## 2 Polynomial and Rational Functions 291

- 2.1 Complex Numbers 292
- 2.2 Quadratic Functions 300
- 2.3 Polynomial Functions and Their Graphs 317
- 2.4 Dividing Polynomials; Remainder and Factor Theorems 334
- 2.5 Zeros of Polynomial Functions 346

### Mid-Chapter Check Point 360

- 2.6 Rational Functions and Their Graphs 361
- 2.7 Polynomial and Rational Inequalities 381
- 2.8 Modeling Using Variation 394

### Summary, Review, and Test 404

### Review Exercises 406

### Chapter 2 Test 410

### Cumulative Review Exercises (Chapters P–2) 412

## 3 Exponential and Logarithmic Functions 413

- 3.1 Exponential Functions 414
- 3.2 Logarithmic Functions 427
- 3.3 Properties of Logarithms 441

### Mid-Chapter Check Point 451

- 3.4 Exponential and Logarithmic Equations 451
- 3.5 Exponential Growth and Decay; Modeling Data 466

### Summary, Review, and Test 482

### Review Exercises 484

### Chapter 3 Test 488

### Cumulative Review Exercises (Chapters P–3) 489

## 4 Trigonometric Functions 491

- 4.1 Angles and Radian Measure 492
- 4.2 Trigonometric Functions: The Unit Circle 508
- 4.3 Right Triangle Trigonometry 523
- 4.4 Trigonometric Functions of Any Angle 537

### Mid-Chapter Check Point 549

- 4.5 Graphs of Sine and Cosine Functions 551
- 4.6 Graphs of Other Trigonometric Functions 572
- 4.7 Inverse Trigonometric Functions 585
- 4.8 Applications of Trigonometric Functions 601

### Summary, Review, and Test 612

### Review Exercises 615

### Chapter 4 Test 618

### Cumulative Review Exercises (Chapters P–4) 619

## 5 Analytic Trigonometry 621

---

- 5.1 Verifying Trigonometric Identities 622
- 5.2 Sum and Difference Formulas 633
- 5.3 Double-Angle, Power-Reducing, and Half-Angle Formulas 644
- Mid-Chapter Check Point** 655
- 5.4 Product-to-Sum and Sum-to-Product Formulas 656
- 5.5 Trigonometric Equations 664
- Summary, Review, and Test** 677
- Review Exercises** 678
- Chapter 5 Test** 680
- Cumulative Review Exercises (Chapters P–5)** 680

## 6 Additional Topics in Trigonometry 681

---

- 6.1 The Law of Sines 682
- 6.2 The Law of Cosines 694
- 6.3 Polar Coordinates 702
- 6.4 Graphs of Polar Equations 714
- Mid-Chapter Check Point** 725
- 6.5 Complex Numbers in Polar Form; DeMoivre's Theorem 726

- 6.6 Vectors 739
- 6.7 The Dot Product 754
- Summary, Review, and Test** 764
- Review Exercises** 766
- Chapter 6 Test** 769
- Cumulative Review Exercises (Chapters P–6)** 769

## 7 Systems of Equations and Inequalities 771

---

- 7.1 Systems of Linear Equations in Two Variables 772
- 7.2 Systems of Linear Equations in Three Variables 792
- 7.3 Partial Fractions 800
- 7.4 Systems of Nonlinear Equations in Two Variables 811
- Mid-Chapter Check Point** 821
- 7.5 Systems of Inequalities 822
- 7.6 Linear Programming 835
- Summary, Review, and Test** 843
- Review Exercises** 844
- Chapter 7 Test** 846
- Cumulative Review Exercises (Chapters P–7)** 847

## 8 Matrices and Determinants 849

---

- 8.1 Matrix Solutions to Linear Systems 850
- 8.2 Inconsistent and Dependent Systems and Their Applications 862
- 8.3 Matrix Operations and Their Applications 872
- Mid-Chapter Check Point** 887

**8.4** Multiplicative Inverses of Matrices and Matrix Equations 888

**8.5** Determinants and Cramer's Rule 902

**Summary, Review, and Test** 914

**Review Exercises** 915

**Chapter 8 Test** 918

**Cumulative Review Exercises (Chapters P–8)** 918

## **9** Conic Sections and Analytic Geometry 919

---

**9.1** The Ellipse 920

**9.2** The Hyperbola 933

**9.3** The Parabola 948

**Mid-Chapter Check Point** 960

**9.4** Rotation of Axes 962

**9.5** Parametric Equations 974

**9.6** Conic Sections in Polar Coordinates 984

**Summary, Review, and Test** 994

**Review Exercises** 996

**Chapter 9 Test** 998

**Cumulative Review Exercises (Chapters P–9)** 999

## **10** Sequences, Induction, and Probability 1001

---

**10.1** Sequences and Summation Notation 1002

**10.2** Arithmetic Sequences 1013

**10.3** Geometric Sequences and Series 1023

**Mid-Chapter Check Point** 1039

**10.4** Mathematical Induction 1040

**10.5** The Binomial Theorem 1048

**10.6** Counting Principles, Permutations, and Combinations 1056

**10.7** Probability 1067

**Summary, Review, and Test** 1082

**Review Exercises** 1084

**Chapter 10 Test** 1087

**Cumulative Review Exercises (Chapters P–10)** 1088

## **11** Introduction to Calculus 1091

---

**11.1** Finding Limits Using Tables and Graphs 1092

**11.2** Finding Limits Using Properties of Limits 1104

**11.3** Limits and Continuity 1117

**Mid-Chapter Check Point** 1124

**11.4** Introduction to Derivatives 1125

**Summary, Review, and Test** 1138

**Review Exercises** 1139

**Chapter 11 Test** 1140

**Cumulative Review Exercises (Chapters P–11)** 1141

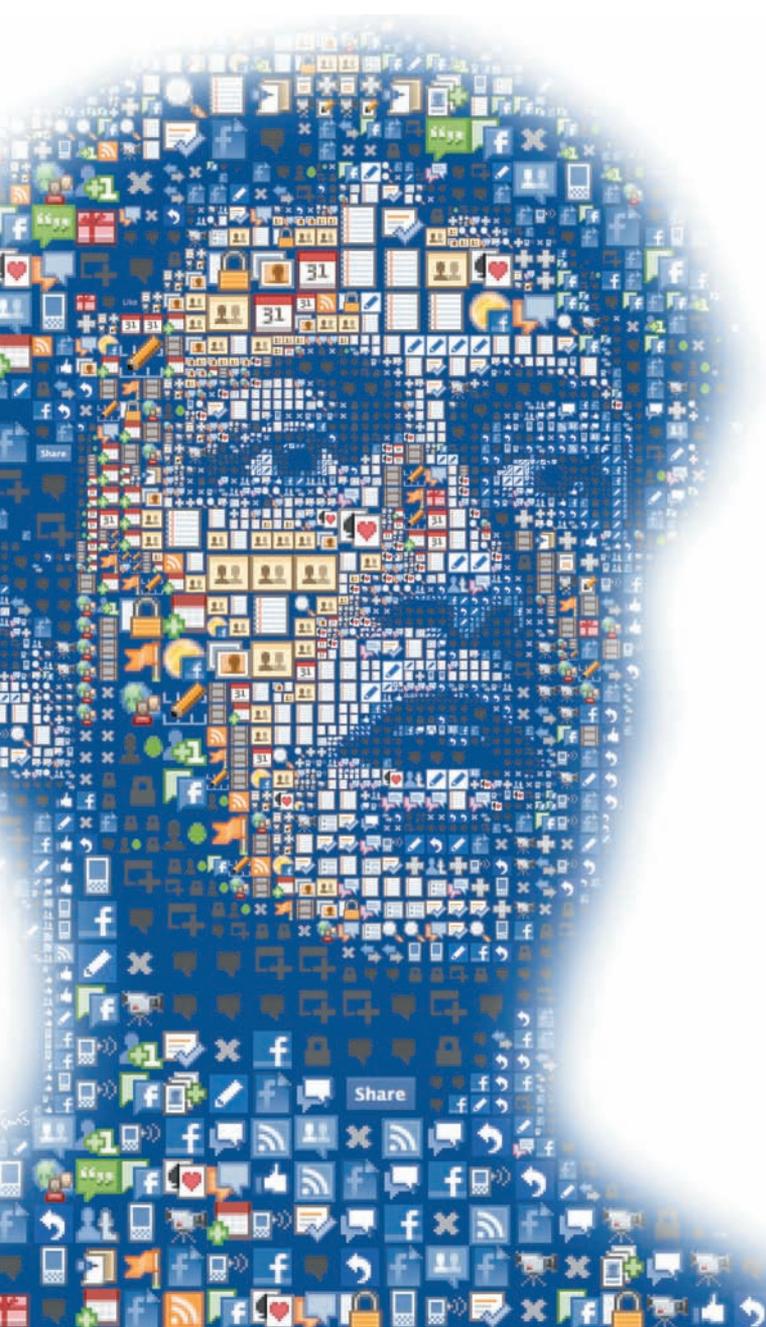

Appendix A: Where Did That Come From? Selected Proofs 1143

Appendix B: The Transition from Precalculus to Calculus 1149

Answers to Selected Exercises AA1

# PREFACE

I've written *Precalculus, Fifth Edition*, to help diverse students, with different backgrounds and future goals, to succeed. The book has three fundamental goals:

1. To help students acquire a solid foundation in algebra and trigonometry, preparing them for other courses such as calculus, business calculus, and finite mathematics.
2. To show students how algebra and trigonometry can model and solve authentic real-world problems.
3. To enable students to develop problem-solving skills, while fostering critical thinking, within an interesting setting.

One major obstacle in the way of achieving these goals is the fact that very few students actually read their textbook. This has been a regular source of frustration for me and for my colleagues in the classroom. Anecdotal evidence gathered over years highlights two basic reasons that students do not take advantage of their textbook:

- “I’ll never use this information.”
- “I can’t follow the explanations.”

I've written every page of the Fifth Edition with the intent of eliminating these two objections. The ideas and tools I've used to do so are described for the student in “A Brief Guide to Getting the Most from This Book,” which appears at the front of the book.

## How Does *Precalculus* Differ from *Algebra and Trigonometry*?

*Precalculus* is not simply a condensed version of my *Algebra and Trigonometry* book. Precalculus students are different from algebra and trigonometry students, and this text reflects those differences. Here are a few examples:

- *Algebra and Trigonometry* devotes an entire chapter to linear equations, rational equations, quadratic equations, radical equations, linear inequalities, and developing models involving these equations and inequalities. *Precalculus* reviews these topics in three sections of the prerequisites chapter (P.7: Equations; P.8: Modeling with Equations; P.9: Linear Inequalities and Absolute Value Inequalities). Functions, the core of any precalculus course, are then introduced in Chapter 1.
  - *Precalculus* contains a section on constructing functions from verbal descriptions and formulas (1.10: Modeling

with Functions) that is not included in *Algebra and Trigonometry*. Modeling skills are applied to situations that students are likely to see in calculus when solving applied problems involving maximum or minimum values.

- *Precalculus* develops trigonometry from the perspective of the unit circle (4.2: Trigonometric Functions: The Unit Circle). In *Algebra and Trigonometry*, trigonometry is developed using right triangles.
- *Precalculus* contains a chapter (Chapter 11: Introduction to Calculus) that takes the student into calculus with discussions of limits, continuity, and derivatives. This chapter is not included in *Algebra and Trigonometry*.
- Many of the liberal arts applications in *Algebra and Trigonometry* are replaced by more scientific or higher level applications in *Precalculus*. Some examples:
  - Black Holes in Space (P.2: Exponents and Scientific Notation)
  - Average Velocity (1.5: More on Slope)
  - Newton’s Law of Cooling (3.5: Exponential Growth and Decay; Modeling Data)
  - Modeling Involving Mixtures and Uniform Motion (7.1: Systems of Linear Equations in Two Variables)

## What’s New in the Fifth Edition?

**New Applications and Real-World Data.** I’m on a constant search for data that can be used to illustrate unique mathematical applications. I researched hundreds of books, magazines, newspapers, almanacs, and online sites to prepare the Fifth Edition. Among the 108 worked-out examples and exercises based on new data sets, you’ll find applications involving modeling blood-alcohol concentration (Section P.1), starting salaries for college graduates (Section P.8), the world’s vanishing tiger population (Section 2.3), and the year humans become immortal (Section 3.1).

**Concept and Vocabulary Checks.** The Fifth Edition contains 679 new short-answer exercises, mainly fill-in-the-blank and true/false items, that assess students’ understanding of the definitions and concepts presented in each section. The Concept and Vocabulary Checks appear as separate features preceding the Exercise Sets.

**Great Question!** This feature takes the content of each Study Tip in the Fourth Edition and presents it in the

context of a student question. Answers to questions offer suggestions for problem solving, point out common errors to avoid, and provide informal hints and suggestions. ‘Great Question!’ should draw students’ attention and curiosity more than the ‘Study Tips.’ As a secondary benefit, this new feature should help students not to feel anxious or threatened when asking questions in class.

#### **New Chapter-Opening and Section-Opening Scenarios.**

Every chapter and every section open with a scenario based on an application, many of which are unique to the Fifth Edition. These scenarios are revisited in the course of the chapter or section in one of the book’s new examples, exercises, or discussions. The often humorous tone of these openers is intended to help fearful and reluctant students overcome their negative perceptions about math.

**New Blitzer Bonuses.** The Fifth Edition contains a variety of new but optional enrichment essays. Examples include “Using Algebra to Measure Blood-Alcohol Concentration” (Section P.1), “Seven Ways to Spend \$1 Trillion” (Section P.2), “Addressing Stress Parabolically” (Section 2.2), “Five Things Scientists Learned from the Hubble Space Telescope” (Section 9.3), and “Ponzi Schemes and Geometric Sequences” (Section 10.3).

**Sample Homework Assignments.** Within each Exercise Set, I have chosen odd-numbered problems, primarily from the Practice Exercises, that can serve as sample homework assignments. These are indicated by a [blue underline](#) in the Annotated Instructor’s Edition. Based on the goals and objectives of your course, you may wish to enrich each sample homework assignment with additional exercises from the other categories in the Exercise Set.

**New Interactive Figures.** These new figures bring mathematical concepts to life and are included in MyMathLab. Used as a lecture tool, the figures help engage students more fully and save the time spent drawing figures by hand. Questions pertaining to each figure are assignable in MyMathLab and reinforce active learning and critical thinking. Each figure has an accompanying Exploratory Exercise that encourages further study and can be used as a presentation tool or as an open-ended learning assignment.

### **What Content and Organizational Changes Have Been Made to the Fifth Edition?**

- **Section P.1 (Algebraic Expressions, Mathematical Models, and Real Numbers)** contains a new essay, now called a Blitzer Bonus, on using algebra to measure blood-alcohol concentration. This Blitzer Bonus should set the stage for the book’s engaging collection of unique applications.
- **Section P.6 (Rational Expressions)** presents a new example on excluding numbers from a rational expression with a trinomial denominator.
- **Section 1.6 (Transformations of Functions)** has a more thoroughly developed discussion of how stretching or shrinking changes a graph’s shape.
- **Section 1.7 (Combinations of Functions; Composite Functions)** has a new example on finding the domain of a function with a square root in the denominator. There is also a new example that ties in with the section opener (number of births and deaths in the United States) and illustrates an application of the algebra of functions.
- **Section 2.3 (Polynomial Functions and Their Graphs)** contains a new example on graphing  $f(x) = -2(x - 1)^2(x + 2)$ , a polynomial function whose equation is given in factored form.
- **Section 2.6 (Rational Functions and Their Graphs)** has a variety of exercises where students must factor to find vertical asymptotes or holes.
- **Section 2.7 (Polynomial and Rational Inequalities)** contains a new example on solving a polynomial inequality with irrational boundary points that requires the use of the quadratic formula.
- **Section 3.1 (Exponential Functions)** presents an intriguing new Blitzer Bonus on the year humans become immortal. The section also contains a new table clarifying interest plans in which interest is paid more than once a year.
- **Section 3.4 (Exponential and Logarithmic Equations)** has a new discussion (within the context of the Great Question! feature) on whether a negative number can belong to the solution set of a logarithmic equation.
- **Section 5.1 (Verifying Trigonometric Identities)** has a new discussion (within the context of the Great Question! feature) on the difference between solving a conditional equation and verifying that an equation is an identity.
- **Section 7.3 (Partial Fractions)** uses the Great Question! feature to include a discussion on speeding up the process of finding partial fraction decompositions.

## What Familiar Features Have Been Retained in the Fifth Edition?

- **Detailed Worked-Out Examples.** Each worked example is titled, making clear the purpose of the example. Examples are clearly written and provide students with detailed step-by-step solutions. No steps are omitted and key steps are thoroughly explained to the right of the mathematics.
- **Explanatory Voice Balloons.** Voice balloons are used in a variety of ways to demystify mathematics. They translate mathematical ideas into everyday English, help clarify problem-solving procedures, present alternative ways of understanding concepts, and connect problem solving to concepts students have already learned.
- **Check Point Examples.** Each example is followed by a similar matched problem, called a Check Point, offering students the opportunity to test their understanding of the example by working a similar exercise. The answers to the Check Points are provided in the answer section.
- **Extensive and Varied Exercise Sets.** An abundant collection of exercises is included in an Exercise Set at the end of each section. Exercises are organized within eight category types: Practice Exercises, Practice Plus Exercises, Application Exercises, Writing in Mathematics, Technology Exercises, Critical Thinking Exercises, Group Exercises, and Preview Exercises. This format makes it easy to create well-rounded homework assignments. The order of the Practice Exercises is exactly the same as the order of the section's worked examples. This parallel order enables students to refer to the titled examples and their detailed explanations to achieve success working the Practice Exercises.
- **Practice Plus Problems.** This category of exercises contains more challenging practice problems that often require students to combine several skills or concepts. With an average of ten Practice Plus problems per Exercise Set, instructors are provided with the option of creating assignments that take Practice Exercises to a more challenging level.
- **Mid-Chapter Check Points.** At approximately the midway point in each chapter, an integrated set of Review Exercises allows students to review and assimilate the skills and concepts they learned separately over several sections.
- **Graphing and Functions.** Graphing and functions are introduced in Chapter 1, with an integrated graphing functional approach emphasized throughout the book. Graphs and functions that model data appear in nearly every section and Exercise Set. Examples and exercises use graphs of functions to explore relationships between data and to provide ways of visualizing a problem's solution. Because functions are the core of this course, students are repeatedly shown how functions relate to equations and graphs.
  - **Section Objectives.** Learning objectives are clearly stated at the beginning of each section. These objectives help students recognize and focus on the section's most important ideas. The objectives are restated in the margin at their point of use.

- **Integration of Technology Using Graphic and Numerical Approaches to Problems.** Side-by-side features in the Technology boxes connect a problem's solution to graphic and numerical approaches to solving that problem. Although the use of graphing utilities is optional, students can use the explanatory voice balloons to understand different approaches to problems even if they are not using a graphing utility in the course.
- **Chapter Summaries.** Each chapter contains a review chart that summarizes the definitions and concepts in every section of the chapter. Examples that illustrate these key concepts are also referenced in the chart.
- **End-of-Chapter Materials.** A comprehensive collection of Review Exercises for each of the chapter's sections follows the Summary. This is followed by a Chapter Test that enables students to test their understanding of the material covered in

the chapter. Beginning with Chapter 2, each chapter concludes with a comprehensive collection of mixed Cumulative Review Exercises.

- **Discovery.** Discovery boxes, found throughout the text, encourage students to further explore algebraic and trigonometric concepts. These explorations are optional and their omission does not interfere with the continuity of the topic at hand.

I hope that my passion for teaching, as well as my respect for the diversity of students I have taught and learned from over the years, is apparent throughout this new edition. By connecting algebra and trigonometry to the whole spectrum of learning, it is my intent to show students that their world is profoundly mathematical, and indeed,  $\pi$  is in the sky.

*Robert Blitzer*

## Acknowledgments

An enormous benefit of authoring a successful series is the broad-based feedback I receive from the students, dedicated users, and reviewers. Every change to this edition is the result of their thoughtful comments and suggestions. I would like to express my appreciation to all the reviewers, whose collective insights form the backbone of this revision. In particular, I would like to thank the following people for reviewing *College Algebra*, *Algebra and Trigonometry*, *Precalculus*, and *Trigonometry*.

Additional acknowledgments are extended to Dan Miller and Kelly Barber for preparing the solutions manuals; Brad Davis for preparing the answer section, serving as accuracy checker, and writing the new learning guide; cMPreparé formatting team for the book's brilliant paging; Brian Morris and Kevin Morris at Scientific Illustrators for superbly illustrating the book; Sheila Norman, photo researcher, for obtaining the book's new photographs; Rebecca Dunn, project manager, and Kathleen Manley, production editor, whose collective talents kept every aspect of this complex project moving through its many stages.

I would like to thank my editors at Pearson, Katie O'Connor and Dawn Murrin, who, with the assistance of Joseph Colella, guided and coordinated the book from manuscript through production. Thanks to Beth Paquin for the beautiful covers and interior design. Finally, thanks to Peggy Lucas for her innovative marketing efforts and to the entire Pearson sales force for their confidence and enthusiasm about the book.

*Robert Blitzer*

# DYNAMIC RESOURCES

## MyMathLab® Online Course (access code required)

MyMathLab delivers **proven results** in helping individual students succeed. It provides **engaging experiences** that personalize, stimulate, and measure learning for each student. And it comes from a **trusted partner** with educational expertise and an eye on the future.

To learn more about how MyMathLab combines proven learning applications with powerful assessment, visit [www.mymathlab.com](http://www.mymathlab.com) or contact your Pearson representative.

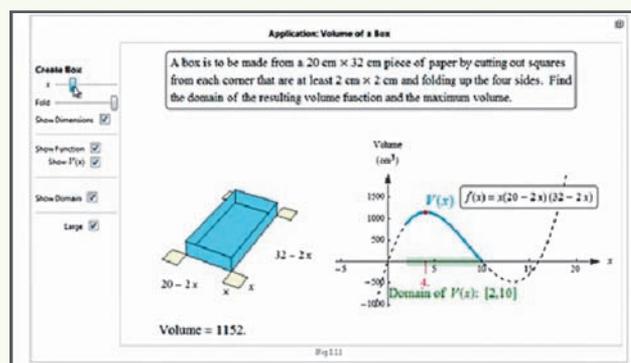

In Blitzer's **MyMathLab®** course, you have access to the most cutting-edge, innovative study solutions proven to increase student success. Noteworthy features include the following:

### Ready to Go Courses.

These new courses provide students with all the same great MyMathLab features that you're used to but make it easier for instructors to get started. Each course includes author-chosen, preassigned homework, integrated review questions, quizzes, and cumulative review exercises to make creating your course even simpler.

### Interactive Figures.

These *Mathematica*-based figures make the figures from the text come alive. Used during a lecture, interactive figures engage students more fully and save time that would otherwise be spent drawing them by hand. Exercises pertaining to each interactive figure are assignable in MyMathLab to reinforce active learning, critical thinking, and conceptual reasoning.

### Integrated Review.

Skill review quizzes are assignable throughout the course, testing students on prerequisite knowledge. From these quizzes, each student receives a personalized, just-in-time review assignment, allowing them to refresh forgotten concepts.

### MathTalk Videos.

Engaging videos connect mathematics to real-life events and interesting applications. These fun, instructional videos show students that math is relevant to their daily lives and are assignable in MyMathLab.

### Video Assessment.

Assignable MXL exercises are available for MathTalk videos to help students retain valuable information presented in the videos.

### Section-Lecture Videos.

These videos provide lectures for each section of the text to help students review important concepts and procedures 24/7.

### Concept and Vocabulary Check.

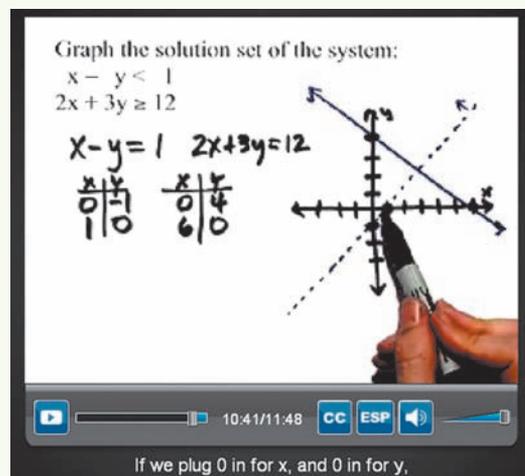

New and assignable in MyMathLab, these short-answer and fill-in-the-blank exercises provide a quick check for understanding of concepts. These questions also test for reading comprehension before the student moves on to the exercises.

[www.youtube.com/BlitzerPrecalculus5e](http://www.youtube.com/BlitzerPrecalculus5e)

### Chapter Test Prep Videos.

Students can watch instructors work through step-by-step solutions to all the Chapter Test exercises from the textbook. These are available in MyMathLab and on YouTube.

### Instructor Resources

Additional resources can be downloaded from [www.pearsonhighered.com](http://www.pearsonhighered.com) or hardcopy resources can be ordered from your sales representative.

#### TestGen.

Enables instructors to build, edit, print, and administer tests using a computerized bank of algorithmic questions developed to cover all the objectives of the text.

#### PowerPoint Lecture Slides.

Fully editable lecture slides that correlate to the textbook.

#### Instructor's Solutions Manual.

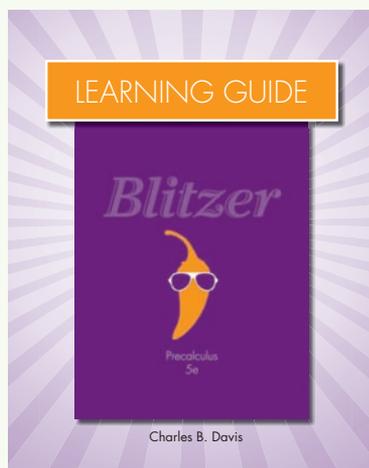

Fully worked solutions to all textbook exercises.

#### Mini Lecture Notes.

Additional examples and helpful teaching tips for each section.

#### Annotated Instructor's Edition.

Shorter answers are on the page beside the exercises. Longer answers are in the back of the text.

### Student Resources

Additional resources to help student success are available to be packaged with the Blitzer textbook and MyMathLab access code.

#### Student's Solutions Manual.

Fully worked solutions to odd-numbered exercises and available to be packaged with the textbook.

#### Learning Guide.

This note-taking guide is organized by objective and begins each chapter with an engaging application, providing additional examples and exercises for students to work through for greater conceptual understanding and mastery of mathematical topics. The Learning Guide is available as PDFs and customizable Word files in MyMathLab. They can also be packaged with the textbook and MyMathLab access code.

# TO THE STUDENT

The bar graph shows some of the qualities that students say make a great teacher. It was my goal to incorporate each of these qualities throughout the pages of this book.

## Explains Things Clearly

I understand that your primary purpose in reading *Precalculus* is to acquire a solid understanding of the required algebra and trigonometry topics in your precalculus course. In order to achieve this goal, I've carefully explained each topic. Important definitions and procedures are set off in boxes, and worked-out examples that present solutions in a step-by-step manner appear in every section. Each example is followed by a similar matched problem, called a Check Point, for you to try so that you can actively participate in the learning process as you read the book. (Answers to all Check Points appear in the back of the book.)

## Funny & Entertaining

Who says that a precalculus textbook can't be entertaining? From our quirky cover to the photos in the chapter and section openers, prepare to expect the unexpected. I hope some of the book's enrichment essays, called Blitzer Bonuses, will put a smile on your face from time to time.

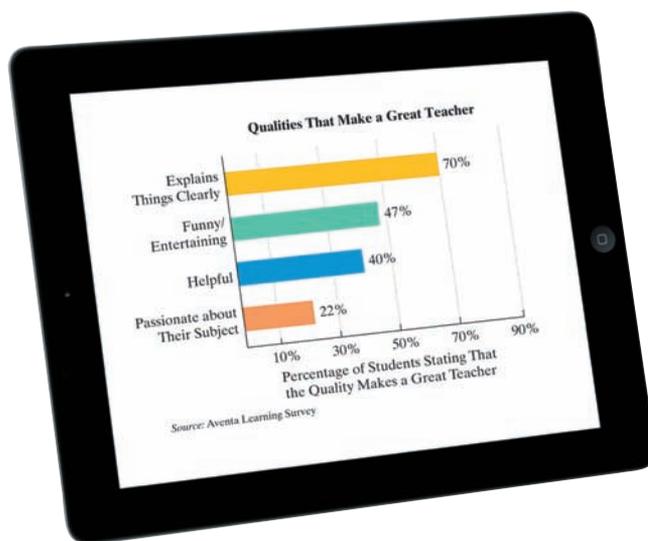

## Helpful

I designed the book's features to help you acquire knowledge of algebra and trigonometry, as well as to show you how algebra and trigonometry can solve authentic problems that apply to your life. These helpful features include

- **Explanatory Voice Balloons:** Voice balloons are used in a variety of ways to make math less intimidating. They translate algebraic and trigonometric language into everyday English, help clarify problem-solving procedures, present alternative ways of understanding concepts, and connect new concepts to concepts you have already learned.
- **Great Question!:** The book's Great Question! boxes are based on questions students ask in class. The answers to these questions give suggestions for problem solving, point out common errors to avoid, and provide informal hints and suggestions.
- **Chapter Summaries:** Each chapter contains a review chart that summarizes the definitions and concepts in every section of the chapter. Examples from the chapter that illustrate these key concepts are also referenced in the chart. Review these summaries and you'll know the most important material in the chapter!

## Passionate about the Subject

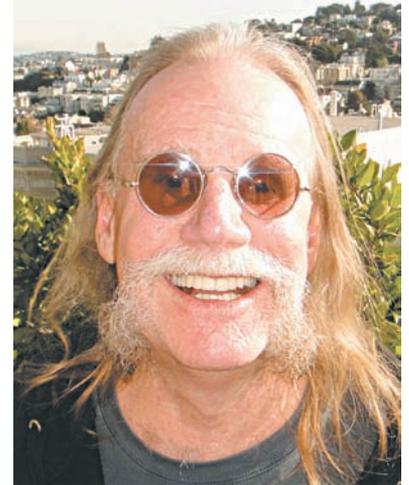

I passionately believe that no other discipline comes close to math in offering a more extensive set of tools for application and development of your mind. I wrote the book in Point Reyes National Seashore, 40 miles north of San Francisco. The park consists of 75,000 acres with miles of pristine surf-washed beaches, forested ridges, and bays bordered by white cliffs. It was my hope to convey the beauty and excitement of mathematics using nature's unspoiled beauty as a source of inspiration and creativity. Enjoy the pages that follow as you empower yourself with the algebra and trigonometry needed to succeed in college, your career, and your life.

Regards,  
*Bob*  
Robert Blitzer

# ABOUT THE AUTHOR

**Bob Blitzler** is a native of Manhattan and received a Bachelor of Arts degree with dual majors in mathematics and psychology (minor: English literature) from the City College of New York. His unusual combination of academic interests led him toward a Master of Arts in mathematics from the University of Miami and a doctorate in behavioral sciences from Nova University. Bob's love for teaching mathematics was nourished for nearly 30 years at Miami Dade College, where he received numerous teaching awards, including Innovator of the Year from the League for Innovations in the Community College and an endowed chair based on excellence in the classroom. In addition to *Precalculus*, Bob has written textbooks covering introductory algebra, intermediate algebra, college algebra, algebra and trigonometry, trigonometry, and liberal arts mathematics, all published by Pearson. When not secluded in his Northern California writer's cabin, Bob can be found hiking the beaches and trails of Point Reyes National Seashore and tending to the chores required by his beloved entourage of horses, chickens, and irritable roosters.

# APPLICATIONS INDEX

- A**
- Academy awards, films winning most, 245–246
  - Acid rain, 464
  - Actor selection, 1065, 1086
  - Adulthood, transition to, 886
  - Adult residential community costs, 1013, 1019–1020
  - Advertising
    - sales and price and, 399–400, 404
    - worldwide spending on, 1089
  - African life span, AIDS and, 799
  - Age(s). *See also* Marriage age
    - average number of awakenings during night by, 151
    - body-mass index and, 833
    - calories needed to maintain energy by, 84–85
    - chances of surviving to various, 171
    - of driver, accidents per day and, 917
    - driver's. *See* Driver's age
    - height as function of, 207, 210, 228–229, 1125–1126, 1130
    - perceived length of time period and, 403
    - percentage of U.S. population never married, ages 25–29, 200, 202
    - percent body fat in adults by, 185
    - preferred age in a mate, 255
    - for sex and marriage, legal, 170–171
    - spatial orientation and, 1102
    - verbal ability and, 1102
    - of wife at marriage, probability of divorce and, 148–149
  - Aging rate, space travel and, 32, 44, 47, 1115
  - AIDS. *See also* HIV infection, T cell count and
    - African life span and, 799
    - cases diagnosed (U.S.), 317, 318, 321
  - Aircraft, Mach speed of, 654
  - Airline revenue, number of customers and, 269–270, 277
  - Airplane line up for departure on runway, 1086
  - Airplanes. *See* Plane(s)
  - Airports, distance between, 700
  - Alcohol and risk of accident, 458–459, 464
    - arrests and drunk driving, 381
  - Alcohol content of wines, mixture based on, 787
  - Alcohol use
    - moderate wine consumption and heart disease, 201–202
    - by U.S. high school seniors, 151
  - Alligators
    - tail length given body length, 402
  - Altitude
    - atmospheric pressure and, 486
    - gained by hiker climbing incline, 616
    - increase on inclined road of, 534
  - American Idol* ratings, 316
  - Amusia (tone deafness), sound quality and, 633, 635
  - Angle(s)
    - in architecture, 492
    - clock hands forming, 492, 493
    - of depression, 530
    - of elevation, 531–532, 535, 536, 550, 583, 610, 611, 616, 618, 691–692
  - Angular speed
    - of audio records, 504
    - of carousel, 503
    - of hard drive in computer, 503
    - of propeller on wind generator, 615
  - Annuities, 1030–1032
    - value of, 1037, 1085
  - Antenna on top of building, height of, 617
  - Arch, height of, 535
  - Arch bridge, 996
  - Archer's arrow, path of, 310
  - Architecture
    - angles in, 492
    - conic sections in, 933, 943
  - Area
    - of circle with changing radius, 1136
    - of greenhouse, 1103
    - maximum, 311–312, 314–315, 360, 407, 1141
    - of oblique triangle, 688
    - of page, as function of width of rectangle containing print on, 380
    - of plane figure, 57
    - of rectangular garden/field, 271–273, 290
    - of region under curve, 600
    - of shaded region, 57, 69
    - of square with changing side, 1136
    - of triangle, 698, 913
  - Area code possibilities, 1065
  - Arrests and drunk driving, 381
  - Artists in documentary, 1060–1061
  - Asteroid detection, 811
  - Atmospheric pressure and altitude, 486
  - Attitudes in U.S., changing, 117
  - Audio records, angular speed and linear speed of, 504
  - Autistic disorder, 1011
  - Automobiles
    - accidents per day, age of driver and, 917
    - computing work of pushing, 760, 762
    - depreciation, 117, 172
    - fuel efficiency of, 173
    - leaving city at same time, distance between, 766
    - possible race finishes, 1065
    - purchase options, 1064
    - rentals, 120, 123, 129–130, 138, 276, 1103
    - repair estimate, 133
    - required stopping distance, 381–382, 392
    - stopping distances for, at selected speeds, 381–382
  - Average cost function, 374, 378, 408, 411
  - Average growth rates, 1125–1126
  - Average rate of change, 207–209, 229
    - of area of square, 1136
    - of volume, 1131–1132, 1140
  - Average velocity, 118, 210, 380, 409, 1133
    - of airplane, 787
    - of ball rolling down ramp, 210–211
    - of boat, 787
  - B**
  - Babies born out of wedlock, 276
  - Ball. *See also* Baseball; Football
    - angle of elevation and throwing distance of, 680
    - attached to spring
      - finding amplitude and period of motion of, 643
      - simple harmonic motion of, 605–606, 676, 680
    - height above ground, 287, 314, 389–390, 392, 798, 860, 1089
    - baseball, 489
    - bounce height, 402
    - football, 17, 308–309, 407, 860
    - maximum height, 407, 769, 1140
    - location of thrown, 974–975
    - rolling down ramp, average velocity of, 210–211
    - thrown straight up
      - instantaneous velocity of, 1133–1134, 1137, 1140, 1142
      - maximum height of, 1140
  - Bank and credit union charges, 133
  - Banking angle and turning radius of bicycle, 402
  - Bank loans, interest on, 1141
  - Baseball
    - angle of elevation and throwing distance of, 676
    - height above ground, 489
    - hit straight upward, instantaneous velocity of, 1136
    - path of, 974, 983
    - pitcher's angle of turn to throw ball, 701
    - position as function of time, 983
  - Baseball contract, 1001, 1036, 1039
  - Baseball diamond, distance from pitcher's mound to bases on, 701
  - Baseball game attendance, ticket price and, 277
  - Basketball court, dimensions of, 112
  - Bass in lake over time, 409
  - Batting average, 118
  - Bearings, 604–605, 618
    - of boat, 605, 611, 700–701, 1142
    - distance at certain, 611, 617
    - to fire from two fire stations, 689, 691
    - of jet from control tower, 611
    - true, of plane, 752–753
    - between two cities, 618
  - Beauty
    - changes in cultural values of, 771
    - earnings and, 140
    - symmetry and, 176
  - Benefit concert lineup possibilities, 1065
  - Berlin Airlift, 835, 841
  - Biorhythms, 491, 508, 522, 569–570, 571
  - Birthday, probability of same, 1081
  - Birthday cake, 48
  - Birthday date sharing, 255, 656
  - Births and deaths in U.S. from 2000 through 2009, 231, 236–237
  - Births to unmarried women, 481
  - Black holes, formation of, 28–29
  - Blood, speed of, 29
  - Blood alcohol concentration, 15, 19, 458–459, 464
  - Blood volume and body weight, 395–396
  - Boat/ship
    - average velocity of, 787
    - bearing of, 605, 611, 700–701, 1142
    - direction angle of, 768
    - distance from lighthouse, 693
    - ground speed, 768
    - on tilted ramp, vector components of force on, 758, 762
    - velocity of, 768
    - velocity vector of, 749
  - Body fat in adults by age and gender, percent, 185
  - Body-mass index, 402
    - age and, 833
  - Body temperature, variation in, 616–617
  - Book club selections, 1066
  - Book selections, 1065, 1087
  - Books on shelf, arranging, 1060
  - Bouquet, mixture of flowers in, 822
  - Box dimensions, 345. *See also* Open boxes

# PREREQUISITES: FUNDAMENTAL CONCEPTS OF ALGEBRA

## CHAPTER

# P

### *What can algebra possibly have to tell me about*

- the skyrocketing cost of a college education?
- my workouts?
- the effects of alcohol?
- the meaning of the national debt that exceeds \$15 trillion?
- time dilation on a futuristic high-speed journey to a nearby star?
- ethnic diversity in the United States?
- the widening imbalance between numbers of women and men on college campuses?

This chapter reviews fundamental concepts of algebra that are prerequisites for the study of precalculus. Throughout the chapter, you will see how the special language of algebra describes your world.

### HERE'S WHERE YOU'LL FIND THESE APPLICATIONS:

College costs: Section P.1, Example 2;  
Exercise Set P.1, Exercises 131–132

Workouts: Exercise Set P.1, Exercises  
129–130

The effects of alcohol: Blitzer Bonus on  
page 15

The national debt: Section P.2,  
Example 6

Time dilation: Blitzer Bonus on page 44  
U.S. ethnic diversity: Chapter P Review,  
Exercise 23

College gender imbalance: Chapter P  
Test, Exercise 32.

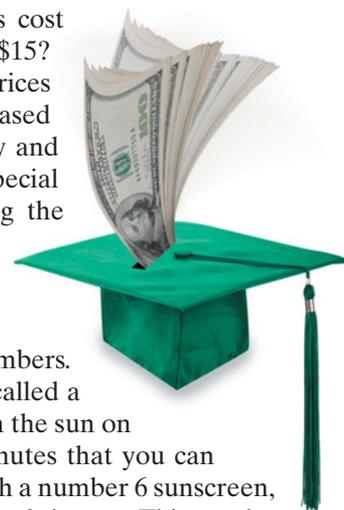

## SECTION P.1

Algebraic Expressions, Mathematical Models,  
and Real Numbers

## Objectives

- 1 Evaluate algebraic expressions.
- 2 Use mathematical models.
- 3 Find the intersection of two sets.
- 4 Find the union of two sets.
- 5 Recognize subsets of the real numbers.
- 6 Use inequality symbols.
- 7 Evaluate absolute value.
- 8 Use absolute value to express distance.
- 9 Identify properties of the real numbers.
- 10 Simplify algebraic expressions.

How would your lifestyle change if a gallon of gas cost \$9.15? Or if the price of a staple such as milk was \$15? That's how much those products would cost if their prices had increased at the same rate college tuition has increased since 1980. (Source: Center for College Affordability and Productivity) In this section, you will learn how the special language of algebra describes your world, including the skyrocketing cost of a college education.

## Algebraic Expressions

Algebra uses letters, such as  $x$  and  $y$ , to represent numbers. If a letter is used to represent various numbers, it is called a **variable**. For example, imagine that you are basking in the sun on the beach. We can let  $x$  represent the number of minutes that you can stay in the sun without burning with no sunscreen. With a number 6 sunscreen, exposure time without burning is six times as long, or 6 times  $x$ . This can be written  $6 \cdot x$ , but it is usually expressed as  $6x$ . Placing a number and a letter next to one another indicates multiplication.

Notice that  $6x$  combines the number 6 and the variable  $x$  using the operation of multiplication. A combination of variables and numbers using the operations of addition, subtraction, multiplication, or division, as well as powers or roots, is called an **algebraic expression**. Here are some examples of algebraic expressions:

$$x + 6, \quad x - 6, \quad 6x, \quad \frac{x}{6}, \quad 3x + 5, \quad x^2 - 3, \quad \sqrt{x} + 7.$$

Many algebraic expressions involve *exponents*. For example, the algebraic expression

$$4x^2 + 341x + 3194$$

approximates the average cost of tuition and fees at public U.S. colleges for the school year ending  $x$  years after 2000. The expression  $x^2$  means  $x \cdot x$  and is read “ $x$  to the second power” or “ $x$  squared.” The exponent, 2, indicates that the base,  $x$ , appears as a factor two times.

## Exponential Notation

If  $n$  is a counting number (1, 2, 3, and so on),

$$b^n = \underbrace{b \cdot b \cdot b \cdots b}_{b \text{ appears as a factor } n \text{ times.}}$$

Exponent or Power points to  $n$   
Base points to  $b$

$b^n$  is read “the  $n$ th power of  $b$ ” or “ $b$  to the  $n$ th power.” Thus, the  $n$ th power of  $b$  is defined as the product of  $n$  factors of  $b$ . The expression  $b^n$  is called an **exponential expression**. Furthermore,  $b^1 = b$ .

For example,

$$8^2 = 8 \cdot 8 = 64, \quad 5^3 = 5 \cdot 5 \cdot 5 = 125, \quad \text{and} \quad 2^4 = 2 \cdot 2 \cdot 2 \cdot 2 = 16.$$

## 1 Evaluate algebraic expressions.

## Evaluating Algebraic Expressions

**Evaluating an algebraic expression** means to find the value of the expression for a given value of the variable.

Many algebraic expressions involve more than one operation. Evaluating an algebraic expression without a calculator involves carefully applying the following order of operations agreement:

## The Order of Operations Agreement

1. Perform operations within the innermost parentheses and work outward. If the algebraic expression involves a fraction, treat the numerator and the denominator as if they were each enclosed in parentheses.
2. Evaluate all exponential expressions.
3. Perform multiplications and divisions **as they occur**, working **from left to right**.
4. Perform additions and subtractions **as they occur**, working **from left to right**.

## EXAMPLE 1 Evaluating an Algebraic Expression

Evaluate  $7 + 5(x - 4)^3$  for  $x = 6$ .

## SOLUTION

$$\begin{aligned}
 7 + 5(x - 4)^3 &= 7 + 5(6 - 4)^3 && \text{Replace } x \text{ with } 6. \\
 &= 7 + 5(2)^3 && \text{First work inside parentheses: } 6 - 4 = 2. \\
 &= 7 + 5(8) && \text{Evaluate the exponential expression: } 2^3 = 2 \cdot 2 \cdot 2 = 8. \\
 &= 7 + 40 && \text{Multiply: } 5(8) = 40. \\
 &= 47 && \text{Add.}
 \end{aligned}$$

 **Check Point 1** Evaluate  $8 + 6(x - 3)^2$  for  $x = 13$ .

## 2 Use mathematical models.

## Formulas and Mathematical Models

An **equation** is formed when an equal sign is placed between two algebraic expressions. One aim of algebra is to provide a compact, symbolic description of the world. These descriptions involve the use of *formulas*. A **formula** is an equation that uses variables to express a relationship between two or more quantities.

Here are two examples of formulas related to heart rate and exercise.

## Couch-Potato Exercise

$$H = \frac{1}{5}(220 - a)$$

Heart rate, in beats per minute,

is

$\frac{1}{5}$  of

the difference between 220 and your age.

## Working It

$$H = \frac{9}{10}(220 - a)$$

Heart rate, in beats per minute,

is

$\frac{9}{10}$  of

the difference between 220 and your age.

The process of finding formulas to describe real-world phenomena is called **mathematical modeling**. Such formulas, together with the meaning assigned to the variables, are called **mathematical models**. We often say that these formulas model, or describe, the relationships among the variables.

### EXAMPLE 2 Modeling the Cost of Attending a Public College

The bar graph in **Figure P.1** shows the average cost of tuition and fees for public four-year colleges, adjusted for inflation. The formula

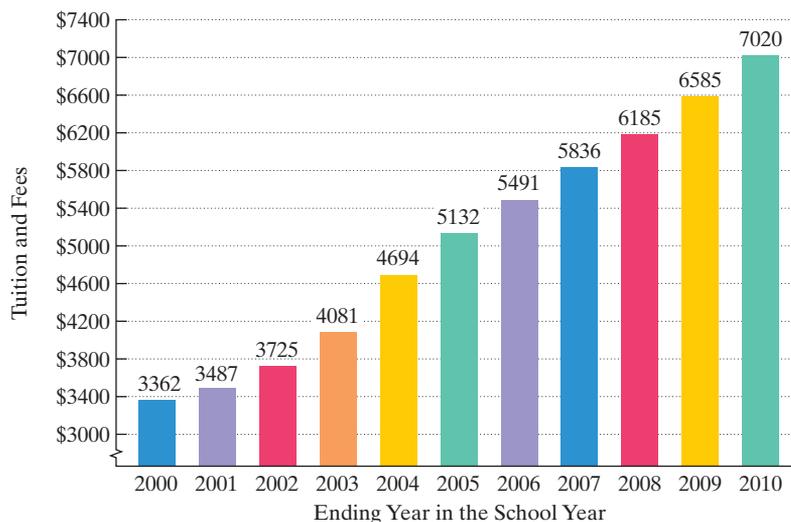

$$T = 4x^2 + 341x + 3194$$

models the average cost of tuition and fees,  $T$ , for public U.S. colleges for the school year ending  $x$  years after 2000.

- Use the formula to find the average cost of tuition and fees at public U.S. colleges for the school year ending in 2010.
- By how much does the formula underestimate or overestimate the actual cost shown in **Figure P.1**?

Average Cost of Tuition and Fees at Public Four-Year United States Colleges

**FIGURE P.1**  
Source: The College Board

### SOLUTION

- Because 2010 is 10 years after 2000, we substitute 10 for  $x$  in the given formula. Then we use the order of operations to find  $T$ , the average cost of tuition and fees for the school year ending in 2010.

$$T = 4x^2 + 341x + 3194$$

$$T = 4(10)^2 + 341(10) + 3194$$

$$T = 4(100) + 341(10) + 3194$$

$$T = 400 + 3410 + 3194$$

$$T = 7004$$

This is the given mathematical model.

Replace each occurrence of  $x$  with 10.

Evaluate the exponential expression:

$$10^2 = 10 \cdot 10 = 100.$$

Multiply from left to right:  $4(100) = 400$  and  $341(10) = 3410$ .

Add.

The formula indicates that for the school year ending in 2010, the average cost of tuition and fees at public U.S. colleges was \$7004.

- Figure P.1** shows that the average cost of tuition and fees for the school year ending in 2010 was \$7020.

The cost obtained from the formula, \$7004, underestimates the actual data value by  $\$7020 - \$7004$ , or by \$16.

 **Check Point 2** Assuming trends indicated by the data in **Figure P.1** continue, use the formula  $T = 4x^2 + 341x + 3194$ , described in Example 2, to project the average cost of tuition and fees at public U.S. colleges for the school year ending in 2015.

Sometimes a mathematical model gives an estimate that is not a good approximation or is extended to include values of the variable that do not make sense. In these cases, we say that **model breakdown** has occurred. For example, it is not likely that the formula in Example 2 would give a good estimate of tuition and fees in 2050 because it is too far in the future. Thus, model breakdown would occur.

### Sets

Before we describe the set of real numbers, let's be sure you are familiar with some basic ideas about sets. A **set** is a collection of objects whose contents can be clearly determined. The objects in a set are called the **elements** of the set. For example, the set of numbers used for counting can be represented by

$$\{1, 2, 3, 4, 5, \dots\}.$$

The braces,  $\{ \}$ , indicate that we are representing a set. This form of representation, called the **roster method**, uses commas to separate the elements of the set. The symbol consisting of three dots after the 5, called an *ellipsis*, indicates that there is no final element and that the listing goes on forever.

A set can also be written in **set-builder notation**. In this notation, the elements of the set are described but not listed. Here is an example:

$$\{x \mid x \text{ is a counting number less than } 6\}.$$

The set of all  $x$     such that     $x$  is a counting number less than 6.

The same set written using the roster method is

$$\{1, 2, 3, 4, 5\}.$$

If  $A$  and  $B$  are sets, we can form a new set consisting of all elements that are in both  $A$  and  $B$ . This set is called the *intersection* of the two sets.

#### Definition of the Intersection of Sets

The **intersection** of sets  $A$  and  $B$ , written  $A \cap B$ , is the set of elements common to both set  $A$  and set  $B$ . This definition can be expressed in set-builder notation as follows:

$$A \cap B = \{x \mid x \text{ is an element of } A \text{ AND } x \text{ is an element of } B\}.$$

**Figure P.2** shows a useful way of picturing the intersection of sets  $A$  and  $B$ . The figure indicates that  $A \cap B$  contains those elements that belong to both  $A$  and  $B$  at the same time.

#### EXAMPLE 3 Finding the Intersection of Two Sets

Find the intersection:  $\{7, 8, 9, 10, 11\} \cap \{6, 8, 10, 12\}$ .

#### SOLUTION

The elements common to  $\{7, 8, 9, 10, 11\}$  and  $\{6, 8, 10, 12\}$  are 8 and 10. Thus,

$$\{7, 8, 9, 10, 11\} \cap \{6, 8, 10, 12\} = \{8, 10\}.$$

...

 **Check Point 3** Find the intersection:  $\{3, 4, 5, 6, 7\} \cap \{3, 7, 8, 9\}$ .

### GREAT QUESTION!

**Can I use symbols other than braces when writing sets using the roster method?**

No. Grouping symbols such as parentheses,  $( )$ , and square brackets,  $[ ]$ , are not used to represent sets in the roster method. Furthermore, only commas are used to separate the elements of a set. Separators such as colons or semicolons are not used.

**3** Find the intersection of two sets.

**FIGURE P.2** Picturing the intersection of two sets

If a set has no elements, it is called the **empty set**, or the **null set**, and is represented by the symbol  $\emptyset$  (the Greek letter phi). Here is an example that shows how the empty set can result when finding the intersection of two sets:

$$\{2, 4, 6\} \cap \{3, 5, 7\} = \emptyset.$$

These sets have no common elements.

Their intersection has no elements and is the empty set.

#### 4 Find the union of two sets.

Another set that we can form from sets  $A$  and  $B$  consists of elements that are in  $A$  or  $B$  or in both sets. This set is called the *union* of the two sets.

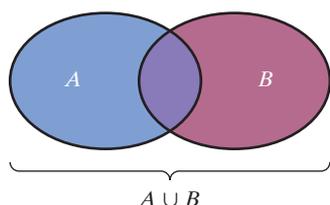

FIGURE P.3 Picturing the union of two sets

#### Definition of the Union of Sets

The **union** of sets  $A$  and  $B$ , written  $A \cup B$ , is the set of elements that are members of set  $A$  or of set  $B$  or of both sets. This definition can be expressed in set-builder notation as follows:

$$A \cup B = \{x | x \text{ is an element of } A \text{ OR } x \text{ is an element of } B\}.$$

Figure P.3 shows a useful way of picturing the union of sets  $A$  and  $B$ . The figure indicates that  $A \cup B$  is formed by joining the sets together.

We can find the union of set  $A$  and set  $B$  by listing the elements of set  $A$ . Then we include any elements of set  $B$  that have not already been listed. Enclose all elements that are listed with braces. This shows that the union of two sets is also a set.

### GREAT QUESTION!

**How can I use the words *union* and *intersection* to help me distinguish between these two operations?**

Union, as in a marriage union, suggests joining things, or uniting them. Intersection, as in the intersection of two crossing streets, brings to mind the area common to both, suggesting things that overlap.

#### EXAMPLE 4 Finding the Union of Two Sets

Find the union:  $\{7, 8, 9, 10, 11\} \cup \{6, 8, 10, 12\}$ .

#### SOLUTION

To find  $\{7, 8, 9, 10, 11\} \cup \{6, 8, 10, 12\}$ , start by listing all the elements from the first set, namely, 7, 8, 9, 10, and 11. Now list all the elements from the second set that are not in the first set, namely, 6 and 12. The union is the set consisting of all these elements. Thus,

$$\{7, 8, 9, 10, 11\} \cup \{6, 8, 10, 12\} = \{6, 7, 8, 9, 10, 11, 12\}.$$

Although 8 and 10 appear in both sets,

do not list 8 and 10 twice.

...

**Check Point 4** Find the union:  $\{3, 4, 5, 6, 7\} \cup \{3, 7, 8, 9\}$ .

#### 5 Recognize subsets of the real numbers.

### The Set of Real Numbers

The sets that make up the real numbers are summarized in **Table P.1** at the top of the next page. We refer to these sets as **subsets** of the real numbers, meaning that all elements in each subset are also elements in the set of real numbers.

Notice the use of the symbol  $\approx$  in the examples of irrational numbers. The symbol means “is approximately equal to.” Thus,

$$\sqrt{2} \approx 1.414214.$$

We can verify that this is only an approximation by multiplying 1.414214 by itself. The product is very close to, but not exactly, 2:

$$1.414214 \times 1.414214 = 2.000001237796.$$

### TECHNOLOGY

A calculator with a square root key gives a decimal approximation for  $\sqrt{2}$ , not the exact value.

Table P.1 Important Subsets of the Real Numbers

Name/Symbol	Description	Examples
Natural numbers $\mathbb{N}$	$\{1, 2, 3, 4, 5, \dots\}$ These are the numbers that we use for counting.	2, 3, 5, 17
Whole numbers $\mathbb{W}$	$\{0, 1, 2, 3, 4, 5, \dots\}$ The set of whole numbers includes 0 and the natural numbers.	0, 2, 3, 5, 17
Integers $\mathbb{Z}$	$\{\dots, -5, -4, -3, -2, -1, 0, 1, 2, 3, 4, 5, \dots\}$ The set of integers includes the negatives of the natural numbers and the whole numbers.	-17, -5, -3, -2, 0, 2, 3, 5, 17
Rational numbers $\mathbb{Q}$	$\left\{\frac{a}{b} \mid a \text{ and } b \text{ are integers and } b \neq 0\right\}$ <div style="border: 1px solid black; border-radius: 10px; padding: 2px; display: inline-block; margin: 5px 0;">This means that <math>b</math> is not equal to zero.</div> The set of rational numbers is the set of all numbers that can be expressed as a quotient of two integers, with the denominator not 0. Rational numbers can be expressed as terminating or repeating decimals.	$-17 = \frac{-17}{1}$ , $-5 = \frac{-5}{1}$ , -3, -2, 0, 2, 3, 5, 17, $\frac{2}{5} = 0.4$ , $\frac{-2}{3} = -0.6666\dots = -0.\bar{6}$
Irrational numbers $\mathbb{I}$	The set of irrational numbers is the set of all numbers whose decimal representations are neither terminating nor repeating. Irrational numbers cannot be expressed as a quotient of integers.	$\sqrt{2} \approx 1.414214$ $-\sqrt{3} \approx -1.73205$ $\pi \approx 3.142$ $-\frac{\pi}{2} \approx -1.571$

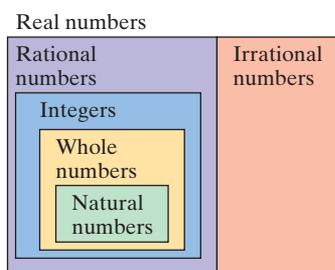

FIGURE P.4 Every real number is either rational or irrational.

**Not all square roots are irrational.** For example,  $\sqrt{25} = 5$  because  $5^2 = 5 \cdot 5 = 25$ . Thus,  $\sqrt{25}$  is a natural number, a whole number, an integer, and a rational number ( $\sqrt{25} = \frac{5}{1}$ ).

The set of *real numbers* is formed by taking the union of the sets of rational numbers and irrational numbers. Thus, every real number is either rational or irrational, as shown in **Figure P.4**.

### Real Numbers

The set of **real numbers** is the set of numbers that are either rational or irrational:

$$\{x \mid x \text{ is rational or } x \text{ is irrational}\}.$$

The symbol  $\mathbb{R}$  is used to represent the set of real numbers. Thus,

$$\mathbb{R} = \{x \mid x \text{ is rational}\} \cup \{x \mid x \text{ is irrational}\}.$$

### EXAMPLE 5 Recognizing Subsets of the Real Numbers

Consider the following set of numbers:

$$\left\{-7, -\frac{3}{4}, 0, 0.\bar{6}, \sqrt{5}, \pi, 7.3, \sqrt{81}\right\}.$$

List the numbers in the set that are

- a. natural numbers.      b. whole numbers.      c. integers.  
d. rational numbers.      e. irrational numbers.      f. real numbers.

### SOLUTION

- a. Natural numbers: The natural numbers are the numbers used for counting. The only natural number in the set  $\{-7, -\frac{3}{4}, 0, 0.\bar{6}, \sqrt{5}, \pi, 7.3, \sqrt{81}\}$  is  $\sqrt{81}$  because  $\sqrt{81} = 9$ . (9 multiplied by itself, or  $9^2$ , is 81.)

- b. Whole numbers: The whole numbers consist of the natural numbers and 0. The elements of the set  $\{-7, -\frac{3}{4}, 0, 0.\overline{6}, \sqrt{5}, \pi, 7.3, \sqrt{81}\}$  that are whole numbers are 0 and  $\sqrt{81}$ .
- c. Integers: The integers consist of the natural numbers, 0, and the negatives of the natural numbers. The elements of the set  $\{-7, -\frac{3}{4}, 0, 0.\overline{6}, \sqrt{5}, \pi, 7.3, \sqrt{81}\}$  that are integers are  $\sqrt{81}$ , 0, and  $-7$ .
- d. Rational numbers: All numbers in the set  $\{-7, -\frac{3}{4}, 0, 0.\overline{6}, \sqrt{5}, \pi, 7.3, \sqrt{81}\}$  that can be expressed as the quotient of integers are rational numbers. These include  $-7(-7 = \frac{-7}{1})$ ,  $-\frac{3}{4}$ ,  $0(0 = \frac{0}{1})$ , and  $\sqrt{81}(\sqrt{81} = \frac{9}{1})$ . Furthermore, all numbers in the set that are terminating or repeating decimals are also rational numbers. These include  $0.\overline{6}$  and  $7.3$ .
- e. Irrational numbers: The irrational numbers in the set  $\{-7, -\frac{3}{4}, 0, 0.\overline{6}, \sqrt{5}, \pi, 7.3, \sqrt{81}\}$  are  $\sqrt{5}(\sqrt{5} \approx 2.236)$  and  $\pi(\pi \approx 3.14)$ . Both  $\sqrt{5}$  and  $\pi$  are only approximately equal to 2.236 and 3.14, respectively. In decimal form,  $\sqrt{5}$  and  $\pi$  neither terminate nor have blocks of repeating digits.
- f. Real numbers: All the numbers in the given set  $\{-7, -\frac{3}{4}, 0, 0.\overline{6}, \sqrt{5}, \pi, 7.3, \sqrt{81}\}$  are real numbers. ●●●

**Check Point 5** Consider the following set of numbers:

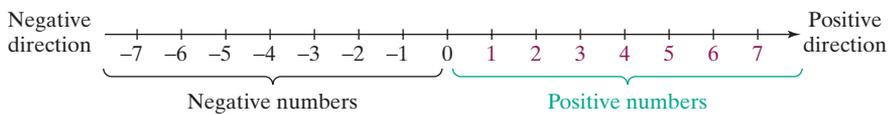

$$\left\{-9, -1.3, 0, 0.\overline{3}, \frac{\pi}{2}, \sqrt{9}, \sqrt{10}\right\}.$$

List the numbers in the set that are

- a. natural numbers.
- b. whole numbers.
- c. integers.
- d. rational numbers.
- e. irrational numbers.
- f. real numbers.

### The Real Number Line

The **real number line** is a graph used to represent the set of real numbers. An arbitrary point, called the **origin**, is labeled 0. Select a point to the right of 0 and label it 1. The distance from 0 to 1 is called the **unit distance**. Numbers to the right of the origin are **positive** and numbers to the left of the origin are **negative**. The real number line is shown in **Figure P.5**.

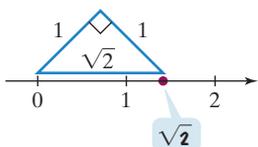

**FIGURE P.5** The real number line

### GREAT QUESTION!

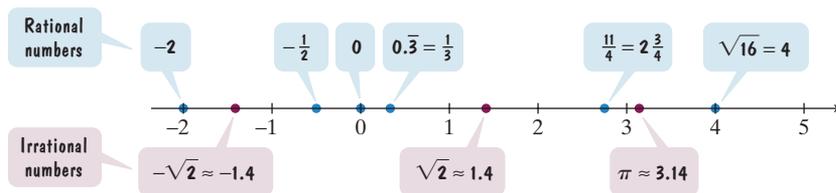

**How did you locate  $\sqrt{2}$  as a precise point on the number line in Figure P.6?**

We used a right triangle with two legs of length 1. The remaining side has a length measuring  $\sqrt{2}$ .

We'll have lots more to say about right triangles later in the book.

Real numbers are **graphed** on a number line by placing a dot at the correct location for each number. The integers are easiest to locate. In **Figure P.6**, we've graphed six rational numbers and three irrational numbers on a real number line.

**FIGURE P.6** Graphing numbers on a real number line

Every real number corresponds to a point on the number line and every point on the number line corresponds to a real number. We say that there is a **one-to-one correspondence** between all the real numbers and all points on a real number line.

## 6 Use inequality symbols.

## Ordering the Real Numbers

On the real number line, the real numbers increase from left to right. The lesser of two real numbers is the one farther to the left on a number line. The greater of two real numbers is the one farther to the right on a number line.

Look at the number line in **Figure P.7**. The integers  $-4$  and  $-1$  are graphed.

FIGURE P.7

Observe that  $-4$  is to the left of  $-1$  on the number line. This means that  $-4$  is less than  $-1$ .

$$-4 < -1$$

*-4 is less than -1 because -4 is to the left of -1 on the number line.*

In **Figure P.7**, we can also observe that  $-1$  is to the right of  $-4$  on the number line. This means that  $-1$  is greater than  $-4$ .

$$-1 > -4$$

*-1 is greater than -4 because -1 is to the right of -4 on the number line.*

The symbols  $<$  and  $>$  are called **inequality symbols**. These symbols always point to the lesser of the two real numbers when the inequality statement is true.

$$-4 < -1$$

*-4 is less than -1. The symbol points to -4, the lesser number.*

$$-1 > -4$$

*-1 is greater than -4. The symbol still points to -4, the lesser number.*

The symbols  $<$  and  $>$  may be combined with an equal sign, as shown in the following table:

	Symbols	Meaning	Examples	Explanation
This inequality is true if either the $<$ part or the $=$ part is true.	$a \leq b$	$a$ is less than or equal to $b$ .	$2 \leq 9$ $9 \leq 9$	Because $2 < 9$ Because $9 = 9$
	$b \geq a$	$b$ is greater than or equal to $a$ .	$9 \geq 2$ $2 \geq 2$	Because $9 > 2$ Because $2 = 2$

## 7 Evaluate absolute value.

## Absolute Value

The **absolute value** of a real number  $a$ , denoted by  $|a|$ , is the distance from 0 to  $a$  on the number line. This distance is always taken to be nonnegative. For example, the real number line in **Figure P.8** shows that

$$|-3| = 3 \quad \text{and} \quad |5| = 5.$$

The absolute value of  $-3$  is 3 because  $-3$  is 3 units from 0 on the number line. The absolute value of 5 is 5 because 5 is 5 units from 0 on the number line. The absolute value of a positive real number or 0 is the number itself. The absolute value of a negative real number, such as  $-3$ , is the number without the negative sign.

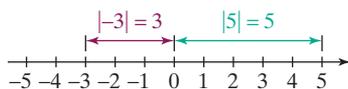

FIGURE P.8 Absolute value as the distance from 0

We can define the absolute value of the real number  $x$  without referring to a number line. The algebraic definition of the absolute value of  $x$  is given as follows:

### Definition of Absolute Value

$$|x| = \begin{cases} x & \text{if } x \geq 0 \\ -x & \text{if } x < 0 \end{cases}$$

If  $x$  is nonnegative (that is,  $x \geq 0$ ), the absolute value of  $x$  is the number itself. For example,

$$|5| = 5 \quad |\pi| = \pi \quad \left| \frac{1}{3} \right| = \frac{1}{3} \quad |0| = 0.$$

Zero is the only number whose absolute value is 0.

If  $x$  is a negative number (that is,  $x < 0$ ), the absolute value of  $x$  is the opposite of  $x$ . This makes the absolute value positive. For example,

$$|-3| = -(-3) = 3 \quad |-\pi| = -(-\pi) = \pi \quad \left| -\frac{1}{3} \right| = -\left( -\frac{1}{3} \right) = \frac{1}{3}.$$

This middle step is usually omitted.

### EXAMPLE 6 Evaluating Absolute Value

Rewrite each expression without absolute value bars:

a.  $|\sqrt{3} - 1|$       b.  $|2 - \pi|$       c.  $\frac{|x|}{x}$  if  $x < 0$ .

### SOLUTION

- a. Because  $\sqrt{3} \approx 1.7$ , the number inside the absolute value bars,  $\sqrt{3} - 1$ , is positive. The absolute value of a positive number is the number itself. Thus,

$$|\sqrt{3} - 1| = \sqrt{3} - 1.$$

- b. Because  $\pi \approx 3.14$ , the number inside the absolute value bars,  $2 - \pi$ , is negative. The absolute value of  $x$  when  $x < 0$  is  $-x$ . Thus,

$$|2 - \pi| = -(2 - \pi) = \pi - 2.$$

- c. If  $x < 0$ , then  $|x| = -x$ . Thus,

$$\frac{|x|}{x} = \frac{-x}{x} = -1. \quad \dots$$

 **Check Point 6** Rewrite each expression without absolute value bars:

a.  $|1 - \sqrt{2}|$       b.  $|\pi - 3|$       c.  $\frac{|x|}{x}$  if  $x > 0$ .

**DISCOVERY**

Verify the triangle inequality if  $a = 4$  and  $b = 5$ . Verify the triangle inequality if  $a = 4$  and  $b = -5$ .

When does equality occur in the triangle inequality and when does inequality occur? Verify your observation with additional number pairs.

- 8 Use absolute value to express distance.

Listed below are several basic properties of absolute value. Each of these properties can be derived from the definition of absolute value.

**Properties of Absolute Value**

For all real numbers  $a$  and  $b$ ,

1.  $|a| \geq 0$
2.  $|-a| = |a|$
3.  $a \leq |a|$
4.  $|ab| = |a||b|$
5.  $\left|\frac{a}{b}\right| = \frac{|a|}{|b|}$ ,  $b \neq 0$
6.  $|a + b| \leq |a| + |b|$  (called the triangle inequality)

**Distance between Points on a Real Number Line**

Absolute value is used to find the distance between two points on a real number line. If  $a$  and  $b$  are any real numbers, the **distance between  $a$  and  $b$**  is the absolute value of their difference. For example, the distance between 4 and 10 is 6. Using absolute value, we find this distance in one of two ways:

$$|10 - 4| = |6| = 6 \quad \text{or} \quad |4 - 10| = |-6| = 6.$$

The distance between 4 and 10 on the real number line is 6.

Notice that we obtain the same distance regardless of the order in which we subtract.

**Distance between Two Points on the Real Number Line**

If  $a$  and  $b$  are any two points on a real number line, then the distance between  $a$  and  $b$  is given by

$$|a - b| \quad \text{or} \quad |b - a|.$$

**EXAMPLE 7 Distance between Two Points on a Number Line**

Find the distance between  $-5$  and  $3$  on the real number line.

**SOLUTION**

Because the distance between  $a$  and  $b$  is given by  $|a - b|$ , the distance between  $-5$  and  $3$  is

$$|-5 - 3| = |-8| = 8.$$

$$a = -5 \quad b = 3$$

**Figure P.9** verifies that there are 8 units between  $-5$  and  $3$  on the real number line. We obtain the same distance if we reverse the order of the subtraction:

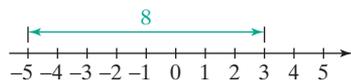

$$|3 - (-5)| = |8| = 8. \quad \dots$$

 **Check Point 7** Find the distance between  $-4$  and  $5$  on the real number line.

**Properties of Real Numbers and Algebraic Expressions**

When you use your calculator to add two real numbers, you can enter them in any order. The fact that two real numbers can be added in any order is called the **commutative property of addition**. You probably use this property, as well as other

- 9 Identify properties of the real numbers.

**FIGURE P.9** The distance between  $-5$  and  $3$  is 8.

properties of real numbers listed in **Table P.2**, without giving it much thought. The properties of the real numbers are especially useful when working with algebraic expressions. For each property listed in **Table P.2**,  $a$ ,  $b$ , and  $c$  represent real numbers, variables, or algebraic expressions.

Table P.2 Properties of the Real Numbers

Name	Meaning	Examples
Commutative Property of Addition	Changing order when adding does not affect the sum. $a + b = b + a$	<ul style="list-style-type: none"> <li><math>13 + 7 = 7 + 13</math></li> <li><math>13x + 7 = 7 + 13x</math></li> </ul>
Commutative Property of Multiplication	Changing order when multiplying does not affect the product. $ab = ba$	<ul style="list-style-type: none"> <li><math>\sqrt{2} \cdot \sqrt{5} = \sqrt{5} \cdot \sqrt{2}</math></li> <li><math>x \cdot 6 = 6x</math></li> </ul>
Associative Property of Addition	Changing grouping when adding does not affect the sum. $(a + b) + c = a + (b + c)$	<ul style="list-style-type: none"> <li><math>3 + (8 + x) = (3 + 8) + x = 11 + x</math></li> </ul>
Associative Property of Multiplication	Changing grouping when multiplying does not affect the product. $(ab)c = a(bc)$	<ul style="list-style-type: none"> <li><math>-2(3x) = (-2 \cdot 3)x = -6x</math></li> </ul>
Distributive Property of Multiplication over Addition	Multiplication distributes over addition. $a \cdot (b + c) = a \cdot b + a \cdot c$	<ul style="list-style-type: none"> <li><math>7(4 + \sqrt{3}) = 7 \cdot 4 + 7 \cdot \sqrt{3} = 28 + 7\sqrt{3}</math></li> <li><math>5(3x + 7) = 5 \cdot 3x + 5 \cdot 7 = 15x + 35</math></li> </ul>
Identity Property of Addition	Zero can be deleted from a sum. $a + 0 = a$ $0 + a = a$	<ul style="list-style-type: none"> <li><math>\sqrt{3} + 0 = \sqrt{3}</math></li> <li><math>0 + 6x = 6x</math></li> </ul>
Identity Property of Multiplication	One can be deleted from a product. $a \cdot 1 = a$ $1 \cdot a = a$	<ul style="list-style-type: none"> <li><math>1 \cdot \pi = \pi</math></li> <li><math>13x \cdot 1 = 13x</math></li> </ul>
Inverse Property of Addition	The sum of a real number and its additive inverse gives 0, the additive identity. $a + (-a) = 0$ $(-a) + a = 0$	<ul style="list-style-type: none"> <li><math>\sqrt{5} + (-\sqrt{5}) = 0</math></li> <li><math>-\pi + \pi = 0</math></li> <li><math>6x + (-6x) = 0</math></li> <li><math>(-4y) + 4y = 0</math></li> </ul>
Inverse Property of Multiplication	The product of a nonzero real number and its multiplicative inverse gives 1, the multiplicative identity. $a \cdot \frac{1}{a} = 1, a \neq 0$ $\frac{1}{a} \cdot a = 1, a \neq 0$	<ul style="list-style-type: none"> <li><math>7 \cdot \frac{1}{7} = 1</math></li> <li><math>\left(\frac{1}{x-3}\right)(x-3) = 1, x \neq 3</math></li> </ul>

### Blitzer Bonus

#### The Associative Property and the English Language

In the English language, phrases can take on different meanings depending on the way the words are associated with commas.

Here are three examples.

- Woman, without her man, is nothing.  
Woman, without her, man is nothing.
- What's the latest dope?  
What's the latest, dope?
- Population of Amsterdam broken down by age and sex  
Population of Amsterdam, broken down by age and sex

The properties of the real numbers in **Table P.2** apply to the operations of addition and multiplication. Subtraction and division are defined in terms of addition and multiplication.

### Definitions of Subtraction and Division

Let  $a$  and  $b$  represent real numbers.

**Subtraction:**  $a - b = a + (-b)$

We call  $-b$  the **additive inverse** or **opposite** of  $b$ .

**Division:**  $a \div b = a \cdot \frac{1}{b}$ , where  $b \neq 0$

We call  $\frac{1}{b}$  the **multiplicative inverse** or **reciprocal** of  $b$ . The quotient of  $a$  and  $b$ ,  $a \div b$ , can be written in the form  $\frac{a}{b}$ , where  $a$  is the **numerator** and  $b$  the **denominator** of the fraction.

Because subtraction is defined in terms of adding an inverse, the distributive property can be applied to subtraction:

$$\begin{aligned} a(b - c) &= ab - ac \\ (b - c)a &= ba - ca. \end{aligned}$$

For example,

$$4(2x - 5) = 4 \cdot 2x - 4 \cdot 5 = 8x - 20.$$

## 10 Simplify algebraic expressions.

### Simplifying Algebraic Expressions

The **terms** of an algebraic expression are those parts that are separated by addition. For example, consider the algebraic expression

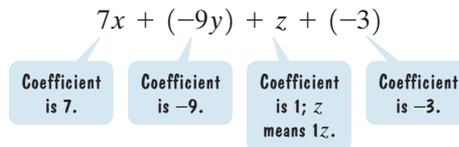

$$7x - 9y + z - 3,$$

which can be expressed as

$$7x + (-9y) + z + (-3).$$

This expression contains four terms, namely,  $7x$ ,  $-9y$ ,  $z$ , and  $-3$ .

The numerical part of a term is called its **coefficient**. In the term  $7x$ , the 7 is the coefficient. If a term containing one or more variables is written without a coefficient, the coefficient is understood to be 1. Thus,  $z$  means  $1z$ . If a term is a constant, its coefficient is that constant. Thus, the coefficient of the constant term  $-3$  is  $-3$ .

The parts of each term that are multiplied are called the **factors** of the term. The factors of the term  $7x$  are 7 and  $x$ .

**Like terms** are terms that have exactly the same variable factors. For example,  $3x$  and  $7x$  are like terms. The distributive property in the form

$$ba + ca = (b + c)a$$

enables us to add or subtract like terms. For example,

$$\begin{aligned} 3x + 7x &= (3 + 7)x = 10x \\ 7y^2 - y^2 &= 7y^2 - 1y^2 = (7 - 1)y^2 = 6y^2. \end{aligned}$$

This process is called **combining like terms**.

## GREAT QUESTION!

**What is the bottom line for combining like terms?**

To combine like terms mentally, add or subtract the coefficients of the terms. Use this result as the coefficient of the terms' variable factor(s).

An algebraic expression is **simplified** when parentheses have been removed and like terms have been combined.

### EXAMPLE 8 Simplifying an Algebraic Expression

Simplify:  $6(2x^2 + 4x) + 10(4x^2 + 3x)$ .

#### SOLUTION

$52x^2$  and  $54x$  are not like terms. They contain different variable factors,  $x^2$  and  $x$ , and cannot be combined.

$$\begin{aligned} & 6(2x^2 + 4x) + 10(4x^2 + 3x) \\ &= 6 \cdot 2x^2 + 6 \cdot 4x + 10 \cdot 4x^2 + 10 \cdot 3x \\ &= 12x^2 + 24x + 40x^2 + 30x \\ &= (12x^2 + 40x^2) + (24x + 30x) \\ &= 52x^2 + 54x \end{aligned}$$

Use the distributive property to remove the parentheses. Multiply.

Group like terms.

Combine like terms. ●●●

 **Check Point 8** Simplify:  $7(4x^2 + 3x) + 2(5x^2 + x)$ .

### Properties of Negatives

The distributive property can be extended to cover more than two terms within parentheses. For example,

$$\begin{aligned} -3(4x - 2y + 6) &= -3 \cdot 4x - (-3) \cdot 2y - 3 \cdot 6 \\ &= -12x - (-6y) - 18 \\ &= -12x + 6y - 18. \end{aligned}$$

This sign represents subtraction.

This sign tells us that the number is negative.

The voice balloons illustrate that negative signs can appear side by side. They can represent the operation of subtraction or the fact that a real number is negative. Here is a list of properties of negatives and how they are applied to algebraic expressions:

#### Properties of Negatives

Let  $a$  and  $b$  represent real numbers, variables, or algebraic expressions.

Property	Examples
1. $(-1)a = -a$	$(-1)4xy = -4xy$
2. $-(-a) = a$	$-(-6y) = 6y$
3. $(-a)b = -ab$	$(-7)4xy = -7 \cdot 4xy = -28xy$
4. $a(-b) = -ab$	$5x(-3y) = -5x \cdot 3y = -15xy$
5. $-(a + b) = -a - b$	$-(7x + 6y) = -7x - 6y$
6. $-(a - b) = -a + b$ $= b - a$	$-(3x - 7y) = -3x + 7y$ $= 7y - 3x$

It is not uncommon to see algebraic expressions with parentheses preceded by a negative sign or subtraction. Properties 5 and 6 in the box,  $-(a + b) = -a - b$  and  $-(a - b) = -a + b$ , are related to this situation. An expression of the form  $-(a + b)$  can be simplified as follows:

$$-(a + b) = -1(a + b) = (-1)a + (-1)b = -a + (-b) = -a - b.$$

Do you see a fast way to obtain the simplified expression on the right in the preceding equation? **If a negative sign or a subtraction symbol appears outside parentheses, drop the parentheses and change the sign of every term within the parentheses.** For example,

$$-(3x^2 - 7x - 4) = -3x^2 + 7x + 4.$$

**EXAMPLE 9** Simplifying an Algebraic Expression

Simplify:  $8x + 2[5 - (x - 3)]$ .

**SOLUTION**

$$\begin{aligned} & 8x + 2[5 - (x - 3)] \\ &= 8x + 2[5 - x + 3] \\ &= 8x + 2[8 - x] \\ &= 8x + 16 - 2x \\ &= (8x - 2x) + 16 \\ &= (8 - 2)x + 16 \\ &= 6x + 16 \end{aligned}$$

Drop parentheses and change the sign of each term in parentheses:  $-(x - 3) = -x + 3$ .  
Simplify inside brackets:  $5 + 3 = 8$ .  
Apply the distributive property:  
 $2[8 - x] = 2 \cdot 8 - 2x = 16 - 2x$ .  
Group like terms.  
Apply the distributive property.  
Simplify.

 **Check Point 9** Simplify:  $6 + 4[7 - (x - 2)]$ .

*Blitzer Bonus* || Using Algebra to Measure Blood-Alcohol Concentration

The amount of alcohol in a person's blood is known as blood-alcohol concentration (BAC), measured in grams of alcohol per deciliter of blood. A BAC of 0.08, meaning 0.08%, indicates that a person has 8 parts alcohol per 10,000 parts blood. In every state in the United States, it is illegal to drive with a BAC of 0.08 or higher.

**How Do I Measure My Blood-Alcohol Concentration?**

Here's a formula that models BAC for a person who weighs  $w$  pounds and who has  $n$  drinks\* per hour.

$$\text{BAC} = \frac{600n}{w(0.6n + 169)}$$

Number of drinks consumed in an hour

Blood-alcohol concentration

Body weight, in pounds

\*A drink can be a 12-ounce can of beer, a 5-ounce glass of wine, or a 1.5-ounce shot of liquor. Each contains approximately 14 grams, or  $\frac{1}{2}$  ounce, of alcohol.

Blood-alcohol concentration can be used to quantify the meaning of "tipsy."

BAC	Effects on Behavior
0.05	Feeling of well-being; mild release of inhibitions; absence of observable effects
0.08	Feeling of relaxation; mild sedation; exaggeration of emotions and behavior; slight impairment of motor skills; increase in reaction time
0.12	Muscle control and speech impaired; difficulty performing motor skills; uncoordinated behavior
0.15	Euphoria; major impairment of physical and mental functions; irresponsible behavior; some difficulty standing, walking, and talking
0.35	Surgical anesthesia; lethal dosage for a small percentage of people
0.40	Lethal dosage for 50% of people; severe circulatory and respiratory depression; alcohol poisoning/overdose

Source: National Clearinghouse for Alcohol and Drug Information

(continues on next page)

Keeping in mind the meaning of “tipsy,” we can use our model to compare blood-alcohol concentrations of a 120-pound person and a 200-pound person for various numbers of drinks.

We determined each BAC using a calculator, rounding to three decimal places.

Blood-Alcohol Concentrations of a 120-Pound Person

$$\text{BAC} = \frac{600n}{120(0.6n + 169)}$$

<b><i>n</i> (number of drinks per hour)</b>	1	2	3	4	5	6	7	8	9	10
<b>BAC (blood-alcohol concentration)</b>	0.029	0.059	0.088	0.117	0.145	0.174	0.202	0.230	0.258	0.286

Illegal to drive

Blood-Alcohol Concentrations of a 200-Pound Person

$$\text{BAC} = \frac{600n}{200(0.6n + 169)}$$

<b><i>n</i> (number of drinks per hour)</b>	1	2	3	4	5	6	7	8	9	10
<b>BAC (blood-alcohol concentration)</b>	0.018	0.035	0.053	0.070	0.087	0.104	0.121	0.138	0.155	0.171

Illegal to drive

Like all mathematical models, the formula for BAC gives approximate rather than exact values. There are other variables that influence blood-alcohol concentration that are not contained

in the model. These include the rate at which an individual’s body processes alcohol, how quickly one drinks, sex, age, physical condition, and the amount of food eaten prior to drinking.

### CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- A combination of numbers, variables, and operation symbols is called an algebraic \_\_\_\_\_.
- If  $n$  is a counting number,  $b^n$ , read \_\_\_\_\_, indicates that there are  $n$  factors of  $b$ . The number  $b$  is called the \_\_\_\_\_ and the number  $n$  is called the \_\_\_\_\_.
- An equation that expresses a relationship between two or more variables, such as  $H = \frac{9}{10}(220 - a)$ , is called a/an \_\_\_\_\_. The process of finding such equations to describe real-world phenomena is called mathematical \_\_\_\_\_. Such equations, together with the meaning assigned to the variables, are called mathematical \_\_\_\_\_.
- The set of elements common to both set  $A$  and set  $B$  is called the \_\_\_\_\_ of sets  $A$  and  $B$ , and is symbolized by \_\_\_\_\_.
- The set of elements that are members of set  $A$  or set  $B$  or of both sets is called the \_\_\_\_\_ of sets  $A$  or  $B$  and is symbolized by \_\_\_\_\_.
- The set  $\{1, 2, 3, 4, 5, \dots\}$  is called the set of \_\_\_\_\_ numbers.
- The set  $\{0, 1, 2, 3, 4, 5, \dots\}$  is called the set of \_\_\_\_\_ numbers.
- The set  $\{\dots, -4, -3, -2, -1, 0, 1, 2, 3, 4, \dots\}$  is called the set of \_\_\_\_\_.
- The set of numbers in the form  $\frac{a}{b}$ , where  $a$  and  $b$  belong to the set in Exercise 8 and  $b \neq 0$ , is called the set of \_\_\_\_\_ numbers.
- The set of numbers whose decimal representations are neither terminating nor repeating is called the set of \_\_\_\_\_ numbers.
- Every real number is either a/an \_\_\_\_\_ number or a/an \_\_\_\_\_ number.
- The notation  $|x|$  is read the \_\_\_\_\_ of  $x$ . If  $x \geq 0$ , then  $|x| = \underline{\hspace{1cm}}$ . If  $x < 0$ , then  $|x| = \underline{\hspace{1cm}}$ .
- The commutative properties state that  $a + b = \underline{\hspace{1cm}}$  and  $ab = \underline{\hspace{1cm}}$ .
- The associative properties state that  $(a + b) + c = \underline{\hspace{1cm}}$  and  $\underline{\hspace{1cm}} = a(bc)$ .
- The distributive property states that  $a(b + c) = \underline{\hspace{1cm}}$ .
- $a + (-a) = \underline{\hspace{1cm}}$ : The sum of a real number and its additive \_\_\_\_\_ is \_\_\_\_\_, the additive \_\_\_\_\_.
- $a \cdot \frac{1}{a} = 1, a \neq 0$ : The product of a nonzero real number and its multiplicative \_\_\_\_\_ is \_\_\_\_\_, the multiplicative \_\_\_\_\_.
- An algebraic expression is \_\_\_\_\_ when parentheses have been removed and like terms have been combined.
- $-(-a) = \underline{\hspace{1cm}}$ .

83.  $\frac{1}{(x + 3)}(x + 3) = 1, x \neq -3$

84.  $(x + 4) + [-(x + 4)] = 0$

In Exercises 85–96, simplify each algebraic expression.

85.  $5(3x + 4) - 4$

86.  $2(5x + 4) - 3$

87.  $5(3x - 2) + 12x$

88.  $2(5x - 1) + 14x$

89.  $7(3y - 5) + 2(4y + 3)$

90.  $4(2y - 6) + 3(5y + 10)$

91.  $5(3y - 2) - (7y + 2)$

92.  $4(5y - 3) - (6y + 3)$

93.  $7 - 4[3 - (4y - 5)]$

94.  $6 - 5[8 - (2y - 4)]$

95.  $18x^2 + 4 - [6(x^2 - 2) + 5]$

96.  $14x^2 + 5 - [7(x^2 - 2) + 4]$

In Exercises 97–102, write each algebraic expression without parentheses.

97.  $-(-14x)$

98.  $-(-17y)$

99.  $-(2x - 3y - 6)$

100.  $-(5x - 13y - 1)$

101.  $\frac{1}{3}(3x) + [(4y) + (-4y)]$

102.  $\frac{1}{2}(2y) + [(-7x) + 7x]$

**Practice Plus**

In Exercises 103–110, insert either  $<$ ,  $>$ , or  $=$  in the shaded area to make a true statement.

103.  $|-6| \blacksquare |-3|$

104.  $|-20| \blacksquare |-50|$

105.  $\left|\frac{3}{5}\right| \blacksquare |-0.6|$

106.  $\left|\frac{5}{2}\right| \blacksquare |-2.5|$

107.  $\frac{30}{40} - \frac{3}{4} \blacksquare \frac{14}{15} \cdot \frac{15}{14}$

108.  $\frac{17}{18} \cdot \frac{18}{17} \blacksquare \frac{50}{60} - \frac{5}{6}$

109.  $\frac{8}{13} \div \frac{8}{13} \blacksquare |-1|$

110.  $|-2| \blacksquare \frac{4}{17} \div \frac{4}{17}$

In Exercises 111–120, use the order of operations to simplify each expression.

111.  $8^2 - 16 \div 2^2 \cdot 4 - 3$

112.  $10^2 - 100 \div 5^2 \cdot 2 - 3$

113.  $\frac{5 \cdot 2 - 3^2}{[3^2 - (-2)]^2}$

114.  $\frac{10 \div 2 + 3 \cdot 4}{(12 - 3 \cdot 2)^2}$

115.  $8 - 3[-2(2 - 5) - 4(8 - 6)]$

116.  $8 - 3[-2(5 - 7) - 5(4 - 2)]$

117.  $\frac{2(-2) - 4(-3)}{5 - 8}$

118.  $\frac{6(-4) - 5(-3)}{9 - 10}$

119.  $\frac{(5 - 6)^2 - 2|3 - 7|}{89 - 3 \cdot 5^2}$

120.  $\frac{12 \div 3 \cdot 5|2^2 + 3^2|}{7 + 3 - 6^2}$

In Exercises 121–128, write each English phrase as an algebraic expression. Then simplify the expression. Let  $x$  represent the number.

121. A number decreased by the sum of the number and four

122. A number decreased by the difference between eight and the number

123. Six times the product of negative five and a number

124. Ten times the product of negative four and a number

125. The difference between the product of five and a number and twice the number

126. The difference between the product of six and a number and negative two times the number

127. The difference between eight times a number and six more than three times the number

128. Eight decreased by three times the sum of a number and six

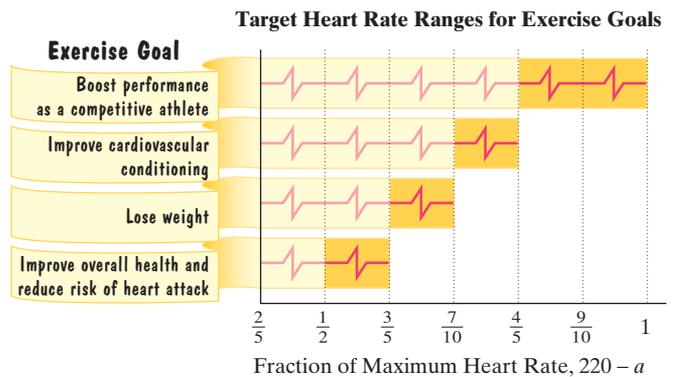

**Application Exercises**

The maximum heart rate, in beats per minute, that you should achieve during exercise is 220 minus your age:

$220 - a.$

This algebraic expression gives maximum heart rate in terms of age,  $a$ .

The following bar graph shows the target heart rate ranges for four types of exercise goals. The lower and upper limits of these ranges are fractions of the maximum heart rate,  $220 - a$ . Exercises 129–130 are based on the information in the graph.

129. If your exercise goal is to improve cardiovascular conditioning, the graph shows the following range for target heart rate,  $H$ , in beats per minute:

Lower limit of range  $H = \frac{7}{10}(220 - a)$

Upper limit of range  $H = \frac{4}{5}(220 - a)$

- a. What is the lower limit of the heart range, in beats per minute, for a 20-year-old with this exercise goal?
- b. What is the upper limit of the heart range, in beats per minute, for a 20-year-old with this exercise goal?

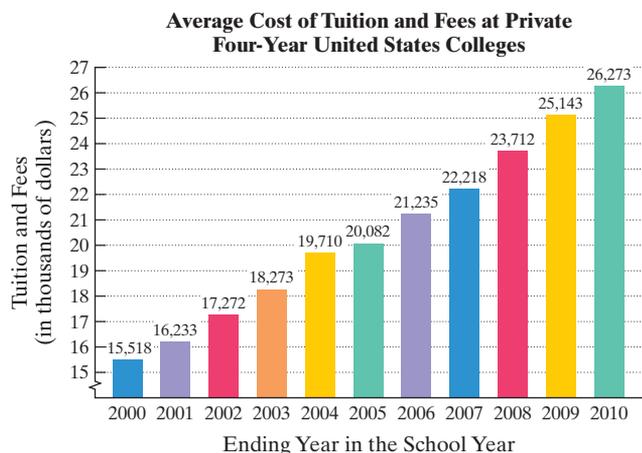

130. If your exercise goal is to improve overall health, the graph shows the following range for target heart rate,  $H$ , in beats per minute:

Lower limit of range  $H = \frac{1}{2}(220 - a)$

Upper limit of range  $H = \frac{3}{5}(220 - a)$

- a. What is the lower limit of the heart range, in beats per minute, for a 30-year-old with this exercise goal?
- b. What is the upper limit of the heart range, in beats per minute, for a 30-year-old with this exercise goal?

The bar graph shows the average cost of tuition and fees at private four-year colleges in the United States.

Source: The College Board

The formula

$$T = 26x^2 + 819x + 15,527$$

models the average cost of tuition and fees,  $T$ , at private U.S. colleges for the school year ending  $x$  years after 2000. Use this information to solve Exercises 131–132.

- 131. a.** Use the formula to find the average cost of tuition and fees at private U.S. colleges for the school year ending in 2010.
- b.** By how much does the formula underestimate or overestimate the actual cost shown by the graph for the school year ending in 2010?
- c.** Use the formula to project the average cost of tuition and fees at private U.S. colleges for the school year ending in 2013.
- 132. a.** Use the formula to find the average cost of tuition and fees at private U.S. colleges for the school year ending in 2009.
- b.** By how much does the formula underestimate or overestimate the actual cost shown by the graph for the school year ending in 2009?
- c.** Use the formula to project the average cost of tuition and fees at private U.S. colleges for the school year ending in 2012.
- 133.** You had \$10,000 to invest. You put  $x$  dollars in a safe, government-insured certificate of deposit paying 5% per year. You invested the remainder of the money in noninsured corporate bonds paying 12% per year. Your total interest earned at the end of the year is given by the algebraic expression

$$0.05x + 0.12(10,000 - x).$$

- a.** Simplify the algebraic expression.
- b.** Use each form of the algebraic expression to determine your total interest earned at the end of the year if you invested \$6000 in the safe, government-insured certificate of deposit.

- 134.** It takes you 50 minutes to get to campus. You spend  $t$  minutes walking to the bus stop and the rest of the time riding the bus. Your walking rate is 0.06 mile per minute and the bus travels at a rate of 0.5 mile per minute. The total distance walking and traveling by bus is given by the algebraic expression

$$0.06t + 0.5(50 - t).$$

- a.** Simplify the algebraic expression.
- b.** Use each form of the algebraic expression to determine the total distance that you travel if you spend 20 minutes walking to the bus stop.
- 135.** Read the Blitzer Bonus beginning on page 15. Use the formula

$$\text{BAC} = \frac{600n}{w(0.6n + 169)}$$

and replace  $w$  with your body weight. Using this formula and a calculator, compute your BAC for integers from  $n = 1$  to  $n = 10$ . Round to three decimal places. According to this model, how many drinks can you consume in an hour without exceeding the legal measure of drunk driving?

### Writing in Mathematics

Writing about mathematics will help you learn mathematics.

For all writing exercises in this book, use complete sentences to respond to the question. Some writing exercises can be answered in a sentence; others require a paragraph or two. You can decide how much you need to write as long as your writing clearly and directly answers the question in the exercise. Standard references such as a dictionary and a thesaurus should be helpful.

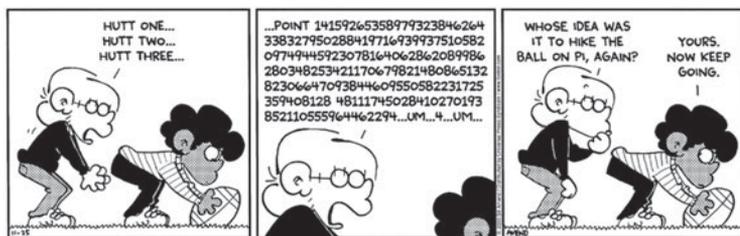

- 136.** What is an algebraic expression? Give an example with your explanation.
- 137.** If  $n$  is a natural number, what does  $b^n$  mean? Give an example with your explanation.
- 138.** What does it mean when we say that a formula models real-world phenomena?
- 139.** What is the intersection of sets  $A$  and  $B$ ?
- 140.** What is the union of sets  $A$  and  $B$ ?
- 141.** How do the whole numbers differ from the natural numbers?
- 142.** Can a real number be both rational and irrational? Explain your answer.
- 143.** If you are given two real numbers, explain how to determine which is the lesser.

### Critical Thinking Exercises

**Make Sense?** In Exercises 144–147, determine whether each statement makes sense or does not make sense, and explain your reasoning.

- 144.** My mathematical model describes the data for tuition and fees at public four-year colleges for the past ten years extremely well, so it will serve as an accurate prediction for the cost of public colleges in 2050.
- 145.** A model that describes the average cost of tuition and fees at private U.S. colleges for the school year ending  $x$  years after 2000 cannot be used to estimate the cost of private education for the school year ending in 2000.

146. The humor in this cartoon is based on the fact that the football will never be hiked.

Foxtrot © 2003, 2009 by Bill Amend/Used by permission of Universal Uclick. All rights reserved.

147. Just as the commutative properties change groupings, the associative properties change order.

In Exercises 148–155, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

- 148. Every rational number is an integer.
- 149. Some whole numbers are not integers.
- 150. Some rational numbers are not positive.
- 151. Irrational numbers cannot be negative.
- 152. The term  $x$  has no coefficient.
- 153.  $5 + 3(x - 4) = 8(x - 4) = 8x - 32$
- 154.  $-x - x = -x + (-x) = 0$
- 155.  $x - 0.02(x + 200) = 0.98x - 4$

In Exercises 156–158, insert either  $<$  or  $>$  in the shaded area between the numbers to make the statement true.

- 156.  $\sqrt{2}$    1.5
- 157.  $-\pi$     $-3.5$
- 158.  $-\frac{3.14}{2}$     $-\frac{\pi}{2}$

**Preview Exercises**

Exercises 159–161 will help you prepare for the material covered in the next section.

- 159. In parts (a) and (b), complete each statement.
  - a.  $b^4 \cdot b^3 = (b \cdot b \cdot b \cdot b)(b \cdot b \cdot b) = b^?$
  - b.  $b^5 \cdot b^5 = (b \cdot b \cdot b \cdot b \cdot b)(b \cdot b \cdot b \cdot b \cdot b) = b^?$
  - c. Generalizing from parts (a) and (b), what should be done with the exponents when multiplying exponential expressions with the same base?
- 160. In parts (a) and (b), complete each statement.
  - a.  $\frac{b^7}{b^3} = \frac{b \cdot b \cdot b \cdot b \cdot b \cdot b \cdot b}{b \cdot b \cdot b} = b^?$
  - b.  $\frac{b^8}{b^2} = \frac{b \cdot b \cdot b \cdot b \cdot b \cdot b \cdot b \cdot b}{b \cdot b} = b^?$
  - c. Generalizing from parts (a) and (b), what should be done with the exponents when dividing exponential expressions with the same base?
- 161. If 6.2 is multiplied by  $10^3$ , what does this multiplication do to the decimal point in 6.2?

## SECTION P.2

## Exponents and Scientific Notation

### Objectives

- 1 Use properties of exponents.
- 2 Simplify exponential expressions.
- 3 Use scientific notation.

*Bigger than the biggest thing ever and then some. Much bigger than that in fact, really amazingly immense, a totally stunning size, real ‘wow, that’s big’, time ... Gigantic multiplied by colossal multiplied by staggeringly huge is the sort of concept we’re trying to get across here.*

Douglas Adams, *The Restaurant at the End of the Universe*

Although Adams’s description may not quite apply to this \$15.2 trillion national debt, exponents can be used to explore the meaning of this “staggeringly huge” number. In this section, you will learn to use exponents to provide a way of putting large and small numbers in perspective.

- 1 Use properties of exponents.

### Properties of Exponents

The major properties of exponents are summarized in the box that follows on the next page.

**GREAT QUESTION!**

**Cut to the chase. What do I do with negative exponents?**

When a negative integer appears as an exponent, switch the position of the base (from numerator to denominator or from denominator to numerator) and make the exponent positive.

**GREAT QUESTION!**

**What's the difference between**

$$\frac{4^3}{4^5} \text{ and } \frac{4^5}{4^3}?$$

These quotients represent different numbers:

$$\frac{4^3}{4^5} = 4^{3-5} = 4^{-2} = \frac{1}{4^2} = \frac{1}{16}$$

$$\frac{4^5}{4^3} = 4^{5-3} = 4^2 = 16.$$

**Properties of Exponents****Property****The Negative-Exponent Rule**

If  $b$  is any real number other than 0 and  $n$  is a natural number, then

$$b^{-n} = \frac{1}{b^n}.$$

**The Zero-Exponent Rule**

If  $b$  is any real number other than 0,

$$b^0 = 1.$$

**Examples**

- $5^{-3} = \frac{1}{5^3} = \frac{1}{125}$
- $\frac{1}{4^{-2}} = \frac{1}{\frac{1}{4^2}} = 4^2 = 16$

- $7^0 = 1$
- $(-5)^0 = 1$
- $-5^0 = -1$

Only 5 is raised to the zero power.

**The Product Rule**

If  $b$  is a real number or algebraic expression, and  $m$  and  $n$  are integers,

$$b^m \cdot b^n = b^{m+n}.$$

When multiplying exponential expressions with the same base, add the exponents. Use this sum as the exponent of the common base.

**The Power Rule**

If  $b$  is a real number or algebraic expression, and  $m$  and  $n$  are integers,

$$(b^m)^n = b^{mn}.$$

When an exponential expression is raised to a power, multiply the exponents. Place the product of the exponents on the base and remove the parentheses.

**The Quotient Rule**

If  $b$  is a nonzero real number or algebraic expression, and  $m$  and  $n$  are integers,

$$\frac{b^m}{b^n} = b^{m-n}.$$

When dividing exponential expressions with the same nonzero base, subtract the exponent in the denominator from the exponent in the numerator. Use this difference as the exponent of the common base.

**Products Raised to Powers**

If  $a$  and  $b$  are real numbers or algebraic expressions, and  $n$  is an integer,

$$(ab)^n = a^n b^n.$$

When a product is raised to a power, raise each factor to that power.

**Quotients Raised to Powers**

If  $a$  and  $b$  are real numbers,  $b \neq 0$ , or algebraic expressions, and  $n$  is an integer,

$$\left(\frac{a}{b}\right)^n = \frac{a^n}{b^n}.$$

When a quotient is raised to a power, raise the numerator to that power and divide by the denominator to that power.

- $2^2 \cdot 2^3 = 2^{2+3} = 2^5 = 32$
- $x^{-3} \cdot x^7 = x^{-3+7} = x^4$

- $(2^2)^3 = 2^{2 \cdot 3} = 2^6 = 64$
- $(x^{-3})^4 = x^{-3 \cdot 4} = x^{-12} = \frac{1}{x^{12}}$

- $\frac{2^8}{2^4} = 2^{8-4} = 2^4 = 16$

- $\frac{x^3}{x^7} = x^{3-7} = x^{-4} = \frac{1}{x^4}$

- $(-2y)^4 = (-2)^4 y^4 = 16y^4$

- $(-2xy)^3 = (-2)^3 x^3 y^3 = -8x^3 y^3$

- $\left(\frac{2}{5}\right)^4 = \frac{2^4}{5^4} = \frac{16}{625}$

- $\left(-\frac{3}{x}\right)^3 = \frac{(-3)^3}{x^3} = -\frac{27}{x^3}$

## 2 Simplify exponential expressions.

**Simplifying Exponential Expressions**

Properties of exponents are used to simplify exponential expressions. An exponential expression is **simplified** when

- No parentheses appear.
- No powers are raised to powers.
- Each base occurs only once.
- No negative or zero exponents appear.

**Simplifying Exponential Expressions**

	<b>Example</b>
<p>1. If necessary, remove parentheses by using</p> $(ab)^n = a^n b^n \quad \text{or} \quad \left(\frac{a}{b}\right)^n = \frac{a^n}{b^n}.$	$(xy)^3 = x^3 y^3$
<p>2. If necessary, simplify powers to powers by using</p> $(b^m)^n = b^{mn}.$	$(x^4)^3 = x^{4 \cdot 3} = x^{12}$
<p>3. If necessary, be sure that each base appears only once by using</p> $b^m \cdot b^n = b^{m+n} \quad \text{or} \quad \frac{b^m}{b^n} = b^{m-n}.$	$x^4 \cdot x^3 = x^{4+3} = x^7$
<p>4. If necessary, rewrite exponential expressions with zero powers as 1 (<math>b^0 = 1</math>). Furthermore, write the answer with positive exponents by using</p> $b^{-n} = \frac{1}{b^n} \quad \text{or} \quad \frac{1}{b^{-n}} = b^n.$	$\frac{x^5}{x^8} = x^{5-8} = x^{-3} = \frac{1}{x^3}$

The following example shows how to simplify exponential expressions. Throughout the example, assume that no variable in a denominator is equal to zero.

**EXAMPLE 1** Simplifying Exponential Expressions

Simplify:

a.  $(-3x^4y^5)^3$

b.  $(-7xy^4)(-2x^5y^6)$

c.  $\frac{-35x^2y^4}{5x^6y^{-8}}$

d.  $\left(\frac{4x^2}{y}\right)^{-3}$ .

## SOLUTION

a.  $(-3x^4y^5)^3 = (-3)^3(x^4)^3(y^5)^3$  *Raise each factor inside the parentheses to the third power.*

$= (-3)^3x^{4 \cdot 3}y^{5 \cdot 3}$  *Multiply the exponents when raising powers to powers.*

$= -27x^{12}y^{15}$   $(-3)^3 = (-3)(-3)(-3) = -27$

b.  $(-7xy^4)(-2x^5y^6) = (-7)(-2)xx^5y^4y^6$  *Group factors with the same base.*

$= 14x^{1+5}y^{4+6}$  *When multiplying expressions with the same base, add the exponents.*

$= 14x^6y^{10}$  *Simplify.*

c.  $\frac{-35x^2y^4}{5x^6y^{-8}} = \left(\frac{-35}{5}\right)\left(\frac{x^2}{x^6}\right)\left(\frac{y^4}{y^{-8}}\right)$  *Group factors with the same base.*

$= -7x^{2-6}y^{4-(-8)}$  *When dividing expressions with the same base, subtract the exponents.*

$= -7x^{-4}y^{12}$  *Simplify. Notice that  $4 - (-8) = 4 + 8 = 12$ .*

$= \frac{-7y^{12}}{x^4}$  *Write as a fraction and move the base with the negative exponent,  $x^{-4}$ , to the other side of the fraction bar and make the negative exponent positive.*

d.  $\left(\frac{4x^2}{y}\right)^{-3} = \frac{(4x^2)^{-3}}{y^{-3}}$  *Raise the numerator and the denominator to the  $-3$  power.*

$= \frac{4^{-3}(x^2)^{-3}}{y^{-3}}$  *Raise each factor inside the parentheses to the  $-3$  power.*

$= \frac{4^{-3}x^{-6}}{y^{-3}}$  *Multiply the exponents when raising a power to a power:  
 $(x^2)^{-3} = x^{2(-3)} = x^{-6}$ .*

$= \frac{y^3}{4^3x^6}$  *Move each base with a negative exponent to the other side of the fraction bar and make each negative exponent positive.*

$= \frac{y^3}{64x^6}$   $4^3 = 4 \cdot 4 \cdot 4 = 64$  ...

 **Check Point 1** Simplify:

a.  $(2x^3y^6)^4$

b.  $(-6x^2y^5)(3xy^3)$

c.  $\frac{100x^{12}y^2}{20x^{16}y^{-4}}$

d.  $\left(\frac{5x}{y^4}\right)^{-2}$

**GREAT QUESTION!**

**Simplifying exponential expressions seems to involve lots of steps. Are there common errors I can avoid along the way?**

Yes. Here's a list. The first column has the correct simplification. The second column contains common errors you should try to avoid.

Correct	Incorrect	Description of Error
$b^3 \cdot b^4 = b^7$	<del><math>b^3 \cdot b^4 = b^{12}</math></del>	The exponents should be added, not multiplied.
$3^2 \cdot 3^4 = 3^6$	<del><math>3^2 \cdot 3^4 = 9^6</math></del>	The common base should be retained, not multiplied.
$\frac{5^{16}}{5^4} = 5^{12}$	<del><math>\frac{5^{16}}{5^4} = 5^4</math></del>	The exponents should be subtracted, not divided.
$(4a)^3 = 64a^3$	<del><math>(4a)^3 = 4a^3</math></del>	Both factors should be cubed.
$b^{-n} = \frac{1}{b^n}$	<del><math>b^{-n} = -\frac{1}{b^n}</math></del>	Only the exponent should change sign.
$(a + b)^{-1} = \frac{1}{a + b}$	<del><math>(a + b)^{-1} = \frac{1}{a} + \frac{1}{b}</math></del>	The exponent applies to the entire expression $a + b$ .

