree equation, 969  
and horizontal line test, 251–252  
horizontal shifts, 218–220, 224, 225, 226, 418, 432  
horizontal stretching and shrinking, 223–224, 225, 418, 432  
hyperbolas, 937–943  
information obtained from, 163–164  
interpreting information given by, 147–149  
inverse functions, 252–253, 592  
lemniscates, 721  
limaçons, 718  
linear inequalities in two variables, 823–826  
lines, 147–149  
logarithmic functions, 430–433  
modeling periodic behavior, 565–568  
nonlinear inequalities in two variables, 826–827  
odd functions, 177–178  
one-to-one function, 252  
parabolas, 950–955  
piecewise function, 179–180  
plane curves described by parametric equations, 975–976  
polar equations, 714–724, 987–991  
polynomial functions, 319–322, 326–329  
quadratic functions, 300–306  
in form  $f(x) = ax^2 + bx + c$ , 96  
rational functions, 368–372  
real numbers, 8  
reciprocal function, 363–364  
rectangular equation of curve defined parametrically, 977–979  
reflection about the  $x$ -axis, 220–221, 224  
reflection about the  $y$ -axis, 221, 224  
reflections of, 220–221, 224, 252, 418, 432, 433  
relative maximum or relative minimum on, 175–176  
rose curves, 719–720  
secant function, 577–579  
sequences, 1003–1004  
transformations, 224–226  
sine function, 551–560, 580  
smooth, 319  
systems of linear equations in two variables solved by, 773, 779  
systems of linear inequalities, 828–831  
tangent function, 572–575, 580  
of transformations of functions, 215–230  
using intercepts, 146–147, 195–196  
vertical lines, 194  
vertical shifts, 216–217, 220, 224, 225, 226, 564–565  
vertical stretching and shrinking, 222–223, 224, 225, 226, 418, 432  
Gravitation, Newton’s formula for, 400  
Greater than or equal to symbol, 9, 120  
Greater than symbol, 9, 120  
absolute value inequalities using, 127  
Greatest Common Factor (GCF), 58  
common binomial factor, 59  
factoring out, 58–59, 67  
Greatest integer function, 180  
Ground speed, 752  
Grouping/grouping method, factoring by, 59  
Growing entity, 467  
Growth models, logistic, 470–471  
Growth rate, for world population, 466
- H**  
Half-angle formulas, 648–650, 651  
Half-life, 469  
Half-planes, 823  
Halley’s Comet, 929, 943, 955  
Harding, Warren G., 656  
Harmonic motion, simple, 605–608  
Harvey, William, 142  
Heron’s formula, 698  
Higher-order determinants, 910–911  
Horizontal asymptote(s)  
definition of, 367  
of exponential function, 431–432  
locating, 367  
in logistic growth model, 470  
of rational functions, 366–368, 370, 371, 372, 375  
 $x$ -axis as, 416, 417  
Horizontal component of vector, 742  
Horizontal lines, 196  
equations of, 194, 196  
Horizontal line test  
applying, 251–252  
for inverse functions, 250–252  
Horizontal shifts, 218–220, 224, 225, 226  
of exponential function, 418  
to left, 218, 219  
of logarithmic function, 432  
to right, 218  
Horizontal stretching or shrinking, 223–224, 225  
of exponential function, 418  
of logarithmic function, 432  
Hubble Space Telescope, 948, 956, 957  
Hyperbolas, 920, 933–948  
applications with, 943–944  
asymptotes of, 936–937, 938–939, 941, 943, 965  
definition of, 933  
eccentricity for, 985  
focus-directrix definition of, 985  
graphing, 937–943  
identifying, 963, 972  
polar equation of, graphing, 990–991  
standard form of equation of, 934–936, 940, 965  
Hyperbolic cosine function, 427  
Hyperbolic sine function, 427  
Hypocycloid, 983  
Hypotenuse of right triangle, 113, 524  
Pythagorean Theorem to find length of, 525, 526
- I**  
 $i$  (imaginary unit), 292–293  
square roots of negative numbers in terms of, 295–296  
IBM, 902  
Identity(ies), 664  
for cosine of difference of two angles, 633–635  
double-angle formulas, 644–647, 651  
fundamental trigonometric, 622–633  
half-angle formulas, 648–650, 651  
principal trigonometric, 644–651  
product-to-sum formulas, 657  
Pythagorean, 622, 671  
quotient, 515, 622  
reciprocal, 622  
solving trigonometric equations using, 669–672  
sum-to-product formulas, 658–659  
trigonometric. *See* Trigonometric identities  
verifying. *See* Verifying an identity  
Identity function  
graph of, 216  
limits of, 1104–1105  
Identity property  
of addition, 12  
of multiplication, 12  
scalar, 876  
Imaginary axis, 726  
Imaginary numbers, 292  
Imaginary part, of complex number, 292  
Incidence ratio, 379  
Inconsistent systems, 778–779, 796  
determinants used for identifying, 910  
geometric possibilities for, 864  
Increasing function, 174–175  
relative maximum/minimum, 175–176  
Independent events, 1077–1079  
Independent variable, 158  
Index, 39  
reducing, 44  
of summation, 1007, 1008  
Individual Retirement Account, 1030–1032  
Induction. *See* Mathematical induction  
Inequalities  
absolute value, 127–129  
compound, 126–127  
and English sentences, 123  
equivalent, 123, 124  
isolating  $x$  in middle of, 126  
polynomial, 381–386, 389–390  
rational, 387–389  
solution set of, 120  
solving, 123–126  
triangle, 11  
Inequality symbols, 9, 120, 823  
reversal of direction of, 124  
Infinite geometric series, 1032–1034  
sum of, 1032–1034  
Infinite interval, 120  
Infinite sequence, 1003  
Infinity symbol, 120  
Initial point  
of directed line segment, 740  
of vector at origin (position vector), 743  
Initial side of angle, 492–493  
Inside terms, in binomial, 52  
Instantaneous rate of change, 1126, 1127, 1129, 1130  
finding, 1131–1133  
Instantaneous velocity, 211, 1133–1134  
Integers, 7  
Intercepts  
for graphing linear equations, 195–196  
graphing using, 146–147, 195–196  
identifying, 147  
identifying, from function’s graph, 167  
Interest  
compound, 421–423, 459–460, 466–467, 1030, 1031  
simple, 274  
Interest rates, doubling time and, 460  
Intermediate Value Theorem, 325–326  
Intersection(s)  
of intervals, 121–122  
of sets, 5–6, 232  
Interval notation, 120–121, 126, 232  
to represent function’s domain and range, 165, 166  
Intervals  
closed, 120  
infinite, 120  
intersections and unions of, 121–122  
of nonrestricted cosine function, 592  
open, 120, 174, 175  
on real number line, 121  
satisfying polynomial inequality, 384, 385, 386  
satisfying rational inequality, 388  
on which function increases, decreases, or is constant, 174–175  
Inverse  
additive, 13, 874  
equation of the, finding, 248–250  
multiplicative (reciprocal), 13, 74  
Inverse cosine function, 588–590  
defined, 589  
exact values of, 589–590  
inverse properties, 594  
Inverse function(s), 245–256, 585  
defined, 247

- of exponential function. *See* Logarithmic functions  
 finding, 248–250  
 graphing, 252–253  
 horizontal line test for, 250–252  
 inverse of domain-restricted function, finding, 253  
 notation, 247, 248  
 verifying, 247–248
- Inverse property(ies)  
 of addition, 12  
 of logarithms, 430  
 of multiplication, 12  
 using, 436
- Inverse sine function, 531, 585–588  
 defined, 586  
 exact values of, finding, 587–588  
 inverse properties, 594  
 notation, 586  
 simplifying expression involving, 597
- Inverse tangent function, 590–592  
 defined, 590  
 exact values of, 591–592  
 inverse properties, 594
- Inverse trigonometric functions, 585–601  
 exact values of composite functions with, 593–597  
 inverse properties, 594  
 using calculator to evaluate, 593
- Inverse variation, 397–399  
 in combined variation, 399–400  
 equations, 398  
 problem solving, 397–399
- Inverted cycloid, 981
- Invertible square matrix, 891, 894–895
- Investments  
 choosing between, 422–423  
 and compound interest, 422–423, 459–460, 1031
- Irrational number, 7  
 natural base  $e$ , 420–421, 437, 477  
 as solutions to quadratic equations, 99
- Isolating  $x$  in the middle of inequality, 126
- Isosceles right triangle, 526
- J**
- Japan, calculus in, 1109
- Jeter, Derek, 983
- Job offers, 1023
- Joint variation, 400–401
- Jordan, Wilhelm, 857
- K**
- Kahl, Joseph, 916
- Kepler, Johannes, 928, 991
- Kidney stone disintegration, 919, 928
- Kim, Scott, 300
- Kurzweil, Ray, 418
- L**
- Laffer, Arthur, 345
- Large numbers  
 and exponents, 24  
 names of, 24
- Last terms, in binomial, 52
- Latus rectum of parabola, 951, 952, 954, 955
- Law of Cosines, 694–702  
 applications of, 697–698  
 defined, 695  
 derivation, 694–696  
 dot product formula derived using, 756  
 oblique triangles solved using, 695–697
- Law of Sines, 682–693, 696, 697  
 ambiguous case, solving triangle in, 685–688  
 applications of, 688–689  
 area of oblique triangle, finding, 688  
 defined, 682  
 derivation of, 682–683  
 solving oblique triangle using, 683–685
- Leading coefficient, 49, 318
- Leading Coefficient Test, 319–322
- Leaning Tower of Pisa, 389–390
- Least common denominator (LCD)  
 finding, 76–77  
 in solving linear equation involving fractions, 88  
 in solving rational equations, 89, 91
- Left-hand limit, 1097, 1098
- Legs, of right triangle, 113
- Leibniz, Gottfried, 1104, 1106
- Lemniscates, 721
- Less than or equal to symbol, 9, 120
- Less than symbol, 9
- Light, theory of, 981
- Like radicals, 36  
 adding and subtracting, 36
- Like terms, 13  
 combining, 13, 14, 50
- Limaçon, 718
- Limitations, inequalities to describe, 836–837
- Limit notation, 1093  
 for one-sided limits, 1097
- Limits, 1093–1123  
 of constant functions, 1104–1105  
 continuity and, 1117–1123  
 derivative of a function and, 1129–1134  
 of difference, 1106, 1111  
 finding  
 by factoring, 1112–1113  
 by rationalizing a numerator, 1113  
 using graphs, 1095–1096, 1098–1099  
 using properties of limits, 1104–1116  
 using tables, 1093–1095  
 of fractional expressions when limit of denominator is zero, 1112–1114  
 of identity function, 1104–1105  
 instantaneous rate of change, 1127, 1131–1133  
 of monomial, 1108  
 one-sided, 1097–1099, 1112  
 of polynomial, 1109  
 of power, 1109–1110, 1111  
 of product, 1107, 1111  
 properties of, 1105–1113  
 of quotient, 1110–1111  
 of root, 1110, 1111
- slope of tangent line, 1127–1128  
 of sum, 1106, 1111
- Line(s)  
 equations of, 196. *See also* Equation of line  