**3** Use scientific notation.

**Table P.3** Names of Large Numbers

$10^2$	hundred
$10^3$	thousand
$10^6$	million
$10^9$	billion
$10^{12}$	trillion
$10^{15}$	quadrillion
$10^{18}$	quintillion
$10^{21}$	sextillion
$10^{24}$	septillion
$10^{27}$	octillion
$10^{30}$	nonillion
$10^{100}$	googol
$10^{\text{googol}}$	googolplex

### Scientific Notation

As of December 2011, the national debt of the United States was about \$15.2 trillion. This is the amount of money the government has had to borrow over the years, mostly by selling bonds, because it has spent more than it has collected in taxes. A stack of \$1 bills equaling the national debt would measure more than 950,000 miles. That's more than two round trips from Earth to the moon. Because a trillion is  $10^{12}$  (see **Table P.3**), the national debt can be expressed as

$$15.2 \times 10^{12}.$$

Because  $15.2 = 1.52 \times 10$ , the national debt can be expressed as

$$\begin{aligned} 15.2 \times 10^{12} &= (1.52 \times 10) \times 10^{12} = 1.52 \times (10 \times 10^{12}) \\ &= 1.52 \times 10^{1+12} = 1.52 \times 10^{13} \end{aligned}$$

The number  $1.52 \times 10^{13}$  is written in a form called *scientific notation*.

#### Scientific Notation

A number is written in **scientific notation** when it is expressed in the form

$$a \times 10^n,$$

where the absolute value of  $a$  is greater than or equal to 1 and less than 10 ( $1 \leq |a| < 10$ ), and  $n$  is an integer.

It is customary to use the multiplication symbol,  $\times$ , rather than a dot, when writing a number in scientific notation.

### Converting from Scientific to Decimal Notation

Here are two examples of numbers in scientific notation:

$$6.4 \times 10^5 \text{ means } 640,000.$$

$$2.17 \times 10^{-3} \text{ means } 0.00217.$$

Do you see that the number with the positive exponent is relatively large and the number with the negative exponent is relatively small?

We can use  $n$ , the exponent on the 10 in  $a \times 10^n$ , to change a number in scientific notation to decimal notation. If  $n$  is **positive**, move the decimal point in  $a$  to the **right**  $n$  places. If  $n$  is **negative**, move the decimal point in  $a$  to the **left**  $|n|$  places.

**EXAMPLE 2** Converting from Scientific to Decimal Notation

Write each number in decimal notation:

a.  $6.2 \times 10^7$       b.  $-6.2 \times 10^7$       c.  $2.019 \times 10^{-3}$       d.  $-2.019 \times 10^{-3}$ .

**SOLUTION**

In each case, we use the exponent on the 10 to determine how far to move the decimal point and in which direction. In parts (a) and (b), the exponent is positive, so we move the decimal point to the right. In parts (c) and (d), the exponent is negative, so we move the decimal point to the left.

a.  $6.2 \times 10^7 = 62,000,000$

$n = 7$

Move the decimal point  
7 places to the right.

b.  $-6.2 \times 10^7 = -62,000,000$

$n = 7$

Move the decimal point  
7 places to the right.

c.  $2.019 \times 10^{-3} = 0.002019$

$n = -3$

Move the decimal point  
|-3| places, or 3 places,  
to the left.

d.  $-2.019 \times 10^{-3} = -0.002019$

$n = -3$

Move the decimal point  
|-3| places, or 3 places,  
to the left. ...

 **Check Point 2** Write each number in decimal notation:

a.  $-2.6 \times 10^9$

b.  $3.017 \times 10^{-6}$ .

**Converting from Decimal to Scientific Notation**

To convert from decimal notation to scientific notation, we reverse the procedure of Example 2.

**Converting from Decimal to Scientific Notation**Write the number in the form  $a \times 10^n$ .

- Determine  $a$ , the numerical factor. Move the decimal point in the given number to obtain a number whose absolute value is between 1 and 10, including 1.
- Determine  $n$ , the exponent on  $10^n$ . The absolute value of  $n$  is the number of places the decimal point was moved. The exponent  $n$  is positive if the decimal point was moved to the left, negative if the decimal point was moved to the right, and 0 if the decimal point was not moved.

**EXAMPLE 3** Converting from Decimal Notation to Scientific Notation

Write each number in scientific notation:

a. 34,970,000,000,000      b. -34,970,000,000,000

c. 0.0000000000802      d. -0.0000000000802.

**SOLUTION**

a.  $34,970,000,000,000 = 3.497 \times 10^{13}$

Move the decimal point to get  
a number whose absolute value  
is between 1 and 10.

The decimal point was  
moved 13 places to the  
left, so  $n = 13$ .

b.  $-34,970,000,000,000 = -3.497 \times 10^{13}$

### TECHNOLOGY

You can use your calculator's **EE** (enter exponent) or **EXP** key to convert from decimal to scientific notation. Here is how it's done for 0.000000000802.

#### Many Scientific Calculators

Keystrokes

.000000000802 **EE** **=**

Display

8.02E - 11

#### Many Graphing Calculators

Use the mode setting for scientific notation.

Keystrokes

.000000000802 **ENTER**

Display

8.02E - 11

c.  $0.000000000802 = 8.02 \times 10^{-11}$

Move the decimal point to get a number whose absolute value is between 1 and 10.

The decimal point was moved 11 places to the right, so  $n = -11$ .

d.  $-0.000000000802 = -8.02 \times 10^{-11}$

**Check Point 3** Write each number in scientific notation:

a. 5,210,000,000

b.  $-0.0000006893$ .

### GREAT QUESTION!

**In scientific notation, which numbers have positive exponents and which have negative exponents?**

If the absolute value of a number is greater than 10, it will have a positive exponent in scientific notation. If the absolute value of a number is less than 1, it will have a negative exponent in scientific notation.

### EXAMPLE 4 Expressing the U.S. Population in Scientific Notation

As of December 2011, the population of the United States was approximately 312 million. Express the population in scientific notation.

#### SOLUTION

Because a million is  $10^6$ , the 2011 population can be expressed as

$$312 \times 10^6.$$

This factor is not between 1 and 10, so the number is not in scientific notation.

The voice balloon indicates that we need to convert 312 to scientific notation.

$$312 \times 10^6 = (3.12 \times 10^2) \times 10^6 = 3.12 \times 10^{2+6} = 3.12 \times 10^8$$

$$312 = 3.12 \times 10^2$$

In scientific notation, the population is  $3.12 \times 10^8$ .

**Check Point 4** Express  $410 \times 10^7$  in scientific notation.

### Computations with Scientific Notation

Properties of exponents are used to perform computations with numbers that are expressed in scientific notation.

### TECHNOLOGY

$$(6.1 \times 10^5)(4 \times 10^{-9})$$

On a Calculator:

#### Many Scientific Calculators

6.1 **EE** 5 **×** 4 **EE** 9 **+/-** **=**

Display

2.44E - 03

#### Many Graphing Calculators

6.1 **EE** 5 **×** 4 **EE** **(-)** 9 **ENTER**

Display (in scientific notation mode)

2.44E - 3

### EXAMPLE 5 Computations with Scientific Notation

Perform the indicated computations, writing the answers in scientific notation:

a.  $(6.1 \times 10^5)(4 \times 10^{-9})$       b.  $\frac{1.8 \times 10^4}{3 \times 10^{-2}}$

#### SOLUTION

a.  $(6.1 \times 10^5)(4 \times 10^{-9})$   
 $= (6.1 \times 4) \times (10^5 \times 10^{-9})$   
 $= 24.4 \times 10^{5+(-9)}$   
 $= 24.4 \times 10^{-4}$   
 $= (2.44 \times 10^1) \times 10^{-4}$   
 $= 2.44 \times 10^{-3}$

Regroup factors.

Add the exponents on 10 and multiply the other parts.

Simplify.

Convert 24.4 to scientific notation:  
 $24.4 = 2.44 \times 10^1$ .

$$10^1 \times 10^{-4} = 10^{1+(-4)} = 10^{-3}$$

$$\begin{aligned}
 \text{b. } \frac{1.8 \times 10^4}{3 \times 10^{-2}} &= \left(\frac{1.8}{3}\right) \times \left(\frac{10^4}{10^{-2}}\right) && \text{Regroup factors.} \\
 &= 0.6 \times 10^{4-(-2)} && \text{Subtract the exponents on 10 and divide the other parts.} \\
 &= 0.6 \times 10^6 && \text{Simplify: } 4 - (-2) = 4 + 2 = 6. \\
 &= (6 \times 10^{-1}) \times 10^6 && \text{Convert 0.6 to scientific notation: } 0.6 = 6 \times 10^{-1}. \\
 &= 6 \times 10^5 && 10^{-1} \times 10^6 = 10^{-1+6} = 10^5 \quad \dots
 \end{aligned}$$

 **Check Point 5** Perform the indicated computations, writing the answers in scientific notation:

a.  $(7.1 \times 10^5)(5 \times 10^{-7})$

b.  $\frac{1.2 \times 10^6}{3 \times 10^{-3}}$

### Applications: Putting Numbers in Perspective

Due to tax cuts and spending increases, the United States began accumulating large deficits in the 1980s. To finance the deficit, the government had borrowed \$15.2 trillion as of December 2011. The graph in **Figure P.10** shows the national debt increasing over time.

**FIGURE P.10**

Source: Office of Management and Budget

Example 6 shows how we can use scientific notation to comprehend the meaning of a number such as 15.2 trillion.

#### **EXAMPLE 6** The National Debt

As of December 2011, the national debt was \$15.2 trillion, or  $15.2 \times 10^{12}$  dollars. At that time, the U.S. population was approximately 312,000,000 (312 million), or  $3.12 \times 10^8$ . If the national debt was evenly divided among every individual in the United States, how much would each citizen have to pay?

**SOLUTION**

The amount each citizen must pay is the total debt,  $15.2 \times 10^{12}$  dollars, divided by the number of citizens,  $3.12 \times 10^8$ .

$$\begin{aligned}\frac{15.2 \times 10^{12}}{3.12 \times 10^8} &= \left(\frac{15.2}{3.12}\right) \times \left(\frac{10^{12}}{10^8}\right) \\ &\approx 4.87 \times 10^{12-8} \\ &= 4.87 \times 10^4 \\ &= 48,700\end{aligned}$$

Every U.S. citizen would have to pay approximately \$48,700 to the federal government to pay off the national debt. ●●●

 **Check Point 6** As of December 2011, the United States had spent \$2.6 trillion for the wars in Iraq and Afghanistan. (Source: costsofwar.org) At that time, the U.S. population was approximately 312 million ( $3.12 \times 10^8$ ). If the cost of these wars was evenly divided among every individual in the United States, how much, to the nearest hundred dollars, would each citizen have to pay?

**An Application: Black Holes in Space**

The concept of a black hole, a region in space where matter appears to vanish, intrigues scientists and nonscientists alike. Scientists theorize that when massive stars run out of nuclear fuel, they begin to collapse under the force of their own gravity. As the star collapses, its density increases. In turn, the force of gravity increases so tremendously that even light cannot escape from the star. Consequently, it appears black.

A mathematical model, called the Schwarzschild formula, describes the critical value to which the radius of a massive body must be reduced for it to become a black hole. This model forms the basis of our next example.

**EXAMPLE 7 An Application of Scientific Notation**

Use the Schwarzschild formula

$$R_s = \frac{2GM}{c^2}$$

where

$R_s$  = Radius of the star, in meters, that would cause it to become a black hole

$M$  = Mass of the star, in kilograms

$G$  = A constant, called the gravitational constant

$$= 6.7 \times 10^{-11} \frac{\text{m}^3}{\text{kg} \cdot \text{s}^2}$$

$c$  = Speed of light

$$= 3 \times 10^8 \text{ meters per second}$$

to determine to what length the radius of the sun must be reduced for it to become a black hole. The sun's mass is approximately  $2 \times 10^{30}$  kilograms.

**SOLUTION**

$$\begin{aligned}R_s &= \frac{2GM}{c^2} \\ &= \frac{2 \times 6.7 \times 10^{-11} \times 2 \times 10^{30}}{(3 \times 10^8)^2} \\ &= \frac{(2 \times 6.7 \times 2) \times (10^{-11} \times 10^{30})}{(3 \times 10^8)^2} \\ &= \frac{26.8 \times 10^{-11+30}}{3^2 \times (10^8)^2}\end{aligned}$$

Use the given model.

Substitute the given values:

$$G = 6.7 \times 10^{-11}, M = 2 \times 10^{30}, \text{ and } c = 3 \times 10^8.$$

Rearrange factors in the numerator.

Add exponents in the numerator. Raise each factor in the denominator to the power.

$$\begin{aligned}
 &= \frac{26.8 \times 10^{19}}{9 \times 10^{16}} \\
 &= \frac{26.8}{9} \times 10^{19-16} \\
 &\approx 2.978 \times 10^3 \\
 &= 2978
 \end{aligned}$$

Multiply powers to powers:  
 $(10^8)^2 = 10^{8 \cdot 2} = 10^{16}$ .

When dividing expressions with the same base, subtract the exponents.

Simplify.

Although the sun is not massive enough to become a black hole (its radius is approximately 700,000 kilometers), the Schwarzschild model theoretically indicates that if the sun's radius were reduced to approximately 2978 meters, that is, about  $\frac{1}{235,000}$  its present size, it would become a black hole. ●●●

 **Check Point 7** The speed of blood,  $S$ , in centimeters per second, located  $r$  centimeters from the central axis of an artery is modeled by

$$S = (1.76 \times 10^5)[(1.44 \times 10^{-2}) - r^2].$$

Find the speed of blood at the central axis of this artery.

### Blitzer Bonus || Seven Ways to Spend \$1 Trillion

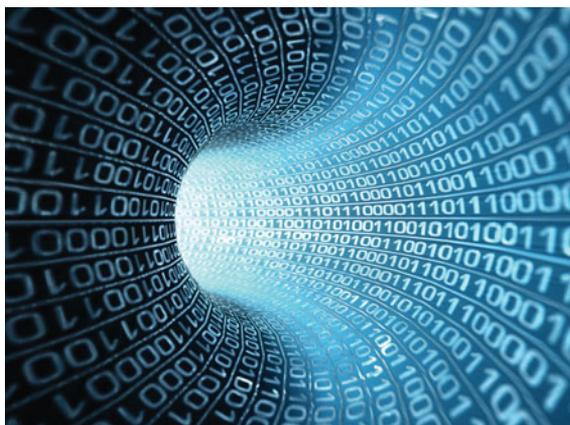

Image © photobank.kiev.ua, 2009

Confronting a national debt of \$15.2 trillion starts with grasping just how colossal \$1 trillion ( $1 \times 10^{12}$ ) actually is. To help you wrap your head around this mind-boggling number, and to put the national debt in further perspective, consider what \$1 trillion will buy:

- 40,816,326 new cars based on an average sticker price of \$24,500 each
- 5,574,136 homes based on the national median price of \$179,400 for existing single-family homes
- one year's salary for 14.7 million teachers based on the average teacher salary of \$68,000 in California
- the annual salaries of all 535 members of Congress for the next 10,742 years based on current salaries of \$174,000 per year
- the salary of basketball superstar LeBron James for 50,000 years based on an annual salary of \$20 million
- annual base pay for 59.5 million U.S. privates (that's 100 times the total number of active-duty soldiers in the Army) based on basic pay of \$16,794 per year
- salaries to hire all 2.8 million residents of the state of Kansas in full-time minimum-wage jobs for the next 23 years based on the federal minimum wage of \$7.25 per hour

Source: Kiplinger.com

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

1. The product rule for exponents states that  $b^m \cdot b^n = \underline{\hspace{2cm}}$ . When multiplying exponential expressions with the same base,          the exponents.
2. The quotient rule for exponents states that  $\frac{b^m}{b^n} = \underline{\hspace{2cm}}$ ,  $b \neq 0$ . When dividing exponential expressions with the same nonzero base,          the exponents.
3. If  $b \neq 0$ , then  $b^0 = \underline{\hspace{2cm}}$ .
4. The negative-exponent rule states that  $b^{-n} = \underline{\hspace{2cm}}$ ,  $b \neq 0$ .
5. True or false:  $5^{-2} = -5^2$
6. Negative exponents in denominators can be evaluated using  $\frac{1}{b^{-n}} = \underline{\hspace{2cm}}$ ,  $b \neq 0$ .
7. True or false:  $\frac{1}{8^{-2}} = 8^2$
8. A positive number is written in scientific notation when it is expressed in the form  $a \times 10^n$ , where  $a$  is          and  $n$  is a/an         .
9. True or false:  $4 \times 10^3$  is written in scientific notation.
10. True or false:  $40 \times 10^2$  is written in scientific notation.

## EXERCISE SET P.2

## Practice Exercises

Evaluate each exponential expression in Exercises 1–22.

- |                       |                       |
|-----------------------|-----------------------|
| 1. $5^2 \cdot 2$      | 2. $6^2 \cdot 2$      |
| 3. $(-2)^6$           | 4. $(-2)^4$           |
| 5. $-2^6$             | 6. $-2^4$             |
| 7. $(-3)^0$           | 8. $(-9)^0$           |
| 9. $-3^0$             | 10. $-9^0$            |
| 11. $4^{-3}$          | 12. $2^{-6}$          |
| 13. $2^2 \cdot 2^3$   | 14. $3^3 \cdot 3^2$   |
| 15. $(2^2)^3$         | 16. $(3^3)^2$         |
| 17. $\frac{2^8}{2^4}$ | 18. $\frac{3^8}{3^4}$ |
| 19. $3^{-3} \cdot 3$  | 20. $2^{-3} \cdot 2$  |
| 21. $\frac{2^3}{2^7}$ | 22. $\frac{3^4}{3^7}$ |

Simplify each exponential expression in Exercises 23–64.

- |  |  |
|--|--|
| 23. $x^{-2}y$  | 24. $xy^{-3}$  |
| 25. $x^0y^5$   | 26. $x^7y^0$   |
| 27. $x^3 \cdot x^7$                                  | 28. $x^{11} \cdot x^5$                                   |
| 29. $x^{-5} \cdot x^{10}$                            | 30. $x^{-6} \cdot x^{12}$                                |
| 31. $(x^3)^7$  | 32. $(x^{11})^5$   |
| 33. $(x^{-5})^3$                                     | 34. $(x^{-6})^4$   |
| 35. $\frac{x^{14}}{x^7}$                             | 36. $\frac{x^{30}}{x^{10}}$                              |
| 37. $\frac{x^{14}}{x^{-7}}$                          | 38. $\frac{x^{30}}{x^{-10}}$                             |
| 39. $(8x^3)^2$                                       | 40. $(6x^4)^2$   |
| 41. $\left(-\frac{4}{x}\right)^3$                    | 42. $\left(-\frac{6}{y}\right)^3$                        |
| 43. $(-3x^2y^5)^2$                                   | 44. $(-3x^4y^6)^3$                                       |
| 45. $(3x^4)(2x^7)$                                   | 46. $(11x^5)(9x^{12})$                                   |
| 47. $(-9x^3y)(-2x^6y^4)$                             | 48. $(-5x^4y)(-6x^7y^{11})$                              |
| 49. $\frac{8x^{20}}{2x^4}$                           | 50. $\frac{20x^{24}}{10x^6}$                             |
| 51. $\frac{25a^{13}b^4}{-5a^2b^3}$                   | 52. $\frac{35a^{14}b^6}{-7a^7b^3}$                       |
| 53. $\frac{14b^7}{7b^{14}}$                          | 54. $\frac{20b^{10}}{10b^{20}}$                          |
| 55. $(4x^3)^{-2}$                                    | 56. $(10x^2)^{-3}$                                       |
| 57. $\frac{24x^3y^5}{32x^7y^{-9}}$                   | 58. $\frac{10x^4y^9}{30x^{12}y^{-3}}$                    |
| 59. $\left(\frac{5x^3}{y}\right)^{-2}$               | 60. $\left(\frac{3x^4}{y}\right)^{-3}$                   |
| 61. $\left(\frac{-15a^4b^2}{5a^{10}b^{-3}}\right)^3$ | 62. $\left(\frac{-30a^{14}b^8}{10a^{17}b^{-2}}\right)^3$ |

$$63. \left(\frac{3a^{-5}b^2}{12a^3b^{-4}}\right)^0 \qquad 64. \left(\frac{4a^{-5}b^3}{12a^3b^{-5}}\right)^0$$

In Exercises 65–76, write each number in decimal notation without the use of exponents.

- |                               |                               |
|-------------------------------|-------------------------------|
| 65. $3.8 \times 10^2$         | 66. $9.2 \times 10^2$         |
| 67. $6 \times 10^{-4}$        | 68. $7 \times 10^{-5}$        |
| 69. $-7.16 \times 10^6$       | 70. $-8.17 \times 10^6$       |
| 71. $7.9 \times 10^{-1}$      | 72. $6.8 \times 10^{-1}$      |
| 73. $-4.15 \times 10^{-3}$    | 74. $-3.14 \times 10^{-3}$    |
| 75. $-6.00001 \times 10^{10}$ | 76. $-7.00001 \times 10^{10}$ |

In Exercises 77–86, write each number in scientific notation.

- |                             |                             |
|-----------------------------|-----------------------------|
| 77. 32,000                  | 78. 64,000                  |
| 79. 638,000,000,000,000,000 | 80. 579,000,000,000,000,000 |
| 81. -5716                   | 82. -3829                   |
| 83. 0.0027                  | 84. 0.0083                  |
| 85. -0.00000000504          | 86. -0.00000000405          |

In Exercises 87–106, perform the indicated computations. Write the answers in scientific notation. If necessary, round the decimal factor in your scientific notation answer to two decimal places.

- |  |   |
|--|---|
| 87. $(3 \times 10^4)(2.1 \times 10^3)$               | 88. $(2 \times 10^4)(4.1 \times 10^3)$                |
| 89. $(1.6 \times 10^{15})(4 \times 10^{-11})$        | 90. $(1.4 \times 10^{15})(3 \times 10^{-11})$         |
| 91. $(6.1 \times 10^{-8})(2 \times 10^{-4})$         | 92. $(5.1 \times 10^{-8})(3 \times 10^{-4})$          |
| 93. $(4.3 \times 10^8)(6.2 \times 10^4)$             | 94. $(8.2 \times 10^8)(4.6 \times 10^4)$              |
| 95. $\frac{8.4 \times 10^8}{4 \times 10^5}$          | 96. $\frac{6.9 \times 10^8}{3 \times 10^5}$           |
| 97. $\frac{3.6 \times 10^4}{9 \times 10^{-2}}$       | 98. $\frac{1.2 \times 10^4}{2 \times 10^{-2}}$        |
| 99. $\frac{4.8 \times 10^{-2}}{2.4 \times 10^6}$     | 100. $\frac{7.5 \times 10^{-2}}{2.5 \times 10^6}$     |
| 101. $\frac{2.4 \times 10^{-2}}{4.8 \times 10^{-6}}$ | 102. $\frac{1.5 \times 10^{-2}}{3 \times 10^{-6}}$    |
| 103. $\frac{480,000,000,000}{0.00012}$               | 104. $\frac{282,000,000,000}{0.00141}$                |
| 105. $\frac{0.00072 \times 0.003}{0.00024}$          | 106. $\frac{66,000 \times 0.001}{0.003 \times 0.002}$ |

## Practice Plus

In Exercises 107–114, simplify each exponential expression. Assume that variables represent nonzero real numbers.

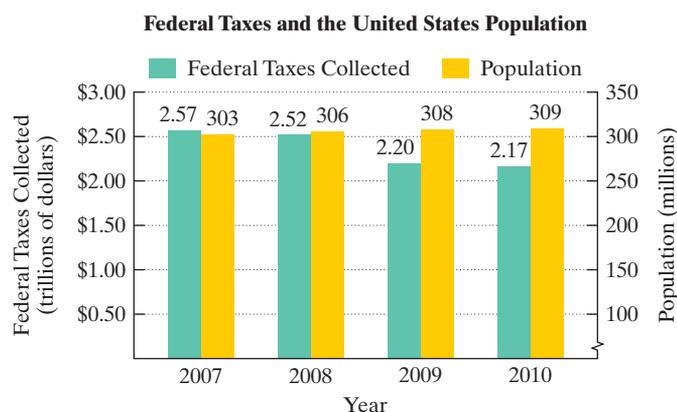

- |   |   |
|---|---|
| 107. $\frac{(x^{-2}y)^{-3}}{(x^2y^{-1})^3}$                   | 108. $\frac{(xy^{-2})^{-2}}{(x^{-2}y)^{-3}}$                  |
| 109. $(2x^{-3}yz^{-6})(2x)^{-5}$                              | 110. $(3x^{-4}yz^{-7})(3x)^{-3}$                              |
| 111. $\left(\frac{x^3y^4z^5}{x^{-3}y^{-4}z^{-5}}\right)^{-2}$ | 112. $\left(\frac{x^4y^5z^6}{x^{-4}y^{-5}z^{-6}}\right)^{-4}$ |

$$113. \frac{(2^{-1}x^{-2}y^{-1})^{-2}(2x^{-4}y^3)^{-2}(16x^{-3}y^3)^0}{(2x^{-3}y^{-5})^2}$$

$$114. \frac{(2^{-1}x^{-3}y^{-1})^{-2}(2x^{-6}y^4)^{-2}(9x^3y^{-3})^0}{(2x^{-4}y^{-6})^2}$$

### Application Exercises

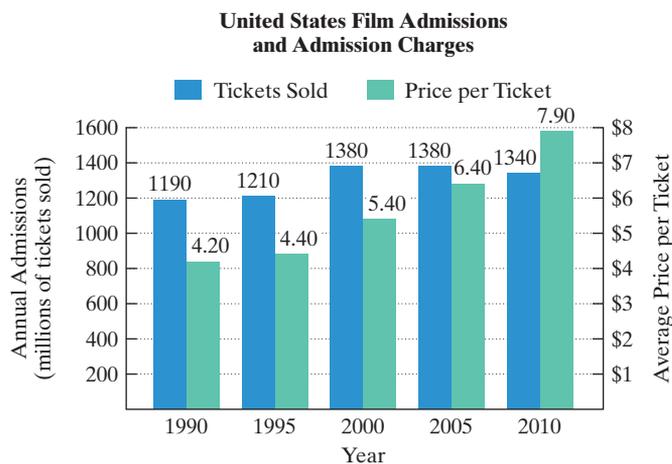

The bar graph shows the total amount Americans paid in federal taxes, in trillions of dollars, and the U.S. population, in millions, from 2007 through 2010. Exercises 115–116 are based on the numbers displayed by the graph.

Sources: Internal Revenue Service and U.S. Census Bureau

- 115. a.** In 2010, the United States government collected \$2.17 trillion in taxes. Express this number in scientific notation.
- b.** In 2010, the population of the United States was approximately 309 million. Express this number in scientific notation.
- c.** Use your scientific notation answers from parts (a) and (b) to answer this question: If the total 2010 tax collections were evenly divided among all Americans, how much would each citizen pay? Express the answer in decimal notation, rounded to the nearest dollar.
- 116. a.** In 2009, the United States government collected \$2.20 trillion in taxes. Express this number in scientific notation.
- b.** In 2009, the population of the United States was approximately 308 million. Express this number in scientific notation.
- c.** Use your scientific notation answers from parts (a) and (b) to answer this question: If the total 2009 tax collections were evenly divided among all Americans, how much would each citizen pay? Express the answer in decimal notation, rounded to the nearest dollar.

*In the dramatic arts, ours is the era of the movies. As individuals and as a nation, we've grown up with them. Our images of love, war, family, country—even of things that terrify us—owe much to what we've seen on screen. The bar graph at the top of the next column quantifies our love for movies by showing the number of tickets sold, in millions, and the average price per ticket for five selected years. Exercises 117–118 are based on the numbers displayed by the graph.*

Source: Motion Picture Association of America

- 117.** Use scientific notation to compute the amount of money that the motion picture industry made from box-office receipts in 2010. Express the answer in scientific notation.
- 118.** Use scientific notation to compute the amount of money that the motion picture industry made from box office receipts in 2005. Express the answer in scientific notation.
- 119.** The mass of one oxygen molecule is  $5.3 \times 10^{-23}$  gram. Find the mass of 20,000 molecules of oxygen. Express the answer in scientific notation.
- 120.** The mass of one hydrogen atom is  $1.67 \times 10^{-24}$  gram. Find the mass of 80,000 hydrogen atoms. Express the answer in scientific notation.
- 121.** There are approximately  $3.2 \times 10^7$  seconds in a year. According to the United States Department of Agriculture, Americans consume 127 chickens per second. How many chickens are eaten per year in the United States? Express the answer in scientific notation.
- 122.** Convert 365 days (one year) to hours, to minutes, and, finally, to seconds, to determine how many seconds there are in a year. Express the answer in scientific notation.

### Writing in Mathematics

- 123.** Describe what it means to raise a number to a power. In your description, include a discussion of the difference between  $-5^2$  and  $(-5)^2$ .
- 124.** Explain the product rule for exponents. Use  $2^3 \cdot 2^5$  in your explanation.
- 125.** Explain the power rule for exponents. Use  $(3^2)^4$  in your explanation.
- 126.** Explain the quotient rule for exponents. Use  $\frac{5^8}{5^2}$  in your explanation.
- 127.** Why is  $(-3x^2)(2x^{-5})$  not simplified? What must be done to simplify the expression?
- 128.** How do you know if a number is written in scientific notation?
- 129.** Explain how to convert from scientific to decimal notation and give an example.
- 130.** Explain how to convert from decimal to scientific notation and give an example.
- 131.** Refer to the Blitzer Bonus on page 29. Use scientific notation to verify any three of the bulleted items on ways to spend \$1 trillion.

## Critical Thinking Exercises

**Make Sense?** In Exercises 132–135, determine whether each statement makes sense or does not make sense, and explain your reasoning.

132. There are many exponential expressions that are equal to  $36x^{12}$ , such as  $(6x^6)^2$ ,  $(6x^3)(6x^9)$ ,  $36(x^3)^9$ , and  $6^2(x^2)^6$ .
133. If  $5^{-2}$  is raised to the third power, the result is a number between 0 and 1.
134. The population of Colorado is approximately  $4.6 \times 10^{12}$ .
135. I just finished reading a book that contained approximately  $1.04 \times 10^5$  words.

In Exercises 136–143, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

136.  $4^{-2} < 4^{-3}$
137.  $5^{-2} > 2^{-5}$
138.  $(-2)^4 = 2^{-4}$
139.  $5^2 \cdot 5^{-2} > 2^5 \cdot 2^{-5}$
140.  $534.7 = 5.347 \times 10^3$
141.  $\frac{8 \times 10^{30}}{4 \times 10^{-5}} = 2 \times 10^{25}$
142.  $(7 \times 10^5) + (2 \times 10^{-3}) = 9 \times 10^2$
143.  $(4 \times 10^3) + (3 \times 10^2) = 4.3 \times 10^3$
144. The mad Dr. Frankenstein has gathered enough bits and pieces (so to speak) for  $2^{-1} + 2^{-2}$  of his creature-to-be. Write a fraction that represents the amount of his creature that must still be obtained.
145. If  $b^A = MN$ ,  $b^C = M$ , and  $b^D = N$ , what is the relationship among  $A$ ,  $C$ , and  $D$ ?
146. Our hearts beat approximately 70 times per minute. Express in scientific notation how many times the heart beats over a lifetime of 80 years. Round the decimal factor in your scientific notation answer to two decimal places.

## Group Exercise

**147. Putting Numbers into Perspective.** A large number can be put into perspective by comparing it with another number. For example, we put the \$15.2 trillion national debt (Example 12) and the \$2.17 trillion the government collected in taxes (Exercise 115) by comparing these numbers to the number of U.S. citizens.

For this project, each group member should consult an almanac, a newspaper, or the Internet to find a number greater than one million. Explain to other members of the group the context in which the large number is used. Express the number in scientific notation. Then put the number into perspective by comparing it with another number.

## Preview Exercises

Exercises 148–150 will help you prepare for the material covered in the next section.

148. a. Find  $\sqrt{16} \cdot \sqrt{4}$ .  
b. Find  $\sqrt{16 \cdot 4}$ .  
c. Based on your answers to parts (a) and (b), what can you conclude?
149. a. Use a calculator to approximate  $\sqrt{300}$  to two decimal places.  
b. Use a calculator to approximate  $10\sqrt{3}$  to two decimal places.  
c. Based on your answers to parts (a) and (b), what can you conclude?
150. a. Simplify:  $21x + 10x$ .  
b. Simplify:  $21\sqrt{2} + 10\sqrt{2}$ .

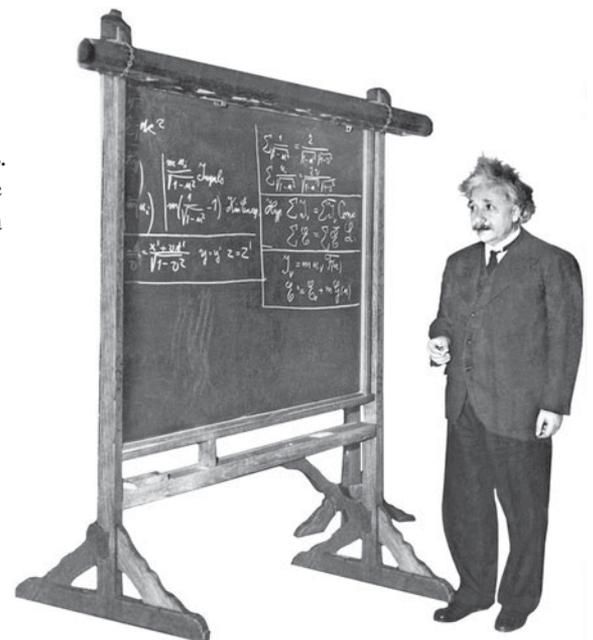

## SECTION P.3

## Radicals and Rational Exponents

## Objectives

- 1 Evaluate square roots.
- 2 Simplify expressions of the form  $\sqrt{a^2}$ .
- 3 Use the product rule to simplify square roots.
- 4 Use the quotient rule to simplify square roots.
- 5 Add and subtract square roots.
- 6 Rationalize denominators.
- 7 Evaluate and perform operations with higher roots.
- 8 Understand and use rational exponents.

This photograph shows mathematical models used by Albert Einstein at a lecture on relativity. Notice the radicals that appear in many of the formulas. Among these models, there is one describing how an astronaut in a moving spaceship ages more slowly than friends who remain on Earth. No description of your world can be complete without roots and radicals. In this section, in addition to reviewing the basics of radical expressions and the use of rational exponents to indicate radicals, you will see how radicals model time dilation for a futuristic high-speed trip to a nearby star.

## 1 Evaluate square roots.

## Square Roots

From our earlier work with exponents, we are aware that the square of both 5 and  $-5$  is 25:

$$5^2 = 25 \quad \text{and} \quad (-5)^2 = 25.$$

The reverse operation of squaring a number is finding the *square root* of the number. For example,

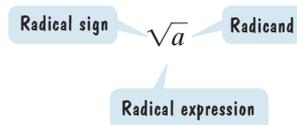

- One square root of 25 is 5 because  $5^2 = 25$ .
- Another square root of 25 is  $-5$  because  $(-5)^2 = 25$ .

In general, **if  $b^2 = a$ , then  $b$  is a square root of  $a$ .**

The symbol  $\sqrt{\quad}$  is used to denote the *nonnegative* or *principal square root* of a number. For example,

- $\sqrt{25} = 5$  because  $5^2 = 25$  and 5 is positive.
- $\sqrt{100} = 10$  because  $10^2 = 100$  and 10 is positive.

The symbol  $\sqrt{\quad}$  that we use to denote the principal square root is called a **radical sign**. The number under the radical sign is called the **radicand**. Together we refer to the radical sign and its radicand as a **radical expression**.

## Definition of the Principal Square Root

If  $a$  is a nonnegative real number, the nonnegative number  $b$  such that  $b^2 = a$ , denoted by  $b = \sqrt{a}$ , is the **principal square root** of  $a$ .

The symbol  $-\sqrt{\quad}$  is used to denote the negative square root of a number. For example,

- $-\sqrt{25} = -5$  because  $(-5)^2 = 25$  and  $-5$  is negative.
- $-\sqrt{100} = -10$  because  $(-10)^2 = 100$  and  $-10$  is negative.

## EXAMPLE 1 Evaluating Square Roots

Evaluate:

a.  $\sqrt{64}$     b.  $-\sqrt{49}$     c.  $\sqrt{\frac{1}{4}}$     d.  $\sqrt{9 + 16}$     e.  $\sqrt{9} + \sqrt{16}$ .

## SOLUTION

a.  $\sqrt{64} = 8$

The principal square root of 64 is 8. Check:  $8^2 = 64$ .

b.  $-\sqrt{49} = -7$

The negative square root of 49 is  $-7$ . Check:  $(-7)^2 = 49$ .

c.  $\sqrt{\frac{1}{4}} = \frac{1}{2}$

The principal square root of  $\frac{1}{4}$  is  $\frac{1}{2}$ . Check:  $(\frac{1}{2})^2 = \frac{1}{4}$ .

d.  $\sqrt{9 + 16} = \sqrt{25}$   
 $= 5$

First simplify the expression under the radical sign.

Then take the principal square root of 25, which is 5.

e.  $\sqrt{9} + \sqrt{16} = 3 + 4$   
 $= 7$

$\sqrt{9} = 3$  because  $3^2 = 9$ .  $\sqrt{16} = 4$  because  $4^2 = 16$ .

## GREAT QUESTION!

Is  $\sqrt{a + b}$  equal to  $\sqrt{a} + \sqrt{b}$ ?

No. In Example 1, parts (d) and (e), observe that  $\sqrt{9 + 16}$  is not equal to  $\sqrt{9} + \sqrt{16}$ . In general,

$$\sqrt{a + b} \neq \sqrt{a} + \sqrt{b}$$

and

$$\sqrt{a - b} \neq \sqrt{a} - \sqrt{b}.$$

 **Check Point 1** Evaluate:

a.  $\sqrt{81}$

b.  $-\sqrt{9}$

c.  $\sqrt{\frac{1}{25}}$

d.  $\sqrt{36 + 64}$

e.  $\sqrt{36} + \sqrt{64}$ .

A number that is the square of a rational number is called a **perfect square**. All the radicands in Example 1 and Check Point 1 are perfect squares.

- 64 is a perfect square because  $64 = 8^2$ . Thus,  $\sqrt{64} = 8$ .
- $\frac{1}{4}$  is a perfect square because  $\frac{1}{4} = \left(\frac{1}{2}\right)^2$ . Thus,  $\sqrt{\frac{1}{4}} = \frac{1}{2}$ .

Let's see what happens to the radical expression  $\sqrt{x}$  if  $x$  is a negative number. Is the square root of a negative number a real number? For example, consider  $\sqrt{-25}$ . Is there a real number whose square is  $-25$ ? No. Thus,  $\sqrt{-25}$  is not a real number. In general, **a square root of a negative number is not a real number**.

If a number  $a$  is nonnegative ( $a \geq 0$ ), then  $(\sqrt{a})^2 = a$ . For example,

$$(\sqrt{2})^2 = 2, \quad (\sqrt{3})^2 = 3, \quad (\sqrt{4})^2 = 4, \quad \text{and} \quad (\sqrt{5})^2 = 5.$$

- 2 Simplify expressions of the form  $\sqrt{a^2}$ .

### Simplifying Expressions of the Form $\sqrt{a^2}$

You may think that  $\sqrt{a^2} = a$ . However, this is not necessarily true. Consider the following examples:

$$\sqrt{4^2} = \sqrt{16} = 4 \quad \text{The result is not } -4, \text{ but rather the absolute value of } -4, \text{ or } 4.$$

$$\sqrt{(-4)^2} = \sqrt{16} = 4.$$

Here is a rule for simplifying expressions of the form  $\sqrt{a^2}$ :

#### Simplifying $\sqrt{a^2}$

For any real number  $a$ ,

$$\sqrt{a^2} = |a|.$$

In words, the principal square root of  $a^2$  is the absolute value of  $a$ .

For example,  $\sqrt{6^2} = |6| = 6$  and  $\sqrt{(-6)^2} = |-6| = 6$ .

- 3 Use the product rule to simplify square roots.

### The Product Rule for Square Roots

A rule for multiplying square roots can be generalized by comparing  $\sqrt{25} \cdot \sqrt{4}$  and  $\sqrt{25 \cdot 4}$ . Notice that

$$\sqrt{25} \cdot \sqrt{4} = 5 \cdot 2 = 10 \quad \text{and} \quad \sqrt{25 \cdot 4} = \sqrt{100} = 10.$$

Because we obtain 10 in both situations, the original radical expressions must be equal. That is,

$$\sqrt{25} \cdot \sqrt{4} = \sqrt{25 \cdot 4}.$$

This result is a special case of the **product rule for square roots** that can be generalized as follows:

#### The Product Rule for Square Roots

If  $a$  and  $b$  represent nonnegative real numbers, then

$$\sqrt{ab} = \sqrt{a} \cdot \sqrt{b} \quad \text{and} \quad \sqrt{a} \cdot \sqrt{b} = \sqrt{ab}.$$

The square root of a product is the product of the square roots.

The product of two square roots is the square root of the product of the radicands.

A square root is **simplified** when its radicand has no factors other than 1 that are perfect squares. For example,  $\sqrt{500}$  is not simplified because it can be expressed as  $\sqrt{100 \cdot 5}$  and 100 is a perfect square. Example 2 shows how the product rule is used to remove from the square root any perfect squares that occur as factors.

### EXAMPLE 2 Using the Product Rule to Simplify Square Roots

Simplify:

a.  $\sqrt{500}$                       b.  $\sqrt{6x} \cdot \sqrt{3x}$ .

#### SOLUTION

a.  $\sqrt{500} = \sqrt{100 \cdot 5}$       Factor 500. 100 is the greatest perfect square factor.  
 $= \sqrt{100}\sqrt{5}$       Use the product rule:  $\sqrt{ab} = \sqrt{a} \cdot \sqrt{b}$ .  
 $= 10\sqrt{5}$       Write  $\sqrt{100}$  as 10. We read  $10\sqrt{5}$  as “ten times the square root of 5.”

b. We can simplify  $\sqrt{6x} \cdot \sqrt{3x}$  using the product rule only if  $6x$  and  $3x$  represent nonnegative real numbers. Thus,  $x \geq 0$ .

$$\begin{aligned} \sqrt{6x} \cdot \sqrt{3x} &= \sqrt{6x \cdot 3x} && \text{Use the product rule: } \sqrt{a}\sqrt{b} = \sqrt{ab}. \\ &= \sqrt{18x^2} && \text{Multiply in the radicand.} \\ &= \sqrt{9x^2 \cdot 2} && \text{Factor 18. 9 is the greatest perfect square factor.} \\ &= \sqrt{9x^2} \sqrt{2} && \text{Use the product rule: } \sqrt{ab} = \sqrt{a} \cdot \sqrt{b}. \\ &= \sqrt{9} \sqrt{x^2} \sqrt{2} && \text{Use the product rule to write } \sqrt{9x^2} \text{ as the} \\ & && \text{product of two square roots.} \\ &= 3x\sqrt{2} && \sqrt{x^2} = |x| = x \text{ because } x \geq 0. \end{aligned}$$

### GREAT QUESTION!

**When simplifying square roots, what happens if I use a perfect square factor that isn't the greatest perfect square factor possible?**

You'll need to simplify even further. For example, consider the following factorization:

$$\sqrt{500} = \sqrt{25 \cdot 20} = \sqrt{25}\sqrt{20} = 5\sqrt{20}.$$

25 is a perfect square factor of 500, but not the greatest perfect square factor.

Because 20 contains a perfect square factor, 4, the simplification is not complete.

$$5\sqrt{20} = 5\sqrt{4 \cdot 5} = 5\sqrt{4}\sqrt{5} = 5 \cdot 2\sqrt{5} = 10\sqrt{5}$$

Although the result checks with our simplification using  $\sqrt{500} = \sqrt{100 \cdot 5}$ , **more work is required when the greatest perfect square factor is not used.**

### Check Point 2 Simplify:

a.  $\sqrt{75}$                       b.  $\sqrt{5x} \cdot \sqrt{10x}$ .

- 4 Use the quotient rule to simplify square roots.

### The Quotient Rule for Square Roots

Another property for square roots involves division.

#### The Quotient Rule for Square Roots

If  $a$  and  $b$  represent nonnegative real numbers and  $b \neq 0$ , then

$$\sqrt{\frac{a}{b}} = \frac{\sqrt{a}}{\sqrt{b}} \quad \text{and} \quad \frac{\sqrt{a}}{\sqrt{b}} = \sqrt{\frac{a}{b}}.$$

The square root of a quotient is the quotient of the square roots.

The quotient of two square roots is the square root of the quotient of the radicands.

**EXAMPLE 3** Using the Quotient Rule to Simplify Square Roots

Simplify:

$$\text{a. } \sqrt{\frac{100}{9}} \qquad \text{b. } \frac{\sqrt{48x^3}}{\sqrt{6x}}.$$

**SOLUTION**

$$\text{a. } \sqrt{\frac{100}{9}} = \frac{\sqrt{100}}{\sqrt{9}} = \frac{10}{3}$$

b. We can simplify the quotient of  $\sqrt{48x^3}$  and  $\sqrt{6x}$  using the quotient rule only if  $48x^3$  and  $6x$  represent nonnegative real numbers and  $6x \neq 0$ . Thus,  $x > 0$ .

$$\frac{\sqrt{48x^3}}{\sqrt{6x}} = \sqrt{\frac{48x^3}{6x}} = \sqrt{8x^2} = \sqrt{4x^2}\sqrt{2} = \sqrt{4}\sqrt{x^2}\sqrt{2} = 2x\sqrt{2}$$

$\sqrt{x^2} = |x| = x$  because  $x > 0$ .

**Check Point 3** Simplify:

$$\text{a. } \sqrt{\frac{25}{16}} \qquad \text{b. } \frac{\sqrt{150x^3}}{\sqrt{2x}}.$$

**5** Add and subtract square roots.**GREAT QUESTION!**

Should like radicals remind me of like terms?

Yes. Adding or subtracting like radicals is similar to adding or subtracting like terms:

$$7x + 6x = 13x$$

and

$$7\sqrt{11} + 6\sqrt{11} = 13\sqrt{11}.$$

**Adding and Subtracting Square Roots**

Two or more square roots can be combined using the distributive property provided that they have the same radicand. Such radicals are called **like radicals**. For example,

$$7\sqrt{11} + 6\sqrt{11} = (7 + 6)\sqrt{11} = 13\sqrt{11}.$$

7 square roots of 11 plus 6 square roots of 11 result in 13 square roots of 11.

**EXAMPLE 4** Adding and Subtracting Like Radicals

Add or subtract as indicated:

$$\text{a. } 7\sqrt{2} + 5\sqrt{2} \qquad \text{b. } \sqrt{5x} - 7\sqrt{5x}.$$

**SOLUTION**

$$\text{a. } 7\sqrt{2} + 5\sqrt{2} = (7 + 5)\sqrt{2} \qquad \text{Apply the distributive property.}$$

$$= 12\sqrt{2} \qquad \text{Simplify.}$$

$$\text{b. } \sqrt{5x} - 7\sqrt{5x} = 1\sqrt{5x} - 7\sqrt{5x} \qquad \text{Write } \sqrt{5x} \text{ as } 1\sqrt{5x}.$$

$$= (1 - 7)\sqrt{5x} \qquad \text{Apply the distributive property.}$$

$$= -6\sqrt{5x} \qquad \text{Simplify.}$$

**Check Point 4** Add or subtract as indicated:

$$\text{a. } 8\sqrt{13} + 9\sqrt{13} \qquad \text{b. } \sqrt{17x} - 20\sqrt{17x}.$$

In some cases, radicals can be combined once they have been simplified. For example, to add  $\sqrt{2}$  and  $\sqrt{8}$ , we can write  $\sqrt{8}$  as  $\sqrt{4 \cdot 2}$  because 4 is a perfect square factor of 8.

$$\sqrt{2} + \sqrt{8} = \sqrt{2} + \sqrt{4 \cdot 2} = 1\sqrt{2} + 2\sqrt{2} = (1 + 2)\sqrt{2} = 3\sqrt{2}$$

**EXAMPLE 5** Combining Radicals That First Require Simplification

Add or subtract as indicated:

a.  $7\sqrt{3} + \sqrt{12}$       b.  $4\sqrt{50x} - 6\sqrt{32x}$ .

**SOLUTION**

$$\begin{aligned} \text{a. } & 7\sqrt{3} + \sqrt{12} \\ & = 7\sqrt{3} + \sqrt{4 \cdot 3} \\ & = 7\sqrt{3} + 2\sqrt{3} \\ & = (7 + 2)\sqrt{3} \end{aligned}$$

Split 12 into two factors such that one is a perfect square.

$$\sqrt{4 \cdot 3} = \sqrt{4} \sqrt{3} = 2\sqrt{3}$$

Apply the distributive property. You will find that this step is usually done mentally.

Simplify.

$$\begin{aligned} \text{b. } & 4\sqrt{50x} - 6\sqrt{32x} \\ & = 4\sqrt{25 \cdot 2x} - 6\sqrt{16 \cdot 2x} \\ & = 4 \cdot 5\sqrt{2x} - 6 \cdot 4\sqrt{2x} \\ & = 20\sqrt{2x} - 24\sqrt{2x} \\ & = (20 - 24)\sqrt{2x} \\ & = -4\sqrt{2x} \end{aligned}$$

25 is the greatest perfect square factor of  $50x$  and 16 is the greatest perfect square factor of  $32x$ .

$$\begin{aligned} \sqrt{25 \cdot 2x} & = \sqrt{25} \sqrt{2x} = 5\sqrt{2x} \text{ and} \\ \sqrt{16 \cdot 2x} & = \sqrt{16} \sqrt{2x} = 4\sqrt{2x}. \end{aligned}$$

Multiply:  $4 \cdot 5 = 20$  and  $6 \cdot 4 = 24$ .

Apply the distributive property.

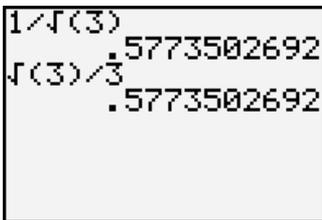

Simplify. ...**Check Point 5** Add or subtract as indicated:

a.  $5\sqrt{27} + \sqrt{12}$       b.  $6\sqrt{18x} - 4\sqrt{8x}$ .

**6** Rationalize denominators.**Rationalizing Denominators**The calculator screen in **Figure P.11** shows approximate values for  $\frac{1}{\sqrt{3}}$  and  $\frac{\sqrt{3}}{3}$ . The two approximations are the same. This is not a coincidence:

$$\frac{1}{\sqrt{3}} = \frac{1}{\sqrt{3}} \cdot \frac{\sqrt{3}}{\sqrt{3}} = \frac{\sqrt{3}}{\sqrt{9}} = \frac{\sqrt{3}}{3}.$$

Any number divided by itself is 1.  
Multiplication by 1 does not change  
the value of  $\frac{1}{\sqrt{3}}$ .

**FIGURE P.11** The calculator screen shows approximate values for

$$\frac{1}{\sqrt{3}} \text{ and } \frac{\sqrt{3}}{3}.$$

This process involves rewriting a radical expression as an equivalent expression in which the denominator no longer contains any radicals. The process is called **rationalizing the denominator**. If the denominator consists of the square root of a natural number that is not a perfect square, **multiply the numerator and the denominator by the smallest number that produces the square root of a perfect square in the denominator**.

**EXAMPLE 6** Rationalizing Denominators

Rationalize the denominator:

a.  $\frac{15}{\sqrt{6}}$       b.  $\frac{12}{\sqrt{8}}$ .

**GREAT QUESTION!**

What exactly does rationalizing a denominator do to an irrational number in the denominator?

Rationalizing a numerical denominator makes that denominator a rational number.

**SOLUTION**

- a. If we multiply the numerator and the denominator of  $\frac{15}{\sqrt{6}}$  by  $\sqrt{6}$ , the denominator becomes  $\sqrt{6} \cdot \sqrt{6} = \sqrt{36} = 6$ . Therefore, we multiply by 1, choosing  $\frac{\sqrt{6}}{\sqrt{6}}$  for 1.

$$\frac{15}{\sqrt{6}} = \frac{15}{\sqrt{6}} \cdot \frac{\sqrt{6}}{\sqrt{6}} = \frac{15\sqrt{6}}{\sqrt{36}} = \frac{15\sqrt{6}}{6} = \frac{5\sqrt{6}}{2}$$

Multiply by 1.

Simplify:  $\frac{15}{6} = \frac{15 \div 3}{6 \div 3} = \frac{5}{2}$ .

- b. The *smallest* number that will produce the square root of a perfect square in the denominator of  $\frac{12}{\sqrt{8}}$  is  $\sqrt{2}$ , because  $\sqrt{8} \cdot \sqrt{2} = \sqrt{16} = 4$ . We multiply by 1, choosing  $\frac{\sqrt{2}}{\sqrt{2}}$  for 1.

$$\frac{12}{\sqrt{8}} = \frac{12}{\sqrt{8}} \cdot \frac{\sqrt{2}}{\sqrt{2}} = \frac{12\sqrt{2}}{\sqrt{16}} = \frac{12\sqrt{2}}{4} = 3\sqrt{2}$$

...

 **Check Point 6** Rationalize the denominator:

a.  $\frac{5}{\sqrt{3}}$

b.  $\frac{6}{\sqrt{12}}$

Radical expressions that involve the sum and difference of the same two terms are called **conjugates**. Thus,

$$\sqrt{a} + \sqrt{b} \quad \text{and} \quad \sqrt{a} - \sqrt{b}$$

are conjugates. Conjugates are used to rationalize denominators because the product of such a pair contains no radicals:

Multiply each term of  $\sqrt{a} - \sqrt{b}$  by each term of  $\sqrt{a} + \sqrt{b}$ .

$$\begin{aligned} & (\sqrt{a} + \sqrt{b})(\sqrt{a} - \sqrt{b}) \\ &= \sqrt{a}(\sqrt{a} - \sqrt{b}) + \sqrt{b}(\sqrt{a} - \sqrt{b}) \end{aligned}$$

Distribute  $\sqrt{a}$  over  $\sqrt{a} - \sqrt{b}$ .

Distribute  $\sqrt{b}$  over  $\sqrt{a} - \sqrt{b}$ .

$$\begin{aligned} &= \sqrt{a} \cdot \sqrt{a} - \sqrt{a} \cdot \sqrt{b} + \sqrt{b} \cdot \sqrt{a} - \sqrt{b} \cdot \sqrt{b} \\ &= (\sqrt{a})^2 - \sqrt{ab} + \sqrt{ab} - (\sqrt{b})^2 \end{aligned}$$

$-\sqrt{ab} + \sqrt{ab} = 0$

$$\begin{aligned} &= (\sqrt{a})^2 - (\sqrt{b})^2 \\ &= a - b. \end{aligned}$$

**Multiplying Conjugates**

$$(\sqrt{a} + \sqrt{b})(\sqrt{a} - \sqrt{b}) = (\sqrt{a})^2 - (\sqrt{b})^2 = a - b$$

How can we rationalize a denominator if the denominator contains two terms with one or more square roots? **Multiply the numerator and the denominator by the conjugate of the denominator.** Here are three examples of such expressions:

• $\frac{7}{5 + \sqrt{3}}$	• $\frac{8}{3\sqrt{2} - 4}$	• $\frac{h}{\sqrt{x+h} - \sqrt{x}}$
The conjugate of the denominator is $5 - \sqrt{3}$ .	The conjugate of the denominator is $3\sqrt{2} + 4$ .	The conjugate of the denominator is $\sqrt{x+h} + \sqrt{x}$ .

The product of the denominator and its conjugate is found using the formula

$$(\sqrt{a} + \sqrt{b})(\sqrt{a} - \sqrt{b}) = (\sqrt{a})^2 - (\sqrt{b})^2 = a - b.$$

The simplified product will not contain a radical.

### EXAMPLE 7 Rationalizing a Denominator Containing Two Terms

Rationalize the denominator:  $\frac{7}{5 + \sqrt{3}}$ .

#### SOLUTION

The conjugate of the denominator is  $5 - \sqrt{3}$ . If we multiply the numerator and denominator by  $5 - \sqrt{3}$ , the simplified denominator will not contain a radical.

Therefore, we multiply by 1, choosing  $\frac{5 - \sqrt{3}}{5 - \sqrt{3}}$  for 1.

$$\frac{7}{5 + \sqrt{3}} = \frac{7}{5 + \sqrt{3}} \cdot \frac{5 - \sqrt{3}}{5 - \sqrt{3}} = \frac{7(5 - \sqrt{3})}{5^2 - (\sqrt{3})^2} = \frac{7(5 - \sqrt{3})}{25 - 3}$$

Multiply by 1.

$$\begin{aligned} (\sqrt{a} + \sqrt{b})(\sqrt{a} - \sqrt{b}) \\ = (\sqrt{a})^2 - (\sqrt{b})^2 \end{aligned}$$

$$= \frac{7(5 - \sqrt{3})}{22} \text{ or } \frac{35 - 7\sqrt{3}}{22}$$

In either form of the answer, there is no radical in the denominator.

...

**Check Point 7** Rationalize the denominator:  $\frac{8}{4 + \sqrt{5}}$ .

**7** Evaluate and perform operations with higher roots.

### Other Kinds of Roots

We define the **principal  $n$ th root** of a real number  $a$ , symbolized by  $\sqrt[n]{a}$ , as follows:

#### Definition of the Principal $n$ th Root of a Real Number

$$\sqrt[n]{a} = b \text{ means that } b^n = a.$$

If  $n$ , the **index**, is even, then  $a$  is nonnegative ( $a \geq 0$ ) and  $b$  is also nonnegative ( $b \geq 0$ ). If  $n$  is odd,  $a$  and  $b$  can be any real numbers.

For example,

$$\sqrt[3]{64} = 4 \text{ because } 4^3 = 64 \quad \text{and} \quad \sqrt[5]{-32} = -2 \text{ because } (-2)^5 = -32.$$

The same vocabulary that we learned for square roots applies to  $n$ th roots. The symbol  $\sqrt[n]{\phantom{x}}$  is called a **radical** and the expression under the radical is called the **radicand**.

### GREAT QUESTION!

Should I know the higher roots of certain numbers by heart?

Some higher roots occur so frequently that you might want to memorize them.

Cube Roots	
$\sqrt[3]{1} = 1$	$\sqrt[3]{125} = 5$
$\sqrt[3]{8} = 2$	$\sqrt[3]{216} = 6$
$\sqrt[3]{27} = 3$	$\sqrt[3]{1000} = 10$
$\sqrt[3]{64} = 4$	

Fourth Roots	Fifth Roots
$\sqrt[4]{1} = 1$	$\sqrt[5]{1} = 1$
$\sqrt[4]{16} = 2$	$\sqrt[5]{32} = 2$
$\sqrt[4]{81} = 3$	$\sqrt[5]{243} = 3$
$\sqrt[4]{256} = 4$	
$\sqrt[4]{625} = 5$	

A number that is the  $n$ th power of a rational number is called a **perfect  $n$ th power**. For example, 8 is a perfect third power, or perfect cube, because  $8 = 2^3$ . Thus,  $\sqrt[3]{8} = \sqrt[3]{2^3} = 2$ . In general, one of the following rules can be used to find the  $n$ th root of a perfect  $n$ th power:

#### Finding $n$ th Roots of Perfect $n$ th Powers

If  $n$  is odd,  $\sqrt[n]{a^n} = a$ .

If  $n$  is even,  $\sqrt[n]{a^n} = |a|$ .

For example,

$$\sqrt[3]{(-2)^3} = -2 \quad \text{and} \quad \sqrt[4]{(-2)^4} = |-2| = 2.$$

Absolute value is not needed with odd roots, but is necessary with even roots.

### The Product and Quotient Rules for Other Roots

The product and quotient rules apply to cube roots, fourth roots, and all higher roots.

#### The Product and Quotient Rules for $n$ th Roots

For all real numbers  $a$  and  $b$ , where the indicated roots represent real numbers,

$$\sqrt[n]{ab} = \sqrt[n]{a} \cdot \sqrt[n]{b} \quad \text{and} \quad \sqrt[n]{a} \cdot \sqrt[n]{b} = \sqrt[n]{ab}$$

The  $n$ th root of a product is the product of the  $n$ th roots.

The product of two  $n$ th roots is the  $n$ th root of the product of the radicands.

$$\sqrt[n]{\frac{a}{b}} = \frac{\sqrt[n]{a}}{\sqrt[n]{b}}, b \neq 0 \quad \text{and} \quad \frac{\sqrt[n]{a}}{\sqrt[n]{b}} = \sqrt[n]{\frac{a}{b}}, b \neq 0.$$

The  $n$ th root of a quotient is the quotient of the  $n$ th roots.

The quotient of two  $n$ th roots is the  $n$ th root of the quotient of the radicands.

### EXAMPLE 8 Simplifying, Multiplying, and Dividing Higher Roots

Simplify: a.  $\sqrt[3]{24}$       b.  $\sqrt[4]{8} \cdot \sqrt[4]{4}$       c.  $\sqrt[4]{\frac{81}{16}}$

#### SOLUTION

a.  $\sqrt[3]{24} = \sqrt[3]{8 \cdot 3}$

Find the greatest perfect cube that is a factor of 24.  $2^3 = 8$ , so 8 is a perfect cube and is the greatest perfect cube factor of 24.

$$= \sqrt[3]{8} \cdot \sqrt[3]{3}$$

$$\sqrt[n]{ab} = \sqrt[n]{a} \cdot \sqrt[n]{b}$$

$$= 2\sqrt[3]{3}$$

$$\sqrt[3]{8} = 2$$

b.  $\sqrt[4]{8} \cdot \sqrt[4]{4} = \sqrt[4]{8 \cdot 4}$

$$\sqrt[n]{a} \cdot \sqrt[n]{b} = \sqrt[n]{ab}$$

$$= \sqrt[4]{32}$$

Find the greatest perfect fourth power that is a factor of 32.

$$= \sqrt[4]{16 \cdot 2}$$

$2^4 = 16$ , so 16 is a perfect fourth power and is the greatest perfect fourth power that is a factor of 32.

$$= \sqrt[4]{16} \cdot \sqrt[4]{2}$$

$$\sqrt[n]{ab} = \sqrt[n]{a} \cdot \sqrt[n]{b}$$

$$= 2\sqrt[4]{2}$$

$$\sqrt[4]{16} = 2$$

$$\begin{aligned} \text{c. } \sqrt[4]{\frac{81}{16}} &= \frac{\sqrt[4]{81}}{\sqrt[4]{16}} & \sqrt[n]{\frac{a}{b}} &= \frac{\sqrt[n]{a}}{\sqrt[n]{b}} \\ &= \frac{3}{2} & \sqrt[4]{81} &= 3 \text{ because } 3^4 = 81 \text{ and } \sqrt[4]{16} = 2 \text{ because } 2^4 = 16. \dots \end{aligned}$$

 **Check Point 8** Simplify:

a.  $\sqrt[3]{40}$

b.  $\sqrt[5]{8} \cdot \sqrt[5]{8}$

c.  $\sqrt[3]{\frac{125}{27}}$

We have seen that adding and subtracting square roots often involves simplifying terms. The same idea applies to adding and subtracting higher roots.

### EXAMPLE 9 Combining Cube Roots

Subtract:  $5\sqrt[3]{16} - 11\sqrt[3]{2}$ .

#### SOLUTION

$$\begin{aligned} &5\sqrt[3]{16} - 11\sqrt[3]{2} \\ &= 5\sqrt[3]{8 \cdot 2} - 11\sqrt[3]{2} && \text{Factor 16. 8 is the greatest perfect cube factor: } 2^3 = 8 \text{ and } \sqrt[3]{8} = 2. \\ &= 5 \cdot 2\sqrt[3]{2} - 11\sqrt[3]{2} && \sqrt[3]{8 \cdot 2} = \sqrt[3]{8} \sqrt[3]{2} = 2\sqrt[3]{2} \\ &= 10\sqrt[3]{2} - 11\sqrt[3]{2} && \text{Multiply: } 5 \cdot 2 = 10. \\ &= (10 - 11)\sqrt[3]{2} && \text{Apply the distributive property.} \\ &= -1\sqrt[3]{2} \text{ or } -\sqrt[3]{2} && \text{Simplify.} \end{aligned}$$

 **Check Point 9** Subtract:  $3\sqrt[3]{81} - 4\sqrt[3]{3}$ .

**8** Understand and use rational exponents.

### Rational Exponents

We define rational exponents so that their properties are the same as the properties for integer exponents. For example, we know that exponents are multiplied when an exponential expression is raised to a power. For this to be true,

$$\left(7^{\frac{1}{2}}\right)^2 = 7^{\frac{1}{2} \cdot 2} = 7^1 = 7.$$

We also know that

$$(\sqrt{7})^2 = \sqrt{7} \cdot \sqrt{7} = \sqrt{49} = 7.$$

Can you see that the square of both  $7^{\frac{1}{2}}$  and  $\sqrt{7}$  is 7? It is reasonable to conclude that

$$7^{\frac{1}{2}} \text{ means } \sqrt{7}.$$

We can generalize the fact that  $7^{\frac{1}{2}}$  means  $\sqrt{7}$  with the following definition:

#### The Definition of $a^{\frac{1}{n}}$

If  $\sqrt[n]{a}$  represents a real number, where  $n \geq 2$  is an integer, then

$$a^{\frac{1}{n}} = \sqrt[n]{a}.$$

The denominator of the rational exponent is the radical's index.

Furthermore,

$$a^{-\frac{1}{n}} = \frac{1}{a^{\frac{1}{n}}} = \frac{1}{\sqrt[n]{a}}, \quad a \neq 0.$$

**EXAMPLE 10** Using the Definition of  $a^{\frac{1}{n}}$ 

Simplify:

a.  $64^{\frac{1}{2}}$     b.  $125^{\frac{1}{3}}$     c.  $-16^{\frac{1}{4}}$     d.  $(-27)^{\frac{1}{3}}$     e.  $64^{-\frac{1}{3}}$ .

**SOLUTION**

a.  $64^{\frac{1}{2}} = \sqrt{64} = 8$

b.  $125^{\frac{1}{3}} = \sqrt[3]{125} = 5$

The denominator is the index.

c.  $-16^{\frac{1}{4}} = -(\sqrt[4]{16}) = -2$

The base is 16 and the negative sign is not affected by the exponent.

d.  $(-27)^{\frac{1}{3}} = \sqrt[3]{-27} = -3$

Parentheses show that the base is  $-27$  and that the negative sign is affected by the exponent.

e.  $64^{-\frac{1}{3}} = \frac{1}{64^{\frac{1}{3}}} = \frac{1}{\sqrt[3]{64}} = \frac{1}{4}$     ...

 **Check Point 10** Simplify:

a.  $25^{\frac{1}{2}}$     b.  $8^{\frac{1}{3}}$     c.  $-81^{\frac{1}{4}}$     d.  $(-8)^{\frac{1}{3}}$     e.  $27^{-\frac{1}{3}}$ .

In Example 10 and Check Point 10, each rational exponent had a numerator of 1. If the numerator is some other integer, we still want to multiply exponents when raising a power to a power. For this reason,

$$a^{\frac{2}{3}} = (a^{\frac{1}{3}})^2 \quad \text{and} \quad a^{\frac{2}{3}} = (a^2)^{\frac{1}{3}}.$$

This means  $(\sqrt[3]{a})^2$ .This means  $\sqrt[3]{a^2}$ .

Thus,

$$a^{\frac{2}{3}} = (\sqrt[3]{a})^2 = \sqrt[3]{a^2}.$$

Do you see that the denominator, 3, of the rational exponent is the same as the index of the radical? The numerator, 2, of the rational exponent serves as an exponent in each of the two radical forms. We generalize these ideas with the following definition:

**The Definition of  $a^{\frac{m}{n}}$** 

If  $\sqrt[n]{a}$  represents a real number and  $\frac{m}{n}$  is a positive rational number,  $n \geq 2$ , then

$$a^{\frac{m}{n}} = (\sqrt[n]{a})^m.$$

Also,

$$a^{\frac{m}{n}} = \sqrt[n]{a^m}.$$

Furthermore, if  $a^{-\frac{m}{n}}$  is a nonzero real number, then

$$a^{-\frac{m}{n}} = \frac{1}{a^{\frac{m}{n}}}.$$

The first form of the definition of  $a^{\frac{m}{n}}$ , shown again below, involves taking the root first. This form is often preferable because smaller numbers are involved. Notice that the rational exponent consists of two parts, indicated by the following voice balloons:

The numerator is the exponent.

$$a^{\frac{m}{n}} = (\sqrt[n]{a})^m.$$

The denominator is the radical's index.

### EXAMPLE 11 Using the Definition of $a^{\frac{m}{n}}$

Simplify:

a.  $27^{\frac{2}{3}}$

b.  $9^{\frac{3}{2}}$

c.  $81^{-\frac{3}{4}}$

#### SOLUTION

a.  $27^{\frac{2}{3}} = (\sqrt[3]{27})^2 = 3^2 = 9$

b.  $9^{\frac{3}{2}} = (\sqrt{9})^3 = 3^3 = 27$

c.  $81^{-\frac{3}{4}} = \frac{1}{81^{\frac{3}{4}}} = \frac{1}{(\sqrt[4]{81})^3} = \frac{1}{3^3} = \frac{1}{27}$

 **Check Point 11** Simplify:

a.  $27^{\frac{4}{3}}$

b.  $4^{\frac{3}{2}}$

c.  $32^{-\frac{2}{5}}$

### TECHNOLOGY

Here are the calculator keystroke sequences for  $81^{-\frac{3}{4}}$ :

#### Many Scientific Calculators

$$81 \text{ [y}^x \text{] [(] [3] [+/-] [\div] [4] [)] [=]$$

#### Many Graphing Calculators

$$81 \text{ [^] [(] [( - )] [3] [\div] [4] [)] [ENTER]$$

Properties of exponents can be applied to expressions containing rational exponents.

### EXAMPLE 12 Simplifying Expressions with Rational Exponents

Simplify using properties of exponents:

a.  $(5x^{\frac{1}{2}})(7x^{\frac{3}{4}})$

b.  $\frac{32x^{\frac{5}{3}}}{16x^{\frac{3}{4}}}$

#### SOLUTION

$$\begin{aligned} \text{a. } (5x^{\frac{1}{2}})(7x^{\frac{3}{4}}) &= 5 \cdot 7x^{\frac{1}{2}} \cdot x^{\frac{3}{4}} \\ &= 35x^{\frac{1}{2} + \frac{3}{4}} \\ &= 35x^{\frac{5}{4}} \end{aligned}$$

Group numerical factors and group variable factors with the same base.

When multiplying expressions with the same base, add the exponents.

$$\frac{1}{2} + \frac{3}{4} = \frac{2}{4} + \frac{3}{4} = \frac{5}{4}$$

$$\begin{aligned} \text{b. } \frac{32x^{\frac{5}{3}}}{16x^{\frac{3}{4}}} &= \left(\frac{32}{16}\right)\left(\frac{x^{\frac{5}{3}}}{x^{\frac{3}{4}}}\right) \\ &= 2x^{\frac{5}{3} - \frac{3}{4}} \\ &= 2x^{\frac{11}{12}} \end{aligned}$$

Group numerical factors and group variable factors with the same base.

When dividing expressions with the same base, subtract the exponents.

$$\frac{5}{3} - \frac{3}{4} = \frac{20}{12} - \frac{9}{12} = \frac{11}{12}$$

 **Check Point 12** Simplify using properties of exponents:

a.  $(2x^{\frac{4}{3}})(5x^{\frac{8}{3}})$

b.  $\frac{20x^4}{5x^{\frac{3}{2}}}$

Rational exponents are sometimes useful for simplifying radicals by reducing the index.

### EXAMPLE 13 Reducing the Index of a Radical

Simplify:  $\sqrt[9]{x^3}$ .

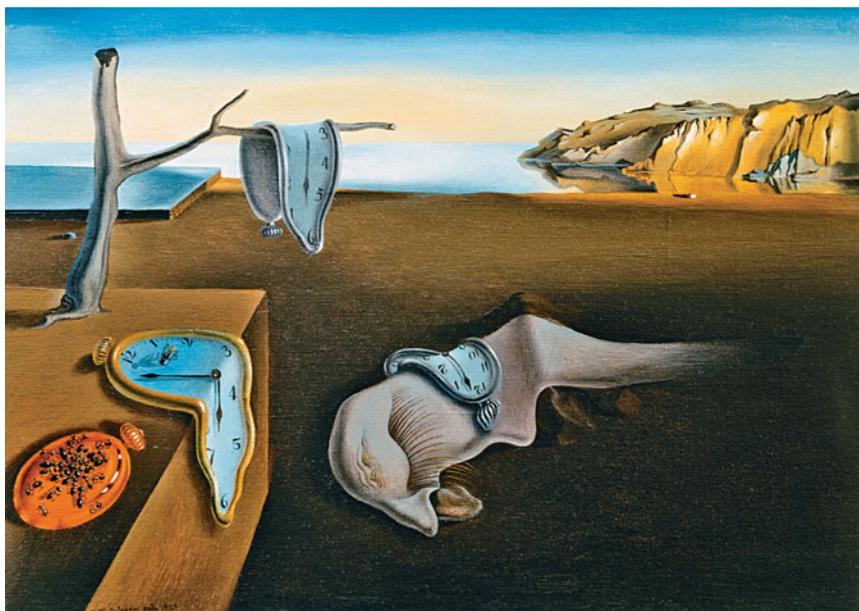

#### SOLUTION

$$\sqrt[9]{x^3} = x^{\frac{3}{9}} = x^{\frac{1}{3}} = \sqrt[3]{x}$$

...

 **Check Point 13** Simplify:  $\sqrt[6]{x^3}$ .

### Blitzer Bonus || A Radical Idea: Time Is Relative

*The Persistence of Memory* (1931), Salvador Dali. © 2011 MOMA/ARS.

What does travel in space have to do with radicals? Imagine that in the future we will be able to travel at velocities approaching the speed of light (approximately 186,000 miles per second). According to Einstein's theory of special relativity, time would pass more quickly on Earth than it would in the moving spaceship. The special-relativity equation

$$R_a = R_f \sqrt{1 - \left(\frac{v}{c}\right)^2}$$

gives the aging rate of an astronaut,  $R_a$ , relative to the aging rate of a friend,  $R_f$ , on Earth. In this formula,  $v$  is the astronaut's speed and  $c$  is the speed of light. As the astronaut's speed approaches the speed of light, we can substitute  $c$  for  $v$ .

$$R_a = R_f \sqrt{1 - \left(\frac{v}{c}\right)^2}$$

Einstein's equation gives the aging rate of an astronaut,  $R_a$ , relative to the aging rate of a friend,  $R_f$ , on Earth.

$$R_a = R_f \sqrt{1 - \left(\frac{c}{c}\right)^2}$$

The velocity,  $v$ , is approaching the speed of light,  $c$ , so let  $v = c$ .

$$= R_f \sqrt{1 - 1}$$

$$\left(\frac{c}{c}\right)^2 = 1^2 = 1 \cdot 1 = 1$$

$$= R_f \sqrt{0}$$

Simplify the radicand:  $1 - 1 = 0$ .

$$= R_f \cdot 0$$

$$\sqrt{0} = 0$$

$$= 0$$

Multiply:  $R_f \cdot 0 = 0$ .

Close to the speed of light, the astronaut's aging rate,  $R_a$ , relative to a friend,  $R_f$ , on Earth is nearly 0. What does this mean? As we age here on Earth, the space traveler would barely get older. The space traveler would return to an unknown futuristic world in which friends and loved ones would be long gone.

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- The symbol  $\sqrt{\quad}$  is used to denote the nonnegative, or \_\_\_\_\_, square root of a number.
- $\sqrt{64} = 8$  because  $\_\_ = 64$ .
- $\sqrt{a^2} = \_\_$
- The product rule for square roots states that if  $a$  and  $b$  are nonnegative, then  $\sqrt{ab} = \_\_$ .
- The quotient rule for square roots states that if  $a$  and  $b$  are nonnegative and  $b \neq 0$ , then  $\sqrt{\frac{a}{b}} = \_\_$ .
- $8\sqrt{3} + 10\sqrt{3} = \_\_$
- $\sqrt{3} + \sqrt{75} = \sqrt{3} + \sqrt{25 \cdot 3} = \sqrt{3} + \_\_ \sqrt{3} = \_\_$
- The conjugate of  $7 + \sqrt{3}$  is \_\_\_\_\_.
- We rationalize the denominator of  $\frac{5}{\sqrt{10} - \sqrt{2}}$  by multiplying the numerator and denominator by \_\_\_\_\_.
- In the expression  $\sqrt[3]{64}$ , the number 3 is called the \_\_\_\_\_ and the number 64 is called the \_\_\_\_\_.
- $\sqrt[5]{-32} = -2$  because  $\_\_ = -32$ .
- If  $n$  is odd,  $\sqrt[n]{a^n} = \_\_$ .  
If  $n$  is even,  $\sqrt[n]{a^n} = \_\_$ .
- $a^{\frac{1}{n}} = \_\_$
- $16^{\frac{3}{4}} = (\sqrt[4]{16})^3 = (\_\_)^3 = \_\_$

## EXERCISE SET P.3

## Practice Exercises

Evaluate each expression in Exercises 1–12, or indicate that the root is not a real number.

- |                            |                              |
|----------------------------|------------------------------|
| 1. $\sqrt{36}$             | 2. $\sqrt{25}$               |
| 3. $-\sqrt{36}$            | 4. $-\sqrt{25}$              |
| 5. $\sqrt{-36}$            | 6. $\sqrt{-25}$              |
| 7. $\sqrt{25 - 16}$        | 8. $\sqrt{144 + 25}$         |
| 9. $\sqrt{25 - \sqrt{16}}$ | 10. $\sqrt{144 + \sqrt{25}}$ |
| 11. $\sqrt{(-13)^2}$       | 12. $\sqrt{(-17)^2}$         |

Use the product rule to simplify the expressions in Exercises 13–22. In Exercises 17–22, assume that variables represent nonnegative real numbers.

- |                                   |                                   |
|-----------------------------------|-----------------------------------|
| 13. $\sqrt{50}$                   | 14. $\sqrt{27}$                   |
| 15. $\sqrt{45x^2}$                | 16. $\sqrt{125x^2}$               |
| 17. $\sqrt{2x} \cdot \sqrt{6x}$   | 18. $\sqrt{10x} \cdot \sqrt{8x}$  |
| 19. $\sqrt{x^3}$                  | 20. $\sqrt{y^3}$                  |
| 21. $\sqrt{2x^2} \cdot \sqrt{6x}$ | 22. $\sqrt{6x} \cdot \sqrt{3x^2}$ |

Use the quotient rule to simplify the expressions in Exercises 23–32. Assume that  $x > 0$ .

- |   |   |
|---|---|
| 23. $\sqrt{\frac{1}{81}}$                   | 24. $\sqrt{\frac{1}{49}}$                   |
| 25. $\sqrt{\frac{49}{16}}$                  | 26. $\sqrt{\frac{121}{9}}$                  |
| 27. $\frac{\sqrt{48x^3}}{\sqrt{3x}}$        | 28. $\frac{\sqrt{72x^3}}{\sqrt{8x}}$        |
| 29. $\frac{\sqrt{150x^4}}{\sqrt{3x}}$       | 30. $\frac{\sqrt{24x^4}}{\sqrt{3x}}$        |
| 31. $\frac{\sqrt{200x^3}}{\sqrt{10x^{-1}}}$ | 32. $\frac{\sqrt{500x^3}}{\sqrt{10x^{-1}}}$ |

In Exercises 33–44, add or subtract terms whenever possible.

- |                                 |                                 |
|---------------------------------|---------------------------------|
| 33. $7\sqrt{3} + 6\sqrt{3}$     | 34. $8\sqrt{5} + 11\sqrt{5}$    |
| 35. $6\sqrt{17x} - 8\sqrt{17x}$ | 36. $4\sqrt{13x} - 6\sqrt{13x}$ |

- |  |                               |
|--|-------------------------------|
| 37. $\sqrt{8} + 3\sqrt{2}$                             | 38. $\sqrt{20} + 6\sqrt{5}$   |
| 39. $\sqrt{50x} - \sqrt{8x}$                           | 40. $\sqrt{63x} - \sqrt{28x}$ |
| 41. $3\sqrt{18} + 5\sqrt{50}$                          | 42. $4\sqrt{12} - 2\sqrt{75}$ |
| 43. $3\sqrt{8} - \sqrt{32} + 3\sqrt{72} - \sqrt{75}$   |                               |
| 44. $3\sqrt{54} - 2\sqrt{24} - \sqrt{96} + 4\sqrt{63}$ |                               |

In Exercises 45–54, rationalize the denominator.

- |                                     |                                      |
|-------------------------------------|--------------------------------------|
| 45. $\frac{1}{\sqrt{7}}$            | 46. $\frac{2}{\sqrt{10}}$            |
| 47. $\frac{\sqrt{2}}{\sqrt{5}}$     | 48. $\frac{\sqrt{7}}{\sqrt{3}}$      |
| 49. $\frac{13}{3 + \sqrt{11}}$      | 50. $\frac{3}{3 + \sqrt{7}}$         |
| 51. $\frac{7}{\sqrt{5} - 2}$        | 52. $\frac{5}{\sqrt{3} - 1}$         |
| 53. $\frac{6}{\sqrt{5} + \sqrt{3}}$ | 54. $\frac{11}{\sqrt{7} - \sqrt{3}}$ |

Evaluate each expression in Exercises 55–66, or indicate that the root is not a real number.

- |                        |                               |                              |
|------------------------|-------------------------------|------------------------------|
| 55. $\sqrt[3]{125}$    | 56. $\sqrt[3]{8}$             | 57. $\sqrt[3]{-8}$           |
| 58. $\sqrt[3]{-125}$   | 59. $\sqrt[4]{-16}$           | 60. $\sqrt[4]{-81}$          |
| 61. $\sqrt[4]{(-3)^4}$ | 62. $\sqrt[4]{(-2)^4}$        | 63. $\sqrt[5]{(-3)^5}$       |
| 64. $\sqrt[5]{(-2)^5}$ | 65. $\sqrt[5]{-\frac{1}{32}}$ | 66. $\sqrt[6]{\frac{1}{64}}$ |

Simplify the radical expressions in Exercises 67–74 if possible.

- |  |   |
|--|---|
| 67. $\sqrt[3]{32}$                         | 68. $\sqrt[3]{150}$                         |
| 69. $\sqrt[3]{x^4}$                        | 70. $\sqrt[3]{x^5}$                         |
| 71. $\sqrt[3]{9} \cdot \sqrt[3]{6}$        | 72. $\sqrt[3]{12} \cdot \sqrt[3]{4}$        |
| 73. $\frac{\sqrt[5]{64x^6}}{\sqrt[3]{2x}}$ | 74. $\frac{\sqrt[4]{162x^5}}{\sqrt[4]{2x}}$ |

In Exercises 75–82, add or subtract terms whenever possible.

- 75.  $4\sqrt[5]{2} + 3\sqrt[5]{2}$
- 76.  $6\sqrt[5]{3} + 2\sqrt[5]{3}$
- 77.  $5\sqrt[3]{16} + \sqrt[3]{54}$
- 78.  $3\sqrt[3]{24} + \sqrt[3]{81}$
- 79.  $\sqrt[3]{54xy^3} - y\sqrt[3]{128x}$
- 80.  $\sqrt[3]{24xy^3} - y\sqrt[3]{81x}$
- 81.  $\sqrt{2} + \sqrt[3]{8}$
- 82.  $\sqrt{3} + \sqrt[3]{15}$

In Exercises 83–90, evaluate each expression without using a calculator.

- 83.  $36^{\frac{1}{2}}$
- 84.  $121^{\frac{1}{2}}$
- 85.  $8^{\frac{1}{3}}$
- 86.  $27^{\frac{1}{3}}$
- 87.  $125^{\frac{2}{3}}$
- 88.  $8^{\frac{2}{3}}$
- 89.  $32^{-\frac{4}{5}}$
- 90.  $16^{-\frac{5}{2}}$

In Exercises 91–100, simplify using properties of exponents.

- 91.  $(7x^{\frac{1}{3}})(2x^{\frac{1}{4}})$
- 92.  $(3x^{\frac{2}{3}})(4x^{\frac{3}{4}})$
- 93.  $\frac{20x^2}{5x^4}$
- 94.  $\frac{72x^4}{9x^{\frac{3}{5}}}$
- 95.  $(x^{\frac{2}{3}})^3$
- 96.  $(x^{\frac{4}{5}})^5$
- 97.  $(25x^4y^6)^{\frac{1}{2}}$
- 98.  $(125x^9y^6)^{\frac{1}{3}}$
- 99.  $\frac{(3y^4)^3}{y^{\frac{1}{2}}}$
- 100.  $\frac{(2y^{\frac{1}{5}})^4}{y^{\frac{3}{10}}}$

In Exercises 101–108, simplify by reducing the index of the radical.

- 101.  $\sqrt[4]{5^2}$
- 102.  $\sqrt[4]{7^2}$
- 103.  $\sqrt[3]{x^6}$
- 104.  $\sqrt[4]{x^{12}}$
- 105.  $\sqrt[6]{x^4}$
- 106.  $\sqrt[9]{x^6}$
- 107.  $\sqrt[9]{x^6y^3}$
- 108.  $\sqrt[12]{x^4y^8}$

**Practice Plus**

In Exercises 109–110, evaluate each expression.

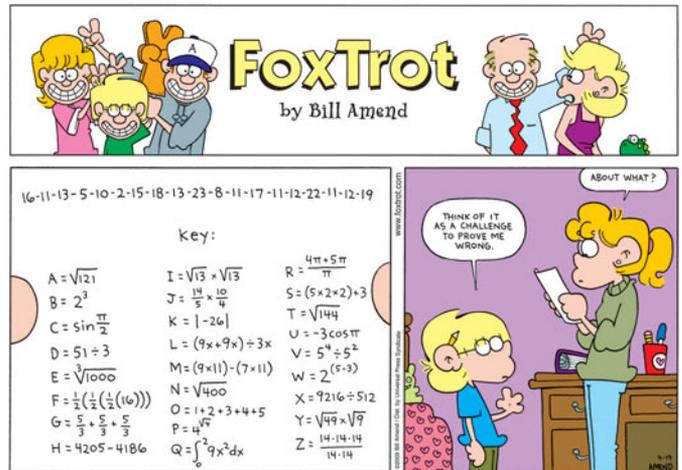

- 109.  $\sqrt[3]{\sqrt[4]{16}} + \sqrt{625}$
- 110.  $\sqrt[3]{\sqrt{\sqrt{169}} + \sqrt{9}} + \sqrt{\sqrt[3]{1000}} + \sqrt[3]{216}$

In Exercises 111–114, simplify each expression. Assume that all variables represent positive numbers.

- 111.  $(49x^{-2}y^4)^{-\frac{1}{2}}(xy^{\frac{1}{2}})$
- 112.  $(8x^{-6}y^3)^{\frac{1}{3}}(x^{\frac{5}{6}}y^{-\frac{1}{3}})^6$
- 113.  $\left(\frac{x^{-\frac{5}{4}}y^{\frac{1}{3}}}{x^{-\frac{3}{4}}}\right)^{-6}$
- 114.  $\left(\frac{x^{\frac{1}{2}}y^{-\frac{7}{4}}}{y^{-\frac{5}{4}}}\right)^{-4}$

**Application Exercises**

115. The popular comic strip *FoxTrot* follows the off-the-wall lives of the Fox family. Youngest son Jason is forever obsessed by his love of math. In the math-themed strip shown at the top of the next column, Jason shares his opinion in a coded message about the mathematical abilities of his sister Paige.

*FoxTrot* © 2003, 2009 by Bill Amend/Used by permission of Universal Uclick. All rights reserved.

Solve problems A through Z in the left panel. Then decode Jason Fox’s message involving his opinion about the mathematical abilities of his sister Paige shown on the first line.

*Hints:* Here is the solution for problem C and partial solutions for problems Q and U.

These are from trigonometry.

$$C = \sin \frac{\pi}{2} = \sin 90^\circ = 1$$

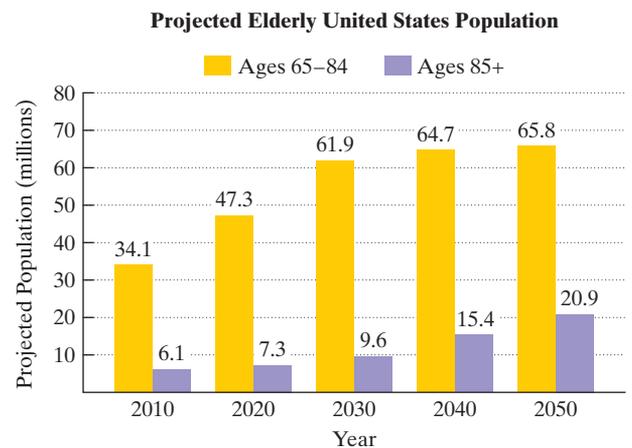

$$Q = \int_0^2 9x^2 dx = 3x^3 \Big|_0^2 = 3 \cdot 2^3 - 3 \cdot 0^3 = \underline{\hspace{2cm}}$$

This is from calculus.

$$U = -3 \cos \pi = -3 \cos 180^\circ = -3(-1) = \underline{\hspace{2cm}}$$

*Note:* The comic strip *FoxTrot* is now printed in more than one thousand newspapers. What made cartoonist Bill Amend, a college physics major, put math in the comic? “I always try to use math in the strip to make the joke accessible to anyone,” he said. “But if you understand math, hopefully you’ll like it that much more!” We highly recommend the math humor in Amend’s *FoxTrot* collection *Math, Science, and Unix Underpants* (Andrews McMeel Publishing, 2009).

116. America is getting older. The graph shows the projected elderly U.S. population for ages 65–84 and for ages 85 and older.

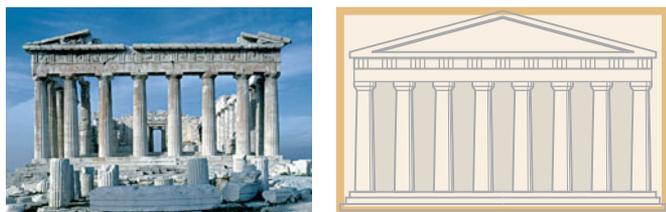

Source: U.S. Census Bureau

The formula  $E = 5\sqrt{x} + 34.1$  models the projected number of elderly Americans ages 65–84,  $E$ , in millions,  $x$  years after 2010.

- Use the formula to find the projected increase in the number of Americans ages 65–84, in millions, from 2020 to 2050. Express this difference in simplified radical form.
  - Use a calculator and write your answer in part (a) to the nearest tenth. Does this rounded decimal overestimate or underestimate the difference in the projected data shown by the bar graph on the previous page? By how much?
117. The early Greeks believed that the most pleasing of all rectangles were **golden rectangles**, whose ratio of width to height is

$$\frac{w}{h} = \frac{2}{\sqrt{5} - 1}.$$

The Parthenon at Athens fits into a golden rectangle once the triangular pediment is reconstructed.

Rationalize the denominator of the golden ratio. Then use a calculator and find the ratio of width to height, correct to the nearest hundredth, in golden rectangles.

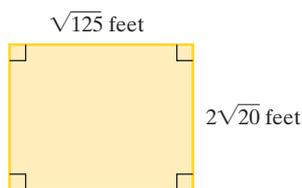

118. Use Einstein's special-relativity equation

$$R_a = R_f \sqrt{1 - \left(\frac{v}{c}\right)^2},$$

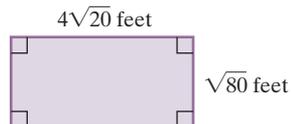

described in the Blitzer Bonus on page 44, to solve this exercise. You are moving at 90% of the speed of light. Substitute  $0.9c$  for  $v$ , your velocity, in the equation. What is your aging rate, correct to two decimal places, relative to a friend on Earth? If you are gone for 44 weeks, approximately how many weeks have passed for your friend?

The perimeter,  $P$ , of a rectangle with length  $l$  and width  $w$  is given by the formula  $P = 2l + 2w$ . The area,  $A$ , is given by the formula  $A = lw$ . In Exercises 119–120, use these formulas to find the perimeter and area of each rectangle. Express answers in simplified radical form. Remember that perimeter is measured in linear units, such as feet or meters, and area is measured in square units, such as square feet,  $\text{ft}^2$ , or square meters,  $\text{m}^2$ .

119.

120.

### Writing in Mathematics

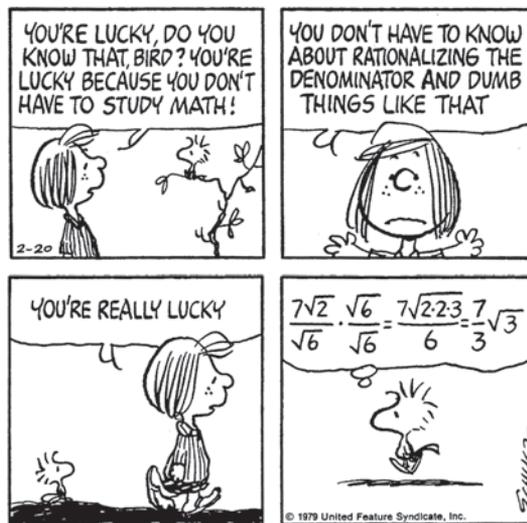

- Explain how to simplify  $\sqrt{10} \cdot \sqrt{5}$ .
- Explain how to add  $\sqrt{3} + \sqrt{12}$ .

- Describe what it means to rationalize a denominator. Use both  $\frac{1}{\sqrt{5}}$  and  $\frac{1}{5 + \sqrt{5}}$  in your explanation.
- What difference is there in simplifying  $\sqrt[3]{(-5)^3}$  and  $\sqrt[3]{(-5)^4}$ ?
- What does  $a^{\frac{m}{n}}$  mean?
- Describe the kinds of numbers that have rational fifth roots.
- Why must  $a$  and  $b$  represent nonnegative numbers when we write  $\sqrt{a} \cdot \sqrt{b} = \sqrt{ab}$ ? Is it necessary to use this restriction in the case of  $\sqrt[3]{a} \cdot \sqrt[3]{b} = \sqrt[3]{ab}$ ? Explain.
- Read the Blitzer Bonus on page 44. The future is now: You have the opportunity to explore the cosmos in a starship traveling near the speed of light. The experience will enable you to understand the mysteries of the universe in deeply personal ways, transporting you to unimagined levels of knowing and being. The downside: You return from your two-year journey to a futuristic world in which friends and loved ones are long gone. Do you explore space or stay here on Earth? What are the reasons for your choice?

### Critical Thinking Exercises

**Make Sense?** In Exercises 129–132, determine whether each statement makes sense or does not make sense, and explain your reasoning.

129. The joke in this Peanuts cartoon would be more effective if Woodstock had rationalized the denominator correctly in the last frame.

Peanuts © 1978 Peanuts Worldwide LLC. Used by permission of Universal Uclick. All rights reserved.

- Using my calculator, I determined that  $6^7 = 279,936$ , so 6 must be a seventh root of 279,936.
- I simplified the terms of  $2\sqrt{20} + 4\sqrt{75}$ , and then I was able to add the like radicals.
- When I use the definition for  $a^{\frac{m}{n}}$ , I usually prefer to first raise  $a$  to the  $m$  power because smaller numbers are involved.

In Exercises 133–136, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

- $7^{\frac{1}{2}} \cdot 7^{\frac{1}{2}} = 49$
- $8^{-\frac{1}{3}} = -2$

135. The cube root of  $-8$  is not a real number.

136.  $\frac{\sqrt{20}}{8} = \frac{\sqrt{10}}{4}$

In Exercises 137–138, fill in each box to make the statement true.

137.  $(5 + \sqrt{\square})(5 - \sqrt{\square}) = 22$

138.  $\sqrt{\square}x^{\square} = 5x^7$

139. Find the exact value of  $\sqrt{13 + \sqrt{2} + \frac{7}{3 + \sqrt{2}}}$  without the use of a calculator.

140. Place the correct symbol,  $>$  or  $<$ , in the shaded area between the given numbers. Do not use a calculator. Then check your result with a calculator.

a.  $3^2 \square 3^3$

b.  $\sqrt{7} + \sqrt{18} \square \sqrt{7} + 18$

141. a. A mathematics professor recently purchased a birthday cake for her son with the inscription

Happy  $(2^{\frac{5}{2}} \cdot 2^{\frac{3}{4}} \div 2^{\frac{1}{4}})$ th Birthday.

How old is the son?

b. The birthday boy, excited by the inscription on the cake, tried to wolf down the whole thing. Professor Mom, concerned about the possible metamorphosis of her son into a blimp, exclaimed, “Hold on! It is your birthday, so why

not take  $\frac{8^{-\frac{4}{3}} + 2^{-2}}{16^{-\frac{3}{4}} + 2^{-1}}$  of the cake? I’ll eat half of what’s left over.” How much of the cake did the professor eat?

**Preview Exercises**

Exercises 142–144 will help you prepare for the material covered in the next section.

142. Multiply:  $(2x^3y^2)(5x^4y^7)$ .

143. Use the distributive property to multiply:  $2x^4(8x^4 + 3x)$ .

144. Simplify and express the answer in descending powers of  $x$ :  $2x(x^2 + 4x + 5) + 3(x^2 + 4x + 5)$ .

**SECTION P.4**

**Polynomials**

*Objectives*

- 1 Understand the vocabulary of polynomials.
- 2 Add and subtract polynomials.
- 3 Multiply polynomials.
- 4 Use FOIL in polynomial multiplication.
- 5 Use special products in polynomial multiplication.
- 6 Perform operations with polynomials in several variables.

Can that be Axl, your author’s yellow lab, sharing a special moment with a baby chick? And if it is (it is), what possible relevance can this have to polynomials? An answer is promised before you reach the Exercise Set. For now, we open the section by defining and describing polynomials.

Old Dog...New Chicks

**How We Define Polynomials**

More education results in a higher income. The mathematical models

$$M = 0.6x^3 + 285x^2 - 2256x + 15,112$$

and  $W = -1.2x^3 + 367x^2 - 4900x + 26,561$

describe the median, or middlemost, annual income for men,  $M$ , and women,  $W$ , who have completed  $x$  years of education. We’ll be working with these models and the data upon which they are based in the Exercise Set.

The algebraic expressions that appear on the right sides of the models are examples of *polynomials*. A **polynomial** is a single term or the sum of two or more terms containing variables with whole-number exponents. The polynomials above each contain four terms. Equations containing polynomials are used in such diverse areas as science, business, medicine, psychology, and sociology. In this section, we review basic ideas about polynomials and their operations.

**How We Describe Polynomials**

Consider the polynomial

$$7x^3 - 9x^2 + 13x - 6.$$

- 1 Understand the vocabulary of polynomials.

We can express  $7x^3 - 9x^2 + 13x - 6$  as

$$7x^3 + (-9x^2) + 13x + (-6).$$

The polynomial contains four terms. It is customary to write the terms in the order of descending powers of the variable. This is the **standard form** of a polynomial.

Some polynomials contain only one variable. Each term of such a polynomial in  $x$  is of the form  $ax^n$ . If  $a \neq 0$ , the **degree** of  $ax^n$  is  $n$ . For example, the degree of the term  $7x^3$  is 3.

## GREAT QUESTION!

**Why doesn't the constant 0 have a degree?**

We can express 0 in many ways, including  $0x$ ,  $0x^2$ , and  $0x^3$ . It is impossible to assign a single exponent on the variable. This is why 0 has no defined degree.

### The Degree of $ax^n$

If  $a \neq 0$ , the degree of  $ax^n$  is  $n$ . The degree of a nonzero constant is 0. The constant 0 has no defined degree.

Here is an example of a polynomial and the degree of each of its four terms:

$$6x^4 - 3x^3 + 2x - 5.$$

Notice that the exponent on  $x$  for the term  $2x$ , meaning  $2x^1$ , is understood to be 1. For this reason, the degree of  $2x$  is 1. You can think of  $-5$  as  $-5x^0$ ; thus, its degree is 0.

A polynomial is simplified when it contains no grouping symbols and no like terms. A simplified polynomial that has exactly one term is called a **monomial**. A **binomial** is a simplified polynomial that has two terms. A **trinomial** is a simplified polynomial with three terms. Simplified polynomials with four or more terms have no special names.

The **degree of a polynomial** is the greatest degree of all the terms of the polynomial. For example,  $4x^2 + 3x$  is a binomial of degree 2 because the degree of the first term is 2, and the degree of the other term is less than 2. Also,  $7x^5 - 2x^2 + 4$  is a trinomial of degree 5 because the degree of the first term is 5, and the degrees of the other terms are less than 5.

Up to now, we have used  $x$  to represent the variable in a polynomial. However, any letter can be used. For example,

- $7x^5 - 3x^3 + 8$  is a polynomial (in  $x$ ) of degree 5. Because there are three terms, the polynomial is a trinomial.
- $6y^3 + 4y^2 - y + 3$  is a polynomial (in  $y$ ) of degree 3. Because there are four terms, the polynomial has no special name.
- $z^7 + \sqrt{2}$  is a polynomial (in  $z$ ) of degree 7. Because there are two terms, the polynomial is a binomial.

We can tie together the threads of our discussion with the formal definition of a polynomial in one variable. In this definition, the coefficients of the terms are represented by  $a_n$  (read “ $a$  sub  $n$ ”),  $a_{n-1}$  (read “ $a$  sub  $n$  minus 1”),  $a_{n-2}$ , and so on. The small letters to the lower right of each  $a$  are called **subscripts** and are *not exponents*. Subscripts are used to distinguish one constant from another when a large and undetermined number of such constants are needed.

### Definition of a Polynomial in $x$

A **polynomial in  $x$**  is an algebraic expression of the form

$$a_n x^n + a_{n-1} x^{n-1} + a_{n-2} x^{n-2} + \cdots + a_1 x + a_0,$$

where  $a_n, a_{n-1}, a_{n-2}, \dots, a_1$ , and  $a_0$  are real numbers,  $a_n \neq 0$ , and  $n$  is a nonnegative integer. The polynomial is of **degree  $n$** ,  $a_n$  is the **leading coefficient**, and  $a_0$  is the **constant term**.

2 Add and subtract polynomials.

### Adding and Subtracting Polynomials

Polynomials are added and subtracted by combining like terms. For example, we can combine the monomials  $-9x^3$  and  $13x^3$  using addition as follows:

$$-9x^3 + 13x^3 = (-9 + 13)x^3 = 4x^3.$$

These like terms both contain  $x$  to the third power.

Add coefficients and keep the same variable factor,  $x^3$ .

### GREAT QUESTION!

**Can I use a vertical format to add and subtract polynomials?**

Yes. Arrange like terms in columns and combine vertically:

$$\begin{array}{r} 7x^3 - 8x^2 + 9x - 6 \\ -2x^3 + 6x^2 + 3x - 9 \\ \hline 5x^3 - 2x^2 + 12x - 15 \end{array}$$

The like terms can be combined by adding their coefficients and keeping the same variable factor.

### EXAMPLE 1

 Adding and Subtracting Polynomials

Perform the indicated operations and simplify:

- a.  $(-9x^3 + 7x^2 - 5x + 3) + (13x^3 + 2x^2 - 8x - 6)$   
 b.  $(7x^3 - 8x^2 + 9x - 6) - (2x^3 - 6x^2 - 3x + 9)$

### SOLUTION

a.  $(-9x^3 + 7x^2 - 5x + 3) + (13x^3 + 2x^2 - 8x - 6)$   
 $= (-9x^3 + 13x^3) + (7x^2 + 2x^2) + (-5x - 8x) + (3 - 6)$  *Group like terms.*  
 $= 4x^3 + 9x^2 + (-13x) + (-3)$  *Combine like terms.*  
 $= 4x^3 + 9x^2 - 13x - 3$  *Simplify.*

b.  $(7x^3 - 8x^2 + 9x - 6) - (2x^3 - 6x^2 - 3x + 9)$  *Rewrite subtraction as addition of the additive inverse.*

Change the sign of each coefficient.

$$\begin{aligned} &= (7x^3 - 8x^2 + 9x - 6) + (-2x^3 + 6x^2 + 3x - 9) \\ &= (7x^3 - 2x^3) + (-8x^2 + 6x^2) + (9x + 3x) + (-6 - 9) \quad \text{Group like terms.} \\ &= 5x^3 + (-2x^2) + 12x + (-15) \quad \text{Combine like terms.} \\ &= 5x^3 - 2x^2 + 12x - 15 \quad \text{Simplify.} \end{aligned}$$

3 Multiply polynomials.

### GREAT QUESTION!

**Because monomials with the same base and different exponents can be multiplied, can they also be added?**

No. Don't confuse adding and multiplying monomials.

**Addition:**

$$5x^4 + 6x^4 = 11x^4$$

**Multiplication:**

$$\begin{aligned} (5x^4)(6x^4) &= (5 \cdot 6)(x^4 \cdot x^4) \\ &= 30x^{4+4} \\ &= 30x^8 \end{aligned}$$

Only like terms can be added or subtracted, but unlike terms may be multiplied.

**Addition:**

$$5x^4 + 3x^2 \text{ cannot be simplified.}$$

**Multiplication:**

$$\begin{aligned} (5x^4)(3x^2) &= (5 \cdot 3)(x^4 \cdot x^2) \\ &= 15x^{4+2} \\ &= 15x^6 \end{aligned}$$

### Check Point 1

 Perform the indicated operations and simplify:

- a.  $(-17x^3 + 4x^2 - 11x - 5) + (16x^3 - 3x^2 + 3x - 15)$   
 b.  $(13x^3 - 9x^2 - 7x + 1) - (-7x^3 + 2x^2 - 5x + 9)$

### Multiplying Polynomials

The product of two monomials is obtained by using properties of exponents. For example,

$$(-8x^6)(5x^3) = -8 \cdot 5x^{6+3} = -40x^9.$$

Multiply coefficients and add exponents.

Furthermore, we can use the distributive property to multiply a monomial and a polynomial that is not a monomial. For example,

$$3x^4(2x^3 - 7x + 3) = 3x^4 \cdot 2x^3 - 3x^4 \cdot 7x + 3x^4 \cdot 3 = 6x^7 - 21x^5 + 9x^4.$$

Monomial

Trinomial

How do we multiply two polynomials if neither is a monomial? For example, consider

$$(2x + 3)(x^2 + 4x + 5).$$

Binomial

Trinomial

One way to perform  $(2x + 3)(x^2 + 4x + 5)$  is to distribute  $2x$  throughout the trinomial

$$2x(x^2 + 4x + 5)$$

and 3 throughout the trinomial

$$3(x^2 + 4x + 5).$$

Then combine the like terms that result.

### Multiplying Polynomials When Neither Is a Monomial

Multiply each term of one polynomial by each term of the other polynomial. Then combine like terms.

#### EXAMPLE 2 Multiplying a Binomial and a Trinomial

Multiply:  $(2x + 3)(x^2 + 4x + 5)$ .

#### SOLUTION

$$\begin{aligned} &(2x + 3)(x^2 + 4x + 5) \\ &= 2x(x^2 + 4x + 5) + 3(x^2 + 4x + 5) \\ &= 2x \cdot x^2 + 2x \cdot 4x + 2x \cdot 5 + 3x^2 + 3 \cdot 4x + 3 \cdot 5 \\ &= 2x^3 + 8x^2 + 10x + 3x^2 + 12x + 15 \\ &= 2x^3 + 11x^2 + 22x + 15 \end{aligned}$$

Multiply the trinomial by each term of the binomial.

Use the distributive property. Multiply monomials: Multiply coefficients and add exponents.

Combine like terms:

$$8x^2 + 3x^2 = 11x^2 \text{ and}$$

$$10x + 12x = 22x. \quad \dots$$

Another method for performing the multiplication is to use a vertical format similar to that used for multiplying whole numbers.

$$\begin{array}{r} x^2 + 4x + 5 \\ 2x + 3 \\ \hline 3x^2 + 12x + 15 \\ 2x^3 + 8x^2 + 10x \\ \hline 2x^3 + 11x^2 + 22x + 15 \end{array}$$

Write like terms in the same column.  
Combine like terms.