 parallel, 203–204, 778  
 perpendicular, 204–206  
 regression, 188  
 secant, 207–208, 210, 1125, 1126  
 slope of, 188–190  
 tangent, to circle, 266
- Linear combination of vectors, 742
- Linear equations, 86–89  
 defined, 86  
 with fractions, 88–89  
 intercepts used for graphing, 195–196  
 in one variable, 86  
 solving, 86, 87–89  
 in three variables, 792–800
- Linear Factorization Theorem, 353–354
- Linear factors  
 partial fraction decomposition with, 803–805  
 partial fraction decomposition with distinct, 801–803
- Linear functions, 161, 188–202, 319  
 constant function, 194, 319  
 data modeled with, 196–197  
 graphing in slope-intercept form, 192–193  
 limit of, 1109
- Linear inequalities  
 in one variable, 120, 123–126  
 problem solving with, 129–130  
 properties of, 124  
 solving, 123–126  
 systems of, 827–831, 835–842  
 in two variables, 822–826
- Linear numerators, partial fraction decomposition with, 805–806, 807–808
- Linear programming, 835–842  
 constraints in, 836–837  
 objective functions in, 835–836, 838  
 problem solving with, 837–839
- Linear speed, 503, 504
- Linear systems. *See* Systems of linear equations
- Line graphs, 147  
 interpreting, 147–149
- Line segments  
 directed, 740–741  
 midpoint of, 258–259
- Lissajous Curve, 983
- Logarithmic equations, 455–461  
 applications of, 458–461  
 defined, 455  
 one-to-one property of logarithms to solve, 458  
 product rule used for solving, 457  
 quotient rule used for solving, 458  
 solving, 455–458
- Logarithmic expressions  
 condensing, 445–446  
 expanding, 441–445
- Logarithmic form, 428  
 changing from exponential form to, 429  
 changing to exponential form from, 428
- equations in, 428  
 location of base and exponent in, 428
- Logarithmic functions, 427–440  
 with base  $b$ , 428  
 change-of-base property to graph, 448  
 common, 434–435  
 definition of, 427–428  
 domain of, 433  
 graphs of, 430–433  
 modeling data with, 471–477  
 natural, 435–436  
 transformations involving, 432–433
- Logarithmic properties, 441–450  
 change-of-base property, 446–448  
 involving one, 429  
 power rule, 443–444, 445  
 product rule, 441–442, 444, 445, 457  
 quotient rule, 442–443, 444, 445, 458  
 using, 429–430
- Logarithmic regression option, graphing utility, 474
- Logarithms  
 common, 434–435, 447  
 evaluating, 429  
 inverse properties of, 430  
 natural, 435–436, 447, 448, 453–455  
 one-to-one property of, solving logarithmic equations using, 458
- Logistic growth model, 470–471
- Long division, polynomial, 334–338
- Lower limit of summation, 1007, 1008
- M**
- Mach, Ernst, 654
- Magnitude, 740  
 of directed line segment, 740  
 and direction. *See* Vector(s)  
 equal vectors with same direction and, 740–741  
 scalars involving, 740  
 of single point, 742  
 of vector in rectangular coordinates, finding, 743  
 writing vector in terms of its direction and, 747–748
- Main diagonal, 850
- Major axis, of ellipse, 921, 923, 924, 925, 926–927
- Malthus, Thomas, 1025
- Mandelbrot set, 726, 735
- Marx, Groucho, 1066
- Mathematical induction, 1040–1048  
 domino analogy illustrating, 1041  
 principle of, 1040–1043  
 proving statements about positive integers using, 1043–1046  
 steps in proof by, 1041
- Mathematical models/modeling, 4, 148–149. *See also* Modeling and formulas, 3–5  
 with systems of linear inequalities, 827–828  
 word problems, solving, 107–116

## 18 Subject Index

- Mathematics, universality of, 1053  
Matrix equations, solving, 876–877  
    using inverse of matrix, 896–897  
Matrix (matrices), 849–918  
    augmented, 850–858, 862–863, 893, 894  
    coded, 897–898  
    coding, 897  
    coefficient, 895  
    column, 895  
    constant, 895  
    determinant of  $2 \times 2$ , 902–903  
    determinant of  $3 \times 3$ , 905–908  
    equal, 873  
    inconsistent and dependent systems identified with, 862–871  
    linear systems solved using, 850–862  
    multiplicative inverse of, 888–901  
    nonsquare, 891  
    notation for, 872–873  
    of order  $m \times n$ , 872  
    square, 872, 888–896  
    zero, 874  
Matrix operations, 872–887  
    addition, 873–874  
    applications, 881–883  
    multiplication, 877–881  
    scalar multiplication, 875–876  
    solving matrix equations involving, 876–877  
    subtraction, 873–874  
Matrix row operations, 851–852  
Maximized quantity, objective function describing, 835–836, 838  
Maximum, relative, 175–176  
Maximum point  
    on cosine curve, 579  
    in graph of cosine function, 563, 564  
    in graph of sine function, 552, 553, 554, 557, 559, 562  
    on sine curve, 578  
Maximum value of quadratic functions, 306–312  
Midpoint formula, 258–259  
Minimized quantity, objective function describing, 835–836  
Minimum, relative, 175–176  
Minimum function feature, on graphing utility, 796  
Minimum point  
    on cosine curve, 579  
    in graph of cosine function, 563, 564  
    in graph of sine function, 552, 553, 554, 557, 559, 562  
    on sine curve, 578  
Minimum value of quadratic functions, 306–312  
Minor, 906, 911  
    expansion by, 906, 908  
Minor axis, of ellipse, 921, 926–927  
Mixture problem, solving, 780–781  
Model breakdown, 5  
Modeling. *See also* Mathematical models/modeling  
    chaos theory and, 681  
    with equations, 106–119  
    with exponential and logarithmic functions, 473–476  
    with functions, 266–281  
    music, 607  
    periodic behavior, 565–568  
    simple harmonic motion, 605–608  
    with variation, 394–404  
    verbal models, 266–270  
Modulus of complex number, 728  
Monomials, 49  
    limit of, 1108  
    multiplying, 50  
    multiplying polynomial that is not monomial and, 50  
Monteverdi, 142  
Morphing, 215  
Motion  
    and change analyzed in calculus, 1092, 1125  
    uniform, 375–376, 782–783  
Moving object, parametric representation of, 980  
Multiple angles, trigonometric equations involving, 666–667  
Multiple representation of points, 704–705  
Multiplication  
    associative property of, 12  
    of binomial and trinomial, 50–51  
    commutative property of, 12  
    of complex numbers, 294, 729–730  
    of conjugates, 38–39  
    distributive property of, over addition, 12  
    identity property of, 12  
    inverse property of, 12  
    matrix, 877–881  
    of monomial and polynomial, 50  
    of monomials, 50  
    with numbers in scientific notation, 26  
    of numerator and denominator by same factor, verifying an identity by, 627  
    of polynomials, 50–53, 55  
    of polynomials in two variables, 54  
    product rule. *See* Product rule of radical expressions, 40–41  
    of rational expressions, 73–74  
    of real numbers, 12  
    scalar, 741, 745, 746, 875–876  
    of sum and difference of two terms, 53  
Multiplication property of inequality, 124  
Multiplicative identity, 12  
Multiplicative identity matrix, 888–891  
Multiplicative inverse of matrix, 888–901  
    applications to coding, 897–898  
    of  $n \times n$  matrices with  $n$  greater than 2, 892–895  
    quick method for finding, 891, 892  
    solving systems of equations using, 895–897  
    of a square matrix, 888–896  
Multiplicative inverse (or reciprocal), 13, 74  
Multiplicities of zeros,  $x$ -intercepts and, 324–325, 327  
Multiplier effect, and tax rebates, 1034  
Music  
    sinusoidal sound, 660  
    sound quality and amusia, 633, 635  
Mutually exclusive events, 1074–1075  
**N**  
National debt, 20, 24, 27–28  
Natural base ( $e$ ), 420–421, 437, 477  
Natural exponential function, 420  
Natural logarithmic functions, 435–436  
Natural logarithms, 435–436  
    changing base to, 448  
    exponential equations solved using, 453–455  
    introducing, 447  
    properties of, 436  
Natural numbers, 7  
 $n$  compounding periods per year, 422  
Negative angles, 493, 499  
Negative discriminants, 297  
Negative-exponent rule, 21  
Negative exponents, 24, 25, 67  
Negative multiplication property of inequality, 124  
Negative numbers, 8  
    multiplying a vector by, 741  
    properties of, 14–15  
    square root of, 33  
        as multiples of  $i$ , 292  
        operations with, 295–296  
        principal, 295–296  
Negative real zeros, 354–355  
Negative reciprocal, 205  
Negative slope, 190  
Negative square root, 33  
Newton, Isaac, 437, 471  
    calculus developed by, 1104, 1106  
    gravitation formula of, 400  
Newton's Law of Cooling, 471–473  
 $n$  factorial ( $n!$ ), 437  
Nonlinear inequality in two variables, graphing, 826–827  
Nonlinear systems, 811–821  
    applications with, 817–818  
    recognizing, 811  
    solving by addition method, 814–817  
    solving by substitution, 812–814  
Nonsingular square matrix, 891  
Nonsquare matrix, 891  
Nonsquare systems, 866  
 $n$ th-order determinant, 910  
 $n$ th partial sum, 1017, 1027  
 $n$ th roots  
    even and odd, 40  
    of real numbers, 39  
    solving radical equations containing, 101  
Numbers, sets of, 5  
    irrational numbers, 7  
    rational numbers, 7  
    real numbers, 6–8  
Numerator(s), 13  
    partial fraction decomposition with constant, 804, 808  
    partial fraction decomposition with linear, 805–806, 807–808  
    rationalizing, 81–82, 1113  
Numerical coefficient, 13  
**O**  
Objective functions, in linear programming, 835–836  
Objective functions, in linear programming, 838  
Oblique triangle, 682  
    abbreviating known measurements in, 683  
    area of, finding, 688  
    Law of Cosines to solve, 695–697  
    Law of Sines to solve, 683–685  
Obtuse angle, 493  
Odd function, 176–178  
    cosecant function as, 577  
    cotangent function as, 576  
    definition of, 176  
    and origin symmetry, 178  
    sine function as, 552  
    tangent function as, 572, 573  
Odd multiplicity, zero of, 324  
Odd roots, 40  
Odd trigonometric function, 513–514  
One radian, 494  
One-sided limits, 1097–1099, 1112  
    equal and unequal, 1098–1099  
    finding, by using graph, 1098–1099  