$3(x^2 + 4x + 5)$   
 $2x(x^2 + 4x + 5)$

 **Check Point 2** Multiply:  $(5x - 2)(3x^2 - 5x + 4)$ .

**4** Use FOIL in polynomial multiplication.

### The Product of Two Binomials: FOIL

Frequently, we need to find the product of two binomials. One way to perform this multiplication is to distribute each term in the first binomial through the second binomial. For example, we can find the product of the binomials  $3x + 2$  and  $4x + 5$  as follows:

$$\begin{aligned} (3x + 2)(4x + 5) &= 3x(4x + 5) + 2(4x + 5) \\ &= 3x(4x) + 3x(5) + 2(4x) + 2(5) \\ &= 12x^2 + 15x + 8x + 10. \end{aligned}$$

Distribute  $3x$  over  $4x + 5$ .      Distribute  $2$  over  $4x + 5$ .

We'll combine these like terms later. For now, our interest is in how to obtain each of these four terms.

We can also find the product of  $3x + 2$  and  $4x + 5$  using a method called FOIL, which is based on our preceding work. Any two binomials can be quickly multiplied

by using the FOIL method, in which **F** represents the product of the **first** terms in each binomial, **O** represents the product of the **outside** terms, **I** represents the product of the **inside** terms, and **L** represents the product of the **last**, or second, terms in each binomial. For example, we can use the FOIL method to find the product of the binomials  $3x + 2$  and  $4x + 5$  as follows:

$$\begin{array}{c}
 \begin{array}{ccc}
 \text{first} & & \text{last} \\
 \downarrow & & \downarrow \\
 (3x + 2)(4x + 5) & = & 12x^2 + 15x + 8x + 10 \\
 \uparrow & & \uparrow \\
 & \text{inside} & \\
 & \text{outside} & 
 \end{array} \\
 \begin{array}{cccc}
 \text{F} & \text{O} & \text{I} & \text{L} \\
 \text{Product of} & \text{Product of} & \text{Product of} & \text{Product of} \\
 \text{First} & \text{Outside} & \text{Inside} & \text{Last} \\
 \text{terms} & \text{terms} & \text{terms} & \text{terms}
 \end{array}
 \end{array}$$

$$= 12x^2 + 23x + 10 \quad \text{Combine like terms.}$$

In general, here's how to use the FOIL method to find the product of  $ax + b$  and  $cx + d$ :

### Using the FOIL Method to Multiply Binomials

$$\begin{array}{c}
 \begin{array}{ccc}
 \text{first} & & \text{last} \\
 \downarrow & & \downarrow \\
 (ax + b)(cx + d) & = & ax \cdot cx + ax \cdot d + b \cdot cx + b \cdot d \\
 \uparrow & & \uparrow \\
 & \text{inside} & \\
 & \text{outside} & 
 \end{array} \\
 \begin{array}{cccc}
 \text{F} & \text{O} & \text{I} & \text{L} \\
 \text{Product of} & \text{Product of} & \text{Product of} & \text{Product of} \\
 \text{First} & \text{Outside} & \text{Inside} & \text{Last} \\
 \text{terms} & \text{terms} & \text{terms} & \text{terms}
 \end{array}
 \end{array}$$

### EXAMPLE 3 Using the FOIL Method

Multiply:  $(3x + 4)(5x - 3)$ .

### SOLUTION

$$\begin{array}{c}
 \begin{array}{ccc}
 \text{first} & & \text{last} \\
 \downarrow & & \downarrow \\
 (3x + 4)(5x - 3) & = & 3x \cdot 5x + 3x(-3) + 4 \cdot 5x + 4(-3) \\
 \uparrow & & \uparrow \\
 & \text{inside} & \\
 & \text{outside} & 
 \end{array} \\
 \begin{array}{cccc}
 \text{F} & \text{O} & \text{I} & \text{L} \\
 15x^2 - 9x + 20x - 12 \\
 = 15x^2 + 11x - 12 \quad \text{Combine like terms.} \quad \dots
 \end{array}
 \end{array}$$

 **Check Point 3** Multiply:  $(7x - 5)(4x - 3)$ .

- 5 Use special products in polynomial multiplication.

## GREAT QUESTION!

**Do I have to memorize the special products shown in the table on the right?**

Not necessarily. Although it's convenient to memorize these forms, the FOIL method can be used on all five examples in the box. To cube  $x + 4$ , you can first square  $x + 4$  using FOIL and then multiply this result by  $x + 4$ . We suggest memorizing these special forms because they let you multiply far more rapidly than using the FOIL method.

## Special Products

There are several products that occur so frequently that it's convenient to memorize the form, or pattern, of these formulas.

### Special Products

Let  $A$  and  $B$  represent real numbers, variables, or algebraic expressions.

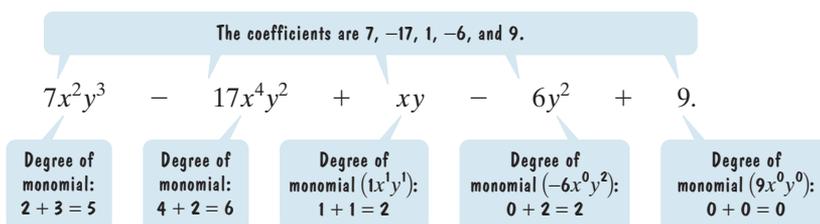

Special Product	Example
<i>Sum and Difference of Two Terms</i>	
$(A + B)(A - B) = A^2 - B^2$	$(2x + 3)(2x - 3) = (2x)^2 - 3^2$ $= 4x^2 - 9$
<i>Squaring a Binomial</i>	
$(A + B)^2 = A^2 + 2AB + B^2$	$(y + 5)^2 = y^2 + 2 \cdot y \cdot 5 + 5^2$ $= y^2 + 10y + 25$
$(A - B)^2 = A^2 - 2AB + B^2$	$(3x - 4)^2$ $= (3x)^2 - 2 \cdot 3x \cdot 4 + 4^2$ $= 9x^2 - 24x + 16$
<i>Cubing a Binomial</i>	
$(A + B)^3 = A^3 + 3A^2B + 3AB^2 + B^3$	$(x + 4)^3$ $= x^3 + 3x^2(4) + 3x(4)^2 + 4^3$ $= x^3 + 12x^2 + 48x + 64$
$(A - B)^3 = A^3 - 3A^2B + 3AB^2 - B^3$	$(x - 2)^3$ $= x^3 - 3x^2(2) + 3x(2)^2 - 2^3$ $= x^3 - 6x^2 + 12x - 8$

- 6 Perform operations with polynomials in several variables.

## Polynomials in Several Variables

A **polynomial in two variables**,  $x$  and  $y$ , contains the sum of one or more monomials in the form  $ax^n y^m$ . The constant,  $a$ , is the **coefficient**. The exponents,  $n$  and  $m$ , represent whole numbers. The **degree** of the monomial  $ax^n y^m$  is  $n + m$ .

Here is an example of a polynomial in two variables:

The **degree of a polynomial in two variables** is the highest degree of all its terms. For the preceding polynomial, the degree is 6.

Polynomials containing two or more variables can be added, subtracted, and multiplied just like polynomials that contain only one variable. For example, we can add the monomials  $-7xy^2$  and  $13xy^2$  as follows:

$$-7xy^2 + 13xy^2 = (-7 + 13)xy^2 = 6xy^2.$$

These like terms both contain the variable factors  $x$  and  $y^2$ .

Add coefficients and keep the same variable factors,  $xy^2$ .

**EXAMPLE 4** Multiplying Polynomials in Two VariablesMultiply: **a.**  $(x + 4y)(3x - 5y)$       **b.**  $(5x + 3y)^2$ .**SOLUTION**

We will perform the multiplication in part (a) using the FOIL method. We will multiply in part (b) using the formula for the square of a binomial sum,  $(A + B)^2$ .

**a.**  $(x + 4y)(3x - 5y)$       *Multiply these binomials using the FOIL method.*

$$\begin{aligned}
 & \begin{array}{cccc} \text{F} & & \text{O} & & \text{I} & & \text{L} \\ \hline & & & & & & \end{array} \\
 & = (x)(3x) + (x)(-5y) + (4y)(3x) + (4y)(-5y) \\
 & = 3x^2 - 5xy + 12xy - 20y^2 \\
 & = 3x^2 + 7xy - 20y^2 \quad \text{Combine like terms.}
 \end{aligned}$$

$$(A + B)^2 = A^2 + 2 \cdot A \cdot B + B^2$$

**b.**  $(5x + 3y)^2 = (5x)^2 + 2(5x)(3y) + (3y)^2$   
 $= 25x^2 + 30xy + 9y^2$       ...

**Check Point 4** Multiply:

**a.**  $(7x - 6y)(3x - y)$

**b.**  $(2x + 4y)^2$ .

Special products can sometimes be used to find the products of certain trinomials, as illustrated in Example 5.

**EXAMPLE 5** Using the Special ProductsMultiply: **a.**  $(7x + 5 + 4y)(7x + 5 - 4y)$       **b.**  $(3x + y + 1)^2$ .**SOLUTION**

**a.** By grouping the first two terms within each of the parentheses, we can find the product using the form for the sum and difference of two terms.

$$\begin{aligned}
 & (A + B) \cdot (A - B) = A^2 - B^2 \\
 & [(7x + 5) + 4y] \cdot [(7x + 5) - 4y] = (7x + 5)^2 - (4y)^2 \\
 & \qquad \qquad \qquad = (7x)^2 + 2 \cdot 7x \cdot 5 + 5^2 - (4y)^2 \\
 & \qquad \qquad \qquad = 49x^2 + 70x + 25 - 16y^2
 \end{aligned}$$

**b.** We can group the terms of  $(3x + y + 1)^2$  so that the formula for the square of a binomial can be applied.

$$\begin{aligned}
 & (A + B)^2 = A^2 + 2 \cdot A \cdot B + B^2 \\
 & [(3x + y) + 1]^2 = (3x + y)^2 + 2 \cdot (3x + y) \cdot 1 + 1^2 \\
 & \qquad \qquad \qquad = 9x^2 + 6xy + y^2 + 6x + 2y + 1
 \end{aligned}$$

...

**Check Point 5** Multiply:

**a.**  $(3x + 2 + 5y)(3x + 2 - 5y)$

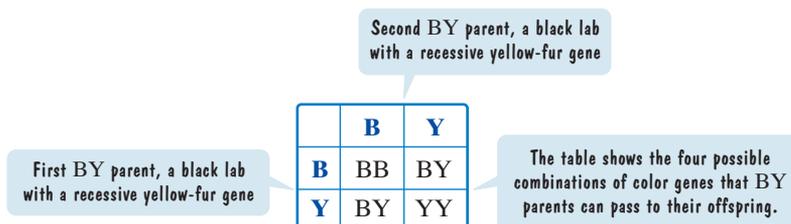

**b.**  $(2x + y + 3)^2$ .

## Blitzer Bonus || Labrador Retrievers and Polynomial Multiplication

The color of a Labrador retriever is determined by its pair of genes. A single gene is inherited at random from each parent. The black-fur gene,  $B$ , is dominant. The yellow-fur gene,  $Y$ , is recessive. This means that labs with at least one black-fur gene ( $BB$  or  $BY$ ) have black coats. Only labs with two yellow-fur genes ( $YY$ ) have yellow coats.

Axl, your author's yellow lab, inherited his genetic makeup from two black  $BY$  parents.

Because  $YY$  is one of four possible outcomes, the probability that a yellow lab like Axl will be the offspring of these black parents is  $\frac{1}{4}$ .

The probabilities suggested by the table can be modeled by the expression  $(\frac{1}{2}B + \frac{1}{2}Y)^2$ .

$$\begin{aligned} \left(\frac{1}{2}B + \frac{1}{2}Y\right)^2 &= \left(\frac{1}{2}B\right)^2 + 2\left(\frac{1}{2}B\right)\left(\frac{1}{2}Y\right) + \left(\frac{1}{2}Y\right)^2 \\ &= \frac{1}{4}BB + \frac{1}{2}BY + \frac{1}{4}YY \end{aligned}$$

The probability of a black lab with two dominant black genes is  $\frac{1}{4}$ .

The probability of a black lab with a recessive yellow gene is  $\frac{1}{2}$ .

The probability of a yellow lab with two recessive yellow genes is  $\frac{1}{4}$ .

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- A polynomial is a single term or the sum of two or more terms containing variables with exponents that are \_\_\_\_\_ numbers.
- It is customary to write the terms of a polynomial in the order of descending powers of the variable. This is called the \_\_\_\_\_ form of a polynomial.
- A simplified polynomial that has exactly one term is called a/an \_\_\_\_\_.
- A simplified polynomial that has two terms is called a/an \_\_\_\_\_.
- A simplified polynomial that has three terms is called a/an \_\_\_\_\_.
- If  $a \neq 0$ , the degree of  $ax^n$  is \_\_\_\_\_.
- Polynomials are added by combining \_\_\_\_\_ terms.
- To multiply  $7x^3(4x^5 - 8x^2 + 6)$ , use the \_\_\_\_\_ property to multiply each term of the trinomial \_\_\_\_\_ by the monomial \_\_\_\_\_.
- To multiply  $(5x + 3)(x^2 + 8x + 7)$ , begin by multiplying each term of  $x^2 + 8x + 7$  by \_\_\_\_\_. Then multiply each term of  $x^2 + 8x + 7$  by \_\_\_\_\_. Then combine \_\_\_\_\_ terms.
- When using the FOIL method to find  $(x + 7)(3x + 5)$ , the product of the first terms is \_\_\_\_\_, the product of the outside terms is \_\_\_\_\_, the product of the inside terms is \_\_\_\_\_, and the product of the last terms is \_\_\_\_\_.
- $(A + B)(A - B) = \underline{\hspace{2cm}}$ . The product of the sum and difference of the same two terms is the square of the first term \_\_\_\_\_ the square of the second term.
- $(A + B)^2 = \underline{\hspace{2cm}}$ . The square of a binomial sum is the first term \_\_\_\_\_ plus 2 times the \_\_\_\_\_ plus the last term \_\_\_\_\_.
- $(A - B)^2 = \underline{\hspace{2cm}}$ . The square of a binomial difference is the first term squared \_\_\_\_\_ 2 times the \_\_\_\_\_ \_\_\_\_\_ the last term squared.

plus or minus?

- If  $a \neq 0$ , the degree of  $ax^n y^m$  is \_\_\_\_\_.

## EXERCISE SET P.4

## Practice Exercises

In Exercises 1–4, is the algebraic expression a polynomial? If it is, write the polynomial in standard form.

- $2x + 3x^2 - 5$
- $2x + 3x^{-1} - 5$
- $\frac{2x + 3}{x}$
- $x^2 - x^3 + x^4 - 5$

In Exercises 5–8, find the degree of the polynomial.

- $3x^2 - 5x + 4$
- $-4x^3 + 7x^2 - 11$
- $x^2 - 4x^3 + 9x - 12x^4 + 63$
- $x^2 - 8x^3 + 15x^4 + 91$

In Exercises 9–14, perform the indicated operations. Write the resulting polynomial in standard form and indicate its degree.

- $(-6x^3 + 5x^2 - 8x + 9) + (17x^3 + 2x^2 - 4x - 13)$
- $(-7x^3 + 6x^2 - 11x + 13) + (19x^3 - 11x^2 + 7x - 17)$
- $(17x^3 - 5x^2 + 4x - 3) - (5x^3 - 9x^2 - 8x + 11)$
- $(18x^4 - 2x^3 - 7x + 8) - (9x^4 - 6x^3 - 5x + 7)$
- $(5x^2 - 7x - 8) + (2x^2 - 3x + 7) - (x^2 - 4x - 3)$
- $(8x^2 + 7x - 5) - (3x^2 - 4x) - (-6x^3 - 5x^2 + 3)$

In Exercises 15–82, find each product.

- $(x + 1)(x^2 - x + 1)$
- $(x + 5)(x^2 - 5x + 25)$
- $(2x - 3)(x^2 - 3x + 5)$
- $(2x - 1)(x^2 - 4x + 3)$
- $(x + 7)(x + 3)$
- $(x + 8)(x + 5)$
- $(x - 5)(x + 3)$
- $(x - 1)(x + 2)$
- $(3x + 5)(2x + 1)$
- $(7x + 4)(3x + 1)$
- $(2x - 3)(5x + 3)$
- $(2x - 5)(7x + 2)$
- $(5x^2 - 4)(3x^2 - 7)$
- $(7x^2 - 2)(3x^2 - 5)$
- $(8x^3 + 3)(x^2 - 5)$
- $(7x^3 + 5)(x^2 - 2)$
- $(x + 3)(x - 3)$
- $(x + 5)(x - 5)$
- $(3x + 2)(3x - 2)$
- $(2x + 5)(2x - 5)$
- $(5 - 7x)(5 + 7x)$
- $(4 - 3x)(4 + 3x)$
- $(4x^2 + 5x)(4x^2 - 5x)$
- $(3x^2 + 4x)(3x^2 - 4x)$
- $(1 - y^5)(1 + y^5)$
- $(2 - y^5)(2 + y^5)$
- $(x + 2)^2$
- $(x + 5)^2$
- $(2x + 3)^2$
- $(3x + 2)^2$
- $(x - 3)^2$
- $(x - 4)^2$
- $(4x^2 - 1)^2$
- $(5x^2 - 3)^2$
- $(7 - 2x)^2$
- $(9 - 5x)^2$
- $(x + 1)^3$
- $(x + 2)^3$
- $(2x + 3)^3$
- $(3x + 4)^3$
- $(x - 3)^3$
- $(x - 1)^3$
- $(3x - 4)^3$
- $(2x - 3)^3$
- $(x + 5y)(7x + 3y)$
- $(x + 9y)(6x + 7y)$
- $(x - 3y)(2x + 7y)$
- $(3x - y)(2x + 5y)$
- $(3xy - 1)(5xy + 2)$
- $(7x^2y + 1)(2x^2y - 3)$
- $(7x + 5y)^2$
- $(9x + 7y)^2$
- $(x^2y^2 - 3)^2$
- $(x^2y^2 - 5)^2$
- $(x - y)(x^2 + xy + y^2)$
- $(x + y)(x^2 - xy + y^2)$
- $(3x + 5y)(3x - 5y)$
- $(7x + 3y)(7x - 3y)$
- $(x + y + 3)(x + y - 3)$
- $(x + y + 5)(x + y - 5)$
- $(3x + 7 - 5y)(3x + 7 + 5y)$
- $(5x + 7y - 2)(5x + 7y + 2)$

- $[5y - (2x + 3)][5y + (2x + 3)]$
- $[8y + (7 - 3x)][8y - (7 - 3x)]$
- $(x + y + 1)^2$
- $(x + y + 2)^2$
- $(2x + y + 1)^2$
- $(5x + 1 + 6y)^2$

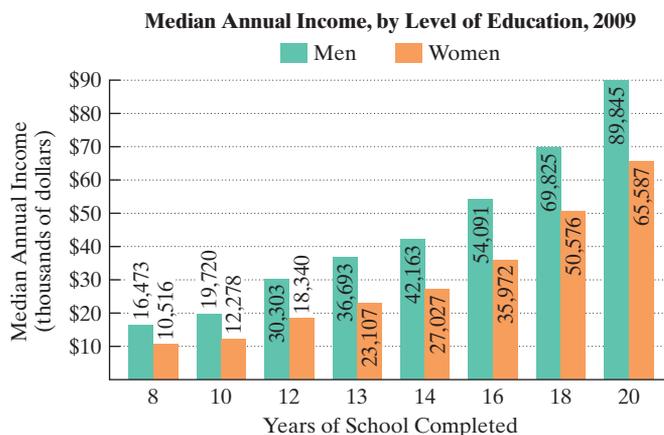

## Practice Plus

In Exercises 83–90, perform the indicated operation or operations.

- $(3x + 4y)^2 - (3x - 4y)^2$
- $(5x + 2y)^2 - (5x - 2y)^2$
- $(5x - 7)(3x - 2) - (4x - 5)(6x - 1)$
- $(3x + 5)(2x - 9) - (7x - 2)(x - 1)$
- $(2x + 5)(2x - 5)(4x^2 + 25)$
- $(3x + 4)(3x - 4)(9x^2 + 16)$
- $\frac{(2x - 7)^5}{(2x - 7)^3}$
- $\frac{(5x - 3)^6}{(5x - 3)^4}$

## Application Exercises

As you complete more years of education, you can count on a greater income. The bar graph shows the median, or middlemost, annual income for Americans, by level of education, in 2009.

Source: Bureau of the Census

Here are polynomial models that describe the median annual income for men,  $M$ , and for women,  $W$ , who have completed  $x$  years of education:

$$M = 312x^2 - 2615x + 16,615$$

$$W = 316x^2 - 4224x + 23,730$$

$$M = 0.6x^3 + 285x^2 - 2256x + 15,112$$

$$W = -1.2x^3 + 367x^2 - 4900x + 26,561$$

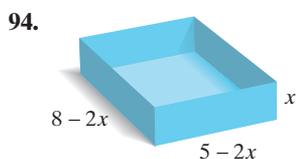

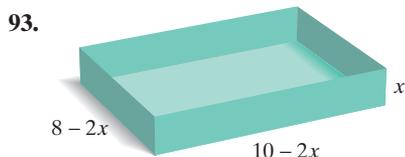

Exercises 91–92 are based on these models and the data displayed by the graph above.

- Use the equation defined by a polynomial of degree 2 to find the median annual income for a man with 16 years of education. Does this underestimate or overestimate the median income shown by the bar graph? By how much?
  - Use the equations defined by polynomials of degree 3 to find a mathematical model for  $M - W$ .

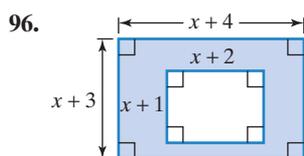

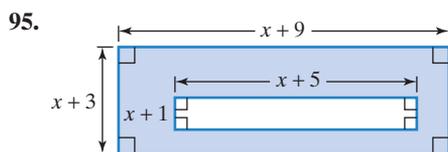

- c. According to the model in part (b), what is the difference, rounded to the nearest dollar, in the median annual income between men and women with 14 years of education?
- d. According to the data displayed by the graph, what is the actual difference in the median annual income between men and women with 14 years of education? Did the result of part (c) underestimate or overestimate this difference? By how much?
92. a. Use the equation defined by a polynomial of degree 2 to find the median annual income for a woman with 18 years of education. Does this underestimate or overestimate the median income shown by the bar graph? By how much?
- b. Use the equations defined by polynomials of degree 3 to find a mathematical model for  $M - W$ .
- c. According to the model in part (b), what is the difference, rounded to the nearest dollar, in the median annual income between men and women with 16 years of education?
- d. According to the data displayed by the graph, what is the actual difference in the median annual income between men and women with 16 years of education? Did the result of part (c) underestimate or overestimate this difference? By how much?

The volume,  $V$ , of a rectangular solid with length  $l$ , width  $w$ , and height  $h$  is given by the formula  $V = lwh$ . In Exercises 93–94, use this formula to write a polynomial in standard form that models, or represents, the volume of the open box.

In Exercises 95–96, write a polynomial in standard form that models, or represents, the area of the shaded region.

### Writing in Mathematics

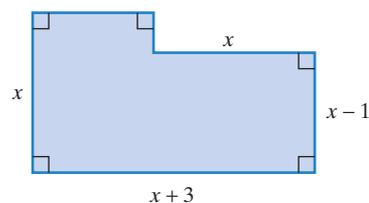

97. What is a polynomial in  $x$ ?
98. Explain how to subtract polynomials.
99. Explain how to multiply two binomials using the FOIL method. Give an example with your explanation.
100. Explain how to find the product of the sum and difference of two terms. Give an example with your explanation.

101. Explain how to square a binomial difference. Give an example with your explanation.
102. Explain how to find the degree of a polynomial in two variables.

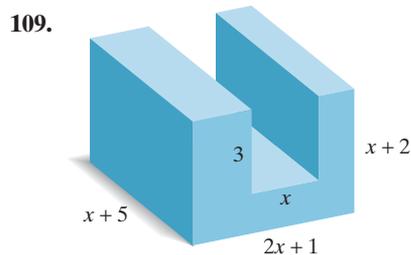

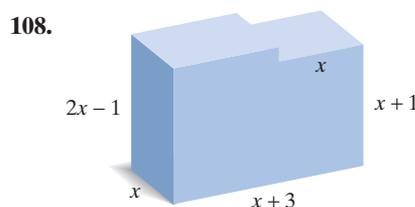

### Critical Thinking Exercises

**Make Sense?** In Exercises 103–106, determine whether each statement makes sense or does not make sense, and explain your reasoning.

103. Knowing the difference between factors and terms is important: In  $(3x^2y)^2$ , I can distribute the exponent 2 on each factor, but in  $(3x^2 + y)^2$ , I cannot do the same thing on each term.
104. I used the FOIL method to find the product of  $x + 5$  and  $x^2 + 2x + 1$ .
105. Many English words have prefixes with meanings similar to those used to describe polynomials, such as *monologue*, *binocular*, and *tricuspid*.
106. Special-product formulas have patterns that make their multiplications quicker than using the FOIL method.
107. Express the area of the plane figure shown as a polynomial in standard form.

In Exercises 108–109, represent the volume of each figure as a polynomial in standard form.

110. Simplify:  $(y^n + 2)(y^n - 2) - (y^n - 3)^2$ .

### Preview Exercises

Exercises 111–113 will help you prepare for the material covered in the next section. In each exercise, replace the boxed question mark with an integer that results in the given product. Some trial and error may be necessary.

111.  $(x + 3)(x + \boxed{?}) = x^2 + 7x + 12$
112.  $(x - \boxed{?})(x - 12) = x^2 - 14x + 24$
113.  $(4x + 1)(2x - \boxed{?}) = 8x^2 - 10x - 3$

## SECTION P.5

## Factoring Polynomials

## Objectives

- 1 Factor out the greatest common factor of a polynomial.
- 2 Factor by grouping.
- 3 Factor trinomials.
- 4 Factor the difference of squares.
- 5 Factor perfect square trinomials.
- 6 Factor the sum or difference of two cubes.
- 7 Use a general strategy for factoring polynomials.
- 8 Factor algebraic expressions containing fractional and negative exponents.

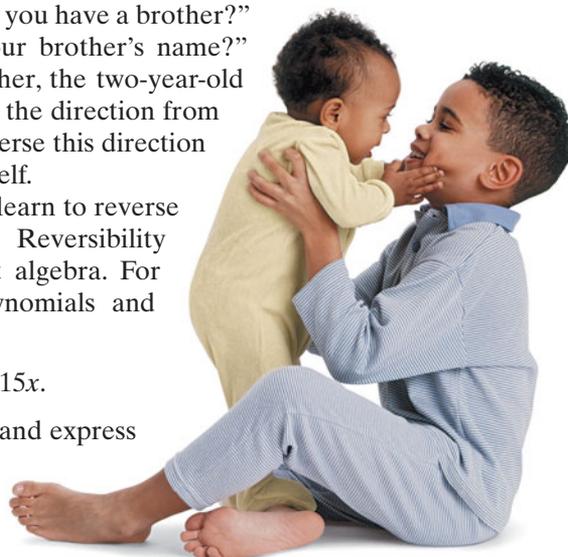

A two-year-old boy is asked, “Do you have a brother?” He answers, “Yes.” “What is your brother’s name?” “Tom.” Asked if Tom has a brother, the two-year-old replies, “No.” The child can go in the direction from self to brother, but he cannot reverse this direction and move from brother back to self.

As our intellects develop, we learn to reverse the direction of our thinking. Reversibility of thought is found throughout algebra. For example, we can multiply polynomials and show that

$$5x(2x + 3) = 10x^2 + 15x.$$

We can also reverse this process and express the resulting polynomial as

$$10x^2 + 15x = 5x(2x + 3).$$

**Factoring** a polynomial expressed as the sum of monomials means finding an equivalent expression that is a product.

Factoring  $10x^2 + 15x$ 

Sum of monomials

Equivalent expression that is a product

$$10x^2 + 15x = 5x(2x + 3)$$

The factors of  $10x^2 + 15x$  are  $5x$  and  $2x + 3$ .

In this section, we will be **factoring over the set of integers**, meaning that the coefficients in the factors are integers. Polynomials that cannot be factored using integer coefficients are called **irreducible over the integers**, or **prime**.

The goal in factoring a polynomial is to use one or more factoring techniques until each of the polynomial’s factors, except possibly for a monomial factor, is prime or irreducible. In this situation, the polynomial is said to be **factored completely**.

We will now discuss basic techniques for factoring polynomials.

- 1 Factor out the greatest common factor of a polynomial.

## Common Factors

In any factoring problem, the first step is to look for the *greatest common factor*. The **greatest common factor**, abbreviated GCF, is an expression of the highest degree that divides each term of the polynomial. The distributive property in the reverse direction

$$ab + ac = a(b + c)$$

can be used to factor out the greatest common factor.

## EXAMPLE 1 Factoring Out the Greatest Common Factor

Factor:

a.  $18x^3 + 27x^2$       b.  $x^2(x + 3) + 5(x + 3)$ .

**GREAT QUESTION!**

Is there a rule that can help me determine the greatest common factor?

Yes. The variable part of the greatest common factor always contains the *smallest* power of a variable or algebraic expression that appears in all terms of the polynomial.

**SOLUTION**

- a. First, determine the greatest common factor.

9 is the greatest integer that divides 18 and 27.

$$18x^3 + 27x^2$$

$x^2$  is the greatest expression that divides  $x^3$  and  $x^2$ .

The GCF of the two terms of the polynomial is  $9x^2$ .

$$\begin{aligned} 18x^3 + 27x^2 &= 9x^2(2x) + 9x^2(3) && \text{Express each term as the product} \\ & && \text{of the GCF and its other factor.} \\ &= 9x^2(2x + 3) && \text{Factor out the GCF.} \end{aligned}$$

- b. In this situation, the greatest common factor is the common binomial factor  $(x + 3)$ . We factor out this common factor as follows:

$$x^2(x + 3) + 5(x + 3) = (x + 3)(x^2 + 5). \quad \text{Factor out the common binomial factor.}$$

...

 **Check Point 1** Factor:

a.  $10x^3 - 4x^2$

b.  $2x(x - 7) + 3(x - 7)$ .

**2** Factor by grouping.

**Factoring by Grouping**

Some polynomials have only a greatest common factor of 1. However, by a suitable grouping of the terms, it still may be possible to factor. This process, called **factoring by grouping**, is illustrated in Example 2.

**EXAMPLE 2** Factoring by Grouping

Factor:  $x^3 + 4x^2 + 3x + 12$ .

**SOLUTION**

There is no factor other than 1 common to all terms. However, we can group terms that have a common factor:

$$\boxed{x^3 + 4x^2} + \boxed{3x + 12}.$$

Common factor is  $x^2$ .      Common factor is 3.

We now factor the given polynomial as follows:

$$\begin{aligned} x^3 + 4x^2 + 3x + 12 &= (x^3 + 4x^2) + (3x + 12) && \text{Group terms with common factors.} \\ &= x^2(x + 4) + 3(x + 4) && \text{Factor out the greatest common factor} \\ & && \text{from the grouped terms. The remaining two} \\ & && \text{terms have } x + 4 \text{ as a common binomial} \\ & && \text{factor.} \\ &= (x + 4)(x^2 + 3). && \text{Factor out the GCF, } x + 4. \end{aligned}$$

Thus,  $x^3 + 4x^2 + 3x + 12 = (x + 4)(x^2 + 3)$ . Check the factorization by multiplying the right side of the equation using the FOIL method. Because the factorization is correct, you should obtain the original polynomial. ...

**DISCOVERY**

In Example 2, group the terms as follows:

$$(x^3 + 3x) + (4x^2 + 12).$$

Factor out the greatest common factor from each group and complete the factoring process. Describe what happens. What can you conclude?

 **Check Point 2** Factor:  $x^3 + 5x^2 - 2x - 10$ .

## 3 Factor trinomials.

## Factoring Trinomials

To factor a trinomial of the form  $ax^2 + bx + c$ , a little trial and error may be necessary.

A Strategy for Factoring  $ax^2 + bx + c$ 

Assume, for the moment, that there is no greatest common factor.

1. Find two **F**irst terms whose product is  $ax^2$ :

$$(\square x + \square)(\square x + \square) = ax^2 + bx + c.$$

2. Find two **L**ast terms whose product is  $c$ :

$$(\square x + \square)(\square x + \square) = ax^2 + bx + c.$$

3. By trial and error, perform steps 1 and 2 until the sum of the **O**utside product and **I**nside product is  $bx$ :

$$(\square x + \square)(\square x + \square) = ax^2 + bx + c.$$

Sum of O + I

If no such combination exists, the polynomial is prime.

## GREAT QUESTION!

Should I feel discouraged if it takes me a while to get the correct factorization?

The *error* part of the factoring strategy plays an important role in the process. If you do not get the correct factorization the first time, this is not a bad thing. This error is often helpful in leading you to the correct factorization.

## EXAMPLE 3 Factoring a Trinomial Whose Leading Coefficient Is 1

Factor:  $x^2 + 6x + 8$ .

## SOLUTION

- Step 1** Find two **F**irst terms whose product is  $x^2$ .

$$x^2 + 6x + 8 = (x \quad)(x \quad)$$

- Step 2** Find two **L**ast terms whose product is 8.

Factors of 8	8, 1	4, 2	-8, -1	-4, -2
--------------	------	------	--------	--------

- Step 3** Try various combinations of these factors. The correct factorization of  $x^2 + 6x + 8$  is the one in which the sum of the **O**utside and **I**nside products is equal to  $6x$ . Here is a list of the possible factorizations:

Possible Factorizations of $x^2 + 6x + 8$	Sum of Outside and Inside Products (Should Equal $6x$ )
$(x + 8)(x + 1)$	$x + 8x = 9x$
$(x + 4)(x + 2)$	$2x + 4x = 6x$
$(x - 8)(x - 1)$	$-x - 8x = -9x$
$(x - 4)(x - 2)$	$-2x - 4x = -6x$

This is the required middle term.

Thus,  $x^2 + 6x + 8 = (x + 4)(x + 2)$  or  $(x + 2)(x + 4)$ . ...

In factoring a trinomial of the form  $x^2 + bx + c$ , you can speed things up by listing the factors of  $c$  and then finding their sums. We are interested in a sum of  $b$ . For example, in factoring  $x^2 + 6x + 8$ , we are interested in the factors of 8 whose sum is 6.

Factors of 8	8, 1	4, 2	-8, -1	-4, -2
Sum of Factors	9	6	-9	-6

This is the desired sum.

Thus,  $x^2 + 6x + 8 = (x + 4)(x + 2)$ .

 **Check Point 3** Factor:  $x^2 + 13x + 40$ .

**EXAMPLE 4** Factoring a Trinomial Whose Leading Coefficient Is 1

Factor:  $x^2 + 3x - 18$ .

**SOLUTION**

**Step 1** Find two First terms whose product is  $x^2$ .

$$x^2 + 3x - 18 = (x \quad)(x \quad)$$

To find the second term of each factor, we must find two integers whose product is  $-18$  and whose sum is 3.

**Step 2** Find two Last terms whose product is  $-18$ .

<b>Factors of <math>-18</math></b>	18, $-1$	$-18$ , 1	9, $-2$	$-9$ , 2	6, $-3$	$-6$ , 3
------------------------------------	----------	-----------	---------	----------	---------	----------

**Step 3** Try various combinations of these factors. We are looking for the pair of factors whose sum is 3.

<b>Factors of <math>-18</math></b>	18, $-1$	$-18$ , 1	9, $-2$	$-9$ , 2	6, $-3$	$-6$ , 3
<b>Sum of Factors</b>	17	$-17$	7	$-7$	3	$-3$

This is the desired sum.

Thus,  $x^2 + 3x - 18 = (x + 6)(x - 3)$  or  $(x - 3)(x + 6)$ . ...

**GREAT QUESTION!**

Is there a way to eliminate some of the combinations of factors for a trinomial whose leading coefficient is 1?

Yes. To factor  $x^2 + bx + c$  when  $c$  is positive, find two numbers with the same sign as the middle term.

$$x^2 + 6x + 8 = (x + 4)(x + 2)$$

Same signs

$$x^2 - 5x + 6 = (x - 3)(x - 2)$$

Same signs

To factor  $x^2 + bx + c$  when  $c$  is negative, find two numbers with opposite signs whose sum is the coefficient of the middle term.

$$x^2 + 3x - 18 = (x + 6)(x - 3)$$

Negative

Opposite signs

$$x^2 - 2x - 99 = (x + 9)(x - 11)$$

Negative

Opposite signs

 **Check Point 4** Factor:  $x^2 - 5x - 14$ .

**EXAMPLE 5** Factoring a Trinomial Whose Leading Coefficient Is Not 1

Factor:  $8x^2 - 10x - 3$ .

**GREAT QUESTION!**

When factoring trinomials, must I list every possible factorization before getting the correct one?

With practice, you will find that it is not necessary to list every possible factorization of the trinomial. As you practice factoring, you will be able to narrow down the list of possible factors to just a few. When it comes to factoring, practice makes perfect.

**SOLUTION**

**Step 1 Find two First terms whose product is  $8x^2$ .**

$$8x^2 - 10x - 3 \stackrel{?}{=} (8x \quad)(x \quad)$$

$$8x^2 - 10x - 3 \stackrel{?}{=} (4x \quad)(2x \quad)$$

**Step 2 Find two Last terms whose product is  $-3$ .** The possible factorizations are  $1(-3)$  and  $-1(3)$ .

**Step 3 Try various combinations of these factors.** The correct factorization of  $8x^2 - 10x - 3$  is the one in which the sum of the **Outside** and **Inside** products is equal to  $-10x$ . Here is a list of the possible factorizations:

Possible Factorizations of $8x^2 - 10x - 3$	Sum of Outside and Inside Products (Should Equal $-10x$ )
$(8x + 1)(x - 3)$	$-24x + x = -23x$
$(8x - 3)(x + 1)$	$8x - 3x = 5x$
$(8x - 1)(x + 3)$	$24x - x = 23x$
$(8x + 3)(x - 1)$	$-8x + 3x = -5x$
$(4x + 1)(2x - 3)$	$-12x + 2x = -10x$
$(4x - 3)(2x + 1)$	$4x - 6x = -2x$
$(4x - 1)(2x + 3)$	$12x - 2x = 10x$
$(4x + 3)(2x - 1)$	$-4x + 6x = 2x$

These four factorizations use  $(8x \quad)(x \quad)$  with  $1(-3)$  and  $-1(3)$  as factorizations of  $-3$ .

These four factorizations use  $(4x \quad)(2x \quad)$  with  $1(-3)$  and  $-1(3)$  as factorizations of  $-3$ .

This is the required middle term.

Thus,  $8x^2 - 10x - 3 = (4x + 1)(2x - 3)$  or  $(2x - 3)(4x + 1)$ .

Use FOIL multiplication to check either of these factorizations. ...

 **Check Point 5** Factor:  $6x^2 + 19x - 7$ .

**GREAT QUESTION!**

I zone out reading your long lists of possible factorizations. Are there any rules for shortening these lists?

Here are some suggestions for reducing the list of possible factorizations for  $ax^2 + bx + c$ :

1. If  $b$  is relatively small, avoid the larger factors of  $a$ .
2. If  $c$  is positive, the signs in both binomial factors must match the sign of  $b$ .
3. If the trinomial has no common factor, no binomial factor can have a common factor.
4. Reversing the signs in the binomial factors changes the sign of  $bx$ , the middle term.

**EXAMPLE 6** Factoring a Trinomial in Two Variables

Factor:  $2x^2 - 7xy + 3y^2$ .

**SOLUTION**

**Step 1 Find two First terms whose product is  $2x^2$ .**

$$2x^2 - 7xy + 3y^2 = (2x \quad)(x \quad)$$

**Step 2 Find two Last terms whose product is  $3y^2$ .** The possible factorizations are  $(y)(3y)$  and  $(-y)(-3y)$ .

**Step 3 Try various combinations of these factors.** The correct factorization of  $2x^2 - 7xy + 3y^2$  is the one in which the sum of the **Outside** and **Inside** products is equal to  $-7xy$ . Here is a list of possible factorizations:

Possible Factorizations of $2x^2 - 7xy + 3y^2$	Sum of Outside and Inside Products (Should Equal $-7xy$ )
$(2x + 3y)(x + y)$	$2xy + 3xy = 5xy$
$(2x + y)(x + 3y)$	$6xy + xy = 7xy$
$(2x - 3y)(x - y)$	$-2xy - 3xy = -5xy$
$(2x - y)(x - 3y)$	$-6xy - xy = -7xy$

This is the required middle term.

Thus,

$$2x^2 - 7xy + 3y^2 = (2x - y)(x - 3y) \quad \text{or} \quad (x - 3y)(2x - y).$$

Use FOIL multiplication to check either of these factorizations. ...

**Check Point 6** Factor:  $3x^2 - 13xy + 4y^2$ .

**4** Factor the difference of squares.

### Factoring the Difference of Two Squares

A method for factoring the difference of two squares is obtained by reversing the special product for the sum and difference of two terms.

#### The Difference of Two Squares

If  $A$  and  $B$  are real numbers, variables, or algebraic expressions, then

$$A^2 - B^2 = (A + B)(A - B).$$

In words: The difference of the squares of two terms factors as the product of a sum and a difference of those terms.

#### EXAMPLE 7 Factoring the Difference of Two Squares

Factor: **a.**  $x^2 - 4$       **b.**  $81x^2 - 49$ .

#### SOLUTION

We must express each term as the square of some monomial. Then we use the formula for factoring  $A^2 - B^2$ .

$$\text{a.} \quad x^2 - 4 = x^2 - 2^2 = (x + 2)(x - 2)$$

$$A^2 - B^2 = (A + B)(A - B)$$

$$\text{b.} \quad 81x^2 - 49 = (9x)^2 - 7^2 = (9x + 7)(9x - 7)$$
...

**Check Point 7** Factor:

**a.**  $x^2 - 81$

**b.**  $36x^2 - 25$ .

We have seen that a polynomial is factored completely when it is written as the product of prime polynomials. To be sure that you have factored completely, check to see whether any factors with more than one term in the factored polynomial can be factored further. If so, continue factoring.

### GREAT QUESTION!

Why isn't factoring  $x^4 - 81$  as  $(x^2 + 9)(x^2 - 9)$  a complete factorization?

The second factor,  $x^2 - 9$ , is itself a difference of two squares and can be factored.

#### EXAMPLE 8 A Repeated Factorization

Factor completely:  $x^4 - 81$ .

#### SOLUTION

$$\begin{aligned} x^4 - 81 &= (x^2)^2 - 9^2 \\ &= (x^2 + 9)(x^2 - 9) \\ &= (x^2 + 9)(x^2 - 3^2) \\ &= (x^2 + 9)(x + 3)(x - 3) \end{aligned}$$

Express as the difference of two squares.

The factors are the sum and the difference of the expressions being squared.

The factor  $x^2 - 9$  is the difference of two squares and can be factored.

The factors of  $x^2 - 9$  are the sum and the difference of the expressions being squared. ...

 **Check Point 8** Factor completely:  $81x^4 - 16$ .

**5** Factor perfect square trinomials.

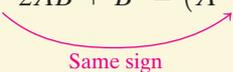

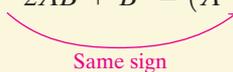

### Factoring Perfect Square Trinomials

Our next factoring technique is obtained by reversing the special products for squaring binomials. The trinomials that are factored using this technique are called **perfect square trinomials**.

#### Factoring Perfect Square Trinomials

Let  $A$  and  $B$  be real numbers, variables, or algebraic expressions.

$$1. A^2 + 2AB + B^2 = (A + B)^2 \quad 2. A^2 - 2AB + B^2 = (A - B)^2$$

The two items in the box show that perfect square trinomials,  $A^2 + 2AB + B^2$  and  $A^2 - 2AB + B^2$ , come in two forms: one in which the coefficient of the middle term is positive and one in which the coefficient of the middle term is negative. Here's how to recognize a perfect square trinomial:

1. The first and last terms are squares of monomials or integers.
2. The middle term is twice the product of the expressions being squared in the first and last terms.

#### EXAMPLE 9 Factoring Perfect Square Trinomials

Factor: **a.**  $x^2 + 6x + 9$       **b.**  $25x^2 - 60x + 36$ .

#### SOLUTION

$$\mathbf{a.} \quad x^2 + 6x + 9 = x^2 + 2 \cdot x \cdot 3 + 3^2 = (x + 3)^2$$

*The middle term has a positive sign.*

$$A^2 + 2AB + B^2 = (A + B)^2$$

- b.** We suspect that  $25x^2 - 60x + 36$  is a perfect square trinomial because  $25x^2 = (5x)^2$  and  $36 = 6^2$ . The middle term can be expressed as twice the product of  $5x$  and  $6$ .

$$25x^2 - 60x + 36 = (5x)^2 - 2 \cdot 5x \cdot 6 + 6^2 = (5x - 6)^2$$

$$A^2 - 2AB + B^2 = (A - B)^2$$

...

 **Check Point 9** Factor:

**a.**  $x^2 + 14x + 49$

**b.**  $16x^2 - 56x + 49$ .

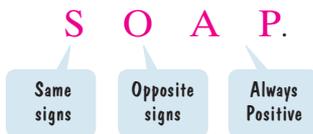

- 6 Factor the sum or difference of two cubes.

## GREAT QUESTION!

### A Cube of SOAP

The formulas for factoring  $A^3 + B^3$  and  $A^3 - B^3$  are difficult to remember and easy to confuse. Can you help me out?

When factoring sums or differences of cubes, observe the sign patterns shown by the voice balloons in the box. The word *SOAP* is a way to remember these patterns:

## Factoring the Sum or Difference of Two Cubes

We can use the following formulas to factor the sum or the difference of two cubes:

### Factoring the Sum or Difference of Two Cubes

#### 1. Factoring the Sum of Two Cubes

$$A^3 + B^3 = (A + B)(A^2 - AB + B^2)$$

#### 2. Factoring the Difference of Two Cubes

$$A^3 - B^3 = (A - B)(A^2 + AB + B^2)$$

### EXAMPLE 10 Factoring Sums and Differences of Two Cubes

Factor: a.  $x^3 + 8$       b.  $64x^3 - 125$ .

### SOLUTION

- a. To factor  $x^3 + 8$ , we must express each term as the cube of some monomial. Then we use the formula for factoring  $A^3 + B^3$ .

$$x^3 + 8 = x^3 + 2^3 = (x + 2)(x^2 - x \cdot 2 + 2^2) = (x + 2)(x^2 - 2x + 4)$$

$$A^3 + B^3 = (A + B)(A^2 - AB + B^2)$$

- b. To factor  $64x^3 - 125$ , we must express each term as the cube of some monomial. Then we use the formula for factoring  $A^3 - B^3$ .

$$64x^3 - 125 = (4x)^3 - 5^3 = (4x - 5)[(4x)^2 + (4x)(5) + 5^2]$$

$$A^3 - B^3 = (A - B)(A^2 + AB + B^2)$$

$$= (4x - 5)(16x^2 + 20x + 25)$$

...

### Check Point 10 Factor:

a.  $x^3 + 1$

b.  $125x^3 - 8$ .

- 7 Use a general strategy for factoring polynomials.

## A Strategy for Factoring Polynomials

It is important to practice factoring a wide variety of polynomials so that you can quickly select the appropriate technique. The polynomial is factored completely when all its polynomial factors, except possibly for monomial factors, are prime. Because of the commutative property, the order of the factors does not matter.

### A Strategy for Factoring a Polynomial

1. If there is a common factor, factor out the GCF.
2. Determine the number of terms in the polynomial and try factoring as follows:
  - a. If there are two terms, can the binomial be factored by using one of the following special forms?

$$\text{Difference of two squares: } A^2 - B^2 = (A + B)(A - B)$$

$$\text{Sum of two cubes: } A^3 + B^3 = (A + B)(A^2 - AB + B^2)$$

$$\text{Difference of two cubes: } A^3 - B^3 = (A - B)(A^2 + AB + B^2)$$

- b. If there are three terms, is the trinomial a perfect square trinomial? If so, factor by using one of the following special forms:

$$A^2 + 2AB + B^2 = (A + B)^2$$

$$A^2 - 2AB + B^2 = (A - B)^2.$$

If the trinomial is not a perfect square trinomial, try factoring by trial and error.

- c. If there are four or more terms, try factoring by grouping.
3. Check to see if any factors with more than one term in the factored polynomial can be factored further. If so, factor completely.

### EXAMPLE 11 Factoring a Polynomial

Factor:  $2x^3 + 8x^2 + 8x$ .

#### SOLUTION

**Step 1** If there is a common factor, factor out the GCF. Because  $2x$  is common to all terms, we factor it out.

$$2x^3 + 8x^2 + 8x = 2x(x^2 + 4x + 4) \quad \text{Factor out the GCF.}$$

**Step 2** Determine the number of terms and factor accordingly. The factor  $x^2 + 4x + 4$  has three terms and is a perfect square trinomial. We factor using  $A^2 + 2AB + B^2 = (A + B)^2$ .

$$2x^3 + 8x^2 + 8x = 2x(x^2 + 4x + 4)$$

$$= 2x(x^2 + 2 \cdot x \cdot 2 + 2^2)$$

$$A^2 + 2AB + B^2$$

$$= 2x(x + 2)^2$$

$$A^2 + 2AB + B^2 = (A + B)^2$$

**Step 3** Check to see if factors can be factored further. In this problem, they cannot. Thus,

$$2x^3 + 8x^2 + 8x = 2x(x + 2)^2. \quad \dots$$

 **Check Point 11** Factor:  $3x^3 - 30x^2 + 75x$ .

### EXAMPLE 12 Factoring a Polynomial

Factor:  $x^2 - 25a^2 + 8x + 16$ .

**SOLUTION**

**Step 1** If there is a common factor, factor out the GCF. Other than 1 or  $-1$ , there is no common factor.

**Step 2** Determine the number of terms and factor accordingly. There are four terms. We try factoring by grouping. It can be shown that grouping into two groups of two terms does not result in a common binomial factor. Let's try grouping as a difference of squares.

$$\begin{aligned} x^2 - 25a^2 + 8x + 16 & \\ &= (x^2 + 8x + 16) - 25a^2 && \text{Rearrange terms and group as a perfect square trinomial minus } 25a^2 \text{ to obtain a difference of squares.} \\ &= (x + 4)^2 - (5a)^2 && \text{Factor the perfect square trinomial.} \\ &= (x + 4 + 5a)(x + 4 - 5a) && \text{Factor the difference of squares. The factors are the sum and difference of the expressions being squared.} \end{aligned}$$

**Step 3** Check to see if factors can be factored further. In this case, they cannot, so we have factored completely. ●●●

 **Check Point 12** Factor:  $x^2 - 36a^2 + 20x + 100$ .

**8** Factor algebraic expressions containing fractional and negative exponents.

### Factoring Algebraic Expressions Containing Fractional and Negative Exponents

Although expressions containing fractional and negative exponents are not polynomials, they can be simplified using factoring techniques.

#### EXAMPLE 13 Factoring Involving Fractional and Negative Exponents

Factor and simplify:  $x(x + 1)^{-\frac{3}{4}} + (x + 1)^{\frac{1}{4}}$ .

**SOLUTION**

The greatest common factor of  $x(x + 1)^{-\frac{3}{4}} + (x + 1)^{\frac{1}{4}}$  is  $x + 1$  with the *smaller exponent* in the two terms. Thus, the greatest common factor is  $(x + 1)^{-\frac{3}{4}}$ .

$$\begin{aligned} x(x + 1)^{-\frac{3}{4}} + (x + 1)^{\frac{1}{4}} & \\ &= (x + 1)^{-\frac{3}{4}}x + (x + 1)^{-\frac{3}{4}}(x + 1)^{\frac{4}{4}} && \text{Express each term as the product of the greatest common factor and its other factor. Note that } (x + 1)^{-\frac{3}{4}}(x + 1)^{\frac{4}{4}} = (x + 1)^{-\frac{3}{4} + \frac{4}{4}} = (x + 1)^{\frac{1}{4}}. \\ &= (x + 1)^{-\frac{3}{4}}x + (x + 1)^{-\frac{3}{4}}(x + 1) && \text{Simplify: } (x + 1)^{\frac{4}{4}} = (x + 1). \\ &= (x + 1)^{-\frac{3}{4}}[x + (x + 1)] && \text{Factor out the greatest common factor.} \\ &= \frac{2x + 1}{(x + 1)^{\frac{3}{4}}} && b^{-n} = \frac{1}{b^n} \end{aligned}$$

 **Check Point 13** Factor and simplify:  $x(x - 1)^{-\frac{1}{2}} + (x - 1)^{\frac{1}{2}}$

## CONCEPT AND VOCABULARY CHECK

Here is a list of the factoring techniques that we have discussed.

- a. Factoring out the GCF
- b. Factoring by grouping
- c. Factoring trinomials by trial and error
- d. Factoring the difference of two squares  

$$A^2 - B^2 = (A + B)(A - B)$$
- e. Factoring perfect square trinomials  

$$A^2 + 2AB + B^2 = (A + B)^2$$
  

$$A^2 - 2AB + B^2 = (A - B)^2$$
- f. Factoring the sum of two cubes  

$$A^3 + B^3 = (A + B)(A^2 - AB + B^2)$$
- g. Factoring the difference of two cubes  

$$A^3 - B^3 = (A - B)(A^2 + AB + B^2)$$

Fill in each blank by writing the letter of the technique (a through g) for factoring the polynomial.

1.  $16x^2 - 25$  \_\_\_\_\_
2.  $27x^3 - 1$  \_\_\_\_\_
3.  $x^2 + 7x + xy + 7y$  \_\_\_\_\_
4.  $4x^2 + 8x + 3$  \_\_\_\_\_
5.  $9x^2 + 24x + 16$  \_\_\_\_\_
6.  $5x^2 + 10x$  \_\_\_\_\_
7.  $x^3 + 1000$  \_\_\_\_\_
8. The algebraic expression  $(x + 1)^{\frac{1}{2}} - \frac{1}{3}(x + 1)^{\frac{3}{2}}$  can be factored using \_\_\_\_\_ as the greatest common factor.

## EXERCISE SET P.5

### Practice Exercises

In Exercises 1–10, factor out the greatest common factor.

- |                             |                                |
|-----------------------------|--------------------------------|
| 1. $18x + 27$               | 2. $16x - 24$                  |
| 3. $3x^2 + 6x$              | 4. $4x^2 - 8x$                 |
| 5. $9x^4 - 18x^3 + 27x^2$   | 6. $6x^4 - 18x^3 + 12x^2$      |
| 7. $x(x + 5) + 3(x + 5)$    | 8. $x(2x + 1) + 4(2x + 1)$     |
| 9. $x^2(x - 3) + 12(x - 3)$ | 10. $x^2(2x + 5) + 17(2x + 5)$ |

In Exercises 11–16, factor by grouping.

- |                            |                            |
|----------------------------|----------------------------|
| 11. $x^3 - 2x^2 + 5x - 10$ | 12. $x^3 - 3x^2 + 4x - 12$ |
| 13. $x^3 - x^2 + 2x - 2$   | 14. $x^3 + 6x^2 - 2x - 12$ |
| 15. $3x^3 - 2x^2 - 6x + 4$ | 16. $x^3 - x^2 - 5x + 5$   |

In Exercises 17–38, factor each trinomial, or state that the trinomial is prime.

- |                         |                         |
|-------------------------|-------------------------|
| 17. $x^2 + 5x + 6$      | 18. $x^2 + 8x + 15$     |
| 19. $x^2 - 2x - 15$     | 20. $x^2 - 4x - 5$      |
| 21. $x^2 - 8x + 15$     | 22. $x^2 - 14x + 45$    |
| 23. $3x^2 - x - 2$      | 24. $2x^2 + 5x - 3$     |
| 25. $3x^2 - 25x - 28$   | 26. $3x^2 - 2x - 5$     |
| 27. $6x^2 - 11x + 4$    | 28. $6x^2 - 17x + 12$   |
| 29. $4x^2 + 16x + 15$   | 30. $8x^2 + 33x + 4$    |
| 31. $9x^2 - 9x + 2$     | 32. $9x^2 + 5x - 4$     |
| 33. $20x^2 + 27x - 8$   | 34. $15x^2 - 19x + 6$   |
| 35. $2x^2 + 3xy + y^2$  | 36. $3x^2 + 4xy + y^2$  |
| 37. $6x^2 - 5xy - 6y^2$ | 38. $6x^2 - 7xy - 5y^2$ |

In Exercises 39–48, factor the difference of two squares.

- |                    |                     |
|--------------------|---------------------|
| 39. $x^2 - 100$    | 40. $x^2 - 144$     |
| 41. $36x^2 - 49$   | 42. $64x^2 - 81$    |
| 43. $9x^2 - 25y^2$ | 44. $36x^2 - 49y^2$ |

- |                  |                 |
|------------------|-----------------|
| 45. $x^4 - 16$   | 46. $x^4 - 1$   |
| 47. $16x^4 - 81$ | 48. $81x^4 - 1$ |

In Exercises 49–56, factor each perfect square trinomial.

- |                      |                       |
|----------------------|-----------------------|
| 49. $x^2 + 2x + 1$   | 50. $x^2 + 4x + 4$    |
| 51. $x^2 - 14x + 49$ | 52. $x^2 - 10x + 25$  |
| 53. $4x^2 + 4x + 1$  | 54. $25x^2 + 10x + 1$ |
| 55. $9x^2 - 6x + 1$  | 56. $64x^2 - 16x + 1$ |

In Exercises 57–64, factor using the formula for the sum or difference of two cubes.

- |                  |                  |
|------------------|------------------|
| 57. $x^3 + 27$   | 58. $x^3 + 64$   |
| 59. $x^3 - 64$   | 60. $x^3 - 27$   |
| 61. $8x^3 - 1$   | 62. $27x^3 - 1$  |
| 63. $64x^3 + 27$ | 64. $8x^3 + 125$ |

In Exercises 65–92, factor completely, or state that the polynomial is prime.

- |                                   |                              |
|-----------------------------------|------------------------------|
| 65. $3x^3 - 3x$                   | 66. $5x^3 - 45x$             |
| 67. $4x^2 - 4x - 24$              | 68. $6x^2 - 18x - 60$        |
| 69. $2x^4 - 162$                  | 70. $7x^4 - 7$               |
| 71. $x^3 + 2x^2 - 9x - 18$        | 72. $x^3 + 3x^2 - 25x - 75$  |
| 73. $2x^2 - 2x - 112$             | 74. $6x^2 - 6x - 12$         |
| 75. $x^3 - 4x$                    | 76. $9x^3 - 9x$              |
| 77. $x^2 + 64$                    | 78. $x^2 + 36$               |
| 79. $x^3 + 2x^2 - 4x - 8$         | 80. $x^3 + 2x^2 - x - 2$     |
| 81. $y^5 - 81y$                   | 82. $y^5 - 16y$              |
| 83. $20y^4 - 45y^2$               | 84. $48y^4 - 3y^2$           |
| 85. $x^2 - 12x + 36 - 49y^2$      | 86. $x^2 - 10x + 25 - 36y^2$ |
| 87. $9b^2x - 16y - 16x + 9b^2y$   |                              |
| 88. $16a^2x - 25y - 25x + 16a^2y$ |                              |

89.  $x^2y - 16y + 32 - 2x^2$       90.  $12x^2y - 27y - 4x^2 + 9$   
 91.  $2x^3 - 8a^2x + 24x^2 + 72x$   
 92.  $2x^3 - 98a^2x + 28x^2 + 98x$

In Exercises 93–102, factor and simplify each algebraic expression.

93.  $x^{\frac{3}{2}} - x^{\frac{1}{2}}$       94.  $x^{\frac{3}{4}} - x^{\frac{1}{4}}$   
 95.  $4x^{-\frac{2}{3}} + 8x^{\frac{1}{3}}$       96.  $12x^{-\frac{3}{4}} + 6x^{\frac{1}{4}}$   
 97.  $(x + 3)^{\frac{1}{2}} - (x + 3)^{\frac{3}{2}}$       98.  $(x^2 + 4)^{\frac{3}{2}} + (x^2 + 4)^{\frac{7}{2}}$   
 99.  $(x + 5)^{-\frac{1}{2}} - (x + 5)^{-\frac{3}{2}}$   
 100.  $(x^2 + 3)^{-\frac{2}{3}} + (x^2 + 3)^{-\frac{5}{3}}$   
 101.  $(4x - 1)^{\frac{1}{2}} - \frac{1}{3}(4x - 1)^{\frac{3}{2}}$   
 102.  $-8(4x + 3)^{-2} + 10(5x + 1)(4x + 3)^{-1}$

**Practice Plus**

In Exercises 103–114, factor completely.

103.  $10x^2(x + 1) - 7x(x + 1) - 6(x + 1)$   
 104.  $12x^2(x - 1) - 4x(x - 1) - 5(x - 1)$   
 105.  $6x^4 + 35x^2 - 6$       106.  $7x^4 + 34x^2 - 5$   
 107.  $y^7 + y$       108.  $(y + 1)^3 + 1$   
 109.  $x^4 - 5x^2y^2 + 4y^4$       110.  $x^4 - 10x^2y^2 + 9y^4$   
 111.  $(x - y)^4 - 4(x - y)^2$       112.  $(x + y)^4 - 100(x + y)^2$   
 113.  $2x^2 - 7xy^2 + 3y^4$       114.  $3x^2 + 5xy^2 + 2y^4$

**Application Exercises**

115. Your computer store is having an incredible sale. The price on one model is reduced by 40%. Then the sale price is reduced by another 40%. If  $x$  is the computer's original price, the sale price can be modeled by

$$(x - 0.4x) - 0.4(x - 0.4x).$$

- a. Factor out  $(x - 0.4x)$  from each term. Then simplify the resulting expression.  
 b. Use the simplified expression from part (a) to answer these questions. With a 40% reduction followed by a 40% reduction, is the computer selling at 20% of its original price? If not, at what percentage of the original price is it selling?

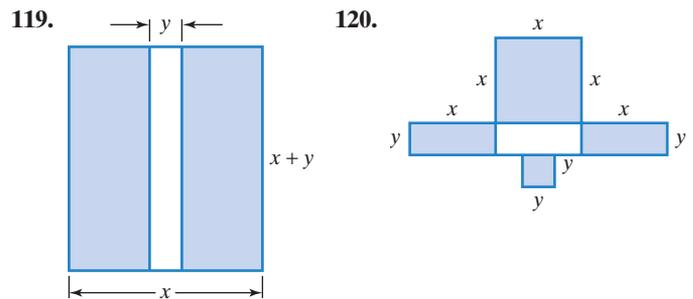

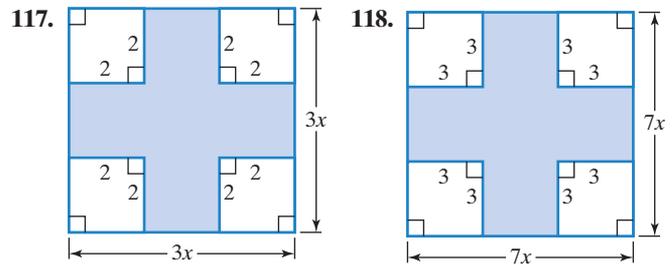

116. Your local electronics store is having an end-of-the-year sale. The price on a plasma television had been reduced by 30%. Now the sale price is reduced by another 30%. If  $x$  is the television's original price, the sale price can be modeled by

$$(x - 0.3x) - 0.3(x - 0.3x).$$

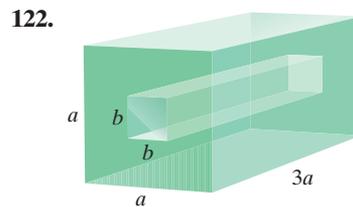

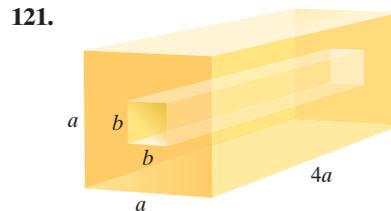

- a. Factor out  $(x - 0.3x)$  from each term. Then simplify the resulting expression.  
 b. Use the simplified expression from part (a) to answer these questions. With a 30% reduction followed by a 30% reduction, is the television selling at 40% of its original price? If not, at what percentage of the original price is it selling?

In Exercises 117–120,

- a. Write an expression for the area of the shaded region.  
 b. Write the expression in factored form.

In Exercises 121–122, find the formula for the volume of the region outside the smaller rectangular solid and inside the larger rectangular solid. Then express the volume in factored form.

**Writing in Mathematics**

123. Using an example, explain how to factor out the greatest common factor of a polynomial.  
 124. Suppose that a polynomial contains four terms. Explain how to use factoring by grouping to factor the polynomial.  
 125. Explain how to factor  $3x^2 + 10x + 8$ .  
 126. Explain how to factor the difference of two squares. Provide an example with your explanation.  
 127. What is a perfect square trinomial and how is it factored?  
 128. Explain how to factor  $x^3 + 1$ .  
 129. What does it mean to factor completely?

32.  $64y - y^4$   
 33.  $50x^3 + 20x^2 + 2x$   
 34.  $x^2 - 6x + 9 - 49y^2$

In Exercises 35–36, factor and simplify each algebraic expression.

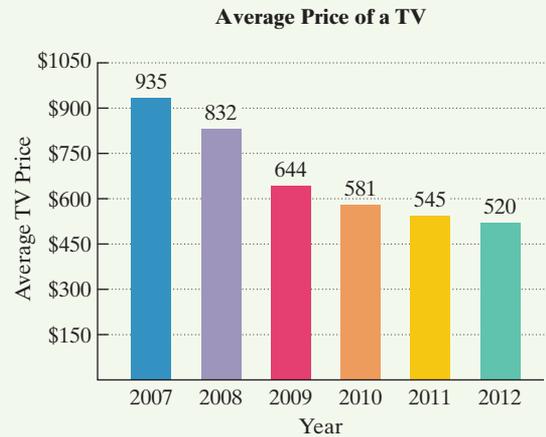

35.  $x^{-\frac{3}{2}} - 2x^{-\frac{1}{2}} + x^{\frac{1}{2}}$   
 36.  $(x^2 + 1)^{\frac{1}{2}} - 10(x^2 + 1)^{-\frac{1}{2}}$

37. List all the rational numbers in this set:

$$\left\{-11, -\frac{3}{7}, 0, 0.45, \sqrt{23}, \sqrt{25}\right\}.$$

In Exercises 38–39, rewrite each expression without absolute value bars.

38.  $|2 - \sqrt{13}|$   
 39.  $x^2|x|$  if  $x < 0$   
 40. If the population of the United States is approximately  $3.0 \times 10^8$  and each person produces about 4.6 pounds of garbage per day, express the total number of pounds of garbage produced in the United States in one day in scientific notation.  
 41. A human brain contains  $3 \times 10^{10}$  neurons and a gorilla brain contains  $7.5 \times 10^9$  neurons. How many times as many neurons are in the brain of a human as in the brain of a gorilla?  
 42. TVs keep getting fancier and bigger, but prices do not. The bar graph at the top of the next column shows the average price of a TV in the United States from 2007 through 2012.

Source: Consumer Electronics Association

Here are two mathematical models for the data shown by the graph. In each formula,  $P$  represents the average price of a TV  $x$  years after 2007.

Model 1  $P = -86x + 890$

Model 2  $P = 18x^2 - 175x + 950$

- a. Which model better describes the data for 2007?  
 b. Does the polynomial model of degree 2 underestimate or overestimate the average TV price for 2012? By how much?

## SECTION P.6

### Rational Expressions

#### Objectives

- Specify numbers that must be excluded from the domain of a rational expression.
- Simplify rational expressions.
- Multiply rational expressions.
- Divide rational expressions.
- Add and subtract rational expressions.
- Simplify complex rational expressions.
- Simplify fractional expressions that occur in calculus.
- Rationalize numerators.

How do we describe the costs of reducing environmental pollution? We often use algebraic expressions involving quotients of polynomials. For example, the algebraic expression

$$\frac{250x}{100 - x}$$

describes the cost, in millions of dollars, to remove  $x$  percent of the pollutants that are discharged into a river. Removing a modest percentage of pollutants, say 40%, is far less costly than removing a substantially greater percentage, such as 95%. We see this by evaluating the algebraic expression for  $x = 40$  and  $x = 95$ .

Evaluating  $\frac{250x}{100 - x}$  for

$$x = 40:$$

$$\text{Cost is } \frac{250(40)}{100 - 40} \approx 167.$$

$$x = 95:$$

$$\text{Cost is } \frac{250(95)}{100 - 95} = 4750.$$

The cost increases from approximately \$167 million to a possibly prohibitive \$4750 million, or \$4.75 billion. Costs spiral upward as the percentage of removed pollutants increases.

Many algebraic expressions that describe costs of environmental projects are examples of *rational expressions*. First we will define rational expressions. Then we will review how to perform operations with such expressions.

- 1 Specify numbers that must be excluded from the domain of a rational expression.

### Rational Expressions

A **rational expression** is the quotient of two polynomials. Some examples are

$$\frac{x-2}{4}, \quad \frac{4}{x-2}, \quad \frac{x}{x^2-1}, \quad \text{and} \quad \frac{x^2+1}{x^2+2x-3}.$$

The set of real numbers for which an algebraic expression is defined is the **domain** of the expression. Because rational expressions indicate division and division by zero is undefined, **we must exclude numbers from a rational expression's domain that make the denominator zero.**

#### EXAMPLE 1 Excluding Numbers from the Domain

Find all the numbers that must be excluded from the domain of each rational expression:

a.  $\frac{4}{x-2}$       b.  $\frac{x}{x^2-1}$       c.  $\frac{9x}{x^2+3x-18}$

#### SOLUTION

To determine the numbers that must be excluded from each domain, examine the denominators.

a.  $\frac{4}{x-2}$

This denominator would equal zero if  $x = 2$ .

b.  $\frac{x}{x^2-1} = \frac{x}{(x+1)(x-1)}$

This factor would equal zero if  $x = -1$ .

This factor would equal zero if  $x = 1$ .

c.  $\frac{9x}{x^2+3x-18} = \frac{9x}{(x+6)(x-3)}$

This factor would equal zero if  $x = -6$ .

This factor would equal zero if  $x = 3$ .

For the rational expression in part (a), we must exclude 2 from the domain. For the rational expression in part (b), we must exclude both  $-1$  and  $1$  from the domain. For the rational expression in part (c), we must exclude both  $-6$  and  $3$  from the domain. These excluded numbers are often written to the right of a rational expression:

$$\frac{4}{x-2}, x \neq 2 \quad \frac{x}{x^2-1}, x \neq -1, x \neq 1 \quad \frac{9x}{x^2+3x-18}, x \neq -6, x \neq 3. \dots$$

 **Check Point 1** Find all the numbers that must be excluded from the domain of each rational expression:

a.  $\frac{7}{x+5}$

b.  $\frac{x}{x^2-36}$

c.  $\frac{7x}{x^2-5x-14}$

- 2 Simplify rational expressions.

### Simplifying Rational Expressions

A rational expression is **simplified** if its numerator and denominator have no common factors other than 1 or  $-1$ . The following procedure can be used to simplify rational expressions:

#### Simplifying Rational Expressions

1. Factor the numerator and the denominator completely.
2. Divide both the numerator and the denominator by any common factors.

**EXAMPLE 2** Simplifying Rational Expressions

Simplify:

$$\text{a. } \frac{x^3 + x^2}{x + 1} \qquad \text{b. } \frac{x^2 + 6x + 5}{x^2 - 25}.$$

**SOLUTION**

$$\text{a. } \frac{x^3 + x^2}{x + 1} = \frac{x^2(x + 1)}{x + 1}$$

Factor the numerator. Because the denominator is  $x + 1$ ,  $x \neq -1$ .

$$= \frac{x^{\cancel{2}}(\cancel{x+1})}{\cancel{x+1}1}$$

Divide out the common factor,  $x + 1$ .

$$= x^2, x \neq -1$$

Denominators of 1 need not be written because  $\frac{a}{1} = a$ .

$$\text{b. } \frac{x^2 + 6x + 5}{x^2 - 25} = \frac{(x + 5)(x + 1)}{(x + 5)(x - 5)}$$

Factor the numerator and denominator. Because the denominator is  $(x + 5)(x - 5)$ ,  $x \neq -5$  and  $x \neq 5$ .

$$= \frac{(\cancel{x+5})(x + 1)}{(\cancel{x+5})(x - 5)}$$

Divide out the common factor,  $x + 5$ .

$$= \frac{x + 1}{x - 5}, \quad x \neq -5, \quad x \neq 5$$

...

**Check Point 2** Simplify:

$$\text{a. } \frac{x^3 + 3x^2}{x + 3} \qquad \text{b. } \frac{x^2 - 1}{x^2 + 2x + 1}.$$

**3** Multiply rational expressions.**Multiplying Rational Expressions**

The product of two rational expressions is the product of their numerators divided by the product of their denominators. Here is a step-by-step procedure for multiplying rational expressions:

**Multiplying Rational Expressions**

1. Factor all numerators and denominators completely.
2. Divide numerators and denominators by common factors.
3. Multiply the remaining factors in the numerators and multiply the remaining factors in the denominators.

**EXAMPLE 3** Multiplying Rational Expressions

Multiply:  $\frac{x - 7}{x - 1} \cdot \frac{x^2 - 1}{3x - 21}$ .

## SOLUTION

$$\begin{aligned} & \frac{x-7}{x-1} \cdot \frac{x^2-1}{3x-21} \\ &= \frac{x-7}{x-1} \cdot \frac{(x+1)(x-1)}{3(x-7)} \\ &= \frac{\overset{1}{x} \cancel{-7}}{\cancel{x-1}} \cdot \frac{(x+1)\overset{1}{\cancel{(x-1)}}}{3(\cancel{x-7})} \\ &= \frac{x+1}{3}, x \neq 1, x \neq 7 \end{aligned}$$

This is the given multiplication problem.

Factor as many numerators and denominators as possible. Because the denominators have factors of  $x-1$  and  $x-7$ ,  $x \neq 1$  and  $x \neq 7$ .

Divide numerators and denominators by common factors.

Multiply the remaining factors in the numerators and denominators.

These excluded numbers from the domain must also be excluded from the simplified expression's domain.

...

 **Check Point 3** Multiply:

$$\frac{x+3}{x^2-4} \cdot \frac{x^2-x-6}{x^2+6x+9}$$

**4** Divide rational expressions.

**Dividing Rational Expressions**

The quotient of two rational expressions is the product of the first expression and the multiplicative inverse, or reciprocal, of the second expression. The reciprocal is found by interchanging the numerator and the denominator. Thus, **we find the quotient of two rational expressions by inverting the divisor and multiplying.**

**EXAMPLE 4** Dividing Rational Expressions

Divide:  $\frac{x^2-2x-8}{x^2-9} \div \frac{x-4}{x+3}$ .

## SOLUTION

$$\begin{aligned} & \frac{x^2-2x-8}{x^2-9} \div \frac{x-4}{x+3} \\ &= \frac{x^2-2x-8}{x^2-9} \cdot \frac{x+3}{x-4} \\ &= \frac{(x-4)(x+2)}{(x+3)(x-3)} \cdot \frac{x+3}{x-4} \\ &= \frac{\overset{1}{(x-4)} \cancel{(x+2)}}{\overset{1}{\cancel{(x+3)}}(x-3)} \cdot \frac{\overset{1}{\cancel{(x+3)}}}{\overset{1}{\cancel{(x-4)}}} \\ &= \frac{x+2}{x-3}, x \neq -3, x \neq 3, x \neq 4 \end{aligned}$$

This is the given division problem.

Invert the divisor and multiply.

Factor as many numerators and denominators as possible. For nonzero denominators,  $x \neq -3$ ,  $x \neq 3$ , and  $x \neq 4$ .

Divide numerators and denominators by common factors.

Multiply the remaining factors in the numerators and in the denominators.

...

 **Check Point 4** Divide:

$$\frac{x^2 - 2x + 1}{x^3 + x} \div \frac{x^2 + x - 2}{3x^2 + 3}$$

- 5** Add and subtract rational expressions.

### Adding and Subtracting Rational Expressions with the Same Denominator

We add or subtract rational expressions with the same denominator by (1) adding or subtracting the numerators, (2) placing this result over the common denominator, and (3) simplifying, if possible.

#### EXAMPLE 5 Subtracting Rational Expressions with the Same Denominator

Subtract:  $\frac{5x + 1}{x^2 - 9} - \frac{4x - 2}{x^2 - 9}$

#### SOLUTION

#### GREAT QUESTION!

**When subtracting a numerator containing more than one term, do I have to insert parentheses like you did in Example 5?**

Yes. When a numerator is being subtracted, we must **subtract every term in that expression**. Parentheses indicate that every term inside is being subtracted.

Don't forget the parentheses.

$$\frac{5x + 1}{x^2 - 9} - \frac{4x - 2}{x^2 - 9} = \frac{5x + 1 - (4x - 2)}{x^2 - 9}$$

Subtract numerators and include parentheses to indicate that both terms are subtracted. Place this difference over the common denominator.

$$= \frac{5x + 1 - 4x + 2}{x^2 - 9}$$

Remove parentheses and then change the sign of each term in parentheses.

$$= \frac{x + 3}{x^2 - 9}$$

Combine like terms.

$$= \frac{\overset{1}{x+3}}{\underset{1}{(x+3)}(x-3)}$$

Factor and simplify ( $x \neq -3$  and  $x \neq 3$ ).

$$= \frac{1}{x-3}, x \neq -3, x \neq 3$$

...

 **Check Point 5** Subtract:  $\frac{x}{x+1} - \frac{3x+2}{x+1}$

### Adding and Subtracting Rational Expressions with Different Denominators

Rational expressions that have no common factors in their denominators can be added or subtracted using one of the following properties:

$$\frac{a}{b} + \frac{c}{d} = \frac{ad + bc}{bd} \quad \frac{a}{b} - \frac{c}{d} = \frac{ad - bc}{bd}, b \neq 0, d \neq 0.$$

The denominator,  $bd$ , is the product of the factors in the two denominators. Because we are considering rational expressions that have no common factors in their denominators, the product  $bd$  gives the least common denominator.

**EXAMPLE 6** Subtracting Rational Expressions Having No Common Factors in Their Denominators

Subtract:  $\frac{x+2}{2x-3} - \frac{4}{x+3}$ .

**SOLUTION**

We need to find the least common denominator. This is the product of the distinct factors in each denominator, namely  $(2x-3)(x+3)$ . We can therefore use the subtraction property given previously as follows:

$$\begin{aligned} \frac{\frac{a}{b}}{\frac{x+2}{2x-3}} - \frac{\frac{c}{d}}{\frac{4}{x+3}} &= \frac{ad-bc}{bd} \\ \frac{x+2}{2x-3} - \frac{4}{x+3} &= \frac{(x+2)(x+3) - (2x-3)4}{(2x-3)(x+3)} \\ &= \frac{x^2 + 5x + 6 - (8x - 12)}{(2x-3)(x+3)} \\ &= \frac{x^2 + 5x + 6 - 8x + 12}{(2x-3)(x+3)} \\ &= \frac{x^2 - 3x + 18}{(2x-3)(x+3)}, x \neq \frac{3}{2}, x \neq -3 \end{aligned}$$

Observe that

$a = x + 2$ ,  $b = 2x - 3$ ,  $c = 4$ ,  
and  $d = x + 3$ .

Multiply in the numerator.

Remove parentheses and  
then change the sign of each  
term in parentheses.

Combine like terms in the  
numerator. ●●●

 **Check Point 6** Add:  $\frac{3}{x+1} + \frac{5}{x-1}$ .

The **least common denominator**, or LCD, of several rational expressions is a polynomial consisting of the product of all prime factors in the denominators, with each factor raised to the greatest power of its occurrence in any denominator. When adding and subtracting rational expressions that have different denominators with one or more common factors in the denominators, it is efficient to find the least common denominator first.

**Finding the Least Common Denominator**

1. Factor each denominator completely.
2. List the factors of the first denominator.
3. Add to the list in step 2 any factors of the second denominator that do not appear in the list.
4. Form the product of the factors from the list in step 3. This product is the least common denominator.

**EXAMPLE 7** Finding the Least Common Denominator

Find the least common denominator of

$$\frac{7}{5x^2 + 15x} \quad \text{and} \quad \frac{9}{x^2 + 6x + 9}$$

**SOLUTION****Step 1 Factor each denominator completely.**

$$5x^2 + 15x = 5x(x + 3)$$

$$x^2 + 6x + 9 = (x + 3)^2 \quad \text{or} \quad (x + 3)(x + 3)$$

Factors are  
5, x, and x + 3.

$\frac{7}{5x^2 + 15x}$

$\frac{9}{x^2 + 6x + 9}$

Factors are  
x + 3 and x + 3.

**Step 2 List the factors of the first denominator.**

$$5, x, x + 3$$

**Step 3 Add any unlisted factors from the second denominator.** One factor of  $x^2 + 6x + 9$  is already in our list. That factor is  $x + 3$ . However, the other factor of  $x + 3$  is not listed in step 2. We add a second factor of  $x + 3$  to the list. We have

$$5, x, x + 3, x + 3.$$

**Step 4 The least common denominator is the product of all factors in the final list.** Thus,

$$5x(x + 3)(x + 3) \quad \text{or} \quad 5x(x + 3)^2$$

is the least common denominator. ...

**Check Point 7** Find the least common denominator of

$$\frac{3}{x^2 - 6x + 9} \quad \text{and} \quad \frac{7}{x^2 - 9}.$$

Finding the least common denominator for two (or more) rational expressions is the first step needed to add or subtract the expressions.

### Adding and Subtracting Rational Expressions That Have Different Denominators

1. Find the LCD of the rational expressions.
2. Rewrite each rational expression as an equivalent expression whose denominator is the LCD. To do so, multiply the numerator and the denominator of each rational expression by any factor(s) needed to convert the denominator into the LCD.
3. Add or subtract numerators, placing the resulting expression over the LCD.
4. If possible, simplify the resulting rational expression.

### EXAMPLE 8 Adding Rational Expressions with Different Denominators

Add:  $\frac{x + 3}{x^2 + x - 2} + \frac{2}{x^2 - 1}.$

**SOLUTION****Step 1 Find the least common denominator.** Start by factoring the denominators.

$$x^2 + x - 2 = (x + 2)(x - 1)$$

$$x^2 - 1 = (x + 1)(x - 1)$$

The factors of the first denominator are  $x + 2$  and  $x - 1$ . The only factor from the second denominator that is not listed is  $x + 1$ . Thus, the least common denominator is

$$(x + 2)(x - 1)(x + 1).$$

**Step 2 Write equivalent expressions with the LCD as denominators.** We must rewrite each rational expression with a denominator of  $(x + 2)(x - 1)(x + 1)$ . We do so by multiplying both the numerator and the denominator of each rational expression by any factor(s) needed to convert the expression's denominator into the LCD.

$$\frac{x + 3}{(x + 2)(x - 1)} \cdot \frac{x + 1}{x + 1} = \frac{(x + 3)(x + 1)}{(x + 2)(x - 1)(x + 1)} \quad \frac{2}{(x + 1)(x - 1)} \cdot \frac{x + 2}{x + 2} = \frac{2(x + 2)}{(x + 2)(x - 1)(x + 1)}$$

Multiply the numerator and denominator by  $x + 1$  to get  $(x + 2)(x - 1)(x + 1)$ , the LCD.

Multiply the numerator and denominator by  $x + 2$  to get  $(x + 2)(x - 1)(x + 1)$ , the LCD.

Because  $\frac{x + 1}{x + 1} = 1$  and  $\frac{x + 2}{x + 2} = 1$ , we are not changing the value of either rational expression, only its appearance.

Now we are ready to perform the indicated addition.

$$\begin{aligned} \frac{x + 3}{x^2 + x - 2} + \frac{2}{x^2 - 1} & \quad \text{This is the given problem.} \\ & \quad \text{Factor the denominators.} \\ & \quad \text{The LCD is} \\ & \quad \text{The LCD is } (x + 2)(x - 1)(x + 1). \\ & = \frac{x + 3}{(x + 2)(x - 1)} + \frac{2}{(x + 1)(x - 1)} \\ & = \frac{(x + 3)(x + 1)}{(x + 2)(x - 1)(x + 1)} + \frac{2(x + 2)}{(x + 2)(x - 1)(x + 1)} \quad \text{Rewrite equivalent} \\ & \quad \text{expressions with the LCD.} \end{aligned}$$

**Step 3 Add numerators, putting this sum over the LCD.**

$$\begin{aligned} & = \frac{(x + 3)(x + 1) + 2(x + 2)}{(x + 2)(x - 1)(x + 1)} \\ & = \frac{x^2 + 4x + 3 + 2x + 4}{(x + 2)(x - 1)(x + 1)} \quad \text{Perform the multiplications in} \\ & \quad \text{the numerator.} \\ & = \frac{x^2 + 6x + 7}{(x + 2)(x - 1)(x + 1)}, x \neq -2, x \neq 1, x \neq -1 \quad \text{Combine like terms in the} \\ & \quad \text{numerator: } 4x + 2x = 6x \\ & \quad \text{and } 3 + 4 = 7. \end{aligned}$$

**Step 4 If necessary, simplify.** Because the numerator is prime, no further simplification is possible. ...

**Check Point 8** Subtract:  $\frac{x}{x^2 - 10x + 25} - \frac{x - 4}{2x - 10}$ .

**6** Simplify complex rational expressions.

### Complex Rational Expressions

**Complex rational expressions**, also called **complex fractions**, have numerators or denominators containing one or more rational expressions. Here are two examples of such expressions:

$$\frac{1 + \frac{1}{x}}{1 - \frac{1}{x}}$$

Separate rational expressions occur in the numerator and the denominator.

$$\frac{\frac{1}{x + h} - \frac{1}{x}}{h}$$

Separate rational expressions occur in the numerator.

One method for simplifying a complex rational expression is to combine its numerator into a single expression and combine its denominator into a single expression. Then perform the division by inverting the denominator and multiplying.

### EXAMPLE 9 Simplifying a Complex Rational Expression

Simplify:  $\frac{1 + \frac{1}{x}}{1 - \frac{1}{x}}$ .

#### SOLUTION

**Step 1 Add to get a single rational expression in the numerator.**

$$1 + \frac{1}{x} = \frac{1}{1} + \frac{1}{x} = \frac{1 \cdot x}{1 \cdot x} + \frac{1}{x} = \frac{x}{x} + \frac{1}{x} = \frac{x + 1}{x}$$

The LCD is  $1 \cdot x$ , or  $x$ .

**Step 2 Subtract to get a single rational expression in the denominator.**

$$1 - \frac{1}{x} = \frac{1}{1} - \frac{1}{x} = \frac{1 \cdot x}{1 \cdot x} - \frac{1}{x} = \frac{x}{x} - \frac{1}{x} = \frac{x - 1}{x}$$

The LCD is  $1 \cdot x$ , or  $x$ .

**Step 3 Perform the division indicated by the main fraction bar: Invert and multiply. If possible, simplify.**

$$\frac{1 + \frac{1}{x}}{1 - \frac{1}{x}} = \frac{\frac{x + 1}{x}}{\frac{x - 1}{x}} = \frac{x + 1}{x} \cdot \frac{x}{x - 1} = \frac{x + 1}{\cancel{x}} \cdot \frac{\cancel{x}}{x - 1} = \frac{x + 1}{x - 1}$$

Invert and multiply.

...

**Check Point 9** Simplify:

$$\frac{\frac{1}{x} - \frac{3}{2}}{\frac{1}{x} + \frac{3}{4}}$$

A second method for simplifying a complex rational expression is to find the least common denominator of all the rational expressions in its numerator and denominator. Then multiply each term in its numerator and denominator by this least common denominator. Because we are multiplying by a form of 1, we will obtain an equivalent expression that does not contain fractions in its numerator or denominator. Here we use this method to simplify the complex rational expression in Example 9.

$$\frac{1 + \frac{1}{x}}{1 - \frac{1}{x}} = \frac{\left(1 + \frac{1}{x}\right) \cdot x}{\left(1 - \frac{1}{x}\right) \cdot x}$$

The least common denominator of all the rational expressions is  $x$ . Multiply the numerator and denominator by  $x$ . Because  $\frac{x}{x} = 1$ , we are not changing the complex fraction ( $x \neq 0$ ).

$$\begin{aligned} &= \frac{1 \cdot x + \frac{1}{x} \cdot x}{1 \cdot x - \frac{1}{x} \cdot x} \\ &= \frac{x + 1}{x - 1}, x \neq 0, x \neq 1 \end{aligned}$$

Use the distributive property. Be sure to distribute  $x$  to every term.

Multiply. The complex rational expression is now simplified.

**EXAMPLE 10** Simplifying a Complex Rational Expression

$$\text{Simplify: } \frac{\frac{1}{x+h} - \frac{1}{x}}{h}.$$

**SOLUTION**

We will use the method of multiplying each of the three terms,  $\frac{1}{x+h}$ ,  $\frac{1}{x}$ , and  $h$ , by the least common denominator. The least common denominator is  $x(x+h)$ .

$$\frac{\frac{1}{x+h} - \frac{1}{x}}{h}$$

$$= \frac{\left(\frac{1}{x+h} - \frac{1}{x}\right)x(x+h)}{hx(x+h)}$$

Multiply the numerator and denominator by  $x(x+h)$ ,  $h \neq 0$ ,  $x \neq 0$ ,  $x \neq -h$ .

$$= \frac{\frac{1}{x+h} \cdot x(x+h) - \frac{1}{x} \cdot x(x+h)}{hx(x+h)}$$

Use the distributive property in the numerator.

$$= \frac{x - (x+h)}{hx(x+h)}$$

Simplify:  $\frac{1}{x+h} \cdot x(x+h) = x$  and  $\frac{1}{x} \cdot x(x+h) = x+h$ .

$$= \frac{x - x - h}{hx(x+h)}$$

Subtract in the numerator. Remove parentheses and change the sign of each term in parentheses.

$$= \frac{-h}{hx(x+h)}$$

Simplify:  $x - x - h = -h$ .

$$= -\frac{1}{x(x+h)}, h \neq 0, x \neq 0, x \neq -h$$

Divide the numerator and denominator by  $h$ .

...

 **Check Point 10** Simplify:  $\frac{\frac{1}{x+7} - \frac{1}{x}}{7}$ .

- 7** Simplify fractional expressions that occur in calculus.

**Fractional Expressions in Calculus**

Fractional expressions containing radicals occur frequently in calculus. Because of the radicals, these expressions are not rational expressions. However, they can often be simplified using the procedure for simplifying complex rational expressions.

**EXAMPLE 11** Simplifying a Fractional Expression Containing Radicals

$$\text{Simplify: } \frac{\sqrt{9-x^2} + \frac{x^2}{\sqrt{9-x^2}}}{9-x^2}.$$

## SOLUTION

$$\frac{\sqrt{9-x^2} + \frac{x^2}{\sqrt{9-x^2}}}{9-x^2}$$

The least common denominator is  $\sqrt{9-x^2}$ .

$$= \frac{\sqrt{9-x^2} + \frac{x^2}{\sqrt{9-x^2}}}{9-x^2} \cdot \frac{\sqrt{9-x^2}}{\sqrt{9-x^2}}$$

Multiply the numerator and the denominator by  $\sqrt{9-x^2}$ .

$$= \frac{\sqrt{9-x^2}\sqrt{9-x^2} + \frac{x^2}{\sqrt{9-x^2}}\sqrt{9-x^2}}{(9-x^2)\sqrt{9-x^2}}$$

Use the distributive property in the numerator.

$$= \frac{(9-x^2) + x^2}{(9-x^2)^{\frac{3}{2}}}$$

In the denominator:

$$= \frac{9}{\sqrt{(9-x^2)^3}}$$

Because the original expression was in radical form, write the denominator in radical form. ●●●

 **Check Point 11** Simplify:  $\frac{\sqrt{x} + \frac{1}{\sqrt{x}}}{x}$ .

**7** Rationalize numerators.

Another fractional expression that you will encounter in calculus is

$$\frac{\sqrt{x+h} - \sqrt{x}}{h}$$

Can you see that this expression is not defined if  $h = 0$ ? However, in calculus, you will ask the following question:

What happens to the expression as  $h$  takes on values that get closer and closer to 0, such as  $h = 0.1$ ,  $h = 0.01$ ,  $h = 0.001$ ,  $h = 0.0001$ , and so on?

The question is answered by first **rationalizing the numerator**. This process involves rewriting the fractional expression as an equivalent expression in which the numerator no longer contains any radicals. **To rationalize a numerator, multiply by 1 to eliminate the radicals in the numerator. Multiply the numerator and the denominator by the conjugate of the numerator.**

**EXAMPLE 12** Rationalizing a Numerator

Rationalize the numerator:

$$\frac{\sqrt{x+h} - \sqrt{x}}{h}$$

## SOLUTION

The conjugate of the numerator is  $\sqrt{x+h} + \sqrt{x}$ . If we multiply the numerator and denominator by  $\sqrt{x+h} + \sqrt{x}$ , the simplified numerator will not contain a radical. Therefore, we multiply by 1, choosing  $\frac{\sqrt{x+h} + \sqrt{x}}{\sqrt{x+h} + \sqrt{x}}$  for 1.

$$\begin{aligned} \frac{\sqrt{x+h} - \sqrt{x}}{h} &= \frac{\sqrt{x+h} - \sqrt{x}}{h} \cdot \frac{\sqrt{x+h} + \sqrt{x}}{\sqrt{x+h} + \sqrt{x}} \\ &= \frac{(\sqrt{x+h})^2 - (\sqrt{x})^2}{h(\sqrt{x+h} + \sqrt{x})} \\ &= \frac{x+h-x}{h(\sqrt{x+h} + \sqrt{x})} \\ &= \frac{h}{h(\sqrt{x+h} + \sqrt{x})} \\ &= \frac{1}{\sqrt{x+h} + \sqrt{x}}, \quad h \neq 0 \end{aligned}$$

Multiply by 1.

$$\begin{aligned} (\sqrt{a} - \sqrt{b})(\sqrt{a} + \sqrt{b}) &= \\ (\sqrt{a})^2 - (\sqrt{b})^2 & \end{aligned}$$

$$\begin{aligned} (\sqrt{x+h})^2 &= x+h \\ \text{and } (\sqrt{x})^2 &= x. \end{aligned}$$

Simplify:  $x+h-x=h$ .

Divide both the numerator and denominator by  $h$ . ●●●

### Blitzer Bonus Calculus Preview

In calculus, you will summarize the discussion on the right using the special notation

$$\lim_{h \rightarrow 0} \frac{\sqrt{x+h} - \sqrt{x}}{h} = \frac{1}{2\sqrt{x}}.$$

This is read “the limit of  $\frac{\sqrt{x+h} - \sqrt{x}}{h}$  as  $h$  approaches 0 equals  $\frac{1}{2\sqrt{x}}$ .” Limits are discussed in Chapter 11, where we present an introduction to calculus.

What happens to  $\frac{\sqrt{x+h} - \sqrt{x}}{h}$  as  $h$  gets closer and closer to 0? In Example 12, we showed that

$$\frac{\sqrt{x+h} - \sqrt{x}}{h} = \frac{1}{\sqrt{x+h} + \sqrt{x}}.$$

As  $h$  gets closer to 0, the expression on the right gets closer to  $\frac{1}{\sqrt{x+0} + \sqrt{x}} =$

$\frac{1}{\sqrt{x} + \sqrt{x}}$ , or  $\frac{1}{2\sqrt{x}}$ . Thus, the fractional expression  $\frac{\sqrt{x+h} - \sqrt{x}}{h}$  approaches  $\frac{1}{2\sqrt{x}}$  as  $h$  gets closer to 0.

 **Check Point 12** Rationalize the numerator:  $\frac{\sqrt{x+3} - \sqrt{x}}{3}$ .

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- A rational expression is the quotient of two \_\_\_\_\_.
- The set of real numbers for which a rational expression is defined is the \_\_\_\_\_ of the expression. We must exclude all numbers from this set that make the denominator of the rational expression \_\_\_\_.
- We simplify a rational expression by \_\_\_\_\_ the numerator and the denominator completely. Then we divide the numerator and the denominator by any \_\_\_\_\_.

4.  $\frac{x}{5} \cdot \frac{x}{3} = \underline{\hspace{2cm}}$       5.  $\frac{x}{5} \div \frac{x}{3} = \underline{\hspace{2cm}}, x \neq 0$

6.  $\frac{x^2}{3} - \frac{x-4}{3} = \underline{\hspace{2cm}}$

7. Consider the following subtraction problem:

$$\frac{x-1}{x^2+x-6} - \frac{x-2}{x^2+4x+3}$$

The factors of the first denominator are \_\_\_\_\_.  
The factors of the second denominator are \_\_\_\_\_.  
The LCD is \_\_\_\_\_.

8. An equivalent expression for  $\frac{3x+2}{x-5}$  with a denominator of  $(3x+4)(x-5)$  can be obtained by multiplying the numerator and denominator by \_\_\_\_\_.

9. A rational expression whose numerator or denominator or both contain rational expressions is called a/an \_\_\_\_\_ rational expression or a/an \_\_\_\_\_ fraction.

10. 
$$\frac{\frac{1}{x+3} - \frac{1}{x}}{3} = \frac{x(x+3)}{x(x+3)} \cdot \frac{\left(\frac{1}{x+3} - \frac{1}{x}\right)}{3} = \frac{\underline{\hspace{2cm}} - (\underline{\hspace{2cm}})}{3x(x+3)}$$

$= \underline{\hspace{2cm}}$

$= \underline{\hspace{2cm}}$

11. We can simplify

$$\frac{\sqrt{x} + \frac{1}{\sqrt{x}}}{x}$$

by multiplying the numerator and the denominator by \_\_\_\_\_.

12. We can rationalize the numerator of  $\frac{\sqrt{x+7} - \sqrt{x}}{7}$

by multiplying the numerator and the denominator by \_\_\_\_\_.

## EXERCISE SET P.6

## Practice Exercises

In Exercises 1–6, find all numbers that must be excluded from the domain of each rational expression.

1.  $\frac{7}{x-3}$

2.  $\frac{13}{x+9}$

3.  $\frac{x+5}{x^2-25}$

4.  $\frac{x+7}{x^2-49}$

5.  $\frac{x-1}{x^2+11x+10}$

6.  $\frac{x-3}{x^2+4x-45}$

In Exercises 7–14, simplify each rational expression. Find all numbers that must be excluded from the domain of the simplified rational expression.

7.  $\frac{3x-9}{x^2-6x+9}$

8.  $\frac{4x-8}{x^2-4x+4}$

9.  $\frac{x^2-12x+36}{4x-24}$

10.  $\frac{x^2-8x+16}{3x-12}$

11.  $\frac{y^2+7y-18}{y^2-3y+2}$

12.  $\frac{y^2-4y-5}{y^2+5y+4}$

13.  $\frac{x^2+12x+36}{x^2-36}$

14.  $\frac{x^2-14x+49}{x^2-49}$

In Exercises 15–32, multiply or divide as indicated.

15.  $\frac{x-2}{3x+9} \cdot \frac{2x+6}{2x-4}$

16.  $\frac{6x+9}{3x-15} \cdot \frac{x-5}{4x+6}$

17.  $\frac{x^2-9}{x^2} \cdot \frac{x^2-3x}{x^2+x-12}$

18.  $\frac{x^2-4}{x^2-4x+4} \cdot \frac{2x-4}{x+2}$

19.  $\frac{x^2-5x+6}{x^2-2x-3} \cdot \frac{x^2-1}{x^2-4}$

20.  $\frac{x^2+5x+6}{x^2+x-6} \cdot \frac{x^2-9}{x^2-x-6}$

21.  $\frac{x^3-8}{x^2-4} \cdot \frac{x+2}{3x}$

22.  $\frac{x^2+6x+9}{x^3+27} \cdot \frac{1}{x+3}$

23.  $\frac{x+1}{3} \div \frac{3x+3}{7}$

24.  $\frac{x+5}{7} \div \frac{4x+20}{9}$

25.  $\frac{x^2-4}{x} \div \frac{x+2}{x-2}$

26.  $\frac{x^2-4}{x-2} \div \frac{x+2}{4x-8}$

27.  $\frac{4x^2+10}{x-3} \div \frac{6x^2+15}{x^2-9}$

28.  $\frac{x^2+x}{x^2-4} \div \frac{x^2-1}{x^2+5x+6}$

29.  $\frac{x^2-25}{2x-2} \div \frac{x^2+10x+25}{x^2+4x-5}$

30.  $\frac{x^2-4}{x^2+3x-10} \div \frac{x^2+5x+6}{x^2+8x+15}$

31.  $\frac{x^2+x-12}{x^2+x-30} \cdot \frac{x^2+5x+6}{x^2-2x-3} \div \frac{x+3}{x^2+7x+6}$

32.  $\frac{x^3-25x}{4x^2} \cdot \frac{2x^2-2}{x^2-6x+5} \div \frac{x^2+5x}{7x+7}$

In Exercises 33–58, add or subtract as indicated.

33.  $\frac{4x+1}{6x+5} + \frac{8x+9}{6x+5}$

34.  $\frac{3x+2}{3x+4} + \frac{3x+6}{3x+4}$

35.  $\frac{x^2-2x}{x^2+3x} + \frac{x^2+x}{x^2+3x}$

36.  $\frac{x^2-4x}{x^2-x-6} + \frac{4x-4}{x^2-x-6}$

37.  $\frac{4x-10}{x-2} - \frac{x-4}{x-2}$

39.  $\frac{x^2+3x}{x^2+x-12} - \frac{x^2-12}{x^2+x-12}$

40.  $\frac{x^2-4x}{x^2-x-6} - \frac{x-6}{x^2-x-6}$

41.  $\frac{3}{x+4} + \frac{6}{x+5}$

43.  $\frac{3}{x+1} - \frac{3}{x}$

45.  $\frac{2x}{x+2} + \frac{x+2}{x-2}$

47.  $\frac{x+5}{x-5} + \frac{x-5}{x+5}$

49.  $\frac{3}{2x+4} + \frac{2}{3x+6}$

51.  $\frac{4}{x^2+6x+9} + \frac{4}{x+3}$

53.  $\frac{3x}{x^2+3x-10} - \frac{2x}{x^2+x-6}$

54.  $\frac{x}{x^2-2x-24} - \frac{x}{x^2-7x+6}$

55.  $\frac{x+3}{x^2-1} - \frac{x+2}{x-1}$

57.  $\frac{4x^2+x-6}{x^2+3x+2} - \frac{3x}{x+1} + \frac{5}{x+2}$

58.  $\frac{6x^2+17x-40}{x^2+x-20} + \frac{3}{x-4} - \frac{5x}{x+5}$

In Exercises 59–72, simplify each complex rational expression.

59.  $\frac{\frac{x}{3}-1}{x-3}$

60.  $\frac{\frac{x}{4}-1}{x-4}$

61.  $\frac{1+\frac{1}{x}}{3-\frac{1}{x}}$

62.  $\frac{8+\frac{1}{x}}{4-\frac{1}{x}}$

63.  $\frac{\frac{1}{x}+\frac{1}{y}}{x+y}$

64.  $\frac{1-\frac{1}{x}}{xy}$

65.  $\frac{x-\frac{x}{x+3}}{x+2}$

66.  $\frac{x-3}{x-\frac{3}{x-2}}$

67.  $\frac{\frac{3}{x-2}-\frac{4}{x+2}}{\frac{7}{x^2-4}}$

68.  $\frac{\frac{x}{x-2}+1}{\frac{3}{x^2-4}+1}$

$$69. \frac{\frac{1}{x+1}}{\frac{1}{x^2-2x-3} + \frac{1}{x-3}}$$

$$70. \frac{\frac{6}{x^2+2x-15} - \frac{1}{x-3}}{\frac{1}{x+5} + 1}$$

$$71. \frac{\frac{1}{(x+h)^2} - \frac{1}{x^2}}{h}$$

$$72. \frac{\frac{x+h}{x+h+1} - \frac{x}{x+1}}{h}$$

Exercises 73–78 contain fractional expressions that occur frequently in calculus. Simplify each expression.

$$73. \frac{\sqrt{x} - \frac{1}{3\sqrt{x}}}{\sqrt{x}}$$

$$74. \frac{\sqrt{x} - \frac{1}{4\sqrt{x}}}{\sqrt{x}}$$

$$75. \frac{\frac{x^2}{\sqrt{x^2+2}} - \sqrt{x^2+2}}{x^2}$$

$$76. \frac{\sqrt{5-x^2} + \frac{x^2}{\sqrt{5-x^2}}}{5-x^2}$$

$$77. \frac{\frac{1}{\sqrt{x+h}} - \frac{1}{\sqrt{x}}}{h}$$

$$78. \frac{\frac{1}{\sqrt{x+3}} - \frac{1}{\sqrt{x}}}{3}$$

In Exercises 79–82, rationalize the numerator.

$$79. \frac{\sqrt{x+5} - \sqrt{x}}{5}$$

$$80. \frac{\sqrt{x+7} - \sqrt{x}}{7}$$

$$81. \frac{\sqrt{x} + \sqrt{y}}{x^2 - y^2}$$

$$82. \frac{\sqrt{x} - \sqrt{y}}{x^2 - y^2}$$

**Practice Plus**

In Exercises 83–90, perform the indicated operations. Simplify the result, if possible.

$$83. \left(\frac{2x+3}{x+1} \cdot \frac{x^2+4x-5}{2x^2+x-3}\right) - \frac{2}{x+2}$$

$$84. \frac{1}{x^2-2x-8} \div \left(\frac{1}{x-4} - \frac{1}{x+2}\right)$$

$$85. \left(2 - \frac{6}{x+1}\right)\left(1 + \frac{3}{x-2}\right)$$

$$86. \left(4 - \frac{3}{x+2}\right)\left(1 + \frac{5}{x-1}\right)$$

$$87. \frac{y^{-1} - (y+5)^{-1}}{5} \qquad 88. \frac{y^{-1} - (y+2)^{-1}}{2}$$

$$89. \left(\frac{1}{a^3-b^3} \cdot \frac{ac+ad-bc-bd}{1}\right) - \frac{c-d}{a^2+ab+b^2}$$

$$90. \frac{ab}{a^2+ab+b^2} + \left(\frac{ac-ad-bc+bd}{ac-ad+bc-bd} \div \frac{a^3-b^3}{a^3+b^3}\right)$$

**Application Exercises**

91. The rational expression

$$\frac{130x}{100-x}$$

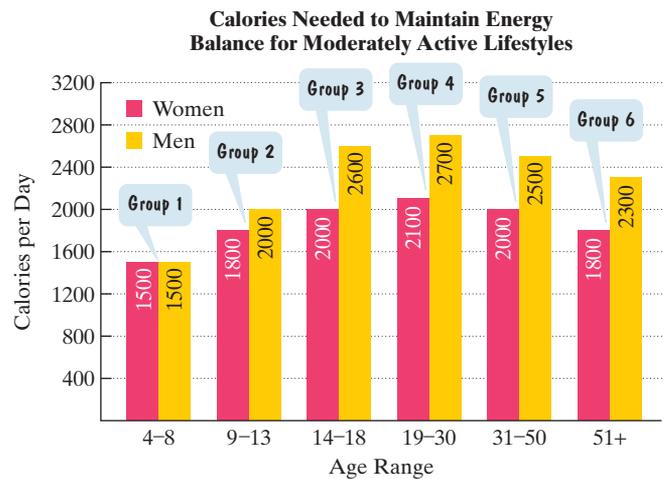

describes the cost, in millions of dollars, to inoculate  $x$  percent of the population against a particular strain of flu.

- a. Evaluate the expression for  $x = 40$ ,  $x = 80$ , and  $x = 90$ . Describe the meaning of each evaluation in terms of percentage inoculated and cost.
  - b. For what value of  $x$  is the expression undefined?
  - c. What happens to the cost as  $x$  approaches 100%? How can you interpret this observation?
92. The average rate on a round-trip commute having a one-way distance  $d$  is given by the complex rational expression

$$\frac{2d}{\frac{d}{r_1} + \frac{d}{r_2}}$$

in which  $r_1$  and  $r_2$  are the average rates on the outgoing and return trips, respectively. Simplify the expression. Then find your average rate if you drive to campus averaging 40 miles per hour and return home on the same route averaging 30 miles per hour. Explain why the answer is not 35 miles per hour.

93. The bar graph shows the estimated number of calories per day needed to maintain energy balance for various gender and age groups for moderately active lifestyles. (Moderately active means a lifestyle that includes physical activity equivalent to walking 1.5 to 3 miles per day at 3 to 4 miles per hour, in addition to the light physical activity associated with typical day-to-day life.)

Source: U.S.D.A.

a. The mathematical model

$$W = -66x^2 + 526x + 1030$$

describes the number of calories needed per day,  $W$ , by women in age group  $x$  with moderately active lifestyles. According to the model, how many calories per day are needed by women between the ages of 19 and 30, inclusive, with this lifestyle? Does this underestimate or overestimate the number shown by the graph? By how much?

b. The mathematical model

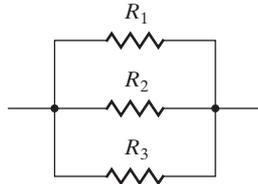

$$M = -120x^2 + 998x + 590$$

describes the number of calories needed per day,  $M$ , by men in age group  $x$  with moderately active lifestyles. According to the model, how many calories per day are needed by men between the ages of 19 and 30, inclusive, with this lifestyle? Does this underestimate or overestimate the number shown by the graph? By how much?

c. Write a simplified rational expression that describes the ratio of the number of calories needed per day by women in age group  $x$  to the number of calories needed per day by men in age group  $x$  for people with moderately active lifestyles.

94. If three resistors with resistances  $R_1$ ,  $R_2$ , and  $R_3$  are connected in parallel, their combined resistance is given by the expression

$$\frac{1}{\frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3}}$$

Simplify the complex rational expression. Then find the combined resistance when  $R_1$  is 4 ohms,  $R_2$  is 8 ohms, and  $R_3$  is 12 ohms.

In Exercises 95–96, express the perimeter of each rectangle as a single rational expression.

95.  $\frac{x}{x+3}$

96.  $\frac{x}{x+5}$   $\frac{x}{x+6}$

### Writing in Mathematics

97. What is a rational expression?  
 98. Explain how to determine which numbers must be excluded from the domain of a rational expression.  
 99. Explain how to simplify a rational expression.  
 100. Explain how to multiply rational expressions.  
 101. Explain how to divide rational expressions.  
 102. Explain how to add or subtract rational expressions with the same denominators.  
 103. Explain how to add rational expressions having no common factors in their denominators. Use  $\frac{3}{x+5} + \frac{7}{x+2}$  in your explanation.  
 104. Explain how to find the least common denominator for denominators of  $x^2 - 100$  and  $x^2 - 20x + 100$ .  
 105. Describe two ways to simplify  $\frac{\frac{3}{x} + \frac{2}{x^2}}{\frac{1}{x^2} + \frac{2}{x}}$ .

Explain the error in Exercises 106–108. Then rewrite the right side of the equation to correct the error that now exists.

106.  $\frac{1}{a} + \frac{1}{b} = \frac{1}{a+b}$

107.  $\frac{1}{x} + 7 = \frac{1}{x+7}$

108.  $\frac{a}{x} + \frac{a}{b} = \frac{a}{x+b}$

### Critical Thinking Exercises

**Make Sense?** In Exercises 109–112, determine whether each statement makes sense or does not make sense, and explain your reasoning.

109. I evaluated  $\frac{3x-3}{4x(x-1)}$  for  $x = 1$  and obtained 0.

110. The rational expressions

$$\frac{7}{14x} \quad \text{and} \quad \frac{7}{14+x}$$

can both be simplified by dividing each numerator and each denominator by 7.

111. When performing the division

$$\frac{7x}{x+3} \div \frac{(x+3)^2}{x-5},$$

I began by dividing the numerator and the denominator by the common factor,  $x+3$ .

112. I subtracted  $\frac{3x-5}{x-1}$  from  $\frac{x-3}{x-1}$  and obtained a constant.

In Exercises 113–116, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

113.  $\frac{x^2-25}{x-5} = x-5$

114. The expression  $\frac{-3y-6}{y+2}$  simplifies to the consecutive integer that follows  $-4$ .

115.  $\frac{2x-1}{x-7} + \frac{3x-1}{x-7} - \frac{5x-2}{x-7} = 0$

116.  $6 + \frac{1}{x} = \frac{7}{x}$

In Exercises 117–119, perform the indicated operations.

117.  $\frac{1}{x^n-1} - \frac{1}{x^n+1} - \frac{1}{x^{2n}-1}$

118.  $\left(1 - \frac{1}{x}\right)\left(1 - \frac{1}{x+1}\right)\left(1 - \frac{1}{x+2}\right)\left(1 - \frac{1}{x+3}\right)$

119.  $(x-y)^{-1} + (x-y)^{-2}$

120. In one short sentence, five words or less, explain what

$$\frac{\frac{1}{x} + \frac{1}{x^2} + \frac{1}{x^3}}{\frac{1}{x^4} + \frac{1}{x^5} + \frac{1}{x^6}}$$

does to each number  $x$ .

### Preview Exercises

Exercises 121–123 will help you prepare for the material covered in the next section.

121. If 6 is substituted for  $x$  in the equation

$$2(x-3) - 17 = 13 - 3(x+2),$$

is the resulting statement true or false?

122. Multiply and simplify:  $12\left(\frac{x+2}{4} - \frac{x-1}{3}\right)$ .

123. Evaluate

$$\frac{-b - \sqrt{b^2 - 4ac}}{2a}$$

for  $a = 2$ ,  $b = 9$ , and  $c = -5$ .

## SECTION P.7

## Equations

## Objectives

- 1 Solve linear equations in one variable.
- 2 Solve linear equations containing fractions.
- 3 Solve rational equations with variables in the denominators.
- 4 Solve a formula for a variable.
- 5 Solve equations involving absolute value.
- 6 Solve quadratic equations by factoring.
- 7 Solve quadratic equations by the square root property.
- 8 Solve quadratic equations by completing the square.
- 9 Solve quadratic equations using the quadratic formula.
- 10 Use the discriminant to determine the number and type of solutions of quadratic equations.
- 11 Determine the most efficient method to use when solving a quadratic equation.
- 12 Solve radical equations.

*I'm very well acquainted, too, with matters mathematical,  
I understand equations, both simple and quadratical.  
About binomial theorem I'm teeming with a lot of news,  
With many cheerful facts about the square of the hypotenuse.*

— Gilbert and Sullivan,  
*The Pirates of Penzance*

Equations quadratical? Cheerful news about the square of the hypotenuse? You've come to the right place. In this section, we will review how to solve a variety of equations, including linear equations, quadratic equations, and radical equations. (Yes, it's *quadratic* and not *quadratical*, despite the latter's rhyme with mathematical.) In the next section, we will look at applications of quadratic equations, introducing (cheerfully, of course) the Pythagorean Theorem and the square of the hypotenuse.

## Solving Linear Equations in One Variable

We begin with a general definition of a linear equation in one variable.

## Definition of a Linear Equation

A **linear equation in one variable**  $x$  is an equation that can be written in the form

$$ax + b = 0,$$

where  $a$  and  $b$  are real numbers, and  $a \neq 0$ .

An example of a linear equation in one variable is

$$4x + 12 = 0.$$

**Solving an equation** in  $x$  involves determining all values of  $x$  that result in a true statement when substituted into the equation. Such values are **solutions**, or **roots**, of the equation. For example, substitute  $-3$  for  $x$  in  $4x + 12 = 0$ . We obtain

$$4(-3) + 12 = 0, \quad \text{or} \quad -12 + 12 = 0.$$

This simplifies to the true statement  $0 = 0$ . Thus,  $-3$  is a solution of the equation  $4x + 12 = 0$ . We also say that  $-3$  **satisfies** the equation  $4x + 12 = 0$ , because when we substitute  $-3$  for  $x$ , a true statement results. The set of all such solutions is called the equation's **solution set**. For example, the solution set of the equation  $4x + 12 = 0$  is  $\{-3\}$  because  $-3$  is the equation's only solution.

Two or more equations that have the same solution set are called **equivalent equations**. For example, the equations

$$4x + 12 = 0 \quad \text{and} \quad 4x = -12 \quad \text{and} \quad x = -3$$

are equivalent equations because the solution set for each is  $\{-3\}$ . To solve a linear equation in  $x$ , we transform the equation into an equivalent equation one or more times. Our final equivalent equation should be of the form

$$x = \text{a number.}$$

The solution set of this equation is the set consisting of the number.

To generate equivalent equations, we will use the following principles:

### Generating Equivalent Equations

An equation can be transformed into an equivalent equation by one or more of the following operations:

Operation	Example
1. Simplify an expression by removing grouping symbols and combining like terms.	$3(x - 6) = 6x - x$ $3x - 18 = 5x$
2. Add (or subtract) the same real number or variable expression on <i>both</i> sides of the equation.	$3x - 18 = 5x$ $3x - 18 - 3x = 5x - 3x$ $-18 = 2x$ <p>Subtract <math>3x</math> from both sides of the equation.</p>
3. Multiply (or divide) by the same <i>nonzero</i> quantity on <i>both</i> sides of the equation.	$-18 = 2x$ $\frac{-18}{2} = \frac{2x}{2}$ $-9 = x$ <p>Divide both sides of the equation by 2.</p>
4. Interchange the two sides of the equation.	$-9 = x$ $x = -9$

If you look closely at the equations in the box, you will notice that we have solved the equation  $3(x - 6) = 6x - x$ . The final equation,  $x = -9$ , with  $x$  isolated on the left side, shows that  $\{-9\}$  is the solution set. The idea in solving a linear equation is to get the variable by itself on one side of the equal sign and a number by itself on the other side.

Here is a step-by-step procedure for solving a linear equation in one variable. Not all of these steps are necessary to solve every equation.

- 1 Solve linear equations in one variable.

### Solving a Linear Equation

1. Simplify the algebraic expression on each side by removing grouping symbols and combining like terms.
2. Collect all the variable terms on one side and all the numbers, or constant terms, on the other side.
3. Isolate the variable and solve.
4. Check the proposed solution in the original equation.

#### EXAMPLE 1 Solving a Linear Equation

Solve and check:  $2(x - 3) - 17 = 13 - 3(x + 2)$ .

#### SOLUTION

**Step 1** Simplify the algebraic expression on each side.

Do not begin with  $13 - 3$ . Multiplication (the distributive property) is applied before subtraction.

$$2(x - 3) - 17 = 13 - 3(x + 2)$$

$$2x - 6 - 17 = 13 - 3x - 6$$

$$2x - 23 = -3x + 7$$

This is the given equation.

Use the distributive property.

Combine like terms.

**Step 2 Collect variable terms on one side and constant terms on the other side.** We will collect variable terms of  $2x - 23 = -3x + 7$  on the left by adding  $3x$  to both sides. We will collect the numbers on the right by adding  $23$  to both sides.

$$\begin{aligned} 2x - 23 + 3x &= -3x + 7 + 3x && \text{Add } 3x \text{ to both sides.} \\ 5x - 23 &= 7 && \text{Simplify: } 2x + 3x = 5x. \\ 5x - 23 + 23 &= 7 + 23 && \text{Add } 23 \text{ to both sides.} \\ 5x &= 30 && \text{Simplify.} \end{aligned}$$

**Step 3 Isolate the variable and solve.** We isolate the variable,  $x$ , by dividing both sides of  $5x = 30$  by  $5$ .

$$\begin{aligned} \frac{5x}{5} &= \frac{30}{5} && \text{Divide both sides by } 5. \\ x &= 6 && \text{Simplify.} \end{aligned}$$

**Step 4 Check the proposed solution in the original equation.** Substitute  $6$  for  $x$  in the original equation.

$$\begin{aligned} 2(x - 3) - 17 &= 13 - 3(x + 2) && \text{This is the original equation.} \\ 2(6 - 3) - 17 &\stackrel{?}{=} 13 - 3(6 + 2) && \text{Substitute } 6 \text{ for } x. \\ 2(3) - 17 &\stackrel{?}{=} 13 - 3(8) && \text{Simplify inside parentheses.} \\ 6 - 17 &\stackrel{?}{=} 13 - 24 && \text{Multiply.} \\ -11 &= -11 && \text{Subtract.} \end{aligned}$$

The true statement  $-11 = -11$  verifies that the solution set is  $\{6\}$ . ...

## DISCOVERY

Solve the equation in Example 1 by collecting terms with the variable on the right and numerical terms on the left. What do you observe?

 **Check Point 1** Solve and check:  $4(2x + 1) = 29 + 3(2x - 5)$ .

**2** Solve linear equations containing fractions.

## Linear Equations with Fractions

Equations are easier to solve when they do not contain fractions. How do we remove fractions from an equation? We begin by multiplying both sides of the equation by the least common denominator of any fractions in the equation. The least common denominator is the smallest number that all denominators will divide into. Multiplying every term on both sides of the equation by the least common denominator will eliminate the fractions in the equation. Example 2 shows how we “clear an equation of fractions.”

### EXAMPLE 2 Solving a Linear Equation Involving Fractions

Solve and check:  $\frac{x + 2}{4} - \frac{x - 1}{3} = 2$ .

#### SOLUTION

The fractional terms have denominators of  $4$  and  $3$ . The smallest number that is divisible by  $4$  and  $3$  is  $12$ . We begin by multiplying both sides of the equation by  $12$ , the least common denominator.

$$\begin{aligned} \frac{x + 2}{4} - \frac{x - 1}{3} &= 2 && \text{This is the given equation.} \\ 12 \left( \frac{x + 2}{4} - \frac{x - 1}{3} \right) &= 12 \cdot 2 && \text{Multiply both sides by } 12. \end{aligned}$$

$$12\left(\frac{x+2}{4}\right) - 12\left(\frac{x-1}{3}\right) = 24$$

Use the distributive property and multiply each term on the left by 12.

$$\overset{3}{12}\left(\frac{x+2}{\underset{1}{4}}\right) - \overset{4}{12}\left(\frac{x-1}{\underset{1}{3}}\right) = 24$$

Divide out common factors in each multiplication on the left.

$$3(x+2) - 4(x-1) = 24$$

The fractions are now cleared.

$$3x + 6 - 4x + 4 = 24$$

Use the distributive property.

$$-x + 10 = 24$$

Combine like terms:  $3x - 4x = -x$  and  $6 + 4 = 10$ .

$$-x + 10 - 10 = 24 - 10$$

Subtract 10 from both sides.

$$-x = 14$$

Simplify.

We're not finished. A negative sign should not precede the variable.

Isolate  $x$  by multiplying or dividing both sides of this equation by  $-1$ .

$$\frac{-x}{-1} = \frac{14}{-1}$$

Divide both sides by  $-1$ .

$$x = -14$$

Simplify.

Check the proposed solution. Substitute  $-14$  for  $x$  in the original equation. You should obtain  $2 = 2$ . This true statement verifies that the solution set is  $\{-14\}$ . ●●●

 **Check Point 2** Solve and check:  $\frac{x-3}{4} = \frac{5}{14} - \frac{x+5}{7}$ .

- 3** Solve rational equations with variables in the denominators.

### Rational Equations

A **rational equation** is an equation containing one or more rational expressions. In Example 2, we solved a rational equation with constants in the denominators. This rational equation was a linear equation. Now, let's consider a rational equation such as

$$\frac{3}{x+6} + \frac{1}{x-2} = \frac{4}{x^2+4x-12}$$

Can you see how this rational equation differs from the rational equation that we solved earlier? The variable appears in the denominators. Although this rational equation is not a linear equation, the solution procedure still involves multiplying each side by the least common denominator. However, we must avoid any values of the variable that make a denominator zero.

#### EXAMPLE 3 Solving a Rational Equation

Solve:  $\frac{3}{x+6} + \frac{1}{x-2} = \frac{4}{x^2+4x-12}$ .

#### SOLUTION

To identify values of  $x$  that make denominators zero, let's factor  $x^2 + 4x - 12$ , the denominator on the right. This factorization is also necessary in identifying the least common denominator.

$$\frac{3}{x+6} + \frac{1}{x-2} = \frac{4}{(x+6)(x-2)}$$

This denominator is zero if  $x = -6$ .

This denominator is zero if  $x = 2$ .

This denominator is zero if  $x = -6$  or  $x = 2$ .

We see that  $x$  cannot equal  $-6$  or  $2$ . The least common denominator is  $(x + 6)(x - 2)$ .

$$\frac{3}{x + 6} + \frac{1}{x - 2} = \frac{4}{(x + 6)(x - 2)}, \quad x \neq -6, x \neq 2$$

This is the given equation with a denominator factored.

$$(x + 6)(x - 2) \left( \frac{3}{x + 6} + \frac{1}{x - 2} \right) = (x + 6)(x - 2) \cdot \frac{4}{(x + 6)(x - 2)}$$

Multiply both sides by  $(x + 6)(x - 2)$ , the LCD.

$$(x + 6)(x - 2) \cdot \frac{3}{x + 6} + (x + 6)(x - 2) \cdot \frac{1}{x - 2} = (x + 6)(x - 2) \cdot \frac{4}{(x + 6)(x - 2)}$$

Use the distributive property and divide out common factors.

$$3(x - 2) + 1(x + 6) = 4$$

Simplify. This equation is cleared of fractions.

$$3x - 6 + x + 6 = 4$$

Use the distributive property.

$$4x = 4$$

Combine like terms.

$$\frac{4x}{4} = \frac{4}{4}$$

Divide both sides by 4.

$$x = 1$$

Simplify. This is not part of the restriction that  $x \neq -6$  and  $x \neq 2$ .

Check the proposed solution. Substitute 1 for  $x$  in the original equation. You should obtain  $-\frac{4}{7} = -\frac{4}{7}$ . This true statement verifies that the solution set is  $\{1\}$ . ●●●

 **Check Point 3** Solve:  $\frac{6}{x + 3} - \frac{5}{x - 2} = \frac{-20}{x^2 + x - 6}$ .

#### EXAMPLE 4 Solving a Rational Equation

Solve:  $\frac{1}{x + 1} = \frac{2}{x^2 - 1} - \frac{1}{x - 1}$ .

#### SOLUTION

We begin by factoring  $x^2 - 1$ .

$$\frac{1}{x + 1} = \frac{2}{(x + 1)(x - 1)} - \frac{1}{x - 1}$$

This denominator is zero if  $x = -1$ .

This denominator is zero if  $x = -1$  or  $x = 1$ .

This denominator is zero if  $x = 1$ .

We see that  $x$  cannot equal  $-1$  or  $1$ . The least common denominator is  $(x + 1)(x - 1)$ .

$$\frac{1}{x + 1} = \frac{2}{(x + 1)(x - 1)} - \frac{1}{x - 1}, \quad x \neq -1, x \neq 1$$

This is the given equation with a denominator factored.

$$(x + 1)(x - 1) \cdot \frac{1}{x + 1} = (x + 1)(x - 1) \left( \frac{2}{(x + 1)(x - 1)} - \frac{1}{x - 1} \right)$$

Multiply both sides by  $(x + 1)(x - 1)$ , the LCD.

$$(x + 1)(x - 1) \cdot \frac{1}{x + 1} = (x + 1)(x - 1) \cdot \frac{2}{(x + 1)(x - 1)} - (x + 1)(x - 1) \cdot \frac{1}{x - 1}$$

Use the distributive property and divide out common factors.

$$\begin{aligned}
 1(x - 1) &= 2 - (x + 1) && \text{Simplify. This equation is cleared} \\
 &&& \text{of fractions.} \\
 x - 1 &= 2 - x - 1 && \text{Simplify.} \\
 x - 1 &= -x + 1 && \text{Combine numerical terms.} \\
 x + x - 1 &= -x + x + 1 && \text{Add } x \text{ to both sides.} \\
 2x - 1 &= 1 && \text{Simplify.} \\
 2x - 1 + 1 &= 1 + 1 && \text{Add 1 to both sides.} \\
 2x &= 2 && \text{Simplify.} \\
 \frac{2x}{2} &= \frac{2}{2} && \text{Divide both sides by 2.} \\
 x &= 1 && \text{Simplify.}
 \end{aligned}$$

## GREAT QUESTION!

### When do I get rid of proposed solutions in rational equations?

Reject any proposed solution that causes any denominator in an equation to equal 0.

The proposed solution, 1, is *not* a solution because of the restriction that  $x \neq 1$ . There is *no solution to this equation*. The solution set for this equation contains no elements. The solution set is  $\emptyset$ , the empty set. ●●●

 **Check Point 4** Solve:  $\frac{1}{x+2} = \frac{4}{x^2-4} - \frac{1}{x-2}$ .

## 4 Solve a formula for a variable.

### Solving a Formula for One of Its Variables

**Solving a formula for a variable** means rewriting the formula so that the variable is isolated on one side of the equation. It does not mean obtaining a numerical value for that variable.

To solve a formula for one of its variables, treat that variable as if it were the only variable in the equation. Think of the other variables as if they were numbers.

### EXAMPLE 5 Solving a Formula for a Variable

If you wear glasses, did you know that each lens has a measurement called its focal length,  $f$ ? When an object is in focus, its distance from the lens,  $p$ , and the distance from the lens to your retina,  $q$ , satisfy the formula

$$\frac{1}{p} + \frac{1}{q} = \frac{1}{f}$$

(See **Figure P.12**.) Solve this formula for  $p$ .

### SOLUTION

Our goal is to isolate the variable  $p$ . We begin by multiplying both sides by the least common denominator,  $pqf$ , to clear the equation of fractions.

**We need to isolate  $p$ .**  $\frac{1}{p} + \frac{1}{q} = \frac{1}{f}$  **This is the given formula.**

$pqf\left(\frac{1}{p} + \frac{1}{q}\right) = pqf\left(\frac{1}{f}\right)$  **Multiply both sides by  $pqf$ , the LCD.**

$pqf\left(\frac{1}{p}\right) + pqf\left(\frac{1}{q}\right) = pqf\left(\frac{1}{f}\right)$  **Use the distributive property on the left side and divide out common factors.**

$qf + pf = pq$  **Simplify. The formula is cleared of fractions.**

**We need to isolate  $p$ .**

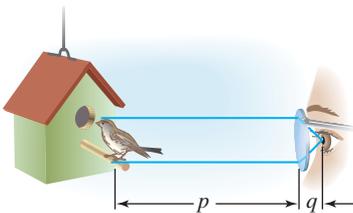

FIGURE P.12

**GREAT QUESTION!**

Can I solve  $qf + pf = pq$  for  $p$  by dividing both sides by  $q$  and writing

$$\frac{qf + pf}{q} = p?$$

No. When a formula is solved for a specified variable, that variable must be isolated on one side. The variable  $p$  occurs on both sides of

$$\frac{qf + pf}{q} = p.$$

To collect terms with  $p$  on one side of  $qf + pf = pq$ , subtract  $pf$  from both sides. Then factor  $p$  from the two resulting terms on the right to convert two occurrences of  $p$  into one.

$$qf + pf = pq \quad \text{This is the equation cleared of fractions.}$$

$$qf + pf - pf = pq - pf \quad \text{Subtract } pf \text{ from both sides.}$$

$$qf = pq - pf \quad \text{Simplify.}$$

$$qf = p(q - f) \quad \text{Factor out } p, \text{ the specified variable.}$$

$$\frac{qf}{q - f} = \frac{p(q - f)}{q - f} \quad \text{Divide both sides by } q - f \text{ and solve for } p.$$

$$\frac{qf}{q - f} = p \quad \text{Simplify.} \quad \dots$$

 **Check Point 5** Solve for  $q$ :  $\frac{1}{p} + \frac{1}{q} = \frac{1}{f}$ .

- 5** Solve equations involving absolute value.

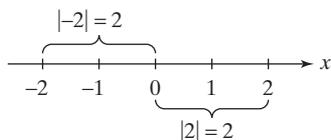

FIGURE P.13

**Equations Involving Absolute Value**

We have seen that the absolute value of  $x$ , denoted  $|x|$ , describes the distance of  $x$  from zero on a number line. Now consider an **absolute value equation**, such as

$$|x| = 2.$$

This means that we must determine real numbers whose distance from the origin on a number line is 2. **Figure P.13** shows that there are two numbers such that  $|x| = 2$ , namely, 2 and  $-2$ . We write  $x = 2$  or  $x = -2$ . This observation can be generalized as follows:

**Rewriting an Absolute Value Equation without Absolute Value Bars**

If  $c$  is a positive real number and  $u$  represents any algebraic expression, then  $|u| = c$  is equivalent to  $u = c$  or  $u = -c$ .

**EXAMPLE 6** Solving an Equation Involving Absolute Value

Solve:  $5|1 - 4x| - 15 = 0$ .

**SOLUTION**

$$5|1 - 4x| - 15 = 0 \quad \text{This is the given equation.}$$

We need to isolate  $|1 - 4x|$ , the absolute value expression.

$$5|1 - 4x| = 15 \quad \text{Add 15 to both sides.}$$

$$|1 - 4x| = 3 \quad \text{Divide both sides by 5.}$$

$$1 - 4x = 3 \quad \text{or} \quad 1 - 4x = -3 \quad \text{Rewrite } |u| = c \text{ as } u = c \text{ or } u = -c.$$

$$-4x = 2 \quad -4x = -4 \quad \text{Subtract 1 from both sides of each equation.}$$

$$x = -\frac{1}{2} \quad x = 1 \quad \text{Divide both sides of each equation by } -4.$$

Take a moment to check  $-\frac{1}{2}$  and 1, the proposed solutions, in the original equation,  $5|1 - 4x| - 15 = 0$ . In each case, you should obtain the true statement  $0 = 0$ . The solution set is  $\{-\frac{1}{2}, 1\}$ . ...

 **Check Point 6** Solve:  $4|1 - 2x| - 20 = 0$ .

The absolute value of a number is never negative. Thus, if  $u$  is an algebraic expression and  $c$  is a negative number, then  $|u| = c$  has no solution. For example, the equation  $|3x - 6| = -2$  has no solution because  $|3x - 6|$  cannot be negative. The solution set is  $\emptyset$ , the empty set.

The absolute value of 0 is 0. Thus, if  $u$  is an algebraic expression and  $|u| = 0$ , the solution is found by solving  $u = 0$ . For example, the solution of  $|x - 2| = 0$  is obtained by solving  $x - 2 = 0$ . The solution is 2 and the solution set is  $\{2\}$ .

**6** Solve quadratic equations by factoring.

### Quadratic Equations and Factoring

Linear equations are first-degree polynomial equations of the form  $ax + b = 0$ . *Quadratic equations* are second-degree polynomial equations and contain an additional term involving the square of the variable.

#### Definition of a Quadratic Equation

A **quadratic equation** in  $x$  is an equation that can be written in the **general form**

$$ax^2 + bx + c = 0,$$

where  $a$ ,  $b$ , and  $c$  are real numbers, with  $a \neq 0$ . A quadratic equation in  $x$  is also called a **second-degree polynomial equation** in  $x$ .

Here are examples of quadratic equations in general form:

$$4x^2 - 2x = 0 \qquad 2x^2 + 7x - 4 = 0.$$

$a = 4$     $b = -2$     $c = 0$ 
 $a = 2$     $b = 7$     $c = -4$

Some quadratic equations, including the two shown above, can be solved by factoring and using the **zero-product principle**.

#### The Zero-Product Principle

If the product of two algebraic expressions is zero, then at least one of the factors is equal to zero.

$$\text{If } AB = 0, \text{ then } A = 0 \text{ or } B = 0.$$

The zero-product principle can be applied only when a quadratic equation is in general form, with zero on one side of the equation.

#### Solving a Quadratic Equation by Factoring

1. If necessary, rewrite the equation in the general form  $ax^2 + bx + c = 0$ , moving all terms to one side, thereby obtaining zero on the other side.
2. Factor completely.
3. Apply the zero-product principle, setting each factor containing a variable equal to zero.
4. Solve the equations in step 3.
5. Check the solutions in the original equation.

#### EXAMPLE 7 Solving Quadratic Equations by Factoring

Solve by factoring:

a.  $4x^2 - 2x = 0$                       b.  $2x^2 + 7x = 4$ .

## SOLUTION

a.  $4x^2 - 2x = 0$

$$2x(2x - 1) = 0$$

$$2x = 0 \quad \text{or} \quad 2x - 1 = 0$$

$$x = 0$$

$$2x = 1$$

$$x = \frac{1}{2}$$

The given equation is in general form, with zero on one side.

Factor.

Use the zero-product principle and set each factor equal to zero.

Solve the resulting equations.

Check the proposed solutions, 0 and  $\frac{1}{2}$ , in the original equation.

**Check 0:**

$$4x^2 - 2x = 0$$

$$4 \cdot 0^2 - 2 \cdot 0 \stackrel{?}{=} 0$$

$$0 - 0 \stackrel{?}{=} 0$$

$$0 = 0, \quad \text{true}$$

**Check  $\frac{1}{2}$ :**

$$4x^2 - 2x = 0$$

$$4\left(\frac{1}{2}\right)^2 - 2\left(\frac{1}{2}\right) \stackrel{?}{=} 0$$

$$4\left(\frac{1}{4}\right) - 2\left(\frac{1}{2}\right) \stackrel{?}{=} 0$$

$$1 - 1 \stackrel{?}{=} 0$$

$$0 = 0, \quad \text{true}$$

The solution set is  $\left\{0, \frac{1}{2}\right\}$ .

b.  $2x^2 + 7x = 4$

$$2x^2 + 7x - 4 = 4 - 4$$

$$2x^2 + 7x - 4 = 0$$

$$(2x - 1)(x + 4) = 0$$

$$2x - 1 = 0 \quad \text{or} \quad x + 4 = 0$$

$$2x = 1$$

$$x = -4$$

$$x = \frac{1}{2}$$

This is the given equation.

Subtract 4 from both sides and write the quadratic equation in general form.

Simplify.

Factor.

Use the zero-product principle and set each factor equal to zero.

Solve the resulting equations.

Check the proposed solutions,  $\frac{1}{2}$  and  $-4$ , in the original equation.

**Check  $\frac{1}{2}$ :**

$$2x^2 + 7x = 4$$

$$2\left(\frac{1}{2}\right)^2 + 7\left(\frac{1}{2}\right) \stackrel{?}{=} 4$$

$$\frac{1}{2} + \frac{7}{2} \stackrel{?}{=} 4$$

$$4 = 4, \quad \text{true}$$

**Check  $-4$ :**

$$2x^2 + 7x = 4$$

$$2(-4)^2 + 7(-4) \stackrel{?}{=} 4$$

$$32 + (-28) \stackrel{?}{=} 4$$

$$4 = 4, \quad \text{true}$$

The solution set is  $\left\{-4, \frac{1}{2}\right\}$ . ...

 **Check Point 7** Solve by factoring:

a.  $3x^2 - 9x = 0$

b.  $2x^2 + x = 1$ .

**7** Solve quadratic equations by the square root property.

### Quadratic Equations and the Square Root Property

Quadratic equations of the form  $u^2 = d$ , where  $u$  is an algebraic expression and  $d$  is a positive real number, can be solved by the *square root property*. First, isolate the squared expression  $u^2$  on one side of the equation and the number  $d$  on the other side. Then take the square root of both sides. Remember, there are two numbers whose square is  $d$ . One number is  $\sqrt{d}$  and one is  $-\sqrt{d}$ .

We can use factoring to verify that  $u^2 = d$  has these two solutions.

$$\begin{array}{ll} u^2 = d & \text{This is the given equation.} \\ u^2 - d = 0 & \text{Move all terms to one side and obtain} \\ & \text{zero on the other side.} \\ (u + \sqrt{d})(u - \sqrt{d}) = 0 & \text{Factor.} \\ u + \sqrt{d} = 0 \quad \text{or} \quad u - \sqrt{d} = 0 & \text{Set each factor equal to zero.} \\ u = -\sqrt{d} \quad \quad \quad u = \sqrt{d} & \text{Solve the resulting equations.} \end{array}$$

Because the solutions differ only in sign, we can write them in abbreviated notation as  $u = \pm\sqrt{d}$ . We read this as “ $u$  equals positive or negative square root of  $d$ ” or “ $u$  equals plus or minus square root of  $d$ .”

Now that we have verified these solutions, we can solve  $u^2 = d$  directly by taking square roots. This process is called the **square root property**.

### The Square Root Property

If  $u$  is an algebraic expression and  $d$  is a positive real number, then  $u^2 = d$  has exactly two solutions:

$$\text{If } u^2 = d, \text{ then } u = \sqrt{d} \text{ or } u = -\sqrt{d}.$$

Equivalently,

$$\text{If } u^2 = d, \text{ then } u = \pm\sqrt{d}.$$

### EXAMPLE 8 Solving Quadratic Equations by the Square Root Property

Solve by the square root property:

a.  $3x^2 - 15 = 0$       b.  $(x - 2)^2 = 6$ .

### SOLUTION

To apply the square root property, we need a squared expression by itself on one side of the equation.

$$3x^2 - 15 = 0$$

We want  $x^2$   
by itself.

a. 
$$\begin{aligned} 3x^2 - 15 &= 0 \\ 3x^2 &= 15 \\ x^2 &= 5 \\ x &= \sqrt{5} \text{ or } x = -\sqrt{5} \end{aligned}$$

$$(x - 2)^2 = 6$$

The squared expression  
is by itself.

b. 
$$\begin{aligned} (x - 2)^2 &= 6 \\ x - 2 &= \pm\sqrt{6} \\ x &= 2 \pm \sqrt{6} \end{aligned}$$

*This is the original equation.  
Add 15 to both sides.  
Divide both sides by 3.  
Apply the square root property.  
Equivalently,  $x = \pm\sqrt{5}$ .*

By checking both proposed solutions in the original equation, we can confirm that the solution set is  $\{-\sqrt{5}, \sqrt{5}\}$  or  $\{\pm\sqrt{5}\}$ .

b. 
$$\begin{aligned} (x - 2)^2 &= 6 \\ x - 2 &= \pm\sqrt{6} \\ x &= 2 \pm \sqrt{6} \end{aligned}$$

*This is the original equation.  
Apply the square root property.  
Add 2 to both sides.*

By checking both values in the original equation, we can confirm that the solution set is  $\{2 + \sqrt{6}, 2 - \sqrt{6}\}$  or  $\{2 \pm \sqrt{6}\}$ . ...

 **Check Point 8** Solve by the square root property:

a.  $3x^2 - 21 = 0$       b.  $(x + 5)^2 = 11$ .

- 8 Solve quadratic equations by completing the square.

### Quadratic Equations and Completing the Square

How do we solve an equation in the form  $ax^2 + bx + c = 0$  if the trinomial  $ax^2 + bx + c$  cannot be factored? We cannot use the zero-product principle in such a case. However, we can convert the equation into an equivalent equation that can be solved using the square root property. This is accomplished by **completing the square**.

#### Completing the Square

If  $x^2 + bx$  is a binomial, then by adding  $\left(\frac{b}{2}\right)^2$ , which is the square of half the coefficient of  $x$ , a perfect square trinomial will result. That is,

$$x^2 + bx + \left(\frac{b}{2}\right)^2 = \left(x + \frac{b}{2}\right)^2.$$

We can solve any quadratic equation by completing the square. If the coefficient of the  $x^2$ -term is one, we add the square of half the coefficient of  $x$  to both sides of the equation. **When you add a constant term to one side of the equation to complete the square, be certain to add the same constant to the other side of the equation.** These ideas are illustrated in Example 9.

#### EXAMPLE 9 Solving a Quadratic Equation by Completing the Square

Solve by completing the square:  $x^2 - 6x + 4 = 0$ .

#### SOLUTION

We begin by subtracting 4 from both sides. This is done to isolate the binomial  $x^2 - 6x$  so that we can complete the square.

$$x^2 - 6x + 4 = 0 \quad \text{This is the original equation.}$$

$$x^2 - 6x = -4 \quad \text{Subtract 4 from both sides.}$$

Next, we work with  $x^2 - 6x = -4$  and complete the square. Find half the coefficient of the  $x$ -term and square it. The coefficient of the  $x$ -term is  $-6$ . Half of  $-6$  is  $-3$  and  $(-3)^2 = 9$ . Thus, we add 9 to both sides of the equation.

$$x^2 - 6x + 9 = -4 + 9 \quad \text{Add 9 to both sides of } x^2 - 6x = -4 \text{ to complete the square.}$$

$$(x - 3)^2 = 5 \quad \text{Factor and simplify.}$$

$$x - 3 = \sqrt{5} \quad \text{or} \quad x - 3 = -\sqrt{5} \quad \text{Apply the square root property.}$$

$$x = 3 + \sqrt{5} \quad \quad \quad x = 3 - \sqrt{5} \quad \text{Add 3 to both sides in each equation.}$$

The solutions are  $3 \pm \sqrt{5}$  and the solution set is  $\{3 + \sqrt{5}, 3 - \sqrt{5}\}$ , or  $\{3 \pm \sqrt{5}\}$ . ...

 **Check Point 9** Solve by completing the square:  $x^2 + 4x - 1 = 0$ .

- 9 Solve quadratic equations using the quadratic formula.

## Quadratic Equations and the Quadratic Formula

We can use the method of completing the square to derive a formula that can be used to solve all quadratic equations. The derivation given here also shows a particular quadratic equation,  $3x^2 - 2x - 4 = 0$ , to specifically illustrate each of the steps.

Notice that if the coefficient of the  $x^2$ -term in a quadratic equation is not one, you must divide each side of the equation by this coefficient before completing the square.

### Deriving the Quadratic Formula

General Form of a Quadratic Equation	Comment	A Specific Example
$ax^2 + bx + c = 0, a > 0$	This is the given equation.	$3x^2 - 2x - 4 = 0$
$x^2 + \frac{b}{a}x + \frac{c}{a} = 0$	Divide both sides by $a$ so that the coefficient of $x^2$ is 1.	$x^2 - \frac{2}{3}x - \frac{4}{3} = 0$
$x^2 + \frac{b}{a}x = -\frac{c}{a}$	Isolate the binomial by adding $-\frac{c}{a}$ on both sides of the equation.	$x^2 - \frac{2}{3}x = \frac{4}{3}$
$x^2 + \frac{b}{a}x + \left(\frac{b}{2a}\right)^2 = -\frac{c}{a} + \left(\frac{b}{2a}\right)^2$ <small>(half)<sup>2</sup></small>	Complete the square. Add the square of half the coefficient of $x$ to both sides.	$x^2 - \frac{2}{3}x + \left(\frac{-1}{3}\right)^2 = \frac{4}{3} + \left(\frac{-1}{3}\right)^2$ <small>(half)<sup>2</sup></small>
$x^2 + \frac{b}{a}x + \frac{b^2}{4a^2} = -\frac{c}{a} + \frac{b^2}{4a^2}$		$x^2 - \frac{2}{3}x + \frac{1}{9} = \frac{4}{3} + \frac{1}{9}$
$\left(x + \frac{b}{2a}\right)^2 = -\frac{c}{a} \cdot \frac{4a}{4a} + \frac{b^2}{4a^2}$	Factor on the left side and obtain a common denominator on the right side.	$\left(x - \frac{1}{3}\right)^2 = \frac{4}{3} \cdot \frac{3}{3} + \frac{1}{9}$
$\left(x + \frac{b}{2a}\right)^2 = \frac{-4ac + b^2}{4a^2}$ $\left(x + \frac{b}{2a}\right)^2 = \frac{b^2 - 4ac}{4a^2}$	Add fractions on the right side.	$\left(x - \frac{1}{3}\right)^2 = \frac{12 + 1}{9}$ $\left(x - \frac{1}{3}\right)^2 = \frac{13}{9}$
$x + \frac{b}{2a} = \pm \sqrt{\frac{b^2 - 4ac}{4a^2}}$	Apply the square root property.	$x - \frac{1}{3} = \pm \sqrt{\frac{13}{9}}$
$x + \frac{b}{2a} = \pm \frac{\sqrt{b^2 - 4ac}}{2a}$	Take the square root of the quotient, simplifying the denominator.	$x - \frac{1}{3} = \pm \frac{\sqrt{13}}{3}$
$x = \frac{-b}{2a} \pm \frac{\sqrt{b^2 - 4ac}}{2a}$	Solve for $x$ by subtracting $\frac{b}{2a}$ from both sides.	$x = \frac{1}{3} \pm \frac{\sqrt{13}}{3}$
$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$	Combine fractions on the right side.	$x = \frac{1 \pm \sqrt{13}}{3}$

The formula shown at the bottom of the left column is called the *quadratic formula*. A similar proof shows that the same formula can be used to solve quadratic equations if  $a$ , the coefficient of the  $x^2$ -term, is negative.

### The Quadratic Formula

The solutions of a quadratic equation in general form  $ax^2 + bx + c = 0$ , with  $a \neq 0$ , are given by the **quadratic formula**

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

*x* equals negative *b* plus or minus the square root of  $b^2 - 4ac$ , all divided by  $2a$ .

To use the quadratic formula, write the quadratic equation in general form if necessary. Then determine the numerical values for  $a$  (the coefficient of the  $x^2$ -term),  $b$  (the coefficient of the  $x$ -term), and  $c$  (the constant term). Substitute the values of  $a$ ,  $b$ , and  $c$  into the quadratic formula and evaluate the expression. The  $\pm$  sign indicates that there are two solutions of the equation.

### EXAMPLE 10 Solving a Quadratic Equation Using the Quadratic Formula

Solve using the quadratic formula:  $2x^2 - 6x + 1 = 0$ .

#### SOLUTION

The given equation is in general form. Begin by identifying the values for  $a$ ,  $b$ , and  $c$ .

$$2x^2 - 6x + 1 = 0$$

$a = 2$

$b = -6$

$c = 1$

Substituting these values into the quadratic formula and simplifying gives the equation's solutions.

$$\begin{aligned}
 x &= \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} && \text{Use the quadratic formula.} \\
 &= \frac{-(-6) \pm \sqrt{(-6)^2 - 4(2)(1)}}{2 \cdot 2} && \text{Substitute the values for } a, b, \text{ and } c: \\
 & && a = 2, b = -6, \text{ and } c = 1. \\
 &= \frac{6 \pm \sqrt{36 - 8}}{4} && -(-6) = 6, (-6)^2 = (-6)(-6) = 36, \text{ and} \\
 & && 4(2)(1) = 8. \\
 &= \frac{6 \pm \sqrt{28}}{4} && \text{Complete the subtraction under the radical.} \\
 &= \frac{6 \pm 2\sqrt{7}}{4} && \sqrt{28} = \sqrt{4 \cdot 7} = \sqrt{4} \sqrt{7} = 2\sqrt{7} \\
 &= \frac{2(3 \pm \sqrt{7})}{4} && \text{Factor out 2 from the numerator.} \\
 &= \frac{3 \pm \sqrt{7}}{2} && \text{Divide the numerator and denominator by 2.}
 \end{aligned}$$

### GREAT QUESTION!

**Should I check irrational solutions by substitution in the given quadratic equation?**

No. Checking irrational solutions can be time-consuming. The solutions given by the quadratic formula are always correct, unless you have made a careless error. Checking for computational errors or errors in simplification is sufficient.

The solution set is  $\left\{ \frac{3 + \sqrt{7}}{2}, \frac{3 - \sqrt{7}}{2} \right\}$  or  $\left\{ \frac{3 \pm \sqrt{7}}{2} \right\}$ . ...

**Check Point 10** Solve using the quadratic formula:

$$2x^2 + 2x - 1 = 0.$$

- 10 Use the discriminant to determine the number and type of solutions of quadratic equations.

## Quadratic Equations and the Discriminant

The quantity  $b^2 - 4ac$ , which appears under the radical sign in the quadratic formula, is called the **discriminant**. **Table P.4** shows how the discriminant of the quadratic equation  $ax^2 + bx + c = 0$  determines the number and type of solutions.

**Table P.4** The Discriminant and the Kinds of Solutions to  $ax^2 + bx + c = 0$

Discriminant $b^2 - 4ac$	Kinds of Solutions to $ax^2 + bx + c = 0$
$b^2 - 4ac > 0$	<b>Two unequal real solutions:</b> If $a$ , $b$ , and $c$ are rational numbers and the discriminant is a perfect square, the solutions are rational. If the discriminant is not a perfect square, the solutions are irrational.
$b^2 - 4ac = 0$	<b>One solution (a repeated solution) that is a real number:</b> If $a$ , $b$ , and $c$ are rational numbers, the repeated solution is also a rational number.
$b^2 - 4ac < 0$	<b>No real solutions</b>

### GREAT QUESTION!

**Is the square root sign part of the discriminant?**

No. The discriminant is  $b^2 - 4ac$ . It is not  $\sqrt{b^2 - 4ac}$ , so do not give the discriminant as a radical.

### EXAMPLE 11 Using the Discriminant

Compute the discriminant of  $4x^2 - 8x + 1 = 0$ . What does the discriminant indicate about the number and type of solutions?

#### SOLUTION

Begin by identifying the values for  $a$ ,  $b$ , and  $c$ .

$$4x^2 - 8x + 1 = 0$$

a = 4

b = -8

c = 1

Substitute and compute the discriminant:

$$b^2 - 4ac = (-8)^2 - 4 \cdot 4 \cdot 1 = 64 - 16 = 48.$$

The discriminant is 48. Because the discriminant is positive, the equation  $4x^2 - 8x + 1 = 0$  has two unequal real solutions. ●●●

- Check Point 11** Compute the discriminant of  $3x^2 - 2x + 5 = 0$ . What does the discriminant indicate about the number and type of solutions?

- 11 Determine the most efficient method to use when solving a quadratic equation.

### Determining Which Method to Use

All quadratic equations can be solved by the quadratic formula. However, if an equation is in the form  $u^2 = d$ , such as  $x^2 = 5$  or  $(2x + 3)^2 = 8$ , it is faster to use the square root property, taking the square root of both sides. If the equation is not in the form  $u^2 = d$ , write the quadratic equation in general form ( $ax^2 + bx + c = 0$ ). Try to solve the equation by factoring. If  $ax^2 + bx + c$  cannot be factored, then solve the quadratic equation by the quadratic formula.

Because we used the method of completing the square to derive the quadratic formula, we no longer need it for solving quadratic equations. However, we will use completing the square later in the book to help graph circles and other kinds of equations.

**Table P.5** on the next page summarizes our observations about which technique to use when solving a quadratic equation.

Table P.5 Determining the Most Efficient Technique to Use When Solving a Quadratic Equation

Description and Form of the Quadratic Equation	Most Efficient Solution Method	Example
$ax^2 + bx + c = 0$ and $ax^2 + bx + c$ can be factored easily.	Factor and use the zero-product principle.	$3x^2 + 5x - 2 = 0$ $(3x - 1)(x + 2) = 0$ $3x - 1 = 0 \quad \text{or} \quad x + 2 = 0$ $x = \frac{1}{3} \qquad \qquad \qquad x = -2$
$ax^2 + bx = 0$ The quadratic equation has no constant term. ( $c = 0$ )	Factor and use the zero-product principle.	$6x^2 + 9x = 0$ $3x(2x + 3) = 0$ $3x = 0 \quad \text{or} \quad 2x + 3 = 0$ $x = 0 \qquad \qquad \qquad 2x = -3$ $\qquad \qquad \qquad \qquad \qquad x = -\frac{3}{2}$
$ax^2 + c = 0$ The quadratic equation has no $x$ -term. ( $b = 0$ )	Solve for $x^2$ and apply the square root property.	$7x^2 - 4 = 0$ $7x^2 = 4$ $x^2 = \frac{4}{7}$ $x = \pm \sqrt{\frac{4}{7}}$ $= \pm \frac{2}{\sqrt{7}} = \pm \frac{2}{\sqrt{7}} \cdot \frac{\sqrt{7}}{\sqrt{7}} = \pm \frac{2\sqrt{7}}{7}$
$u^2 = d$ ; $u$ is a first-degree polynomial.	Use the square root property.	$(x + 4)^2 = 5$ $x + 4 = \pm \sqrt{5}$ $x = -4 \pm \sqrt{5}$
$ax^2 + bx + c = 0$ and $ax^2 + bx + c$ cannot be factored or the factoring is too difficult.	Use the quadratic formula: $x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$	$x^2 - 2x - 6 = 0$ <div style="display: flex; justify-content: center; gap: 10px; margin-bottom: 10px;"> <div style="border: 1px solid black; border-radius: 5px; padding: 2px 5px;"><math>a = 1</math></div> <div style="border: 1px solid black; border-radius: 5px; padding: 2px 5px;"><math>b = -2</math></div> <div style="border: 1px solid black; border-radius: 5px; padding: 2px 5px;"><math>c = -6</math></div> </div> $x = \frac{-(-2) \pm \sqrt{(-2)^2 - 4(1)(-6)}}{2(1)}$ $= \frac{2 \pm \sqrt{4 + 24}}{2(1)}$ $= \frac{2 \pm \sqrt{28}}{2} = \frac{2 \pm \sqrt{4 \cdot 7}}{2}$ $= \frac{2 \pm 2\sqrt{7}}{2} = \frac{2(1 \pm \sqrt{7})}{2}$ $= 1 \pm \sqrt{7}$

## 12 Solve radical equations.

### Radical Equations

A **radical equation** is an equation in which the variable occurs in a square root, cube root, or any higher root. An example of a radical equation is

$$\sqrt{x} = 9.$$

We solve the equation by squaring both sides:

Squaring both sides eliminates the square root.

$$(\sqrt{x})^2 = 9^2$$

$$x = 81.$$

The proposed solution, 81, can be checked in the original equation,  $\sqrt{x} = 9$ . Because  $\sqrt{81} = 9$ , the solution is 81 and the solution set is {81}.

In general, we solve radical equations with square roots by squaring both sides of the equation. We solve radical equations with  $n$ th roots by raising both sides of the equation to the  $n$ th power. Unfortunately, if  $n$  is even, all the solutions of the equation raised to the even power may not be solutions of the original equation. Consider, for example, the equation

$$x = 4.$$

If we square both sides, we obtain

$$x^2 = 16.$$

Solving this equation using the square root property, we obtain

$$x = \pm\sqrt{16} = \pm 4.$$

The new equation  $x^2 = 16$  has two solutions,  $-4$  and  $4$ . By contrast, only  $4$  is a solution of the original equation,  $x = 4$ . For this reason, **when raising both sides of an equation to an even power, always check proposed solutions in the original equation.**

Here is a general method for solving radical equations with  $n$ th roots:

### Solving Radical Equations Containing $n$ th Roots

1. If necessary, arrange terms so that one radical is isolated on one side of the equation.
2. Raise both sides of the equation to the  $n$ th power to eliminate the isolated  $n$ th root.
3. Solve the resulting equation. If this equation still contains radicals, repeat steps 1 and 2.
4. Check all proposed solutions in the original equation.

Extra solutions may be introduced when you raise both sides of a radical equation to an even power. Such solutions, which are not solutions of the given equation, are called **extraneous solutions** or **extraneous roots**.

### EXAMPLE 12 Solving a Radical Equation

Solve:  $\sqrt{2x - 1} + 2 = x$ .

#### SOLUTION

**Step 1 Isolate a radical on one side.** We isolate the radical,  $\sqrt{2x - 1}$ , by subtracting 2 from both sides.

$$\sqrt{2x - 1} + 2 = x \quad \text{This is the given equation.}$$

$$\sqrt{2x - 1} = x - 2 \quad \text{Subtract 2 from both sides.}$$

**Step 2 Raise both sides to the  $n$ th power.** Because  $n$ , the index, is 2, we square both sides.

$$(\sqrt{2x - 1})^2 = (x - 2)^2$$

$$2x - 1 = x^2 - 4x + 4 \quad \text{Simplify. Use the formula } (A - B)^2 = A^2 - 2AB + B^2 \text{ on the right side.}$$

### GREAT QUESTION!

**Can I square the right side of  $\sqrt{2x - 1} = x - 2$  by first squaring  $x$  and then squaring 2?**

No. Be sure to square *both sides* of an equation. Do *not* square each term.

**Correct:**

$$(\sqrt{2x - 1})^2 = (x - 2)^2$$

**Incorrect!**

~~$$(\sqrt{2x - 1})^2 = x^2 - 2^2$$~~

**Step 3 Solve the resulting equation.** Because of the  $x^2$ -term in  $2x - 1 = x^2 - 4x + 4$ , the resulting equation is a quadratic equation. We can obtain 0 on the left side by subtracting  $2x$  and adding 1 on both sides.

$$\begin{aligned} 2x - 1 &= x^2 - 4x + 4 \\ 0 &= x^2 - 6x + 5 \end{aligned}$$

The resulting equation is quadratic.

Write in general form, subtracting  $2x$  and adding 1 on both sides.

$$0 = (x - 1)(x - 5)$$

Factor.

$$x - 1 = 0 \quad \text{or} \quad x - 5 = 0$$

Set each factor equal to 0.

$$x = 1$$

$$x = 5$$

Solve the resulting equations.

**Step 4 Check the proposed solutions in the original equation.**

**Check 1:**

$$\sqrt{2x - 1} + 2 = x$$

$$\sqrt{2 \cdot 1 - 1} + 2 \stackrel{?}{=} 1$$

$$\sqrt{1} + 2 \stackrel{?}{=} 1$$

$$1 + 2 \stackrel{?}{=} 1$$

$$3 = 1,$$

false

**Check 5:**

$$\sqrt{2x - 1} + 2 = x$$

$$\sqrt{2 \cdot 5 - 1} + 2 \stackrel{?}{=} 5$$

$$\sqrt{9} + 2 \stackrel{?}{=} 5$$

$$3 + 2 \stackrel{?}{=} 5$$

$$5 = 5,$$

true

Thus, 1 is an extraneous solution. The only solution is 5, and the solution set is  $\{5\}$ .

 **Check Point 12** Solve:  $\sqrt{x + 3} + 3 = x$ .

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- An equation in the form  $ax + b = 0$ ,  $a \neq 0$ , such as  $3x + 17 = 0$ , is called a/an \_\_\_\_\_ equation in one variable.
- Two or more equations that have the same solution set are called \_\_\_\_\_ equations.
- The first step in solving  $7 + 3(x - 2) = 2x + 10$  is to \_\_\_\_\_.
- The fractions in the equation 
$$\frac{x}{4} = 2 + \frac{x - 3}{3}$$
 can be eliminated by multiplying both sides by the \_\_\_\_\_ of  $\frac{x}{4}$  and  $\frac{x - 3}{3}$ , which is \_\_\_\_.
- We reject any proposed solution of a rational equation that causes a denominator to equal \_\_\_\_.
- The restrictions on the variable in the rational equation 
$$\frac{1}{x - 2} - \frac{2}{x + 4} = \frac{2x - 1}{x^2 + 2x - 8}$$
 are \_\_\_\_\_ and \_\_\_\_\_.
  - $\frac{5}{x + 4} + \frac{3}{x + 3} = \frac{12x + 9}{(x + 4)(x + 3)}$   
 $(x + 4)(x + 3) \left( \frac{5}{x + 4} + \frac{3}{x + 3} \right)$   
 $= (x + 4)(x + 3) \left( \frac{12x + 9}{(x + 4)(x + 3)} \right)$   
 The resulting equation cleared of fractions is \_\_\_\_\_.
- Solving a formula for a variable means rewriting the formula so that the variable is \_\_\_\_\_.
- The first step in solving  $IR + Ir = E$  for  $I$  is to obtain a single occurrence of  $I$  by \_\_\_\_\_  $I$  from the two terms on the left.
- If  $c > 0$ ,  $|u| = c$  is equivalent to  $u = \underline{\hspace{1cm}}$  or  $u = \underline{\hspace{1cm}}$ .
- $|3x - 1| = 7$  is equivalent to \_\_\_\_\_ or \_\_\_\_\_.
- An equation that can be written in the general form  $ax^2 + bx + c = 0$ ,  $a \neq 0$ , is called a/an \_\_\_\_\_ equation.
- The zero-product principle states that if  $AB = 0$ , then \_\_\_\_\_.
- The square root property states that if  $u^2 = d$ , then  $u = \underline{\hspace{1cm}}$ .
- If  $x^2 = 7$ , then  $x = \underline{\hspace{1cm}}$ .
- To solve  $x^2 + 6x = 7$  by completing the square, add \_\_\_\_\_ to both sides of the equation.
- The solutions of a quadratic equation in the general form  $ax^2 + bx + c = 0$ ,  $a \neq 0$ , are given by the quadratic formula  $x = \underline{\hspace{1cm}}$ .
- In order to solve  $2x^2 + 9x - 5 = 0$  by the quadratic formula, we use  $a = \underline{\hspace{1cm}}$ ,  $b = \underline{\hspace{1cm}}$ , and  $c = \underline{\hspace{1cm}}$ .
- In order to solve  $x^2 = 4x + 1$  by the quadratic formula, we use  $a = \underline{\hspace{1cm}}$ ,  $b = \underline{\hspace{1cm}}$ , and  $c = \underline{\hspace{1cm}}$ .

20.  $x = \frac{-(-4) \pm \sqrt{(-4)^2 - 4(1)(2)}}{2(1)}$  simplifies to  
 $x = \underline{\hspace{2cm}}$ .
21. The discriminant of  $ax^2 + bx + c = 0$  is defined by  $\underline{\hspace{2cm}}$ .
22. If the discriminant of  $ax^2 + bx + c = 0$  is negative, the quadratic equation has  $\underline{\hspace{2cm}}$  real solutions.
23. If the discriminant of  $ax^2 + bx + c = 0$  is positive, the quadratic equation has  $\underline{\hspace{2cm}}$  real solutions.
24. The most efficient technique for solving  $(2x + 7)^2 = 25$  is by using  $\underline{\hspace{2cm}}$ .
25. The most efficient technique for solving  $x^2 + 5x - 10 = 0$  is by using  $\underline{\hspace{2cm}}$ .

26. The most efficient technique for solving  $x^2 + 8x + 15 = 0$  is by using  $\underline{\hspace{2cm}}$ .
27. An equation in which the variable occurs in a square root, cube root, or any higher root is called a/an  $\underline{\hspace{2cm}}$  equation.
28. Solutions of a squared equation that are not solutions of the original equation are called  $\underline{\hspace{2cm}}$  solutions.
29. Consider the equation  

$$\sqrt{2x + 1} = x - 7.$$
 Squaring the left side and simplifying results in  $\underline{\hspace{2cm}}$ .  
 Squaring the right side and simplifying results in  $\underline{\hspace{2cm}}$ .

## EXERCISE SET P.7

### Practice Exercises

In Exercises 1–16, solve each linear equation.

- |   |  |

| 1. $7x - 5 = 72$                                      | 2. $6x - 3 = 63$                                       |
| 3. $11x - (6x - 5) = 40$                              | 4. $5x - (2x - 10) = 35$                               |
| 5. $2x - 7 = 6 + x$                                   | 6. $3x + 5 = 2x + 13$                                  |
| 7. $7x + 4 = x + 16$                                  | 8. $13x + 14 = 12x - 5$                                |
| 9. $3(x - 2) + 7 = 2(x + 5)$                          |  |
| 10. $2(x - 1) + 3 = x - 3(x + 1)$                     |  |
| 11. $\frac{x + 3}{6} = \frac{3}{8} + \frac{x - 5}{4}$ | 12. $\frac{x + 1}{4} = \frac{1}{6} + \frac{2 - x}{3}$  |
| 13. $\frac{x}{4} = 2 + \frac{x - 3}{3}$               | 14. $5 + \frac{x - 2}{3} = \frac{x + 3}{8}$            |
| 15. $\frac{x + 1}{3} = 5 - \frac{x + 2}{7}$           | 16. $\frac{3x}{5} - \frac{x - 3}{2} = \frac{x + 2}{3}$ |

Exercises 17–26 contain rational equations with variables in denominators. For each equation, **a.** Write the value or values of the variable that make a denominator zero. These are the restrictions on the variable. **b.** Keeping the restrictions in mind, solve the equation.

- |  |  |
|--|--|
| 17. $\frac{1}{x - 1} + 5 = \frac{11}{x - 1}$                     | 18. $\frac{3}{x + 4} - 7 = \frac{-4}{x + 4}$ |
| 19. $\frac{8x}{x + 1} = 4 - \frac{8}{x + 1}$                     | 20. $\frac{2}{x - 2} = \frac{x}{x - 2} - 2$  |
| 21. $\frac{3}{2x - 2} + \frac{1}{2} = \frac{2}{x - 1}$           |  |
| 22. $\frac{3}{x + 3} = \frac{5}{2x + 6} + \frac{1}{x - 2}$       |  |
| 23. $\frac{2}{x + 1} - \frac{1}{x - 1} = \frac{2x}{x^2 - 1}$     |  |
| 24. $\frac{4}{x + 5} + \frac{2}{x - 5} = \frac{32}{x^2 - 25}$    |  |
| 25. $\frac{1}{x - 4} - \frac{5}{x + 2} = \frac{6}{x^2 - 2x - 8}$ |  |
| 26. $\frac{1}{x - 3} - \frac{2}{x + 1} = \frac{8}{x^2 - 2x - 3}$ |  |

In Exercises 27–42, solve each formula for the specified variable. Do you recognize the formula? If so, what does it describe?

- |   |   |
|---|---|
| 27. $I = Prt$ for $P$                                 | 28. $C = 2\pi r$ for $r$                                    |
| 29. $T = D + pm$ for $p$                              | 30. $P = C + MC$ for $M$                                    |
| 31. $A = \frac{1}{2}h(a + b)$ for $a$                 | 32. $A = \frac{1}{2}h(a + b)$ for $b$                       |
| 33. $S = P + Prt$ for $r$                             | 34. $S = P + Prt$ for $t$                                   |
| 35. $B = \frac{F}{S - V}$ for $S$                     | 36. $S = \frac{C}{1 - r}$ for $r$                           |
| 37. $IR + Ir = E$ for $I$                             | 38. $A = 2lw + 2lh + 2wh$ for $h$                           |
| 39. $\frac{1}{p} + \frac{1}{q} = \frac{1}{f}$ for $f$ | 40. $\frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2}$ for $R_1$ |
| 41. $f = \frac{f_1 f_2}{f_1 + f_2}$ for $f_1$         | 42. $f = \frac{f_1 f_2}{f_1 + f_2}$ for $f_2$               |

In Exercises 43–54, solve each absolute value equation or indicate the equation has no solution.

- |   |   |
|---|---|
| 43. $ x - 2  = 7$                             | 44. $ x + 1  = 5$                             |
| 45. $ 2x - 1  = 5$                            | 46. $ 2x - 3  = 11$                           |
| 47. $2 3x - 2  = 14$                          | 48. $3 2x - 1  = 21$                          |
| 49. $2\left 4 - \frac{5}{2}x\right  + 6 = 18$ | 50. $4\left 1 - \frac{3}{4}x\right  + 7 = 10$ |
| 51. $ x + 1  + 5 = 3$                         | 52. $ x + 1  + 6 = 2$                         |
| 53. $ 2x - 1  + 3 = 3$                        | 54. $ 3x - 2  + 4 = 4$                        |

In Exercises 55–60, solve each quadratic equation by factoring.

- |                         |                          |
|-------------------------|--------------------------|
| 55. $x^2 - 3x - 10 = 0$ | 56. $x^2 - 13x + 36 = 0$ |
| 57. $x^2 = 8x - 15$     | 58. $x^2 = -11x - 10$    |
| 59. $5x^2 = 20x$        | 60. $3x^2 = 12x$         |

In Exercises 61–66, solve each quadratic equation by the square root property.

- |                       |                       |
|-----------------------|-----------------------|
| 61. $3x^2 = 27$       | 62. $5x^2 = 45$       |
| 63. $5x^2 + 1 = 51$   | 64. $3x^2 - 1 = 47$   |
| 65. $3(x - 4)^2 = 15$ | 66. $3(x + 4)^2 = 21$ |

In Exercises 67–74, solve each quadratic equation by completing the square.

- |                         |                        |
|-------------------------|------------------------|
| 67. $x^2 + 6x = 7$      | 68. $x^2 + 6x = -8$    |
| 69. $x^2 - 2x = 2$      | 70. $x^2 + 4x = 12$    |
| 71. $x^2 - 6x - 11 = 0$ | 72. $x^2 - 2x - 5 = 0$ |
| 73. $x^2 + 4x + 1 = 0$  | 74. $x^2 + 6x - 5 = 0$ |

In Exercises 75–82, solve each quadratic equation using the quadratic formula.

75.  $x^2 + 8x + 15 = 0$       76.  $x^2 + 8x + 12 = 0$   
 77.  $x^2 + 5x + 3 = 0$       78.  $x^2 + 5x + 2 = 0$   
 79.  $3x^2 - 3x - 4 = 0$       80.  $5x^2 + x - 2 = 0$   
 81.  $4x^2 = 2x + 7$       82.  $3x^2 = 6x - 1$

Compute the discriminant of each equation in Exercises 83–90. What does the discriminant indicate about the number and type of solutions?

83.  $x^2 - 4x - 5 = 0$       84.  $4x^2 - 2x + 3 = 0$   
 85.  $2x^2 - 11x + 3 = 0$       86.  $2x^2 + 11x - 6 = 0$   
 87.  $x^2 = 2x - 1$       88.  $3x^2 = 2x - 1$   
 89.  $x^2 - 3x - 7 = 0$       90.  $3x^2 + 4x - 2 = 0$

In Exercises 91–114, solve each quadratic equation by the method of your choice.

91.  $2x^2 - x = 1$       92.  $3x^2 - 4x = 4$   
 93.  $5x^2 + 2 = 11x$       94.  $5x^2 = 6 - 13x$   
 95.  $3x^2 = 60$       96.  $2x^2 = 250$   
 97.  $x^2 - 2x = 1$       98.  $2x^2 + 3x = 1$   
 99.  $(2x + 3)(x + 4) = 1$       100.  $(2x - 5)(x + 1) = 2$   
 101.  $(3x - 4)^2 = 16$       102.  $(2x + 7)^2 = 25$   
 103.  $3x^2 - 12x + 12 = 0$       104.  $9 - 6x + x^2 = 0$   
 105.  $4x^2 - 16 = 0$       106.  $3x^2 - 27 = 0$   
 107.  $x^2 = 4x - 2$       108.  $x^2 = 6x - 7$   
 109.  $2x^2 - 7x = 0$       110.  $2x^2 + 5x = 3$   
 111.  $\frac{1}{x} + \frac{1}{x+2} = \frac{1}{3}$   
 112.  $\frac{1}{x} + \frac{1}{x+3} = \frac{1}{4}$   
 113.  $\frac{2x}{x-3} + \frac{6}{x+3} = -\frac{28}{x^2-9}$   
 114.  $\frac{3}{x-3} + \frac{5}{x-4} = \frac{x^2-20}{x^2-7x+12}$

In Exercises 115–124, solve each radical equation. Check all proposed solutions.

115.  $\sqrt{3x+18} = x$       116.  $\sqrt{20-8x} = x$   
 117.  $\sqrt{x+3} = x-3$       118.  $\sqrt{x+10} = x-2$   
 119.  $\sqrt{2x+13} = x+7$       120.  $\sqrt{6x+1} = x-1$   
 121.  $x - \sqrt{2x+5} = 5$       122.  $x - \sqrt{x+11} = 1$   
 123.  $\sqrt{2x+19} - 8 = x$       124.  $\sqrt{2x+15} - 6 = x$

**Practice Plus**

In Exercises 125–134, solve each equation.

125.  $25 - [2 + 5x - 3(x + 2)] = -3(2x - 5) - [5(x - 1) - 3x + 3]$   
 126.  $45 - [4 - 2x - 4(x + 7)] = -4(1 + 3x) - [4 - 3(x + 2) - 2(2x - 5)]$   
 127.  $7 - 7x = (3x + 2)(x - 1)$   
 128.  $10x - 1 = (2x + 1)^2$   
 129.  $|x^2 + 2x - 36| = 12$   
 130.  $|x^2 + 6x + 1| = 8$   
 131.  $\frac{1}{x^2 - 3x + 2} = \frac{1}{x + 2} + \frac{5}{x^2 - 4}$   
 132.  $\frac{x-1}{x-2} + \frac{x}{x-3} = \frac{1}{x^2 - 5x + 6}$

133.  $\sqrt{x+8} - \sqrt{x-4} = 2$

134.  $\sqrt{x+5} - \sqrt{x-3} = 2$

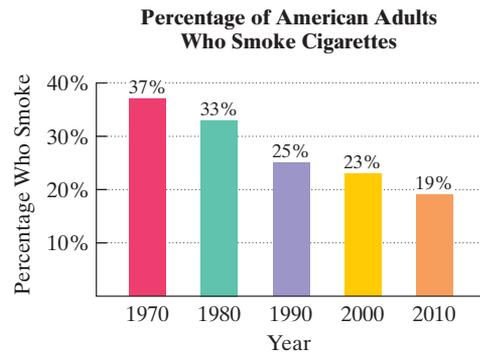

In Exercises 135–136, list all numbers that must be excluded from the domain of each rational expression.

135.  $\frac{3}{2x^2 + 4x - 9}$

136.  $\frac{7}{2x^2 - 8x + 5}$

**Application Exercises**

In the years after warning labels were put on cigarette packs, the number of smokers dropped from approximately two in five adults to one in five. The bar graph shows the percentage of American adults who smoked cigarettes for selected years from 1970 through 2010.

Source: Centers for Disease Control and Prevention

The mathematical model

$$p + \frac{x}{2} = 37$$

describes the percentage of Americans who smoked cigarettes,  $p$ ,  $x$  years after 1970. Use this model to solve Exercises 137–138.

137. a. Does the mathematical model underestimate or overestimate the percentage of American adults who smoked cigarettes in 2010? By how much?  
 b. Use the mathematical model to project the year when only 7% of American adults will smoke cigarettes.
138. a. Does the mathematical model underestimate or overestimate the percentage of American adults who smoked cigarettes in 2000? By how much?  
 b. Use the mathematical model to project the year when only 2% of American adults will smoke cigarettes.
139. A company wants to increase the 10% peroxide content of its product by adding pure peroxide (100% peroxide). If  $x$  liters of pure peroxide are added to 500 liters of its 10% solution, the concentration,  $C$ , of the new mixture is given by

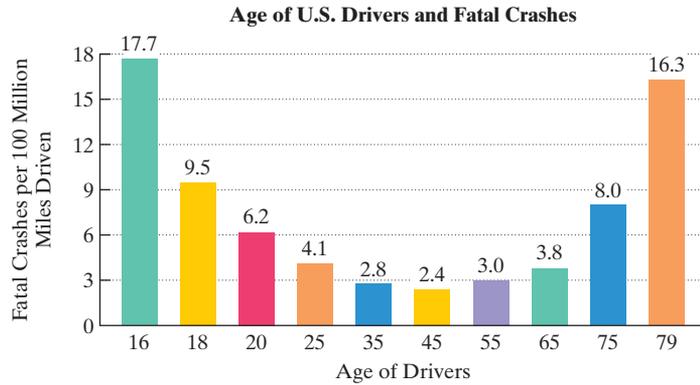

$$C = \frac{x + 0.1(500)}{x + 500}$$

How many liters of pure peroxide should be added to produce a new product that is 28% peroxide?

140. Suppose that  $x$  liters of pure acid are added to 200 liters of a 35% acid solution.
- a. Write a formula that gives the concentration,  $C$ , of the new mixture. (Hint: See Exercise 139.)  
 b. How many liters of pure acid should be added to produce a new mixture that is 74% acid?

A driver's age has something to do with his or her chance of getting into a fatal car crash. The bar graph shows the number of fatal vehicle crashes per 100 million miles driven for drivers of various age groups. For example, 25-year-old drivers are involved in 4.1 fatal crashes per 100 million miles driven. Thus, when a group of 25-year-old Americans have driven a total of 100 million miles, approximately 4 have been in accidents in which someone died.

Source: Insurance Institute for Highway Safety

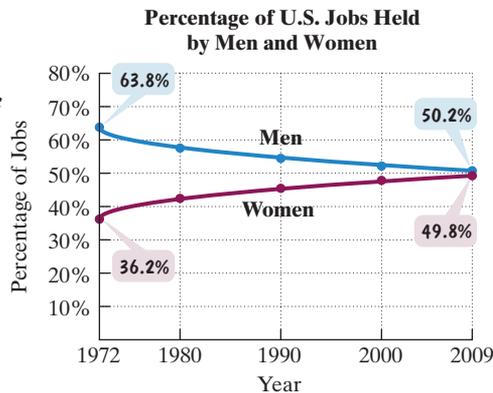

The number of fatal vehicle crashes per 100 million miles,  $y$ , for drivers of age  $x$  can be modeled by the formula

$$y = 0.013x^2 - 1.19x + 28.24.$$

Use the formula above to solve Exercises 141–142.

- 141.** What age groups are expected to be involved in 3 fatal crashes per 100 million miles driven? How well does the formula model the trend in the actual data shown in the bar graph?
- 142.** What age groups are expected to be involved in 10 fatal crashes per 100 million miles driven? How well does the formula model the trend in the actual data shown by the bar graph?

By the end of 2010, women made up more than half of the labor force in the United States for the first time in the country's history. The graphs show the percentage of jobs in the U.S. labor force held by men and by women from 1972 through 2009. Exercises 143–144 are based

Source: Bureau of Labor Statistics

on the data displayed by the graphs.

- 143.** The formula

$$p = 2.2\sqrt{t} + 36.2$$

models the percentage of jobs in the U.S. labor force,  $p$ , held by women  $t$  years after 1972.

- a.** Use the appropriate graph to estimate the percentage of jobs in the U.S. labor force held by women in 2000. Give your estimation to the nearest percent.
- b.** Use the mathematical model to determine the percentage of jobs in the U.S. labor force held by women in 2000. Round to the nearest tenth of a percent.
- c.** According to the formula, when will 52% of jobs in the U.S. labor force be held by women? Round to the nearest year.

- 144.** The formula

$$p = -2.2\sqrt{t} + 63.8$$

models the percentage of jobs in the U.S. labor force,  $p$ , held by men  $t$  years after 1972.

- a.** Use the appropriate graph to estimate the percentage of jobs in the U.S. labor force held by men in 2000. Give your estimation to the nearest percent.
- b.** Use the mathematical model to determine the percentage of jobs in the U.S. labor force held by men in 2000. Round to the nearest tenth of a percent.
- c.** According to the formula, when will 48% of jobs in the U.S. labor force be held by men? Round to the nearest year.

### Writing in Mathematics

- 145.** What is a linear equation in one variable? Give an example of this type of equation.
- 146.** Explain how to determine the restrictions on the variable for the equation
- $$\frac{3}{x+5} + \frac{4}{x-2} = \frac{7}{x^2+3x-6}.$$
- 147.** What does it mean to solve a formula for a variable?
- 148.** Explain how to solve an equation involving absolute value.
- 149.** Why does the procedure that you explained in Exercise 148 not apply to the equation  $|x-2| = -3$ ? What is the solution set for this equation?
- 150.** What is a quadratic equation?
- 151.** Explain how to solve  $x^2 + 6x + 8 = 0$  using factoring and the zero-product principle.
- 152.** Explain how to solve  $x^2 + 6x + 8 = 0$  by completing the square.
- 153.** Explain how to solve  $x^2 + 6x + 8 = 0$  using the quadratic formula.
- 154.** How is the quadratic formula derived?
- 155.** What is the discriminant and what information does it provide about a quadratic equation?
- 156.** If you are given a quadratic equation, how do you determine which method to use to solve it?
- 157.** In solving  $\sqrt{2x-1} + 2 = x$ , why is it a good idea to isolate the radical term? What if we don't do this and simply square each side? Describe what happens.
- 158.** What is an extraneous solution to a radical equation?

**Critical Thinking Exercises**

**Make Sense?** In Exercises 159–162, determine whether each statement makes sense or does not make sense, and explain your reasoning.

- 159. The model  $P = -0.18n + 2.1$  describes the number of pay phones,  $P$ , in millions,  $n$  years after 2000, so I have to solve a linear equation to determine the number of pay phones in 2010.
- 160. Although I can solve  $3x + \frac{1}{5} = \frac{1}{4}$  by first subtracting  $\frac{1}{5}$  from both sides, I find it easier to begin by multiplying both sides by 20, the least common denominator.
- 161. Because I want to solve  $25x^2 - 169 = 0$  fairly quickly, I'll use the quadratic formula.
- 162. When checking a radical equation's proposed solution, I can substitute into the original equation or any equation that is part of the solution process.

In Exercises 163–166, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

- 163. The equation  $(2x - 3)^2 = 25$  is equivalent to  $2x - 3 = 5$ .
- 164. Every quadratic equation has two distinct numbers in its solution set.
- 165. The equations  $3y - 1 = 11$  and  $3y - 7 = 5$  are equivalent.

- 166. The equation  $ax^2 + c = 0$ ,  $a \neq 0$ , cannot be solved by the quadratic formula.
- 167. Find  $b$  such that  $\frac{7x + 4}{b} + 13 = x$  will have a solution set given by  $\{-6\}$ .
- 168. Write a quadratic equation in general form whose solution set is  $\{-3, 5\}$ .
- 169. Solve for  $C$ :  $V = C - \frac{C - S}{L}N$ .
- 170. Solve for  $t$ :  $s = -16t^2 + v_0t$ .

**Preview Exercises**

Exercises 171–173 will help you prepare for the material covered in the next section.

- 171. Jane's salary exceeds Jim's by \$150 per week. If  $x$  represents Jim's weekly salary, write an algebraic expression that models Jane's weekly salary.
- 172. A telephone texting plan has a monthly fee of \$20 with a charge of \$0.05 per text. Write an algebraic expression that models the plan's monthly cost for  $x$  text messages.
- 173. If the width of a rectangle is represented by  $x$  and the length is represented by  $x + 200$ , write a simplified algebraic expression that models the rectangle's perimeter.

**SECTION P.8**

**Modeling with Equations**

*Objective*

1 Use equations to solve problems.

How Long It Takes to Earn \$1000			
			
<b>Howard Stern</b> Radio host 24 sec.	<b>Dr. Phil McGraw</b> Television host 2 min. 24 sec.	<b>Brad Pitt</b> Actor 4 min. 48 sec.	<b>Kobe Bryant</b> Basketball player 5 min. 30 sec.

Source: *Time*

In this section, you'll see examples and exercises focused on how much money Americans earn. These situations illustrate a step-by-step strategy for solving problems. As you become familiar with this strategy, you will learn to solve a wide variety of problems.

## 1 Use equations to solve problems.

## Problem Solving with Equations

We have seen that a model is a mathematical representation of a real-world situation. In this section, we will be solving problems that are presented in English. This means that we must obtain models by translating from the ordinary language of English into the language of algebraic equations. To translate, however, we must understand the English prose and be familiar with the forms of algebraic language. Following are some general steps we will use in solving word problems:

### GREAT QUESTION!

#### Why are word problems important?

There is great value in reasoning through the steps for solving a word problem. This value comes from the problem-solving skills that you will attain and is often more important than the specific problem or its solution.

#### Strategy for Solving Word Problems

**Step 1** Read the problem carefully several times until you can state in your own words what is given and what the problem is looking for. Let  $x$  (or any variable) represent one of the unknown quantities in the problem.

**Step 2** If necessary, write expressions for any other unknown quantities in the problem in terms of  $x$ .

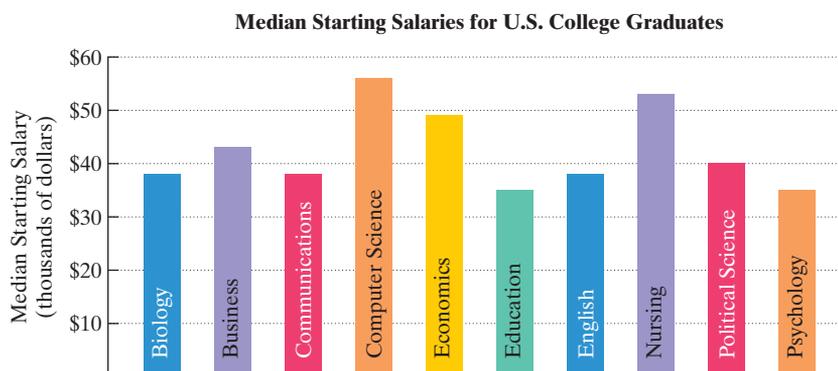

**Step 3** Write an equation in  $x$  that models the verbal conditions of the problem.

**Step 4** Solve the equation and answer the problem's question.

**Step 5** Check the solution *in the original wording* of the problem, not in the equation obtained from the words.

### EXAMPLE 1 Starting Salaries for College Graduates with Undergraduate Degrees

The bar graph in **Figure P.14** shows the ten most popular college majors with median, or middlemost, starting salaries for recent college graduates.

**FIGURE P.14**

Source: PayScale (2010 data)

The median starting salary of a business major exceeds that of a psychology major by \$8 thousand. The median starting salary of an English major exceeds that of a psychology major by \$3 thousand. Combined, their median starting salaries are \$116 thousand. Determine the median starting salaries of psychology majors, business majors, and English majors with bachelor's degrees.

### SOLUTION

**Step 1** Let  $x$  represent one of the unknown quantities. We know something about the median starting salaries of business majors and English majors: Business majors earn \$8 thousand more than psychology majors and English majors earn \$3 thousand more than psychology majors. We will let

$x$  = the median starting salary, in thousands of dollars, of psychology majors.

**Step 2 Represent other unknown quantities in terms of  $x$ .** Because business majors earn \$8 thousand more than psychology majors, let

Salary exceeds a psychology major,  $x$ , by \$8 thousand.

$x + 8 =$  the median starting salary, in thousands of dollars, of business majors.

Because English majors earn \$3 thousand more than psychology majors, let

Salary exceeds a psychology major,  $x$ , by \$3 thousand.

$x + 3 =$  the median starting salary, in thousands of dollars, of English majors.

**Step 3 Write an equation in  $x$  that models the conditions.** Combined, the median starting salaries for psychology, business, and English majors are \$116 thousand.

The median starting salary for psychology majors	plus	the median starting salary for business majors	plus	the median starting salary for English majors	is	\$116 thousand.
$x$	+	$(x + 8)$	+	$(x + 3)$	=	116

**Step 4 Solve the equation and answer the question.**

$$x + (x + 8) + (x + 3) = 116$$

This is the equation that models the problem's conditions.

$$3x + 11 = 116$$

Remove parentheses, regroup, and combine like terms.

$$3x = 105$$

Subtract 11 from both sides.

$$x = 35$$

Divide both sides by 3.

Thus,

$$\text{starting salary of psychology majors} = x = 35$$

$$\text{starting salary of business majors} = x + 8 = 35 + 8 = 43$$

$$\text{starting salary of English majors} = x + 3 = 35 + 3 = 38.$$

The median starting salary of psychology majors is \$35 thousand, the median starting salary of business majors is \$43 thousand, and the median starting salary of English majors is \$38 thousand.

**Step 5 Check the proposed solution in the original wording of the problem.** The problem states that combined, the median starting salaries are \$116 thousand. Using the median salaries we determined in step 4, the sum is

$$\$35 \text{ thousand} + \$43 \text{ thousand} + \$38 \text{ thousand},$$

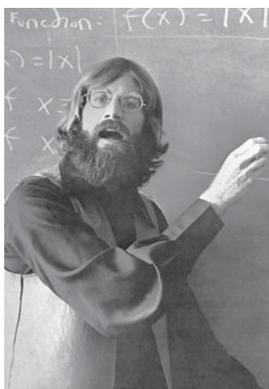

or \$116 thousand, which verifies the problem's conditions. ...

## GREAT QUESTION!

**Example 1 involves using the word *exceeds* to represent two of the unknown quantities. Can you help me to write algebraic expressions for quantities described using *exceeds*?**

Modeling with the word *exceeds* can be a bit tricky. It's helpful to identify the smaller quantity. Then add to this quantity to represent the larger quantity. For example, suppose that Tim's height exceeds Tom's height by  $a$  inches. Tom is the shorter person. If Tom's height is represented by  $x$ , then Tim's height is represented by  $x + a$ .

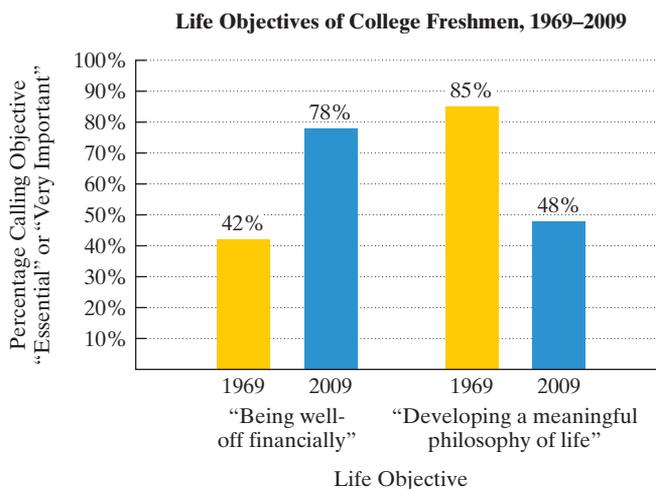

**Check Point 1** Three of the bars in **Figure P.14** on page 107 represent median starting salaries of education, computer science, and economics majors. The median starting salary of a computer science major exceeds that of an education major by \$21 thousand. The median starting salary of an economics major exceeds that of an education major by \$14 thousand. Combined, their median starting salaries are \$140 thousand. Determine the median starting salaries of education majors, computer science majors, and economics majors with bachelor's degrees.

Your author teaching math in 1969

### EXAMPLE 2 Modeling Attitudes of College Freshmen

Researchers have surveyed college freshmen every year since 1969. **Figure P.15** shows that attitudes about some life goals have changed dramatically over the years. In particular, the freshman class of 2009 was more interested in making money than the freshmen of 1969 had been. In 1969, 42% of first-year college students considered “being well-off financially” essential or very important. For the period from 1969 through 2009, this percentage increased by approximately 0.9 each year. If this trend continues, by which year will all college freshmen consider “being well-off financially” essential or very important?

**FIGURE P.15**

Source: Higher Education Research Institute

### SOLUTION

**Step 1 Let  $x$  represent one of the unknown quantities.** We are interested in the year when all college freshmen, or 100% of the freshmen, will consider this life objective essential or very important. Let

$x$  = the number of years after 1969 when all freshmen will consider “being well-off financially” essential or very important.

**Step 2 Represent other unknown quantities in terms of  $x$ .** There are no other unknown quantities to find, so we can skip this step.

**Step 3 Write an equation in  $x$  that models the conditions.**

The 1969 percentage	increased by	0.9 each year for $x$ years	equals	100% of the freshmen.
42	+	$0.9x$	=	100

**Step 4 Solve the equation and answer the question.**

$$42 + 0.9x = 100$$

This is the equation that models the problem's conditions.

$$42 - 42 + 0.9x = 100 - 42$$

Subtract 42 from both sides.

$$0.9x = 58$$

Simplify.

$$\frac{0.9x}{0.9} = \frac{58}{0.9}$$

Divide both sides by 0.9.

$$x = 64.\bar{4} \approx 64$$

Simplify and round to the nearest whole number.

Using current trends, by approximately 64 years after 1969, or in 2033, all freshmen will consider “being well-off financially” essential or very important.

**Step 5 Check the proposed solution in the original wording of the problem.** The problem states that all freshmen (100%, represented by 100 using the model) will consider the objective essential or very important. Does this approximately occur if we increase the 1969 percentage, 42%, by 0.9 each year for 64 years, our proposed solution?

$$42 + 0.9(64) = 42 + 57.6 = 99.6 \approx 100$$

This verifies that using trends shown in **Figure P.15**, all first-year college students will consider the objective essential or very important approximately 64 years after 1969. ●●●

 **Check Point 2** **Figure P.15** on page 109 shows that the freshman class of 2009 was less interested in developing a philosophy of life than the freshmen of 1969 had been. In 1969, 85% of the freshmen considered this objective essential or very important. Since then, this percentage has decreased by approximately 0.9 each year. If this trend continues, by which year will only 25% of college freshmen consider “developing a meaningful philosophy of life” essential or very important?

**EXAMPLE 3** A Price Reduction on a Digital Camera

Your local computer store is having a terrific sale on digital cameras. After a 40% price reduction, you purchase a digital camera for \$276. What was the camera’s price before the reduction?

**SOLUTION**

**Step 1 Let  $x$  represent one of the unknown quantities.** We will let

$x$  = the price of the digital camera prior to the reduction.

**Step 2 Represent other unknown quantities in terms of  $x$ .** There are no other unknown quantities to find, so we can skip this step.

**Step 3 Write an equation in  $x$  that models the conditions.** The camera’s original price minus the 40% reduction is the reduced price, \$276.

**Step 4 Solve the equation and answer the question.**

$$\begin{aligned}
 x - 0.4x &= 276 && \text{This is the equation that models the problem's conditions.} \\
 0.6x &= 276 && \text{Combine like terms: } x - 0.4x = 1x - 0.4x = 0.6x. \\
 \frac{0.6x}{0.6} &= \frac{276}{0.6} && \text{Divide both sides by 0.6.} \\
 x &= 460 && \text{Simplify: } 0.6 \overline{) 276.0} \begin{array}{r} 460. \end{array}
 \end{aligned}$$

The digital camera’s price before the reduction was \$460.

**Step 5 Check the proposed solution in the original wording of the problem.** The price before the reduction, \$460, minus the 40% reduction should equal the reduced price given in the original wording, \$276:

$$460 - 40\% \text{ of } 460 = 460 - 0.4(460) = 460 - 184 = 276.$$

This verifies that the digital camera’s price before the reduction was \$460. ●●●

**GREAT QUESTION!**

Why is the 40% reduction written as  $0.4x$  in Example 3?

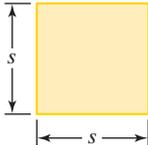

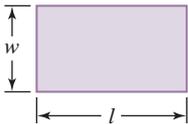

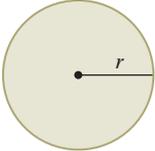

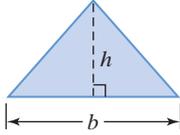

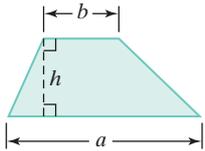

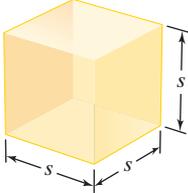

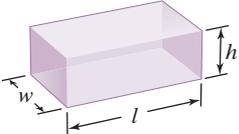

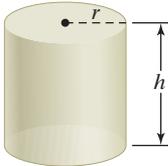

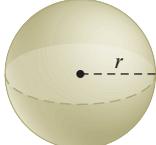

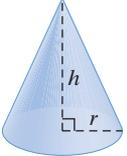

- 40% is written 0.40 or 0.4.
- “Of” represents multiplication, so 40% of the original price is  $0.4x$ .

Notice that the original price,  $x$ , reduced by 40% is  $x - 0.4x$  and *not*  $x - 0.4$ .

 **Check Point 3** After a 30% price reduction, you purchase a new computer for \$840. What was the computer's price before the reduction?

Solving geometry problems usually requires a knowledge of basic geometric ideas and formulas. Formulas for area, perimeter, and volume are given in **Table P.6**.

**Table P.6** Common Formulas for Area, Perimeter, and Volume

<p><b>Square</b></p> $A = s^2$ $P = 4s$	<p><b>Rectangle</b></p> $A = lw$ $P = 2l + 2w$	<p><b>Circle</b></p> $A = \pi r^2$ $C = 2\pi r$	<p><b>Triangle</b></p> $A = \frac{1}{2}bh$	<p><b>Trapezoid</b></p> $A = \frac{1}{2}h(a + b)$
				
<p><b>Cube</b></p> $V = s^3$	<p><b>Rectangular Solid</b></p> $V = lwh$	<p><b>Circular Cylinder</b></p> $V = \pi r^2 h$	<p><b>Sphere</b></p> $V = \frac{4}{3}\pi r^3$	<p><b>Cone</b></p> $V = \frac{1}{3}\pi r^2 h$
				

We will be using the formula for the perimeter of a rectangle,  $P = 2l + 2w$ , in our next example. The formula states that a rectangle's perimeter is the sum of twice its length and twice its width.

#### EXAMPLE 4 Finding the Dimensions of an American Football Field

The length of an American football field is 200 feet more than the width. If the perimeter of the field is 1040 feet, what are its dimensions?

#### SOLUTION

**Step 1** Let  $x$  represent one of the unknown quantities. We know something about the length; the length is 200 feet more than the width. We will let

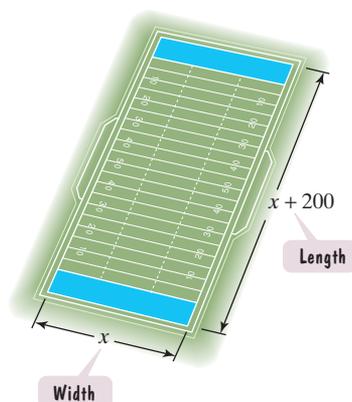

$$x = \text{the width.}$$

**Step 2** Represent other unknown quantities in terms of  $x$ . Because the length is 200 feet more than the width, we add 200 to the width to represent the length. Thus,

$$x + 200 = \text{the length.}$$

**Figure P.16** illustrates an American football field and its dimensions.

**Step 3** Write an equation in  $x$  that models the conditions. Because the perimeter of the field is 1040 feet,

**FIGURE P.16** An American football field

Twice the length	+	twice the width	=	the perimeter.
$2(x + 200)$		$2x$		$1040.$

**GREAT QUESTION!**

Should I draw pictures like Figure P.16 when solving geometry problems?

When solving word problems, particularly problems involving geometric figures, drawing a picture of the situation is often helpful. Label  $x$  on your drawing and, where appropriate, label other parts of the drawing in terms of  $x$ .

**Step 4 Solve the equation and answer the question.**

$$2(x + 200) + 2x = 1040$$

*This is the equation that models the problem's conditions.*

$$2x + 400 + 2x = 1040$$

*Apply the distributive property.*

$$4x + 400 = 1040$$

*Combine like terms:  $2x + 2x = 4x$ .*

$$4x = 640$$

*Subtract 400 from both sides.*

$$x = 160$$

*Divide both sides by 4.*

Thus,

$$\text{width} = x = 160.$$

$$\text{length} = x + 200 = 160 + 200 = 360.$$

The dimensions of an American football field are 160 feet by 360 feet. (The 360-foot length is usually described as 120 yards.)

**Step 5 Check the proposed solution in the original wording of the problem.** The perimeter of the football field using the dimensions that we found is

$$2(360 \text{ feet}) + 2(160 \text{ feet}) = 720 \text{ feet} + 320 \text{ feet} = 1040 \text{ feet}.$$

Because the problem's wording tells us that the perimeter is 1040 feet, our dimensions are correct. ...

**Check Point 4** The length of a rectangular basketball court is 44 feet more than the width. If the perimeter of the basketball court is 288 feet, what are its dimensions?

We will use the formula for the area of a rectangle,  $A = lw$ , in our next example. The formula states that a rectangle's area is the product of its length and its width.

**EXAMPLE 5 Solving a Problem Involving Landscape Design**

A rectangular garden measures 80 feet by 60 feet. A large path of uniform width is to be added along both shorter sides and one longer side of the garden. The landscape designer doing the work wants to double the garden's area with the addition of this path. How wide should the path be?

**SOLUTION**

**Step 1 Let  $x$  represent one of the unknown quantities.** We will let

$$x = \text{the width of the path.}$$

The situation is illustrated in **Figure P.17**. The figure shows the original 80-by-60 foot rectangular garden and the path of width  $x$  added along both shorter sides and one longer side.

**Step 2 Represent other unknown quantities in terms of  $x$ .** Because the path is added along both shorter sides and one longer side, **Figure P.17** shows that

$$80 + 2x = \text{the length of the new, expanded rectangle}$$

$$60 + x = \text{the width of the new, expanded rectangle.}$$

**Step 3 Write an equation in  $x$  that models the conditions.** The area of the rectangle must be doubled by the addition of the path.

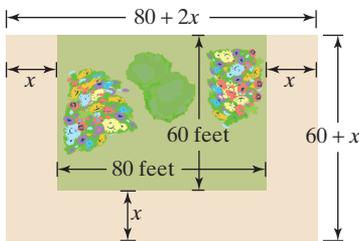

The area, or length times width, of the new, expanded rectangle

must be

twice that of

the area of the garden.

$$(80 + 2x)(60 + x) = 2 \cdot 80 \cdot 60$$

**FIGURE P.17** The garden's area is to be doubled by adding the path.

**Step 4** Solve the equation and answer the question.

$$(80 + 2x)(60 + x) = 2 \cdot 80 \cdot 60$$

This is the equation that models the problem's conditions.

$$4800 + 200x + 2x^2 = 9600$$

Multiply. Use FOIL on the left side.

$$2x^2 + 200x - 4800 = 0$$

Subtract 9600 from both sides and write the quadratic equation in general form.

$$2(x^2 + 100x - 2400) = 0$$

Factor out 2, the GCF.

$$2(x - 20)(x + 120) = 0$$

Factor the trinomial.

$$x - 20 = 0 \quad \text{or} \quad x + 120 = 0$$

Set each variable factor equal to 0.

$$x = 20 \qquad x = -120$$

Solve for  $x$ .

The path cannot have a negative width. Because  $-120$  is geometrically impossible, we use  $x = 20$ . The width of the path should be 20 feet.

**Step 5** Check the proposed solution in the original wording of the problem. Has the landscape architect doubled the garden's area with the 20-foot-wide path? The area of the garden is 80 feet times 60 feet, or 4800 square feet. Because  $80 + 2x$  and  $60 + x$  represent the length and width of the expanded rectangle,

$$80 + 2x = 80 + 2 \cdot 20 = 120 \text{ feet is the expanded rectangle's length.}$$

$$60 + x = 60 + 20 = 80 \text{ feet is the expanded rectangle's width.}$$

The area of the expanded rectangle is 120 feet times 80 feet, or 9600 square feet. This is double the area of the garden, 4800 square feet, as specified by the problem's conditions. ●●●

 **Check Point 5** A rectangular garden measures 16 feet by 12 feet. A path of uniform width is to be added so as to surround the entire garden. The landscape artist doing the work wants the garden and path to cover an area of 320 square feet. How wide should the path be?

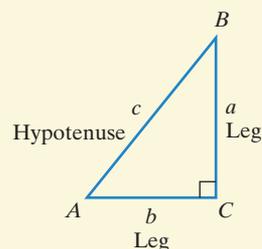

The solution to our next problem relies on knowing the **Pythagorean Theorem**. The theorem relates the lengths of the three sides of a **right triangle**, a triangle with one angle measuring  $90^\circ$ . The side opposite the  $90^\circ$  angle is called the **hypotenuse**. The other sides are called **legs**. The legs form the two sides of the right angle.

**The Pythagorean Theorem**

The sum of the squares of the lengths of the legs of a right triangle equals the square of the length of the hypotenuse.

If the legs have lengths  $a$  and  $b$ , and the hypotenuse has length  $c$ , then

$$a^2 + b^2 = c^2.$$

**EXAMPLE 6** Using the Pythagorean Theorem

- A wheelchair ramp with a length of 122 inches has a horizontal distance of 120 inches. What is the ramp's vertical distance?
- Construction laws are very specific when it comes to access ramps for the disabled. Every vertical rise of 1 inch requires a horizontal run of 12 inches. Does this ramp satisfy the requirement?

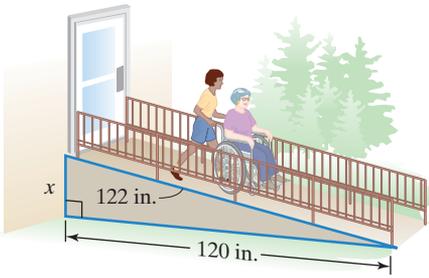

FIGURE P.18

**SOLUTION**

**a. Step 1** Let  $x$  represent one of the unknown quantities. We will let  $x =$  the ramp’s vertical distance.

The situation is illustrated in **Figure P.18**.

**Step 2** Represent other unknown quantities in terms of  $x$ . There are no other unknown quantities, so we can skip this step.

**Step 3** Write an equation in  $x$  that models the conditions. **Figure P.18** shows the right triangle that is formed by the ramp, the wall, and the ground. We can find  $x$ , the ramp’s vertical distance, using the Pythagorean Theorem.

$$\begin{matrix} \text{(leg)}^2 & \text{plus} & \text{(leg)}^2 & \text{equals} & \text{(hypotenuse)}^2 \\ x^2 & + & 120^2 & = & 122^2 \end{matrix}$$

**Step 4** Solve the equation and answer the question. The quadratic equation  $x^2 + 120^2 = 122^2$  can be solved most efficiently by the square root property.

$$x^2 + 120^2 = 122^2$$

This is the equation resulting from the Pythagorean Theorem.

$$x^2 + 14,400 = 14,884$$

Square 120 and 122.

$$x^2 = 484$$

Isolate  $x^2$  by subtracting 14,400 from both sides.

$$x = \sqrt{484} \quad \text{or} \quad x = -\sqrt{484}$$

Apply the square root property.

$$x = 22$$

$$x = -22$$

Simplify.

**GREAT QUESTION!**

**If the sum of the squares of the lengths of two sides of a triangle equals the square of the length of the third side, must the triangle be a right triangle?**

Yes. The Pythagorean Theorem is an *if . . . then* statement: If a triangle is a right triangle, then  $a^2 + b^2 = c^2$ . The **converse** of *if  $p$  then  $q$*  is *if  $q$  then  $p$* . Although the converse of a true statement may not be true, the converse of the Pythagorean Theorem is also a true statement: If  $a^2 + b^2 = c^2$ , then a triangle is a right triangle.

Because  $x$  represents the ramp’s vertical distance, this measurement must be positive. We reject  $-22$ . Thus, the ramp’s vertical distance is 22 inches.

**Step 5** Check the proposed solution in the original wording of the problem. The problem’s wording implies that the ramp, the wall, and the ground form a right triangle. This can be checked using the **converse of the Pythagorean Theorem**: If a triangle has sides of lengths  $a$ ,  $b$ , and  $c$ , where  $c$  is the length of the longest side, and if  $a^2 + b^2 = c^2$ , then the triangle is a right triangle. Let’s check that a vertical distance of 22 inches forms a right triangle with the ramp’s length of 122 inches and its horizontal distance of 120 inches. Is  $22^2 + 120^2 = 122^2$ ? Simplifying the arithmetic, we obtain the true statement  $14,884 = 14,884$ . Thus, a vertical distance of 22 inches forms a right triangle.

**b.** Every vertical rise of 1 inch requires a horizontal run of 12 inches. Because the ramp has a vertical distance of 22 inches, it requires a horizontal distance of  $22(12)$  inches, or 264 inches. The horizontal distance is only 120 inches, so this ramp does not satisfy construction laws for access ramps for the disabled. ●●●

**Check Point 6** A radio tower is supported by two wires that are each 130 yards long and attached to the ground 50 yards from the base of the tower. How tall is the tower?

In our final example, the conditions are modeled by a rational equation.

**EXAMPLE 7** Dividing the Cost of a Yacht

A group of friends agrees to share the cost of a \$50,000 yacht equally. Before the purchase is made, one more person joins the group and enters the agreement. As a result, each person’s share is reduced by \$2500. How many people were in the original group?

**SOLUTION**

**Step 1** Let  $x$  represent one of the unknown quantities. We will let  $x =$  the number of people in the original group.

**Step 2 Represent other unknown quantities in terms of  $x$ .** Because one more person joined the original group, let

$$x + 1 = \text{the number of people in the final group.}$$

**Step 3 Write an equation in  $x$  that models the conditions.** As a result of one more person joining the original group, each person's share is reduced by \$2500.

Original cost per person	minus	\$2500	equals	the final cost per person.
$\frac{50,000}{x}$	-	2500	=	$\frac{50,000}{x + 1}$
This is the yacht's cost, \$50,000, divided by the number of people, $x$ .				This is the yacht's cost, \$50,000, divided by the number of people, $x + 1$ .

**Step 4 Solve the equation and answer the question.**

$$\frac{50,000}{x} - 2500 = \frac{50,000}{x + 1}$$

This is the equation that models the problem's conditions.

$$x(x + 1)\left(\frac{50,000}{x} - 2500\right) = x(x + 1) \cdot \frac{50,000}{x + 1}$$

Multiply both sides by  $x(x + 1)$ , the LCD.

$$x(x + 1) \cdot \frac{50,000}{x} - x(x + 1)2500 = x(x + 1) \cdot \frac{50,000}{(x + 1)}$$

Use the distributive property and divide out common factors.

$$50,000(x + 1) - 2500x(x + 1) = 50,000x$$

Simplify.

$$50,000x + 50,000 - 2500x^2 - 2500x = 50,000x$$

Use the distributive property.

$$-2500x^2 + 47,500x + 50,000 = 50,000x$$

Combine like terms:  
 $50,000x - 2500x = 47,500x$ .

$$-2500x^2 - 2500x + 50,000 = 0$$

Write the quadratic equation in general form, subtracting  $50,000x$  from both sides.

$$-2500(x^2 + x - 20) = 0$$

Factor out  $-2500$ .

$$-2500(x + 5)(x - 4) = 0$$

Factor completely.

$$x + 5 = 0 \quad \text{or} \quad x - 4 = 0$$

Set each variable factor equal to zero.

$$x = -5 \qquad x = 4$$

Solve the resulting equations.

Because  $x$  represents the number of people in the original group,  $x$  cannot be negative. Thus, there were four people in the original group.

**Step 5 Check the proposed solution in the original wording of the problem.**

$$\text{original cost per person} = \frac{\$50,000}{4} = \$12,500$$

$$\text{final cost per person} = \frac{\$50,000}{5} = \$10,000$$

We see that each person's share is reduced by  $\$12,500 - \$10,000$ , or \$2500, as specified by the problem's conditions. ...

 **Check Point 7** A group of people share equally in a \$5,000,000 lottery. Before the money is divided, three more winning ticket holders are declared. As a result, each person's share is reduced by \$375,000. How many people were in the original group of winners?

### CONCEPT AND VOCABULARY CHECK

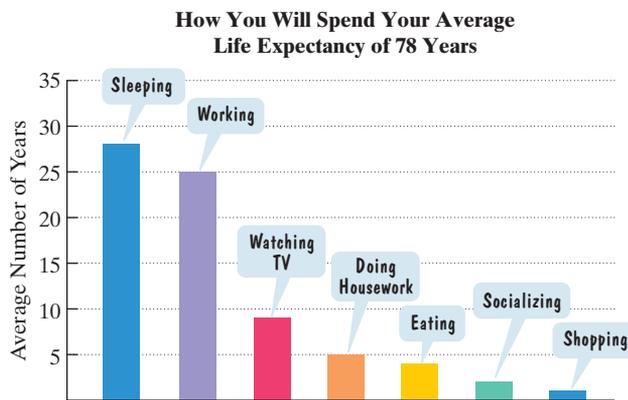

Fill in each blank so that the resulting statement is true.

- According to the U.S. Office of Management and Budget, the 2011 budget for defense exceeded the budget for education by \$658.6 billion. If  $x$  represents the budget for education, in billions of dollars, the budget for defense can be represented by \_\_\_\_\_.
- In 2000, 31% of U.S. adults viewed a college education as essential for success. For the period from 2000 through 2010, this percentage increased by approximately 2.4 each year. The percentage of U.S. adults who viewed a college education as essential for success  $x$  years after 2000 can be represented by \_\_\_\_\_.
- I purchased a computer after a 15% price reduction. If  $x$  represents the computer's original price, the reduced price can be represented by \_\_\_\_\_.
- The length of a rectangle is 5 feet more than the width. If  $x$  represents the width, in feet, the length is represented by \_\_\_\_\_. The perimeter of the rectangle is represented by \_\_\_\_\_. The area of the rectangle is represented by \_\_\_\_\_.
- A triangle with one angle measuring  $90^\circ$  is called a/an \_\_\_\_\_ triangle. The side opposite the  $90^\circ$  angle is called the \_\_\_\_\_. The other sides are called \_\_\_\_\_.
- The Pythagorean Theorem states that in any \_\_\_\_\_ triangle, the sum of the squares of the lengths of the \_\_\_\_\_ equals \_\_\_\_\_.
- If  $x$  people equally share the cost of a \$10,000 boat, the cost per person is represented by \_\_\_\_\_. If two more people share the cost, the cost per person is represented by \_\_\_\_\_.

### EXERCISE SET P.8

#### Practice and Application Exercises

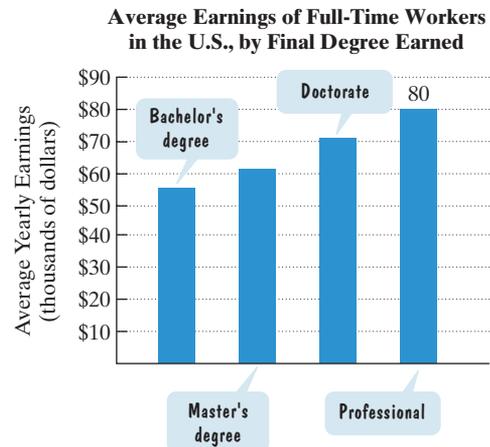

How will you spend your average life expectancy of 78 years? The bar graph shows the average number of years you will devote to each of your most time-consuming activities. Exercises 1–2 are based on the data displayed by the graph.

Source: U.S. Bureau of Labor Statistics

- According to the American Bureau of Labor Statistics, you will devote 37 years to sleeping and watching TV. The number of years sleeping will exceed the number of years watching TV by 19. Over your lifetime, how many years will you spend on each of these activities?
- According to the American Bureau of Labor Statistics, you will devote 32 years to sleeping and eating. The number of years sleeping will exceed the number of years eating by 24. Over your lifetime, how many years will you spend on each of these activities?