    left-hand and right-hand, 1097, 1098  
    using limit properties to find, 1112  
One-to-one correspondence, 8  
One-to-one functions, 252  
One-to-one property of logarithms, 458  
Open dots, 163  
Open intervals, 120, 174, 175  
Opposites (additive inverses), 13  
Orbits, planetary, 991  
Order, distinguishing between combination and permutation and, 1061  
Ordered pairs, 142  
    as solutions of systems, 772–773  
Ordered triples, as solution of system of linear equation in three variables, 792–793, 864  
Order of operations, 4  
Orientation, 976  
Origin, 8, 142  
    graphing ellipse centered at, 923–925  
    graphing ellipse not centered at, 925–927  
    graphing hyperbolas centered at, 937–940  
    graphing hyperbolas not centered at, 940–943  
    graphing parabolas with vertices at, 950–952  
    graphing parabolas with vertices not at, 952–955  
    modeling distance to point on graph from, 275  
Origin symmetry, 178, 573  
*Or* probabilities  
    with events that are not mutually exclusive, 1075–1077  
    with mutually exclusive events, 1074–1075  
    with real-world data, 1076–1077

- Orthogonal vectors, 757  
 dot product and, 757  
 vector as sum of two, 759–760
- Oscillatory motion, modeling, 605  
 diminishing motion with  
 increasing time, 606  
 simple harmonic motion, 605–608
- Outside terms, in binomial, 52
- P**
- Parabolas, 300–306, 920, 948–960  
 applications with, 955–957  
 and axis of symmetry, 301, 949, 950, 953  
 definition of, 948–949  
 downward opening, 300–302, 305–306, 950, 952, 953  
 eccentricity for, 985  
 finding parametric equations for, 979  
 focus-directrix definition of, 955  
 in form  $f(x) = ax^2 + bx + c$ , 304–306  
 in form  $f(x) = a(x - h)^2 + k$ , 301–303  
 graphing, 950–955  
 identifying, 963, 972  
 latus rectum of, 951, 952, 954, 955  
 leftward opening, 950, 953  
 polar equation of, graphing, 989  
 rightward opening, 950, 953  
 standard form of equation of, 949–955  
 translations of, 952–955  
 upward opening, 300–304, 306, 950, 953
- Parallel lines, 203–204  
 inconsistent system and, 778  
 and slope, 203–204
- Parallel vectors, 757
- Parameter, 975, 976–977
- Parametric equations, 974–984  
 advantages over rectangular equations, 980–981  
 defined, 975  
 for function  $y = f(x)$ , finding, 979  
 plane curves and, 974–979
- Parentheses  
 and distributive property, 14–15  
 in interval notation, 121  
 and simplifying algebraic expressions, 14
- Partial fraction, 800–811
- Partial fraction decomposition, 800–810  
 with distinct linear factors, 801–803  
 idea behind, 800–801  
 with prime, nonrepeated quadratic factors, 805–807  
 with prime, repeated quadratic factor, 807–809  
 with repeated linear factors, 803–805  
 steps in, 803
- Pascal, Blaise, 142, 1053
- Pascal's triangle, 1053

 graphing functions by, 161–162  
 in polar coordinate system, 702–704  
 in rectangular system, 142–143
- Point conversion  
 polar-to-rectangular, 705–706  
 rectangular-to-polar, 706–708
- Point-plotting method, 714  
 graphing equation using, 143–144, 714–715  
 graphing plane curves described by parametric equations, 975–976
- Points, plotting. *See* Plotting points
- Point-slope form of equation of line, 190–191, 196  
 perpendicular lines, 205–206  
 tangent line, 1128, 1129  
 writing, 191
- Polar axis, 702–703  
 as axis of symmetry, 986, 988, 989  
 symmetry with respect to, 716, 717, 719, 720, 986, 988, 989
- Polar coordinates, 702–713  
 circles in, 715  
 conic sections in, 984–994  
 equation conversion from rectangular coordinates to, 708–709  
 equation conversion to rectangular coordinates from, 709–710  
 multiple sets of, for given point, 704–705  
 plotting points with, 703–704  
 point conversion from rectangular coordinates to, 706–708  
 point conversion to rectangular coordinates from, 705–706  
 relations between rectangular coordinates and, 705  
 sign of  $r$  and point's location in, 703  
 tests for symmetry in, 716
- Polar coordinate system, 702  
 multiple representation of points in, 704–705  
 plotting points in, 702–704
- Polar equation, 708–709, 714  
 of conics, 985–991  
 graphing, 987–991  
 standard forms of, 986  
 conversion to rectangular equation, 709–710  
 converting rectangular equation to, 708–709  
 graphs of, 714–724  
 for planetary orbits, 991
- Polar form of complex number, 728–735  
 defined, 728  
 powers of complex numbers, 731–732  
 product of two complex numbers, 729–730  
 quotient of two complex numbers, 730–731  
 roots of complex numbers, 733–735
- Polar grids, 714
- Pole, 702–703  
 symmetry with respect to, 716, 717, 719, 720
- Polk, James K., 656
- Polynomial(s), 48–57  
 adding, 50  
 defined, 48  
 degree of, 49, 53  
 dividing, 334–340  
 dividing by those containing more than one term, 334–336  
 dividing using synthetic division, 338–340  
 factoring, 58–70  
 factoring completely, 58  
 limit of, 1109  
 long division of, 334–338  
 prime (irreducible over the integers), 58, 63  
 standard form of, 49  
 strategy for factoring, 60, 65–67  