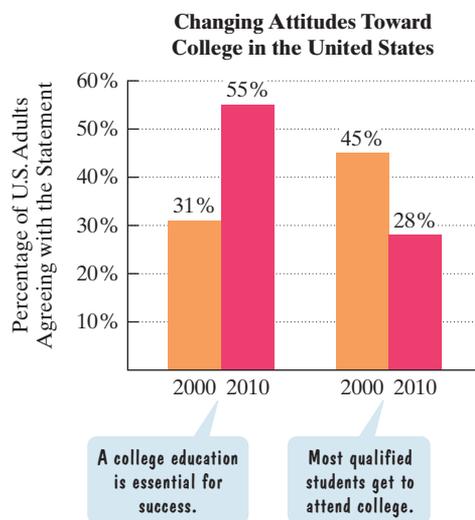

The bar graph shows average yearly earnings in the United States for people with a college education, by final degree earned. Exercises 3–4 are based on the data displayed by the graph.

Source: U.S. Census Bureau

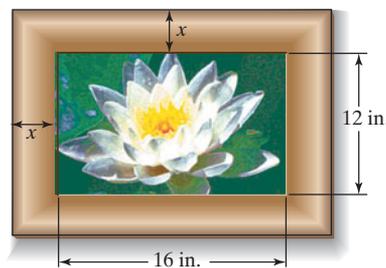

- The average yearly salary of an American whose final degree is a master's is \$49 thousand less than twice that of an American whose final degree is a bachelor's. Combined, two people with each of these educational attainments earn \$116 thousand. Find the average yearly salary of Americans with each of these final degrees.
- The average yearly salary of an American whose final degree is a doctorate is \$39 thousand less than twice that of an American whose final degree is a bachelor's. Combined, two people with each of these educational attainments earn \$126 thousand. Find the average yearly salary of Americans with each of these final degrees.

Even as Americans increasingly view a college education as essential for success, many believe that a college education is becoming less available to qualified students. Exercises 5–6 are based on the data displayed by the graph.

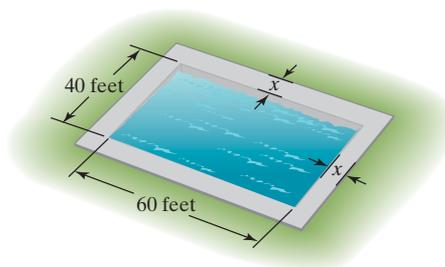

Source: Public Agenda

- In 2000, 31% of U.S. adults viewed a college education as essential for success. For the period 2000 through 2010, the percentage viewing a college education as essential for success increased on average by approximately 2.4 each year. If this trend continues, by which year will 67% of all American adults view a college education as essential for success?
  - The data displayed by the graph indicate that in 2000, 45% of U.S. adults believed most qualified students get to attend college. For the period from 2000 through 2010, the percentage who believed that a college education is available to most qualified students decreased by approximately 1.7 each year. If this trend continues, by which year will only 11% of all American adults believe that most qualified students get to attend college?
  - A new car worth \$24,000 is depreciating in value by \$3000 per year.
    - Write a formula that models the car's value,  $y$ , in dollars, after  $x$  years.
    - Use the formula from part (a) to determine after how many years the car's value will be \$9000.
  - A new car worth \$45,000 is depreciating in value by \$5000 per year.
    - Write a formula that models the car's value,  $y$ , in dollars, after  $x$  years.
    - Use the formula from part (a) to determine after how many years the car's value will be \$10,000.
  - In 2010, there were 13,300 students at college A, with a projected enrollment increase of 1000 students per year. In the same year, there were 26,800 students at college B, with a projected enrollment decline of 500 students per year. According to these projections, when will the colleges have the same enrollment? What will be the enrollment in each college at that time?
  - In 2000, the population of Greece was 10,600,000, with projections of a population decrease of 28,000 people per year. In the same year, the population of Belgium was 10,200,000, with projections of a population decrease of 12,000 people per year. (Source: United Nations) According to these projections, when will the two countries have the same population? What will be the population at that time?
  - After a 20% reduction, you purchase a television for \$336. What was the television's price before the reduction?
  - After a 30% reduction, you purchase a dictionary for \$30.80. What was the dictionary's price before the reduction?
  - Including 8% sales tax, an inn charges \$162 per night. Find the inn's nightly cost before the tax is added.
  - Including 5% sales tax, an inn charges \$252 per night. Find the inn's nightly cost before the tax is added.
- Exercises 15–16 involve markup, the amount added to the dealer's cost of an item to arrive at the selling price of that item.*
- The selling price of a refrigerator is \$584. If the markup is 25% of the dealer's cost, what is the dealer's cost of the refrigerator?
  - The selling price of a scientific calculator is \$15. If the markup is 25% of the dealer's cost, what is the dealer's cost of the calculator?
  - A rectangular soccer field is twice as long as it is wide. If the perimeter of the soccer field is 300 yards, what are its dimensions?
  - A rectangular swimming pool is three times as long as it is wide. If the perimeter of the pool is 320 feet, what are its dimensions?
  - The length of the rectangular tennis court at Wimbledon is 6 feet longer than twice the width. If the court's perimeter is 228 feet, what are the court's dimensions?
  - The length of a rectangular pool is 6 meters less than twice the width. If the pool's perimeter is 126 meters, what are its dimensions?
  - The rectangular painting in the figure shown measures 12 inches by 16 inches and includes a frame of uniform width around the four edges. The perimeter of the rectangle formed by the painting and its frame is 72 inches. Determine the width of the frame.

- The rectangular swimming pool in the figure shown measures 40 feet by 60 feet and includes a path of uniform width around the four edges. The perimeter of the rectangle formed by the pool and the surrounding path is 248 feet. Determine the width of the path.

23. The length of a rectangular sign is 3 feet longer than the width. If the sign's area is 54 square feet, find its length and width.
24. A rectangular parking lot has a length that is 3 yards greater than the width. The area of the parking lot is 180 square yards. Find the length and the width.
25. Each side of a square is lengthened by 3 inches. The area of this new, larger square is 64 square inches. Find the length of a side of the original square.
26. Each side of a square is lengthened by 2 inches. The area of this new, larger square is 36 square inches. Find the length of a side of the original square.
27. A pool measuring 10 meters by 20 meters is surrounded by a path of uniform width. If the area of the pool and the path combined is 600 square meters, what is the width of the path?
28. A vacant rectangular lot is being turned into a community vegetable garden measuring 15 meters by 12 meters. A path of uniform width is to surround the garden. If the area of the lot is 378 square meters, find the width of the path surrounding the garden.
29. As part of a landscaping project, you put in a flower bed measuring 20 feet by 30 feet. To finish off the project, you are putting in a uniform border of pine bark around the outside of the rectangular garden. You have enough pine bark to cover 336 square feet. How wide should the border be?
30. As part of a landscaping project, you put in a flower bed measuring 10 feet by 12 feet. You plan to surround the bed with a uniform border of low-growing plants that require 1 square foot each when mature. If you have 168 of these plants, how wide a strip around the flower bed should you prepare for the border?
31. A 20-foot ladder is 15 feet from a house. How far up the house, to the nearest tenth of a foot, does the ladder reach?
32. The base of a 30-foot ladder is 10 feet from a building. If the ladder reaches the flat roof, how tall, to the nearest tenth of a foot, is the building?
33. A tree is supported by a wire anchored in the ground 5 feet from its base. The wire is 1 foot longer than the height that it reaches on the tree. Find the length of the wire.
34. A tree is supported by a wire anchored in the ground 15 feet from its base. The wire is 4 feet longer than the height that it reaches on the tree. Find the length of the wire.
35. A rectangular piece of land whose length is twice its width has a diagonal distance of 64 yards. How many yards, to the nearest tenth of a yard, does a person save by walking diagonally across the land instead of walking its length and its width?
36. A rectangular piece of land whose length is three times its width has a diagonal distance of 92 yards. How many yards, to the nearest tenth of a yard, does a person save by walking diagonally across the land instead of walking its length and its width?
37. A group of people share equally in a \$20,000,000 lottery. Before the money is divided, two more winning ticket holders are declared. As a result, each person's share is reduced by \$500,000. How many people were in the original group of winners?
38. A group of friends agrees to share the cost of a \$480,000 vacation condominium equally. Before the purchase is made, four more people join the group and enter the agreement. As a result, each person's share is reduced by \$32,000. How many people were in the original group?

*In Exercises 39–42, use the formula*

$$\text{Time traveled} = \frac{\text{Distance traveled}}{\text{Average velocity}}$$

39. A car can travel 300 miles in the same amount of time it takes a bus to travel 180 miles. If the average velocity of the bus is 20 miles per hour slower than the average velocity of the car, find the average velocity for each.
40. A passenger train can travel 240 miles in the same amount of time it takes a freight train to travel 160 miles. If the average velocity of the freight train is 20 miles per hour slower than the average velocity of the passenger train, find the average velocity of each.
41. You ride your bike to campus a distance of 5 miles and return home on the same route. Going to campus, you ride mostly downhill and average 9 miles per hour faster than on your return trip home. If the round trip takes one hour and ten minutes—that is  $\frac{7}{6}$  hours—what is your average velocity on the return trip?
42. An engine pulls a train 140 miles. Then a second engine, whose average velocity is 5 miles per hour faster than the first engine, takes over and pulls the train 200 miles. The total time required for both engines is 9 hours. Find the average velocity of each engine.
43. An automobile repair shop charged a customer \$448, listing \$63 for parts and the remainder for labor. If the cost of labor is \$35 per hour, how many hours of labor did it take to repair the car?
44. A repair bill on a sailboat came to \$1603, including \$532 for parts and the remainder for labor. If the cost of labor is \$63 per hour, how many hours of labor did it take to repair the sailboat?
45. An HMO pamphlet contains the following recommended weight for women: “Give yourself 100 pounds for the first 5 feet plus 5 pounds for every inch over 5 feet tall.” Using this description, what height corresponds to a recommended weight of 135 pounds?
46. A job pays an annual salary of \$33,150, which includes a holiday bonus of \$750. If paychecks are issued twice a month, what is the gross amount for each paycheck?
47. You have 35 hits in 140 times at bat. Your batting average is  $\frac{35}{140}$ , or 0.25. How many consecutive hits must you get to increase your batting average to 0.30?
48. You have 30 hits in 120 times at bat. Your batting average is  $\frac{30}{120}$ , or 0.25. How many consecutive hits must you get to increase your batting average to 0.28?

### Writing in Mathematics

49. In your own words, describe a step-by-step approach for solving algebraic word problems.
50. Write an original word problem that can be solved using an equation. Then solve the problem.
51. In your own words, state the Pythagorean Theorem.

52. In the 1939 movie *The Wizard of Oz*, upon being presented with a Th.D. (Doctor of Thinkology), the Scarecrow proudly exclaims, “The sum of the square roots of any two sides of an isosceles triangle is equal to the square root of the remaining side.” (Source: *The Wizard of Oz*, © 1939, Warner Bros.) Did the Scarecrow get the Pythagorean Theorem right? In particular, describe four errors in the Scarecrow’s statement.

### Critical Thinking Exercises

**Make Sense?** In Exercises 53–56, determine whether statement makes sense or does not make sense, and explain reasoning.

53. By modeling attitudes of college freshmen from 1969 through 2006, I can make precise predictions about the attitudes of the freshman class of 2020.
54. I find the hardest part in solving a word problem is writing the equation that models the verbal conditions.
55. After a 35% reduction, a computer’s price is \$780, so I determined the original price,  $x$ , by solving  $x - 0.35 = 780$ .
56. When I use the square root property to determine the length of a right triangle’s side, I don’t even bother to list the negative square root.
57. The perimeter of a plot of land in the shape of a right triangle is 12 miles. If one leg of the triangle exceeds the other leg by 1 mile, find the length of each boundary of the land.
58. The price of a dress is reduced by 40%. When the dress still does not sell, it is reduced by 40% of the reduced price. If the price of the dress after both reductions is \$72, what was the original price?
59. In a film, the actor Charles Coburn plays an elderly “uncle” character criticized for marrying a woman when he is 3 times her age. He wittily replies, “Ah, but in 20 years time I shall only be twice her age.” How old is the “uncle” and the woman?
60. Suppose that we agree to pay you 8¢ for every problem in this chapter that you solve correctly and fine you 5¢ for every problem done incorrectly. If at the end of 26 problems we do not owe each other any money, how many problems did you solve correctly?
61. It was wartime when the Ricardos found out Mrs. Ricardo was pregnant. Ricky Ricardo was drafted and made out a will, deciding that \$14,000 in a savings account was to be divided between his wife and his child-to-be. Rather strangely, and certainly with gender bias, Ricky stipulated that if the child were a boy, he would get twice the amount of the mother’s portion. If it were a girl, the mother would get twice the amount the girl was to receive. We’ll never know what Ricky was thinking of, for (as fate would have it) he did not return from war. Mrs. Ricardo gave birth to twins—a boy and a girl. How was the money divided?
62. A thief steals a number of rare plants from a nursery. On the way out, the thief meets three security guards, one after another. To each security guard, the thief is forced to give one-half the plants that he still has, plus 2 more. Finally, the thief leaves the nursery with 1 lone palm. How many plants were originally stolen?

### Group Exercise

63. One of the best ways to learn how to *solve* a word problem in algebra is to *design* word problems of your own. Creating a word problem makes you very aware of precisely how much information is needed to solve the problem. You must also focus on the best way to present information to a reader and on how much information to give. As you write your problem, you gain skills that will help you solve problems created by others.

The group should design five different word problems that can be solved using equations. All of the problems should be on different topics. For example, the group should not have more than one problem on the perimeter of a rectangle. The group should turn in both the problems and their algebraic solutions.

### Preview Exercises

Exercises 64–66 will help you prepare for the material covered in the next section.

64. Is  $-1$  a solution of  $3 - 2x \leq 11$ ?
65. Solve:  $-2x - 4 = x + 5$ .
66. Solve:  $\frac{x + 3}{4} = \frac{x - 2}{3} + \frac{1}{4}$ .

## SECTION P.9

## Linear Inequalities and Absolute Value Inequalities

## Objectives

- 1 Use interval notation.
- 2 Find intersections and unions of intervals.
- 3 Solve linear inequalities.
- 4 Solve compound inequalities.
- 5 Solve absolute value inequalities.

- 1 Use interval notation.

Rent-a-Heap, a car rental company, charges \$125 per week plus \$0.20 per mile to rent one of their cars. Suppose you are limited by how much money you can spend for the week: You can spend at most \$335. If we let  $x$  represent the number of miles you drive the heap in a week, we can write an inequality that models the given conditions:

$$\begin{array}{ccccccc} \text{The weekly} & & \text{the charge of} & & \text{must be less} & & \\ \text{charge of } \$125 & \text{plus} & \$0.20 \text{ per mile} & & \text{than} & & \\ & & \text{for } x \text{ miles} & & \text{or equal to} & & \\ & & & & & & \\ 125 & + & 0.20x & \leq & 335. & & \end{array}$$

Placing an inequality symbol between a polynomial of degree 1 and a constant results in a *linear inequality in one variable*. In this section, we will study how to solve linear inequalities such as  $125 + 0.20x \leq 335$ . **Solving an inequality** is the process of finding the set of numbers that make the inequality a true statement. These numbers are called the **solutions** of the inequality and we say that they **satisfy** the inequality. The set of all solutions is called the **solution set** of the inequality. Set-builder notation and a new notation, called *interval notation*, are used to represent these solution sets. We begin this section by looking at interval notation.

## Interval Notation

Some sets of real numbers can be represented using **interval notation**. Suppose that  $a$  and  $b$  are two real numbers such that  $a < b$ .

Interval Notation	Graph
<p>The <b>open interval</b> <math>(a, b)</math> represents the set of real numbers between, but not including, <math>a</math> and <math>b</math>.</p> $(a, b) = \{x \mid a < x < b\}$ <p><math>x</math> is greater than <math>a</math> (<math>a &lt; x</math>) and <math>x</math> is less than <math>b</math> (<math>x &lt; b</math>).</p>	<p>The parentheses in the graph and in interval notation indicate that <math>a</math> and <math>b</math>, the endpoints, are excluded from the interval.</p>
<p>The <b>closed interval</b> <math>[a, b]</math> represents the set of real numbers between, and including, <math>a</math> and <math>b</math>.</p> $[a, b] = \{x \mid a \leq x \leq b\}$ <p><math>x</math> is greater than or equal to <math>a</math> (<math>a \leq x</math>) and <math>x</math> is less than or equal to <math>b</math> (<math>x \leq b</math>).</p>	<p>The square brackets in the graph and in interval notation indicate that <math>a</math> and <math>b</math>, the endpoints, are included in the interval.</p>
<p>The <b>infinite interval</b> <math>(a, \infty)</math> represents the set of real numbers that are greater than <math>a</math>.</p> $(a, \infty) = \{x \mid x > a\}$ <p>The infinity symbol does not represent a real number. It indicates that the interval extends indefinitely to the right.</p>	<p>The parenthesis indicates that <math>a</math> is excluded from the interval.</p>
<p>The <b>infinite interval</b> <math>(-\infty, b]</math> represents the set of real numbers that are less than or equal to <math>b</math>.</p> $(-\infty, b] = \{x \mid x \leq b\}$ <p>The negative infinity symbol indicates that the interval extends indefinitely to the left.</p>	<p>The square bracket indicates that <math>b</math> is included in the interval.</p>

### Parentheses and Brackets in Interval Notation

Parentheses indicate endpoints that are not included in an interval. Square brackets indicate endpoints that are included in an interval. Parentheses are always used with  $\infty$  or  $-\infty$ .

**Table P.7** lists nine possible types of intervals used to describe subsets of real numbers.

**Table P.7** Intervals on the Real Number Line

Let $a$ and $b$ be real numbers such that $a < b$ .		
Interval Notation	Set-Builder Notation	Graph
$(a, b)$	$\{x   a < x < b\}$	
$[a, b]$	$\{x   a \leq x \leq b\}$	
$[a, b)$	$\{x   a \leq x < b\}$	
$(a, b]$	$\{x   a < x \leq b\}$	
$(a, \infty)$	$\{x   x > a\}$	
$[a, \infty)$	$\{x   x \geq a\}$	
$(-\infty, b)$	$\{x   x < b\}$	
$(-\infty, b]$	$\{x   x \leq b\}$	
$(-\infty, \infty)$	$\{x   x \text{ is a real number}\}$ or $\mathbb{R}$ (set of real numbers)	

### EXAMPLE 1 Using Interval Notation

Express each interval in set-builder notation and graph:

- a.  $(-1, 4]$       b.  $[2.5, 4]$       c.  $(-4, \infty)$ .

#### SOLUTION

a.  $(-1, 4] = \{x | -1 < x \leq 4\}$

b.  $[2.5, 4] = \{x | 2.5 \leq x \leq 4\}$

c.  $(-4, \infty) = \{x | x > -4\}$

 **Check Point 1** Express each interval in set-builder notation and graph:

- a.  $[-2, 5)$       b.  $[1, 3.5]$       c.  $(-\infty, -1)$ .

**2** Find intersections and unions of intervals.

### Intersections and Unions of Intervals

In Section P.1, we learned how to find intersections and unions of sets. Recall that  $A \cap B$  ( $A$  intersection  $B$ ) is the set of elements common to both set  $A$  and set  $B$ . By contrast,  $A \cup B$  ( $A$  union  $B$ ) is the set of elements in set  $A$  or in set  $B$  or in both sets.

Because intervals represent sets, it is possible to find their intersections and unions. Graphs are helpful in this process.

### Finding Intersections and Unions of Two Intervals

1. Graph each interval on a number line.
2. **a.** To find the intersection, take the portion of the number line that the two graphs have in common.
- b.** To find the union, take the portion of the number line representing the total collection of numbers in the two graphs.

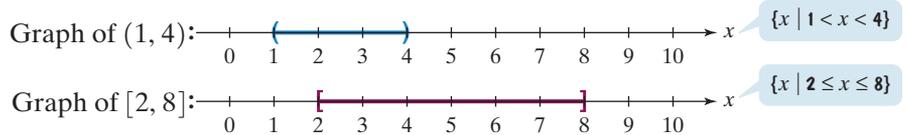

### EXAMPLE 2 Finding Intersections and Unions of Intervals

Use graphs to find each set:

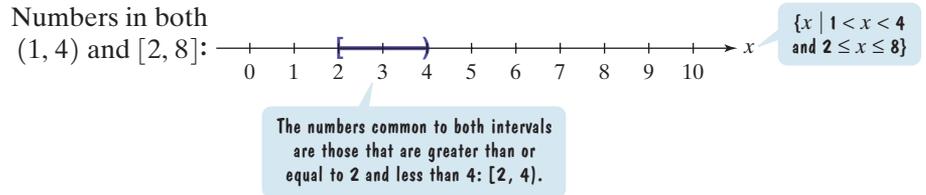

- a.**  $(1, 4) \cap [2, 8]$       **b.**  $(1, 4) \cup [2, 8]$ .

#### SOLUTION

- a.**  $(1, 4) \cap [2, 8]$ , the intersection of the intervals  $(1, 4)$  and  $[2, 8]$ , consists of the numbers that are in both intervals.

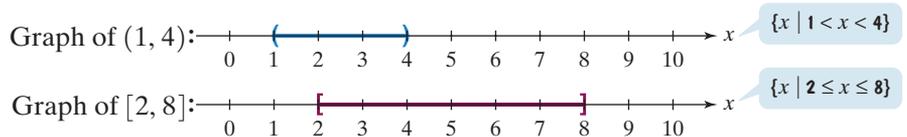

To find  $(1, 4) \cap [2, 8]$ , take the portion of the number line that the two graphs have in common.

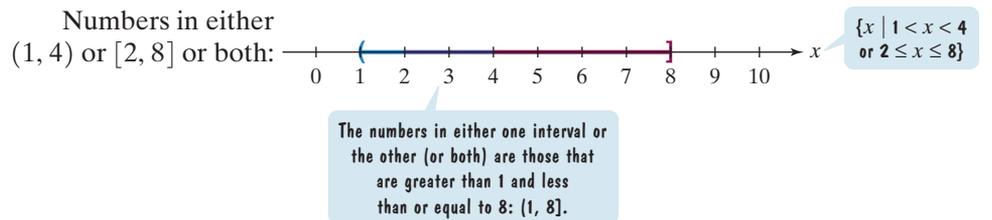

Thus,  $(1, 4) \cap [2, 8] = [2, 4)$ .

- b.**  $(1, 4) \cup [2, 8]$ , the union of the intervals  $(1, 4)$  and  $[2, 8]$ , consists of the numbers that are in either one interval or the other (or both).

To find  $(1, 4) \cup [2, 8]$ , take the portion of the number line representing the total collection of numbers in the two graphs.

Thus,  $(1, 4) \cup [2, 8] = (1, 8]$ .

### Check Point 2 Use graphs to find each set:

- a.**  $[1, 3] \cap (2, 6)$       **b.**  $[1, 3] \cup (2, 6)$ .

## 3 Solve linear inequalities.

## Solving Linear Inequalities in One Variable

We know that a linear equation in  $x$  can be expressed as  $ax + b = 0$ . A **linear inequality in  $x$**  can be written in one of the following forms:

$$ax + b < 0, ax + b \leq 0, ax + b > 0, ax + b \geq 0.$$

In each form,  $a \neq 0$ .

Back to our question that opened this section: How many miles can you drive your Rent-a-Heap car if you can spend at most \$335? We answer the question by solving

$$0.20x + 125 \leq 335$$

for  $x$ . The solution procedure is nearly identical to that for solving

$$0.20x + 125 = 335.$$

Our goal is to get  $x$  by itself on the left side. We do this by subtracting 125 from both sides to isolate  $0.20x$ :

$$\begin{array}{ll} 0.20x + 125 \leq 335 & \text{This is the given inequality.} \\ 0.20x + 125 - 125 \leq 335 - 125 & \text{Subtract 125 from both sides.} \\ 0.20x \leq 210. & \text{Simplify.} \end{array}$$

Finally, we isolate  $x$  from  $0.20x$  by dividing both sides of the inequality by 0.20:

$$\begin{array}{ll} \frac{0.20x}{0.20} \leq \frac{210}{0.20} & \text{Divide both sides by 0.20.} \\ x \leq 1050. & \text{Simplify.} \end{array}$$

With at most \$335 to spend, you can travel at most 1050 miles.

We started with the inequality  $0.20x + 125 \leq 335$  and obtained the inequality  $x \leq 1050$  in the final step. These inequalities have the same solution set, namely  $\{x \mid x \leq 1050\}$ . Inequalities such as these, with the same solution set, are said to be **equivalent**.

We isolated  $x$  from  $0.20x$  by dividing both sides of  $0.20x \leq 210$  by 0.20, a positive number. Let's see what happens if we divide both sides of an inequality by a negative number. Consider the inequality  $10 < 14$ . Divide 10 and 14 by  $-2$ :

$$\frac{10}{-2} = -5 \quad \text{and} \quad \frac{14}{-2} = -7.$$

Because  $-5$  lies to the right of  $-7$  on the number line,  $-5$  is greater than  $-7$ :

$$-5 > -7.$$

Notice that the direction of the inequality symbol is reversed:

$$\begin{array}{l} 10 < 14 \\ \updownarrow \\ -5 > -7. \end{array} \quad \begin{array}{l} \text{Dividing by } -2 \text{ changes} \\ \text{the direction of the} \\ \text{inequality symbol.} \end{array}$$

## GREAT QUESTION!

**What are some common English phrases and sentences that I can model with inequalities?**

English phrases such as “at least” and “at most” can be represented by inequalities.

English Sentence	Inequality
$x$ is at least 5.	$x \geq 5$
$x$ is at most 5.	$x \leq 5$
$x$ is between 5 and 7.	$5 < x < 7$
$x$ is no more than 5.	$x \leq 5$
$x$ is no less than 5.	$x \geq 5$

In general, **when we multiply or divide both sides of an inequality by a negative number, the direction of the inequality symbol is reversed**. When we reverse the direction of the inequality symbol, we say that we change the *sense* of the inequality.

We can isolate a variable in a linear inequality in the same way we isolate a variable in a linear equation. The properties on the next page are used to create equivalent inequalities.

Properties of Inequalities

Property	The Property in Words	Example
<b>The Addition Property of Inequality</b> If $a < b$ , then $a + c < b + c$ . If $a < b$ , then $a - c < b - c$ .	If the same quantity is added to or subtracted from both sides of an inequality, the resulting inequality is equivalent to the original one.	$2x + 3 < 7$ Subtract 3: $2x + 3 - 3 < 7 - 3.$ Simplify: $2x < 4.$
<b>The Positive Multiplication Property of Inequality</b> If $a < b$ and $c$ is positive, then $ac < bc$ . If $a < b$ and $c$ is positive, then $\frac{a}{c} < \frac{b}{c}$ .	If we multiply or divide both sides of an inequality by the same positive quantity, the resulting inequality is equivalent to the original one.	$2x < 4$ Divide by 2: $\frac{2x}{2} < \frac{4}{2}.$ Simplify: $x < 2.$
<b>The Negative Multiplication Property of Inequality</b> If $a < b$ and $c$ is negative, then $ac > bc$ . If $a < b$ and $c$ is negative, then $\frac{a}{c} > \frac{b}{c}$ .	If we multiply or divide both sides of an inequality by the same negative quantity and reverse the direction of the inequality symbol, the resulting inequality is equivalent to the original one.	$-4x < 20$ Divide by $-4$ and change the sense of the inequality: $\frac{-4x}{-4} > \frac{20}{-4}.$ Simplify: $x > -5.$

**EXAMPLE 3** Solving a Linear Inequality

Solve and graph the solution set on a number line:

$$3 - 2x \leq 11.$$

**SOLUTION**

$3 - 2x \leq 11$	<i>This is the given inequality.</i>
$3 - 2x - 3 \leq 11 - 3$	<i>Subtract 3 from both sides.</i>
$-2x \leq 8$	<i>Simplify.</i>
$\frac{-2x}{-2} \geq \frac{8}{-2}$	<i>Divide both sides by <math>-2</math> and change the sense of the inequality.</i>
$x \geq -4$	<i>Simplify.</i>

The solution set consists of all real numbers that are greater than or equal to  $-4$ , expressed as  $\{x | x \geq -4\}$  in set-builder notation. The interval notation for this solution set is  $[-4, \infty)$ . The graph of the solution set is shown as follows:

**DISCOVERY**

As a partial check, select one number from the solution set of  $3 - 2x \leq 11$ . Substitute that number into the original inequality. Perform the resulting computations. You should obtain a true statement.

Is it possible to perform a partial check using a number that is not in the solution set? What should happen in this case? Try doing this.

**Check Point 3** Solve and graph the solution set on a number line:

$$2 - 3x \leq 5.$$

**EXAMPLE 4** Solving a Linear Inequality

Solve and graph the solution set on a number line:

$$-2x - 4 > x + 5.$$

**SOLUTION**

**Step 1 Simplify each side.** Because each side is already simplified, we can skip this step.

**GREAT QUESTION!**

Do I have to solve the inequality in Example 4 by isolating the variable on the left?

No. You can solve

$$-2x - 4 > x + 5$$

by isolating  $x$  on the right side.

Add  $2x$  to both sides.

$$\begin{aligned} -2x - 4 + 2x &> x + 5 + 2x \\ -4 &> 3x + 5 \end{aligned}$$

Now subtract 5 from both sides.

$$\begin{aligned} -4 - 5 &> 3x + 5 - 5 \\ -9 &> 3x \end{aligned}$$

Finally, divide both sides by 3.

$$\begin{aligned} \frac{-9}{3} &> \frac{3x}{3} \\ -3 &> x \end{aligned}$$

This last inequality means the same thing as  $x < -3$ .

**Step 2 Collect variable terms on one side and constant terms on the other side.** We will collect variable terms of  $-2x - 4 > x + 5$  on the left and constant terms on the right.

$$\begin{aligned} -2x - 4 &> x + 5 && \text{This is the given inequality.} \\ -2x - 4 - x &> x + 5 - x && \text{Subtract } x \text{ from both sides.} \\ -3x - 4 &> 5 && \text{Simplify.} \\ -3x - 4 + 4 &> 5 + 4 && \text{Add 4 to both sides.} \\ -3x &> 9 && \text{Simplify.} \end{aligned}$$

**Step 3 Isolate the variable and solve.** We isolate the variable,  $x$ , by dividing both sides by  $-3$ . Because we are dividing by a negative number, we must reverse the inequality symbol.

$$\begin{aligned} \frac{-3x}{-3} &< \frac{9}{-3} && \text{Divide both sides by } -3 \text{ and} \\ &&& \text{change the sense of the inequality.} \\ x &< -3 && \text{Simplify.} \end{aligned}$$

**Step 4 Express the solution set in set-builder or interval notation and graph the set on a number line.** The solution set consists of all real numbers that are less than  $-3$ , expressed in set-builder notation as  $\{x \mid x < -3\}$ . The interval notation for this solution set is  $(-\infty, -3)$ . The graph of the solution set is shown as follows:

 **Check Point 4** Solve and graph the solution set on a number line:  $3x + 1 > 7x - 15$ .

If an inequality contains fractions with constants in the denominators, begin by multiplying both sides by the least common denominator. This will clear the inequality of fractions.

**EXAMPLE 5 Solving a Linear Inequality Containing Fractions**

Solve and graph the solution set on a number line:

$$\frac{x + 3}{4} \geq \frac{x - 2}{3} + \frac{1}{4}$$

**SOLUTION**

The denominators are 4, 3, and 4. The least common denominator is 12. We begin by multiplying both sides of the inequality by 12.

$$\begin{aligned} \frac{x + 3}{4} &\geq \frac{x - 2}{3} + \frac{1}{4} && \text{This is the given inequality.} \\ 12 \left( \frac{x + 3}{4} \right) &\geq 12 \left( \frac{x - 2}{3} + \frac{1}{4} \right) && \text{Multiply both sides by 12. Multiplying} \\ &&& \text{by a positive number preserves the} \\ &&& \text{sense of the inequality.} \\ \frac{12}{1} \cdot \frac{x + 3}{4} &\geq \frac{12}{1} \cdot \frac{x - 2}{3} + \frac{12}{1} \cdot \frac{1}{4} && \text{Multiply each term by 12. Use the} \\ &&& \text{distributive property on the right side.} \\ \frac{\overset{3}{\cancel{12}}}{1} \cdot \frac{x + 3}{\underset{4}{\cancel{4}}} &\geq \frac{\overset{4}{\cancel{12}}}{1} \cdot \frac{x - 2}{\underset{3}{\cancel{3}}} + \frac{\overset{3}{\cancel{12}}}{1} \cdot \frac{1}{\underset{4}{\cancel{4}}} && \text{Divide out common factors in each} \\ &&& \text{multiplication.} \\ 3(x + 3) &\geq 4(x - 2) + 3 && \text{The fractions are now cleared.} \end{aligned}$$

Now that the fractions have been cleared, we follow the four steps that we used in the previous example.

**Step 1 Simplify each side.**

$$3(x + 3) \geq 4(x - 2) + 3$$

This is the inequality with the fractions cleared.

$$3x + 9 \geq 4x - 8 + 3$$

Use the distributive property.

$$3x + 9 \geq 4x - 5$$

Simplify.

**Step 2 Collect variable terms on one side and constant terms on the other side.** We will collect variable terms on the left and constant terms on the right.

$$3x + 9 - 4x \geq 4x - 5 - 4x$$

Subtract  $4x$  from both sides.

$$-x + 9 \geq -5$$

Simplify.

$$-x + 9 - 9 \geq -5 - 9$$

Subtract 9 from both sides.

$$-x \geq -14$$

Simplify.

**Step 3 Isolate the variable and solve.** To isolate  $x$ , we must eliminate the negative sign in front of the  $x$ . Because  $-x$  means  $-1x$ , we can do this by multiplying (or dividing) both sides of the inequality by  $-1$ . We are multiplying by a negative number. Thus, we must reverse the direction of the inequality symbol.

$$(-1)(-x) \leq (-1)(-14)$$

Multiply both sides by  $-1$  and change the sense of the inequality.

$$x \leq 14$$

Simplify.

**Step 4 Express the solution set in set-builder or interval notation and graph the set on a number line.** The solution set consists of all real numbers that are less than or equal to 14, expressed in set-builder notation as  $\{x \mid x \leq 14\}$ . The interval notation for this solution set is  $(-\infty, 14]$ . The graph of the solution set is shown as follows:

 **Check Point 5** Solve and graph the solution set on a number line:

$$\frac{x - 4}{2} \geq \frac{x - 2}{3} + \frac{5}{6}.$$

**4** Solve compound inequalities.

### Solving Compound Inequalities

We now consider two inequalities such as

$$-3 < 2x + 1 \quad \text{and} \quad 2x + 1 \leq 3,$$

expressed as a **compound inequality**

$$-3 < 2x + 1 \leq 3.$$

The word *and* does not appear when the inequality is written in the shorter form, although intersection is implied. The shorter form enables us to solve both inequalities at once. By performing each operation on all three parts of the inequality, our goal is to **isolate  $x$  in the middle**.

#### EXAMPLE 6 Solving a Compound Inequality

Solve and graph the solution set on a number line:

$$-3 < 2x + 1 \leq 3.$$

#### SOLUTION

We would like to isolate  $x$  in the middle. We can do this by first subtracting 1 from all three parts of the compound inequality. Then we isolate  $x$  from  $2x$  by dividing all three parts of the inequality by 2.

$$\begin{array}{ll}
 -3 < 2x + 1 \leq 3 & \text{This is the given inequality.} \\
 -3 - 1 < 2x + 1 - 1 \leq 3 - 1 & \text{Subtract 1 from all three parts.} \\
 -4 < 2x \leq 2 & \text{Simplify.} \\
 \frac{-4}{2} < \frac{2x}{2} \leq \frac{2}{2} & \text{Divide each part by 2.} \\
 -2 < x \leq 1 & \text{Simplify.}
 \end{array}$$

The solution set consists of all real numbers greater than  $-2$  and less than or equal to  $1$ , represented by  $\{x \mid -2 < x \leq 1\}$  in set-builder notation and  $(-2, 1]$  in interval notation. The graph is shown as follows:

**Check Point 6** Solve and graph the solution set on a number line:  $1 \leq 2x + 3 < 11$ .

**5** Solve absolute value inequalities.

**FIGURE P.19**  $|x| < 2$ , so  $-2 < x < 2$ .

**FIGURE P.20**  $|x| > 2$ , so  $x < -2$  or  $x > 2$ .

### Solving Inequalities with Absolute Value

We know that  $|x|$  describes the distance of  $x$  from zero on a real number line. We can use this geometric interpretation to solve an inequality such as

$$|x| < 2.$$

This means that the distance of  $x$  from 0 is *less than* 2, as shown in **Figure P.19**. The interval shows values of  $x$  that lie less than 2 units from 0. Thus,  $x$  can lie between  $-2$  and  $2$ . That is,  $x$  is greater than  $-2$  and less than  $2$ . We write  $(-2, 2)$  or  $\{x \mid -2 < x < 2\}$ .

Some absolute value inequalities use the “greater than” symbol. For example,  $|x| > 2$  means that the distance of  $x$  from 0 is *greater than* 2, as shown in **Figure P.20**. Thus,  $x$  can be less than  $-2$  or greater than  $2$ . We write  $x < -2$  or  $x > 2$ . This can be expressed in interval notation as  $(-\infty, -2) \cup (2, \infty)$ .

These observations suggest the following principles for solving inequalities with absolute value.

### GREAT QUESTION!

The box on the right shows how to rewrite absolute value inequalities without absolute value bars. Once I've done this, how many inequalities do I need to solve?

In the  $|u| < c$  case, we have one compound inequality to solve. In the  $|u| > c$  case, we have two separate inequalities to solve.

#### Solving an Absolute Value Inequality

If  $u$  is an algebraic expression and  $c$  is a positive number,

1. The solutions of  $|u| < c$  are the numbers that satisfy  $-c < u < c$ .
2. The solutions of  $|u| > c$  are the numbers that satisfy  $u < -c$  or  $u > c$ .

These rules are valid if  $<$  is replaced by  $\leq$  and  $>$  is replaced by  $\geq$ .

#### EXAMPLE 7 Solving an Absolute Value Inequality

Solve and graph the solution set on a number line:  $|x - 4| < 3$ .

#### SOLUTION

We rewrite the inequality without absolute value bars.

$$\begin{array}{l}
 |u| < c \text{ means } -c < u < c. \\
 |x - 4| < 3 \text{ means } -3 < x - 4 < 3.
 \end{array}$$

We solve the compound inequality by adding 4 to all three parts.

$$\begin{array}{l}
 -3 < x - 4 < 3 \\
 -3 + 4 < x - 4 + 4 < 3 + 4 \\
 1 < x < 7
 \end{array}$$

The solution set of  $1 < x < 7$  consists of all real numbers greater than 1 and less than 7, denoted by  $\{x \mid 1 < x < 7\}$  or  $(1, 7)$ . The graph of the solution set is shown as follows:

**Check Point 7** Solve and graph the solution set on a number line:  $|x - 2| < 5$ .

### EXAMPLE 8 Solving an Absolute Value Inequality

Solve and graph the solution set on a number line:  $-2|3x + 5| + 7 \geq -13$ .

#### SOLUTION

$$-2|3x + 5| + 7 \geq -13$$

This is the given inequality.

We need to isolate  $|3x + 5|$ , the absolute value expression.

$$-2|3x + 5| + 7 - 7 \geq -13 - 7$$

Subtract 7 from both sides.

$$-2|3x + 5| \geq -20$$

Simplify.

$$\frac{-2|3x + 5|}{-2} \leq \frac{-20}{-2}$$

Divide both sides by  $-2$  and change the sense of the inequality.

$$|3x + 5| \leq 10$$

Simplify.

$$-10 \leq 3x + 5 \leq 10$$

Rewrite without absolute value bars:

$|u| \leq c$  means  $-c \leq u \leq c$ .

Now we need to isolate  $x$  in the middle.

$$-10 - 5 \leq 3x + 5 - 5 \leq 10 - 5$$

Subtract 5 from all three parts.

$$-15 \leq 3x \leq 5$$

Simplify.

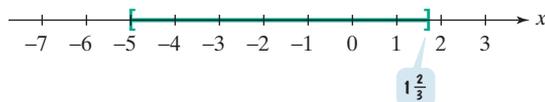

$$\frac{-15}{3} \leq \frac{3x}{3} \leq \frac{5}{3}$$

Divide each part by 3.

$$-5 \leq x \leq \frac{5}{3}$$

Simplify.

The solution set is  $\{x \mid -5 \leq x \leq \frac{5}{3}\}$  in set-builder notation and  $[-5, \frac{5}{3}]$  in interval notation. The graph is shown as follows:

**Check Point 8** Solve and graph the solution set on a number line:  $-3|5x - 2| + 20 \geq -19$ .

### EXAMPLE 9 Solving an Absolute Value Inequality

Solve and graph the solution set on a number line:  $7 < |5 - 2x|$ .

#### SOLUTION

We begin by expressing the inequality with the absolute value expression on the left side:

$$|5 - 2x| > 7.$$

$c < |u|$  means the same thing as  $|u| > c$ . In both cases, the inequality symbol points to  $c$ .

We rewrite this inequality without absolute value bars.

$$|u| > c \text{ means } u < -c \text{ or } u > c.$$

$$|5 - 2x| > 7 \text{ means } 5 - 2x < -7 \text{ or } 5 - 2x > 7.$$

Because  $|5 - 2x| > 7$  means  $5 - 2x < -7$  or  $5 - 2x > 7$ , we solve  $5 - 2x < -7$  and  $5 - 2x > 7$  separately. Then we take the union of their solution sets.

$$5 - 2x < -7 \quad \text{or} \quad 5 - 2x > 7$$

*These are the inequalities without absolute value bars.*

$$5 - 5 - 2x < -7 - 5 \quad 5 - 5 - 2x > 7 - 5$$

*Subtract 5 from both sides.*

$$-2x < -12 \quad -2x > 2$$

*Simplify.*

$$\frac{-2x}{-2} > \frac{-12}{-2} \quad \frac{-2x}{-2} < \frac{2}{-2}$$

*Divide both sides by  $-2$  and change the sense of each inequality.*

$$x > 6 \quad x < -1$$

*Simplify.*

## GREAT QUESTION!

The graph of the solution set in Example 9 consists of two intervals. When is the graph of the solution set of an absolute value inequality a single interval and when is it the union of two intervals?

If  $u$  is a linear expression and  $c > 0$ , the graph of the solution set for  $|u| > c$  will be two intervals whose union cannot be represented as a single interval. The graph of the solution set for  $|u| < c$  will be a single interval. Avoid the common error of rewriting  $|u| > c$  as  $-c < u < c$ .

The solution set consists of all numbers that are less than  $-1$  or greater than  $6$ . The solution set is  $\{x \mid x < -1 \text{ or } x > 6\}$ , or, in interval notation  $(-\infty, -1) \cup (6, \infty)$ . The graph of the solution set is shown as follows:

**Check Point 9** Solve and graph the solution set on a number line:  
 $18 < |6 - 3x|$ .

## Applications

Our next example shows how to use an inequality to select the better deal between two pricing options. We use our strategy for solving word problems, modeling the verbal conditions of the problem with a linear inequality.

### EXAMPLE 10 Selecting the Better Deal

Acme Car rental agency charges \$4 a day plus \$0.15 per mile, whereas Interstate rental agency charges \$20 a day and \$0.05 per mile. How many miles must be driven to make the daily cost of an Acme rental a better deal than an Interstate rental?

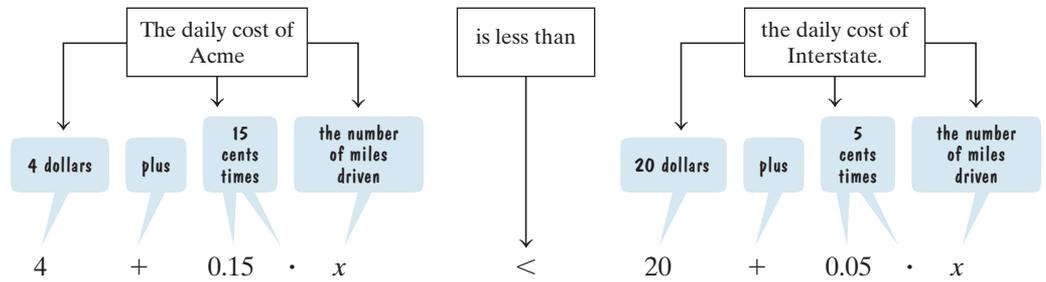

#### SOLUTION

**Step 1** Let  $x$  represent one of the unknown quantities. We are looking for the number of miles that must be driven in a day to make Acme the better deal. Thus,

$$\text{let } x = \text{the number of miles driven in a day.}$$

**Step 2** Represent other unknown quantities in terms of  $x$ . We are not asked to find another quantity, so we can skip this step.

**Step 3 Write an inequality in  $x$  that models the conditions.** Acme is a better deal than Interstate if the daily cost of Acme is less than the daily cost of Interstate.

**Step 4 Solve the inequality and answer the question.**

$$4 + 0.15x < 20 + 0.05x$$

*This is the inequality that models the verbal conditions.*

$$4 + 0.15x - 0.05x < 20 + 0.05x - 0.05x$$

*Subtract  $0.05x$  from both sides.*

$$4 + 0.1x < 20$$

*Simplify.*

$$4 + 0.1x - 4 < 20 - 4$$

*Subtract 4 from both sides.*

$$0.1x < 16$$

*Simplify.*

$$\frac{0.1x}{0.1} < \frac{16}{0.1}$$

*Divide both sides by 0.1.*

$$x < 160$$

*Simplify.*

Thus, driving fewer than 160 miles per day makes Acme the better deal.

**Step 5 Check the proposed solution in the original wording of the problem.** One way to do this is to take a mileage less than 160 miles per day to see if Acme is the better deal. Suppose that 150 miles are driven in a day.

$$\begin{aligned} \text{Cost for Acme} &= 4 + 0.15(150) = 26.50 \\ \text{Cost for Interstate} &= 20 + 0.05(150) = 27.50 \end{aligned}$$

Acme has a lower daily cost, making Acme the better deal. ...

**Check Point 10** A car can be rented from Basic Rental for \$260 per week with no extra charge for mileage. Continental charges \$80 per week plus 25 cents for each mile driven to rent the same car. How many miles must be driven in a week to make the rental cost for Basic Rental a better deal than Continental's?

### CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

1. In interval notation,  $[2, 5)$  represents the set of real numbers between \_\_\_ and \_\_\_, including \_\_\_ but not including \_\_\_.
2. In interval notation,  $(-2, \infty)$  represents the set of real numbers \_\_\_\_\_.  $-2$ .
3. In interval notation,  $(-\infty, -1]$  represents the set of real numbers \_\_\_\_\_.  $-1$ .
4. The set of elements common to both  $(-\infty, 9)$  and  $(-\infty, 12)$  is \_\_\_\_\_. This represents the \_\_\_\_\_ of these intervals.
5. The set of elements in  $(-\infty, 9)$  or  $(-\infty, 12)$  or in both sets is \_\_\_\_\_. This represents the \_\_\_\_\_ of these intervals.
6. The linear inequality  $-3x - 4 > 5$  can be solved by first \_\_\_\_\_ to both sides and then \_\_\_\_\_ both sides by \_\_\_\_\_, which changes the \_\_\_\_\_ of the inequality symbol from \_\_\_\_\_ to \_\_\_\_\_.
7. The way to solve  $-7 < 3x - 4 \leq 5$  is to isolate  $x$  in the \_\_\_\_\_.
8. If  $c > 0$ ,  $|u| < c$  is equivalent to \_\_\_\_\_  $< u <$ \_\_\_\_\_.
9. If  $c > 0$ ,  $|u| > c$  is equivalent to  $u <$ \_\_\_\_\_ or  $u >$ \_\_\_\_\_.
10.  $|x - 7| < 2$  can be rewritten without absolute value bars as \_\_\_\_\_.
11.  $|x - 7| > 2$  can be rewritten without absolute value bars as \_\_\_\_\_.

## EXERCISE SET P.9

## Practice Exercises

In Exercises 1–14, express each interval in set-builder notation and graph the interval on a number line.

- |                      |                      |
|----------------------|----------------------|
| 1. $(1, 6]$          | 2. $(-2, 4]$         |
| 3. $[-5, 2)$         | 4. $[-4, 3)$         |
| 5. $[-3, 1]$         | 6. $[-2, 5]$         |
| 7. $(2, \infty)$     | 8. $(3, \infty)$     |
| 9. $[-3, \infty)$    | 10. $[-5, \infty)$   |
| 11. $(-\infty, 3)$   | 12. $(-\infty, 2)$   |
| 13. $(-\infty, 5.5)$ | 14. $(-\infty, 3.5]$ |

In Exercises 15–26, use graphs to find each set.

- |                                    |                                    |
|------------------------------------|------------------------------------|
| 15. $(-3, 0) \cap [-1, 2]$         | 16. $(-4, 0) \cap [-2, 1]$         |
| 17. $(-3, 0) \cup [-1, 2]$         | 18. $(-4, 0) \cup [-2, 1]$         |
| 19. $(-\infty, 5) \cap [1, 8)$     | 20. $(-\infty, 6) \cap [2, 9)$     |
| 21. $(-\infty, 5) \cup [1, 8)$     | 22. $(-\infty, 6) \cup [2, 9)$     |
| 23. $[3, \infty) \cap (6, \infty)$ | 24. $[2, \infty) \cap (4, \infty)$ |
| 25. $[3, \infty) \cup (6, \infty)$ | 26. $[2, \infty) \cup (4, \infty)$ |

In all exercises, other than  $\emptyset$ , use interval notation to express solution sets and graph each solution set on a number line.

In Exercises 27–48, solve each linear inequality.

- |   |   |
|---|---|
| 27. $5x + 11 < 26$  | 28. $2x + 5 < 17$                                       |
| 29. $3x - 7 \geq 13$  | 30. $8x - 2 \geq 14$                                    |
| 31. $-9x \geq 36$   | 32. $-5x \leq 30$                                       |
| 33. $8x - 11 \leq 3x - 13$  | 34. $18x + 45 \leq 12x - 8$                             |
| 35. $4(x + 1) + 2 \geq 3x + 6$                                    |   |
| 36. $8x + 3 > 3(2x + 1) + x + 5$                                  |   |
| 37. $2x - 11 < -3(x + 2)$   | 38. $-4(x + 2) > 3x + 20$                               |
| 39. $1 - (x + 3) \geq 4 - 2x$                                     | 40. $5(3 - x) \leq 3x - 1$                              |
| 41. $\frac{x}{4} - \frac{3}{2} \leq \frac{x}{2} + 1$              | 42. $\frac{3x}{10} + 1 \geq \frac{1}{5} - \frac{x}{10}$ |
| 43. $1 - \frac{x}{2} > 4$   | 44. $7 - \frac{4}{5}x < \frac{3}{5}$                    |
| 45. $\frac{x - 4}{6} \geq \frac{x - 2}{9} + \frac{5}{18}$         | 46. $\frac{4x - 3}{6} + 2 \geq \frac{2x - 1}{12}$       |
| 47. $3[3(x + 5) + 8x + 7] + 5[3(x - 6) - 2(3x - 5)] < 2(4x + 3)$  |   |
| 48. $5[3(2 - 3x) - 2(5 - x)] - 6[5(x - 2) - 2(4x - 3)] < 3x + 19$ |   |

In Exercises 49–56, solve each compound inequality.

- |                                     |                                     |
|-------------------------------------|-------------------------------------|
| 49. $6 < x + 3 < 8$                 | 50. $7 < x + 5 < 11$                |
| 51. $-3 \leq x - 2 < 1$             | 52. $-6 < x - 4 \leq 1$             |
| 53. $-11 < 2x - 1 \leq -5$          | 54. $3 \leq 4x - 3 < 19$            |
| 55. $-3 \leq \frac{2}{3}x - 5 < -1$ | 56. $-6 \leq \frac{1}{2}x - 4 < -3$ |

In Exercises 57–92, solve each absolute value inequality.

- |   |   |
|---|---|
| 57. $ x  < 3$                             | 58. $ x  < 5$                               |
| 59. $ x - 1  \leq 2$                      | 60. $ x + 3  \leq 4$                        |
| 61. $ 2x - 6  < 8$                        | 62. $ 3x + 5  < 17$                         |
| 63. $ 2(x - 1) + 4  \leq 8$               | 64. $ 3(x - 1) + 2  \leq 20$                |
| 65. $\left  \frac{2x + 6}{3} \right  < 2$ | 66. $\left  \frac{3(x - 1)}{4} \right  < 6$ |

- |   |   |
|---|---|
| 67. $ x  > 3$   | 68. $ x  > 5$   |
| 69. $ x - 1  \geq 2$                                      | 70. $ x + 3  \geq 4$                                    |
| 71. $ 3x - 8  > 7$  | 72. $ 5x - 2  > 13$                                     |
| 73. $\left  \frac{2x + 2}{4} \right  \geq 2$              | 74. $\left  \frac{3x - 3}{9} \right  \geq 1$            |
| 75. $\left  3 - \frac{2}{3}x \right  > 5$                 | 76. $\left  3 - \frac{3}{4}x \right  > 9$               |
| 77. $3 x - 1  + 2 \geq 8$                                 | 78. $5 2x + 1  - 3 \geq 9$                              |
| 79. $-2 x - 4  \geq -4$                                   | 80. $-3 x + 7  \geq -27$                                |
| 81. $-4 1 - x  < -16$                                     | 82. $-2 5 - x  < -6$                                    |
| 83. $3 \leq  2x - 1 $                                     | 84. $9 \leq  4x + 7 $                                   |
| 85. $5 >  4 - x $   | 86. $2 >  11 - x $                                      |
| 87. $1 <  2 - 3x $  | 88. $4 <  2 - x $                                       |
| 89. $12 < \left  -2x + \frac{6}{7} \right  + \frac{3}{7}$ | 90. $1 < \left  x - \frac{11}{3} \right  + \frac{7}{3}$ |
| 91. $4 + \left  3 - \frac{x}{3} \right  \geq 9$           | 92. $\left  2 - \frac{x}{2} \right  - 1 \leq 1$         |

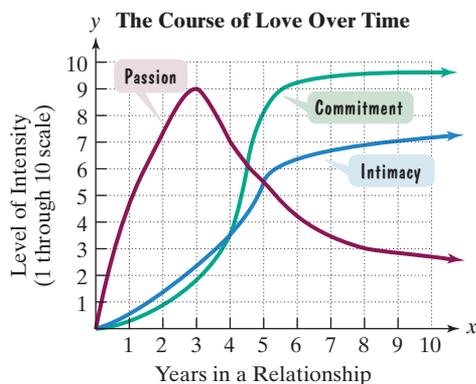

## Practice Plus

In Exercises 93–96, use interval notation to represent all values of  $x$  satisfying the given conditions.

93.  $y = 1 - (x + 3) + 2x$  and  $y$  is at least 4.
94.  $y = 2x - 11 + 3(x + 2)$  and  $y$  is at most 0.
95.  $y = 7 - \left| \frac{x}{2} + 2 \right|$  and  $y$  is at most 4.
96.  $y = 8 - |5x + 3|$  and  $y$  is at least 6.
97. When 3 times a number is subtracted from 4, the absolute value of the difference is at least 5. Use interval notation to express the set of all numbers that satisfy this condition.
98. When 4 times a number is subtracted from 5, the absolute value of the difference is at most 13. Use interval notation to express the set of all numbers that satisfy this condition.

## Application Exercises

The graphs show that the three components of love, namely, passion, intimacy, and commitment, progress differently over time. Passion peaks early in a relationship and then declines. By contrast, intimacy and commitment build gradually. Use the graphs to solve Exercises 99–106.

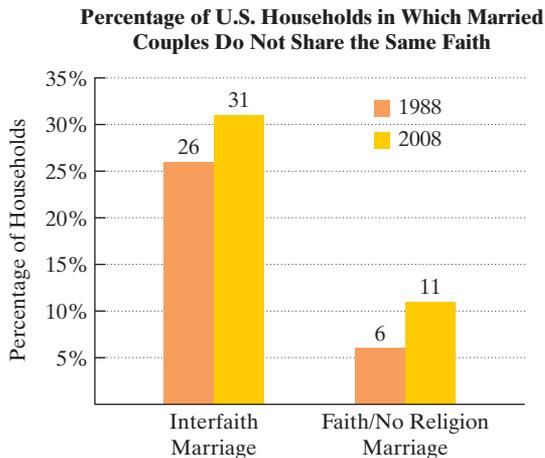

Source: R. J. Sternberg, A Triangular Theory of Love, *Psychological Review*, 93, 119–135.

(In Exercises 99–106, be sure to refer to the graphs at the bottom of the previous page.)

- 99. Use interval notation to write an inequality that expresses for which years in a relationship intimacy is greater than commitment.
- 100. Use interval notation to write an inequality that expresses for which years in a relationship passion is greater than or equal to intimacy.
- 101. What is the relationship between passion and intimacy on the interval  $[5, 7)$ ?
- 102. What is the relationship between intimacy and commitment on the interval  $[4, 7)$ ?
- 103. What is the relationship between passion and commitment for  $\{x | 6 < x < 8\}$ ?
- 104. What is the relationship between passion and commitment for  $\{x | 7 < x < 9\}$ ?
- 105. What is the maximum level of intensity for passion? After how many years in a relationship does this occur?
- 106. After approximately how many years do levels of intensity for commitment exceed the maximum level of intensity for passion?

In more U.S. marriages, spouses have different faiths. The bar graph shows the percentage of households with an interfaith marriage in 1988 and 2008. Also shown is the percentage of households in which a person of faith is married to someone with no religion.

Source: General Social Survey, University of Chicago

The formula

$$I = \frac{1}{4}x + 26$$

models the percentage of U.S. households with an interfaith marriage,  $I$ ,  $x$  years after 1988. The formula

$$N = \frac{1}{4}x + 6$$

models the percentage of U.S. households in which a person of faith is married to someone with no religion,  $N$ ,  $x$  years after 1988. Use these models to solve Exercises 107–108.

- 107. a. In which years will more than 33% of U.S. households have an interfaith marriage?  
b. In which years will more than 14% of U.S. households have a person of faith married to someone with no religion?

- c. Based on your answers to parts (a) and (b), in which years will more than 33% of households have an interfaith marriage and more than 14% have a faith/no religion marriage?
  - d. Based on your answers to parts (a) and (b), in which years will more than 33% of households have an interfaith marriage or more than 14% have a faith/no religion marriage?
- 108. a. In which years will more than 34% of U.S. households have an interfaith marriage?  
b. In which years will more than 15% of U.S. households have a person of faith married to someone with no religion?  
c. Based on your answers to parts (a) and (b), in which years will more than 34% of households have an interfaith marriage and more than 15% have a faith/no religion marriage?  
d. Based on your answers to parts (a) and (b), in which years will more than 34% of households have an interfaith marriage or more than 15% have a faith/no religion marriage?
- 109. A basic cellphone plan costs \$20 per month for 60 calling minutes. Additional time costs \$0.40 per minute. The formula

$$C = 20 + 0.40(x - 60)$$

gives the monthly cost for this plan,  $C$ , for  $x$  calling minutes, where  $x > 60$ . How many calling minutes are possible for a monthly cost of at least \$28 and at most \$40?

- 110. The formula for converting Fahrenheit temperature,  $F$ , to Celsius temperature,  $C$ , is

$$C = \frac{5}{9}(F - 32).$$

If Celsius temperature ranges from  $15^\circ$  to  $35^\circ$ , inclusive, what is the range for the Fahrenheit temperature? Use interval notation to express this range.

- 111. If a coin is tossed 100 times, we would expect approximately 50 of the outcomes to be heads. It can be demonstrated that a coin is unfair if  $h$ , the number of outcomes that result in heads, satisfies  $\left| \frac{h - 50}{5} \right| \geq 1.645$ . Describe the number of outcomes that determine an unfair coin that is tossed 100 times.

In Exercises 112–123, use the strategy for solving word problems, modeling the verbal conditions of the problem with a linear inequality.

- 112. A truck can be rented from Basic Rental for \$50 per day plus \$0.20 per mile. Continental charges \$20 per day plus \$0.50 per mile to rent the same truck. How many miles must be driven in a day to make the rental cost for Basic Rental a better deal than Continental's?
- 113. You are choosing between two texting plans. Plan A has a monthly fee of \$15 with a charge of \$0.08 per text. Plan B has a monthly fee of \$3 with a charge of \$0.12 per text. How many text messages in a month make plan A the better deal?

- 114.** A city commission has proposed two tax bills. The first bill requires that a homeowner pay \$1800 plus 3% of the assessed home value in taxes. The second bill requires taxes of \$200 plus 8% of the assessed home value. What price range of home assessment would make the first bill a better deal?
- 115.** A local bank charges \$8 per month plus 5¢ per check. The credit union charges \$2 per month plus 8¢ per check. How many checks should be written each month to make the credit union a better deal?
- 116.** A company manufactures and sells blank audiocassette tapes. The weekly fixed cost is \$10,000 and it costs \$0.40 to produce each tape. The selling price is \$2.00 per tape. How many tapes must be produced and sold each week for the company to generate a profit?
- 117.** A company manufactures and sells personalized stationery. The weekly fixed cost is \$3000 and it costs \$3.00 to produce each package of stationery. The selling price is \$5.50 per package. How many packages of stationery must be produced and sold each week for the company to generate a profit?
- 118.** An elevator at a construction site has a maximum capacity of 2800 pounds. If the elevator operator weighs 265 pounds and each cement bag weighs 65 pounds, how many bags of cement can be safely lifted on the elevator in one trip?
- 119.** An elevator at a construction site has a maximum capacity of 3000 pounds. If the elevator operator weighs 245 pounds and each cement bag weighs 95 pounds, how many bags of cement can be safely lifted on the elevator in one trip?
- 120.** To earn an A in a course, you must have a final average of at least 90%. On the first four examinations, you have grades of 86%, 88%, 92%, and 84%. If the final examination counts as two grades, what must you get on the final to earn an A in the course?
- 121.** On two examinations, you have grades of 86 and 88. There is an optional final examination, which counts as one grade. You decide to take the final in order to get a course grade of A, meaning a final average of at least 90.
- What must you get on the final to earn an A in the course?
  - By taking the final, if you do poorly, you might risk the B that you have in the course based on the first two exam grades. If your final average is less than 80, you will lose your B in the course. Describe the grades on the final that will cause this to happen.
- 122.** Parts for an automobile repair cost \$175. The mechanic charges \$34 per hour. If you receive an estimate for at least \$226 and at most \$294 for fixing the car, what is the time interval that the mechanic will be working on the job?
- 123.** The toll to a bridge is \$3.00. A three-month pass costs \$7.50 and reduces the toll to \$0.50. A six-month pass costs \$30 and permits crossing the bridge for no additional fee. How many crossings per three-month period does it take for the three-month pass to be the best deal?
- 126.** Describe ways in which solving a linear inequality is different than solving a linear equation.
- 127.** What is a compound inequality and how is it solved?
- 128.** Describe how to solve an absolute value inequality involving the symbol  $<$ . Give an example.
- 129.** Describe how to solve an absolute value inequality involving the symbol  $>$ . Give an example.
- 130.** Explain why  $|x| < -4$  has no solution.
- 131.** Describe the solution set of  $|x| > -4$ .

### Critical Thinking Exercises

**Make Sense?** In Exercises 132–135, determine whether each statement makes sense or does not make sense, and explain your reasoning.

- 132.** I prefer interval notation over set-builder notation because it takes less space to write solution sets.
- 133.** I can check inequalities by substituting 0 for the variable: When 0 belongs to the solution set, I should obtain a true statement, and when 0 does not belong to the solution set, I should obtain a false statement.
- 134.** In an inequality such as  $5x + 4 < 8x - 5$ , I can avoid division by a negative number depending on which side I collect the variable terms and on which side I collect the constant terms.
- 135.** I'll win the contest if I can complete the crossword puzzle in 20 minutes plus or minus 5 minutes, so my winning time,  $x$ , is modeled by  $|x - 20| \leq 5$ .

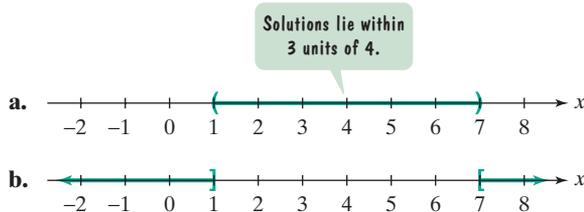

In Exercises 136–139, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

- 136.**  $(-\infty, -1] \cap [-4, \infty) = [-4, -1]$
- 137.**  $(-\infty, 3) \cup (-\infty, -2) = (-\infty, -2)$
- 138.** The inequality  $3x > 6$  is equivalent to  $2 > x$ .
- 139.** All irrational numbers satisfy  $|x - 4| > 0$ .
- 140.** What's wrong with this argument? Suppose  $x$  and  $y$  represent two real numbers, where  $x > y$ .

$$\begin{array}{ll}
 2 > 1 & \text{This is a true statement.} \\
 2(y - x) > 1(y - x) & \text{Multiply both sides by } y - x. \\
 2y - 2x > y - x & \text{Use the distributive property.} \\
 y - 2x > -x & \text{Subtract } y \text{ from both sides.} \\
 y > x & \text{Add } 2x \text{ to both sides.}
 \end{array}$$

The final inequality,  $y > x$ , is impossible because we were initially given  $x > y$ .

- 141.** Write an absolute value inequality for which the interval shown is the solution.

### Writing in Mathematics

- 124.** When graphing the solutions of an inequality, what does a parenthesis signify? What does a square bracket signify?
- 125.** Describe ways in which solving a linear inequality is similar to solving a linear equation.

## Group Exercise

**142.** Each group member should research one situation that provides two different pricing options. These can involve areas such as public transportation options (with or without discount passes), cellphone plans, long-distance telephone plans, or anything of interest. Be sure to bring in all the details for each option. At a second group meeting, select the two pricing situations that are most interesting and relevant. Using each situation, write a word problem about selecting the better of the two options. The word problem should be one that can be solved using a linear inequality. The group should turn in the two problems and their solutions.

## Preview Exercises

Exercises 143–145 will help you prepare for the material covered in the first section of the next chapter.

- 143.** If  $y = 4 - x$ , find the value of  $y$  that corresponds to values of  $x$  for each integer starting with  $-3$  and ending with  $3$ .
- 144.** If  $y = 4 - x^2$ , find the value of  $y$  that corresponds to values of  $x$  for each integer starting with  $-3$  and ending with  $3$ .
- 145.** If  $y = |x + 1|$ , find the value of  $y$  that corresponds to values of  $x$  for each integer starting with  $-4$  and ending with  $2$ .

## CHAPTER P

## Summary, Review, and Test

## SUMMARY: BASIC FORMULAS

## Definition of Absolute Value

$$|x| = \begin{cases} x & \text{if } x \geq 0 \\ -x & \text{if } x < 0 \end{cases}$$

Distance between Points  $a$  and  $b$  on a Number Line

$$|a - b| \quad \text{or} \quad |b - a|$$

## Properties of Real Numbers

Commutative  $a + b = b + a$

$$ab = ba$$

Associative  $(a + b) + c = a + (b + c)$

$$(ab)c = a(bc)$$

Distributive  $a(b + c) = ab + ac$

Identity  $a + 0 = a$

$$a \cdot 1 = a$$

Inverse  $a + (-a) = 0$

$$a \cdot \frac{1}{a} = 1, a \neq 0$$

## Properties of Exponents

$$b^{-n} = \frac{1}{b^n}, \quad b^0 = 1, \quad b^m \cdot b^n = b^{m+n},$$

$$(b^m)^n = b^{mn}, \quad \frac{b^m}{b^n} = b^{m-n}, \quad (ab)^n = a^n b^n, \quad \left(\frac{a}{b}\right)^n = \frac{a^n}{b^n}$$

Product and Quotient Rules for  $n$ th Roots

$$\sqrt[n]{ab} = \sqrt[n]{a} \cdot \sqrt[n]{b}, \quad \sqrt[n]{\frac{a}{b}} = \frac{\sqrt[n]{a}}{\sqrt[n]{b}}$$

## Rational Exponents

$$a^{\frac{1}{n}} = \sqrt[n]{a}, \quad a^{-\frac{1}{n}} = \frac{1}{\sqrt[n]{a}},$$

$$a^{\frac{m}{n}} = (\sqrt[n]{a})^m = \sqrt[n]{a^m}, \quad a^{-\frac{m}{n}} = \frac{1}{a^{\frac{m}{n}}}$$

## Special Products

$$(A + B)(A - B) = A^2 - B^2$$

$$(A + B)^2 = A^2 + 2AB + B^2$$

$$(A - B)^2 = A^2 - 2AB + B^2$$

$$(A + B)^3 = A^3 + 3A^2B + 3AB^2 + B^3$$

$$(A - B)^3 = A^3 - 3A^2B + 3AB^2 - B^3$$

## Factoring Formulas

$$A^2 - B^2 = (A + B)(A - B)$$

$$A^2 + 2AB + B^2 = (A + B)^2$$

$$A^2 - 2AB + B^2 = (A - B)^2$$

$$A^3 + B^3 = (A + B)(A^2 - AB + B^2)$$

$$A^3 - B^3 = (A - B)(A^2 + AB + B^2)$$

## Absolute Value Equations and Inequalities

- If  $c > 0$ , then  $|u| = c$  is equivalent to  $u = c$  or  $u = -c$ .
- If  $c > 0$ , then  $|u| < c$  is equivalent to  $-c < u < c$ .
- If  $c > 0$ , then  $|u| > c$  is equivalent to  $u < -c$  or  $u > c$ .

## The Quadratic Formula

All quadratic equations

$$ax^2 + bx + c = 0, \quad a \neq 0$$

can be solved by the quadratic formula

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

## REVIEW EXERCISES

You can use these review exercises, like the review exercises at the end of each chapter, to test your understanding of the chapter's topics. However, you can also use these exercises as a prerequisite test to check your mastery of the fundamental algebra skills needed in this book.

### P.1

In Exercises 1–2, evaluate each algebraic expression for the given value or values of the variable(s).

- $3 + 6(x - 2)^3$  for  $x = 4$
- $x^2 - 5(x - y)$  for  $x = 6$  and  $y = 2$
- You are riding along an expressway traveling  $x$  miles per hour. The formula

$$S = 0.015x^2 + x + 10$$

models the recommended safe distance,  $S$ , in feet, between your car and other cars on the expressway. What is the recommended safe distance when your speed is 60 miles per hour?

In Exercises 4–7, let  $A = \{a, b, c\}$ ,  $B = \{a, c, d, e\}$ , and  $C = \{a, d, f, g\}$ . Find the indicated set.

- $A \cap B$
- $A \cup C$
- $A \cup B$
- $C \cap A$

- Consider the set:

$$\left\{-17, -\frac{9}{13}, 0, 0.75, \sqrt{2}, \pi, \sqrt{81}\right\}.$$

List all numbers from the set that are **a.** natural numbers, **b.** whole numbers, **c.** integers, **d.** rational numbers, **e.** irrational numbers, **f.** real numbers.

In Exercises 9–11, rewrite each expression without absolute value bars.

- $|-103|$
- $|\sqrt{2} - 1|$
- $|3 - \sqrt{17}|$

- Express the distance between the numbers  $-17$  and  $4$  using absolute value. Then evaluate the absolute value.

In Exercises 13–18, state the name of the property illustrated.

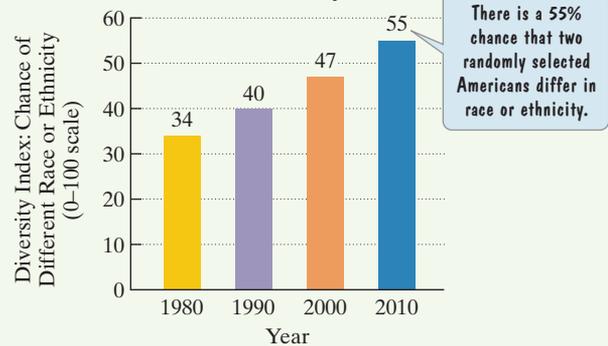

- $3 + 17 = 17 + 3$
- $\sqrt{3}(\sqrt{5} + \sqrt{3}) = \sqrt{15} + 3$
- $(6 \cdot 9) \cdot 2 = 2 \cdot (6 \cdot 9)$
- $\sqrt{3}(\sqrt{5} + \sqrt{3}) = (\sqrt{5} + \sqrt{3})\sqrt{3}$
- $(3 \cdot 7) + (4 \cdot 7) = (4 \cdot 7) + (3 \cdot 7)$

In Exercises 19–22, simplify each algebraic expression.

- $5(2x - 3) + 7x$
- $\frac{1}{5}(5x) + [(3y) + (-3y)] - (-x)$
- $3(4y - 5) - (7y + 2)$
- $8 - 2[3 - (5x - 1)]$

- The diversity index, from 0 (no diversity) to 100, measures the chance that two randomly selected people are a different race or ethnicity. The diversity index in the United States varies widely from region to region, from as high as 81 in Hawaii to as low as 11 in Vermont. The bar graph at the top of the next column shows the national diversity index for the United States for four years in the period from 1980 through 2010.

Chance That Two Randomly Selected Americans Are a Different Race or Ethnicity

Source: USA Today

The data in the graph can be modeled by the formula

$$D = 0.005x^2 + 0.55x + 34,$$

where  $D$  is the national diversity index in the United States  $x$  years after 1980. According to the formula, what was the U.S. diversity index in 2010? How does this compare with the index displayed by the bar graph?

### P.2

Evaluate each exponential expression in Exercises 24–27.

- $(-3)^3(-2)^2$
- $2^{-4} + 4^{-1}$
- $5^{-3} \cdot 5$
- $\frac{3^3}{3^6}$

Simplify each exponential expression in Exercises 28–31.

- $(-2x^4y^3)^3$
- $(-5x^3y^2)(-2x^{-11}y^{-2})$
- $(2x^3)^{-4}$
- $\frac{7x^5y^6}{28x^{15}y^{-2}}$

In Exercises 32–33, write each number in decimal notation.

- $3.74 \times 10^4$
- $7.45 \times 10^{-5}$

In Exercises 34–35, write each number in scientific notation.

- 3,590,000
- 0.00725

In Exercises 36–37, perform the indicated operation and write the answer in decimal notation.

- $(3 \times 10^3)(1.3 \times 10^2)$
- $\frac{6.9 \times 10^3}{3 \times 10^5}$

In 2009, the United States government spent more than it had collected in taxes, resulting in a budget deficit of \$1.35 trillion. In Exercises 38–40, you will use scientific notation to put a number like 1.35 trillion in perspective. Use  $10^{12}$  for 1 trillion.

- Express 1.35 trillion in scientific notation.
- There are approximately 32,000,000 seconds in a year. Express this number in scientific notation.
- Use your scientific notation answers from Exercises 38 and 39 to answer this question: How many years is 1.35 trillion seconds? Round to the nearest year. (Note: 1.35 trillion seconds would take us back in time to a period when Neanderthals were using stones to make tools.)

**P.3**

Use the product rule to simplify the expressions in Exercises 41–44. In Exercises 43–44, assume that variables represent nonnegative real numbers.

41.  $\sqrt{300}$                       42.  $\sqrt{12x^2}$   
 43.  $\sqrt{10x} \cdot \sqrt{2x}$             44.  $\sqrt{r^3}$

Use the quotient rule to simplify the expressions in Exercises 45–46.

45.  $\sqrt{\frac{121}{4}}$  —                      46.  $\frac{\sqrt{96x^3}}{\sqrt{2x}}$  (Assume that  $x > 0$ .)

In Exercises 47–49, add or subtract terms whenever possible.

47.  $7\sqrt{5} + 13\sqrt{5}$             48.  $2\sqrt{50} + 3\sqrt{8}$   
 49.  $4\sqrt{72} - 2\sqrt{48}$

In Exercises 50–53, rationalize the denominator.

50.  $\frac{30}{\sqrt{5}}$                               51.  $\frac{\sqrt{2}}{\sqrt{3}}$   
 52.  $\frac{5}{6 + \sqrt{3}}$                         53.  $\frac{14}{\sqrt{7} - \sqrt{5}}$

Evaluate each expression in Exercises 54–57 or indicate that the root is not a real number.

54.  $\sqrt[3]{125}$                             55.  $\sqrt[3]{-32}$   
 56.  $\sqrt[4]{-125}$                         57.  $\sqrt[4]{(-5)^4}$

Simplify the radical expressions in Exercises 58–62.

58.  $\sqrt[3]{81}$                               59.  $\sqrt[3]{y^5}$   
 60.  $\sqrt[4]{8} \cdot \sqrt[4]{10}$                     61.  $4\sqrt[3]{16} + 5\sqrt[3]{2}$   
 62.  $\frac{\sqrt[4]{32x^5}}{\sqrt[4]{16x}}$  (Assume that  $x > 0$ .)

In Exercises 63–68, evaluate each expression.

63.  $16^{\frac{1}{2}}$                       64.  $25^{-\frac{1}{2}}$                       65.  $125^{\frac{1}{3}}$   
 66.  $27^{-\frac{1}{3}}$                     67.  $64^{\frac{2}{3}}$                       68.  $27^{-\frac{4}{3}}$

In Exercises 69–71, simplify using properties of exponents.

69.  $(5x^{\frac{2}{3}})(4x^{\frac{1}{4}})$                       70.  $\frac{15x^{\frac{4}{3}}}{5x^{\frac{1}{2}}}$   
 71.  $(125x^6)^{\frac{2}{3}}$   
 72. Simplify by reducing the index of the radical:  $\sqrt[6]{y^3}$ .

**P.4**

In Exercises 73–74, perform the indicated operations. Write the resulting polynomial in standard form and indicate its degree.

73.  $(-6x^3 + 7x^2 - 9x + 3) + (14x^3 + 3x^2 - 11x - 7)$   
 74.  $(13x^4 - 8x^3 + 2x^2) - (5x^4 - 3x^3 + 2x^2 - 6)$

In Exercises 75–81, find each product.

75.  $(3x - 2)(4x^2 + 3x - 5)$     76.  $(3x - 5)(2x + 1)$   
 77.  $(4x + 5)(4x - 5)$             78.  $(2x + 5)^2$   
 79.  $(3x - 4)^2$                       80.  $(2x + 1)^3$   
 81.  $(5x - 2)^3$

In Exercises 82–83, perform the indicated operations. Indicate the degree of the resulting polynomial.

82.  $(7x^2 - 8xy + y^2) + (-8x^2 - 9xy - 4y^2)$   
 83.  $(13x^3y^2 - 5x^2y - 9x^2) - (-11x^3y^2 - 6x^2y + 3x^2 - 4)$

In Exercises 84–88, find each product.

84.  $(x + 7y)(3x - 5y)$             85.  $(3x - 5y)^2$   
 86.  $(3x^2 + 2y)^2$                     87.  $(7x + 4y)(7x - 4y)$   
 88.  $(a - b)(a^2 + ab + b^2)$

**P.5**

In Exercises 89–105, factor completely, or state that the polynomial is prime.

89.  $15x^3 + 3x^2$                       90.  $x^2 - 11x + 28$   
 91.  $15x^2 - x - 2$                     92.  $64 - x^2$   
 93.  $x^2 + 16$                             94.  $3x^4 - 9x^3 - 30x^2$   
 95.  $20x^7 - 36x^3$                     96.  $x^3 - 3x^2 - 9x + 27$   
 97.  $16x^2 - 40x + 25$               98.  $x^4 - 16$   
 99.  $y^3 - 8$                             100.  $x^3 + 64$   
 101.  $3x^4 - 12x^2$                     102.  $27x^3 - 125$   
 103.  $x^5 - x$                             104.  $x^3 + 5x^2 - 2x - 10$   
 105.  $x^2 + 18x + 81 - y^2$

In Exercises 106–108, factor and simplify each algebraic expression.

106.  $16x^{-\frac{3}{4}} + 32x^{\frac{1}{4}}$   
 107.  $(x^2 - 4)(x^2 + 3)^{\frac{1}{2}} - (x^2 - 4)^2(x^2 + 3)^{\frac{3}{2}}$   
 108.  $12x^{-\frac{1}{2}} + 6x^{-\frac{3}{2}}$

**P.6**

In Exercises 109–111, simplify each rational expression. Also, list all numbers that must be excluded from the domain.

109.  $\frac{x^3 + 2x^2}{x + 2}$     110.  $\frac{x^2 + 3x - 18}{x^2 - 36}$     111.  $\frac{x^2 + 2x}{x^2 + 4x + 4}$

In Exercises 112–114, multiply or divide as indicated.

112.  $\frac{x^2 + 6x + 9}{x^2 - 4} \cdot \frac{x + 3}{x - 2}$     113.  $\frac{6x + 2}{x^2 - 1} \div \frac{3x^2 + x}{x - 1}$   
 114.  $\frac{x^2 - 5x - 24}{x^2 - x - 12} \div \frac{x^2 - 10x + 16}{x^2 + x - 6}$

In Exercises 115–118, add or subtract as indicated.

115.  $\frac{2x - 7}{x^2 - 9} - \frac{x - 10}{x^2 - 9}$     116.  $\frac{3x}{x + 2} + \frac{x}{x - 2}$   
 117.  $\frac{x}{x^2 - 9} + \frac{x - 1}{x^2 - 5x + 6}$   
 118.  $\frac{4x - 1}{2x^2 + 5x - 3} - \frac{x + 3}{6x^2 + x - 2}$

In Exercises 119–122, simplify each complex rational expression.

119.  $\frac{\frac{1}{x} - \frac{1}{2}}{\frac{1}{3} - \frac{x}{6}}$     120.  $\frac{3 + \frac{12}{x}}{1 - \frac{16}{x^2}}$     121.  $\frac{3 - \frac{1}{x + 3}}{3 + \frac{1}{x + 3}}$   
 122.  $\frac{\sqrt{25 - x^2} + \frac{x^2}{\sqrt{25 - x^2}}}{25 - x^2}$

**P.7**

In Exercises 123–136, solve each equation.

123.  $1 - 2(6 - x) = 3x + 2$   
 124.  $2(x - 4) + 3(x + 5) = 2x - 2$   
 125.  $2x - 4(5x + 1) = 3x + 17$

126.  $\frac{1}{x-1} - \frac{1}{x+1} = \frac{2}{x^2-1}$
127.  $\frac{4}{x+2} + \frac{2}{x-4} = \frac{30}{x^2-2x-8}$
128.  $-4|2x+1| + 12 = 0$
129.  $2x^2 - 11x + 5 = 0$
130.  $(3x+5)(x-3) = 5$
131.  $3x^2 - 7x + 1 = 0$
132.  $x^2 - 9 = 0$
133.  $(x-3)^2 - 24 = 0$
134.  $\frac{2x}{x^2+6x+8} = \frac{x}{x+4} - \frac{2}{x+2}$
135.  $\sqrt{8-2x} - x = 0$
136.  $\sqrt{2x-3} + x = 3$

In Exercises 137–138, solve each formula for the specified variable.

137.  $vt + gt^2 = s$  for  $g$       138.  $T = \frac{A - P}{Pr}$  for  $P$

In Exercises 139–140, without solving the given quadratic equation, determine the number and type of solutions.

139.  $x^2 = 2x - 19$       140.  $9x^2 - 30x + 25 = 0$

142. The bar graph shows the average price of a movie ticket for selected years from 1980 through 2010. The graph indicates that in 1980, the average movie ticket price was \$2.69. For the period from 1980 through 2010, the price increased by approximately \$0.15 per year. If this trend continues, by which year will the average price of a movie ticket be \$8.69?

Sources: Motion Picture Association of America, National Association of Theater Owners (NATO), and Bureau of Labor Statistics (BLS)

143. After a 20% price reduction, a cordless phone sold for \$48. What was the phone's price before the reduction?
144. A salesperson earns \$300 per week plus 5% commission of sales. How much must be sold to earn \$800 in a week?
145. The length of a rectangular field is 6 yards less than triple the width. If the perimeter of the field is 340 yards, what are its dimensions?
146. In 2010, there were 14,100 students at college A, with a projected enrollment increase of 1500 students per year. In the same year, there were 41,700 students at college B, with a projected enrollment decline of 800 students per year. In which year will the colleges have the same enrollment? What will be the enrollment in each college at that time?
147. An architect is allowed 15 square yards of floor space to add a small bedroom to a house. Because of the room's design in relationship to the existing structure, the width of the rectangular floor must be 7 yards less than two times the length. Find the length and width of the rectangular floor that the architect is permitted.
148. A building casts a shadow that is double the length of its height. If the distance from the end of the shadow to the top of the building is 300 meters, how high is the building? Round to the nearest meter.
149. A painting measuring 10 inches by 16 inches is surrounded by a frame of uniform width. If the combined area of the painting and frame is 280 square inches, determine the width of the frame.

**P.8**

In Exercises 141–150, use the five-step strategy for solving word problems.

**141. Destined for Gory. Body Count in Wes Craven's Scream Series**

As sequels to horror films increase, so does the body count. Wes Craven's slasher *Scream* series adheres to that axiom.

Whether it's knife to the back, knife to the gut, or knife to the head, the body count in *Scream 2* exceeds the departed in *Scream* by 2. Appropriately, the number of characters killed off in *Scream 3* exceeds the departed in *Scream* by 3. The total body count in the four *Scream* films shown in the graphic is 33. Find the body count in *Scream*, *Scream 2*, and *Scream 3*.

150. Club members equally share the cost of \$1500 to charter a fishing boat. Shortly before the boat is to leave, four people decide not to go due to rough seas. As a result, the cost per person is increased by \$100. How many people originally intended to go on the fishing trip?

**P.9**

In Exercises 151–153, express each interval in set-builder notation and graph the interval on a number line.

151.  $[-3, 5)$       152.  $(-2, \infty)$       153.  $(-\infty, 0]$

In Exercises 154–157, use graphs to find each set.

154.  $(-2, 1] \cap [-1, 3)$       155.  $(-2, 1] \cup [-1, 3)$   
 156.  $[1, 3) \cap (0, 4)$       157.  $[1, 3) \cup (0, 4)$

In Exercises 158–167, solve each inequality. Use interval notation to express solution sets and graph each solution set on a number line.

158.  $-6x + 3 \leq 15$       159.  $6x - 9 \geq -4x - 3$

160.  $\frac{x}{3} - \frac{3}{4} - 1 > \frac{x}{2}$       161.  $6x + 5 > -2(x - 3) - 25$   
 162.  $3(2x - 1) - 2(x - 4) \geq 7 + 2(3 + 4x)$   
 163.  $7 < 2x + 3 \leq 9$       164.  $|2x + 3| \leq 15$   
 165.  $\left| \frac{2x + 6}{3} \right| > 2$       166.  $|2x + 5| - 7 \geq -6$   
 167.  $-4|x + 2| + 5 \leq -7$   
 168. A car rental agency rents a certain car for \$40 per day with unlimited mileage or \$24 per day plus \$0.20 per mile. How far can a customer drive this car per day for the \$24 option to cost no more than the unlimited mileage option?  
 169. To receive a B in a course, you must have an average of at least 80% but less than 90% on five exams. Your grades on the first four exams were 95%, 79%, 91%, and 86%. What range of grades on the fifth exam will result in a B for the course?

## CHAPTER P TEST

In Exercises 1–18, simplify the given expression or perform the indicated operation (and simplify, if possible), whichever is appropriate.

1.  $5(2x^2 - 6x) - (4x^2 - 3x)$
2.  $7 + 2[3(x + 1) - 2(3x - 1)]$
3.  $\{1, 2, 5\} \cap \{5, a\}$
4.  $\{1, 2, 5\} \cup \{5, a\}$
5.  $\frac{30x^3y^4}{6x^9y^{-4}}$
6.  $\sqrt{6r}\sqrt{3r}$  (Assume that  $r \geq 0$ .)
7.  $4\sqrt{50} - 3\sqrt{18}$
8.  $\frac{3}{5 + \sqrt{2}}$
9.  $\sqrt[3]{16x^4}$
10.  $\frac{x^2 + 2x - 3}{x^2 - 3x + 2}$
11.  $\frac{5 \times 10^{-6}}{20 \times 10^{-8}}$  (Express the answer in scientific notation.)
12.  $(2x - 5)(x^2 - 4x + 3)$
13.  $(5x + 3y)^2$
14.  $\frac{2x + 8}{x - 3} \div \frac{x^2 + 5x + 4}{x^2 - 9}$
15.  $\frac{x}{x + 3} + \frac{5}{x - 3}$
16.  $\frac{2x + 3}{x^2 - 7x + 12} - \frac{2}{x - 3}$
17.  $\frac{1 - \frac{x}{x + 2}}{1 + \frac{1}{x}}$
18.  $\frac{2x\sqrt{x^2 + 5} - \frac{2x^3}{\sqrt{x^2 + 5}}}{x^2 + 5}$

In Exercises 19–24, factor completely, or state that the polynomial is prime.

19.  $x^2 - 9x + 18$       20.  $x^3 + 2x^2 + 3x + 6$   
 21.  $25x^2 - 9$       22.  $36x^2 - 84x + 49$   
 23.  $y^3 - 125$       24.  $x^2 + 10x + 25 - 9y^2$

25. Factor and simplify:

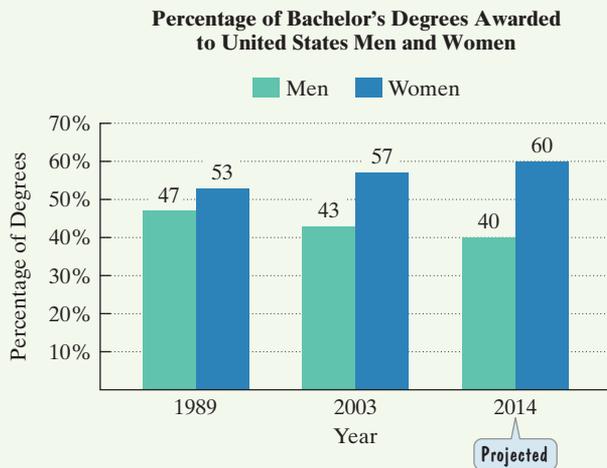

$$x(x + 3)^{-\frac{3}{5}} + (x + 3)^{\frac{2}{5}}$$

26. List all the rational numbers in this set:

$$\left\{-7, -\frac{4}{5}, 0, 0.25, \sqrt{3}, \sqrt{4}, \frac{22}{7}, \pi\right\}.$$

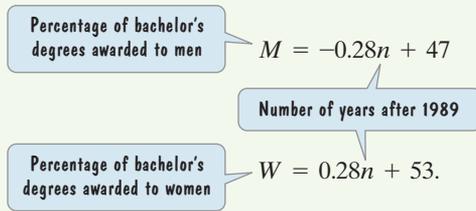

In Exercises 27–28, state the name of the property illustrated.

27.  $3(2 + 5) = 3(5 + 2)$   
 28.  $6(7 + 4) = 6 \cdot 7 + 6 \cdot 4$   
 29. Express in scientific notation: 0.00076.  
 30. Evaluate:  $27^{-\frac{5}{3}}$ .  
 31. In 2007, world population was approximately  $6.6 \times 10^9$ . By some projections, world population will double by 2040. Express the population at that time in scientific notation.  
 32. **Big (Lack of) Men on Campus** In 2007, 135 women received bachelor's degrees for every 100 men. According to the U.S. Department of Education, that gender imbalance will widen in the coming years, as shown by the bar graph.

Source: U.S. Department of Education

The data for bachelor's degrees can be described by the following mathematical models:

- According to the first formula, what percentage of bachelor's degrees were awarded to men in 2003? Does this underestimate or overestimate the actual percent shown by the bar graph on the previous page? By how much?
- Use the given formulas to write a new formula with a rational expression that models the ratio of the percentage of bachelor's degrees received by men to the percentage received by women  $n$  years after 1989. Name this new mathematical model  $R$ , for ratio.
- Use the formula for  $R$  to find the projected ratio of bachelor's degrees received by men to degrees received by women in 2014. According to the model, how many women will receive bachelor's degrees for every two men in 2014? How well does this describe the projections shown by the graph on the previous page?

In Exercises 33–47, solve each equation or inequality. Use interval notation to express solution sets of inequalities and graph these solution sets on a number line.

33.  $7(x - 2) = 4(x + 1) - 21$

34.  $\frac{2x - 3}{4} = \frac{x - 4}{2} - \frac{x + 1}{4}$

35.  $\frac{2}{x - 3} - \frac{4}{x + 3} = \frac{8}{x^2 - 9}$

36.  $2x^2 - 3x - 2 = 0$

37.  $(3x - 1)^2 = 75$

38.  $x(x - 2) = 4$

39.  $\sqrt{x - 3} + 5 = x$

40.  $\sqrt{8 - 2x} - x = 0$

41.  $\left| \frac{2}{3}x - 6 \right| = 2$

42.  $-3|4x - 7| + 15 = 0$

43.  $\frac{2x}{x^2 + 6x + 8} + \frac{2}{x + 2} = \frac{x}{x + 4}$

44.  $3(x + 4) \geq 5x - 12$

45.  $\frac{x}{6} + \frac{1}{8} \leq \frac{x}{2} - \frac{3}{4}$

46.  $-3 \leq \frac{2x + 5}{3} < 6$

47.  $|3x + 2| \geq 3$

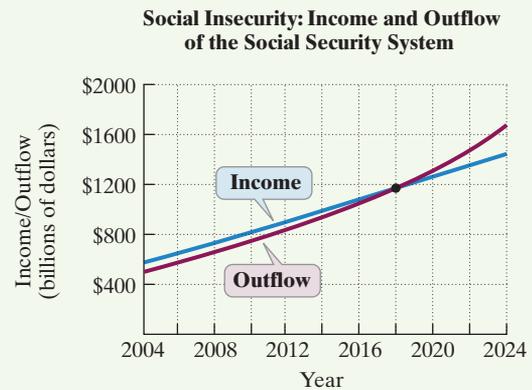

In Exercises 48–50, solve each formula for the specified variable.

48.  $V = \frac{1}{3}lwh$  for  $h$

49.  $y - y_1 = m(x - x_1)$  for  $x$

50.  $R = \frac{as}{a + s}$  for  $a$

The graphs show the amount being paid in Social Security benefits and the amount going into the system. All data are expressed in billions of dollars. Amounts from 2012 through 2024 are projections.

Source: 2004 Social Security Trustees Report

Exercises 51–53 are based on the data shown by the graphs.

- In 2004, the system's income was \$575 billion, projected to increase at an average rate of \$43 billion per year. In which year will the system's income be \$1177 billion?
- The data for the system's outflow can be modeled by the formula

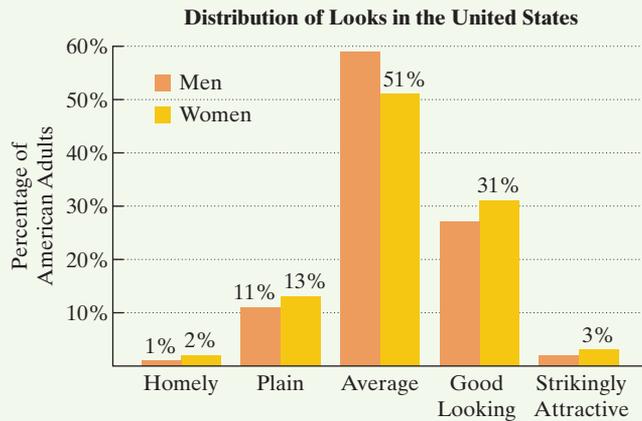

$$B = 0.07x^2 + 47.4x + 500,$$

where  $B$  represents the amount paid in benefits, in billions of dollars,  $x$  years after 2004. According to this model, when will the amount paid in benefits be \$1177 billion? Round to the nearest year.

- How well do your answers to Exercises 51 and 52 model the data shown by the graphs?

**54. Here's Looking at You.** According to University of Texas economist Daniel Hamermesh (*Beauty Pays: Why Attractive People Are More Successful*), strikingly attractive and good-looking men and women can expect to earn an average of \$230,000 more in a lifetime than a person who is homely or plain. (Your author feels the need to start affirmative action for the beauty-bereft, consoled by the reality that looks are only one of many things that matter.) The bar graph shows the distribution of looks for American men and women, ranging from homely to strikingly attractive.

The percentage of average-looking men exceeds the percentage of strikingly attractive men by 57. The percentage of good-looking men exceeds the percentage of strikingly attractive men by 25. A total of 88% of American men range between average looking, good-looking, and strikingly attractive. Find the percentage of men who fall within each of these three categories of looks.

Source: *Time*, August 22, 2011

**55.** The costs for two different kinds of heating systems for a small home are given in the following table. After how many years will total costs for solar heating and electric heating be the same? What will be the cost at that time?

System	Cost to Install	Operating Cost/Year
Solar	\$29,700	\$150
Electric	\$5000	\$1100

**56.** The length of a rectangular carpet is 4 feet greater than twice its width. If the area is 48 square feet, find the carpet's length and width.

**57.** A vertical pole is to be supported by a wire that is 26 feet long and anchored 24 feet from the base of the pole. How far up the pole should the wire be attached?

**58.** After a 60% reduction, a jacket sold for \$20. What was the jacket's price before the reduction?

**59.** A group of people would like to buy a vacation cabin for \$600,000, sharing the cost equally. If they could find five more people to join them, each person's share would be reduced by \$6000. How many people are in the group?

**60.** You are choosing between two texting plans. Plan A charges \$25 per month for unlimited texting. Plan B has a monthly fee of \$13 with a charge of \$0.06 per text. How many text messages in a month make plan A the better deal?

# FUNCTIONS AND GRAPHS

## CHAPTER

# 1

### HERE'S WHERE YOU'LL FIND THESE APPLICATIONS:

A mathematical model involving global warming is developed in Example 9 in Section 1.4.

Using mathematics in a way that is similar to making a movie is discussed in the Blitzer Bonus on page 210.

*A vast expanse of open water at the top of our world* was once covered with ice. The melting of the Arctic ice caps has forced polar bears to swim as far as 40 miles, causing them to drown in significant numbers. Such deaths were rare in the past.

There is strong scientific consensus that human activities are changing the Earth's climate. Scientists now believe that there is a striking correlation between atmospheric carbon dioxide concentration and global temperature. As both of these variables increase at significant rates, there are warnings of a planetary emergency that threatens to condemn coming generations to a catastrophically diminished future.\*

In this chapter, you'll learn to approach our climate crisis mathematically by creating formulas, called functions, that model data for average global temperature and carbon dioxide concentration over time. Understanding the concept of a function will give you a new perspective on many situations, ranging from global warming to using mathematics in a way that is similar to making a movie.

## SECTION 1.1

## Graphs and Graphing Utilities

## Objectives

- 1 Plot points in the rectangular coordinate system.
- 2 Graph equations in the rectangular coordinate system.
- 3 Interpret information about a graphing utility's viewing rectangle or table.
- 4 Use a graph to determine intercepts.
- 5 Interpret information given by graphs.

- 1 Plot points in the rectangular coordinate system.

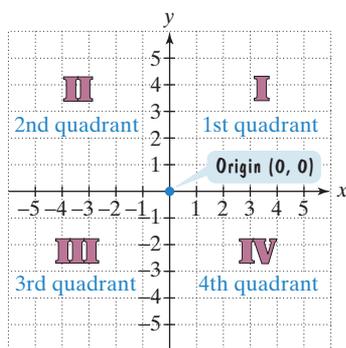

FIGURE 1.1 The rectangular coordinate system

## GREAT QUESTION!

What's the significance of the word "ordered" when describing a pair of real numbers?

The phrase *ordered pair* is used because order is important. The order in which coordinates appear makes a difference in a point's location. This is illustrated in **Figure 1.2**.

The beginning of the seventeenth century was a time of innovative ideas and enormous intellectual progress in Europe. English theatergoers enjoyed a succession of exciting new plays

by Shakespeare. William Harvey proposed the radical notion that the heart was a pump for blood rather than the center of emotion. Galileo, with his newfangled invention called the telescope, supported the theory of Polish astronomer Copernicus that the sun, not the Earth, was the center

of the solar system. Monteverdi was writing the world's first grand operas. French mathematicians Pascal and Fermat invented a new field of mathematics called probability theory.

Into this arena of intellectual electricity stepped French aristocrat René Descartes (1596–1650). Descartes (pronounced “day cart”), propelled by the creativity surrounding him, developed a new branch of mathematics that brought together algebra and geometry in a unified way—a way that visualized numbers as points on a graph, equations as geometric figures, and geometric figures as equations. This new branch of mathematics, called *analytic geometry*, established Descartes as one of the founders of modern thought and among the most original mathematicians and philosophers of any age. We begin this section by looking at Descartes's deceptively simple idea, called the **rectangular coordinate system** or (in his honor) the **Cartesian coordinate system**.

## Points and Ordered Pairs

Descartes used two number lines that intersect at right angles at their zero points, as shown in **Figure 1.1**. The horizontal number line is the **x-axis**. The vertical number line is the **y-axis**. The point of intersection of these axes is their zero points, called the **origin**. Positive numbers are shown to the right and above the origin. Negative numbers are shown to the left and below the origin. The axes divide the plane into four quarters, called **quadrants**. The points located on the axes are not in any quadrant.

Each point in the rectangular coordinate system corresponds to an **ordered pair** of real numbers,  $(x, y)$ . Examples of such pairs are  $(-5, 3)$  and  $(3, -5)$ . The first number in each pair, called the **x-coordinate**, denotes the distance and direction from the origin along the **x-axis**. The second number in each pair, called the **y-coordinate**, denotes vertical distance and direction along a line parallel to the **y-axis** or along the **y-axis** itself.

**Figure 1.2** shows how we **plot**, or locate, the points corresponding to the ordered pairs  $(-5, 3)$  and  $(3, -5)$ . We plot  $(-5, 3)$  by going 5 units from 0 to the left along the **x-axis**. Then we go 3 units up parallel to the **y-axis**. We plot  $(3, -5)$  by going 3 units from 0 to the right along the **x-axis** and 5 units down parallel to the **y-axis**. The phrase “the points corresponding to the ordered pairs  $(-5, 3)$  and  $(3, -5)$ ” is often abbreviated as “the points  $(-5, 3)$  and  $(3, -5)$ .”

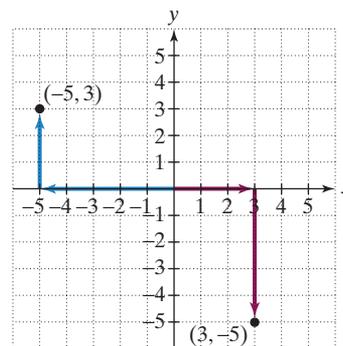

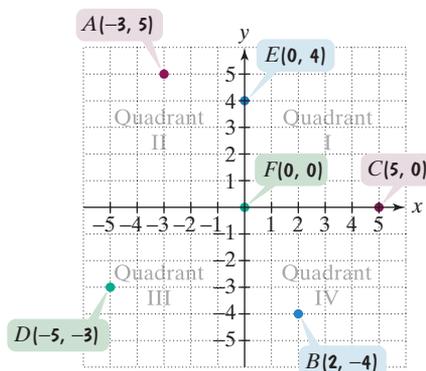

FIGURE 1.2 Plotting  $(-5, 3)$  and  $(3, -5)$

**EXAMPLE 1** Plotting Points in the Rectangular Coordinate SystemPlot the points:  $A(-3, 5)$ ,  $B(2, -4)$ ,  $C(5, 0)$ ,  $D(-5, -3)$ ,  $E(0, 4)$ , and  $F(0, 0)$ .**SOLUTION**See **Figure 1.3**. We move from the origin and plot the points in the following way:

- $A(-3, 5)$ : 3 units left, 5 units up  
 $B(2, -4)$ : 2 units right, 4 units down  
 $C(5, 0)$ : 5 units right, 0 units up or down  
 $D(-5, -3)$ : 5 units left, 3 units down  
 $E(0, 4)$ : 0 units right or left, 4 units up  
 $F(0, 0)$ : 0 units right or left, 0 units up or down

Notice that the origin is represented by  $(0, 0)$ .**FIGURE 1.3** Plotting points**GREAT QUESTION!****Why is it so important to work each of the book's Check Points?**

You learn best by doing. Do not simply look at the worked examples and conclude that you know how to solve them. To be sure you understand the worked examples, try each Check Point. Check your answer in the answer section before continuing your reading. Expect to read this book with pencil and paper handy to work the Check Points.

- 2 Graph equations in the rectangular coordinate system.

**Check Point 1** Plot the points:  $A(-2, 4)$ ,  $B(4, -2)$ ,  $C(-3, 0)$ , and  $D(0, -3)$ .

**Graphs of Equations**

A relationship between two quantities can be expressed as an **equation in two variables**, such as

$$y = 4 - x^2.$$

A **solution of an equation in two variables**,  $x$  and  $y$ , is an ordered pair of real numbers with the following property: When the  $x$ -coordinate is substituted for  $x$  and the  $y$ -coordinate is substituted for  $y$  in the equation, we obtain a true statement. For example, consider the equation  $y = 4 - x^2$  and the ordered pair  $(3, -5)$ . When 3 is substituted for  $x$  and  $-5$  is substituted for  $y$ , we obtain the statement  $-5 = 4 - 3^2$ , or  $-5 = 4 - 9$ , or  $-5 = -5$ . Because this statement is true, the ordered pair  $(3, -5)$  is a solution of the equation  $y = 4 - x^2$ . We also say that  $(3, -5)$  **satisfies** the equation.

We can generate as many ordered-pair solutions as desired to  $y = 4 - x^2$  by substituting numbers for  $x$  and then finding the corresponding values for  $y$ . For example, suppose we let  $x = 3$ :

$x$	$y = 4 - x^2$	Ordered Pair $(x, y)$
3	$y = 4 - 3^2 = 4 - 9 = -5$	$(3, -5)$

Start with  $x$ .  
 Compute  $y$ .  
 Form the ordered pair  $(x, y)$ .  
 Let  $x = 3$ .  
 $(3, -5)$  is a solution of  $y = 4 - x^2$ .

The **graph of an equation in two variables** is the set of all points whose coordinates satisfy the equation. One method for graphing such equations is the **point-plotting method**. First, we find several ordered pairs that are solutions of the equation. Next, we plot these ordered pairs as points in the rectangular coordinate system. Finally, we connect the points with a smooth curve or line. This often gives us a picture of all ordered pairs that satisfy the equation.

**EXAMPLE 2** Graphing an Equation Using the Point-Plotting Method

Graph  $y = 4 - x^2$ . Select integers for  $x$ , starting with  $-3$  and ending with  $3$ .

**SOLUTION**

For each value of  $x$ , we find the corresponding value for  $y$ .

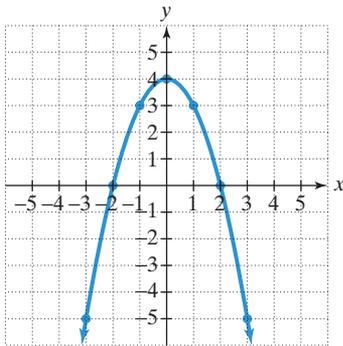

FIGURE 1.4 The graph of  $y = 4 - x^2$

We selected integers from  $-3$  to  $3$ , inclusive, to include three negative numbers,  $0$ , and three positive numbers. We also wanted to keep the resulting computations for  $y$  relatively simple.

$x$	$y = 4 - x^2$	Ordered Pair $(x, y)$
$-3$	$y = 4 - (-3)^2 = 4 - 9 = -5$	$(-3, -5)$
$-2$	$y = 4 - (-2)^2 = 4 - 4 = 0$	$(-2, 0)$
$-1$	$y = 4 - (-1)^2 = 4 - 1 = 3$	$(-1, 3)$
$0$	$y = 4 - 0^2 = 4 - 0 = 4$	$(0, 4)$
$1$	$y = 4 - 1^2 = 4 - 1 = 3$	$(1, 3)$
$2$	$y = 4 - 2^2 = 4 - 4 = 0$	$(2, 0)$
$3$	$y = 4 - 3^2 = 4 - 9 = -5$	$(3, -5)$

Now we plot the seven points and join them with a smooth curve, as shown in **Figure 1.4**. The graph of  $y = 4 - x^2$  is a curve where the part of the graph to the right of the  $y$ -axis is a reflection of the part to the left of it and vice versa. The arrows on the left and the right of the curve indicate that it extends indefinitely in both directions. ...

**Check Point 2** Graph  $y = 4 - x$ . Select integers for  $x$ , starting with  $-3$  and ending with  $3$ .

**EXAMPLE 3** Graphing an Equation Using the Point-Plotting Method

Graph  $y = |x|$ . Select integers for  $x$ , starting with  $-3$  and ending with  $3$ .

**SOLUTION**

For each value of  $x$ , we find the corresponding value for  $y$ .

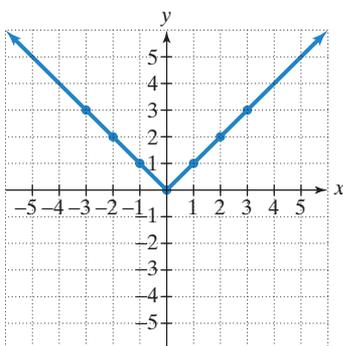

FIGURE 1.5 The graph of  $y = |x|$

$x$	$y =  x $	Ordered Pair $(x, y)$
$-3$	$y =  -3  = 3$	$(-3, 3)$
$-2$	$y =  -2  = 2$	$(-2, 2)$
$-1$	$y =  -1  = 1$	$(-1, 1)$
$0$	$y =  0  = 0$	$(0, 0)$
$1$	$y =  1  = 1$	$(1, 1)$
$2$	$y =  2  = 2$	$(2, 2)$
$3$	$y =  3  = 3$	$(3, 3)$

We plot the points and connect them, resulting in the graph shown in **Figure 1.5**. The graph is V-shaped and centered at the origin. For every point  $(x, y)$  on the graph, the point  $(-x, y)$  is also on the graph. This shows that the absolute value of a positive number is the same as the absolute value of its opposite. ...

**Check Point 3** Graph  $y = |x + 1|$ . Select integers for  $x$ , starting with  $-4$  and ending with  $2$ .

- 3 Interpret information about a graphing utility's viewing rectangle or table.

## Graphing Equations and Creating Tables Using a Graphing Utility

Graphing calculators and graphing software packages for computers are referred to as **graphing utilities** or **graphers**. A graphing utility is a powerful tool that quickly generates the graph of an equation in two variables. **Figures 1.6(a)** and **1.6(b)** show two such graphs for the equations in Examples 2 and 3.

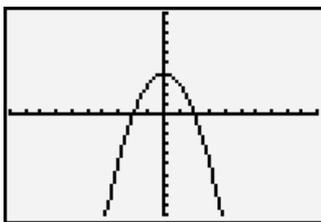

FIGURE 1.6(a) The graph of  $y = 4 - x^2$

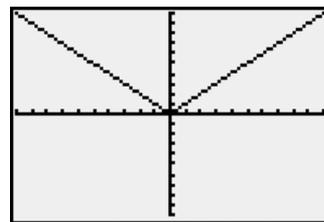

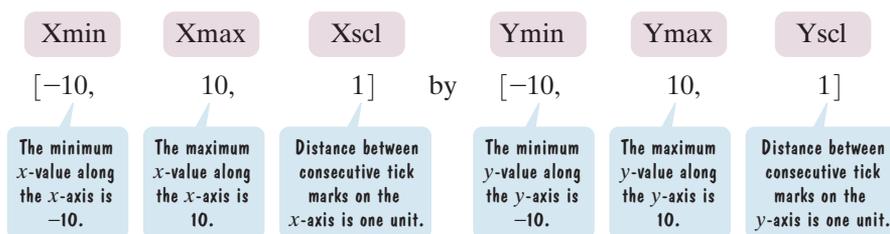

FIGURE 1.6(b) The graph of  $y = |x|$

### GREAT QUESTION!

**I'm not using a graphing calculator, so should I skip this part of the section?**

Even if you are not using a graphing utility in the course, read this part of the section. Knowing about viewing rectangles will enable you to understand the graphs that we display in the technology boxes throughout the book.

What differences do you notice between these graphs and the graphs that we drew by hand? They do seem a bit “jittery.” Arrows do not appear on the left and right ends of the graphs. Furthermore, numbers are not given along the axes. For both graphs in **Figure 1.6**, the  $x$ -axis extends from  $-10$  to  $10$  and the  $y$ -axis also extends from  $-10$  to  $10$ . The distance represented by each consecutive tick mark is one unit. We say that the **viewing rectangle**, or the **viewing window**, is  $[-10, 10, 1]$  by  $[-10, 10, 1]$ .

To graph an equation in  $x$  and  $y$  using a graphing utility, enter the equation and specify the size of the viewing rectangle. The size of the viewing rectangle sets minimum and maximum values for both the  $x$ - and  $y$ -axes. Enter these values, as well as the values representing the distances between consecutive tick marks, on the respective axes. The  $[-10, 10, 1]$  by  $[-10, 10, 1]$  viewing rectangle used in **Figure 1.6** is called the **standard viewing rectangle**.

### EXAMPLE 4 Understanding the Viewing Rectangle

What is the meaning of a  $[-2, 3, 0.5]$  by  $[-10, 20, 5]$  viewing rectangle?

#### SOLUTION

We begin with  $[-2, 3, 0.5]$ , which describes the  $x$ -axis. The minimum  $x$ -value is  $-2$  and the maximum  $x$ -value is  $3$ . The distance between consecutive tick marks is  $0.5$ .

Next, consider  $[-10, 20, 5]$ , which describes the  $y$ -axis. The minimum  $y$ -value is  $-10$  and the maximum  $y$ -value is  $20$ . The distance between consecutive tick marks is  $5$ .

**Figure 1.7** illustrates a  $[-2, 3, 0.5]$  by  $[-10, 20, 5]$  viewing rectangle. To make things clearer, we've placed numbers by each tick mark. These numbers do not appear on the axes when you use a graphing utility to graph an equation. ●●●

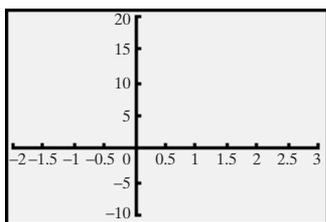

FIGURE 1.7 A  $[-2, 3, 0.5]$  by  $[-10, 20, 5]$  viewing rectangle

**Check Point 4** What is the meaning of a  $[-100, 100, 50]$  by  $[-100, 100, 10]$  viewing rectangle? Create a figure like the one in **Figure 1.7** that illustrates this viewing rectangle.

On most graphing utilities, the display screen is two-thirds as high as it is wide. By using a square setting, you can equally space the  $x$  and  $y$  tick marks. (This does not occur in the standard viewing rectangle.) Graphing utilities can also *zoom in* and *zoom out*.

When you zoom in, you see a smaller portion of the graph, but you do so in greater detail. When you zoom out, you see a larger portion of the graph. Thus, zooming out may help you to develop a better understanding of the overall character of the graph. With practice, you will become more comfortable with graphing equations in two variables using your graphing utility. You will also develop a better sense of the size of the viewing rectangle that will reveal needed information about a particular graph.

Graphing utilities can also be used to create tables showing solutions of equations in two variables. Use the Table Setup function to choose the starting value of  $x$  and to input the increment, or change, between the consecutive  $x$ -values. The corresponding  $y$ -values are calculated based on the equation(s) in two variables in the  $\boxed{Y=}$  screen. In **Figure 1.8**, we used a TI-84 Plus to create a table for  $y = 4 - x^2$  and  $y = |x|$ , the equations in Examples 2 and 3.

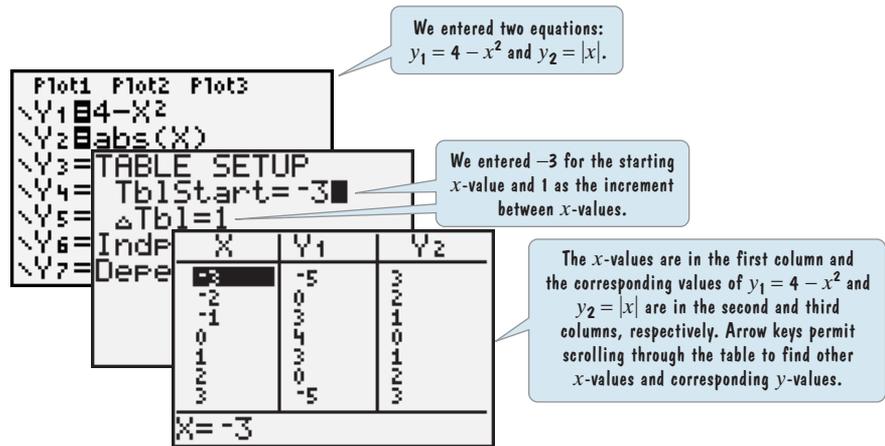

FIGURE 1.8 Creating a table for  $y_1 = 4 - x^2$  and  $y_2 = |x|$

4 Use a graph to determine intercepts.

**Intercepts**

An  **$x$ -intercept** of a graph is the  $x$ -coordinate of a point where the graph intersects the  $x$ -axis. For example, look at the graph of  $y = 4 - x^2$  in **Figure 1.9**. The graph crosses the  $x$ -axis at  $(-2, 0)$  and  $(2, 0)$ . Thus, the  $x$ -intercepts are  $-2$  and  $2$ . **The  $y$ -coordinate corresponding to an  $x$ -intercept is always zero.**

A  **$y$ -intercept** of a graph is the  $y$ -coordinate of a point where the graph intersects the  $y$ -axis. The graph of  $y = 4 - x^2$  in **Figure 1.9** shows that the graph crosses the  $y$ -axis at  $(0, 4)$ . Thus, the  $y$ -intercept is  $4$ . **The  $x$ -coordinate corresponding to a  $y$ -intercept is always zero.**

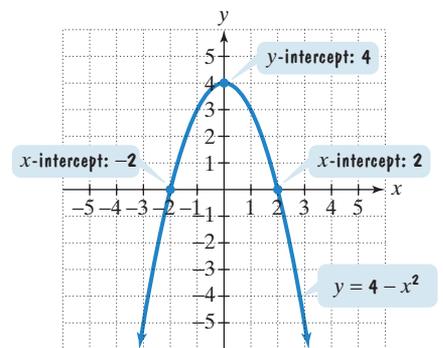

FIGURE 1.9 Intercepts of  $y = 4 - x^2$

**GREAT QUESTION!**

**Are single numbers the only way to represent intercepts? Can ordered pairs also be used?**

Mathematicians tend to use two ways to describe intercepts. Did you notice that we are using single numbers? If  $a$  is an  $x$ -intercept of a graph, then the graph passes through the point  $(a, 0)$ . If  $b$  is a  $y$ -intercept of a graph, then the graph passes through the point  $(0, b)$ .

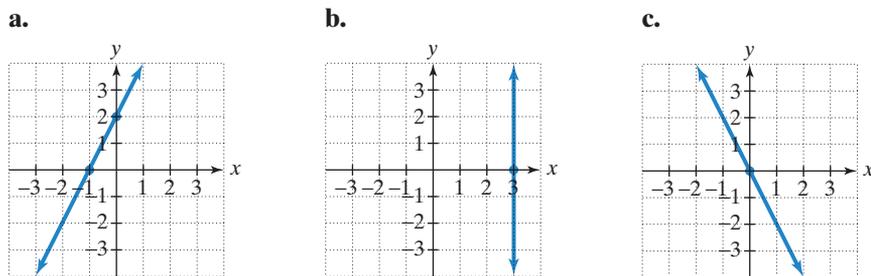

Some books state that the  $x$ -intercept is the *point*  $(a, 0)$  and the  $x$ -intercept is *at*  $a$  on the  $x$ -axis. Similarly, the  $y$ -intercept is the *point*  $(0, b)$  and the  $y$ -intercept is *at*  $b$  on the  $y$ -axis. In these descriptions, the intercepts are the actual points where the graph intersects the axes.

Although we'll describe intercepts as single numbers, we'll immediately state the point on the  $x$ - or  $y$ -axis that the graph passes through. Here's the important thing to keep in mind:

$x$ -intercept: The corresponding value of  $y$  is 0.

$y$ -intercept: The corresponding value of  $x$  is 0.

**EXAMPLE 5** Identifying Intercepts

 Identify the  $x$ - and  $y$ -intercepts.

**SOLUTION**

- The graph crosses the  $x$ -axis at  $(-1, 0)$ . Thus, the  $x$ -intercept is  $-1$ . The graph crosses the  $y$ -axis at  $(0, 2)$ . Thus, the  $y$ -intercept is  $2$ .
- The graph crosses the  $x$ -axis at  $(3, 0)$ , so the  $x$ -intercept is  $3$ . This vertical line does not cross the  $y$ -axis. Thus, there is no  $y$ -intercept.
- This graph crosses the  $x$ - and  $y$ -axes at the same point, the origin. Because the graph crosses both axes at  $(0, 0)$ , the  $x$ -intercept is  $0$  and the  $y$ -intercept is  $0$ . ...

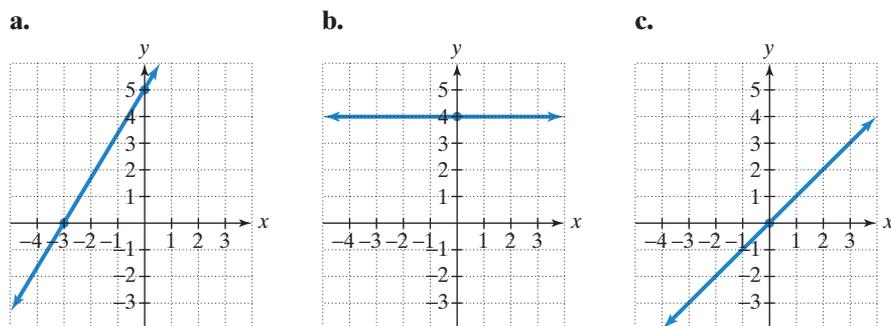

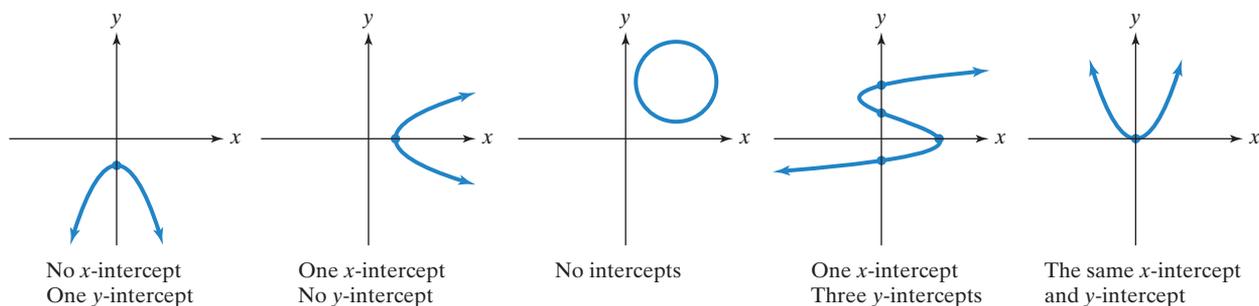

**Check Point 5** Identify the  $x$ - and  $y$ -intercepts.

Figure 1.10 illustrates that a graph may have no intercepts or several intercepts.

**FIGURE 1.10**

 No  $x$ -intercept  
One  $y$ -intercept

 One  $x$ -intercept  
No  $y$ -intercept

No intercepts

 One  $x$ -intercept  
Three  $y$ -intercepts

 The same  $x$ -intercept  
and  $y$ -intercept

- Interpret information given by graphs.

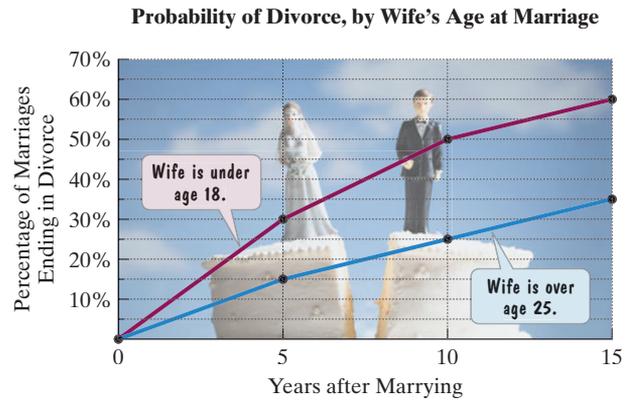

**Interpreting Information Given by Graphs**

**Line graphs** are often used to illustrate trends over time. Some measure of time, such as months or years, frequently appears on the horizontal axis. Amounts are generally listed on the vertical axis. Points are drawn to represent the given information. The graph is formed by connecting the points with line segments.

A line graph displays information in the first quadrant of a rectangular coordinate system. By identifying points on line graphs and their coordinates, you can interpret specific information given by the graph.

**EXAMPLE 6** Age at Marriage and the Probability of Divorce

Divorce rates are considerably higher for couples who marry in their teens. The line graphs in **Figure 1.11** show the percentages of marriages ending in divorce based on the wife’s age at marriage.

**FIGURE 1.11**  
Source: B. E. Pruitt et al., *Human Sexuality*, Prentice Hall, 2007.

Here are two mathematical models that approximate the data displayed by the line graphs:

Wife is under 18 at time of marriage.	Wife is over 25 at time of marriage.
$d = 4n + 5$	$d = 2.3n + 1.5$

In each model, the variable  $n$  is the number of years after marriage and the variable  $d$  is the percentage of marriages ending in divorce.

- a. Use the appropriate formula to determine the percentage of marriages ending in divorce after 10 years when the wife is over 25 at the time of marriage.
- b. Use the appropriate line graph in **Figure 1.11** to determine the percentage of marriages ending in divorce after 10 years when the wife is over 25 at the time of marriage.
- c. Does the value given by the mathematical model underestimate or overestimate the actual percentage of marriages ending in divorce after 10 years as shown by the graph? By how much?

**SOLUTION**

- a. Because the wife is over 25 at the time of marriage, we use the formula on the right,  $d = 2.3n + 1.5$ . To find the percentage of marriages ending in divorce after 10 years, we substitute 10 for  $n$  and evaluate the formula.

$d = 2.3n + 1.5$	This is one of the two given mathematical models.
$d = 2.3(10) + 1.5$	Replace $n$ with 10.
$d = 23 + 1.5$	Multiply: $2.3(10) = 23$ .
$d = 24.5$	Add.

The model indicates that 24.5% of marriages end in divorce after 10 years when the wife is over 25 at the time of marriage.

- b. Now let's use the line graph that shows the percentage of marriages ending in divorce when the wife is over 25 at the time of marriage. The graph is shown again in **Figure 1.12**. To find the percentage of marriages ending in divorce after 10 years:

- Locate 10 on the horizontal axis and locate the point above 10.
- Read across to the corresponding percent on the vertical axis.

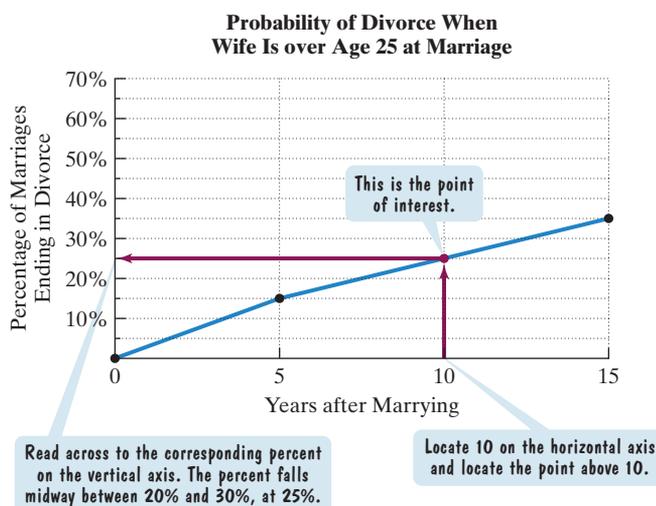

FIGURE 1.12

The actual data displayed by the graph indicate that 25% of these marriages end in divorce after 10 years.

## GREAT QUESTION!

**What am I supposed to do with the exercises in the Concept and Vocabulary Check?**

It is impossible to learn algebra and trigonometry without knowing their special language. The exercises in the Concept and Vocabulary Check, mainly fill-in-the-blank and true/false items, test your understanding of the definitions and concepts presented in each section. **Work all of the exercises in the Concept and Vocabulary Check** regardless of which exercises your professor assigns in the Exercise Set that follows.

- c. The value obtained by evaluating the mathematical model, 24.5%, is close to, but slightly less than, the actual percentage of divorces, 25.0%. The difference between these percents is  $25.0\% - 24.5\%$ , or 0.5%. The value given by the mathematical model, 24.5%, underestimates the actual percent, 25%, by only 0.5, providing a fairly accurate description of the data. ●●●

## Check Point 6

- Use the appropriate formula from Example 6 to determine the percentage of marriages ending in divorce after 15 years when the wife is under 18 at the time of marriage.
- Use the appropriate line graph in **Figure 1.11** to determine the percentage of marriages ending in divorce after 15 years when the wife is under 18 at the time of marriage.
- Does the value given by the mathematical model underestimate or overestimate the actual percentage of marriages ending in divorce after 15 years as shown by the graph? By how much?

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- In the rectangular coordinate system, the horizontal number line is called the \_\_\_\_\_.
- In the rectangular coordinate system, the vertical number line is called the \_\_\_\_\_.
- In the rectangular coordinate system, the point of intersection of the horizontal axis and the vertical axis is called the \_\_\_\_\_.
- The axes of the rectangular coordinate system divide the plane into regions, called \_\_\_\_\_. There are \_\_\_\_\_ of these regions.
- The first number in an ordered pair such as (8, 3) is called the \_\_\_\_\_. The second number in such an ordered pair is called the \_\_\_\_\_.

6. The ordered pair (4, 19) is a/an \_\_\_\_\_ of the equation  $y = x^2 + 3$  because when 4 is substituted for  $x$  and 19 is substituted for  $y$ , we obtain a true statement. We also say that (4, 19) \_\_\_\_\_ the equation.
7. The  $x$ -coordinate of a point where a graph crosses the  $x$ -axis is called a/an \_\_\_\_\_. The  $y$ -coordinate of such a point is always \_\_\_\_\_.
8. The  $y$ -coordinate of a point where a graph crosses the  $y$ -axis is called a/an \_\_\_\_\_. The  $x$ -coordinate of such a point is always \_\_\_\_\_.

### EXERCISE SET 1.1

#### Practice Exercises

In Exercises 1–12, plot the given point in a rectangular coordinate system.

1. (1, 4)      2. (2, 5)      3. (-2, 3)  
 4. (-1, 4)    5. (-3, -5)    6. (-4, -2)  
 7. (4, -1)    8. (3, -2)      9. (-4, 0)  
 10. (0, -3)    11.  $(\frac{7}{2}, -\frac{3}{2})$     12.  $(-\frac{5}{2}, \frac{3}{2})$

Graph each equation in Exercises 13–28. Let  $x = -3, -2, -1, 0, 1, 2$ , and 3.

13.  $y = x^2 - 2$     14.  $y = x^2 + 2$     15.  $y = x - 2$   
 16.  $y = x + 2$     17.  $y = 2x + 1$     18.  $y = 2x - 4$   
 19.  $y = -\frac{1}{2}x$     20.  $y = -\frac{1}{2}x + 2$     21.  $y = 2|x|$   
 22.  $y = -2|x|$     23.  $y = |x| + 1$     24.  $y = |x| - 1$   
 25.  $y = 9 - x^2$     26.  $y = -x^2$     27.  $y = x^3$   
 28.  $y = x^3 - 1$

In Exercises 29–32, match the viewing rectangle with the correct figure. Then label the tick marks in the figure to illustrate this viewing rectangle.

29.  $[-5, 5, 1]$  by  $[-5, 5, 1]$       30.  $[-10, 10, 2]$  by  $[-4, 4, 2]$   
 31.  $[-20, 80, 10]$  by  $[-30, 70, 10]$   
 32.  $[-40, 40, 20]$  by  $[-1000, 1000, 100]$

a. 

b. 

c. 

d. 

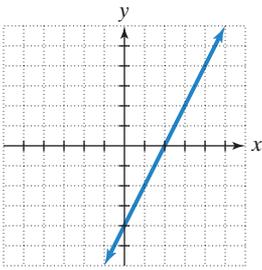

The table of values was generated by a graphing utility with a TABLE feature. Use the table to solve Exercises 33–40.

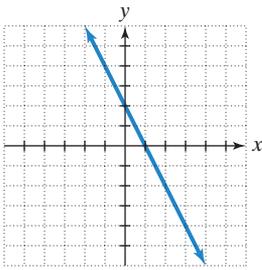

X	Y <sub>1</sub>	Y <sub>2</sub>
0	8	5
1	7	4
2	6	3
3	5	2
4	4	1
5	3	0
6	2	-1
7	1	-2
8	0	-3
9	-1	-4
10	-2	-5

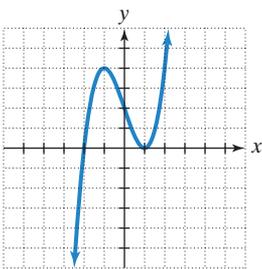

X = -3

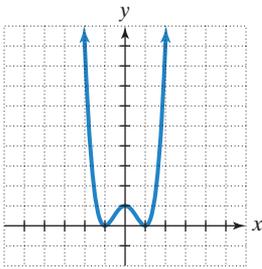

33. Which equation corresponds to  $Y_2$  in the table?  
 a.  $y_2 = x + 8$       b.  $y_2 = x - 2$   
 c.  $y_2 = 2 - x$       d.  $y_2 = 1 - 2x$
34. Which equation corresponds to  $Y_1$  in the table?  
 a.  $y_1 = -3x$       b.  $y_1 = x^2$   
 c.  $y_1 = -x^2$       d.  $y_1 = 2 - x$
35. Does the graph of  $Y_2$  pass through the origin?  
 36. Does the graph of  $Y_1$  pass through the origin?  
 37. At which point does the graph of  $Y_2$  cross the  $x$ -axis?  
 38. At which point does the graph of  $Y_2$  cross the  $y$ -axis?  
 39. At which points do the graphs of  $Y_1$  and  $Y_2$  intersect?  
 40. For which values of  $x$  is  $Y_1 = Y_2$ ?

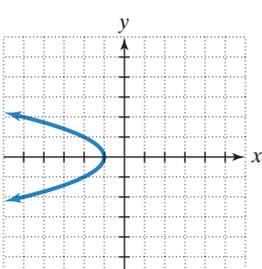

In Exercises 41–46, use the graph to a. determine the  $x$ -intercepts, if any; b. determine the  $y$ -intercepts, if any. For each graph, tick marks along the axes represent one unit each.

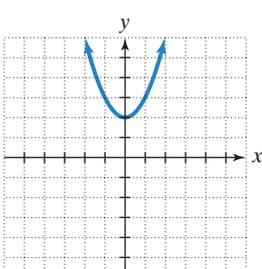

41. 

42. 

43. 

44. 

45. 

46. 

## Practice Plus

In Exercises 47–50, write each English sentence as an equation in two variables. Then graph the equation.

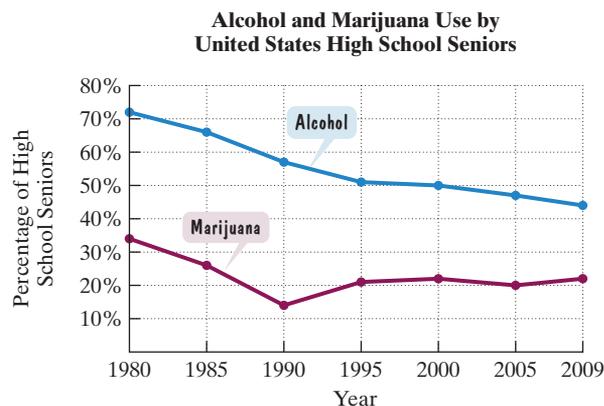

47. The  $y$ -value is four more than twice the  $x$ -value.  
 48. The  $y$ -value is the difference between four and twice the  $x$ -value.  
 49. The  $y$ -value is three decreased by the square of the  $x$ -value.  
 50. The  $y$ -value is two more than the square of the  $x$ -value.

In Exercises 51–54, graph each equation.

51.  $y = 5$  (Let  $x = -3, -2, -1, 0, 1, 2$ , and  $3$ .)  
 52.  $y = -1$  (Let  $x = -3, -2, -1, 0, 1, 2$ , and  $3$ .)  
 53.  $y = \frac{1}{x}$  (Let  $x = -2, -1, -\frac{1}{2}, -\frac{1}{3}, \frac{1}{3}, \frac{1}{2}, 1$ , and  $2$ .)  
 54.  $y = -\frac{1}{x}$  (Let  $x = -2, -1, -\frac{1}{2}, -\frac{1}{3}, \frac{1}{3}, \frac{1}{2}, 1$ , and  $2$ .)

## Application Exercises

The graphs show the percentage of high school seniors who used alcohol or marijuana during the 30 days prior to being surveyed for the University of Michigan's Monitoring the Future study.

Source: U.S. Department of Health and Human Services

The data can be described by the following mathematical models:

Percentage of seniors using alcohol  $A = -0.9n + 69$

Number of years after 1980

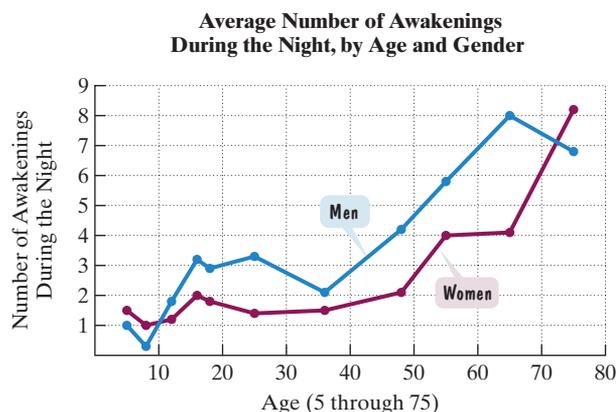

Percentage of seniors using marijuana  $M = -0.3n + 27$

Use this information to solve Exercises 55–56.

55. a. Use the appropriate line graph to determine the percentage of seniors who used marijuana in 2005.  
 b. Use the appropriate formula to determine the percentage of seniors who used marijuana in 2005. Does the formula underestimate or overestimate the actual percentage displayed by the graph? By how much?  
 c. Use the appropriate line graph to estimate the percentage of seniors who used alcohol in 2005.

- d. Use the appropriate formula to determine the percentage of seniors who used alcohol in 2005. How does this compare with your estimate in part (c)?  
 e. For the period from 1980 through 2009, in which year was marijuana use by seniors at a minimum? Estimate the percentage of seniors who used marijuana in that year.
56. a. Use the appropriate line graph to determine the percentage of seniors who used alcohol in 2000.  
 b. Use the appropriate formula to determine the percentage of seniors who used alcohol in 2000. Does the formula underestimate or overestimate the actual percentage displayed by the graph? By how much?  
 c. Use the appropriate line graph to estimate the percentage of seniors who used marijuana in 2000.  
 d. Use the appropriate formula to determine the percentage of seniors who used marijuana in 2000. How does this compare with your estimate in part (c)?  
 e. For the period from 1980 through 2009, in which year was alcohol use by seniors at a maximum? Estimate the percentage of seniors who used alcohol in that year.

Contrary to popular belief, older people do not need less sleep than younger adults. However, the line graphs show that they awaken more often during the night. The numerous awakenings are one reason why some elderly individuals report that sleep is less restful than it had been in the past. Use the line graphs to solve Exercises 57–60.

Source: Stephen Davis and Joseph Palladino, *Psychology*, 5th Edition, Prentice Hall, 2007.

57. At which age, estimated to the nearest year, do women have the least number of awakenings during the night? What is the average number of awakenings at that age?  
 58. At which age do men have the greatest number of awakenings during the night? What is the average number of awakenings at that age?  
 59. Estimate, to the nearest tenth, the difference between the average number of awakenings during the night for 25-year-old men and 25-year-old women.  
 60. Estimate, to the nearest tenth, the difference between the average number of awakenings during the night for 18-year-old men and 18-year-old women.

**Writing in Mathematics**

61. What is the rectangular coordinate system?
62. Explain how to plot a point in the rectangular coordinate system. Give an example with your explanation.
63. Explain why  $(5, -2)$  and  $(-2, 5)$  do not represent the same point.
64. Explain how to graph an equation in the rectangular coordinate system.
65. What does a  $[-20, 2, 1]$  by  $[-4, 5, 0.5]$  viewing rectangle mean?

**Technology Exercise**

66. Use a graphing utility to verify each of your hand-drawn graphs in Exercises 13–28. Experiment with the settings for the viewing rectangle to make the graph displayed by the graphing utility resemble your hand-drawn graph as much as possible.

**Critical Thinking Exercises**

**Make Sense?** In Exercises 67–70, determine whether each statement makes sense or does not make sense, and explain your reasoning.

67. The rectangular coordinate system provides a geometric picture of what an equation in two variables looks like.
68. There is something wrong with my graphing utility because it is not displaying numbers along the  $x$ - and  $y$ -axes.
69. I used the ordered pairs  $(-2, 2)$ ,  $(0, 0)$ , and  $(2, 2)$  to graph a straight line.
70. I used the ordered pairs  
(time of day, calories that I burned)  
to obtain a graph that is a horizontal line.

In Exercises 71–74, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

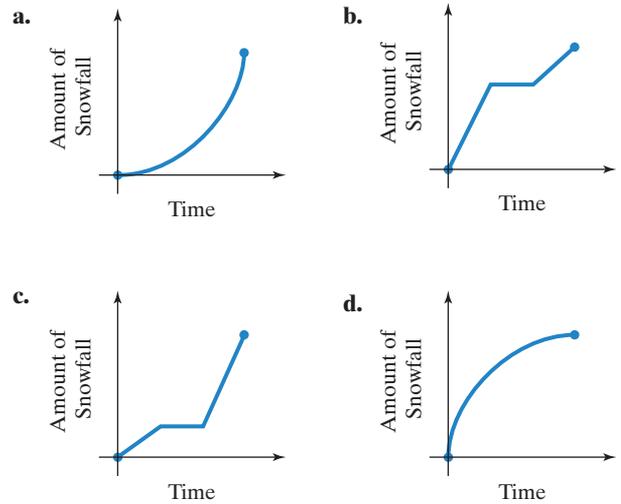

71. If the product of a point's coordinates is positive, the point must be in quadrant I.
72. If a point is on the  $x$ -axis, it is neither up nor down, so  $x = 0$ .
73. If a point is on the  $y$ -axis, its  $x$ -coordinate must be 0.
74. The ordered pair  $(2, 5)$  satisfies  $3y - 2x = -4$ .

In Exercises 75–78, list the quadrant or quadrants satisfying each condition.

75.  $xy > 0$
76.  $\frac{y}{x} < 0$
77.  $x^3 > 0$  and  $y^3 < 0$
78.  $x^3 < 0$  and  $y^3 > 0$

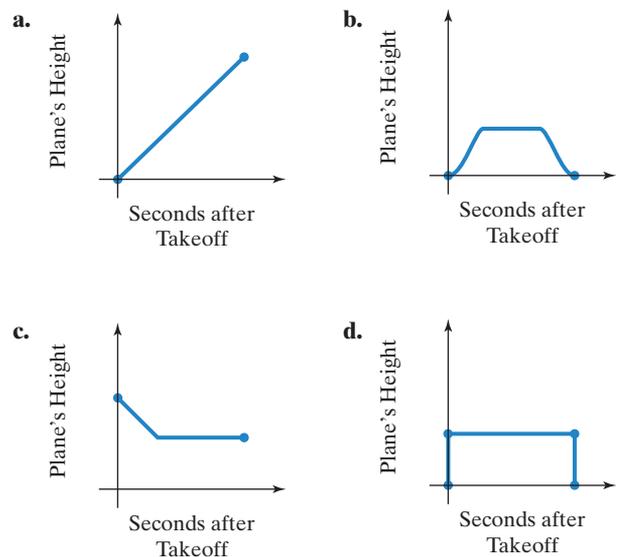

In Exercises 79–82, match the story with the correct figure. The figures are labeled (a), (b), (c), and (d).

79. As the blizzard got worse, the snow fell harder and harder.
80. The snow fell more and more softly.
81. It snowed hard, but then it stopped. After a short time, the snow started falling softly.
82. It snowed softly, and then it stopped. After a short time, the snow started falling hard.

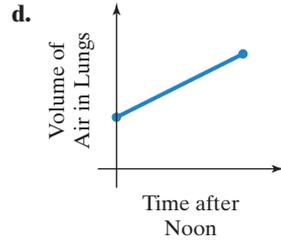

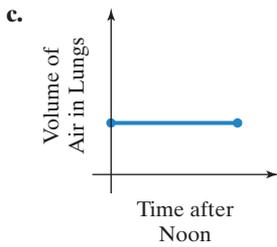

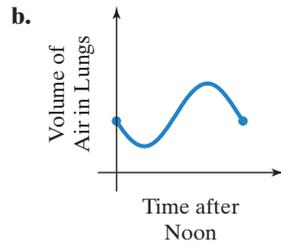

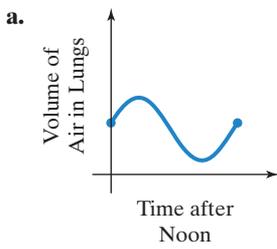

In Exercises 83–86, select the graph that best illustrates each story.

83. An airplane flew from Miami to San Francisco.

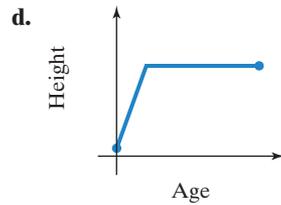

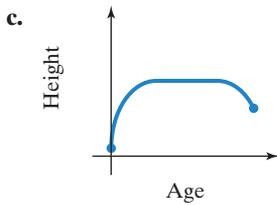

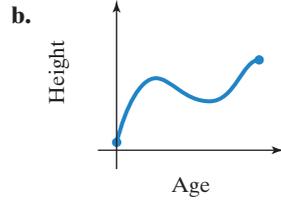

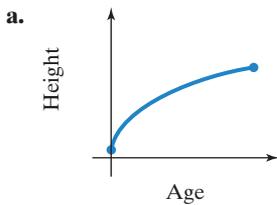

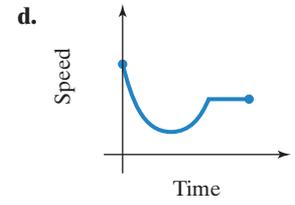

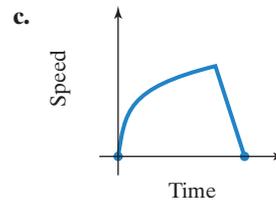

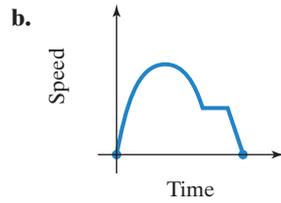

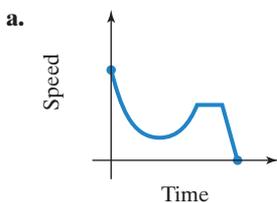

84. At noon, you begin to breathe in.

85. Measurements are taken of a person's height from birth to age 100.

86. You begin your bike ride by riding down a hill. Then you ride up another hill. Finally, you ride along a level surface before coming to a stop.

**Preview Exercises**

Exercises 87–89 will help you prepare for the material covered in the first section of the next chapter.

87. Here are two sets of ordered pairs:

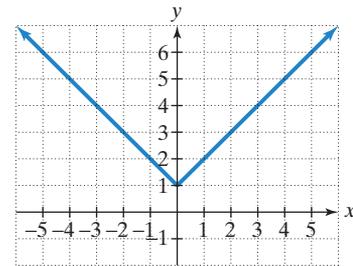

set 1:  $\{(1, 5), (2, 5)\}$

set 2:  $\{(5, 1), (5, 2)\}$ .

In which set is each  $x$ -coordinate paired with only one  $y$ -coordinate?

88. Graph  $y = 2x$  and  $y = 2x + 4$  in the same rectangular coordinate system. Select integers for  $x$ , starting with  $-2$  and ending with  $2$ .

89. Use the following graph to solve this exercise.

- a. What is the  $y$ -coordinate when the  $x$ -coordinate is 2?
- b. What are the  $x$ -coordinates when the  $y$ -coordinate is 4?
- c. Describe the  $x$ -coordinates of all points on the graph.
- d. Describe the  $y$ -coordinates of all points on the graph.

## SECTION 1.2

## Basics of Functions and Their Graphs

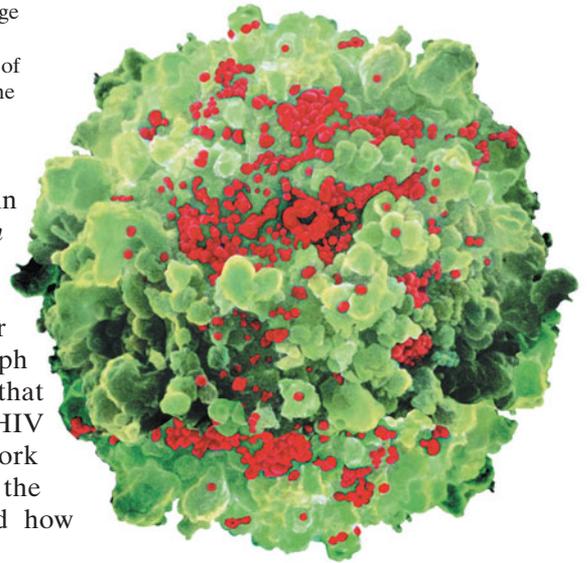

*Objectives*

- 1 Find the domain and range of a relation.
- 2 Determine whether a relation is a function.
- 3 Determine whether an equation represents a function.
- 4 Evaluate a function.
- 5 Graph functions by plotting points.
- 6 Use the vertical line test to identify functions.
- 7 Obtain information about a function from its graph.
- 8 Identify the domain and range of a function from its graph.
- 9 Identify intercepts from a function's graph.

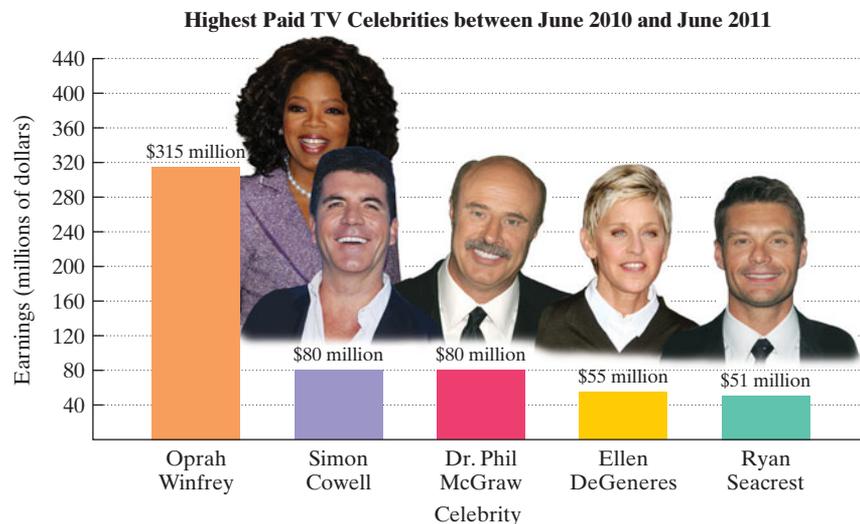

- 1 Find the domain and range of a relation.

Magnified 6000 times, this color-scanned image shows a T-lymphocyte blood cell (green) infected with the HIV virus (red). Depletion of the number of T cells causes destruction of the immune system.

The average number of T cells in a person with HIV is a *function* of time after infection. In this section, you will be introduced to the basics of functions and their graphs. We will analyze the graph of a function using an example that illustrates the progression of HIV and T cell count. Much of our work in this course will be devoted to the important topic of functions and how they model your world.

**Relations**

*Forbes* magazine published a list of the highest-paid TV celebrities between June 2010 and June 2011. The results are shown in **Figure 1.13**.

**FIGURE 1.13**  
Source: *Forbes*

The graph indicates a correspondence between a TV celebrity and that person's earnings, in millions of dollars. We can write this correspondence using a set of ordered pairs:

$$\{(Winfrey, 315), (Cowell, 80), (McGraw, 80), (DeGeneres, 55), (Seacrest, 51)\}.$$

These braces indicate we are representing a set.

The mathematical term for a set of ordered pairs is a *relation*.

**Definition of a Relation**

A **relation** is any set of ordered pairs. The set of all first components of the ordered pairs is called the **domain** of the relation and the set of all second components is called the **range** of the relation.

**EXAMPLE 1 Finding the Domain and Range of a Relation**

Find the domain and range of the relation:

$$\{(\text{Winfrey}, 315), (\text{Cowell}, 80), (\text{McGraw}, 80), (\text{DeGeneres}, 55), (\text{Seacrest}, 51)\}.$$

**SOLUTION**

The domain is the set of all first components. Thus, the domain is

$$\{\text{Winfrey}, \text{Cowell}, \text{McGraw}, \text{DeGeneres}, \text{Seacrest}\}.$$

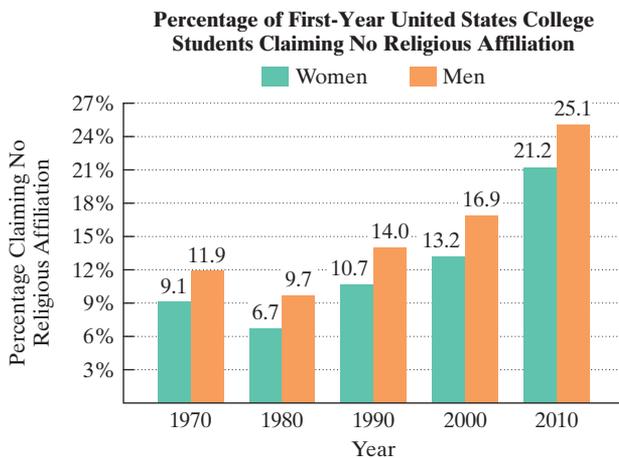

The range is the set of all second components. Thus, the range is

$$\{315, 80, 55, 51\}.$$

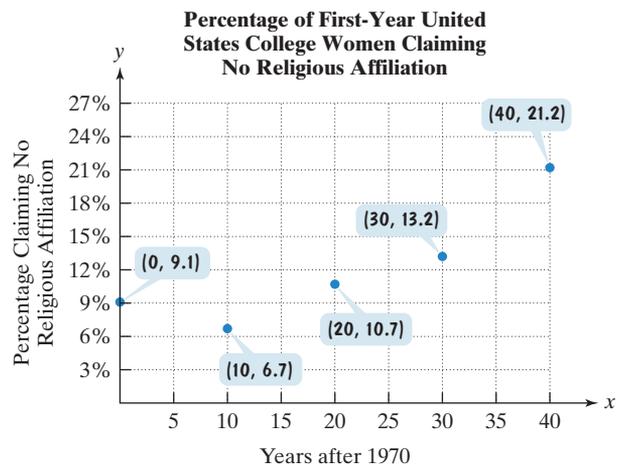

Although Cowell and McGraw both earned \$80 million, it is not necessary to list 80 twice.

 **Check Point 1** Find the domain and range of the relation:  
 $\{(0, 9.1), (10, 6.7), (20, 10.7), (30, 13.2), (40, 21.2)\}.$

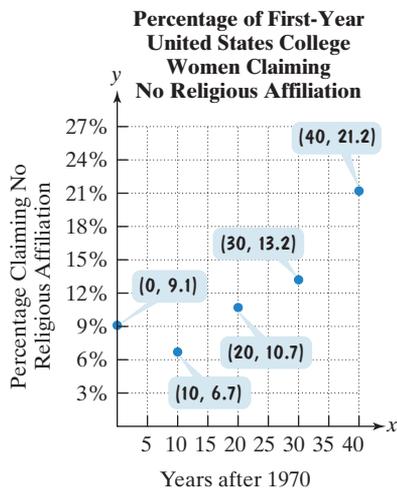

As you worked Check Point 1, did you wonder if there was a rule that assigned the “inputs” in the domain to the “outputs” in the range? For example, for the ordered pair (30, 13.2), how does the output 13.2 depend on the input 30? The ordered pair is based on the data in **Figure 1.14(a)**, which shows the percentage of first-year U.S. college students claiming no religious affiliation.

**FIGURE 1.14(a)** Data for women and men  
 Source: John Macionis, *Sociology*, Fourteenth Edition, Pearson, 2012.

**FIGURE 1.14(b)** Visually representing the relation for the women’s data

**FIGURE 1.14(b)** (repeated)  
Visually representing the relation for the women’s data

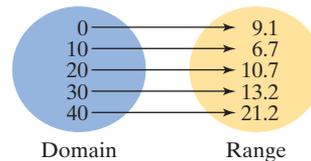

In **Figure 1.14(b)**, we used the data for college women to create the following ordered pairs:

$$\left( \begin{array}{l} \text{years after 1970,} \\ \text{percentage of first-year college} \\ \text{women claiming no religious} \\ \text{affiliation} \end{array} \right).$$

Consider, for example, the ordered pair (30, 13.2).

The five points in **Figure 1.14(b)** visually represent the relation formed from the women’s data. Another way to visually represent the relation is as follows:

- 2 Determine whether a relation is a function.

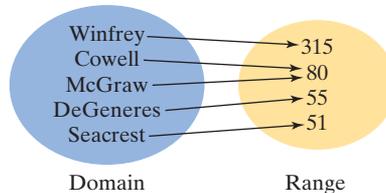

**Table 1.1** Highest-Paid TV Celebrities

Celebrity	Earnings (millions of dollars)
Winfrey	315
Cowell	80
McGraw	80
DeGeneres	55
Seacrest	51

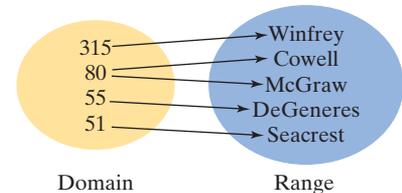

**Functions**

**Table 1.1**, based on our earlier discussion, shows the highest-paid TV celebrities and their earnings between June 2010 and June 2011, in millions of dollars. We’ve used this information to define two relations.

**Figure 1.15(a)** shows a correspondence between celebrities and their earnings. **Figure 1.15(b)** shows a correspondence between earnings and celebrities.

**FIGURE 1.15(a)** Celebrities correspond to earnings.

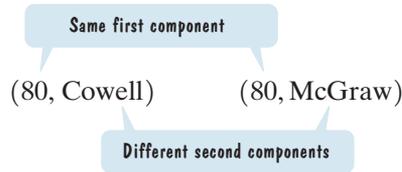

**FIGURE 1.15(b)** Earnings correspond to celebrities.

A relation in which each member of the domain corresponds to exactly one member of the range is a **function**. Can you see that the relation in **Figure 1.15(a)** is a function? Each celebrity in the domain corresponds to exactly one earnings amount in the range: If we know the celebrity, we can be sure of his or her earnings. Notice that more than one element in the domain can correspond to the same element in the range: Cowell and McGraw both earned \$80 million.

Is the relation in **Figure 1.15(b)** a function? Does each member of the domain correspond to precisely one member of the range? This relation is not a function because there is a member of the domain that corresponds to two different members of the range:

$$(80, \text{Cowell}) \quad (80, \text{McGraw}).$$

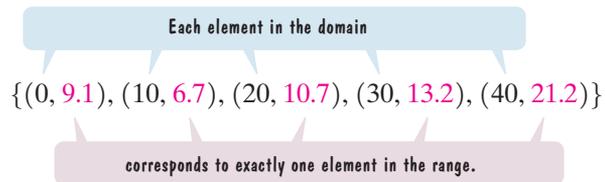

The member of the domain 80 corresponds to both Cowell and McGraw in the range. If we know that earnings are \$80 million, we cannot be sure of the celebrity. Because **a function is a relation in which no two ordered pairs have the same first component and different second components**, the ordered pairs (80, Cowell) and (80, McGraw) are not ordered pairs of a function.

### Definition of a Function

A **function** is a correspondence from a first set, called the **domain**, to a second set, called the **range**, such that each element in the domain corresponds to *exactly one* element in the range.

In Check Point 1, we considered a relation that gave a correspondence between years after 1970 and the percentage of first-year college women claiming no religious affiliation. Can you see that this relation is a function?

However, Example 2 illustrates that not every correspondence between sets is a function.

### EXAMPLE 2 Determining Whether a Relation Is a Function

Determine whether each relation is a function:

- a.  $\{(1, 6), (2, 6), (3, 8), (4, 9)\}$       b.  $\{(6, 1), (6, 2), (8, 3), (9, 4)\}$ .

### SOLUTION

We begin by making a figure for each relation that shows the domain and the range (Figure 1.16).

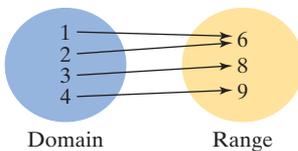

FIGURE 1.16(a)

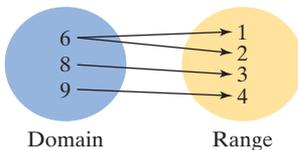

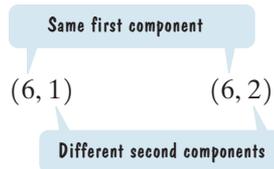

FIGURE 1.16(b)

- a. **Figure 1.16(a)** shows that every element in the domain corresponds to exactly one element in the range. The element 1 in the domain corresponds to the element 6 in the range. Furthermore, 2 corresponds to 6, 3 corresponds to 8, and 4 corresponds to 9. No two ordered pairs in the given relation have the same first component and different second components. Thus, the relation is a function.
- b. **Figure 1.16(b)** shows that 6 corresponds to both 1 and 2. If any element in the domain corresponds to more than one element in the range, the relation is not a function. This relation is not a function; two ordered pairs have the same first component and different second components.

## GREAT QUESTION!

**If I reverse a function's components, will this new relation be a function?**

If a relation is a function, reversing the components in each of its ordered pairs may result in a relation that is not a function.

Look at **Figure 1.16(a)** again. The fact that 1 and 2 in the domain correspond to the same number, 6, in the range does not violate the definition of a function. **A function can have two different first components with the same second component.** By contrast, a relation is not a function when two different ordered pairs have the same first component and different second components. Thus, the relation in **Figure 1.16(b)** is not a function.

 **Check Point 2** Determine whether each relation is a function:

- a.  $\{(1, 2), (3, 4), (5, 6), (5, 8)\}$       b.  $\{(1, 2), (3, 4), (6, 5), (8, 5)\}$ .

- 3** Determine whether an equation represents a function.

### Functions as Equations

Functions are usually given in terms of equations rather than as sets of ordered pairs. For example, here is an equation that models the percentage of first-year college women claiming no religious affiliation as a function of time:

$$y = 0.014x^2 - 0.24x + 8.8.$$

The variable  $x$  represents the number of years after 1970. The variable  $y$  represents the percentage of first-year college women claiming no religious affiliation. The variable  $y$  is a function of the variable  $x$ . For each value of  $x$ , there is one and only one value of  $y$ . The variable  $x$  is called the **independent variable** because it can be assigned any value from the domain. Thus,  $x$  can be assigned any nonnegative integer representing the number of years after 1970. The variable  $y$  is called the **dependent variable** because its value depends on  $x$ . The percentage claiming no religious affiliation depends on the number of years after 1970. The value of the dependent variable,  $y$ , is calculated after selecting a value for the independent variable,  $x$ .

We have seen that not every set of ordered pairs defines a function. Similarly, not all equations with the variables  $x$  and  $y$  define functions. If an equation is solved for  $y$  and more than one value of  $y$  can be obtained for a given  $x$ , then the equation does not define  $y$  as a function of  $x$ .

### EXAMPLE 3 Determining Whether an Equation Represents a Function

Determine whether each equation defines  $y$  as a function of  $x$ :

- a.  $x^2 + y = 4$       b.  $x^2 + y^2 = 4$ .

### SOLUTION

Solve each equation for  $y$  in terms of  $x$ . If two or more values of  $y$  can be obtained for a given  $x$ , the equation is not a function.

a.  $x^2 + y = 4$       *This is the given equation.*  
 $x^2 + y - x^2 = 4 - x^2$       *Solve for  $y$  by subtracting  $x^2$  from both sides.*  
 $y = 4 - x^2$       *Simplify.*

From this last equation we can see that for each value of  $x$ , there is one and only one value of  $y$ . For example, if  $x = 1$ , then  $y = 4 - 1^2 = 3$ . The equation defines  $y$  as a function of  $x$ .

b.  $x^2 + y^2 = 4$       *This is the given equation.*  
 $x^2 + y^2 - x^2 = 4 - x^2$       *Isolate  $y^2$  by subtracting  $x^2$  from both sides.*  
 $y^2 = 4 - x^2$       *Simplify.*  
 $y = \pm\sqrt{4 - x^2}$       *Apply the square root property: If  $u^2 = d$ , then  $u = \pm\sqrt{d}$ .*

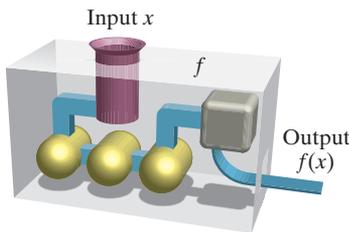

The  $\pm$  in this last equation shows that for certain values of  $x$  (all values between  $-2$  and  $2$ ), there are two values of  $y$ . For example, if  $x = 1$ , then  $y = \pm\sqrt{4 - 1^2} = \pm\sqrt{3}$ . For this reason, the equation does not define  $y$  as a function of  $x$ . ●●●

**Check Point 3** Solve each equation for  $y$  and then determine whether the equation defines  $y$  as a function of  $x$ :

a.  $2x + y = 6$

b.  $x^2 + y^2 = 1$ .

**4** Evaluate a function.

**FIGURE 1.17** A “function machine” with inputs and outputs

**Function Notation**

If an equation in  $x$  and  $y$  gives one and only one value of  $y$  for each value of  $x$ , then the variable  $y$  is a function of the variable  $x$ . When an equation represents a function, the function is often named by a letter such as  $f, g, h, F, G,$  or  $H$ . Any letter can be used to name a function. Suppose that  $f$  names a function. Think of the domain as the set of the function’s inputs and the range as the set of the function’s outputs. As shown in **Figure 1.17**, input is represented by  $x$  and the output by  $f(x)$ . The special notation  $f(x)$ , read “ $f$  of  $x$ ” or “ $f$  at  $x$ ,” represents the **value of the function at the number  $x$** .

Let’s make this clearer by considering a specific example. We know that the equation

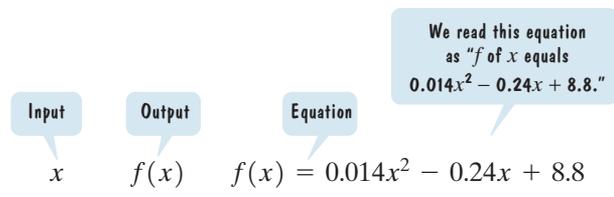

$$y = 0.014x^2 - 0.24x + 8.8$$

defines  $y$  as a function of  $x$ . We’ll name the function  $f$ . Now, we can apply our new function notation.

**GREAT QUESTION!**

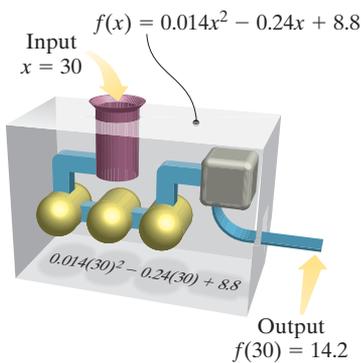

**Doesn’t  $f(x)$  indicate that I need to multiply  $f$  and  $x$ ?**

The notation  $f(x)$  does *not* mean “ $f$  times  $x$ .” The notation describes the value of the function at  $x$ .

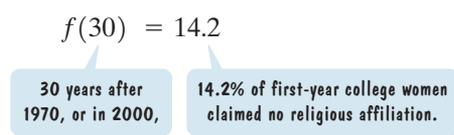

Suppose we are interested in finding  $f(30)$ , the function’s output when the input is 30. To find the value of the function at 30, we substitute 30 for  $x$ . We are **evaluating the function at 30**.

$$\begin{aligned}
 f(x) &= 0.014x^2 - 0.24x + 8.8 && \text{This is the given function.} \\
 f(30) &= 0.014(30)^2 - 0.24(30) + 8.8 && \text{Replace each occurrence of } x \text{ with } 30. \\
 &= 0.014(900) - 0.24(30) + 8.8 && \text{Evaluate the exponential expression: } 30^2 = 30 \cdot 30 = 900. \\
 &= 12.6 - 7.2 + 8.8 && \text{Perform the multiplications.} \\
 f(30) &= 14.2 && \text{Subtract and add from left to right.}
 \end{aligned}$$

**FIGURE 1.18** A function machine at work

The statement  $f(30) = 14.2$ , read “ $f$  of 30 equals 14.2,” tells us that the value of the function at 30 is 14.2. When the function’s input is 30, its output is 14.2. **Figure 1.18** illustrates the input and output in terms of a function machine.

We have seen that in 2000, 13.2% actually claimed nonaffiliation, so our function that models the data slightly overestimates the percent for 2000.

## TECHNOLOGY

Graphing utilities can be used to evaluate functions. The screens below show the evaluation of

$$f(x) = 0.014x^2 - 0.24x + 8.8$$

at 30 on a TI-84 Plus graphing calculator. The function  $f$  is named  $Y_1$ .

```

X= Plot1 Plot2 Plot3
\Y1= .014X^2-.24X+
8.8
\Y2=
\Y3=
\Y4=
\Y5=
\Y6=
  
```

```

Y1(30)
14.2
  
```

We used  $f(x) = 0.014x^2 - 0.24x + 8.8$  to find  $f(30)$ . To find other function values, such as  $f(40)$  or  $f(55)$ , substitute the specified input value, 40 or 55, for  $x$  in the function's equation.

If a function is named  $f$  and  $x$  represents the independent variable, the notation  $f(x)$  corresponds to the  $y$ -value for a given  $x$ . Thus,

$$f(x) = 0.014x^2 - 0.24x + 8.8 \quad \text{and} \quad y = 0.014x^2 - 0.24x + 8.8$$

define the same function. This function may be written as

$$y = f(x) = 0.014x^2 - 0.24x + 8.8.$$

### EXAMPLE 4

 Evaluating a Function

If  $f(x) = x^2 + 3x + 5$ , evaluate each of the following:

- a.  $f(2)$     b.  $f(x + 3)$     c.  $f(-x)$ .

### SOLUTION

We substitute 2,  $x + 3$ , and  $-x$  for  $x$  in the equation for  $f$ . When replacing  $x$  with a variable or an algebraic expression, you might find it helpful to think of the function's equation as

$$f(x) = x^2 + 3x + 5.$$

- a. We find  $f(2)$  by substituting 2 for  $x$  in the equation.

$$f(2) = 2^2 + 3 \cdot 2 + 5 = 4 + 6 + 5 = 15$$

Thus,  $f(2) = 15$ .

- b. We find  $f(x + 3)$  by substituting  $x + 3$  for  $x$  in the equation.

$$f(x + 3) = (x + 3)^2 + 3(x + 3) + 5$$

Equivalently,

$$\begin{aligned}
 f(x + 3) &= (x + 3)^2 + 3(x + 3) + 5 \\
 &= x^2 + 6x + 9 + 3x + 9 + 5 && \text{Square } x + 3 \text{ using } (A + B)^2 = A^2 + 2AB + B^2. \\
 & && \text{Distribute 3 throughout the parentheses.} \\
 &= x^2 + 9x + 23. && \text{Combine like terms.}
 \end{aligned}$$

- c. We find  $f(-x)$  by substituting  $-x$  for  $x$  in the equation.

$$f(-x) = (-x)^2 + 3(-x) + 5$$

Equivalently,

$$\begin{aligned}
 f(-x) &= (-x)^2 + 3(-x) + 5 \\
 &= x^2 - 3x + 5.
 \end{aligned}$$

## DISCOVERY

Using  $f(x) = x^2 + 3x + 5$  and the answers in parts (b) and (c):

1. Is  $f(x + 3)$  equal to  $f(x) + f(3)$ ?
2. Is  $f(-x)$  equal to  $-f(x)$ ?

 **Check Point 4** If  $f(x) = x^2 - 2x + 7$ , evaluate each of the following:

- a.  $f(-5)$       b.  $f(x + 4)$       c.  $f(-x)$ .

**5** Graph functions by plotting points.

**Graphs of Functions**

The **graph of a function** is the graph of its ordered pairs. For example, the graph of  $f(x) = 2x$  is the set of points  $(x, y)$  in the rectangular coordinate system satisfying  $y = 2x$ . Similarly, the graph of  $g(x) = 2x + 4$  is the set of points  $(x, y)$  in the rectangular coordinate system satisfying the equation  $y = 2x + 4$ . In the next example, we graph both of these functions in the same rectangular coordinate system.

**EXAMPLE 5** Graphing Functions

Graph the functions  $f(x) = 2x$  and  $g(x) = 2x + 4$  in the same rectangular coordinate system. Select integers for  $x$ , starting with  $-2$  and ending with  $2$ .

**SOLUTION**

We begin by setting up a partial table of coordinates for each function. Then we plot the five points in each table and connect them, as shown in **Figure 1.19**. The graph of each function is a straight line. Do you see a relationship between the two graphs? The graph of  $g$  is the graph of  $f$  shifted vertically up by 4 units.

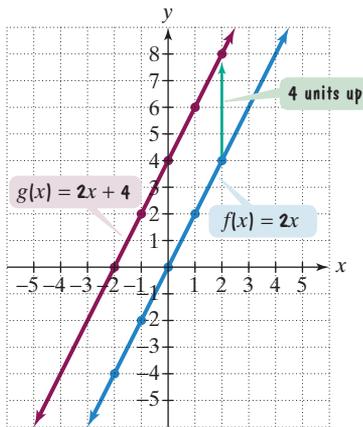

FIGURE 1.19

$x$	$f(x) = 2x$	$(x, y)$ or $(x, f(x))$	$x$	$g(x) = 2x + 4$	$(x, y)$ or $(x, g(x))$
-2	$f(-2) = 2(-2) = -4$	$(-2, -4)$	-2	$g(-2) = 2(-2) + 4 = 0$	$(-2, 0)$
-1	$f(-1) = 2(-1) = -2$	$(-1, -2)$	-1	$g(-1) = 2(-1) + 4 = 2$	$(-1, 2)$
0	$f(0) = 2 \cdot 0 = 0$	$(0, 0)$	0	$g(0) = 2 \cdot 0 + 4 = 4$	$(0, 4)$
1	$f(1) = 2 \cdot 1 = 2$	$(1, 2)$	1	$g(1) = 2 \cdot 1 + 4 = 6$	$(1, 6)$
2	$f(2) = 2 \cdot 2 = 4$	$(2, 4)$	2	$g(2) = 2 \cdot 2 + 4 = 8$	$(2, 8)$

Callouts for the first table: "Choose  $x$ ." (under  $x$ ), "Compute  $f(x)$  by evaluating  $f$  at  $x$ ." (under the calculation), "Form the ordered pair." (under the result).

Callouts for the second table: "Choose  $x$ ." (under  $x$ ), "Compute  $g(x)$  by evaluating  $g$  at  $x$ ." (under the calculation), "Form the ordered pair." (under the result).

The graphs in Example 5 are straight lines. All functions with equations of the form  $f(x) = mx + b$  graph as straight lines. Such functions, called **linear functions**, will be discussed in detail in Section 1.4.

**TECHNOLOGY**

We can use a graphing utility to check the tables and the graphs in Example 5 for the functions

$f(x) = 2x$       and       $g(x) = 2x + 4$ .

Enter  $y_1 = 2x$  in the  $[Y=]$  screen.

**Checking Tables**

We entered  $-2$  for the starting  $x$ -value and 1 as an increment between  $x$ -values to check our tables in Example 5.

Use the first five ordered pairs  $(x, y_1)$  to check the first table.

Use the first five ordered pairs  $(x, y_2)$  to check the second table.

Enter  $y_2 = 2x + 4$  in the  $[Y=]$  screen.

**Checking Graphs**

$y_2 = 2x + 4$

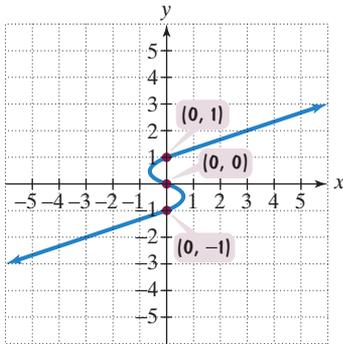

$y_1 = 2x$

$[-6, 6, 1]$  by  $[-6, 9, 1]$

We selected this viewing rectangle, or window, to match Figure 1.19.

 **Check Point 5** Graph the functions  $f(x) = 2x$  and  $g(x) = 2x - 3$  in the same rectangular coordinate system. Select integers for  $x$ , starting with  $-2$  and ending with  $2$ . How is the graph of  $g$  related to the graph of  $f$ ?

**6** Use the vertical line test to identify functions.

**FIGURE 1.20**  $y$  is not a function of  $x$  because  $0$  is paired with three values of  $y$ , namely,  $1$ ,  $0$ , and  $-1$ .

### The Vertical Line Test

Not every graph in the rectangular coordinate system is the graph of a function. The definition of a function specifies that no value of  $x$  can be paired with two or more different values of  $y$ . Consequently, if a graph contains two or more different points with the same first coordinate, the graph cannot represent a function. This is illustrated in **Figure 1.20**. Observe that points sharing a common first coordinate are vertically above or below each other.

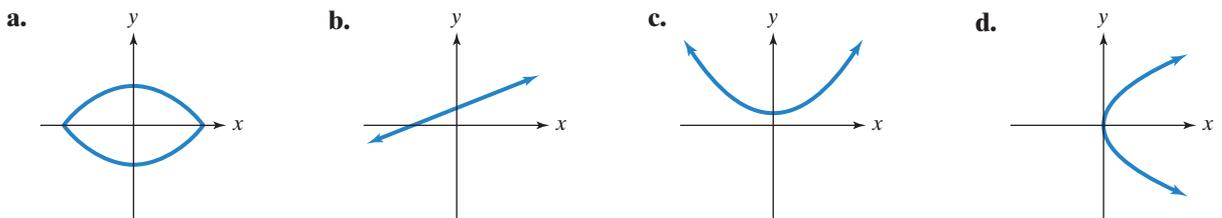

This observation is the basis of a useful test for determining whether a graph defines  $y$  as a function of  $x$ . The test is called the **vertical line test**.

#### The Vertical Line Test for Functions

If any vertical line intersects a graph in more than one point, the graph does not define  $y$  as a function of  $x$ .

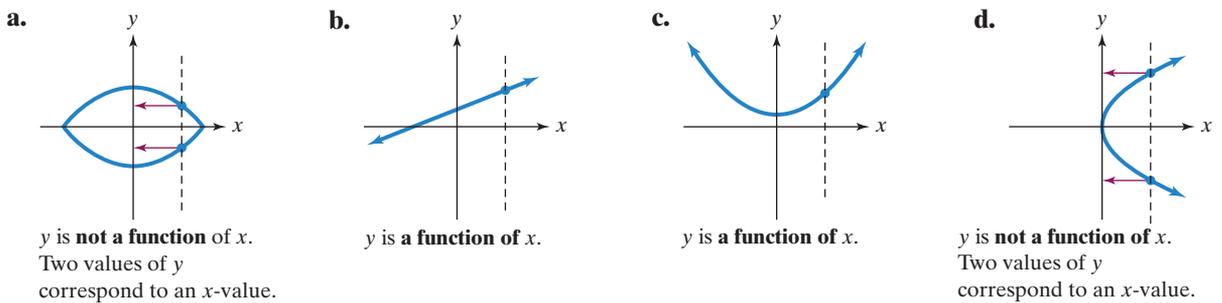

#### EXAMPLE 6 Using the Vertical Line Test

Use the vertical line test to identify graphs in which  $y$  is a function of  $x$ .

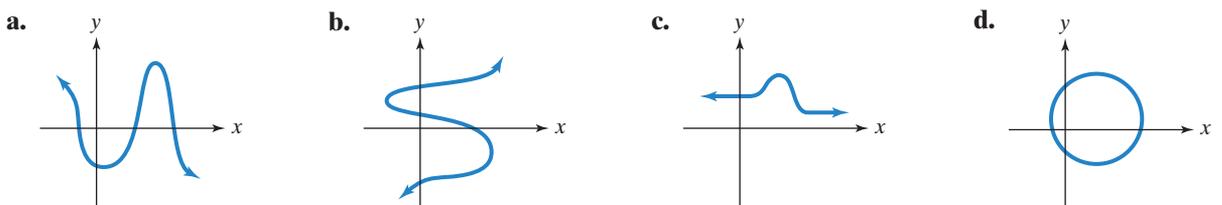

#### SOLUTION

$y$  is a function of  $x$  for the graphs in (b) and (c).

 **Check Point 6** Use the vertical line test to identify graphs in which  $y$  is a function of  $x$ .

- 7 Obtain information about a function from its graph.

### Obtaining Information from Graphs

You can obtain information about a function from its graph. At the right or left of a graph, you will find closed dots, open dots, or arrows.

- A closed dot indicates that the graph does not extend beyond this point and the point belongs to the graph.
- An open dot indicates that the graph does not extend beyond this point and the point does not belong to the graph.
- An arrow indicates that the graph extends indefinitely in the direction in which the arrow points.

#### EXAMPLE 7 Analyzing the Graph of a Function

The human immunodeficiency virus, or HIV, infects and kills helper T cells. Because T cells stimulate the immune system to produce antibodies, their destruction disables the body's defenses against other pathogens. By counting the number of T cells that remain active in the body, the progression of HIV can be monitored. The fewer helper T cells, the more advanced the disease. **Figure 1.21** shows a graph that is used to monitor the average progression of the disease. The average number of T cells,  $f(x)$ , is a function of time after infection,  $x$ .

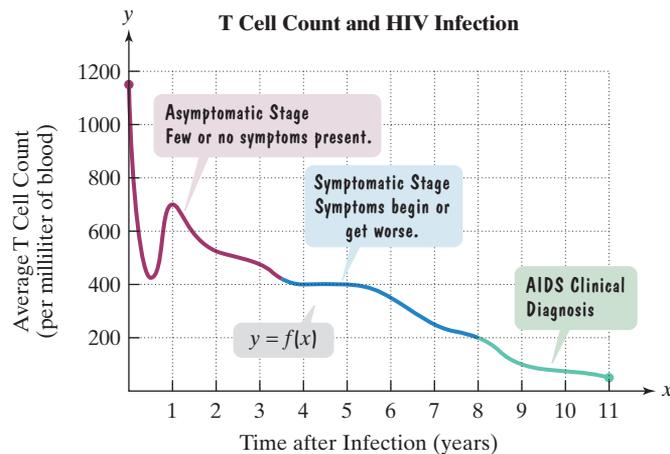

FIGURE 1.21

Source: B. E. Pruitt et al., *Human Sexuality*, Prentice Hall, 2007.

- Explain why  $f$  represents the graph of a function.
- Use the graph to find  $f(8)$ .
- For what value of  $x$  is  $f(x) = 350$ ?
- Describe the general trend shown by the graph.

### SOLUTION

- No vertical line can be drawn that intersects the graph of  $f$  more than once. By the vertical line test,  $f$  represents the graph of a function.
- To find  $f(8)$ , or  $f$  of 8, we locate 8 on the  $x$ -axis. **Figure 1.22** shows the point on the graph of  $f$  for which 8 is the first coordinate. From this point, we look to the  $y$ -axis to find the corresponding  $y$ -coordinate. We see that the  $y$ -coordinate is 200. Thus,

$$f(8) = 200.$$

When the time after infection is 8 years, the average T cell count is 200 cells per milliliter of blood. (AIDS clinical diagnosis is given at a T cell count of 200 or below.)

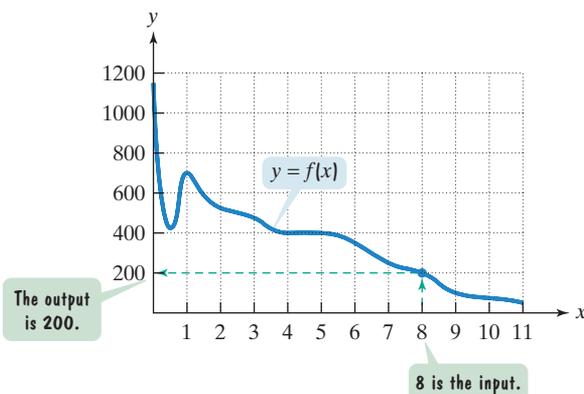

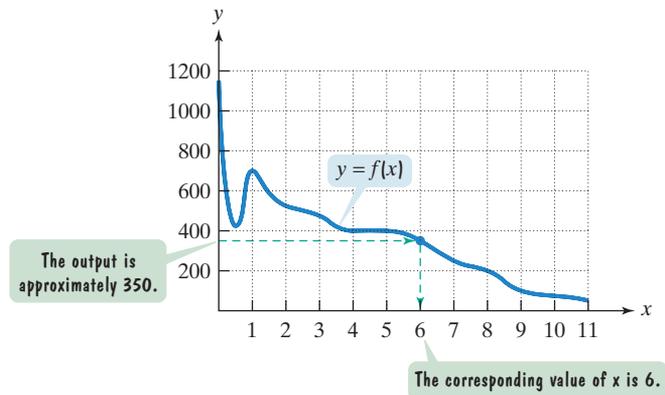

FIGURE 1.22 Finding  $f(8)$

- c. To find the value of  $x$  for which  $f(x) = 350$ , we find the approximate location of 350 on the  $y$ -axis. **Figure 1.23** shows that there is one point on the graph of  $f$  for which 350 is the second coordinate. From this point, we look to the  $x$ -axis to find the corresponding  $x$ -coordinate. We see that the  $x$ -coordinate is 6. Thus,

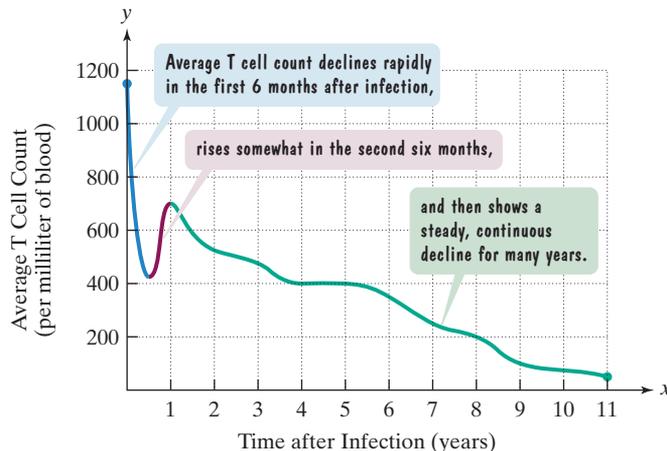

$$f(x) = 350 \text{ for } x = 6.$$

An average T cell count of 350 occurs 6 years after infection.

**FIGURE 1.23** Finding  $x$  for which  $f(x) = 350$

- d. **Figure 1.24** uses voice balloons to describe the general trend shown by the graph.

**FIGURE 1.24** Describing changing T cell count over time in a person infected with HIV

### ✓ Check Point 7

- Use the graph of  $f$  in **Figure 1.21** on page 163 to find  $f(5)$ .
- For what value of  $x$  is  $f(x) = 100$ ?
- Estimate the minimum average T cell count during the asymptomatic stage.

8 Identify the domain and range of a function from its graph.

### Identifying Domain and Range from a Function's Graph

#### GREAT QUESTION!

I peeked below and saw that you are using interval notation. What should I already know about this notation?

Recall that square brackets indicate endpoints that are included in an interval. Parentheses indicate endpoints that are not included in an interval. Parentheses are always used with  $\infty$  or  $-\infty$ . For more detail on interval notation, see Section P.9, pages 120–121.

Figure 1.25 illustrates how the graph of a function is used to determine the function's domain and its range.

Domain: set of inputs

Found on the  $x$ -axis

Range: set of outputs

Found on the  $y$ -axis

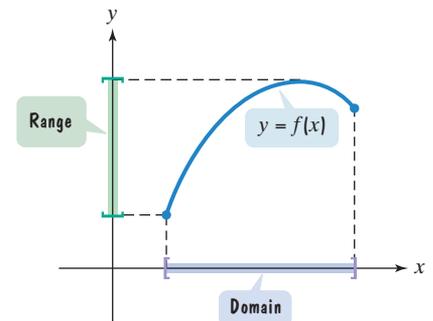

FIGURE 1.25 Domain and range of  $f$

Let's apply these ideas to the graph of the function shown in Figure 1.26. To find the domain, look for all the inputs on the  $x$ -axis that correspond to points on the graph. Can you see that they extend from  $-4$  to  $2$ , inclusive? The function's domain can be represented as follows:

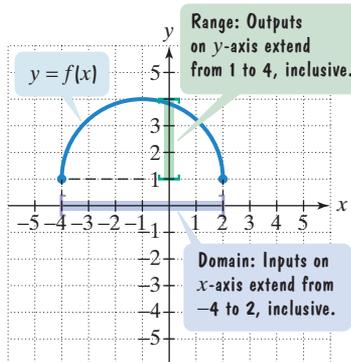

FIGURE 1.26 Domain and range of  $f$

#### Using Set-Builder Notation

$$\{x \mid -4 \leq x \leq 2\}$$

The set of all  $x$

such that

$x$  is greater than or equal to  $-4$  and less than or equal to  $2$ .

#### Using Interval Notation

$$[-4, 2].$$

The square brackets indicate  $-4$  and  $2$  are included. Note the square brackets on the  $x$ -axis in Figure 1.26.

To find the range, look for all the outputs on the  $y$ -axis that correspond to points on the graph. They extend from  $1$  to  $4$ , inclusive. The function's range can be represented as follows:

#### Using Set-Builder Notation

$$\{y \mid 1 \leq y \leq 4\}$$

The set of all  $y$

such that

$y$  is greater than or equal to  $1$  and less than or equal to  $4$ .

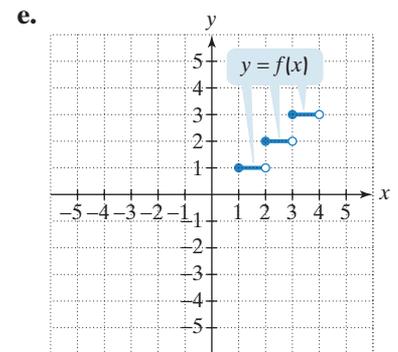

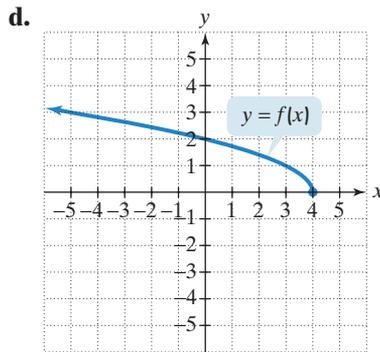

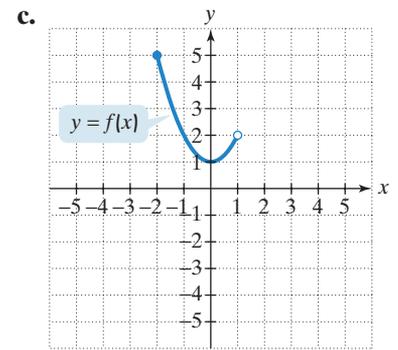

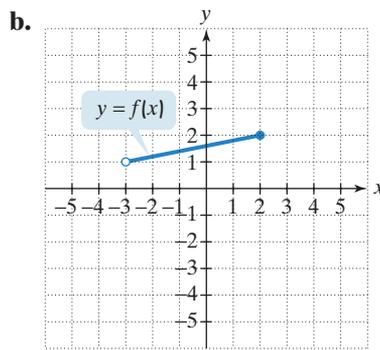

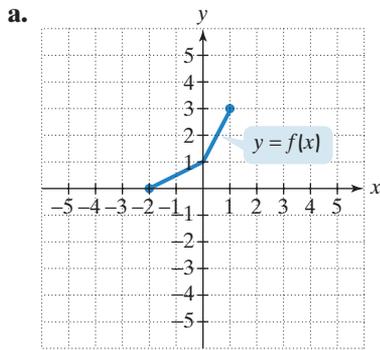

#### Using Interval Notation

$$[1, 4].$$

The square brackets indicate  $1$  and  $4$  are included. Note the square brackets on the  $y$ -axis in Figure 1.26.

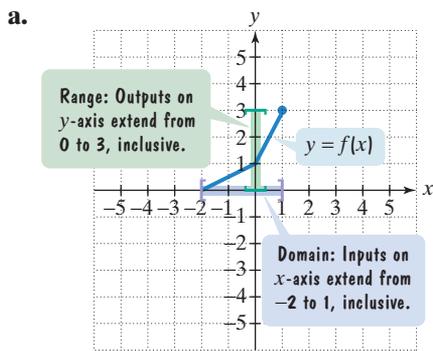

### EXAMPLE 8 Identifying the Domain and Range of a Function from Its Graph

Use the graph of each function to identify its domain and its range.

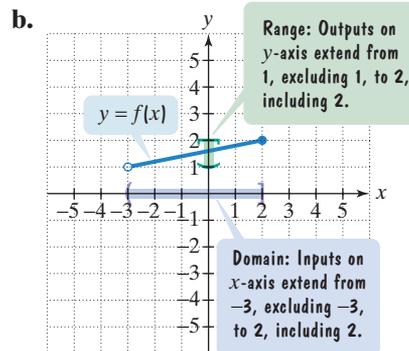

### SOLUTION

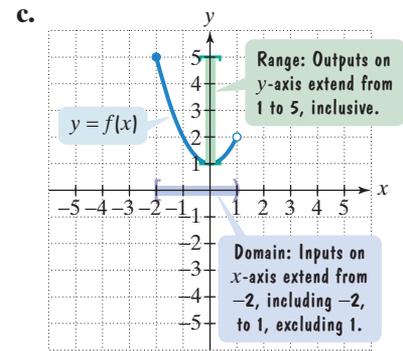

For the graph of each function, the domain is highlighted in purple on the  $x$ -axis and the range is highlighted in green on the  $y$ -axis.

Domain =  $\{x | -2 \leq x \leq 1\}$  or  $[-2, 1]$   
 Range =  $\{y | 0 \leq y \leq 3\}$  or  $[0, 3]$

Domain =  $\{x | -3 < x \leq 2\}$  or  $(-3, 2]$   
 Range =  $\{y | 1 < y \leq 2\}$  or  $(1, 2]$

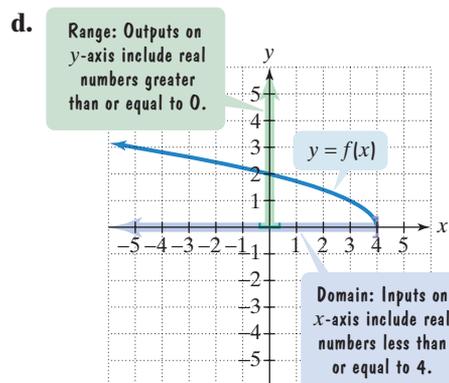

Domain =  $\{x | -2 \leq x < 1\}$  or  $[-2, 1)$   
 Range =  $\{y | 1 \leq y \leq 5\}$  or  $[1, 5]$

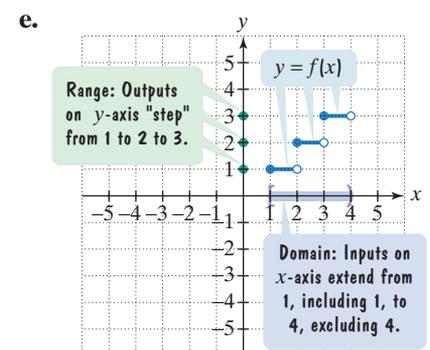

### GREAT QUESTION!

The range in Example 8(e) was identified as  $\{y | y = 1, 2, 3\}$ . Why didn't you also use interval notation like you did in the other parts of Example 8?

Interval notation is not appropriate for describing a set of distinct numbers such as  $\{1, 2, 3\}$ . Interval notation,  $[1, 3]$ , would mean that numbers such as 1.5 and 2.99 are in the range, but they are not. That's why we only used set-builder notation.

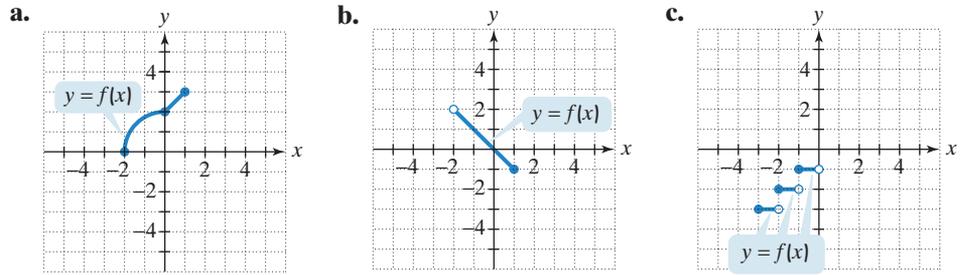

Domain =  $\{x | x \leq 4\}$  or  $(-\infty, 4]$   
 Range =  $\{y | y \geq 0\}$  or  $[0, \infty)$

Domain =  $\{x | 1 \leq x < 4\}$  or  $[1, 4)$   
 Range =  $\{y | y = 1, 2, 3\}$

 **Check Point 8** Use the graph of each function to identify its domain and its range.

**9** Identify intercepts from a function's graph.

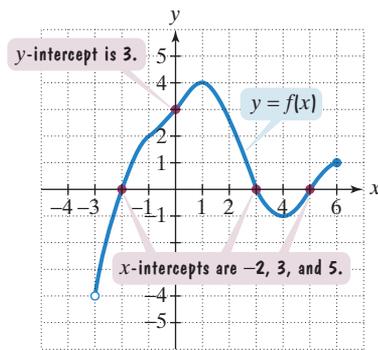

FIGURE 1.27 Identifying intercepts

### Identifying Intercepts from a Function's Graph

Figure 1.27 illustrates how we can identify intercepts from a function's graph. To find the  $x$ -intercepts, look for the points at which the graph crosses the  $x$ -axis. There are three such points:  $(-2, 0)$ ,  $(3, 0)$ , and  $(5, 0)$ . Thus, the  $x$ -intercepts are  $-2$ ,  $3$ , and  $5$ . We express this in function notation by writing  $f(-2) = 0$ ,  $f(3) = 0$ , and  $f(5) = 0$ . We say that  $-2$ ,  $3$ , and  $5$  are the *zeros of the function*. The **zeros of a function  $f$**  are the  $x$ -values for which  $f(x) = 0$ . Thus, the real zeros are the  $x$ -intercepts.

To find the  $y$ -intercept, look for the point at which the graph crosses the  $y$ -axis. This occurs at  $(0, 3)$ . Thus, the  $y$ -intercept is  $3$ . We express this in function notation by writing  $f(0) = 3$ .

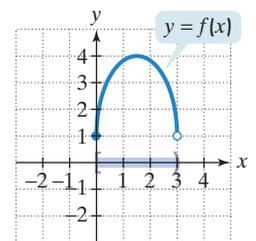

By the definition of a function, for each value of  $x$  we can have at most one value for  $y$ . What does this mean in terms of intercepts? **A function can have more than one  $x$ -intercept but at most one  $y$ -intercept.**

## CONCEPT AND VOCABULARY CHECK

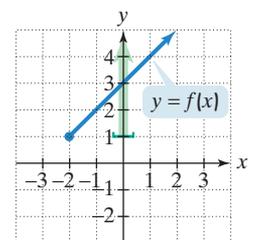

Fill in each blank so that the resulting statement is true.

- Any set of ordered pairs is called a/an \_\_\_\_\_. The set of all first components of the ordered pairs is called the \_\_\_\_\_. The set of all second components of the ordered pairs is called the \_\_\_\_\_.
- A set of ordered pairs in which each member of the set of first components corresponds to exactly one member of the set of second components is called a/an \_\_\_\_\_.
- The notation  $f(x)$  describes the value of \_\_\_\_\_ at \_\_\_\_\_.
- True or false:  $y = x^2 - 1$  defines  $y$  as a function of  $x$ . \_\_\_\_\_
- True or false:  $y = \pm \sqrt{x^2 - 1}$  defines  $y$  as a function of  $x$ . \_\_\_\_\_
- If  $f(x) = x^2 - 5x + 4$ , we can find  $f(x + 6)$  by replacing each occurrence of \_\_\_\_\_ by \_\_\_\_\_.
- The graph of a function is the graph of its \_\_\_\_\_.
- If any vertical line intersects a graph \_\_\_\_\_, the graph does not define  $y$  as a/an \_\_\_\_\_ of  $x$ .

- The shaded set of numbers shown on the  $x$ -axis can be expressed in interval notation as \_\_\_\_\_. This set represents the function's \_\_\_\_\_.

- The shaded set of numbers shown on the  $y$ -axis can be expressed in interval notation as \_\_\_\_\_. This set represents the function's \_\_\_\_\_.

- If the  $x$ -intercepts of a function are  $-1$  and  $3$ , then  $f(-1) = \underline{\hspace{1cm}}$  and  $f(3) = \underline{\hspace{1cm}}$ . The  $x$ -intercepts,  $-1$  and  $3$ , are called the \_\_\_\_\_ of the function.
- True or false: A function can have more than one  $y$ -intercept. \_\_\_\_\_

## EXERCISE SET 1.2

## Practice Exercises

In Exercises 1–10, determine whether each relation is a function. Give the domain and range for each relation.

- $\{(1, 2), (3, 4), (5, 5)\}$
- $\{(4, 5), (6, 7), (8, 8)\}$
- $\{(3, 4), (3, 5), (4, 4), (4, 5)\}$
- $\{(5, 6), (5, 7), (6, 6), (6, 7)\}$
- $\{(3, -2), (5, -2), (7, 1), (4, 9)\}$
- $\{(10, 4), (-2, 4), (-1, 1), (5, 6)\}$
- $\{(-3, -3), (-2, -2), (-1, -1), (0, 0)\}$
- $\{(-7, -7), (-5, -5), (-3, -3), (0, 0)\}$
- $\{(1, 4), (1, 5), (1, 6)\}$
- $\{(4, 1), (5, 1), (6, 1)\}$

In Exercises 11–26, determine whether each equation defines  $y$  as a function of  $x$ .

- $x + y = 16$
- $x + y = 25$
- $x^2 + y = 16$
- $x^2 + y = 25$
- $x^2 + y^2 = 16$
- $x^2 + y^2 = 25$
- $x = y^2$
- $4x = y^2$
- $y = \sqrt{x + 4}$
- $y = -\sqrt{x + 4}$
- $x + y^3 = 8$
- $x + y^3 = 27$
- $xy + 2y = 1$
- $xy - 5y = 1$
- $|x| - y = 2$
- $|x| - y = 5$

In Exercises 27–38, evaluate each function at the given values of the independent variable and simplify.

- $f(x) = 4x + 5$   
a.  $f(6)$       b.  $f(x + 1)$       c.  $f(-x)$
- $f(x) = 3x + 7$   
a.  $f(4)$       b.  $f(x + 1)$       c.  $f(-x)$
- $g(x) = x^2 + 2x + 3$   
a.  $g(-1)$       b.  $g(x + 5)$       c.  $g(-x)$
- $g(x) = x^2 - 10x - 3$   
a.  $g(-1)$       b.  $g(x + 2)$       c.  $g(-x)$
- $h(x) = x^4 - x^2 + 1$   
a.  $h(2)$       b.  $h(-1)$   
c.  $h(-x)$       d.  $h(3a)$
- $h(x) = x^3 - x + 1$   
a.  $h(3)$       b.  $h(-2)$   
c.  $h(-x)$       d.  $h(3a)$
- $f(r) = \sqrt{r + 6} + 3$   
a.  $f(-6)$       b.  $f(10)$       c.  $f(x - 6)$
- $f(r) = \sqrt{25 - r} - 6$   
a.  $f(16)$       b.  $f(-24)$       c.  $f(25 - 2x)$
- $f(x) = \frac{4x^2 - 1}{x^2}$   
a.  $f(2)$       b.  $f(-2)$       c.  $f(-x)$
- $f(x) = \frac{4x^3 + 1}{x^3}$   
a.  $f(2)$       b.  $f(-2)$       c.  $f(-x)$

$$37. f(x) = \frac{x}{|x|}$$

a.  $f(6)$       b.  $f(-6)$       c.  $f(r^2)$

$$38. f(x) = \frac{|x + 3|}{x + 3}$$

a.  $f(5)$       b.  $f(-5)$       c.  $f(-9 - x)$

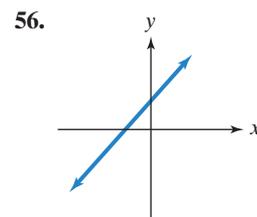

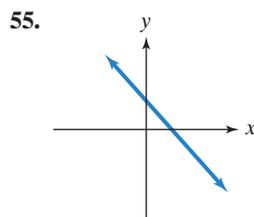

In Exercises 39–50, graph the given functions,  $f$  and  $g$ , in the same rectangular coordinate system. Select integers for  $x$ , starting with  $-2$  and ending with  $2$ . Once you have obtained your graphs, describe how the graph of  $g$  is related to the graph of  $f$ .

- $f(x) = x, g(x) = x + 3$
- $f(x) = x, g(x) = x - 4$
- $f(x) = -2x, g(x) = -2x - 1$
- $f(x) = -2x, g(x) = -2x + 3$
- $f(x) = x^2, g(x) = x^2 + 1$
- $f(x) = x^2, g(x) = x^2 - 2$
- $f(x) = |x|, g(x) = |x| - 2$
- $f(x) = |x|, g(x) = |x| + 1$
- $f(x) = x^3, g(x) = x^3 + 2$
- $f(x) = x^3, g(x) = x^3 - 1$
- $f(x) = 3, g(x) = 5$
- $f(x) = -1, g(x) = 4$

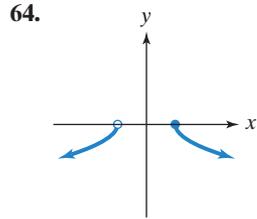

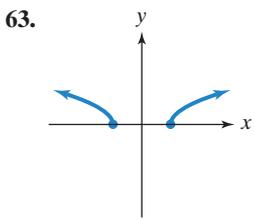

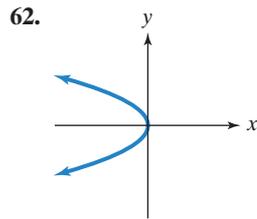

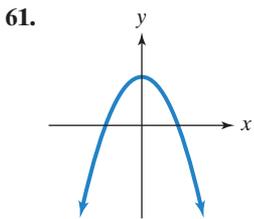

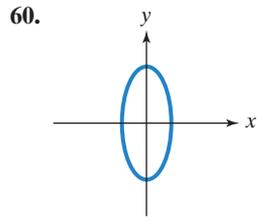

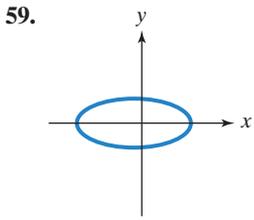

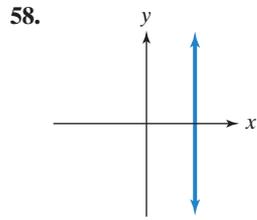

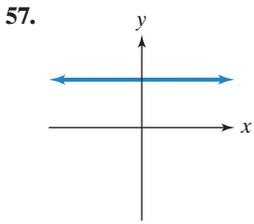

In Exercises 51–54, graph the given square root functions,  $f$  and  $g$ , in the same rectangular coordinate system. Use the integer values of  $x$  given to the right of each function to obtain ordered pairs. Because only nonnegative numbers have square roots that are real numbers, be sure that each graph appears only for values of  $x$  that cause the expression under the radical sign to be greater than or equal to zero. Once you have obtained your graphs, describe how the graph of  $g$  is related to the graph of  $f$ .

- $f(x) = \sqrt{x}$  ( $x = 0, 1, 4, 9$ ) and  $g(x) = \sqrt{x} - 1$  ( $x = 0, 1, 4, 9$ )
- $f(x) = \sqrt{x}$  ( $x = 0, 1, 4, 9$ ) and  $g(x) = \sqrt{x} + 2$  ( $x = 0, 1, 4, 9$ )
- $f(x) = \sqrt{x}$  ( $x = 0, 1, 4, 9$ ) and  $g(x) = \sqrt{x - 1}$  ( $x = 1, 2, 5, 10$ )
- $f(x) = \sqrt{x}$  ( $x = 0, 1, 4, 9$ ) and  $g(x) = \sqrt{x + 2}$  ( $x = -2, -1, 2, 7$ )

In Exercises 55–64, use the vertical line test to identify graphs in which  $y$  is a function of  $x$ .

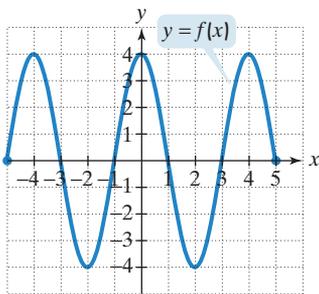

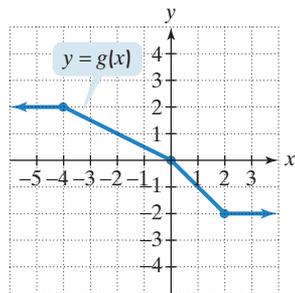

In Exercises 65–70, use the graph of  $f$  to find each indicated function value.

- 65.  $f(-2)$
- 66.  $f(2)$
- 67.  $f(4)$
- 68.  $f(-4)$
- 69.  $f(-3)$
- 70.  $f(-1)$

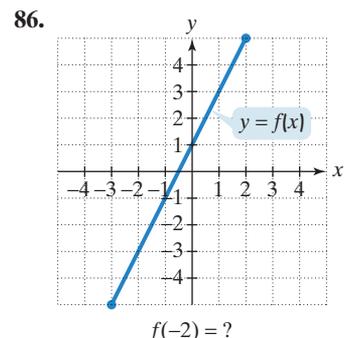

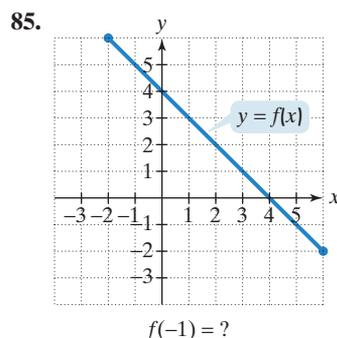

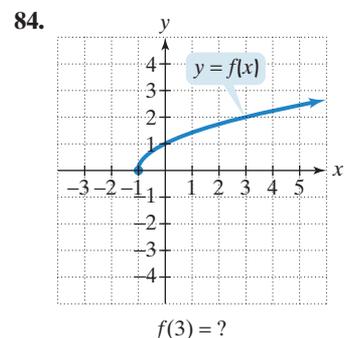

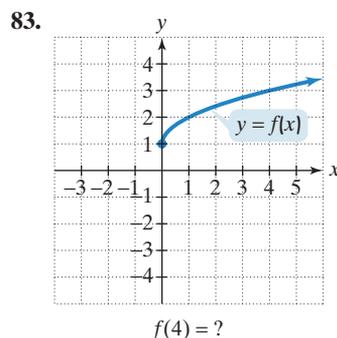

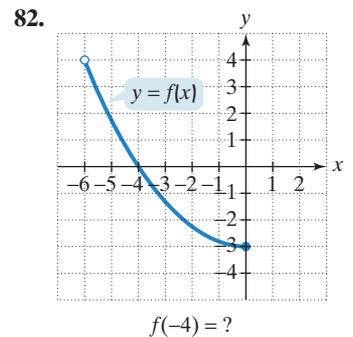

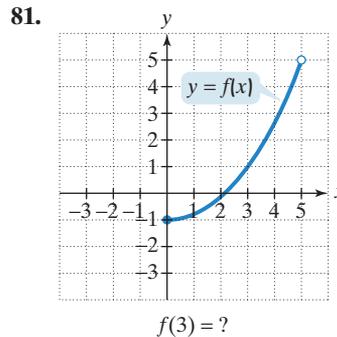

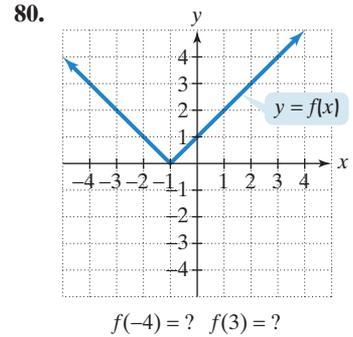

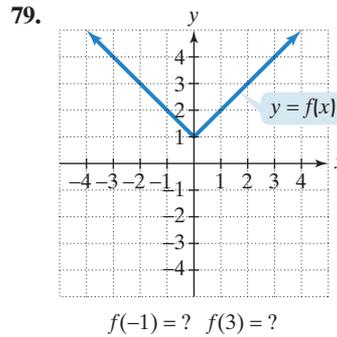

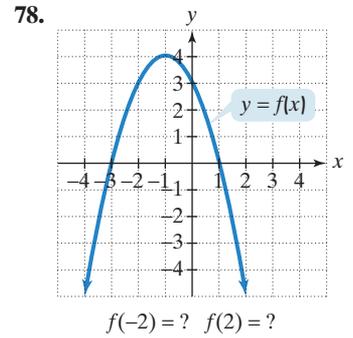

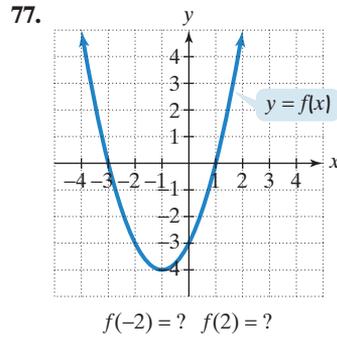

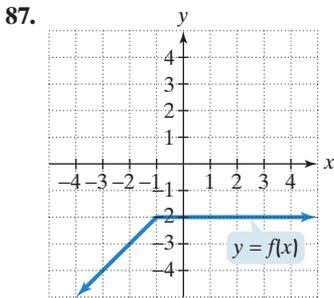

Use the graph of  $g$  to solve Exercises 71–76.

- 71. Find  $g(-4)$ .
- 72. Find  $g(2)$ .
- 73. Find  $g(-10)$ .
- 74. Find  $g(10)$ .
- 75. For what value of  $x$  is  $g(x) = 1$ ?
- 76. For what value of  $x$  is  $g(x) = -1$ ?

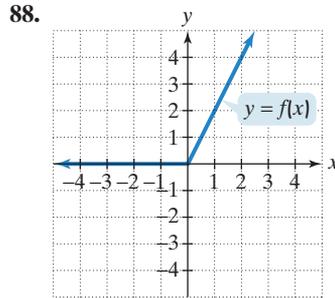

In Exercises 77–92, use the graph to determine **a.** the function's domain; **b.** the function's range; **c.** the  $x$ -intercepts, if any; **d.** the  $y$ -intercept, if any; and **e.** the missing function values, indicated by question marks, below each graph.

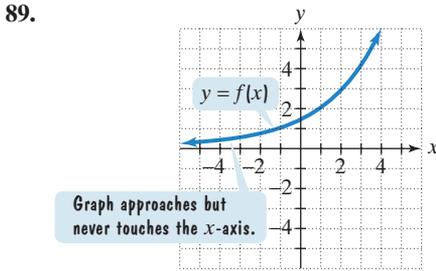

$f(-4) = ?$   $f(4) = ?$

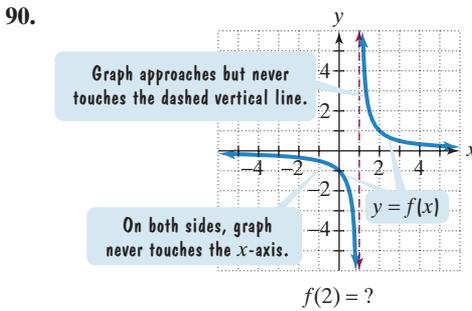

$f(-2) = ?$   $f(2) = ?$

Graph approaches but never touches the x-axis.

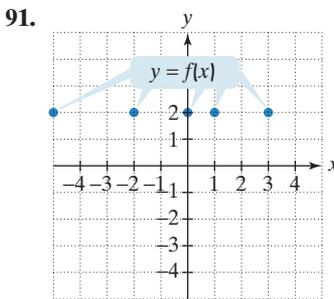

$f(4) = ?$

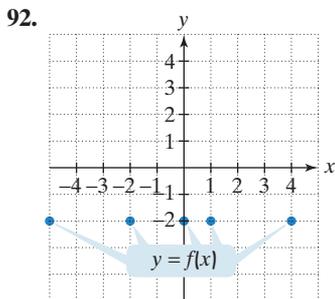

Graph approaches but never touches the dashed vertical line.

On both sides, graph never touches the x-axis.

$f(2) = ?$

$f(-5) + f(3) = ?$

$f(-5) + f(4) = ?$

**Practice Plus**

In Exercises 93–94, let  $f(x) = x^2 - x + 4$  and  $g(x) = 3x - 5$ .