 subtracting, 50  
 in two variables, 53  
 vocabulary of, 48–49
- Polynomial equations  
 Factor Theorem to solve, 341–343  
 Fundamental Theorem of Algebra and roots of, 352–353  
 properties of, 352  
 solving for roots of, 350–353  
 Tartaglia's formula giving root for third degree, 346
- Polynomial functions, 317–334  
 continuous at every number, 1119  
 definition of, 318  
 of degree  $n$ , 318  
 end behavior of, 319–322, 326–327  
 even-degree, 320, 322  
 example of, 291  
 with given zeros, finding, 353–354  
 graphs of, 319–322, 326–329  
 Intermediate Value Theorem for polynomials, 325–326  
 multiplicities of zeros of, 324–325, 327  
 odd-degree, 320, 321  
 quadratic functions, 300–317, 319, 796  
 rational zeros of, 347–348  
 Remainder Theorem used for evaluating, 340–341  
 turning points of, 326, 327  
 zeros of, 322–324, 327, 346–360
- Polynomial inequality, 381–386  
 definition of, 382  
 solving, 383–386  
 solving problems modeled by, 389–390
- Polynomial multiplication, 50–53, 55  
 FOIL method used in, 51–52  
 multiplying monomial and polynomial that is not monomial, 50  
 polynomials in two variables, 54  
 when neither is monomial, 50–51
- Ponzi schemes, 1027
- Population growth  
 geometric, 1025–1026  
 U.S., modeling, 467–468  
 world, 466. *See also* World population

 Pythagorean Theorem, 113–114  
 converse of, 114  
 and distance between two points,  
 257
- Q**  
 Quadrantal angle, 493, 537–538  
 degree and radian measures of,  
 547  
 trigonometric functions of,  
 539–540, 547  
 Quadrants, 142  
 signs of trigonometric functions  
 and, 540–541, 547  
 in which angle lies, finding, 540
- Quadratic equations  
 with complex imaginary  
 solutions, 297  
 defined, 93  
 determining most efficient  
 method for solving, 99–100  
 discriminant of, 98–99  
 in general form, 93, 97, 297  
 irrational solutions to, 99  
 rational solutions to, 99  
 solving  
 by completing the square, 96  
 by factoring, 93–94, 100  
 by square root property,  
 94–95, 99, 100  
 by using quadratic formula,  
 97–98, 100  
 Quadratic factors in denominator of  
 rational expression  
 prime, nonrepeated, 805–807  
 prime, repeated, 807–809  
 Quadratic formula, 97–98, 297  
 deriving, 97  
 quadratic equations solved with,  
 97–98, 100  
 trigonometric equation solved  
 using calculator and, 673  
 Quadratic functions, 270, 291,  
 300–317, 319, 796  
 applications of, 308–312  
 defined, 300  
 graphs of, 300–306  
 minimum and maximum values  
 of, 306–312  
 standard, graph of, 216  
 in standard form, 301–303, 304  
 Quadratic in form, solving equations,  
 667–668  
 Quantities  
 scalar, 739  
 vector. *See* Vector(s)  
 Quarterly compounding of interest,

- Sequences, 1002–1039  
 arithmetic, 1013–1023  
 defined, 1003  
 defined using recursion formulas, 1004–1005  
 factorial notation, 1005–1006  
 Fibonacci, 1002  
 finding particular terms of, from general term, 1003–1004  
 finite, 1003  
 geometric, 1023–1039  
 infinite, 1003  
 summation notation, 1006–1009  
 of transformations, 224–226
- Series, geometric, 1032–1034  
 infinite, 1032–1034
- Set(s), 5  
 empty (null), 6, 91  
 intersection of, 5–6, 232  
 of irrational numbers, 7  
 of numbers, 5  
 of rational numbers, 7  
 of real numbers, 6–8  
 union of, 6, 232
- Set-builder notation, 5, 120, 121, 126, 127  
 for *or* probabilities with mutually exclusive events, 1074  
 to represent function's domain and range, 165–166
- Sherpa, Ang Rita, 523
- Shrinking graphs  
 $\Sigma$ , 1007  
 horizontal, 223–224, 225, 418, 432  
 vertical, 222–223, 225
- Signs  
 Descartes's Rule of, 354–356  
 of trigonometric functions, 540–541, 547
- Simple harmonic motion, 605–608  
 analyzing, 607–608  
 diminishing motion with increasing time, 606  
 finding equation for object in, 606–607  
 frequency of object in, 607, 608  
 resisting damage of, 608
- Simple interest formula, 274
- Simplifying algebraic expressions, 13
- Simplifying complex numbers, 293
- Simplifying complex rational expressions  
 by dividing, 79  
 by multiplying by one, 79–80
- Simplifying exponential expressions, 22–24  
 common errors in, 24  
 with rational exponents, 43
- Simplifying radical expressions, 34, 37, 40–41, 44
- Simplifying rational expressions, 72–73
- Simplifying square roots, 35
- Sine (sin)  
 of  $30^\circ$  and  $60^\circ$ , evaluating, 527–528  
 of  $45^\circ$ , evaluating, 527, 528  
 as cofunction of cosine, 529
- defined, 524  
 double-angle formula for, 644, 645, 651  
 evaluating, 525  
 half-angle formula for, 648, 651  
 inverse, 531  
 Law of Sines, 682–693, 696, 697  
 power-reducing formula for, 651  
 product-to-sum formulas for, 657  
 rotation of axes and, 964–965  
 sum and difference formulas for, 636–639, 651  
 sum-to-product formulas for, 658–659  
 verifying an identity by changing to, 623–628
- Sine curve, 552  
 to obtain cosecant curve, 578–579  
 stretching and shrinking, 553  
 vertical shifts of, 564–565
- Sine function  
 amplitude of, 553–558  