93. Find  $g(1)$  and  $f(g(1))$ .      94. Find  $g(-1)$  and  $f(g(-1))$ .

In Exercises 95–96, let  $f$  and  $g$  be defined by the following table:

$x$	$f(x)$	$g(x)$
-2	6	0
-1	3	4
0	-1	1
1	-4	-3
2	0	-6

95. Find  $\sqrt{f(-1) - f(0)} - [g(2)]^2 + f(-2) \div g(2) \cdot g(-1)$ .

96. Find  $|f(1) - f(0)| - [g(1)]^2 + g(1) \div f(-1) \cdot g(2)$ .

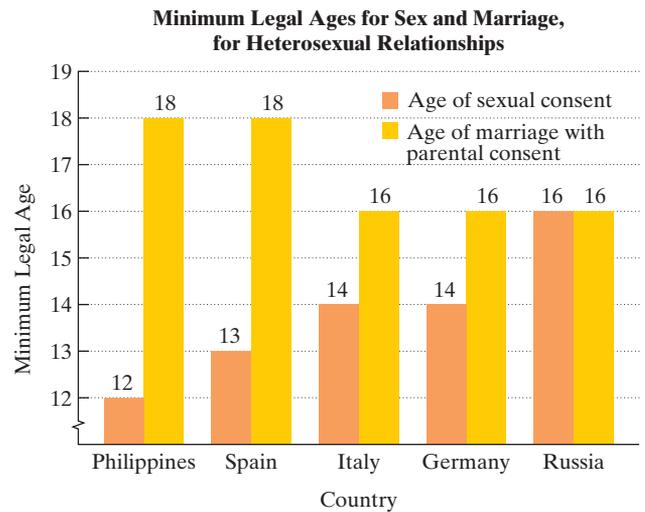

In Exercises 97–98, find  $f(-x) - f(x)$  for the given function  $f$ . Then simplify the expression.

97.  $f(x) = x^3 + x - 5$

98.  $f(x) = x^2 - 3x + 7$

**Application Exercises**

The bar graph shows minimum legal ages for sex and marriage in five selected countries. Use this information to solve Exercises 99–100. (We did not include data for the United States because the legal age of sexual consent varies according to state law. Furthermore, women are allowed to marry younger than men: 16 for women and 18 for men.)

Source: Mitchell Beazley, *Snapshot: The Visual Almanac for Our World Today*. Octopus Publishing, 2009

99. a. Write a set of five ordered pairs in which countries correspond to the minimum legal age of sexual consent. Each ordered pair should be in the form

(country, minimum legal age of sexual consent).

b. Is the relation in part (a) a function? Explain your answer.

c. Write a set of five ordered pairs in which the minimum legal age of sexual consent corresponds to a country. Each ordered pair should be in the form

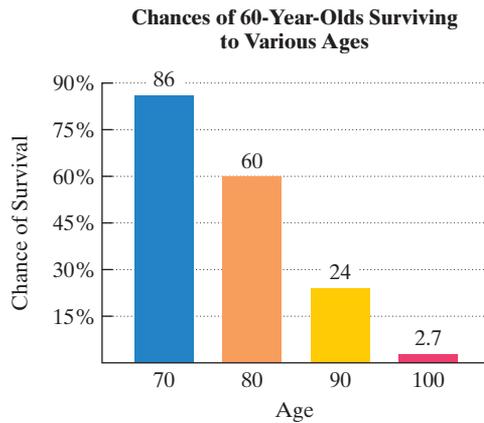

(minimum legal age of sexual consent, country).

d. Is the relation in part (c) a function?

100. a. Write a set of five ordered pairs in which countries correspond to the minimum legal age of marriage with parental consent. Each ordered pair should be in the form  
 (country, minimum legal age of marriage with parental consent).
- b. Is the relation in part (a) a function? Explain your answer.

- c. Write a set of five ordered pairs in which the minimum legal age of marriage with parental consent corresponds to a country. Each ordered pair should be in the form  
 (minimum legal age of marriage with parental consent, country).
- d. Is the relation in part (c) a function?

The bar graph shows your chances of surviving to various ages once you reach 60.

Source: National Center for Health Statistics

The functions

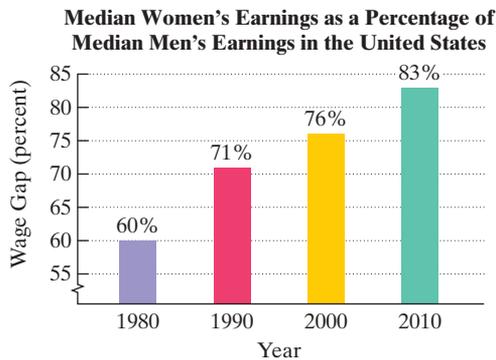

$$f(x) = -2.9x + 286$$

$$\text{and } g(x) = 0.01x^2 - 4.9x + 370$$

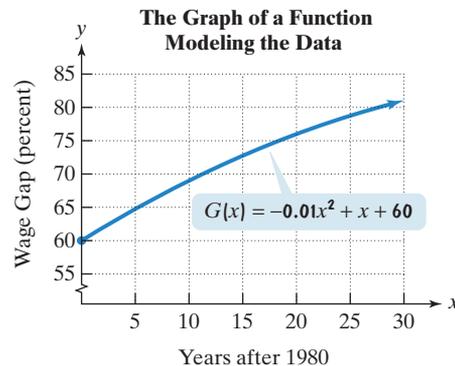

model the chance, as a percent, that a 60-year-old will survive to age  $x$ . Use this information to solve Exercises 101–102.

101. a. Find and interpret  $f(70)$ .  
 b. Find and interpret  $g(70)$ .  
 c. Which function serves as a better model for the chance of surviving to age 70?
102. a. Find and interpret  $f(90)$ .  
 b. Find and interpret  $g(90)$ .  
 c. Which function serves as a better model for the chance of surviving to age 90?

The wage gap is used to compare the status of women's earnings relative to men's. The wage gap is expressed as a percent and is calculated by dividing the median, or middlemost, annual earnings for women by the median annual earnings for men. The bar graph shows the wage gap for selected years from 1980 through 2010.

Source: Bureau of Labor Statistics

The function  $G(x) = -0.01x^2 + x + 60$  models the wage gap, as a percent,  $x$  years after 1980. The graph of function  $G$  is shown to the right of the actual data. Use this information to solve Exercises 103–104.

103. a. Find and interpret  $G(30)$ . Identify this information as a point on the graph of the function.  
 b. Does  $G(30)$  overestimate or underestimate the actual data shown by the bar graph? By how much?
104. a. Find and interpret  $G(10)$ . Identify this information as a point on the graph of the function.  
 b. Does  $G(10)$  overestimate or underestimate the actual data shown by the bar graph? By how much?

In Exercises 105–108, you will be developing functions that model given conditions.

- 105.** A company that manufactures bicycles has a fixed cost of \$100,000. It costs \$100 to produce each bicycle. The total cost for the company is the sum of its fixed cost and variable costs. Write the total cost,  $C$ , as a function of the number of bicycles produced,  $x$ . Then find and interpret  $C(90)$ .
- 106.** A car was purchased for \$22,500. The value of the car decreased by \$3200 per year for the first six years. Write a function that describes the value of the car,  $V$ , after  $x$  years, where  $0 \leq x \leq 6$ . Then find and interpret  $V(3)$ .
- 107.** You commute to work a distance of 40 miles and return on the same route at the end of the day. Your average rate on the return trip is 30 miles per hour faster than your average rate on the outgoing trip. Write the total time,  $T$ , in hours, devoted to your outgoing and return trips as a function of your rate on the outgoing trip,  $x$ . Then find and interpret  $T(30)$ . Hint:

$$\text{Time traveled} = \frac{\text{Distance traveled}}{\text{Rate of travel}}$$

- 108.** A chemist working on a flu vaccine needs to mix a 10% sodium-iodine solution with a 60% sodium-iodine solution to obtain a 50-milliliter mixture. Write the amount of sodium iodine in the mixture,  $S$ , in milliliters, as a function of the number of milliliters of the 10% solution used,  $x$ . Then find and interpret  $S(30)$ .

### Writing in Mathematics

- 109.** What is a relation? Describe what is meant by its domain and its range.
- 110.** Explain how to determine whether a relation is a function. What is a function?
- 111.** How do you determine if an equation in  $x$  and  $y$  defines  $y$  as a function of  $x$ ?
- 112.** Does  $f(x)$  mean  $f$  times  $x$  when referring to a function  $f$ ? If not, what does  $f(x)$  mean? Provide an example with your explanation.
- 113.** What is the graph of a function?
- 114.** Explain how the vertical line test is used to determine whether a graph represents a function.
- 115.** Explain how to identify the domain and range of a function from its graph.
- 116.** For people filing a single return, federal income tax is a function of adjusted gross income because for each value of adjusted gross income there is a specific tax to be paid. By contrast, the price of a house is not a function of the lot size on which the house sits because houses on same-sized lots can sell for many different prices.
- Describe an everyday situation between variables that is a function.
  - Describe an everyday situation between variables that is not a function.

### Technology Exercise

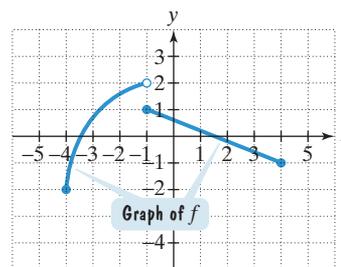

- 117.** Use a graphing utility to verify any five pairs of graphs that you drew by hand in Exercises 39–54.

### Critical Thinking Exercises

**Make Sense?** In Exercises 118–121, determine whether each statement makes sense or does not make sense, and explain your reasoning.

- 118.** My body temperature is a function of the time of day.
- 119.** Using  $f(x) = 3x + 2$ , I found  $f(50)$  by applying the distributive property to  $(3x + 2)50$ .
- 120.** I graphed a function showing how paid vacation days depend on the number of years a person works for a company. The domain was the number of paid vacation days.
- 121.** I graphed a function showing how the average number of annual physician visits depends on a person's age. The domain was the average number of annual physician visits.

Use the graph of  $f$  to determine whether each statement in Exercises 122–125 is true or false.

- 122.** The domain of  $f$  is  $[-4, -1] \cup (-1, 4]$ .
- 123.** The range of  $f$  is  $[-2, 2]$ .
- 124.**  $f(-1) - f(4) = 2$
- 125.**  $f(0) = 2.1$
- 126.** If  $f(x) = 3x + 7$ , find  $\frac{f(a+h) - f(a)}{h}$ .
- 127.** Give an example of a relation with the following characteristics: The relation is a function containing two ordered pairs. Reversing the components in each ordered pair results in a relation that is not a function.
- 128.** If  $f(x+y) = f(x) + f(y)$  and  $f(1) = 3$ , find  $f(2)$ ,  $f(3)$ , and  $f(4)$ . Is  $f(x+y) = f(x) + f(y)$  for all functions?

### Preview Exercises

Exercises 129–131 will help you prepare for the material covered in the next section.

- 129.** The function  $C(t) = 20 + 0.40(t - 60)$  describes the monthly cost,  $C(t)$ , in dollars, for a cellphone plan for  $t$  calling minutes, where  $t > 60$ . Find and interpret  $C(100)$ .
- 130.** Use point plotting to graph  $f(x) = x + 2$  if  $x \leq 1$ .
- 131.** Simplify:  $2(x+h)^2 + 3(x+h) + 5 - (2x^2 + 3x + 5)$ .

## SECTION 1.3

## More on Functions and Their Graphs

*Objectives*

- 1 Identify intervals on which a function increases, decreases, or is constant.
- 2 Use graphs to locate relative maxima or minima.
- 3 Identify even or odd functions and recognize their symmetries.
- 4 Understand and use piecewise functions.
- 5 Find and simplify a function's difference quotient.

It's hard to believe that this gas-guzzler, with its huge fins and overstated design, was available in 1957 for approximately \$1800. The line graph in **Figure 1.28** shows the average fuel efficiency, in miles per gallon, of new U.S. passenger cars for selected years from 1955 through 2009. Based on the averages shown by the graph, it's unlikely that this classic 1957 Chevy got more than 15 miles per gallon.

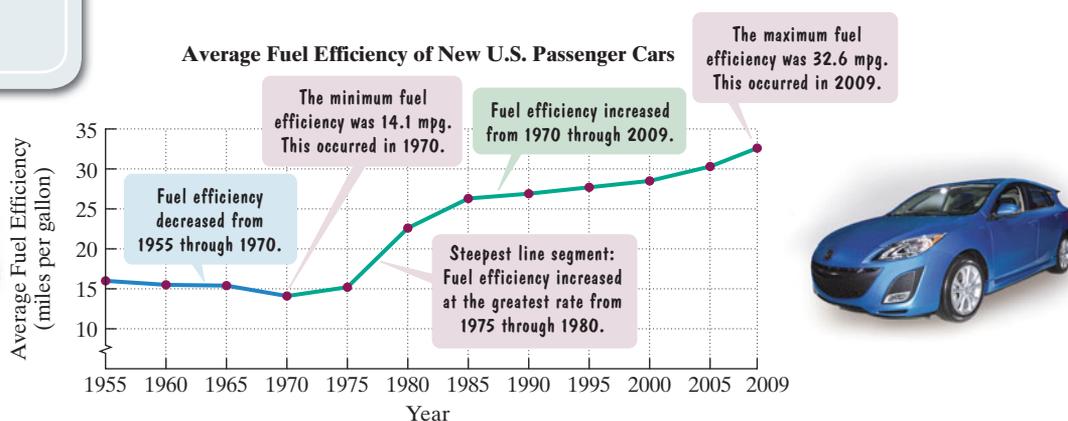

FIGURE 1.28

Source: U.S. Department of Transportation

You are probably familiar with the words used to describe the graph in **Figure 1.28**:

decreased

increased

minimum

maximum

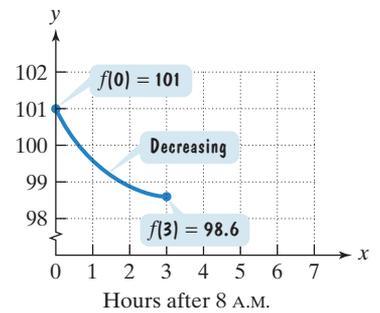

In this section, you will enhance your intuitive understanding of ways of describing graphs by viewing these descriptions from the perspective of functions.

- 1 Identify intervals on which a function increases, decreases, or is constant.

**Increasing and Decreasing Functions**

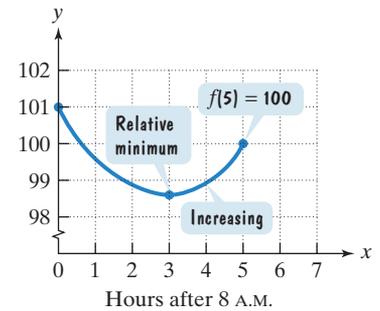

Too late for that flu shot now! It's only 8 A.M. and you're feeling lousy. Your temperature is  $101^{\circ}\text{F}$ . Fascinated by the way that algebra models the world (your author is projecting a bit here), you decide to construct graphs showing your body temperature as a function of the time of day. You decide to let  $x$  represent the number of hours after 8 A.M. and  $f(x)$  your temperature at time  $x$ .

At 8 A.M. your temperature is  $101^\circ\text{F}$  and you are not feeling well. However, your temperature starts to decrease. It reaches normal ( $98.6^\circ\text{F}$ ) by 11 A.M. Feeling energized, you construct the graph shown on the right, indicating decreasing temperature for  $\{x \mid 0 < x < 3\}$ , or on the interval  $(0, 3)$ .

Temperature decreases on  $(0, 3)$ , reaching  $98.6^\circ$  by 11 A.M.

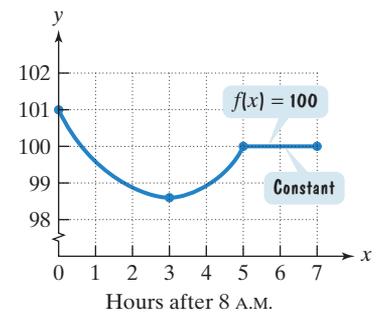

Did creating that first graph drain you of your energy? Your temperature starts to rise after 11 A.M. By 1 P.M., 5 hours after 8 A.M., your temperature reaches  $100^\circ\text{F}$ . However, you keep plotting points on your graph. At the right, we can see that your temperature increases for  $\{x \mid 3 < x < 5\}$ , or on the interval  $(3, 5)$ .

Temperature increases on  $(3, 5)$ .

The graph of  $f$  is decreasing to the left of  $x = 3$  and increasing to the right of  $x = 3$ . Thus, your temperature 3 hours after 8 A.M. was at its lowest point. Your relative minimum temperature was  $98.6^\circ$ .

By 3 P.M., your temperature is no worse than it was at 1 P.M.: It is still  $100^\circ\text{F}$ . (Of course, it's no better, either.) Your temperature remained the same, or constant, for  $\{x \mid 5 < x < 7\}$ , or on the interval  $(5, 7)$ .

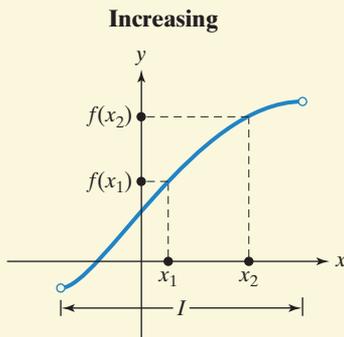

Temperature remains constant at  $100^\circ$  on  $(5, 7)$ .

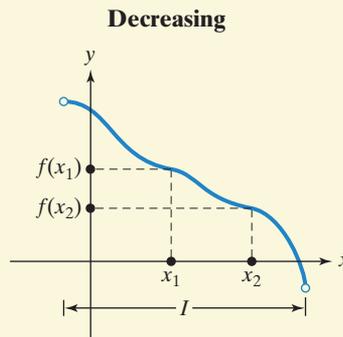

The time-temperature flu scenario illustrates that a function  $f$  is increasing when its graph rises from left to right, decreasing when its graph falls from left to right, and remains constant when it neither rises nor falls. Let's now provide a more precise algebraic description for these intuitive concepts.

### Increasing, Decreasing, and Constant Functions

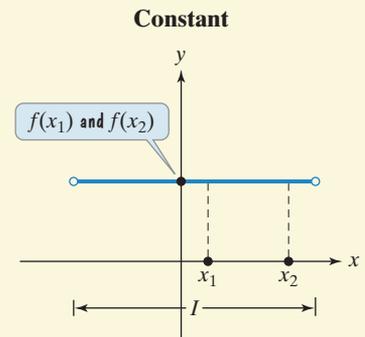

1. A function is **increasing** on an open interval,  $I$ , if  $f(x_1) < f(x_2)$  whenever  $x_1 < x_2$  for any  $x_1$  and  $x_2$  in the interval.
2. A function is **decreasing** on an open interval,  $I$ , if  $f(x_1) > f(x_2)$  whenever  $x_1 < x_2$  for any  $x_1$  and  $x_2$  in the interval.
3. A function is **constant** on an open interval,  $I$ , if  $f(x_1) = f(x_2)$  for any  $x_1$  and  $x_2$  in the interval.

- (1) For  $x_1 < x_2$  in  $I$ ,  
 $f(x_1) < f(x_2)$ ;  
 $f$  is increasing on  $I$ .

- (2) For  $x_1 < x_2$  in  $I$ ,  
 $f(x_1) > f(x_2)$ ;  
 $f$  is decreasing on  $I$ .

- (3) For  $x_1$  and  $x_2$  in  $I$ ,  
 $f(x_1) = f(x_2)$ ;  
 $f$  is constant on  $I$ .

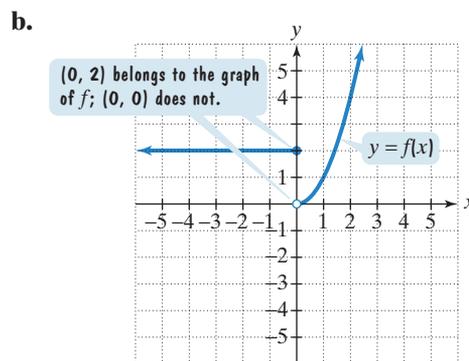

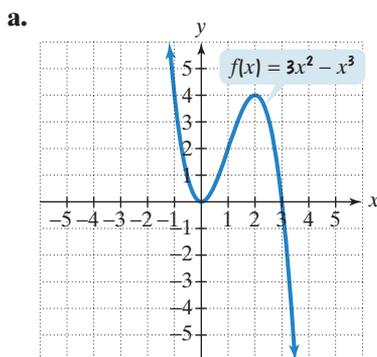

## GREAT QUESTION!

Do you use  $x$ -coordinates or  $y$ -coordinates when describing where functions increase, decrease, or are constant?

The open intervals describing where functions increase, decrease, or are constant use  $x$ -coordinates and not  $y$ -coordinates. Furthermore, points are not used in these descriptions.

### EXAMPLE 1 Intervals on Which a Function Increases, Decreases, or Is Constant

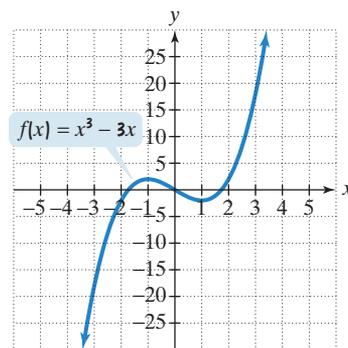

State the intervals on which each given function is increasing, decreasing, or constant.

### SOLUTION

- The function is decreasing on the interval  $(-\infty, 0)$ , increasing on the interval  $(0, 2)$ , and decreasing on the interval  $(2, \infty)$ .
- Although the function's equations are not given, the graph indicates that the function is defined in two pieces. The part of the graph to the left of the  $y$ -axis shows that the function is constant on the interval  $(-\infty, 0)$ . The part to the right of the  $y$ -axis shows that the function is increasing on the interval  $(0, \infty)$ . ...

**Check Point 1** State the intervals on which the given function is increasing, decreasing, or constant.

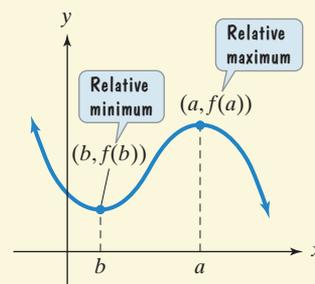

- Use graphs to locate relative maxima or minima.

### Relative Maxima and Relative Minima

The points at which a function changes its increasing or decreasing behavior can be used to find any *relative maximum* or *relative minimum* values of the function.

#### Definitions of Relative Maximum and Relative Minimum

- A function value  $f(a)$  is a **relative maximum** of  $f$  if there exists an open interval containing  $a$  such that  $f(a) > f(x)$  for all  $x \neq a$  in the open interval.
- A function value  $f(b)$  is a **relative minimum** of  $f$  if there exists an open interval containing  $b$  such that  $f(b) < f(x)$  for all  $x \neq b$  in the open interval.

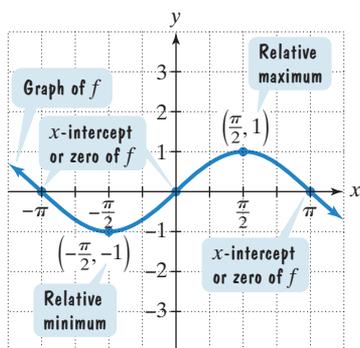

The word *local* is sometimes used instead of *relative* when describing maxima or minima.

## GREAT QUESTION!

**What's the difference between where a function has a relative maximum or minimum and the relative maximum or minimum?**

- If  $f(a)$  is greater than all other values of  $f$  near  $a$ , then  $f$  has a relative maximum at the input value,  $a$ . The relative maximum is the output value,  $f(a)$ . Equivalently,  $f(a)$  is a relative maximum *value* of the function.
- If  $f(b)$  is less than all other values of  $f$  near  $b$ , then  $f$  has a relative minimum at the input value,  $b$ . The relative minimum is the output value,  $f(b)$ . Equivalently,  $f(b)$  is a relative minimum *value* of the function.

**FIGURE 1.29** Using a graph to locate where a function has a relative maximum or minimum

- 3** Identify even or odd functions and recognize their symmetries.

**FIGURE 1.30** To most people, an attractive face is one in which each half is an almost perfect mirror image of the other half.

If the graph of a function is given, we can often visually locate the number(s) at which the function has a relative maximum or a relative minimum. For example, the graph of  $f$  in **Figure 1.29** shows that

- $f$  has a relative maximum at  $\frac{\pi}{2}$ .

The relative maximum is  $f\left(\frac{\pi}{2}\right) = 1$ .

- $f$  has a relative minimum at  $-\frac{\pi}{2}$ .

The relative minimum is  $f\left(-\frac{\pi}{2}\right) = -1$ .

Notice that  $f$  does not have a relative maximum or minimum at  $-\pi$ ,  $0$ , and  $\pi$ , the  $x$ -intercepts, or zeros, of the function.

### Even and Odd Functions and Symmetry

Is beauty in the eye of the beholder? Or are there certain objects (or people) that are so well balanced and proportioned that they are universally pleasing to the eye? What constitutes an attractive human face? In **Figure 1.30**, we've drawn lines between paired features and marked the midpoints. Notice how the features line up almost perfectly. Each half of the face is a mirror image of the other half through the white vertical line.

Did you know that graphs of some equations exhibit exactly the kind of symmetry shown by the attractive face in **Figure 1.30**? The word *symmetry* comes from the Greek *symmetria*, meaning “the same measure.” We can identify a function whose graph has symmetry by looking at the function's equation and determining if the function is *even* or *odd*.

#### Definitions of Even and Odd Functions

The function  $f$  is an **even function** if

$$f(-x) = f(x) \quad \text{for all } x \text{ in the domain of } f.$$

The right side of the equation of an even function does not change if  $x$  is replaced with  $-x$ .

The function  $f$  is an **odd function** if

$$f(-x) = -f(x) \quad \text{for all } x \text{ in the domain of } f.$$

Every term on the right side of the equation of an odd function changes sign if  $x$  is replaced with  $-x$ .

#### EXAMPLE 2 Identifying Even or Odd Functions

Determine whether each of the following functions is even, odd, or neither:

a.  $f(x) = x^3 - 6x$       b.  $g(x) = x^4 - 2x^2$       c.  $h(x) = x^2 + 2x + 1$ .

## SOLUTION

In each case, replace  $x$  with  $-x$  and simplify. If the right side of the equation stays the same, the function is even. If every term on the right side changes sign, the function is odd.

- a. We use the given function's equation,  $f(x) = x^3 - 6x$ , to find  $f(-x)$ .

Use  $f(x) = x^3 - 6x$ .

Replace  $x$  with  $-x$ .

$$f(-x) = (-x)^3 - 6(-x) = (-x)(-x)(-x) - 6(-x) = -x^3 + 6x$$

There are two terms on the right side of the given equation,  $f(x) = x^3 - 6x$ , and each term changed sign when we replaced  $x$  with  $-x$ . Because  $f(-x) = -f(x)$ ,  $f$  is an odd function.

- b. We use the given function's equation,  $g(x) = x^4 - 2x^2$ , to find  $g(-x)$ .

Use  $g(x) = x^4 - 2x^2$ .

Replace  $x$  with  $-x$ .

$$\begin{aligned} g(-x) &= (-x)^4 - 2(-x)^2 = (-x)(-x)(-x)(-x) - 2(-x)(-x) \\ &= x^4 - 2x^2 \end{aligned}$$

The right side of the equation of the given function,  $g(x) = x^4 - 2x^2$ , did not change when we replaced  $x$  with  $-x$ . Because  $g(-x) = g(x)$ ,  $g$  is an even function.

- c. We use the given function's equation,  $h(x) = x^2 + 2x + 1$ , to find  $h(-x)$ .

Use  $h(x) = x^2 + 2x + 1$ .

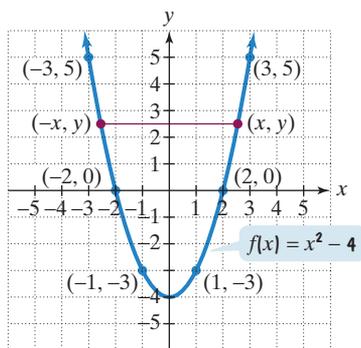

Replace  $x$  with  $-x$ .

$$h(-x) = (-x)^2 + 2(-x) + 1 = x^2 - 2x + 1$$

The right side of the equation of the given function,  $h(x) = x^2 + 2x + 1$ , changed when we replaced  $x$  with  $-x$ . Thus,  $h(-x) \neq h(x)$ , so  $h$  is not an even function. The sign of *each* of the three terms in the equation for  $h(x)$  did not change when we replaced  $x$  with  $-x$ . Only the second term changed signs. Thus,  $h(-x) \neq -h(x)$ , so  $h$  is not an odd function. We conclude that  $h$  is neither an even nor an odd function. ●●●

 **Check Point 2** Determine whether each of the following functions is even, odd, or neither:

- a.  $f(x) = x^2 + 6$       b.  $g(x) = 7x^3 - x$       c.  $h(x) = x^5 + 1$ .

**FIGURE 1.31**  $y$ -axis symmetry with  $f(-x) = f(x)$

Now, let's see what even and odd functions tell us about a function's graph. Begin with the even function  $f(x) = x^2 - 4$ , shown in **Figure 1.31**. The function is even because

$$f(-x) = (-x)^2 - 4 = x^2 - 4 = f(x).$$

Examine the pairs of points shown, such as  $(3, 5)$  and  $(-3, 5)$ . Notice that we obtain the same  $y$ -coordinate whenever we evaluate the function at a value of  $x$  and the value of its opposite,  $-x$ . Like the attractive face, each half of the graph is a mirror image of the other half through the  $y$ -axis. If we were to fold the paper along the  $y$ -axis, the two halves of the graph would coincide. This is what it means for the graph to be *symmetric with respect to the  $y$ -axis*. A graph is **symmetric with respect to the  $y$ -axis** if, for every point  $(x, y)$  on the graph, the point  $(-x, y)$  is also on the graph. All even functions have graphs with this kind of symmetry.

### Even Functions and y-Axis Symmetry

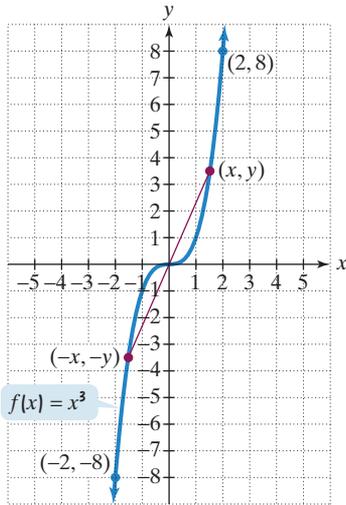

The graph of an even function in which  $f(-x) = f(x)$  is symmetric with respect to the y-axis.

Now, consider the graph of the function  $f(x) = x^3$ , shown in **Figure 1.32**. The function is odd because

$$f(-x) = (-x)^3 = (-x)(-x)(-x) = -x^3 = -f(x).$$

Although the graph in **Figure 1.32** is not symmetric with respect to the y-axis, it is symmetric in another way. Look at the pairs of points, such as (2, 8) and (-2, -8). For each point (x, y) on the graph, the point (-x, -y) is also on the graph. The points (2, 8) and (-2, -8) are reflections of one another through the origin. This means that the origin is the midpoint of the line segment connecting the points.

A graph is **symmetric with respect to the origin** if, for every point (x, y) on the graph, the point (-x, -y) is also on the graph. Observe that the first- and third-quadrant portions of  $f(x) = x^3$  are reflections of one another with respect to the origin. Notice that  $f(x)$  and  $f(-x)$  have opposite signs, so that  $f(-x) = -f(x)$ . All odd functions have graphs with origin symmetry.

**FIGURE 1.32** Origin symmetry with  $f(-x) = -f(x)$

### Odd Functions and Origin Symmetry

The graph of an odd function in which  $f(-x) = -f(x)$  is symmetric with respect to the origin.

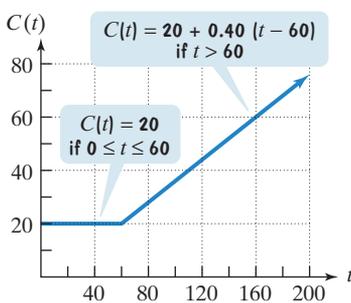

#### 4 Understand and use piecewise functions.

### Piecewise Functions

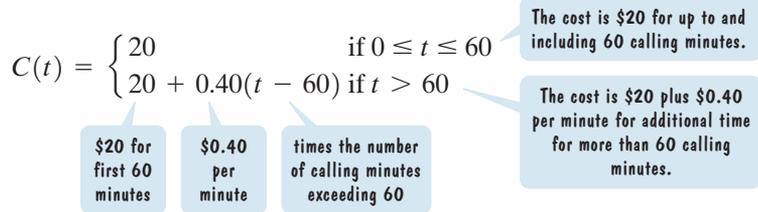

A cellphone company offers the following plan:

- \$20 per month buys 60 minutes.
- Additional time costs \$0.40 per minute.

We can represent this plan mathematically by writing the total monthly cost,  $C$ , as a function of the number of calling minutes,  $t$ .

**FIGURE 1.33**

A function that is defined by two (or more) equations over a specified domain is called a **piecewise function**. Many cellphone plans can be represented with piecewise functions. The graph of the piecewise function described above is shown in **Figure 1.33**.

### EXAMPLE 3 Evaluating a Piecewise Function

Use the function that describes the cellphone plan

$$C(t) = \begin{cases} 20 & \text{if } 0 \leq t \leq 60 \\ 20 + 0.40(t - 60) & \text{if } t > 60 \end{cases}$$

to find and interpret each of the following:

- $C(30)$
- $C(100)$ .

**SOLUTION**

- a. To find  $C(30)$ , we let  $t = 30$ . Because 30 lies between 0 and 60, we use the first line of the piecewise function.

$$C(t) = 20 \quad \text{This is the function's equation for } 0 \leq t \leq 60.$$

$$C(30) = 20 \quad \text{Replace } t \text{ with } 30. \text{ Regardless of this function's input, the constant output is } 20.$$

This means that with 30 calling minutes, the monthly cost is \$20. This can be visually represented by the point (30, 20) on the first piece of the graph in **Figure 1.33**.

- b. To find  $C(100)$ , we let  $t = 100$ . Because 100 is greater than 60, we use the second line of the piecewise function.

$$C(t) = 20 + 0.40(t - 60) \quad \text{This is the function's equation for } t > 60.$$

$$C(100) = 20 + 0.40(100 - 60) \quad \text{Replace } t \text{ with } 100.$$

$$= 20 + 0.40(40) \quad \text{Subtract within parentheses: } 100 - 60 = 40.$$

$$= 20 + 16 \quad \text{Multiply: } 0.40(40) = 16.$$

$$= 36 \quad \text{Add: } 20 + 16 = 36.$$

Thus,  $C(100) = 36$ . This means that with 100 calling minutes, the monthly cost is \$36. This can be visually represented by the point (100, 36) on the second piece of the graph in **Figure 1.33**. ●●●

 **Check Point 3** Use the function in Example 3 to find and interpret each of the following:

- a.  $C(40)$       b.  $C(80)$ .

Identify your solutions by points on the graph in **Figure 1.33**.

**EXAMPLE 4** Graphing a Piecewise Function

Graph the piecewise function defined by

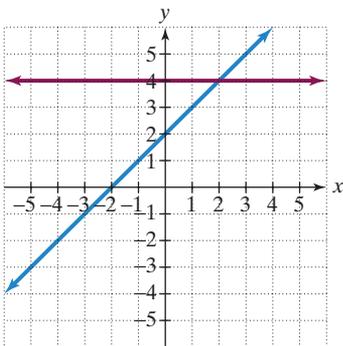

$$f(x) = \begin{cases} x + 2 & \text{if } x \leq 1 \\ 4 & \text{if } x > 1. \end{cases}$$

**SOLUTION**

We graph  $f$  in two parts, using a partial table of coordinates to create each piece. The tables of coordinates and the completed graph are shown in **Figure 1.34**.

**GREAT QUESTION!**

When I graphed the function in Example 4, here's what I got:

**Is my graph ok?**

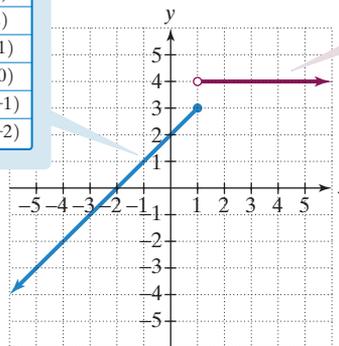

No. You incorrectly ignored the domain for each piece of the function and graphed each equation as if its domain was  $(-\infty, \infty)$ .

Graph  $f(x) = x + 2$  for  $x \leq 1$ .  
Domain =  $(-\infty, 1]$

$x$ ( $x \leq 1$ )	$f(x) = x + 2$	$(x, f(x))$
1	$f(1) = 1 + 2 = 3$	(1, 3)
0	$f(0) = 0 + 2 = 2$	(0, 2)
-1	$f(-1) = -1 + 2 = 1$	(-1, 1)
-2	$f(-2) = -2 + 2 = 0$	(-2, 0)
-3	$f(-3) = -3 + 2 = -1$	(-3, -1)
-4	$f(-4) = -4 + 2 = -2$	(-4, -2)

Graph  $f(x) = 4$  for  $x > 1$ .  
Domain =  $(1, \infty)$

$x$ ( $x > 1$ )	$f(x) = 4$	$(x, f(x))$
1.5	$f(1.5) = 4$	(1.5, 4)
2	$f(2) = 4$	(2, 4)
3	$f(3) = 4$	(3, 4)
4	$f(4) = 4$	(4, 4)
5	$f(5) = 4$	(5, 4)

**FIGURE 1.34** Graphing a piecewise function

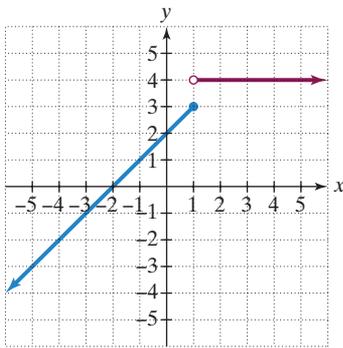

FIGURE 1.34 (repeated)

We can use the graph of the piecewise function in **Figure 1.34** to find the range of  $f$ . The range of the blue piece on the left is  $\{y \mid y \leq 3\}$ . The range of the red horizontal piece on the right is  $\{y \mid y = 4\}$ . Thus, the range of  $f$  is

$$\{y \mid y \leq 3\} \cup \{y \mid y = 4\}, \text{ or } (-\infty, 3] \cup \{4\}.$$

**Check Point 4** Graph the piecewise function defined by

$$f(x) = \begin{cases} 3 & \text{if } x \leq -1 \\ x - 2 & \text{if } x > -1. \end{cases}$$

Some piecewise functions are called **step functions** because their graphs form discontinuous steps. One such function is called the **greatest integer function**, symbolized by  $\text{int}(x)$  or  $\lceil x \rceil$ , where

$\text{int}(x)$  = the greatest integer that is less than or equal to  $x$ .

For example,

$$\text{int}(1) = 1, \quad \text{int}(1.3) = 1, \quad \text{int}(1.5) = 1, \quad \text{int}(1.9) = 1.$$

1 is the greatest integer that is less than or equal to 1, 1.3, 1.5, and 1.9.

Here are some additional examples:

$$\text{int}(2) = 2, \quad \text{int}(2.3) = 2, \quad \text{int}(2.5) = 2, \quad \text{int}(2.9) = 2.$$

2 is the greatest integer that is less than or equal to 2, 2.3, 2.5, and 2.9.

Notice how we jumped from 1 to 2 in the function values for  $\text{int}(x)$ . In particular,

$$\text{If } 1 \leq x < 2, \text{ then } \text{int}(x) = 1.$$

$$\text{If } 2 \leq x < 3, \text{ then } \text{int}(x) = 2.$$

The graph of  $f(x) = \text{int}(x)$  is shown in **Figure 1.35**. The graph of the greatest integer function jumps vertically one unit at each integer. However, the graph is constant between each pair of consecutive integers. The rightmost horizontal step shown in the graph illustrates that

$$\text{If } 5 \leq x < 6, \text{ then } \text{int}(x) = 5.$$

In general,

$$\text{If } n \leq x < n + 1, \text{ where } n \text{ is an integer, then } \text{int}(x) = n.$$

**5** Find and simplify a function's difference quotient.

### Functions and Difference Quotients

In Section 1.5, we will be studying the average rate of change of a function. A ratio, called the *difference quotient*, plays an important role in understanding the rate at which functions change.

#### Definition of the Difference Quotient of a Function

The expression

$$\frac{f(x + h) - f(x)}{h}$$

for  $h \neq 0$  is called the **difference quotient** of the function  $f$ .

#### EXAMPLE 5 Evaluating and Simplifying a Difference Quotient

If  $f(x) = 2x^2 - x + 3$ , find and simplify each expression:

a.  $f(x + h)$       b.  $\frac{f(x + h) - f(x)}{h}, h \neq 0.$

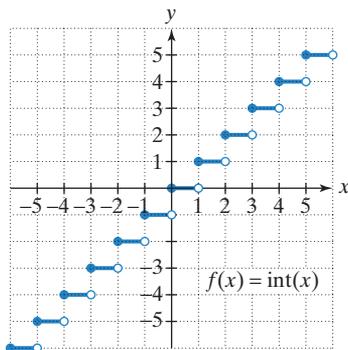

FIGURE 1.35 The graph of the greatest integer function

## SOLUTION

- a. We find  $f(x + h)$  by replacing  $x$  with  $x + h$  each time that  $x$  appears in the equation.

$$f(x) = 2x^2 - x + 3$$

Replace  $x$  with  $x + h$ .      Replace  $x$  with  $x + h$ .      Replace  $x$  with  $x + h$ .      Copy the 3. There is no  $x$  in this term.

$$f(x + h) = 2(x + h)^2 - (x + h) + 3$$

$$= 2(x^2 + 2xh + h^2) - x - h + 3$$

$$= 2x^2 + 4xh + 2h^2 - x - h + 3$$

- b. Using our result from part (a), we obtain the following:

$$\frac{f(x + h) - f(x)}{h} = \frac{2x^2 + 4xh + 2h^2 - x - h + 3}{h} - (2x^2 - x + 3)$$

This is  $f(x + h)$  from part (a).      This is  $f(x)$  from the given equation.

$$= \frac{2x^2 + 4xh + 2h^2 - x - h + 3 - 2x^2 + x - 3}{h}$$

Remove parentheses and change the sign of each term in the parentheses.

$$= \frac{(2x^2 - 2x^2) + (-x + x) + (3 - 3) + 4xh + 2h^2 - h}{h}$$

Group like terms.

$$= \frac{4xh + 2h^2 - 1h}{h}$$

We wrote  $-h$  as  $-1h$  to avoid possible errors in the next factoring step.

Simplify.

$$= \frac{h(4x + 2h - 1)}{h}$$

Factor  $h$  from the numerator.

$$= 4x + 2h - 1$$

Divide out identical factors of  $h$  in the numerator and denominator.

 **Check Point 5** If  $f(x) = -2x^2 + x + 5$ , find and simplify each expression:

- a.  $f(x + h)$       b.  $\frac{f(x + h) - f(x)}{h}, h \neq 0$ .

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

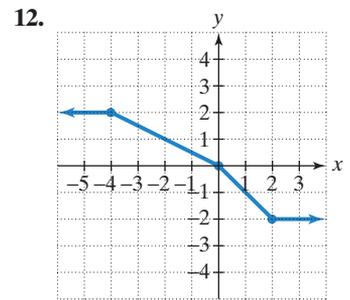

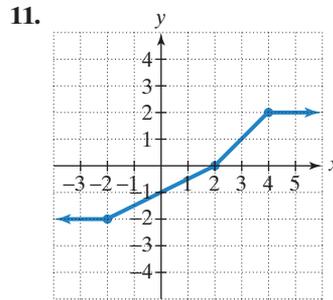

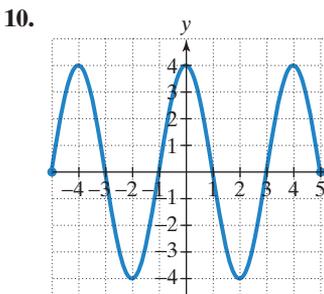

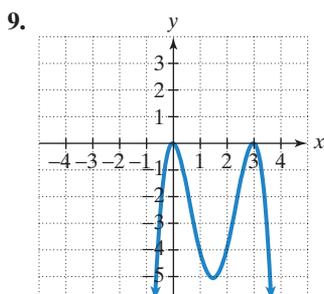

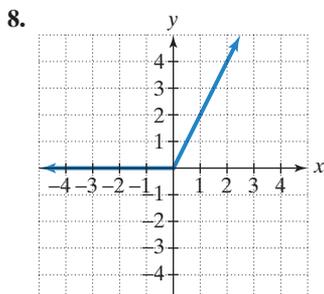

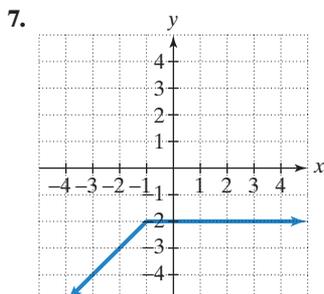

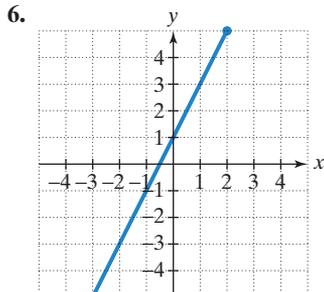

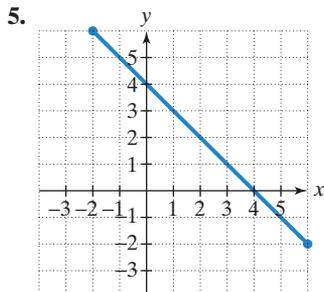

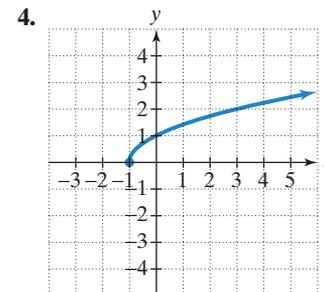

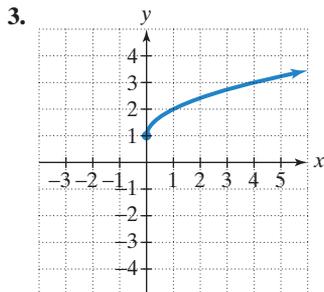

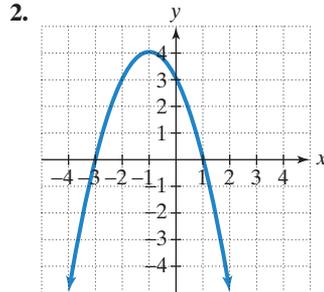

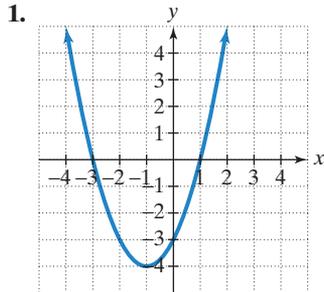

- Assume that  $f$  is a function defined on an open interval  $I$  and  $x_1$  and  $x_2$  are any elements in the interval  $I$ .  
 $f$  is increasing on  $I$  if  $f(x_1)$  \_\_\_\_\_ when  $x_1 < x_2$ .  
 $f$  is decreasing on  $I$  if  $f(x_1)$  \_\_\_\_\_ when  $x_1 < x_2$ .  
 $f$  is constant on  $I$  if  $f(x_1)$  \_\_\_\_\_.
- If  $f(a) > f(x)$  in an open interval containing  $a, x \neq a$ , then the function value  $f(a)$  is a relative \_\_\_\_\_ of  $f$ .  
If  $f(b) < f(x)$  in an open interval containing  $b, x \neq b$ , then the function value  $f(b)$  is a relative \_\_\_\_\_ of  $f$ .
- If  $f$  is an even function, then  $f(-x) =$  \_\_\_\_\_. Such a function is symmetric with respect to the \_\_\_\_\_.
- If  $f$  is an odd function, then  $f(-x) =$  \_\_\_\_\_. The graph of such a function is symmetric with respect to the \_\_\_\_\_.
- A function defined by two or more equations over a specified domain is called a/an \_\_\_\_\_ function.
- The greatest integer function is defined by  $\text{int}(x) =$  the greatest integer that is \_\_\_\_\_.  
For example,  $\text{int}(2.5) =$  \_\_\_\_,  $\text{int}(-2.5) =$  \_\_\_\_, and  $\text{int}(0.5) =$  \_\_\_\_.
- The expression  $\frac{f(x + h) - f(x)}{h}, h \neq 0$ , is called the \_\_\_\_\_ of the function  $f$ . We find this expression by replacing  $x$  with \_\_\_\_\_ each time  $x$  appears in the function's equation. Then we subtract \_\_\_\_\_. After simplifying, we factor \_\_\_\_\_ from the numerator and divide out identical factors of \_\_\_\_\_ in the numerator and denominator.
- True or false:  $f(x + h) = f(x) + h$  \_\_\_\_\_
- True or false:  $f(x + h) = f(x) + f(h)$  \_\_\_\_\_

EXERCISE SET 1.3

Practice Exercises

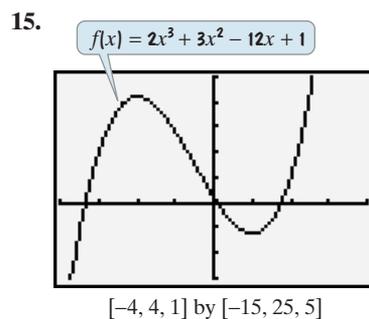

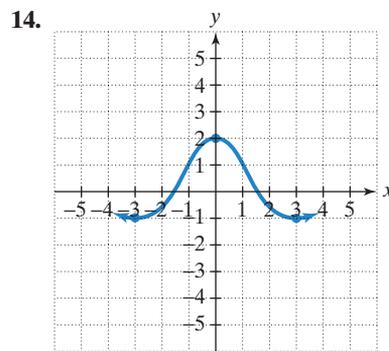

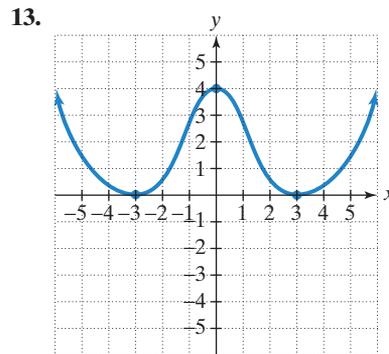

In Exercises 1–12, use the graph to determine

- a. intervals on which the function is increasing, if any.
- b. intervals on which the function is decreasing, if any.
- c. intervals on which the function is constant, if any.

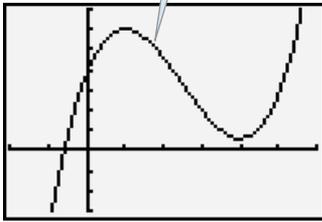

In Exercises 13–16, the graph of a function  $f$  is given. Use the graph to find each of the following:

- a. The numbers, if any, at which  $f$  has a relative maximum. What are these relative maxima?
- b. The numbers, if any, at which  $f$  has a relative minimum. What are these relative minima?

$[-4, 4, 1]$  by  $[-15, 25, 5]$

16.  $f(x) = 2x^3 - 15x^2 + 24x + 19$

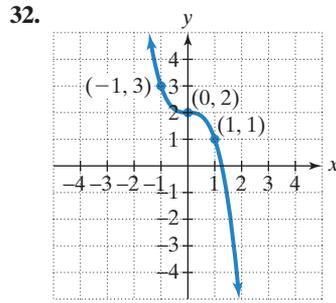

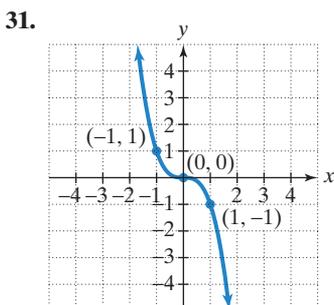

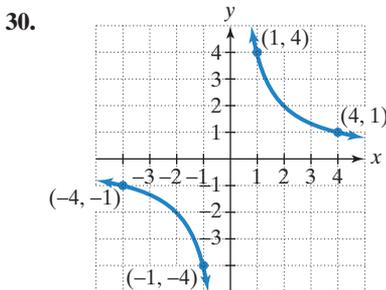

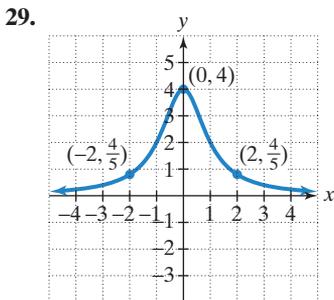

$[-2, 6, 1]$  by  $[-15, 35, 5]$

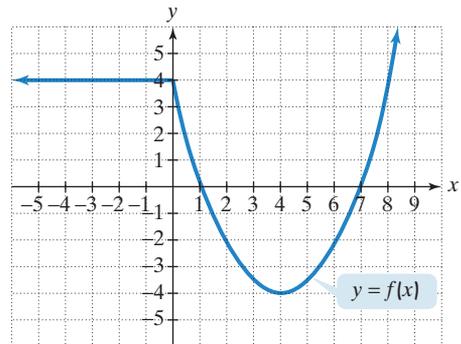

In Exercises 17–28, determine whether each function is even, odd, or neither.

- |                                    |                                |
|------------------------------------|--------------------------------|
| 17. $f(x) = x^3 + x$               | 18. $f(x) = x^3 - x$           |
| 19. $g(x) = x^2 + x$               | 20. $g(x) = x^2 - x$           |
| 21. $h(x) = x^2 - x^4$             | 22. $h(x) = 2x^2 + x^4$        |
| 23. $f(x) = x^2 - x^4 + 1$         | 24. $f(x) = 2x^2 + x^4 + 1$    |
| 25. $f(x) = \frac{1}{5}x^6 - 3x^2$ | 26. $f(x) = 2x^3 - 6x^5$       |
| 27. $f(x) = x\sqrt{1 - x^2}$       | 28. $f(x) = x^2\sqrt{1 - x^2}$ |

In Exercises 29–32, use possible symmetry to determine whether each graph is the graph of an even function, an odd function, or a function that is neither even nor odd.

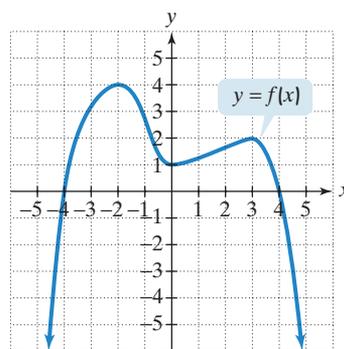

33. Use the graph of  $f$  to determine each of the following. Where applicable, use interval notation.

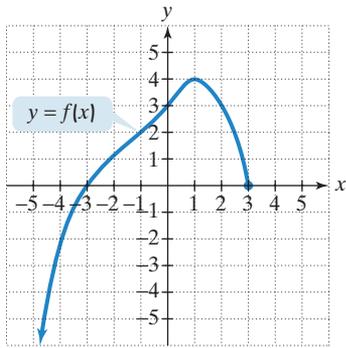

- the domain of  $f$
- the range of  $f$
- the  $x$ -intercepts
- the  $y$ -intercept
- intervals on which  $f$  is increasing
- intervals on which  $f$  is decreasing
- intervals on which  $f$  is constant
- the number at which  $f$  has a relative minimum
- the relative minimum of  $f$
- $f(-3)$
- the values of  $x$  for which  $f(x) = -2$
- Is  $f$  even, odd, or neither?

34. Use the graph of  $f$  to determine each of the following. Where applicable, use interval notation.

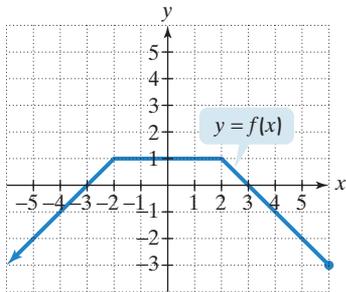

- the domain of  $f$
- the range of  $f$
- the  $x$ -intercepts
- the  $y$ -intercept
- intervals on which  $f$  is increasing
- intervals on which  $f$  is decreasing
- values of  $x$  for which  $f(x) \leq 0$
- the numbers at which  $f$  has a relative maximum
- the relative maxima of  $f$
- $f(-2)$
- the values of  $x$  for which  $f(x) = 0$
- Is  $f$  even, odd, or neither?

35. Use the graph of  $f$  to determine each of the following. Where applicable, use interval notation.

- the domain of  $f$
  - the range of  $f$
  - the zeros of  $f$
  - $f(0)$
  - intervals on which  $f$  is increasing
  - intervals on which  $f$  is decreasing
  - values of  $x$  for which  $f(x) \leq 0$
  - any relative maxima and the numbers at which they occur
- the value of  $x$  for which  $f(x) = 4$
  - Is  $f(-1)$  positive or negative?
36. Use the graph of  $f$  to determine each of the following. Where applicable, use interval notation.

- the domain of  $f$
- the range of  $f$
- the zeros of  $f$
- $f(0)$
- intervals on which  $f$  is increasing
- intervals on which  $f$  is decreasing
- intervals on which  $f$  is constant
- values of  $x$  for which  $f(x) > 0$
- values of  $x$  for which  $f(x) = -2$
- Is  $f(4)$  positive or negative?
- Is  $f$  even, odd, or neither?
- Is  $f(2)$  a relative maximum?

In Exercises 37–42, evaluate each piecewise function at the given values of the independent variable.

37.  $f(x) = \begin{cases} 3x + 5 & \text{if } x < 0 \\ 4x + 7 & \text{if } x \geq 0 \end{cases}$
- $f(-2)$
  - $f(0)$
  - $f(3)$
38.  $f(x) = \begin{cases} 6x - 1 & \text{if } x < 0 \\ 7x + 3 & \text{if } x \geq 0 \end{cases}$
- $f(-3)$
  - $f(0)$
  - $f(4)$
39.  $g(x) = \begin{cases} x + 3 & \text{if } x \geq -3 \\ -(x + 3) & \text{if } x < -3 \end{cases}$
- $g(0)$
  - $g(-6)$
  - $g(-3)$
40.  $g(x) = \begin{cases} x + 5 & \text{if } x \geq -5 \\ -(x + 5) & \text{if } x < -5 \end{cases}$
- $g(0)$
  - $g(-6)$
  - $g(-5)$
41.  $h(x) = \begin{cases} \frac{x^2 - 9}{x - 3} & \text{if } x \neq 3 \\ 6 & \text{if } x = 3 \end{cases}$
- $h(5)$
  - $h(0)$
  - $h(3)$
42.  $h(x) = \begin{cases} \frac{x^2 - 25}{x - 5} & \text{if } x \neq 5 \\ 10 & \text{if } x = 5 \end{cases}$
- $h(7)$
  - $h(0)$
  - $h(5)$

In Exercises 43–54, the domain of each piecewise function is  $(-\infty, \infty)$ .

- Graph each function.
- Use your graph to determine the function's range.

43.  $f(x) = \begin{cases} -x & \text{if } x < 0 \\ x & \text{if } x \geq 0 \end{cases}$
44.  $f(x) = \begin{cases} x & \text{if } x < 0 \\ -x & \text{if } x \geq 0 \end{cases}$
45.  $f(x) = \begin{cases} 2x & \text{if } x \leq 0 \\ 2 & \text{if } x > 0 \end{cases}$
46.  $f(x) = \begin{cases} \frac{1}{2}x & \text{if } x \leq 0 \\ 3 & \text{if } x > 0 \end{cases}$
47.  $f(x) = \begin{cases} x + 3 & \text{if } x < -2 \\ x - 3 & \text{if } x \geq -2 \end{cases}$
48.  $f(x) = \begin{cases} x + 2 & \text{if } x < -3 \\ x - 2 & \text{if } x \geq -3 \end{cases}$
49.  $f(x) = \begin{cases} 3 & \text{if } x \leq -1 \\ -3 & \text{if } x > -1 \end{cases}$
50.  $f(x) = \begin{cases} 4 & \text{if } x \leq -1 \\ -4 & \text{if } x > -1 \end{cases}$
51.  $f(x) = \begin{cases} \frac{1}{2}x^2 & \text{if } x < 1 \\ 2x - 1 & \text{if } x \geq 1 \end{cases}$
52.  $f(x) = \begin{cases} -\frac{1}{2}x^2 & \text{if } x < 1 \\ 2x + 1 & \text{if } x \geq 1 \end{cases}$

$$53. f(x) = \begin{cases} 0 & \text{if } x < -4 \\ -x & \text{if } -4 \leq x < 0 \\ x^2 & \text{if } x \geq 0 \end{cases}$$

$$54. f(x) = \begin{cases} 0 & \text{if } x < -3 \\ -x & \text{if } -3 \leq x < 0 \\ x^2 - 1 & \text{if } x \geq 0 \end{cases}$$

In Exercises 55–76, find and simplify the difference quotient

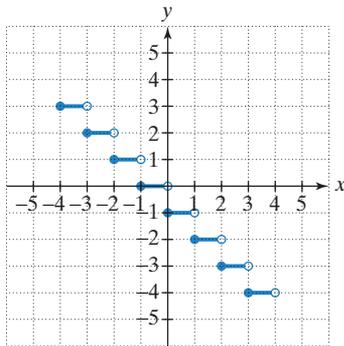

$$\frac{f(x+h) - f(x)}{h}, h \neq 0$$

for the given function.

- |                             |                             |
|-----------------------------|-----------------------------|
| 55. $f(x) = 4x$             | 56. $f(x) = 7x$             |
| 57. $f(x) = 3x + 7$         | 58. $f(x) = 6x + 1$         |
| 59. $f(x) = x^2$            | 60. $f(x) = 2x^2$           |
| 61. $f(x) = x^2 - 4x + 3$   | 62. $f(x) = x^2 - 5x + 8$   |
| 63. $f(x) = 2x^2 + x - 1$   | 64. $f(x) = 3x^2 + x + 5$   |
| 65. $f(x) = -x^2 + 2x + 4$  | 66. $f(x) = -x^2 - 3x + 1$  |
| 67. $f(x) = -2x^2 + 5x + 7$ | 68. $f(x) = -3x^2 + 2x - 1$ |
| 69. $f(x) = -2x^2 - x + 3$  | 70. $f(x) = -3x^2 + x - 1$  |
| 71. $f(x) = 6$              | 72. $f(x) = 7$              |
| 73. $f(x) = \frac{1}{x}$    | 74. $f(x) = \frac{1}{2x}$   |
| 75. $f(x) = \sqrt{x}$       | 76. $f(x) = \sqrt{x-1}$     |

**Practice Plus**

In Exercises 77–78, let  $f$  be defined by the following graph:

77. Find  $\sqrt{f(-1.5) + f(-0.9)} - [f(\pi)]^2 + f(-3) \div f(1) \cdot f(-\pi)$ .
78. Find  $\sqrt{f(-2.5) - f(1.9)} - [f(-\pi)]^2 + f(-3) \div f(1) \cdot f(\pi)$ .

A cellphone company offers the following plans. Also given are the piecewise functions that model these plans. Use this information to solve Exercises 79–80.

**Plan A**

- \$30 per month buys 120 minutes.
- Additional time costs \$0.30 per minute.

$$C(t) = \begin{cases} 30 & \text{if } 0 \leq t \leq 120 \\ 30 + 0.30(t - 120) & \text{if } t > 120 \end{cases}$$

**Plan B**

- \$40 per month buys 200 minutes.
- Additional time costs \$0.30 per minute.

$$C(t) = \begin{cases} 40 & \text{if } 0 \leq t \leq 200 \\ 40 + 0.30(t - 200) & \text{if } t > 200 \end{cases}$$

79. Simplify the algebraic expression in the second line of the piecewise function for plan A. Then use point-plotting to graph the function.
80. Simplify the algebraic expression in the second line of the piecewise function for plan B. Then use point-plotting to graph the function.

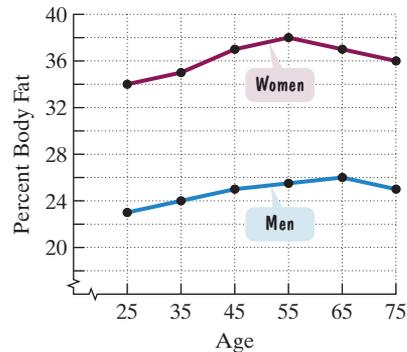

In Exercises 81–82, write a piecewise function that models each cellphone billing plan. Then graph the function.

81. \$50 per month buys 400 minutes. Additional time costs \$0.30 per minute.
82. \$60 per month buys 450 minutes. Additional time costs \$0.35 per minute.

**Application Exercises**

With aging, body fat increases and muscle mass declines. The line graphs show the percent body fat in adult women and men as they age from 25 to 75 years. Use the graphs to solve Exercises 83–90.

**Percent Body Fat in Adults**

Source: Thompson et al., *The Science of Nutrition*, Benjamin Cummings, 2008

83. State the intervals on which the graph giving the percent body fat in women is increasing and decreasing.
84. State the intervals on which the graph giving the percent body fat in men is increasing and decreasing.
85. For what age does the percent body fat in women reach a maximum? What is the percent body fat for that age?
86. At what age does the percent body fat in men reach a maximum? What is the percent body fat for that age?
87. Use interval notation to give the domain and the range for the graph of the function for women.
88. Use interval notation to give the domain and the range for the graph of the function for men.
89. The function  $p(x) = -0.002x^2 + 0.15x + 22.86$  models percent body fat,  $p(x)$ , where  $x$  is the number of years a person's age exceeds 25. Use the graphs to determine whether this model describes percent body fat in women or in men.
90. The function  $p(x) = -0.004x^2 + 0.25x + 33.64$  models percent body fat,  $p(x)$ , where  $x$  is the number of years a person's age exceeds 25. Use the graphs to determine whether this model describes percent body fat in women or in men.

Here is the 2011 Federal Tax Rate Schedule X that specifies the tax owed by a single taxpayer.

If Your Taxable Income Is Over	But Not Over	The Tax You Owe Is	Of the Amount Over
\$ 0	\$ 8500	10%	\$ 0
\$ 8500	\$ 34,500	\$ 850.00 + 15%	\$ 8500
\$ 34,500	\$ 83,600	\$ 4750.00 + 25%	\$ 34,500
\$ 83,600	\$174,400	\$ 17,025.00 + 28%	\$ 83,600
\$174,400	\$379,150	\$ 42,449.00 + 33%	\$174,400
\$379,150	—	\$110,016.50 + 35%	\$379,150

The preceding tax table can be modeled by a piecewise function, where  $x$  represents the taxable income of a single taxpayer and  $T(x)$  is the tax owed:

$$T(x) = \begin{cases} 0.10x & \text{if } 0 < x \leq 8500 \\ 850.00 + 0.15(x - 8500) & \text{if } 8500 < x \leq 34,500 \\ 4750.00 + 0.25(x - 34,500) & \text{if } 34,500 < x \leq 83,600 \\ 17,025.00 + 0.28(x - 83,600) & \text{if } 83,600 < x \leq 174,400 \\ \underline{\quad? \quad} & \text{if } 174,400 < x \leq 379,150 \\ \underline{\quad? \quad} & \text{if } x > 379,150. \end{cases}$$

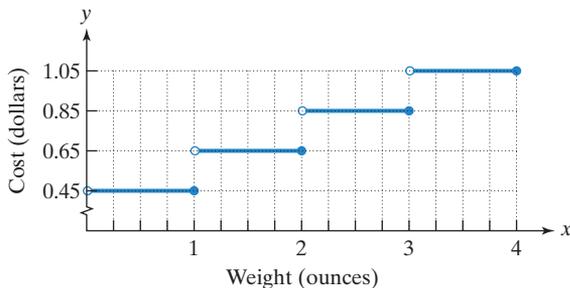

Use this information to solve Exercises 91–94.

- 91. Find and interpret  $T(20,000)$ .
- 92. Find and interpret  $T(50,000)$ .

In Exercises 93–94, refer to the preceding tax table.

- 93. Find the algebraic expression for the missing piece of  $T(x)$  that models tax owed for the domain  $(174,400, 379,150]$ .
- 94. Find the algebraic expression for the missing piece of  $T(x)$  that models tax owed for the domain  $(379,150, \infty)$ .

The figure shows the cost of mailing a first-class letter,  $f(x)$ , as a function of its weight,  $x$ , in ounces. Use the graph to solve Exercises 95–98.

Source: Lynn E. Baring, Postmaster, Inverness, CA

- 95. Find  $f(3)$ . What does this mean in terms of the variables in this situation?

- 96. Find  $f(3.5)$ . What does this mean in terms of the variables in this situation?
- 97. What is the cost of mailing a letter that weighs 1.5 ounces?
- 98. What is the cost of mailing a letter that weighs 1.8 ounces?
- 99. **Furry Finances** A pet insurance policy has a monthly rate that is a function of the age of the insured dog or cat. For pets whose age does not exceed 4, the monthly cost is \$20. The cost then increases by \$2 for each successive year of the pet's age.

Age Not Exceeding	Monthly Cost
4	\$20
5	\$22
6	\$24

The cost schedule continues in this manner for ages not exceeding 10. The cost for pets whose ages exceed 10 is \$40. Use this information to create a graph that shows the monthly cost of the insurance,  $f(x)$ , for a pet of age  $x$ , where the function's domain is  $[0, 14]$ .

### Writing in Mathematics

- 100. What does it mean if a function  $f$  is increasing on an interval?
- 101. Suppose that a function  $f$  whose graph contains no breaks or gaps on  $(a, c)$  is increasing on  $(a, b)$ , decreasing on  $(b, c)$ , and defined at  $b$ . Describe what occurs at  $x = b$ . What does the function value  $f(b)$  represent?
- 102. If you are given a function's equation, how do you determine if the function is even, odd, or neither?
- 103. If you are given a function's graph, how do you determine if the function is even, odd, or neither?
- 104. What is a piecewise function?
- 105. Explain how to find the difference quotient of a function  $f$ ,  $\frac{f(x+h) - f(x)}{h}$ , if an equation for  $f$  is given.

### Technology Exercises

- 106. The function

$$f(x) = -0.00002x^3 + 0.008x^2 - 0.3x + 6.95$$

models the number of annual physician visits,  $f(x)$ , by a person of age  $x$ . Graph the function in a  $[0, 100, 5]$  by  $[0, 40, 2]$  viewing rectangle. What does the shape of the graph indicate about the relationship between one's age and the number of annual physician visits? Use the **TABLE** or minimum function capability to find the coordinates of the minimum point on the graph of the function. What does this mean?

In Exercises 107–112, use a graphing utility to graph each function. Use a  $[-5, 5, 1]$  by  $[-5, 5, 1]$  viewing rectangle. Then find the intervals on which the function is increasing, decreasing, or constant.

- 107.  $f(x) = x^3 - 6x^2 + 9x + 1$
- 108.  $g(x) = |4 - x^2|$
- 109.  $h(x) = |x - 2| + |x + 2|$

110.  $f(x) = x^{\frac{1}{3}}(x - 4)$

111.  $g(x) = x^{\frac{2}{3}}$

112.  $h(x) = 2 - x^{\frac{2}{3}}$

113. a. Graph the functions  $f(x) = x^n$  for  $n = 2, 4,$  and  $6$  in a  $[-2, 2, 1]$  by  $[-1, 3, 1]$  viewing rectangle.
- b. Graph the functions  $f(x) = x^n$  for  $n = 1, 3,$  and  $5$  in a  $[-2, 2, 1]$  by  $[-2, 2, 1]$  viewing rectangle.
- c. If  $n$  is positive and even, where is the graph of  $f(x) = x^n$  increasing and where is it decreasing?
- d. If  $n$  is positive and odd, what can you conclude about the graph of  $f(x) = x^n$  in terms of increasing or decreasing behavior?
- e. Graph all six functions in a  $[-1, 3, 1]$  by  $[-1, 3, 1]$  viewing rectangle. What do you observe about the graphs in terms of how flat or how steep they are?

### Critical Thinking Exercises

**Make Sense?** In Exercises 114–117, determine whether each statement makes sense or does not make sense, and explain your reasoning.

114. My graph is decreasing on  $(-\infty, a)$  and increasing on  $(a, \infty)$ , so  $f(a)$  must be a relative maximum.
115. This work by artist Scott Kim (1955–) has the same kind of symmetry as an even function.

“DYSLEXIA,” 1981

116. I graphed

$$f(x) = \begin{cases} 2 & \text{if } x \neq 4 \\ 3 & \text{if } x = 4 \end{cases}$$

and one piece of my graph is a single point.

117. I noticed that the difference quotient is always zero if  $f(x) = c$ , where  $c$  is any constant.
118. Sketch the graph of  $f$  using the following properties. (More than one correct graph is possible.)  $f$  is a piecewise function that is decreasing on  $(-\infty, 2)$ ,  $f(2) = 0$ ,  $f$  is increasing on  $(2, \infty)$ , and the range of  $f$  is  $[0, \infty)$ .

119. Define a piecewise function on the intervals  $(-\infty, 2]$ ,  $(2, 5)$ , and  $[5, \infty)$  that does not “jump” at 2 or 5 such that one piece is a constant function, another piece is an increasing function, and the third piece is a decreasing function.

120. Suppose that  $h(x) = \frac{f(x)}{g(x)}$ . The function  $f$  can be even, odd, or neither. The same is true for the function  $g$ .
- a. Under what conditions is  $h$  definitely an even function?
- b. Under what conditions is  $h$  definitely an odd function?

### Group Exercise

121. (For assistance with this exercise, refer to the discussion of piecewise functions beginning on page 178, as well as to Exercises 79–80.) Group members who have cellphone plans should describe the total monthly cost of the plan as follows:

\$\_\_\_\_\_ per month buys \_\_\_\_\_ minutes. Additional time costs \$\_\_\_\_\_ per minute.

(For simplicity, ignore other charges.) The group should select any three plans, from “basic” to “premier.” For each plan selected, write a piecewise function that describes the plan and graph the function. Graph the three functions in the same rectangular coordinate system. Now examine the graphs. For any given number of calling minutes, the best plan is the one whose graph is lowest at that point. Compare the three calling plans. Is one plan always a better deal than the other two? If not, determine the interval of calling minutes for which each plan is the best deal. (You can check out cellphone plans by visiting [www.point.com](http://www.point.com).)

### Preview Exercises

Exercises 122–124 will help you prepare for the material covered in the next section.

122. If  $(x_1, y_1) = (-3, 1)$  and  $(x_2, y_2) = (-2, 4)$ , find  $\frac{y_2 - y_1}{x_2 - x_1}$ .
123. Find the ordered pairs  $(\_\_\_\_\_, 0)$  and  $(0, \_\_\_\_\_)$  satisfying  $4x - 3y - 6 = 0$ .
124. Solve for  $y$ :  $3x + 2y - 4 = 0$ .

# SECTION 1.4

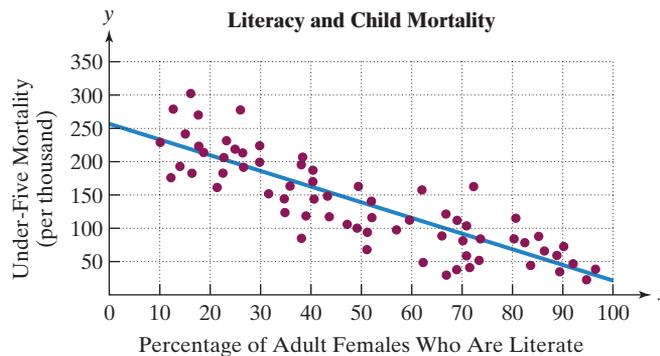

## Linear Functions and Slope

### Objectives

- 1 Calculate a line's slope.
- 2 Write the point-slope form of the equation of a line.
- 3 Write and graph the slope-intercept form of the equation of a line.
- 4 Graph horizontal or vertical lines.
- 5 Recognize and use the general form of a line's equation.
- 6 Use intercepts to graph the general form of a line's equation.
- 7 Model data with linear functions and make predictions.

Is there a relationship between literacy and child mortality? As the percentage of adult females who are literate increases, does the mortality of children under five decrease? **Figure 1.36** indicates that this is, indeed, the case. Each point in the figure represents one country.

**FIGURE 1.36**  
Source: United Nations

Data presented in a visual form as a set of points is called a **scatter plot**. Also shown in **Figure 1.36** is a line that passes through or near the points. A line that best fits the data points in a scatter plot is called a **regression line**. By writing the equation of this line, we can obtain a model for the data and make predictions about child mortality based on the percentage of literate adult females in a country.

Data often fall on or near a line. In this section, we will use functions to model such data and make predictions. We begin with a discussion of a line's steepness.

- 1 Calculate a line's slope.

### The Slope of a Line

Mathematicians have developed a useful measure of the steepness of a line, called the *slope* of the line. Slope compares the vertical change (the **rise**) to the horizontal change (the **run**) when moving from one fixed point to another along the line. To calculate the slope of a line, we use a ratio that compares the change in  $y$  (the rise) to the corresponding change in  $x$  (the run).

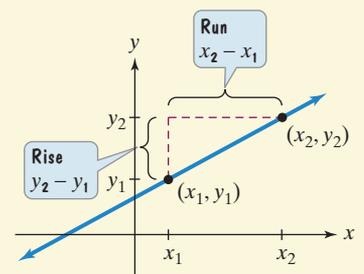

#### Definition of Slope

The **slope** of the line through the distinct points  $(x_1, y_1)$  and  $(x_2, y_2)$  is

$$\begin{aligned} \frac{\text{Change in } y}{\text{Change in } x} &= \frac{\text{Rise}}{\text{Run}} \\ &= \frac{y_2 - y_1}{x_2 - x_1}, \end{aligned}$$

Vertical change  
Horizontal change

where  $x_2 - x_1 \neq 0$ .

It is common notation to let the letter  $m$  represent the slope of a line. The letter  $m$  is used because it is the first letter of the French verb *monter*, meaning “to rise” or “to ascend.”

### EXAMPLE 1 Using the Definition of Slope

Find the slope of the line passing through each pair of points:

- a.  $(-3, -1)$  and  $(-2, 4)$     b.  $(-3, 4)$  and  $(2, -2)$ .

### SOLUTION

- a. Let  $(x_1, y_1) = (-3, -1)$  and  $(x_2, y_2) = (-2, 4)$ . We obtain the slope as follows:

$$m = \frac{\text{Change in } y}{\text{Change in } x} = \frac{y_2 - y_1}{x_2 - x_1} = \frac{4 - (-1)}{-2 - (-3)} = \frac{4 + 1}{-2 + 3} = \frac{5}{1} = 5.$$

The situation is illustrated in **Figure 1.37**. The slope of the line is 5. For every vertical change, or rise, of 5 units, there is a corresponding horizontal change, or run, of 1 unit. The slope is positive and the line rises from left to right.

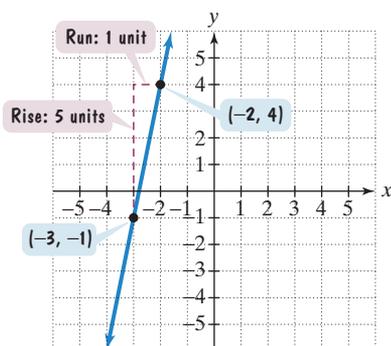

FIGURE 1.37 Visualizing a slope of 5

### GREAT QUESTION!

**When using the definition of slope, how do I know which point to call  $(x_1, y_1)$  and which point to call  $(x_2, y_2)$ ?**

When computing slope, it makes no difference which point you call  $(x_1, y_1)$  and which point you call  $(x_2, y_2)$ . If we let  $(x_1, y_1) = (-2, 4)$  and  $(x_2, y_2) = (-3, -1)$ , the slope is still 5:

$$m = \frac{\text{Change in } y}{\text{Change in } x} = \frac{y_2 - y_1}{x_2 - x_1} = \frac{-1 - 4}{-3 - (-2)} = \frac{-5}{-1} = 5.$$

However, you should not subtract in one order in the numerator ( $y_2 - y_1$ ) and then in a different order in the denominator ( $x_1 - x_2$ ).

$$\frac{-1 - 4}{-2 - (-3)} = \frac{-5}{1} = -5. \quad \text{Incorrect! The slope is not } -5.$$

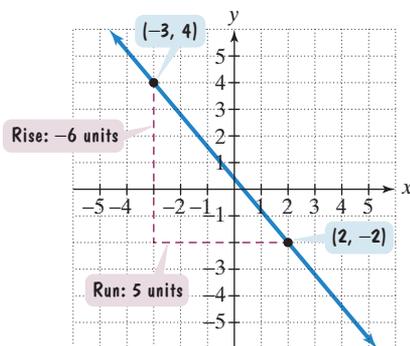

FIGURE 1.38 Visualizing a slope of  $-\frac{6}{5}$

### GREAT QUESTION!

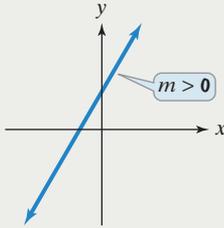

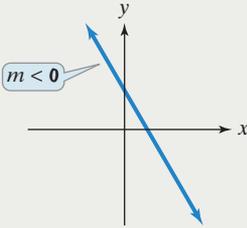

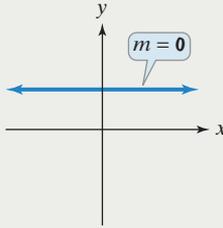

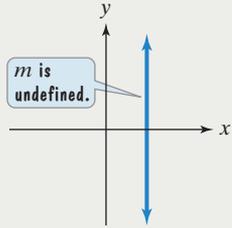

**Is it OK to say that a vertical line has no slope?**

Always be clear in the way you use language, especially in mathematics. For example, it's not a good idea to say that a line has “no slope.” This could mean that the slope is zero or that the slope is undefined.

- Check Point 1** Find the slope of the line passing through each pair of points:  
 a.  $(-3, 4)$  and  $(-4, -2)$     b.  $(4, -2)$  and  $(-1, 5)$ .

Example 1 illustrates that a line with a positive slope is increasing and a line with a negative slope is decreasing. By contrast, a horizontal line is a constant function and has a slope of zero. A vertical line has no horizontal change, so  $x_2 - x_1 = 0$  in the formula for slope. Because we cannot divide by zero, the slope of a vertical line is undefined. This discussion is summarized in **Table 1.2** at the top of the next page.

Table 1.2 Possibilities for a Line's Slope

Positive Slope	Negative Slope	Zero Slope	Undefined Slope
 <p>Line rises from left to right.</p>	 <p>Line falls from left to right.</p>	 <p>Line is horizontal.</p>	 <p>Line is vertical.</p>

- 2 Write the point-slope form of the equation of a line.

### The Point-Slope Form of the Equation of a Line

We can use the slope of a line to obtain various forms of the line's equation. For example, consider a nonvertical line that has slope  $m$  and that contains the point  $(x_1, y_1)$ .

The line in **Figure 1.39** has slope  $m$  and contains the point  $(x_1, y_1)$ . Let  $(x, y)$  represent any other point on the line.

Regardless of where the point  $(x, y)$  is located, the steepness of the line in **Figure 1.39** remains the same. Thus, the ratio for the slope stays a constant  $m$ . This means that for all points  $(x, y)$  along the line

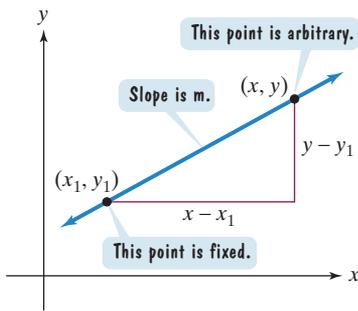

FIGURE 1.39 A line passing through  $(x_1, y_1)$  with slope  $m$

$$m = \frac{\text{Change in } y}{\text{Change in } x} = \frac{y - y_1}{x - x_1}$$

We used  $(x, y)$  instead of  $(x_2, y_2)$  because  $(x_2, y_2)$  represents a fixed point and  $(x, y)$  is not a fixed point on the line.

We can clear the fraction by multiplying both sides by  $x - x_1$ , the least common denominator.

$$m = \frac{y - y_1}{x - x_1} \quad \text{This is the slope of the line in Figure 1.39.}$$

$$m(x - x_1) = \frac{y - y_1}{x - x_1} \cdot (x - x_1) \quad \text{Multiply both sides by } x - x_1.$$

$$m(x - x_1) = y - y_1 \quad \text{Simplify: } \frac{y - y_1}{\cancel{x - x_1}} \cdot \cancel{(x - x_1)} = y - y_1.$$

Now, if we reverse the two sides, we obtain the *point-slope form* of the equation of a line.

### GREAT QUESTION!

**When using  $y - y_1 = m(x - x_1)$ , for which variables do I substitute numbers?**

When writing the point-slope form of a line's equation, you will never substitute numbers for  $x$  and  $y$ . You will substitute values for  $x_1, y_1$ , and  $m$ .

### Point-Slope Form of the Equation of a Line

The **point-slope form of the equation** of a nonvertical line with slope  $m$  that passes through the point  $(x_1, y_1)$  is

$$y - y_1 = m(x - x_1).$$

For example, the point-slope form of the equation of the line passing through  $(1, 5)$  with slope 2 ( $m = 2$ ) is

$$y - 5 = 2(x - 1).$$

We will soon be expressing the equation of a nonvertical line in function notation. To do so, we need to solve the point-slope form of a line's equation for  $y$ . Example 2 illustrates how to isolate  $y$  on one side of the equal sign.

**EXAMPLE 2** Writing an Equation for a Line in Point-Slope Form

Write an equation in point-slope form for the line with slope 4 that passes through the point  $(-1, 3)$ . Then solve the equation for  $y$ .

**SOLUTION**

We use the point-slope form of the equation of a line with  $m = 4$ ,  $x_1 = -1$ , and  $y_1 = 3$ .

$$y - y_1 = m(x - x_1) \quad \text{This is the point-slope form of the equation.}$$

$$y - 3 = 4[x - (-1)] \quad \text{Substitute the given values: } m = 4 \text{ and } (x_1, y_1) = (-1, 3).$$

$$y - 3 = 4(x + 1) \quad \text{We now have an equation in point-slope form for the given line.}$$

Now we solve this equation for  $y$ .

We need to isolate  $y$ .

$$y - 3 = 4(x + 1)$$

This is the point-slope form of the equation.

$$y - 3 = 4x + 4 \quad \text{Use the distributive property.}$$

$$y = 4x + 7 \quad \text{Add 3 to both sides.} \quad \dots$$

 **Check Point 2** Write an equation in point-slope form for the line with slope 6 that passes through the point  $(2, -5)$ . Then solve the equation for  $y$ .

**EXAMPLE 3** Writing an Equation for a Line in Point-Slope Form

Write an equation in point-slope form for the line passing through the points  $(4, -3)$  and  $(-2, 6)$ . (See **Figure 1.40**.) Then solve the equation for  $y$ .

**SOLUTION**

To use the point-slope form, we need to find the slope. The slope is the change in the  $y$ -coordinates divided by the corresponding change in the  $x$ -coordinates.

$$m = \frac{6 - (-3)}{-2 - 4} = \frac{9}{-6} = -\frac{3}{2} \quad \text{This is the definition of slope using } (4, -3) \text{ and } (-2, 6).$$

We can take either point on the line to be  $(x_1, y_1)$ . Let's use  $(x_1, y_1) = (4, -3)$ . Now, we are ready to write the point-slope form of the equation.

$$y - y_1 = m(x - x_1) \quad \text{This is the point-slope form of the equation.}$$

$$y - (-3) = -\frac{3}{2}(x - 4) \quad \text{Substitute: } (x_1, y_1) = (4, -3) \text{ and } m = -\frac{3}{2}.$$

$$y + 3 = -\frac{3}{2}(x - 4) \quad \text{Simplify.}$$

We now have an equation in point-slope form for the line shown in **Figure 1.40**. Now, we solve this equation for  $y$ .

We need to isolate  $y$ .

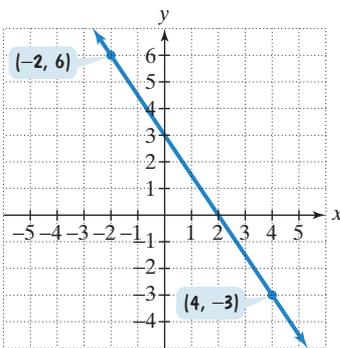

$$y + 3 = -\frac{3}{2}(x - 4)$$

This is the point-slope form of the equation.

$$y + 3 = -\frac{3}{2}x + 6 \quad \text{Use the distributive property.}$$

$$y = -\frac{3}{2}x + 3 \quad \text{Subtract 3 from both sides.} \quad \dots$$

 **Check Point 3** Write an equation in point-slope form for the line passing through the points  $(-2, -1)$  and  $(-1, -6)$ . Then solve the equation for  $y$ .

**FIGURE 1.40** Write an equation in point-slope form for this line.

**DISCOVERY**

You can use either point for  $(x_1, y_1)$  when you write a point-slope equation for a line. Rework Example 3 using  $(-2, 6)$  for  $(x_1, y_1)$ . Once you solve for  $y$ , you should still obtain

$$y = -\frac{3}{2}x + 3.$$

- 3 Write and graph the slope-intercept form of the equation of a line.

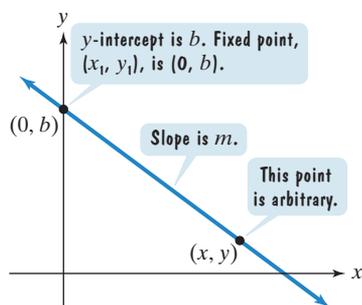

FIGURE 1.41 A line with slope  $m$  and  $y$ -intercept  $b$

### The Slope-Intercept Form of the Equation of a Line

Let's write the point-slope form of the equation of a nonvertical line with slope  $m$  and  $y$ -intercept  $b$ . The line is shown in **Figure 1.41**. Because the  $y$ -intercept is  $b$ , the line passes through  $(0, b)$ . We use the point-slope form with  $x_1 = 0$  and  $y_1 = b$ .

$$y - y_1 = m(x - x_1)$$

$$\text{Let } y_1 = b.$$

$$\text{Let } x_1 = 0.$$

We obtain

$$y - b = m(x - 0).$$

Simplifying on the right side gives us

$$y - b = mx.$$

Finally, we solve for  $y$  by adding  $b$  to both sides.

$$y = mx + b$$

Thus, if a line's equation is written with  $y$  isolated on one side, the coefficient of  $x$  is the line's slope and the constant term is the  $y$ -intercept. This form of a line's equation is called the *slope-intercept form* of the line.

#### Slope-Intercept Form of the Equation of a Line

The **slope-intercept form of the equation** of a nonvertical line with slope  $m$  and  $y$ -intercept  $b$  is

$$y = mx + b.$$

The slope-intercept form of a line's equation,  $y = mx + b$ , can be expressed in function notation by replacing  $y$  with  $f(x)$ :

$$f(x) = mx + b.$$

We have seen that functions in this form are called **linear functions**. Thus, in the equation of a linear function, the coefficient of  $x$  is the line's slope and the constant term is the  $y$ -intercept. Here are two examples:

$$y = 2x - 4$$

The slope is 2.

The  $y$ -intercept is  $-4$ .

$$f(x) = \frac{1}{2}x + 2.$$

The slope is  $\frac{1}{2}$ .

The  $y$ -intercept is 2.

If a linear function's equation is in slope-intercept form, we can use the  $y$ -intercept and the slope to obtain its graph.

### GREAT QUESTION!

If the slope is an integer, such as 2, why should I express it as  $\frac{2}{1}$  for graphing purposes?

Writing the slope,  $m$ , as a fraction allows you to identify the rise (the fraction's numerator) and the run (the fraction's denominator).

#### Graphing $y = mx + b$ Using the Slope and $y$ -Intercept

1. Plot the point containing the  $y$ -intercept on the  $y$ -axis. This is the point  $(0, b)$ .
2. Obtain a second point using the slope,  $m$ . Write  $m$  as a fraction, and use rise over run, starting at the point containing the  $y$ -intercept, to plot this point.
3. Use a straightedge to draw a line through the two points. Draw arrowheads at the ends of the line to show that the line continues indefinitely in both directions.

#### EXAMPLE 4 Graphing Using the Slope and $y$ -Intercept

Graph the linear function:  $f(x) = -\frac{3}{2}x + 2$ .

## SOLUTION

The equation of the line is in the form  $f(x) = mx + b$ . We can find the slope,  $m$ , by identifying the coefficient of  $x$ . We can find the  $y$ -intercept,  $b$ , by identifying the constant term.

$$f(x) = -\frac{3}{2}x + 2$$

The slope is  $-\frac{3}{2}$ .      The  $y$ -intercept is 2.

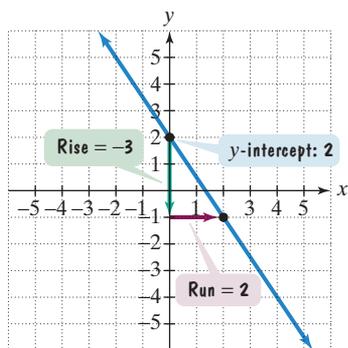

FIGURE 1.42 The graph of  $f(x) = -\frac{3}{2}x + 2$

Now that we have identified the slope,  $-\frac{3}{2}$ , and the  $y$ -intercept, 2, we use the three-step procedure to graph the equation.

**Step 1 Plot the point containing the  $y$ -intercept on the  $y$ -axis.** The  $y$ -intercept is 2. We plot  $(0, 2)$ , shown in **Figure 1.42**.

**Step 2 Obtain a second point using the slope,  $m$ .** Write  $m$  as a fraction, and use **rise over run**, starting at the point containing the  $y$ -intercept, to plot this point. The slope,  $-\frac{3}{2}$ , is already written as a fraction.

$$m = -\frac{3}{2} = \frac{-3}{2} = \frac{\text{Rise}}{\text{Run}}$$

We plot the second point on the line by starting at  $(0, 2)$ , the first point. Based on the slope, we move 3 units *down* (the rise) and 2 units to the *right* (the run). This puts us at a second point on the line,  $(2, -1)$ , shown in **Figure 1.42**.

**Step 3 Use a straightedge to draw a line through the two points.** The graph of the linear function  $f(x) = -\frac{3}{2}x + 2$  is shown as a blue line in **Figure 1.42**. ●●●

 **Check Point 4** Graph the linear function:  $f(x) = \frac{3}{5}x + 1$ .

**4** Graph horizontal or vertical lines.

**Equations of Horizontal and Vertical Lines**

If a line is horizontal, its slope is zero:  $m = 0$ . Thus, the equation  $y = mx + b$  becomes  $y = b$ , where  $b$  is the  $y$ -intercept. All horizontal lines have equations of the form  $y = b$ .

**EXAMPLE 5** Graphing a Horizontal Line

Graph  $y = -4$  in the rectangular coordinate system.

**SOLUTION**

All ordered pairs that are solutions of  $y = -4$  have a value of  $y$  that is always  $-4$ . Any value can be used for  $x$ . In the table on the right, we have selected three of the possible values for  $x$ :  $-2$ ,  $0$ , and  $3$ . The table shows that three ordered pairs that are solutions of  $y = -4$  are  $(-2, -4)$ ,  $(0, -4)$ , and  $(3, -4)$ . Drawing a line that passes through the three points gives the horizontal line shown in **Figure 1.43**. ●●●

$x$	$y = -4$	$(x, y)$
$-2$	$-4$	$(-2, -4)$
$0$	$-4$	$(0, -4)$
$3$	$-4$	$(3, -4)$

For all choices of  $x$ ,  $y$  is a constant  $-4$ .

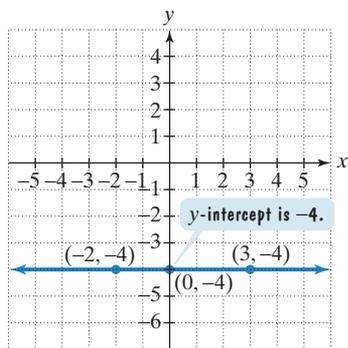

FIGURE 1.43 The graph of  $y = -4$  or  $f(x) = -4$

 **Check Point 5** Graph  $y = 3$  in the rectangular coordinate system.

### Equation of a Horizontal Line

A horizontal line is given by an equation of the form

$$y = b,$$

where  $b$  is the  $y$ -intercept of the line. The slope of a horizontal line is zero.

Because any vertical line can intersect the graph of a horizontal line  $y = b$  only once, a horizontal line is the graph of a function. Thus, we can express the equation  $y = b$  as  $f(x) = b$ . This linear function is often called a **constant function**.

Next, let's see what we can discover about the graph of an equation of the form  $x = a$  by looking at an example.

### EXAMPLE 6 Graphing a Vertical Line

Graph the linear equation:  $x = 2$ .

#### SOLUTION

All ordered pairs that are solutions of  $x = 2$  have a value of  $x$  that is always 2. Any value can be used for  $y$ . In the table on the right, we have selected three of the possible values for  $y$ :  $-2$ ,  $0$ , and  $3$ . The table shows that three ordered pairs that are solutions of  $x = 2$  are  $(2, -2)$ ,  $(2, 0)$ , and  $(2, 3)$ . Drawing a line that passes through the three points gives the vertical line shown in **Figure 1.44**.

For all choices of  $y$ ,

$x = 2$	$y$	$(x, y)$
2	-2	$(2, -2)$
2	0	$(2, 0)$
2	3	$(2, 3)$

$x$  is always 2.

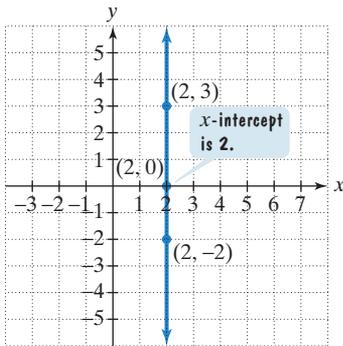

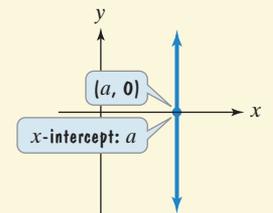

FIGURE 1.44 The graph of  $x = 2$

### Equation of a Vertical Line

A vertical line is given by an equation of the form

$$x = a,$$

where  $a$  is the  $x$ -intercept of the line. The slope of a vertical line is undefined.

Does a vertical line represent the graph of a linear function? No. Look at the graph of  $x = 2$  in **Figure 1.44**. A vertical line drawn through  $(2, 0)$  intersects the graph infinitely many times. This shows that infinitely many outputs are associated with the input 2. **No vertical line represents a linear function.**

**Check Point 6** Graph the linear equation:  $x = -3$ .

- 5 Recognize and use the general form of a line's equation.

### The General Form of the Equation of a Line

The vertical line whose equation is  $x = 5$  cannot be written in slope-intercept form,  $y = mx + b$ , because its slope is undefined. However, every line has an equation that can be expressed in the form  $Ax + By + C = 0$ . For example,  $x = 5$  can be expressed as  $1x + 0y - 5 = 0$ , or  $x - 5 = 0$ . The equation  $Ax + By + C = 0$  is called the *general form* of the equation of a line.

**GREAT QUESTION!**

**In the general form  $Ax + By + C = 0$ , can I immediately determine that the slope is  $A$  and the  $y$ -intercept is  $B$ ?**

No. Avoid this common error. You need to solve  $Ax + By + C = 0$  for  $y$  before finding the slope and the  $y$ -intercept.

**General Form of the Equation of a Line**

Every line has an equation that can be written in the **general form**

$$Ax + By + C = 0,$$

where  $A$ ,  $B$ , and  $C$  are real numbers, and  $A$  and  $B$  are not both zero.

If the equation of a nonvertical line is given in general form, it is possible to find the slope,  $m$ , and the  $y$ -intercept,  $b$ , for the line. We solve the equation for  $y$ , transforming it into the slope-intercept form  $y = mx + b$ . In this form, the coefficient of  $x$  is the slope of the line and the constant term is its  $y$ -intercept.

**EXAMPLE 7 Finding the Slope and the  $y$ -Intercept**

Find the slope and the  $y$ -intercept of the line whose equation is  $3x + 2y - 4 = 0$ .

**SOLUTION**

The equation is given in general form. We begin by rewriting it in the form  $y = mx + b$ . We need to solve for  $y$ .

Our goal is to isolate  $y$ .

$$3x + 2y - 4 = 0$$

$$2y = -3x + 4$$

$$\frac{2y}{2} = \frac{-3x + 4}{2}$$

$$y = -\frac{3}{2}x + 2$$

slope

$y$ -intercept

This is the given equation.

Isolate the term containing  $y$  by adding  $-3x + 4$  to both sides. Divide both sides by 2.

On the right, divide each term in the numerator by 2 to obtain slope-intercept form.

The coefficient of  $x$ ,  $-\frac{3}{2}$ , is the slope and the constant term, 2, is the  $y$ -intercept. This is the form of the equation that we graphed in **Figure 1.42** on page 193. ●●●

 **Check Point 7** Find the slope and the  $y$ -intercept of the line whose equation is  $3x + 6y - 12 = 0$ . Then use the  $y$ -intercept and the slope to graph the equation.

**6** Use intercepts to graph the general form of a line's equation.

**Using Intercepts to Graph  $Ax + By + C = 0$** 

Example 7 and Check Point 7 illustrate that one way to graph the general form of a line's equation is to convert to slope-intercept form,  $y = mx + b$ . Then use the slope and the  $y$ -intercept to obtain the graph.

A second method for graphing  $Ax + By + C = 0$  uses intercepts. This method does not require rewriting the general form in a different form.

**Using Intercepts to Graph  $Ax + By + C = 0$** 

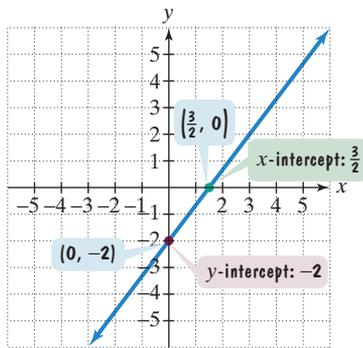

1. Find the  $x$ -intercept. Let  $y = 0$  and solve for  $x$ . Plot the point containing the  $x$ -intercept on the  $x$ -axis.
2. Find the  $y$ -intercept. Let  $x = 0$  and solve for  $y$ . Plot the point containing the  $y$ -intercept on the  $y$ -axis.
3. Use a straightedge to draw a line through the two points containing the intercepts. Draw arrowheads at the ends of the line to show that the line continues indefinitely in both directions.

**EXAMPLE 8** Using Intercepts to Graph a Linear EquationGraph using intercepts:  $4x - 3y - 6 = 0$ .**SOLUTION****Step 1** Find the  $x$ -intercept. Let  $y = 0$  and solve for  $x$ .

$$\begin{aligned} 4x - 3 \cdot 0 - 6 &= 0 && \text{Replace } y \text{ with } 0 \text{ in } 4x - 3y - 6 = 0. \\ 4x - 6 &= 0 && \text{Simplify.} \\ 4x &= 6 && \text{Add } 6 \text{ to both sides.} \\ x &= \frac{6}{4} = \frac{3}{2} && \text{Divide both sides by } 4. \end{aligned}$$

The  $x$ -intercept is  $\frac{3}{2}$ , so the line passes through  $(\frac{3}{2}, 0)$  or  $(1.5, 0)$ , as shown in **Figure 1.45**.**Step 2** Find the  $y$ -intercept. Let  $x = 0$  and solve for  $y$ .

$$\begin{aligned} 4 \cdot 0 - 3y - 6 &= 0 && \text{Replace } x \text{ with } 0 \text{ in } 4x - 3y - 6 = 0. \\ -3y - 6 &= 0 && \text{Simplify.} \\ -3y &= 6 && \text{Add } 6 \text{ to both sides.} \\ y &= -2 && \text{Divide both sides by } -3. \end{aligned}$$

The  $y$ -intercept is  $-2$ , so the line passes through  $(0, -2)$ , as shown in **Figure 1.45**.**Step 3** Graph the equation by drawing a line through the two points containing the intercepts. The graph of  $4x - 3y - 6 = 0$  is shown in **Figure 1.45**. ●●●**FIGURE 1.45** The graph of  $4x - 3y - 6 = 0$ **Check Point 8** Graph using intercepts:  $3x - 2y - 6 = 0$ .

We've covered a lot of territory. Let's take a moment to summarize the various forms for equations of lines.

**Equations of Lines**

1. Point-slope form	$y - y_1 = m(x - x_1)$
2. Slope-intercept form	$y = mx + b$ or $f(x) = mx + b$
3. Horizontal line	$y = b$
4. Vertical line	$x = a$
5. General form	$Ax + By + C = 0$

- 7** Model data with linear functions and make predictions.

**Applications**

Linear functions are useful for modeling data that fall on or near a line.

**EXAMPLE 9** Modeling Global Warming

The amount of carbon dioxide in the atmosphere, measured in parts per million, has been increasing as a result of the burning of oil and coal. The buildup of gases and particles traps heat and raises the planet's temperature. The bar graph in **Figure 1.46(a)** at the top of the next page gives the average atmospheric concentration of carbon dioxide and the average global temperature for six selected years. The data are displayed as a set of six points in a rectangular coordinate system in **Figure 1.46(b)**.

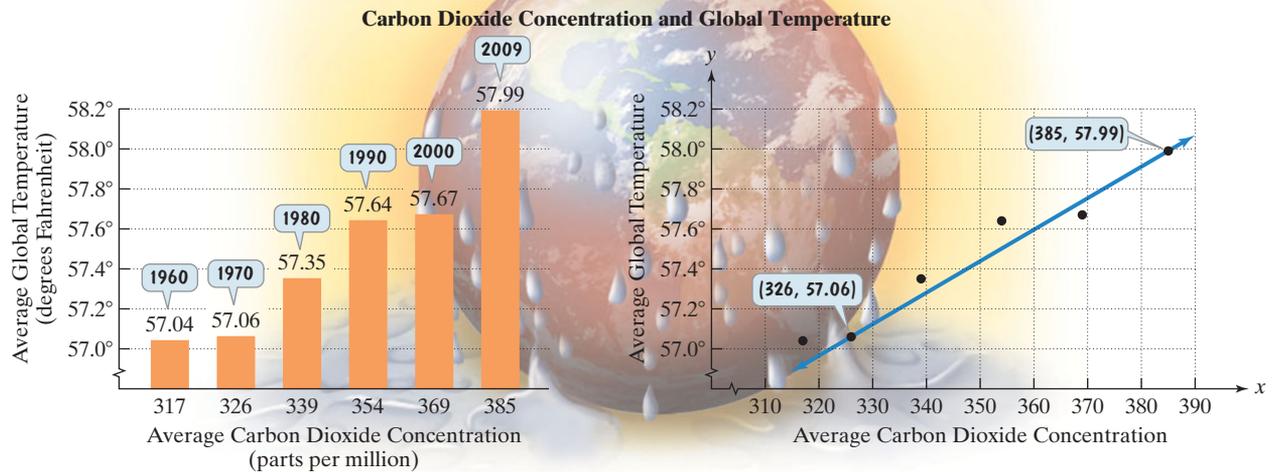

FIGURE 1.46(a)

Source: National Oceanic and Atmospheric Administration

FIGURE 1.46(b)

- Shown on the scatter plot in **Figure 1.46(b)** is a line that passes through or near the six points. Write the slope-intercept form of this equation using function notation.
- The preindustrial concentration of atmospheric carbon dioxide was 280 parts per million. The United Nations' Intergovernmental Panel on Climate Change predicts global temperatures will rise between 2°F and 5°F if carbon dioxide concentration doubles from the preindustrial level. Compared to the average global temperature of 57.99°F for 2009, how well does the function from part (a) model this prediction?

### SOLUTION

- The line in **Figure 1.46(b)** passes through (326, 57.06) and (385, 57.99). We start by finding its slope.

$$m = \frac{\text{Change in } y}{\text{Change in } x} = \frac{57.99 - 57.06}{385 - 326} = \frac{0.93}{59} \approx 0.02$$

The slope indicates that for each increase of one part per million in carbon dioxide concentration, the average global temperature is increasing by approximately 0.02°F.

Now we write the line's equation in slope-intercept form.

$$y - y_1 = m(x - x_1) \quad \text{Begin with the point-slope form.}$$

$$y - 57.06 = 0.02(x - 326) \quad \text{Either ordered pair can be } (x_1, y_1). \text{ Let } (x_1, y_1) = (326, 57.06). \\ \text{From above, } m \approx 0.02.$$

$$y - 57.06 = 0.02x - 6.52 \quad \text{Apply the distributive property: } 0.02(326) = 6.52.$$

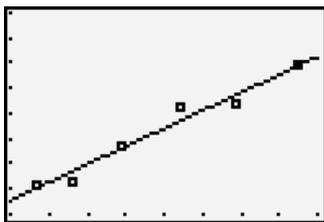

$$y = 0.02x + 50.54 \quad \text{Add 57.06 to both sides and solve for } y.$$

A linear function that models average global temperature,  $f(x)$ , for an atmospheric carbon dioxide concentration of  $x$  parts per million is

$$f(x) = 0.02x + 50.54.$$

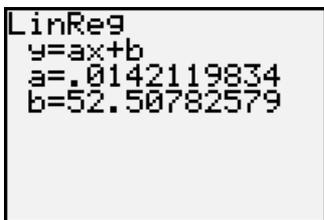

## TECHNOLOGY

You can use a graphing utility to obtain a model for a scatter plot in which the data points fall on or near a straight line. After entering the data in **Figure 1.46(a)** on the previous page, a graphing utility displays a scatter plot of the data and the regression line, that is, the line that best fits the data.