 domain and range of, 511, 512, 552  
 domain of restricted, vs. interval of nonrestricted, 592  
 in form  $y = A \sin Bx$ , 556–558  
 in form  $y = A \sin(Bx - C)$ , 558–560  
 graph of, 551–560, 580  
 inverse, 585–588, 592, 597  
 inverse properties, 594  
 key points in graphing, 552–560, 562  
 modeling periodic behavior, 565–568  
 as odd function, 513–514, 552  
 period, 551–552, 553–558, 667  
 periodic properties of, 517  
 properties of, 552  
 of quadrantal angles, 539–540  
 reference angle to evaluate, 544  
 repetitive behavior of, 518  
 solving right triangles using, 603  
 variations of  $y = \sin x$ , graphing, 552–560  
 vertical shifts of sine curve, 564–565
- Sine waves, 660
- Singular square matrix, 891
- Sinusoidal functions, modeling musical sounds with, 607
- Sinusoidal graphs, 561, 564–565
- Sinusoidal sounds, 660
- Slant asymptotes, 372–373
- Slope  
 as average rate of change, 207–209  
 defined, 188, 206  
 interpreting, 206–207  
 of line, 188–190  
 negative, 190  
 notation for, 189  
 and parallel lines, 203–204  
 and perpendicular lines, 204–205  
 point-slope form of the equation of a line, 190–191, 196, 205–206  
 positive, 190  
 as rate of change, 206–207  
 of secant line, 1126  
 undefined, 190  
 zero, 190

- Slope-intercept form of equation of line, 192–193, 195, 196  
 linear functions graphed in, 192  
 modeling data with, 197  
 perpendicular lines, 205  
 tangent line, 1128
- Smooth graphs, 319
- Solution(s), 664  
 of equation in two variables, 143  
 extraneous, 101  
 of inequality, 120  
 of inequality in two variables, 822  
 of linear equation in one variable, 86  
 of nonlinear system in two variables, 811  
 of polynomial equation, 322, 350–353  
 of system of linear equations, 772–773  
 of system of linear equations in three variables, 792, 864  
 of system of linear inequalities, 827  
 of trigonometric equation, finding, 664–666
- Solution set  
 of inequality, 120  
 of linear equation in one variable, 86  
 of nonlinear system in two variables, 811  
 of system of linear equations in three variables, 792  
 of system of linear inequalities, 828
- Solving a formula for a variable, 91–92
- Solving an inequality, 120
- Solving an oblique triangle, 683–685
- Solving a right triangle, 601–604
- Solving linear equations, 86, 87–89
- Sonic boom, hyperbolic shape of, 943
- Sound quality and amusia, 633, 635

- Sphere  
 surface area formula for, 273  
 volume formula for, 111
- Square  
 area and perimeter formulas for, 111  
 perfect, 34
- Square matrix, 872  
 invertible or nonsingular, 891, 894–895  
 multiplicative identity matrix of order  $n$ , 888–896  
 multiplicative inverse of, 888–896  
 singular, 891
- Square of binomial difference, 53
- Square of binomial sum, 53
- Square root function, graph of, 216
- Square root property, quadratic equations solved by, 94–95, 99, 100
- Square roots, 6, 7, 33–34  
 adding and subtracting, 36–37  
 evaluating, 33–34  
 product rule for, 34–35  
 quotient rule for, 35–36  
 simplified, 35
- Square root signs, 33
- Square roots of negative numbers, 33, 34  
 as multiples of  $i$ , 292  
 multiplying, 295–296
- Standard cubic function, graph of, 216
- Standard form  
 complex numbers in, 293  
 of equation of circle, 259–262  
 of equation of ellipse, 921–925  
 of equation of hyperbola, 934–936, 940, 965  
 of equation of parabola, 949–955  
 of polynomial, 49  
 of quadratic function, graphing, 301–303, 304  
 transforming rotated conics to, 966–971
- Standard position, angle in, 492, 493  
 drawing, 497–499
- Standard quadratic function, graph of, 216

- Subsets of real numbers, 6–7
- Substitution  
 for eliminating variables, 773–775, 793–795, 812–814  
 nonlinear systems solved by, 812–814  
 systems of linear equations in two variables solved by, 773–775
- Subtraction  
 of complex numbers, 293–294  
 definition of, 13  
 of like radicals, 36  
 matrix, 873–874  
 of polynomials, 50  
 of radical expressions, 36–37  
 of rational expressions with different denominators, 75–78  
 of rational expressions with same denominators, 75  
 of real numbers, 13  
 of square roots, 36–37  
 vector, 744–745
- Sum  
 binomial, square of, 53  
 of cubes, factoring, 65  
 and difference of two terms, product of, 53  
 of first  $n$  terms of arithmetic sequence, 1017–1020  
 of first  $n$  terms of geometric sequence, 1027–1030  
 of functions, 234, 235  
 of infinite geometric series, 1032–1034  
 limit of, 1106, 1111
- Sum and difference formulas, 633–644, 651  
 for cosines, 633–639, 651  
 for sines, 636–639, 651  
 for tangents, 639–640, 651
- Summation notation, 1006–1009  
 properties of sums, 1009  
 using, 1007–1008  
 writing sums in, 1009
- Sum-to-product formulas, 658–659
- Supercomputers, 855
- Surface area  
 common formulas for, 273  
 of cylinder with fixed volume, modeling, 273
- Switch-and-solve strategy, 248

 approximation, 6  
 for binomial coefficients, 1049  
 for elements in sets, 5  
 greater than, 9, 120, 127  
 greater than or equal to, 9, 120  
 inequality, 9, 120, 124, 823  
 infinity, 120  
 less than, 9  
 less than or equal to, 9, 120  
 negative square root, 33  
 radical sign, 33  
 for set of real numbers, 7  
 sigma, in adding terms of sequence, 1007  
 square root, 33  
 for subsets of real numbers, 7
- Symmetry  
 axis of, 300, 301, 949, 950, 953, 986, 988, 989  
 even and odd functions and, 176–178  
 graphing a polar equation using, 716–721  
 with respect to polar axis, 716, 717, 719, 720, 986, 988, 989  
 with respect to the origin, 178, 573  
 with respect to  $y$ -axis, 177–178, 327, 716, 717, 719, 720, 986  
 tests for, in polar coordinates, 716
- Synthesizers, 601, 607
- Synthetic division, 338–340  
 polynomials divided using, 338–340
- Systems of equations. *See* Systems of linear equations
- Systems of inequalities. *See* Systems of linear inequalities
- Systems of linear equations, 772  
 matrix solutions to, 850–862  
 multiplicative inverses of matrices to solve, 895–897  
 problem solving and business applications using, 783–785  
 problem solving using, 780–785
- Systems of linear equations in three variables, 792–800  
 Gaussian elimination applied to, 862–871  
 inconsistent and dependent systems, 796  
 problem solving with, 796  
 solution of, 792  
 solving by eliminating variables, 793–796  
 solving by using matrices, 850–862  
 solving those with missing terms, 795  
 solving using determinants and Cramer's rule, 908–910
- Systems of linear equations in two variables, 772–788  
 determining if ordered pair is solution of, 772–773  
 with infinitely many solutions, 778, 779–780  
 with no solutions, 778  
 number of solutions to, 778–780  
 solving by addition method, 775–778  
 solving by graphing, 773, 779  
 solving by substitution method, 773–775  
 solving by using determinants and Cramer's rule, 903–905
- Systems of linear inequalities  
 applications of, 835–839  
 graphing, 828–831
- Systems of nonlinear equations in two variables, 811–821

 combined, 399–400  
 constant of, 394, 397  
 direct, 394–397  
 equations of, 394  
 formulas, 394  
 inverse, 397–399  
 joint, 400–401  
 modeling using, 394–404
- Variation problems, solving, 394–397
- Vector(s), 739–754  
 adding and subtracting, in terms of **i** and **j**, 744–745  
 angle between two, 756  
 applications, 748–749  
 components of, 742  
 difference of two, 742  
 directed line segments and geometric, 740–742  
 dot product of, 755–756  
 equal, using magnitude and direction to show, 740–741  
 force, 748–749  
 orthogonal, 757  
 parallel, 757  
 position, 743  
 projection of vector onto another vector, 758–759  
 properties of vector addition and scalar multiplication, 746  
 in rectangular coordinate system, 742–744  
 relationships between, 740  
 resultant, 741, 748–749  
 scalar multiplication with, 741, 745, 746  
 as sum of two orthogonal vectors, 759–760  
 unit, 742–744, 746–747  
 velocity, 748, 749  
 writing, in terms of magnitude and direction, 747–748  
 zero, 746
- Vector components of force, 758
- Vector components of **v**, 759
- Vector projection of **v** onto **w**, 758–759
- Velocity  
 average, 210–211, 375–376, 1133  
 instantaneous, 211, 1133–1134
- Velocity vector, 748, 749
- Verbal models, 266–270

- Verifying an identity, 622–623  
 changing to sines and cosines for, 623–628  
 combining fractional expressions for, 626–627  
 difference formula for cosines for, 636  
 double-angle formula for cosines for, 646–647  
 guidelines for verifying trigonometric identities, 629–630  
 half-angle formula for, 650  
 multiplying numerator and denominator by same factor for, 627  
 sum and difference formulas for tangents for, 640  
 sum-to-product formulas to, 659  
 using factoring, 625–626  
 using fundamental identities to, 622–633  
 using two techniques, 625–626  
 working with both sides separately in, 628–629
- Vertex (vertices), 837  
 of angle, 492  
 of ellipse, 921  
 of hyperbola, 933, 934, 935–936, 938, 939, 940, 941, 942  
 of parabola, 300, 301–306, 949, 953, 954–955
- Vertical asymptotes  
 of cosecant function, 577  
 of cotangent function, 576–577  
 defined, 364  
 locating, 365  
 of logarithmic function, 432–433  
 of rational function, 364–366, 370, 371, 372  
 of secant function, 578  
 of tangent function, 572, 573, 574  
 y-axis as, 432–433
- Vertical component of vector, 742
- Vertical lines, 196  
 equations of, 194  
 graphs of, 194
- Vertical line test, for functions, 162
- Vertical shifts (transformations), 216–217, 224, 225, 226  
 combining horizontal shifts and, 220  
 downward, 217  
 of exponential function, 418  
 of logarithmic function, 432  
 of sinusoidal graphs, 564–565  
 upward, 217
- Vertical stretching and shrinking, 222–223, 224, 225, 226  
 of exponential function, 418  
 of logarithmic function, 432
- Viewing rectangle  
 on graphing utility, 145  
 understanding, 145–146
- Volume  
 formulas for, 111  
 of rectangular solid, 111, 270–271
- W**
- Wadlow, Robert, 402  
 Walters, Barbara, 1048