[310, 390, 10] by [56.8, 58.4, 0.2]

Also displayed is the regression line's equation.

- b. If carbon dioxide concentration doubles from its preindustrial level of 280 parts per million, which many experts deem very likely, the concentration will reach  $280 \times 2$ , or 560 parts per million. We use the linear function to predict average global temperature at this concentration.

$$f(x) = 0.02x + 50.54 \quad \text{Use the function from part (a).}$$

$$\begin{aligned} f(560) &= 0.02(560) + 50.54 && \text{Substitute 560 for } x. \\ &= 11.2 + 50.54 = 61.74 \end{aligned}$$

Our model projects an average global temperature of  $61.74^\circ\text{F}$  for a carbon dioxide concentration of 560 parts per million. Compared to the average global temperature of  $57.99^\circ$  for 2009 shown in **Figure 1.46(a)** on the previous page, this is an increase of

$$61.74^\circ\text{F} - 57.99^\circ\text{F} = 3.75^\circ\text{F}.$$

This is consistent with a rise between  $2^\circ\text{F}$  and  $5^\circ\text{F}$  as predicted by the Intergovernmental Panel on Climate Change. ...

- Check Point 9** Use the data points (317, 57.04) and (354, 57.64), shown, but not labeled, in **Figure 1.46(b)** on the previous page to obtain a linear function that models average global temperature,  $f(x)$ , for an atmospheric carbon dioxide concentration of  $x$  parts per million. Round  $m$  to three decimal places and  $b$  to one decimal place. Then use the function to project average global temperature at a concentration of 600 parts per million.

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- Data presented in a visual form as a set of points is called a/an \_\_\_\_\_. A line that best fits this set of points is called a/an \_\_\_\_\_ line.
- The slope,  $m$ , of a line through the distinct points  $(x_1, y_1)$  and  $(x_2, y_2)$  is given by the formula  $m = \frac{y_2 - y_1}{x_2 - x_1}$ .
- If a line rises from left to right, the line has \_\_\_\_\_ slope.
- If a line falls from left to right, the line has \_\_\_\_\_ slope.
- The slope of a horizontal line is \_\_\_\_\_.
- The slope of a vertical line is \_\_\_\_\_.
- The point-slope form of the equation of a nonvertical line with slope  $m$  that passes through the point  $(x_1, y_1)$  is \_\_\_\_\_.
- The slope-intercept form of the equation of a line is \_\_\_\_\_, where  $m$  represents the \_\_\_\_\_ and  $b$  represents the \_\_\_\_\_.
- In order to graph the line whose equation is  $y = \frac{2}{5}x + 3$ , begin by plotting the point \_\_\_\_\_. From this point, we move \_\_\_\_\_ units up (the rise) and \_\_\_\_\_ units to the right (the run).
- The graph of the equation  $y = 3$  is a/an \_\_\_\_\_ line.
- The graph of the equation  $x = -2$  is a/an \_\_\_\_\_ line.
- The equation  $Ax + By + C = 0$ , where  $A$  and  $B$  are not both zero, is called the \_\_\_\_\_ form of the equation of a line.

## EXERCISE SET 1.4

## Practice Exercises

In Exercises 1–10, find the slope of the line passing through each pair of points or state that the slope is undefined. Then indicate whether the line through the points rises, falls, is horizontal, or is vertical.

1. (4, 7) and (8, 10)
2. (2, 1) and (3, 4)
3. (-2, 1) and (2, 2)
4. (-1, 3) and (2, 4)
5. (4, -2) and (3, -2)
6. (4, -1) and (3, -1)
7. (-2, 4) and (-1, -1)
8. (6, -4) and (4, -2)
9. (5, 3) and (5, -2)
10. (3, -4) and (3, 5)

In Exercises 11–38, use the given conditions to write an equation for each line in point-slope form and slope-intercept form.

11. Slope = 2, passing through (3, 5)
12. Slope = 4, passing through (1, 3)
13. Slope = 6, passing through (-2, 5)
14. Slope = 8, passing through (4, -1)
15. Slope = -3, passing through (-2, -3)
16. Slope = -5, passing through (-4, -2)
17. Slope = -4, passing through (-4, 0)
18. Slope = -2, passing through (0, -3)
19. Slope = -1, passing through  $(-\frac{1}{2}, -2)$
20. Slope = -1, passing through  $(-4, -\frac{1}{4})$
21. Slope =  $\frac{1}{2}$ , passing through the origin
22. Slope =  $\frac{1}{3}$ , passing through the origin
23. Slope =  $-\frac{2}{3}$ , passing through (6, -2)
24. Slope =  $-\frac{3}{5}$ , passing through (10, -4)
25. Passing through (1, 2) and (5, 10)
26. Passing through (3, 5) and (8, 15)
27. Passing through (-3, 0) and (0, 3)
28. Passing through (-2, 0) and (0, 2)
29. Passing through (-3, -1) and (2, 4)
30. Passing through (-2, -4) and (1, -1)
31. Passing through (-3, -2) and (3, 6)
32. Passing through (-3, 6) and (3, -2)
33. Passing through (-3, -1) and (4, -1)
34. Passing through (-2, -5) and (6, -5)
35. Passing through (2, 4) with  $x$ -intercept = -2
36. Passing through (1, -3) with  $x$ -intercept = -1
37.  $x$ -intercept =  $-\frac{1}{2}$  and  $y$ -intercept = 4
38.  $x$ -intercept = 4 and  $y$ -intercept = -2

In Exercises 39–48, give the slope and  $y$ -intercept of each line whose equation is given. Then graph the linear function.

39.  $y = 2x + 1$
40.  $y = 3x + 2$
41.  $f(x) = -2x + 1$
42.  $f(x) = -3x + 2$
43.  $f(x) = \frac{3}{4}x - 2$
44.  $f(x) = \frac{3}{4}x - 3$
45.  $y = -\frac{3}{5}x + 7$
46.  $y = -\frac{2}{5}x + 6$
47.  $g(x) = -\frac{1}{2}x$
48.  $g(x) = -\frac{1}{3}x$

In Exercises 49–58, graph each equation in a rectangular coordinate system.

49.  $y = -2$
50.  $y = 4$
51.  $x = -3$
52.  $x = 5$
53.  $y = 0$
54.  $x = 0$
55.  $f(x) = 1$
56.  $f(x) = 3$
57.  $3x - 18 = 0$
58.  $3x + 12 = 0$

In Exercises 59–66,

- a. Rewrite the given equation in slope-intercept form.
- b. Give the slope and  $y$ -intercept.
- c. Use the slope and  $y$ -intercept to graph the linear function.

59.  $3x + y - 5 = 0$
60.  $4x + y - 6 = 0$
61.  $2x + 3y - 18 = 0$
62.  $4x + 6y + 12 = 0$
63.  $8x - 4y - 12 = 0$
64.  $6x - 5y - 20 = 0$
65.  $3y - 9 = 0$
66.  $4y + 28 = 0$

In Exercises 67–72, use intercepts to graph each equation.

67.  $6x - 2y - 12 = 0$
68.  $6x - 9y - 18 = 0$
69.  $2x + 3y + 6 = 0$
70.  $3x + 5y + 15 = 0$
71.  $8x - 2y + 12 = 0$
72.  $6x - 3y + 15 = 0$

## Practice Plus

In Exercises 73–76, find the slope of the line passing through each pair of points or state that the slope is undefined. Assume that all variables represent positive real numbers. Then indicate whether the line through the points rises, falls, is horizontal, or is vertical.

73. (0,  $a$ ) and ( $b$ , 0)
74. ( $-a$ , 0) and (0,  $-b$ )
75. ( $a$ ,  $b$ ) and ( $a$ ,  $b + c$ )
76. ( $a - b$ ,  $c$ ) and ( $a$ ,  $a + c$ )

In Exercises 77–78, give the slope and  $y$ -intercept of each line whose equation is given. Assume that  $B \neq 0$ .

77.  $Ax + By = C$
78.  $Ax = By - C$

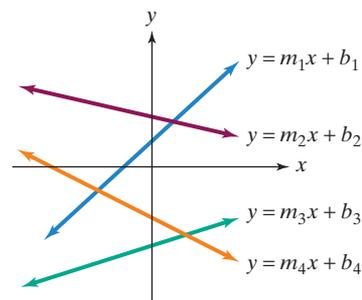

In Exercises 79–80, find the value of  $y$  if the line through the two given points is to have the indicated slope.

79. (3,  $y$ ) and (1, 4),  $m = -3$
80. (-2,  $y$ ) and (4, -4),  $m = \frac{1}{3}$

In Exercises 81–82, graph each linear function.

81.  $3x - 4f(x) - 6 = 0$
82.  $6x - 5f(x) - 20 = 0$
83. If one point on a line is (3, -1) and the line's slope is -2, find the  $y$ -intercept.
84. If one point on a line is (2, -6) and the line's slope is  $-\frac{3}{2}$ , find the  $y$ -intercept.

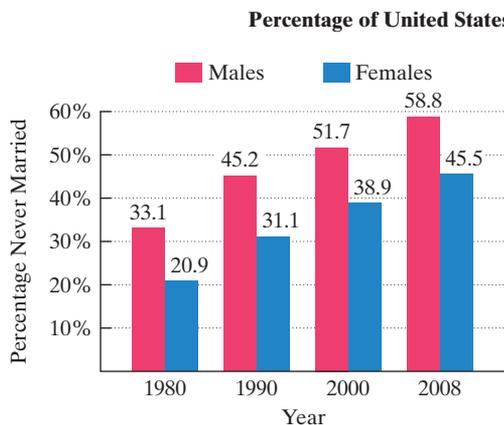

Use the figure to make the lists in Exercises 85–86.

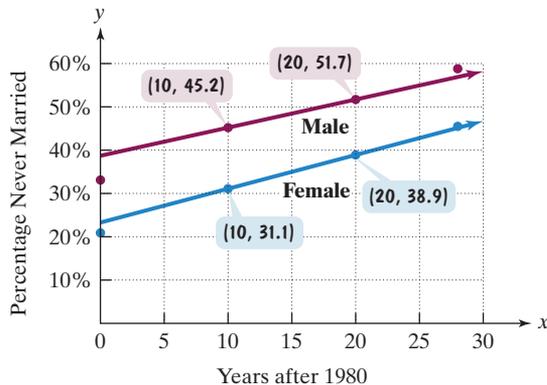

85. List the slopes  $m_1, m_2, m_3,$  and  $m_4$  in order of decreasing size.
86. List the  $y$ -intercepts  $b_1, b_2, b_3,$  and  $b_4$  in order of decreasing size.

Application Exercises

Americans are getting married later in life or not getting married at all. In 2008, nearly half of Americans ages 25 through 29 were unmarried. The following bar graph shows the percentage of never-married men and women in this age group. The data are displayed as two sets of four points each, one scatter plot for the percentage of never-married American men and one for the percentage of never-married American women. Also shown for each scatter plot is a line that passes through or near the four points. Use these lines to solve Exercises 87–88.

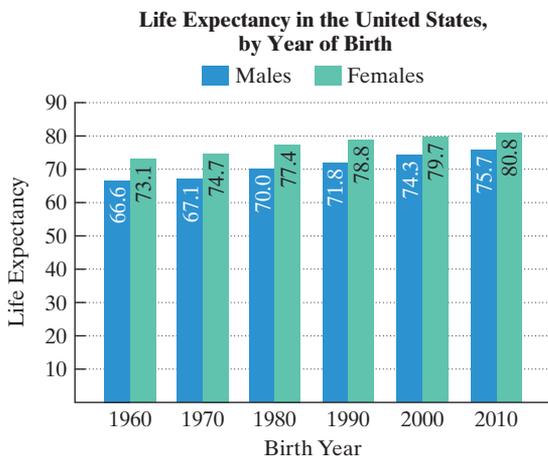

Source: U.S. Census Bureau

87. In this exercise, you will use the blue line for the women shown on the scatter plot to develop a model for the percentage of never-married American females ages 25–29.
- Use the two points whose coordinates are shown by the voice balloons to find the point-slope form of the equation of the line that models the percentage of never-married American females ages 25–29,  $y$ ,  $x$  years after 1980.
  - Write the equation from part (a) in slope-intercept form. Use function notation.
  - Use the linear function to predict the percentage of never-married American females, ages 25–29, in 2020.

The bar graph gives the life expectancy for American men and women born in six selected years. In Exercises 89–90, you will use the data to obtain models for life expectancy and make predictions about how long American men and women will live in the future.

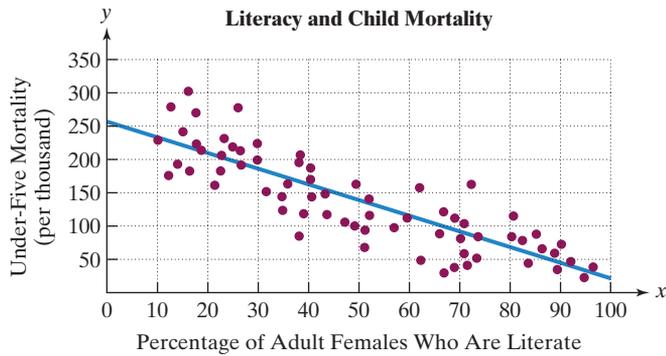

Source: National Center for Health Statistics

88. In this exercise, you will use the red line for the men shown on the scatter plot to develop a model for the percentage of never-married American males ages 25–29.
- Use the two points whose coordinates are shown by the voice balloons to find the point-slope form of the equation of the line that models the percentage of never-married American males ages 25–29,  $y$ ,  $x$  years after 1980.
  - Write the equation from part (a) in slope-intercept form. Use function notation.
  - Use the linear function to predict the percentage of never-married American males, ages 25–29, in 2015.
89. Use the data for males shown in the bar graph at the bottom of the previous column to solve this exercise.
- Let  $x$  represent the number of birth years after 1960 and let  $y$  represent male life expectancy. Create a scatter plot that displays the data as a set of six points in a rectangular coordinate system.
  - Draw a line through the two points that show male life expectancies for 1980 and 2000. Use the coordinates of these points to write a linear function that models life expectancy,  $E(x)$ , for American men born  $x$  years after 1960.
  - Use the function from part (b) to project the life expectancy of American men born in 2020.
90. Use the data for females shown in the bar graph at the bottom of the previous column to solve this exercise.
- Let  $x$  represent the number of birth years after 1960 and let  $y$  represent female life expectancy. Create a scatter plot that displays the data as a set of six points in a rectangular coordinate system.
  - Draw a line through the two points that show female life expectancies for 1970 and 2000. Use the coordinates of these points to write a linear function that models life expectancy,  $E(x)$ , for American women born  $x$  years after 1960. Round the slope to two decimal places.
  - Use the function from part (b) to project the life expectancy of American women born in 2020.

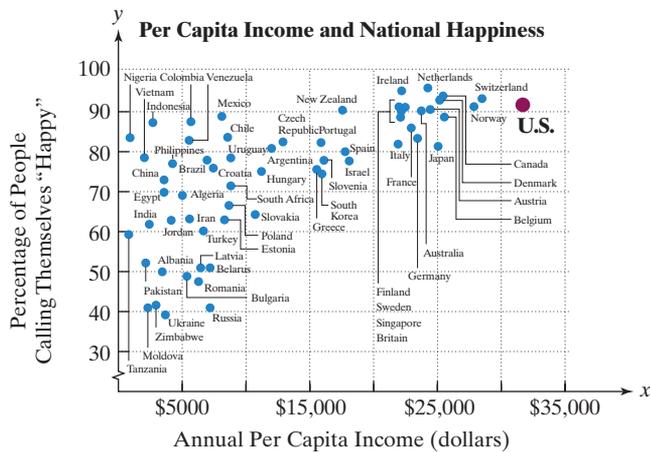

91. Shown, again, is the scatter plot that indicates a relationship between the percentage of adult females in a country who are literate and the mortality of children under five. Also shown is a line that passes through or near the points. Find a linear function that models the data by finding the slope-intercept form of the line's equation. Use the function to make a prediction about child mortality based on the percentage of adult females in a country who are literate.

Source: United Nations

92. Just as money doesn't buy happiness for individuals, the two don't necessarily go together for countries either. However, the scatter plot does show a relationship between a country's annual per capita income and the percentage of people in that country who call themselves "happy."

Source: Richard Layard, *Happiness: Lessons from a New Science*, Penguin, 2005

Draw a line that fits the data so that the spread of the data points around the line is as small as possible. Use the coordinates of two points along your line to write the slope-intercept form of its equation. Express the equation in function notation and use the linear function to make a prediction about national happiness based on per capita income.

### Writing in Mathematics

93. What is the slope of a line and how is it found?  
 94. Describe how to write the equation of a line if the coordinates of two points along the line are known.  
 95. Explain how to derive the slope-intercept form of a line's equation,  $y = mx + b$ , from the point-slope form  $y - y_1 = m(x - x_1)$ .  
 96. Explain how to graph the equation  $x = 2$ . Can this equation be expressed in slope-intercept form? Explain.  
 97. Explain how to use the general form of a line's equation to find the line's slope and y-intercept.  
 98. Explain how to use intercepts to graph the general form of a line's equation.  
 99. Take another look at the scatter plot in Exercise 91. Although there is a relationship between literacy and child mortality, we cannot conclude that increased literacy causes child mortality to decrease. Offer two or more possible explanations for the data in the scatter plot.

### Technology Exercises

Use a graphing utility to graph each equation in Exercises 100–103. Then use the **TRACE** feature to trace along the line and find the coordinates of two points. Use these points to compute the line's slope. Check your result by using the coefficient of  $x$  in the line's equation.

100.  $y = 2x + 4$                       101.  $y = -3x + 6$   
 102.  $y = -\frac{1}{2}x - 5$                     103.  $y = \frac{3}{4}x - 2$   
 104. Is there a relationship between wine consumption and deaths from heart disease? The table gives data from 19 developed countries.

Country	A	B	C	D	E	F	G
Liters of alcohol from drinking wine, per person per year ( $x$ )	2.5	3.9	2.9	2.4	2.9	0.8	9.1
Deaths from heart disease, per 100,000 people per year ( $y$ )	211	167	131	191	220	297	71

Country	H	I	J	K	L	M	N	O	P	Q	R	S
( $x$ )	0.8	0.7	7.9	1.8	1.9	0.8	6.5	1.6	5.8	1.3	1.2	2.7
( $y$ )	211	300	107	167	266	227	86	207	115	285	199	172

Source: *New York Times*

- a. Use the statistical menu of your graphing utility to enter the 19 ordered pairs of data items shown in the table.  
 b. Use the scatter plot capability to draw a scatter plot of the data.

- c. Select the linear regression option. Use your utility to obtain values for  $a$  and  $b$  for the equation of the regression line,  $y = ax + b$ . You may also be given a **correlation coefficient**,  $r$ . Values of  $r$  close to 1 indicate that the points can be described by a linear relationship and the regression line has a positive slope. Values of  $r$  close to  $-1$  indicate that the points can be described by a linear relationship and the regression line has a negative slope. Values of  $r$  close to 0 indicate no linear relationship between the variables. In this case, a linear model does not accurately describe the data.
- d. Use the appropriate sequence (consult your manual) to graph the regression equation on top of the points in the scatter plot.

### Critical Thinking Exercises

**Make Sense?** In Exercises 105–108, determine whether each statement makes sense or does not make sense, and explain your reasoning.

105. The graph of my linear function at first increased, reached a maximum point, and then decreased.
106. A linear function that models tuition and fees at public four-year colleges from 2000 through 2012 has negative slope.
107. Because the variable  $m$  does not appear in  $Ax + By + C = 0$ , equations in this form make it impossible to determine the line's slope.
108. The federal minimum wage was \$5.15 per hour from 1997 through 2006, so  $f(x) = 5.15$  models the minimum wage,  $f(x)$ , in dollars, for the domain  $\{1997, 1998, 1999, \dots, 2006\}$ .

In Exercises 109–112, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

109. The equation  $y = mx + b$  shows that no line can have a  $y$ -intercept that is numerically equal to its slope.
110. Every line in the rectangular coordinate system has an equation that can be expressed in slope-intercept form.
111. The graph of the linear function  $5x + 6y - 30 = 0$  is a line passing through the point  $(6, 0)$  with slope  $-\frac{5}{6}$ .
112. The graph of  $x = 7$  in the rectangular coordinate system is the single point  $(7, 0)$ .

In Exercises 113–114, find the coefficients that must be placed in each shaded area so that the function's graph will be a line satisfying the specified conditions.

113.  $\square x + \square y - 12 = 0$ ;  $x$ -intercept =  $-2$ ;  $y$ -intercept =  $4$
114.  $\square x + \square y - 12 = 0$ ;  $y$ -intercept =  $-6$ ; slope =  $\frac{1}{2}$

115. Prove that the equation of a line passing through  $(a, 0)$  and  $(0, b)$  ( $a \neq 0, b \neq 0$ ) can be written in the form  $\frac{x}{a} + \frac{y}{b} = 1$ . Why is this called the *intercept form* of a line?
116. Excited about the success of celebrity stamps, post office officials were rumored to have put forth a plan to institute two new types of thermometers. On these new scales,  $^{\circ}E$  represents degrees Elvis and  $^{\circ}M$  represents degrees Madonna. If it is known that  $40^{\circ}E = 25^{\circ}M$ ,  $280^{\circ}E = 125^{\circ}M$ , and degrees Elvis is linearly related to degrees Madonna, write an equation expressing  $E$  in terms of  $M$ .

### Group Exercise

117. In Exercises 87–88, we used the data in a bar graph to develop linear functions that modeled the percentage of never-married American females and males, ages 25–29. For this group exercise, you might find it helpful to pattern your work after Exercises 87 and 88. Group members should begin by consulting an almanac, newspaper, magazine, or the Internet to find data that appear to lie approximately on or near a line. Working by hand or using a graphing utility, group members should construct scatter plots for the data that were assembled. If working by hand, draw a line that approximately fits the data in each scatter plot and then write its equation as a function in slope-intercept form. If using a graphing utility, obtain the equation of each regression line. Then use each linear function's equation to make predictions about what might occur in the future. Are there circumstances that might affect the accuracy of the prediction? List some of these circumstances.

### Preview Exercises

Exercises 118–120 will help you prepare for the material covered in the next section.

118. Write the slope-intercept form of the equation of the line passing through  $(-3, 1)$  whose slope is the same as the line whose equation is  $y = 2x + 1$ .
119. Write an equation in general form of the line passing through  $(3, -5)$  whose slope is the negative reciprocal (the reciprocal with the opposite sign) of  $-\frac{1}{4}$ .
120. If  $f(x) = x^2$ , find

$$\frac{f(x_2) - f(x_1)}{x_2 - x_1},$$

where  $x_1 = 1$  and  $x_2 = 4$ .

## SECTION 1.5

## More on Slope

*Objectives*

- 1 Find slopes and equations of parallel and perpendicular lines.
- 2 Interpret slope as rate of change.
- 3 Find a function's average rate of change.

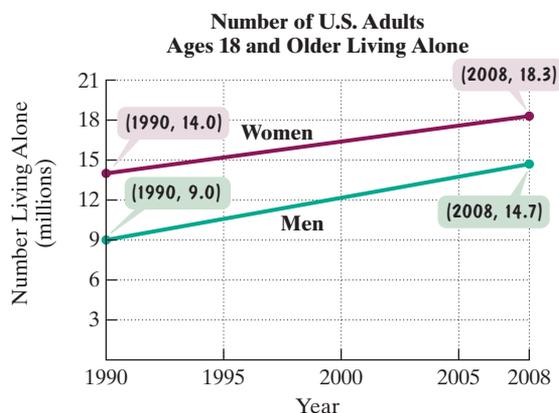

FIGURE 1.47

Source: U.S. Census Bureau

A best guess at the future of our nation indicates that the numbers of men and women living alone will increase each year. **Figure 1.47** shows that in 2008, 14.7 million men and 18.3 million women lived alone, an increase over the numbers displayed in the graph for 1990.

Take a second look at **Figure 1.47**. Can you tell that the green graph representing men has a greater slope than the red graph representing women? This indicates a greater rate of change in the number of men living alone than in the number of women living alone over the period from 1990 through 2008. In this section, you will learn to interpret slope as a rate of change. You will also explore the relationships between slopes of parallel and perpendicular lines.

- 1 Find slopes and equations of parallel and perpendicular lines.

**Parallel and Perpendicular Lines**

Two nonintersecting lines that lie in the same plane are **parallel**. If two lines do not intersect, the ratio of the vertical change to the horizontal change is the same for both lines. Because two parallel lines have the same “steepness,” they must have the same slope.

**Slope and Parallel Lines**

1. If two nonvertical lines are parallel, then they have the same slope.
2. If two distinct nonvertical lines have the same slope, then they are parallel.
3. Two distinct vertical lines, both with undefined slopes, are parallel.

**EXAMPLE 1** Writing Equations of a Line Parallel to a Given Line

Write an equation of the line passing through  $(-3, 1)$  and parallel to the line whose equation is  $y = 2x + 1$ . Express the equation in point-slope form and slope-intercept form.

## SOLUTION

The situation is illustrated in **Figure 1.48**. We are looking for the equation of the red line passing through  $(-3, 1)$  and parallel to the blue line whose equation is  $y = 2x + 1$ . How do we obtain the equation of this red line? Notice that the line passes through the point  $(-3, 1)$ . Using the point-slope form of the line's equation, we have  $x_1 = -3$  and  $y_1 = 1$ .

$$y - y_1 = m(x - x_1)$$

$$y_1 = 1$$

$$x_1 = -3$$

With  $(x_1, y_1) = (-3, 1)$ , the only thing missing from the equation of the red line is  $m$ , the slope. Do we know anything about the slope of either line in **Figure 1.48**? The answer is yes; we know the slope of the blue line on the right, whose equation is given.

$$y = 2x + 1$$

The slope of the blue line on the right in **Figure 1.48** is 2.

Parallel lines have the same slope. Because the slope of the blue line is 2, the slope of the red line, the line whose equation we must write, is also 2:  $m = 2$ . We now have values for  $x_1, y_1$ , and  $m$  for the red line.

$$y - y_1 = m(x - x_1)$$

$$y_1 = 1$$

$$m = 2$$

$$x_1 = -3$$

The point-slope form of the red line's equation is

$$y - 1 = 2[x - (-3)] \text{ or}$$

$$y - 1 = 2(x + 3).$$

Solving for  $y$ , we obtain the slope-intercept form of the equation.

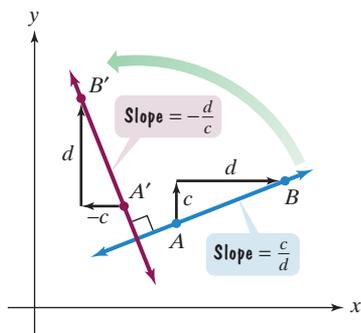

$$y - 1 = 2x + 6$$

Apply the distributive property.

$$y = 2x + 7$$

Add 1 to both sides. This is the slope-intercept form,  $y = mx + b$ , of the equation. Using function notation, the equation is  $f(x) = 2x + 7$ . ●●●

 **Check Point 1** Write an equation of the line passing through  $(-2, 5)$  and parallel to the line whose equation is  $y = 3x + 1$ . Express the equation in point-slope form and slope-intercept form.

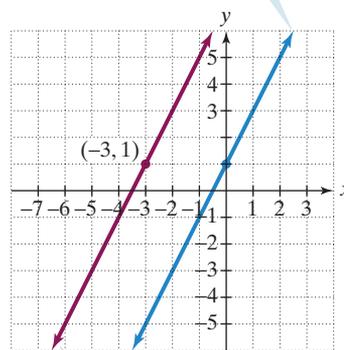

**FIGURE 1.49** Slopes of perpendicular lines

Two lines that intersect at a right angle ( $90^\circ$ ) are said to be **perpendicular**, shown in **Figure 1.49**. The relationship between the slopes of perpendicular lines is not as obvious as the relationship between parallel lines. **Figure 1.49** shows line  $AB$ , with slope  $\frac{c}{d}$ . Rotate line  $AB$  counterclockwise  $90^\circ$  to the left to obtain line  $A'B'$ , perpendicular to line  $AB$ . The figure indicates that the rise and the run of the new line are reversed from the original line, but the former rise, the new run, is now negative. This means that the slope of the new line is  $-\frac{d}{c}$ . Notice that the product of the slopes of the two perpendicular lines is  $-1$ :

$$\left(\frac{c}{d}\right)\left(-\frac{d}{c}\right) = -1.$$

This relationship holds for all perpendicular lines and is summarized in the box at the top of the next page.

The equation of this line is given:  $y = 2x + 1$ .

We must write the equation of this line.

**FIGURE 1.48**

## Slope and Perpendicular Lines

1. If two nonvertical lines are perpendicular, then the product of their slopes is  $-1$ .
2. If the product of the slopes of two lines is  $-1$ , then the lines are perpendicular.
3. A horizontal line having zero slope is perpendicular to a vertical line having undefined slope.

An equivalent way of stating this relationship is to say that **one line is perpendicular to another line if its slope is the negative reciprocal of the slope of the other line**. For example, if a line has slope 5, any line having slope  $-\frac{1}{5}$  is perpendicular to it. Similarly, if a line has slope  $-\frac{3}{4}$ , any line having slope  $\frac{4}{3}$  is perpendicular to it.

**EXAMPLE 2** Writing Equations of a Line Perpendicular to a Given Line

- a. Find the slope of any line that is perpendicular to the line whose equation is  $x + 4y - 8 = 0$ .
- b. Write the equation of the line passing through  $(3, -5)$  and perpendicular to the line whose equation is  $x + 4y - 8 = 0$ . Express the equation in general form.

## SOLUTION

- a. We begin by writing the equation of the given line,  $x + 4y - 8 = 0$ , in slope-intercept form. Solve for  $y$ .

$$x + 4y - 8 = 0$$

This is the given equation.

$$4y = -x + 8$$

To isolate the  $y$ -term, subtract  $x$  and add 8 on both sides.

$$y = -\frac{1}{4}x + 2$$

Divide both sides by 4.

Slope is  $-\frac{1}{4}$ .

The given line has slope  $-\frac{1}{4}$ . Any line perpendicular to this line has a slope that is the negative reciprocal of  $-\frac{1}{4}$ . Thus, the slope of any perpendicular line is 4.

- b. Let's begin by writing the point-slope form of the perpendicular line's equation. Because the line passes through the point  $(3, -5)$ , we have  $x_1 = 3$  and  $y_1 = -5$ . In part (a), we determined that the slope of any line perpendicular to  $x + 4y - 8 = 0$  is 4, so the slope of this particular perpendicular line must also be 4:  $m = 4$ .

$$y - y_1 = m(x - x_1)$$

$$y_1 = -5$$

$$m = 4$$

$$x_1 = 3$$

The point-slope form of the perpendicular line's equation is

$$y - (-5) = 4(x - 3) \text{ or}$$

$$y + 5 = 4(x - 3).$$

How can we express this equation,  $y + 5 = 4(x - 3)$ , in general form ( $Ax + By + C = 0$ )? We need to obtain zero on one side of the equation. Let's do this and keep  $A$ , the coefficient of  $x$ , positive.

$$y + 5 = 4(x - 3)$$

This is the point-slope form of the line's equation.

$$y + 5 = 4x - 12$$

Apply the distributive property.

$$y - y + 5 - 5 = 4x - y - 12 - 5$$

To obtain 0 on the left, subtract  $y$  and subtract 5 on both sides.

$$0 = 4x - y - 17$$

Simplify.

In general form, the equation of the perpendicular line is  $4x - y - 17 = 0$ .

### Check Point 2

- Find the slope of any line that is perpendicular to the line whose equation is  $x + 3y - 12 = 0$ .
- Write the equation of the line passing through  $(-2, -6)$  and perpendicular to the line whose equation is  $x + 3y - 12 = 0$ . Express the equation in general form.

## 2 Interpret slope as rate of change.

### Slope as Rate of Change

Slope is defined as the ratio of a change in  $y$  to a corresponding change in  $x$ . It describes how fast  $y$  is changing with respect to  $x$ . For a linear function, slope may be interpreted as the rate of change of the dependent variable per unit change in the independent variable.

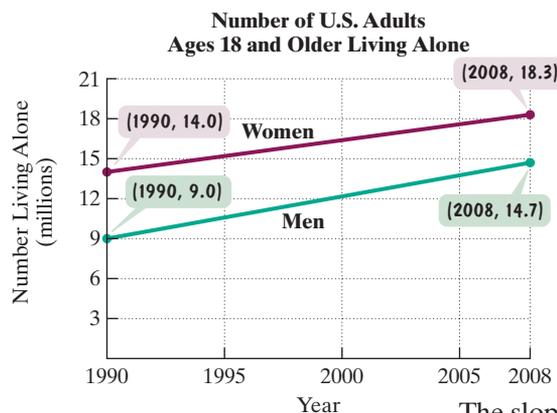

Our next example shows how slope can be interpreted as a rate of change in an applied situation. When calculating slope in applied problems, keep track of the units in the numerator and the denominator.

### EXAMPLE 3 Slope as a Rate of Change

The line graphs for the number of women and men living alone are shown again in **Figure 1.50**. Find the slope of the line segment for the women. Describe what this slope represents.

#### SOLUTION

We let  $x$  represent a year and  $y$  the number of women living alone in that year. The two points shown on the line segment for women have the following coordinates:

(1990, 14.0)

In 1990, 14 million U.S. women lived alone.

(2008, 18.3).

In 2008, 18.3 million U.S. women lived alone.

Now we compute the slope:

$$m = \frac{\text{Change in } y}{\text{Change in } x} = \frac{18.3 - 14.0}{2008 - 1990}$$

$$= \frac{4.3}{18} \approx \frac{0.24 \text{ million women}}{\text{year}}$$

The unit in the numerator is million women.

The unit in the denominator is year.

FIGURE 1.50

The slope indicates that the number of American women living alone increased at a rate of approximately 0.24 million each year for the period from 1990 through 2008. The rate of change is 0.24 million women per year.

 **Check Point 3** Use the ordered pairs in **Figure 1.50** to find the slope of the green line segment for the men. Express the slope correct to two decimal places and describe what it represents.

In Check Point 3, did you find that the slope of the line segment for the men is different from that of the women? The rate of change for the number of men living alone is greater than the rate of change for the number of women living alone. The green line segment representing men in **Figure 1.50** is steeper than the red line segment representing women. If you extend the line segments far enough, the resulting lines will intersect. They are not parallel.

**3** Find a function's average rate of change.

### The Average Rate of Change of a Function

If the graph of a function is not a straight line, the **average rate of change** between any two points is the slope of the line containing the two points. This line is called a **secant line**. For example, **Figure 1.51** shows the graph of a particular man's height, in inches, as a function of his age, in years. Two points on the graph are labeled:  $(13, 57)$  and  $(18, 76)$ . At age 13, this man was 57 inches tall and at age 18, he was 76 inches tall.

**FIGURE 1.51** Height as a function of age

The man's average growth rate between ages 13 and 18 is the slope of the secant line containing  $(13, 57)$  and  $(18, 76)$ :

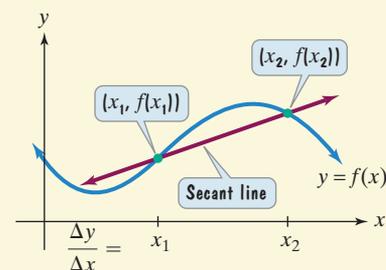

$$m = \frac{\text{Change in } y}{\text{Change in } x} = \frac{76 - 57}{18 - 13} = \frac{19}{5} = 3\frac{4}{5}.$$

This man's average rate of change, or average growth rate, from age 13 to age 18 was  $3\frac{4}{5}$ , or 3.8, inches per year.

### The Average Rate of Change of a Function

Let  $(x_1, f(x_1))$  and  $(x_2, f(x_2))$  be distinct points on the graph of a function  $f$ . (See **Figure 1.52**.) The **average rate of change of  $f$**  from  $x_1$  to  $x_2$ , denoted by  $\frac{\Delta y}{\Delta x}$  (read "delta  $y$  divided by delta  $x$ " or "change in  $y$  divided by change in  $x$ "), is

$$\frac{\Delta y}{\Delta x} = \frac{f(x_2) - f(x_1)}{x_2 - x_1}.$$

**FIGURE 1.52**

**EXAMPLE 4** Finding the Average Rate of ChangeFind the average rate of change of  $f(x) = x^2$  from

- a.  $x_1 = 0$  to  $x_2 = 1$       b.  $x_1 = 1$  to  $x_2 = 2$       c.  $x_1 = -2$  to  $x_2 = 0$ .

**SOLUTION**

- a. The average rate of change of  $f(x) = x^2$  from  $x_1 = 0$  to  $x_2 = 1$  is

$$\frac{\Delta y}{\Delta x} = \frac{f(x_2) - f(x_1)}{x_2 - x_1} = \frac{f(1) - f(0)}{1 - 0} = \frac{1^2 - 0^2}{1} = 1.$$

**Figure 1.53(a)** shows the secant line of  $f(x) = x^2$  from  $x_1 = 0$  to  $x_2 = 1$ . The average rate of change is positive and the function is increasing on the interval  $(0, 1)$ .

- b. The average rate of change of  $f(x) = x^2$  from  $x_1 = 1$  to  $x_2 = 2$  is

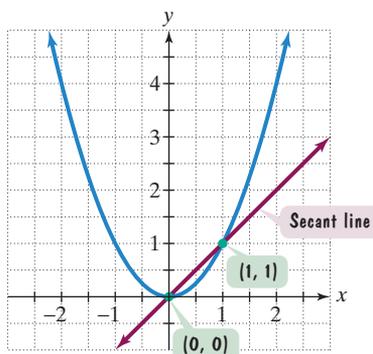

$$\frac{\Delta y}{\Delta x} = \frac{f(x_2) - f(x_1)}{x_2 - x_1} = \frac{f(2) - f(1)}{2 - 1} = \frac{2^2 - 1^2}{1} = 3.$$

**Figure 1.53(b)** shows the secant line of  $f(x) = x^2$  from  $x_1 = 1$  to  $x_2 = 2$ . The average rate of change is positive and the function is increasing on the interval  $(1, 2)$ . Can you see that the graph rises more steeply on the interval  $(1, 2)$  than on  $(0, 1)$ ? This is because the average rate of change from  $x_1 = 1$  to  $x_2 = 2$  is greater than the average rate of change from  $x_1 = 0$  to  $x_2 = 1$ .

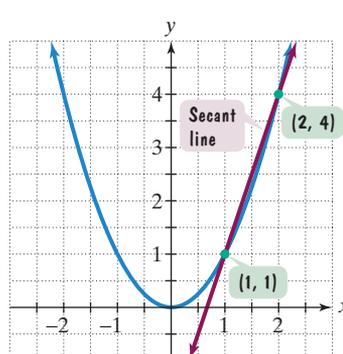

- c. The average rate of change of  $f(x) = x^2$  from  $x_1 = -2$  to  $x_2 = 0$  is

$$\frac{\Delta y}{\Delta x} = \frac{f(x_2) - f(x_1)}{x_2 - x_1} = \frac{f(0) - f(-2)}{0 - (-2)} = \frac{0^2 - (-2)^2}{2} = \frac{-4}{2} = -2.$$

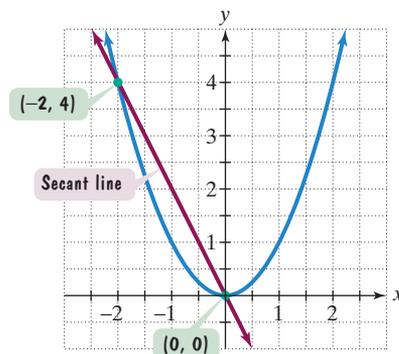

**Figure 1.53(c)** shows the secant line of  $f(x) = x^2$  from  $x_1 = -2$  to  $x_2 = 0$ . The average rate of change is negative and the function is decreasing on the interval  $(-2, 0)$ .

**FIGURE 1.53(a)** The secant line of  $f(x) = x^2$  from  $x_1 = 0$  to  $x_2 = 1$

**FIGURE 1.53(b)** The secant line of  $f(x) = x^2$  from  $x_1 = 1$  to  $x_2 = 2$

**FIGURE 1.53(c)** The secant line of  $f(x) = x^2$  from  $x_1 = -2$  to  $x_2 = 0$  ●●●

**Check Point 4** Find the average rate of change of  $f(x) = x^3$  from

- a.  $x_1 = 0$  to  $x_2 = 1$       b.  $x_1 = 1$  to  $x_2 = 2$       c.  $x_1 = -2$  to  $x_2 = 0$ .

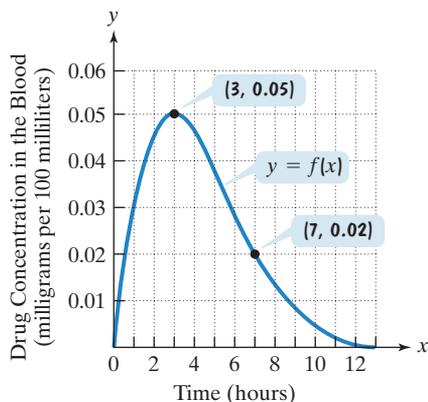

Suppose we are interested in the average rate of change of  $f$  from  $x_1 = x$  to  $x_2 = x + h$ . In this case, the average rate of change is

$$\frac{\Delta y}{\Delta x} = \frac{f(x_2) - f(x_1)}{x_2 - x_1} = \frac{f(x + h) - f(x)}{x + h - x} = \frac{f(x + h) - f(x)}{h}.$$

Do you recognize the last expression? It is the difference quotient that you used in Section 1.3. Thus, the difference quotient gives the average rate of change of a function from  $x$  to  $x + h$ . In the difference quotient,  $h$  is thought of as a number very close to 0. In this way, the average rate of change can be found for a very short interval.

### EXAMPLE 5 Finding the Average Rate of Change

When a person receives a drug injected into a muscle, the concentration of the drug in the body, measured in milligrams per 100 milliliters, is a function of the time elapsed after the injection, measured in hours. **Figure 1.54** shows the graph of such a function, where  $x$  represents hours after the injection and  $f(x)$  is the drug's concentration at time  $x$ . Find the average rate of change in the drug's concentration between 3 and 7 hours.

**FIGURE 1.54** Concentration of a drug as a function of time

### SOLUTION

At 3 hours, the drug's concentration is 0.05 and at 7 hours, the concentration is 0.02. The average rate of change in its concentration between 3 and 7 hours is

$$\frac{\Delta y}{\Delta x} = \frac{f(x_2) - f(x_1)}{x_2 - x_1} = \frac{f(7) - f(3)}{7 - 3} = \frac{0.02 - 0.05}{7 - 3} = \frac{-0.03}{4} = -0.0075.$$

The average rate of change is  $-0.0075$ . This means that the drug's concentration is decreasing at an average rate of 0.0075 milligram per 100 milliliters per hour. ●●●

## GREAT QUESTION!

**Can you clarify how you determine the units that you use when describing slope as a rate of change?**

Units used to describe  $x$  and  $y$  tend to “pile up” when expressing the rate of change of  $y$  with respect to  $x$ . The unit used to express the rate of change of  $y$  with respect to  $x$  is

the unit used  
to describe  $y$       **per**

the unit used  
to describe  $x$ .

In **Figure 1.54**,  $y$ , or drug concentration, is described in milligrams per 100 milliliters.

In **Figure 1.54**,  $x$ , or time, is described in hours.

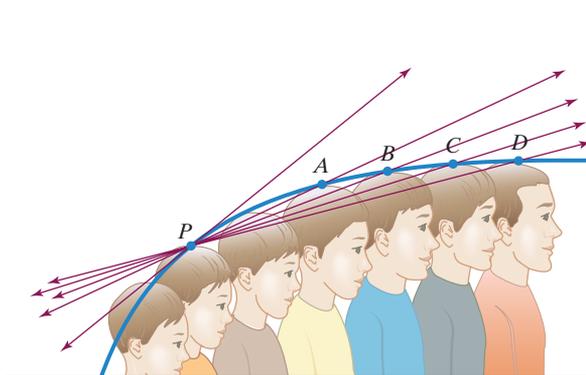

In Example 5, the rate of change is described in terms of milligrams per 100 milliliters per hour.

 **Check Point 5** Use **Figure 1.54** to find the average rate of change in the drug's concentration between 1 hour and 3 hours.

### Blitzer Bonus || How Calculus Studies Change

Take a rapid sequence of still photographs of a moving scene and project them onto a screen at thirty shots a second or faster. Our eyes see the results as continuous motion. The small difference between one frame and the next cannot be detected by the human visual system. The idea of calculus likewise regards continuous motion as made up of a sequence of still configurations. Calculus masters the mystery of movement by “freezing the frame” of a continuous changing process, instant by instant. For example, **Figure 1.55** shows a male’s changing height over intervals of time. Over the period of time from  $P$  to  $D$ , his average rate of growth is his change in height—that is, his height at time  $D$  minus his height at time  $P$ —divided by the change in time from  $P$  to  $D$ . This is the slope of secant line  $PD$ .

The secant lines  $PD$ ,  $PC$ ,  $PB$ , and  $PA$  shown in **Figure 1.55** have slopes that show average growth rates for successively shorter periods of time. Calculus makes these time frames so small that they approach a single point—that is, a single instant in time. This point is shown as point  $P$  in **Figure 1.55**. The slope of the line that touches the graph at  $P$  gives the male’s growth rate at one instant in time,  $P$ .

**FIGURE 1.55** Analyzing continuous growth over intervals of time and at an instant in time

The **average velocity** of an object is its change in position divided by the change in time between the starting and ending positions. If a function expresses an object’s position in terms of time, the function’s average rate of change describes the object’s average velocity.

#### Average Velocity of an Object

Suppose that a function expresses an object’s position,  $s(t)$ , in terms of time,  $t$ . The **average velocity** of the object from  $t_1$  to  $t_2$  is

$$\frac{\Delta s}{\Delta t} = \frac{s(t_2) - s(t_1)}{t_2 - t_1}.$$

#### EXAMPLE 6 Finding Average Velocity

The distance,  $s(t)$ , in feet, traveled by a ball rolling down a ramp is given by the function

$$s(t) = 5t^2,$$

where  $t$  is the time, in seconds, after the ball is released. Find the ball’s average velocity from

- $t_1 = 2$  seconds to  $t_2 = 3$  seconds.
- $t_1 = 2$  seconds to  $t_2 = 2.5$  seconds.
- $t_1 = 2$  seconds to  $t_2 = 2.01$  seconds.

#### SOLUTION

- The ball’s average velocity between 2 and 3 seconds is

$$\frac{\Delta s}{\Delta t} = \frac{s(3) - s(2)}{3 \text{ sec} - 2 \text{ sec}} = \frac{5 \cdot 3^2 - 5 \cdot 2^2}{1 \text{ sec}} = \frac{45 \text{ ft} - 20 \text{ ft}}{1 \text{ sec}} = 25 \text{ ft/sec.}$$

- The ball’s average velocity between 2 and 2.5 seconds is

$$\frac{\Delta s}{\Delta t} = \frac{s(2.5) - s(2)}{2.5 \text{ sec} - 2 \text{ sec}} = \frac{5(2.5)^2 - 5 \cdot 2^2}{0.5 \text{ sec}} = \frac{31.25 \text{ ft} - 20 \text{ ft}}{0.5 \text{ sec}} = 22.5 \text{ ft/sec.}$$

c. The ball's average velocity between 2 and 2.01 seconds is

$$\frac{\Delta s}{\Delta t} = \frac{s(2.01) - s(2)}{2.01 \text{ sec} - 2 \text{ sec}} = \frac{5(2.01)^2 - 5 \cdot 2^2}{0.01 \text{ sec}} = \frac{20.2005 \text{ ft} - 20 \text{ ft}}{0.01 \text{ sec}} = 20.05 \text{ ft/sec.} \quad \bullet \bullet \bullet$$

In Example 6, observe that each calculation begins at 2 seconds and involves shorter and shorter time intervals. In calculus, this procedure leads to the concept of *instantaneous*, as opposed to *average*, velocity. Instantaneous velocity is discussed in the introduction to calculus in Chapter 11.

 **Check Point 6** The distance,  $s(t)$ , in feet, traveled by a ball rolling down a ramp is given by the function

$$s(t) = 4t^2,$$

where  $t$  is the time, in seconds, after the ball is released. Find the ball's average velocity from

- $t_1 = 1$  second to  $t_2 = 2$  seconds.
- $t_1 = 1$  second to  $t_2 = 1.5$  seconds.
- $t_1 = 1$  second to  $t_2 = 1.01$  seconds.

## CONCEPT AND VOCABULARY CHECK

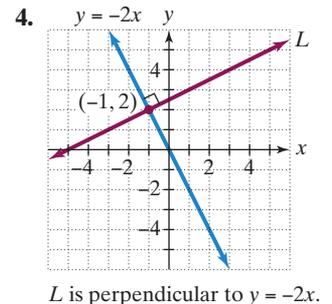

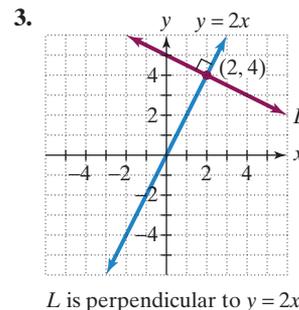

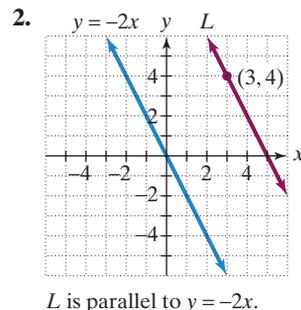

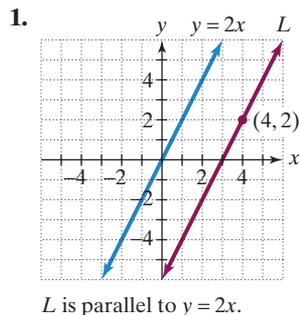

Fill in each blank so that the resulting statement is true.

- If two nonvertical lines are parallel, then they have \_\_\_\_\_ slope.
- If two nonvertical lines are perpendicular, then the product of their slopes is \_\_\_\_\_.
- Consider the line whose equation is  $y = -\frac{1}{3}x + 5$ . The slope of any line that is parallel to this line is \_\_\_\_\_. The slope of any line that is perpendicular to this line is \_\_\_\_\_.
- Consider the line whose equation is  $2x + y - 6 = 0$ . The slope of any line that is parallel to this line is \_\_\_\_\_. The slope of any line that is perpendicular to this line is \_\_\_\_\_.
- The slope of the line through the distinct points  $(x_1, y_1)$  and  $(x_2, y_2)$  can be interpreted as the rate of change in \_\_\_\_\_ with respect to \_\_\_\_\_.
- If  $(x_1, f(x_1))$  and  $(x_2, f(x_2))$  are distinct points on the graph of a function  $f$ , the average rate of change of  $f$  from  $x_1$  to  $x_2$  is  $\frac{\Delta y}{\Delta x} = \underline{\hspace{2cm}}$ .
- A function expresses an object's position,  $s(t)$ , in terms of time,  $t$ . The average velocity of the object from  $t_1 = 3$  seconds to  $t_2 = 6$  seconds is  $\frac{\Delta s}{\Delta t} = \underline{\hspace{2cm}}$ .

## EXERCISE SET 1.5

### Practice Exercises

In Exercises 1–4, write an equation for line  $L$  in point-slope form and slope-intercept form.

In Exercises 5–8, use the given conditions to write an equation for each line in point-slope form and slope-intercept form.

- Passing through  $(-8, -10)$  and parallel to the line whose equation is  $y = -4x + 3$
- Passing through  $(-2, -7)$  and parallel to the line whose equation is  $y = -5x + 4$
- Passing through  $(2, -3)$  and perpendicular to the line whose equation is  $y = \frac{1}{5}x + 6$
- Passing through  $(-4, 2)$  and perpendicular to the line whose equation is  $y = \frac{1}{3}x + 7$

In Exercises 9–12, use the given conditions to write an equation for each line in point-slope form and general form.

- Passing through  $(-2, 2)$  and parallel to the line whose equation is  $2x - 3y - 7 = 0$
- Passing through  $(-1, 3)$  and parallel to the line whose equation is  $3x - 2y - 5 = 0$
- Passing through  $(4, -7)$  and perpendicular to the line whose equation is  $x - 2y - 3 = 0$
- Passing through  $(5, -9)$  and perpendicular to the line whose equation is  $x + 7y - 12 = 0$

In Exercises 13–18, find the average rate of change of the function from  $x_1$  to  $x_2$ .

- $f(x) = 3x$  from  $x_1 = 0$  to  $x_2 = 5$
- $f(x) = 6x$  from  $x_1 = 0$  to  $x_2 = 4$
- $f(x) = x^2 + 2x$  from  $x_1 = 3$  to  $x_2 = 5$
- $f(x) = x^2 - 2x$  from  $x_1 = 3$  to  $x_2 = 6$
- $f(x) = \sqrt{x}$  from  $x_1 = 4$  to  $x_2 = 9$
- $f(x) = \sqrt{x}$  from  $x_1 = 9$  to  $x_2 = 16$

In Exercises 19–20, suppose that a ball is rolling down a ramp. The distance traveled by the ball is given by the function in each exercise, where  $t$  is the time, in seconds, after the ball is released, and  $s(t)$  is measured in feet. For each given function, find the ball's average velocity from

- $t_1 = 3$  to  $t_2 = 4$ .
  - $t_1 = 3$  to  $t_2 = 3.5$ .
  - $t_1 = 3$  to  $t_2 = 3.01$ .
  - $t_1 = 3$  to  $t_2 = 3.001$ .
- $s(t) = 10t^2$
  - $s(t) = 12t^2$

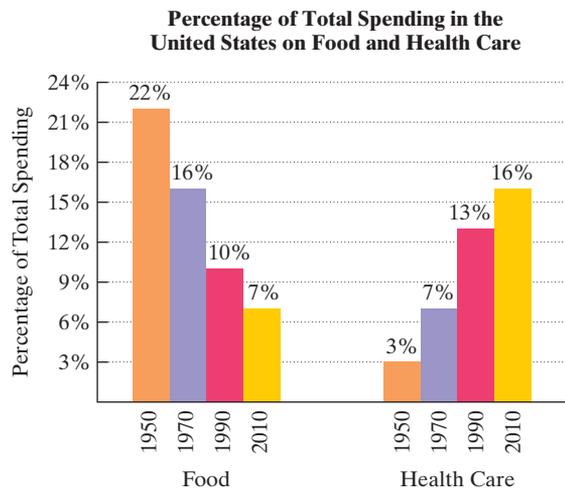

### Practice Plus

In Exercises 21–26, write an equation in slope-intercept form of a linear function  $f$  whose graph satisfies the given conditions.

- The graph of  $f$  passes through  $(-1, 5)$  and is perpendicular to the line whose equation is  $x = 6$ .
- The graph of  $f$  passes through  $(-2, 6)$  and is perpendicular to the line whose equation is  $x = -4$ .
- The graph of  $f$  passes through  $(-6, 4)$  and is perpendicular to the line that has an  $x$ -intercept of 2 and a  $y$ -intercept of  $-4$ .
- The graph of  $f$  passes through  $(-5, 6)$  and is perpendicular to the line that has an  $x$ -intercept of 3 and a  $y$ -intercept of  $-9$ .
- The graph of  $f$  is perpendicular to the line whose equation is  $3x - 2y - 4 = 0$  and has the same  $y$ -intercept as this line.
- The graph of  $f$  is perpendicular to the line whose equation is  $4x - y - 6 = 0$  and has the same  $y$ -intercept as this line.

### Application Exercises

The bar graph shows that as costs changed over the decades, Americans devoted less of their budget to groceries and more to health care.

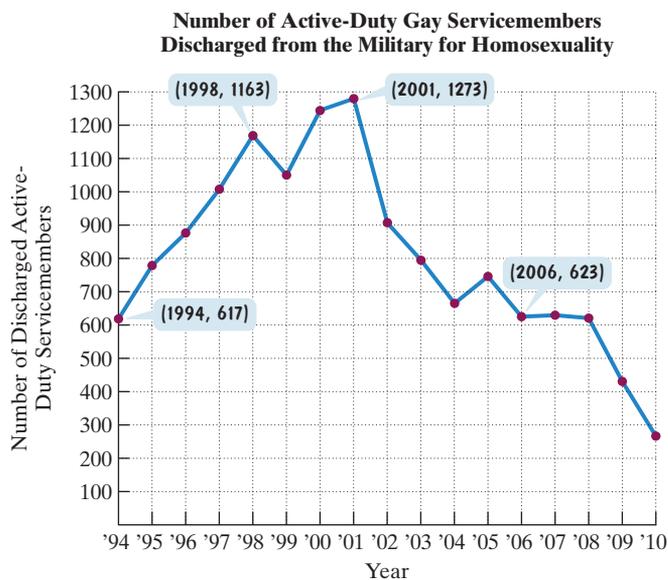

Source: *Time*, October 10, 2011

In Exercises 27–28, find a linear function in slope-intercept form that models the given description. Each function should model the percentage of total spending,  $p(x)$ , by Americans  $x$  years after 1950.

- In 1950, Americans spent 22% of their budget on food. This has decreased at an average rate of approximately 0.25% per year since then.
- In 1950, Americans spent 3% of their budget on health care. This has increased at an average rate of approximately 0.22% per year since then.

The stated intent of the 1994 “don’t ask, don’t tell” policy was to reduce the number of discharges of gay men and lesbians from the military. Nearly 14,000 active-duty gay servicemembers were dismissed under the policy, which officially ended in 2011, after 18 years. The line graph shows the number of discharges under “don’t ask, don’t tell” from 1994 through 2010. Use the data displayed by the graph to solve Exercises 29–30.

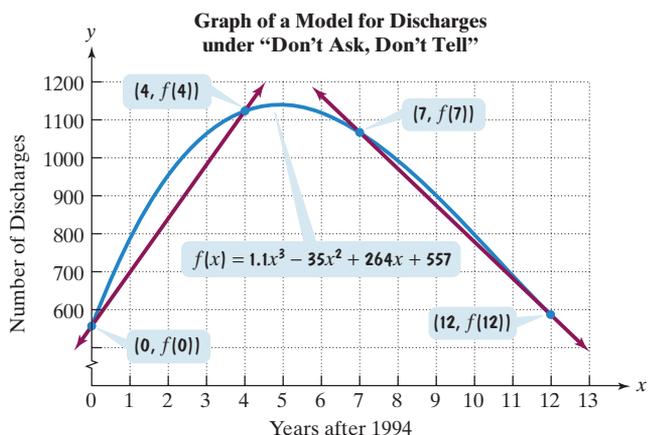

Source: General Accountability Office

(In Exercises 29–30, be sure to refer to the graph at the bottom of the previous page.)

29. Find the average rate of change, rounded to the nearest whole number, from 1994 through 1998. Describe what this means.
30. Find the average rate of change, rounded to the nearest whole number, from 2001 through 2006. Describe what this means.

The function  $f(x) = 1.1x^3 - 35x^2 + 264x + 557$  models the number of discharges,  $f(x)$ , under “don’t ask, don’t tell”  $x$  years after 1994. Use this model and its graph, shown on the domain  $[0, 12]$ , to solve Exercises 31–32.

31. a. Find the slope of the secant line, rounded to the nearest whole number, from  $x_1 = 0$  to  $x_2 = 4$ .
- b. Does the slope from part (a) underestimate or overestimate the average yearly increase that you determined in Exercise 29? By how much?
32. a. Find the slope of the secant line, rounded to the nearest whole number, from  $x_1 = 7$  to  $x_2 = 12$ .
- b. Does the slope from part (b) underestimate or overestimate the average yearly decrease that you determined in Exercise 30? By how much?

### Writing in Mathematics

33. If two lines are parallel, describe the relationship between their slopes.
34. If two lines are perpendicular, describe the relationship between their slopes.
35. If you know a point on a line and you know the equation of a line perpendicular to this line, explain how to write the line’s equation.
36. A formula in the form  $y = mx + b$  models the average retail price,  $y$ , of a new car  $x$  years after 2000. Would you expect  $m$  to be positive, negative, or zero? Explain your answer.
37. What is a secant line?
38. What is the average rate of change of a function?

### Technology Exercise

39. a. Why are the lines whose equations are  $y = \frac{1}{3}x + 1$  and  $y = -3x - 2$  perpendicular?
- b. Use a graphing utility to graph the equations in a  $[-10, 10, 1]$  by  $[-10, 10, 1]$  viewing rectangle. Do the lines appear to be perpendicular?
- c. Now use the zoom square feature of your utility. Describe what happens to the graphs. Explain why this is so.

### Critical Thinking Exercises

**Make Sense?** In Exercises 40–43, determine whether each statement makes sense or does not make sense, and explain your reasoning.

40. Some of the steel girders in this photo of the Eiffel Tower appear to have slopes that are negative reciprocals of each other.

41. I have linear functions that model changes for men and women over the same time period. The functions have the same slope, so their graphs are parallel lines, indicating that the rate of change for men is the same as the rate of change for women.
42. The graph of my function is not a straight line, so I cannot use slope to analyze its rates of change.
43. According to the Blitzer Bonus on page 210, calculus studies change by analyzing slopes of secant lines over successively shorter intervals.
44. What is the slope of a line that is perpendicular to the line whose equation is  $Ax + By + C = 0$ ,  $A \neq 0$  and  $B \neq 0$ ?
45. Determine the value of  $A$  so that the line whose equation is  $Ax + y - 2 = 0$  is perpendicular to the line containing the points  $(1, -3)$  and  $(-2, 4)$ .

### Preview Exercises

Exercises 46–48 will help you prepare for the material covered in the next section. In each exercise, graph the functions in parts (a) and (b) in the same rectangular coordinate system.

46. a. Graph  $f(x) = |x|$  using the ordered pairs  $(-3, f(-3))$ ,  $(-2, f(-2))$ ,  $(-1, f(-1))$ ,  $(0, f(0))$ ,  $(1, f(1))$ ,  $(2, f(2))$ , and  $(3, f(3))$ .
- b. Subtract 4 from each  $y$ -coordinate of the ordered pairs in part (a). Then graph the ordered pairs and connect them with two linear pieces.
- c. Describe the relationship between the graph in part (b) and the graph in part (a).
47. a. Graph  $f(x) = x^2$  using the ordered pairs  $(-3, f(-3))$ ,  $(-2, f(-2))$ ,  $(-1, f(-1))$ ,  $(0, f(0))$ ,  $(1, f(1))$ ,  $(2, f(2))$ , and  $(3, f(3))$ .
- b. Add 2 to each  $x$ -coordinate of the ordered pairs in part (a). Then graph the ordered pairs and connect them with a smooth curve.
- c. Describe the relationship between the graph in part (b) and the graph in part (a).

48. a. Graph  $f(x) = x^3$  using the ordered pairs  $(-2, f(-2))$ ,  $(-1, f(-1))$ ,  $(0, f(0))$ ,  $(1, f(1))$ , and  $(2, f(2))$ .  
 b. Replace each  $x$ -coordinate of the ordered pairs in part (a) with its opposite, or additive inverse. Then graph the ordered pairs and connect them with a smooth curve.

- c. Describe the relationship between the graph in part (b) and the graph in part (a).

# CHAPTER 1

## Mid-Chapter Check Point

**WHAT YOU KNOW:** We learned that a function is a relation in which no two ordered pairs have the same first component and different second components. We represented functions as equations and used function notation. We graphed functions and applied the vertical line test to identify graphs of functions. We determined the domain and range of a function from its graph, using inputs on the  $x$ -axis for the domain and outputs on the  $y$ -axis for the range. We used graphs to identify intervals on which functions increase, decrease, or are constant, as well as to locate relative maxima or minima. We identified even functions [ $f(-x) = f(x)$ :  $y$ -axis symmetry] and odd functions [ $f(-x) = -f(x)$ : origin symmetry]. Finally, we studied linear functions and slope, using slope (change in  $y$  divided by change in  $x$ ) to develop various forms for equations of lines:

Point-slope form	Slope-intercept form	Horizontal line	Vertical line	General form
$y - y_1 = m(x - x_1)$	$y = f(x) = mx + b$	$y = f(x) = b$	$x = a$	$Ax + By + C = 0.$

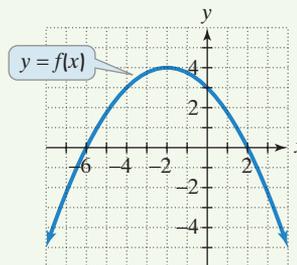

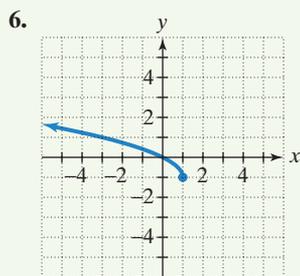

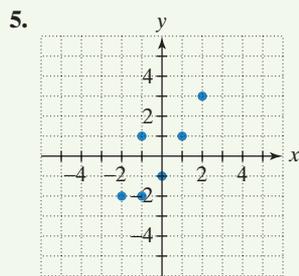

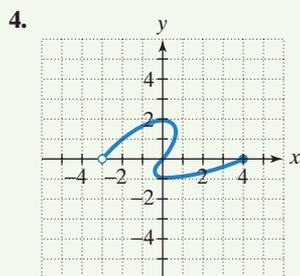

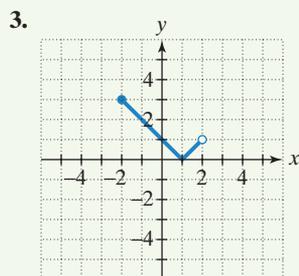

We saw that parallel lines have the same slope and that perpendicular lines have slopes that are negative reciprocals. For linear functions, slope was interpreted as the rate of change of the dependent variable per unit change in the independent variable. For nonlinear functions, the slope of the secant line between  $(x_1, f(x_1))$  and  $(x_2, f(x_2))$  described the average rate of change of  $f$  from  $x_1$  to  $x_2$ :  $\frac{\Delta y}{\Delta x} = \frac{f(x_2) - f(x_1)}{x_2 - x_1}$ .

In Exercises 1–6, determine whether each relation is a function. Give the domain and range for each relation.

Use the graph of  $f$  to solve Exercises 9–24. Where applicable, use interval notation.

1.  $\{(2, 6), (1, 4), (2, -6)\}$

2.  $\{(0, 1), (2, 1), (3, 4)\}$

In Exercises 7–8, determine whether each equation defines  $y$  as a function of  $x$ .

7.  $x^2 + y = 5$

8.  $x + y^2 = 5$

9. Explain why  $f$  represents the graph of a function.
10. Find the domain of  $f$ .
11. Find the range of  $f$ .
12. Find the  $x$ -intercept(s).
13. Find the  $y$ -intercept.
14. Find the interval(s) on which  $f$  is increasing.
15. Find the interval(s) on which  $f$  is decreasing.
16. At what number does  $f$  have a relative maximum?
17. What is the relative maximum of  $f$ ?
18. Find  $f(-4)$ .
19. For what value or values of  $x$  is  $f(x) = -2$ ?
20. For what value or values of  $x$  is  $f(x) = 0$ ?
21. For what values of  $x$  is  $f(x) > 0$ ?
22. Is  $f(100)$  positive or negative?
23. Is  $f$  even, odd, or neither?
24. Find the average rate of change of  $f$  from  $x_1 = -4$  to  $x_2 = 4$ .

In Exercises 25–36, graph each equation in a rectangular coordinate system.

25.  $y = -2x$       26.  $y = -2$       27.  $x + y = -2$   
 28.  $y = \frac{1}{3}x - 2$       29.  $x = 3.5$       30.  $4x - 2y = 8$   
 31.  $f(x) = x^2 - 4$       32.  $f(x) = x - 4$       33.  $f(x) = |x| - 4$   
 34.  $5y = -3x$       35.  $5y = 20$

36.  $f(x) = \begin{cases} -1 & \text{if } x \leq 0 \\ 2x + 1 & \text{if } x > 0 \end{cases}$

37. Let  $f(x) = -2x^2 + x - 5$ .

a. Find  $f(-x)$ . Is  $f$  even, odd, or neither?

b. Find  $\frac{f(x+h) - f(x)}{h}$ ,  $h \neq 0$ .

38. Let  $C(x) = \begin{cases} 30 & \text{if } 0 \leq x \leq 200 \\ 30 + 0.40(x - 200) & \text{if } x > 200 \end{cases}$

a. Find  $C(150)$ .

b. Find  $C(250)$ .

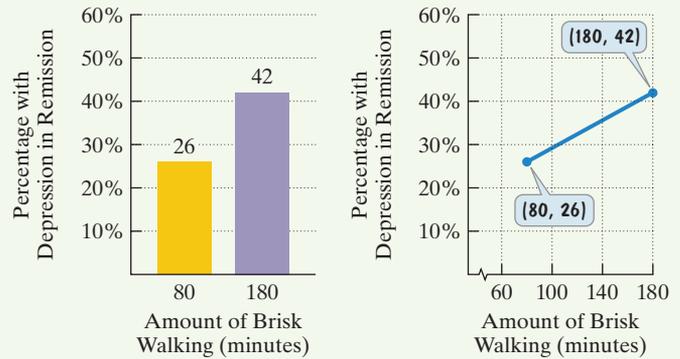

In Exercises 39–42, write a function in slope-intercept form whose graph satisfies the given conditions.

39. Slope =  $-2$ , passing through  $(-4, 3)$   
 40. Passing through  $(-1, -5)$  and  $(2, 1)$   
 41. Passing through  $(3, -4)$  and parallel to the line whose equation is  $3x - y - 5 = 0$   
 42. Passing through  $(-4, -3)$  and perpendicular to the line whose equation is  $2x - 5y - 10 = 0$   
 43. Determine whether the line through  $(2, -4)$  and  $(7, 0)$  is parallel to a second line through  $(-4, 2)$  and  $(1, 6)$ .

44. Exercise is useful not only in preventing depression, but also as a treatment. The following graphs show the percentage of patients with depression in remission when exercise (brisk walking) was used as a treatment. (The control group that engaged in no exercise had 11% of the patients in remission.)

a. Find the slope of the line passing through the two points shown by the voice balloons. Express the slope as a decimal.

Exercise and Percentage of Patients with Depression in Remission

Source: *Newsweek*, March 26, 2007

b. Use your answer from part (a) to complete this statement:  
 For each minute of brisk walking, the percentage of patients with depression in remission increased by \_\_\_\_%.  
 The rate of change is \_\_\_\_% per \_\_\_\_\_.

45. Find the average rate of change of  $f(x) = 3x^2 - x$  from  $x_1 = -1$  to  $x_2 = 2$ .

## SECTION 1.6

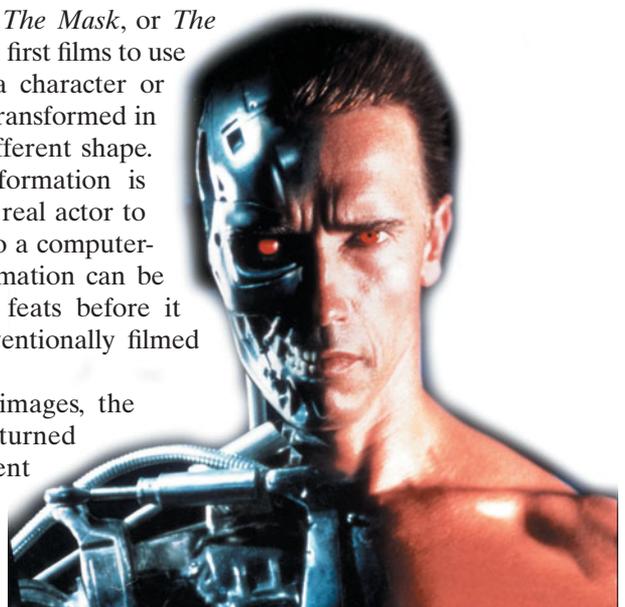

## Transformations of Functions

### Objectives

- 1 Recognize graphs of common functions.
- 2 Use vertical shifts to graph functions.
- 3 Use horizontal shifts to graph functions.
- 4 Use reflections to graph functions.
- 5 Use vertical stretching and shrinking to graph functions.
- 6 Use horizontal stretching and shrinking to graph functions.
- 7 Graph functions involving a sequence of transformations.

Have you seen *Terminator 2*, *The Mask*, or *The Matrix*? These were among the first films to use spectacular effects in which a character or object having one shape was transformed in a fluid fashion into a quite different shape. The name for such a transformation is **morphing**. The effect allows a real actor to be seamlessly transformed into a computer-generated animation. The animation can be made to perform impossible feats before it is morphed back to the conventionally filmed image.

Like transformed movie images, the graph of one function can be turned into the graph of a different function. To do this, we need to rely on a function's equation. Knowing that a graph is a transformation of a familiar graph makes graphing easier.

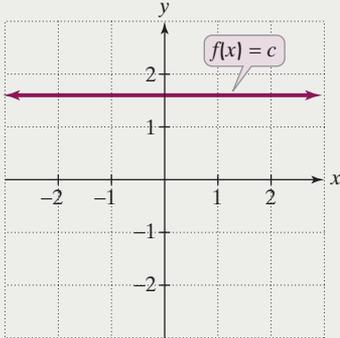

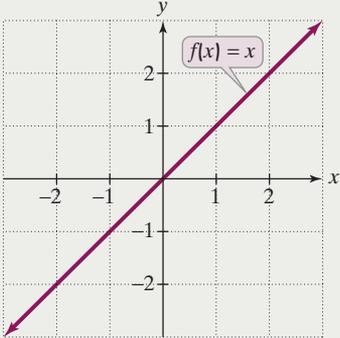

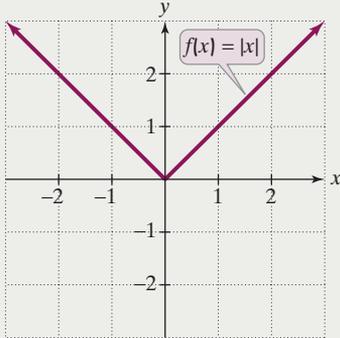

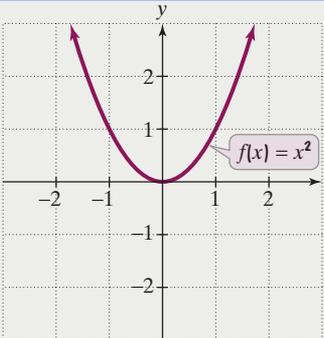

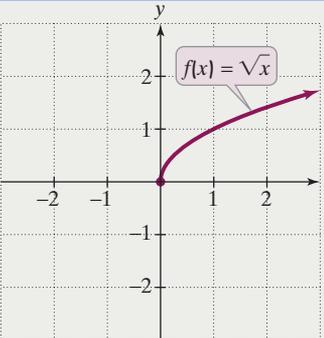

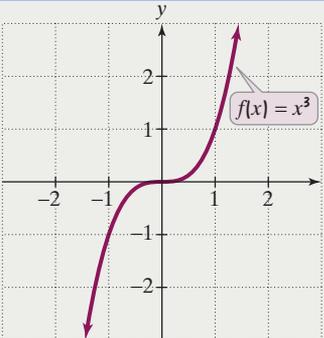

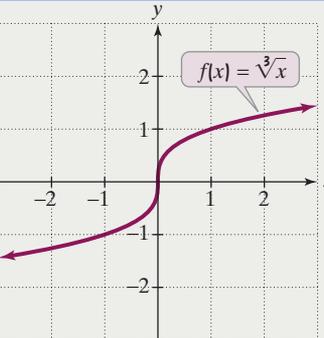

- 1 Recognize graphs of common functions.

## Graphs of Common Functions

**Table 1.3** gives names to seven frequently encountered functions in algebra. The table shows each function's graph and lists characteristics of the function. Study the shape of each graph and take a few minutes to verify the function's characteristics from its graph. Knowing these graphs is essential for analyzing their transformations into more complicated graphs.

Table 1.3 Algebra's Common Graphs

Constant Function	Identity Function	Absolute Value Function	
			
<ul style="list-style-type: none"> <li>• Domain: <math>(-\infty, \infty)</math></li> <li>• Range: the single number <math>c</math></li> <li>• Constant on <math>(-\infty, \infty)</math></li> <li>• Even function</li> </ul>	<ul style="list-style-type: none"> <li>• Domain: <math>(-\infty, \infty)</math></li> <li>• Range: <math>(-\infty, \infty)</math></li> <li>• Increasing on <math>(-\infty, \infty)</math></li> <li>• Odd function</li> </ul>	<ul style="list-style-type: none"> <li>• Domain: <math>(-\infty, \infty)</math></li> <li>• Range: <math>[0, \infty)</math></li> <li>• Decreasing on <math>(-\infty, 0)</math> and increasing on <math>(0, \infty)</math></li> <li>• Even function</li> </ul>	
Standard Quadratic Function	Square Root Function	Standard Cubic Function	Cube Root Function
			
<ul style="list-style-type: none"> <li>• Domain: <math>(-\infty, \infty)</math></li> <li>• Range: <math>[0, \infty)</math></li> <li>• Decreasing on <math>(-\infty, 0)</math> and increasing on <math>(0, \infty)</math></li> <li>• Even function</li> </ul>	<ul style="list-style-type: none"> <li>• Domain: <math>[0, \infty)</math></li> <li>• Range: <math>[0, \infty)</math></li> <li>• Increasing on <math>(0, \infty)</math></li> <li>• Neither even nor odd</li> </ul>	<ul style="list-style-type: none"> <li>• Domain: <math>(-\infty, \infty)</math></li> <li>• Range: <math>(-\infty, \infty)</math></li> <li>• Increasing on <math>(-\infty, \infty)</math></li> <li>• Odd function</li> </ul>	<ul style="list-style-type: none"> <li>• Domain: <math>(-\infty, \infty)</math></li> <li>• Range: <math>(-\infty, \infty)</math></li> <li>• Increasing on <math>(-\infty, \infty)</math></li> <li>• Odd function</li> </ul>

## DISCOVERY

The study of how changing a function's equation can affect its graph can be explored with a graphing utility. Use your graphing utility to verify the hand-drawn graphs as you read this section.

- 2 Use vertical shifts to graph functions.

## Vertical Shifts

Let's begin by looking at three graphs whose shapes are the same. **Figure 1.56** on the next page shows the graphs. The black graph in the middle is the standard quadratic function,  $f(x) = x^2$ . Now, look at the blue graph on the top. The equation of this graph,  $g(x) = x^2 + 2$ , adds 2 to the right side of  $f(x) = x^2$ . The  $y$ -coordinate of each

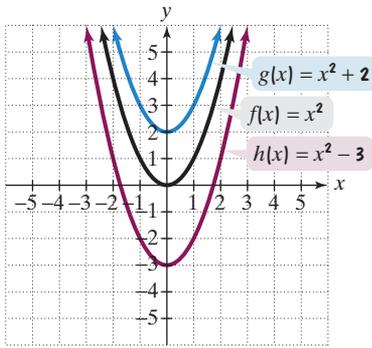

FIGURE 1.56 Vertical shifts

point of  $g$  is 2 more than the corresponding  $y$ -coordinate of each point of  $f$ . What effect does this have on the graph of  $f$ ? It shifts the graph vertically up by 2 units.

$$g(x) = x^2 + 2 = f(x) + 2$$

The graph of  $g$  shifts the graph of  $f$  up 2 units.

Finally, look at the red graph on the bottom in **Figure 1.56**. The equation of this graph,  $h(x) = x^2 - 3$ , subtracts 3 from the right side of  $f(x) = x^2$ . The  $y$ -coordinate of each point of  $h$  is 3 less than the corresponding  $y$ -coordinate of each point of  $f$ . What effect does this have on the graph of  $f$ ? It shifts the graph vertically down by 3 units.

$$h(x) = x^2 - 3 = f(x) - 3$$

The graph of  $h$  shifts the graph of  $f$  down 3 units.

In general, if  $c$  is positive,  $y = f(x) + c$  shifts the graph of  $f$  upward  $c$  units and  $y = f(x) - c$  shifts the graph of  $f$  downward  $c$  units. These are called **vertical shifts** of the graph of  $f$ .

### GREAT QUESTION!

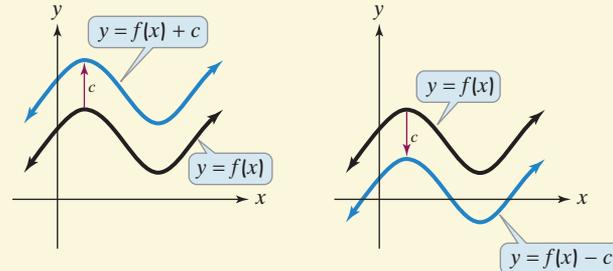

**If I'm using the graph of a familiar function, how do I actually obtain the graph of a transformation?**

To keep track of transformations and obtain their graphs, identify a number of points on the given function's graph. Then analyze what happens to the coordinates of these points with each transformation.

### Vertical Shifts

Let  $f$  be a function and  $c$  a positive real number.

- The graph of  $y = f(x) + c$  is the graph of  $y = f(x)$  shifted  $c$  units vertically upward.
- The graph of  $y = f(x) - c$  is the graph of  $y = f(x)$  shifted  $c$  units vertically downward.

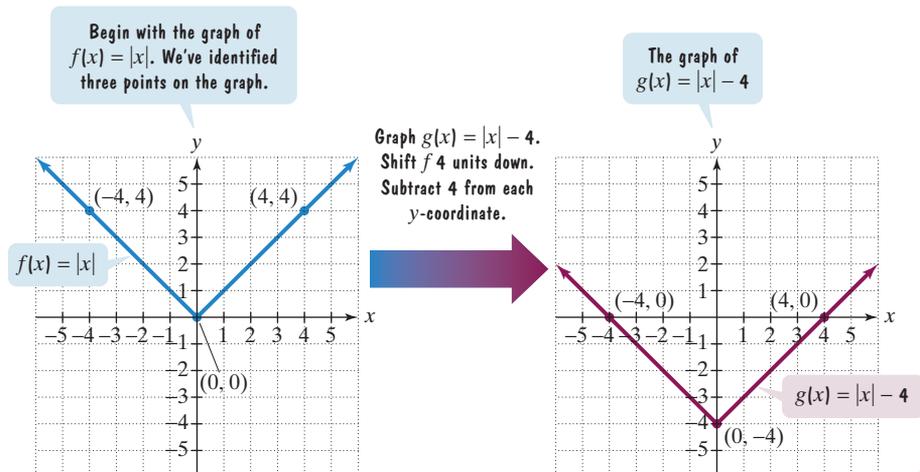

### EXAMPLE 1 Vertical Shift Downward

Use the graph of  $f(x) = |x|$  to obtain the graph of  $g(x) = |x| - 4$ .

### SOLUTION

The graph of  $g(x) = |x| - 4$  has the same shape as the graph of  $f(x) = |x|$ . However, it is shifted down vertically 4 units.

 **Check Point 1** Use the graph of  $f(x) = |x|$  to obtain the graph of  $g(x) = |x| + 3$ .

**3** Use horizontal shifts to graph functions.

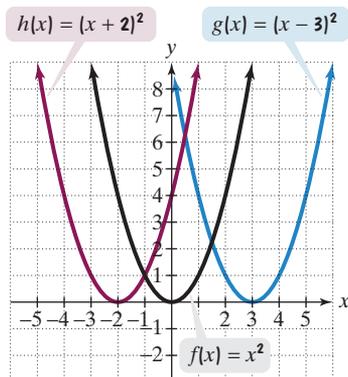

FIGURE 1.57 Horizontal shifts

### Horizontal Shifts

We return to the graph of  $f(x) = x^2$ , the standard quadratic function. In **Figure 1.57**, the graph of function  $f$  is in the middle of the three graphs. By contrast to the vertical shift situation, this time there are graphs to the left and to the right of the graph of  $f$ . Look at the blue graph on the right. The equation of this graph,  $g(x) = (x - 3)^2$ , subtracts 3 from each value of  $x$  before squaring it. What effect does this have on the graph of  $f(x) = x^2$ ? It shifts the graph horizontally to the right by 3 units.

$$g(x) = (x - 3)^2 = f(x - 3)$$

The graph of  $g$  shifts the graph of  $f$  3 units to the right.

Does it seem strange that *subtracting* 3 in the domain causes a shift of 3 units to the *right*? Perhaps a partial table of coordinates for each function will numerically convince you of this shift.

$x$	$f(x) = x^2$	$x$	$g(x) = (x - 3)^2$
-2	$(-2)^2 = 4$	1	$(1 - 3)^2 = (-2)^2 = 4$
-1	$(-1)^2 = 1$	2	$(2 - 3)^2 = (-1)^2 = 1$
0	$0^2 = 0$	3	$(3 - 3)^2 = 0^2 = 0$
1	$1^2 = 1$	4	$(4 - 3)^2 = 1^2 = 1$
2	$2^2 = 4$	5	$(5 - 3)^2 = 2^2 = 4$

Notice that for the values of  $f(x)$  and  $g(x)$  to be the same, the values of  $x$  used in graphing  $g$  must each be 3 units greater than those used to graph  $f$ . For this reason, the graph of  $g$  is the graph of  $f$  shifted 3 units to the right.

Now, look at the red graph on the left in **Figure 1.57**. The equation of this graph,  $h(x) = (x + 2)^2$ , adds 2 to each value of  $x$  before squaring it. What effect does this have on the graph of  $f(x) = x^2$ ? It shifts the graph horizontally to the left by 2 units.

$$h(x) = (x + 2)^2 = f(x + 2)$$

The graph of  $h$  shifts the graph of  $f$  2 units to the left.

In general, if  $c$  is positive,  $y = f(x + c)$  shifts the graph of  $f$  to the left  $c$  units and  $y = f(x - c)$  shifts the graph of  $f$  to the right  $c$  units. These are called **horizontal shifts** of the graph of  $f$ .

### GREAT QUESTION!

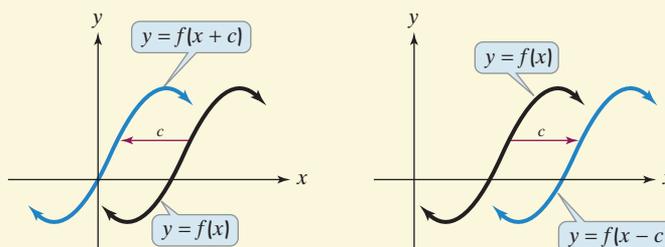

Using my intuition, it seems that  $f(x + c)$  should cause a shift to the right and  $f(x - c)$  should cause a shift to the left. Is my intuition on target when it comes to these horizontal shifts?

No. On a number line, if  $x$  represents a number and  $c$  is positive, then  $x + c$  lies  $c$  units to the right of  $x$  and  $x - c$  lies  $c$  units to the left of  $x$ . This orientation does not apply to horizontal shifts:  $f(x + c)$  causes a shift of  $c$  units to the left and  $f(x - c)$  causes a shift of  $c$  units to the right.

### Horizontal Shifts

Let  $f$  be a function and  $c$  a positive real number.

- The graph of  $y = f(x + c)$  is the graph of  $y = f(x)$  shifted to the left  $c$  units.
- The graph of  $y = f(x - c)$  is the graph of  $y = f(x)$  shifted to the right  $c$  units.

**EXAMPLE 2** Horizontal Shift to the Left

Use the graph of  $f(x) = \sqrt{x}$  to obtain the graph of  $g(x) = \sqrt{x + 5}$ .

**SOLUTION**

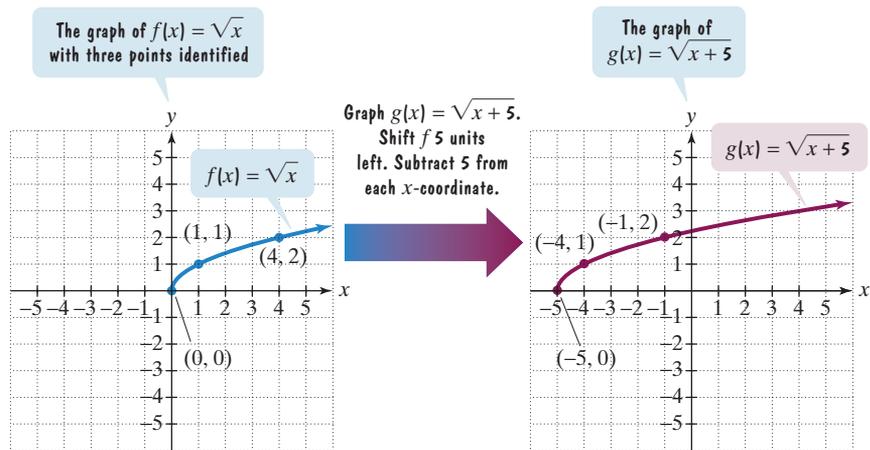

Compare the equations for  $f(x) = \sqrt{x}$  and  $g(x) = \sqrt{x + 5}$ . The equation for  $g$  adds 5 to each value of  $x$  before taking the square root.

$$y = g(x) = \sqrt{x + 5} = f(x + 5)$$

The graph of  $g$

shifts the graph of  $f$  5 units to the left.

The graph of  $g(x) = \sqrt{x + 5}$  has the same shape as the graph of  $f(x) = \sqrt{x}$ . However, it is shifted horizontally to the left 5 units.

**GREAT QUESTION!**

What's the difference between  $f(x) + c$  and  $f(x + c)$ ?

- $y = f(x) + c$  shifts the graph of  $y = f(x)$   $c$  units vertically upward.
- $y = f(x + c)$  shifts the graph of  $y = f(x)$   $c$  units horizontally to the left.

There are analogous differences between  $f(x) - c$  and  $f(x - c)$ .

**Check Point 2** Use the graph of  $f(x) = \sqrt{x}$  to obtain the graph of  $g(x) = \sqrt{x - 4}$ .

Some functions can be graphed by combining horizontal and vertical shifts. These functions will be variations of a function whose equation you know how to graph, such as the standard quadratic function, the standard cubic function, the square root function, the cube root function, or the absolute value function.

In our next example, we will use the graph of the standard quadratic function,  $f(x) = x^2$ , to obtain the graph of  $h(x) = (x + 1)^2 - 3$ . We will graph three functions:

$$f(x) = x^2 \quad g(x) = (x + 1)^2 \quad h(x) = (x + 1)^2 - 3.$$

Start by graphing the standard quadratic function.

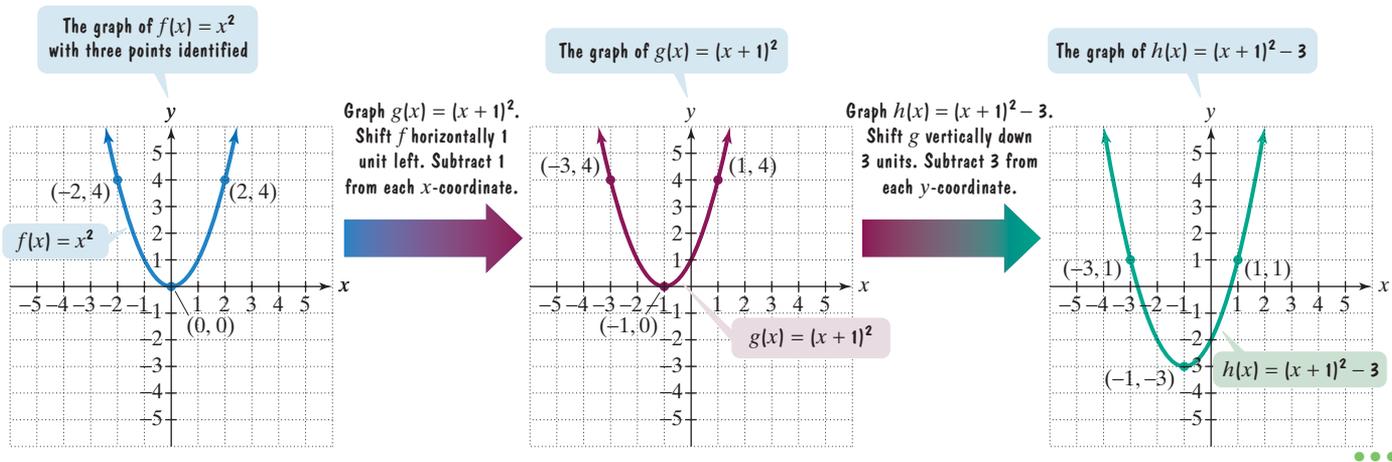

Shift the graph of  $f$  horizontally one unit to the left.

Shift the graph of  $g$  vertically down 3 units.

**EXAMPLE 3** Combining Horizontal and Vertical Shifts

Use the graph of  $f(x) = x^2$  to obtain the graph of  $h(x) = (x + 1)^2 - 3$ .

**SOLUTION**

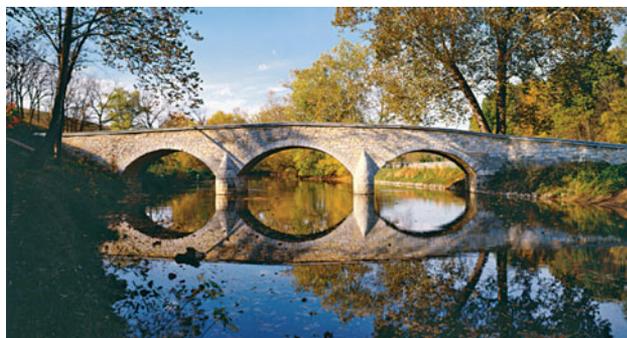

**DISCOVERY**

Work Example 3 by first shifting the graph of  $f(x) = x^2$  three units down, graphing  $g(x) = x^2 - 3$ . Now, shift this graph one unit left to graph  $h(x) = (x + 1)^2 - 3$ . Did you obtain the last graph shown in the solution of Example 3? What can you conclude?

**Check Point 3** Use the graph of  $f(x) = \sqrt{x}$  to obtain the graph of  $h(x) = \sqrt{x - 1} - 2$ .

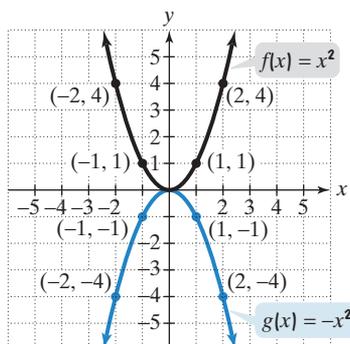

**4** Use reflections to graph functions.

**Reflections of Graphs**

This photograph shows a reflection of an old bridge in a Maryland river. This perfect reflection occurs because the surface of the water is absolutely still. A mild breeze rippling the water's surface would distort the reflection.

Is it possible for graphs to have mirror-like qualities? Yes. **Figure 1.58**

**FIGURE 1.58** Reflection about the  $x$ -axis

shows the graphs of  $f(x) = x^2$  and  $g(x) = -x^2$ . The graph of  $g$  is a **reflection about the  $x$ -axis** of the graph of  $f$ . For corresponding values of  $x$ , the  $y$ -coordinates of  $g$  are the opposites of the  $y$ -coordinates of  $f$ . In general, the graph of  $y = -f(x)$  reflects the graph of  $f$  about the  $x$ -axis. Thus, the graph of  $g$  is a reflection of the graph of  $f$  about the  $x$ -axis because

$$g(x) = -x^2 = -f(x).$$

**Reflection about the  $x$ -Axis**

The graph of  $y = -f(x)$  is the graph of  $y = f(x)$  reflected about the  $x$ -axis.

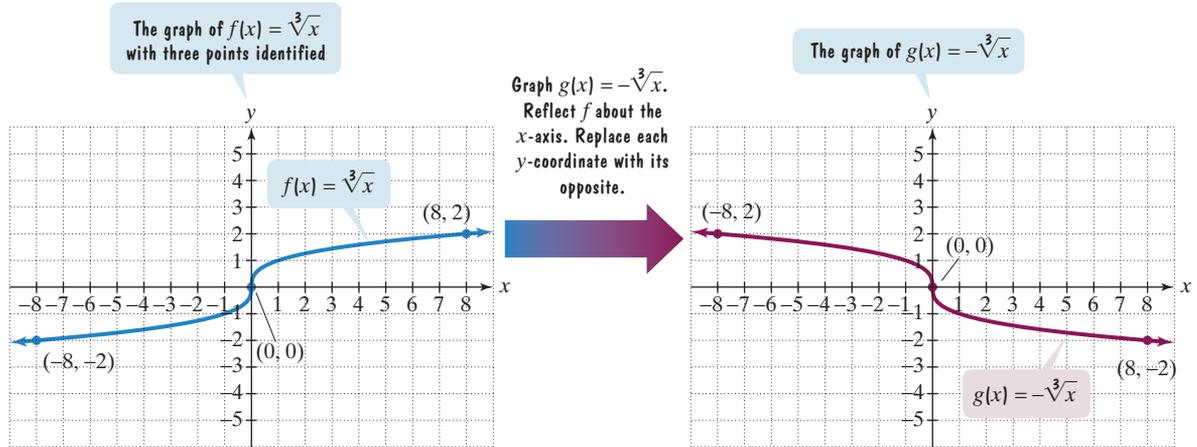

**EXAMPLE 4** Reflection about the  $x$ -Axis

Use the graph of  $f(x) = \sqrt[3]{x}$  to obtain the graph of  $g(x) = -\sqrt[3]{x}$ .

**SOLUTION**

Compare the equations for  $f(x) = \sqrt[3]{x}$  and  $g(x) = -\sqrt[3]{x}$ . The graph of  $g$  is a reflection about the  $x$ -axis of the graph of  $f$  because

$$g(x) = -\sqrt[3]{x} = -f(x).$$

**Check Point 4** Use the graph of  $f(x) = |x|$  to obtain the graph of  $g(x) = -|x|$ .

It is also possible to reflect graphs about the  $y$ -axis.

**Reflection about the  $y$ -Axis**

The graph of  $y = f(-x)$  is the graph of  $y = f(x)$  reflected about the  $y$ -axis.

For each point  $(x, y)$  on the graph of  $y = f(x)$ , the point  $(-x, y)$  is on the graph of  $y = f(-x)$ .

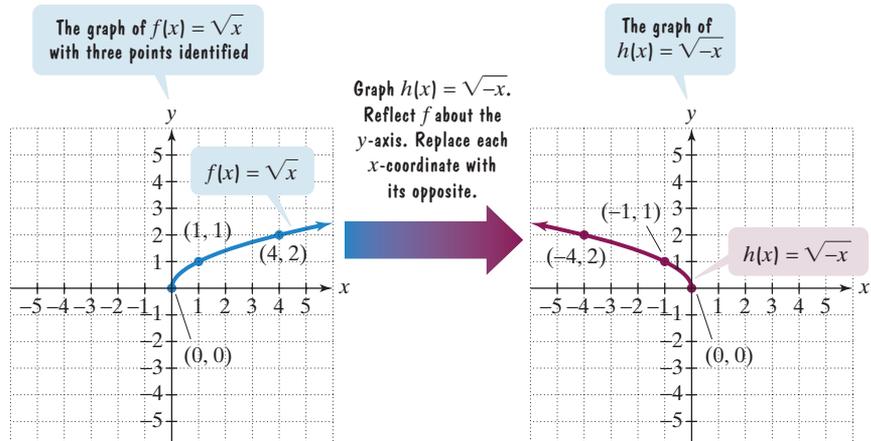

**EXAMPLE 5** Reflection about the  $y$ -Axis

Use the graph of  $f(x) = \sqrt{x}$  to obtain the graph of  $h(x) = \sqrt{-x}$ .

**SOLUTION**

Compare the equations for  $f(x) = \sqrt{x}$  and  $h(x) = \sqrt{-x}$ . The graph of  $h$  is a reflection about the  $y$ -axis of the graph of  $f$  because

$$h(x) = \sqrt{-x} = f(-x).$$

**Check Point 5** Use the graph of  $f(x) = \sqrt[3]{x}$  to obtain the graph of  $h(x) = \sqrt[3]{-x}$ .

- 5 Use vertical stretching and shrinking to graph functions.

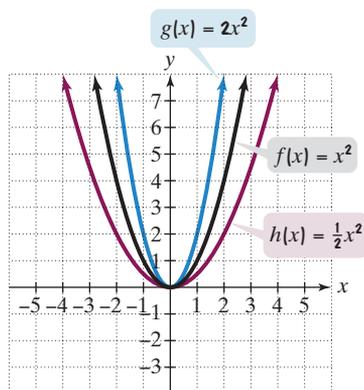

FIGURE 1.59 Vertically stretching and shrinking  $f(x) = x^2$

## GREAT QUESTION!

**Does vertical stretching or shrinking change a graph's shape?**

Yes. A vertical stretch moves a function's graph away from the  $x$ -axis. A vertical shrink compresses a function's graph toward the  $x$ -axis. The other transformations we have discussed (vertical shifts, horizontal shifts, and reflections) change only the position of a function's graph without changing the shape of the basic graph.

## Vertical Stretching and Shrinking

Morphing does much more than move an image horizontally, vertically, or about an axis. An object having one shape is transformed into a different shape. Horizontal shifts, vertical shifts, and reflections do not change the basic shape of a graph. Graphs remain rigid and proportionally the same when they undergo these transformations. How can we shrink and stretch graphs, thereby altering their basic shapes?

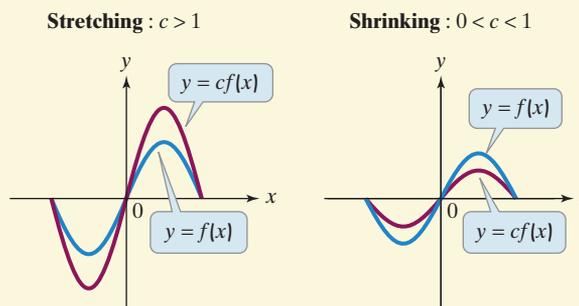

Look at the three graphs in **Figure 1.59**. The black graph in the middle is the graph of the standard quadratic function,  $f(x) = x^2$ . Now, look at the blue graph on the top. The equation of this graph is  $g(x) = 2x^2$ , or  $g(x) = 2f(x)$ . Thus, for each  $x$ , the  $y$ -coordinate of  $g$  is two times as large as the corresponding  $y$ -coordinate on the graph of  $f$ . The result is a narrower graph because the values of  $y$  are rising faster. We say that the graph of  $g$  is obtained by vertically *stretching* the graph of  $f$ . Now, look at the red graph on the bottom. The equation of this graph is  $h(x) = \frac{1}{2}x^2$ , or  $h(x) = \frac{1}{2}f(x)$ . Thus, for each  $x$ , the  $y$ -coordinate of  $h$  is one-half as large as the corresponding  $y$ -coordinate on the graph of  $f$ . The result is a wider graph because the values of  $y$  are rising more slowly. We say that the graph of  $h$  is obtained by vertically *shrinking* the graph of  $f$ .

These observations can be summarized as follows:

### Vertically Stretching and Shrinking Graphs

Let  $f$  be a function and  $c$  a positive real number.

- If  $c > 1$ , the graph of  $y = cf(x)$  is the graph of  $y = f(x)$  vertically stretched by multiplying each of its  $y$ -coordinates by  $c$ .
- If  $0 < c < 1$ , the graph of  $y = cf(x)$  is the graph of  $y = f(x)$  vertically shrunk by multiplying each of its  $y$ -coordinates by  $c$ .

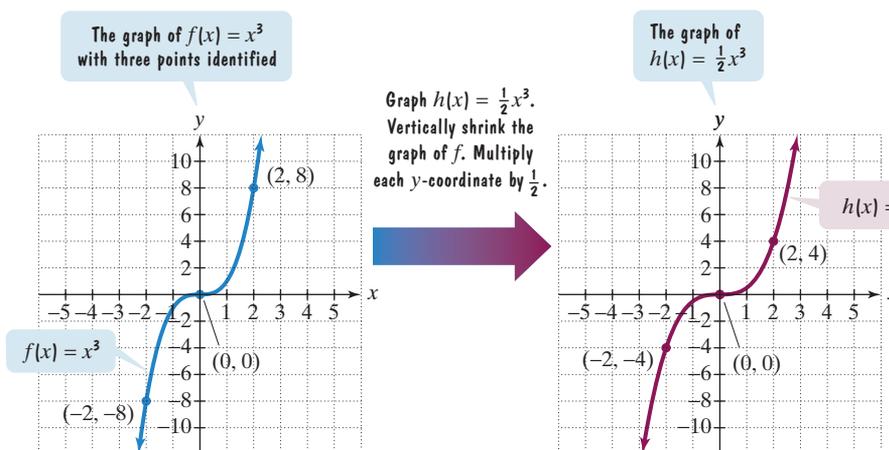

### EXAMPLE 6 Vertically Shrinking a Graph

Use the graph of  $f(x) = x^3$  to obtain the graph of  $h(x) = \frac{1}{2}x^3$ .

#### SOLUTION

The graph of  $h(x) = \frac{1}{2}x^3$  is obtained by vertically shrinking the graph of  $f(x) = x^3$ .

 **Check Point 6** Use the graph of  $f(x) = |x|$  to obtain the graph of  $g(x) = 2|x|$ .

**6** Use horizontal stretching and shrinking to graph functions.

**GREAT QUESTION!**

**How does horizontal shrinking or stretching change a graph's shape?**

A horizontal shrink compresses a function's graph toward the  $y$ -axis. A horizontal stretch moves a function's graph away from the  $y$ -axis.

**Horizontal Stretching and Shrinking**

It is also possible to stretch and shrink graphs horizontally.

**Horizontally Stretching and Shrinking Graphs**

Let  $f$  be a function and  $c$  a positive real number.

- If  $c > 1$ , the graph of  $y = f(cx)$  is the graph of  $y = f(x)$  horizontally shrunk by dividing each of its  $x$ -coordinates by  $c$ .
- If  $0 < c < 1$ , the graph of  $y = f(cx)$  is the graph of  $y = f(x)$  horizontally stretched by dividing each of its  $x$ -coordinates by  $c$ .

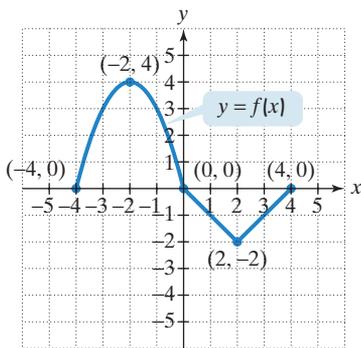

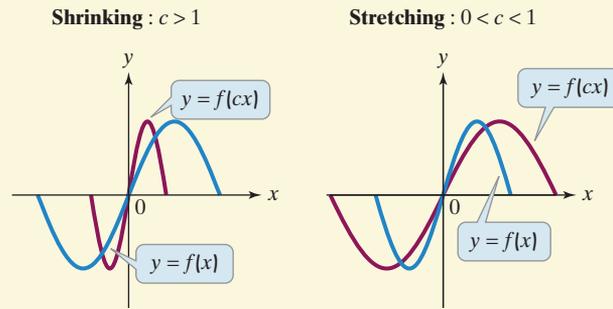

FIGURE 1.60

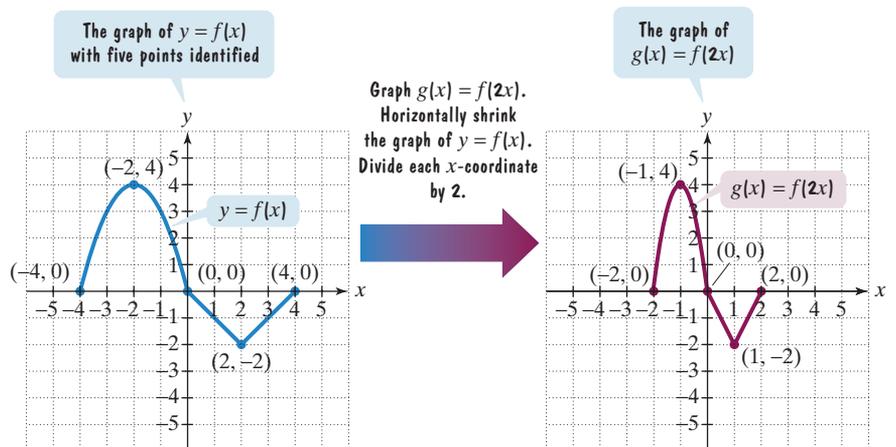

**EXAMPLE 7** Horizontally Stretching and Shrinking a Graph

Use the graph of  $y = f(x)$  in **Figure 1.60** to obtain each of the following graphs:

- a.  $g(x) = f(2x)$       b.  $h(x) = f(\frac{1}{2}x)$

**SOLUTION**

- a. The graph of  $g(x) = f(2x)$  is obtained by horizontally shrinking the graph of  $y = f(x)$ .

- b. The graph of  $h(x) = f(\frac{1}{2}x)$  is obtained by horizontally stretching the graph of  $y = f(x)$ .

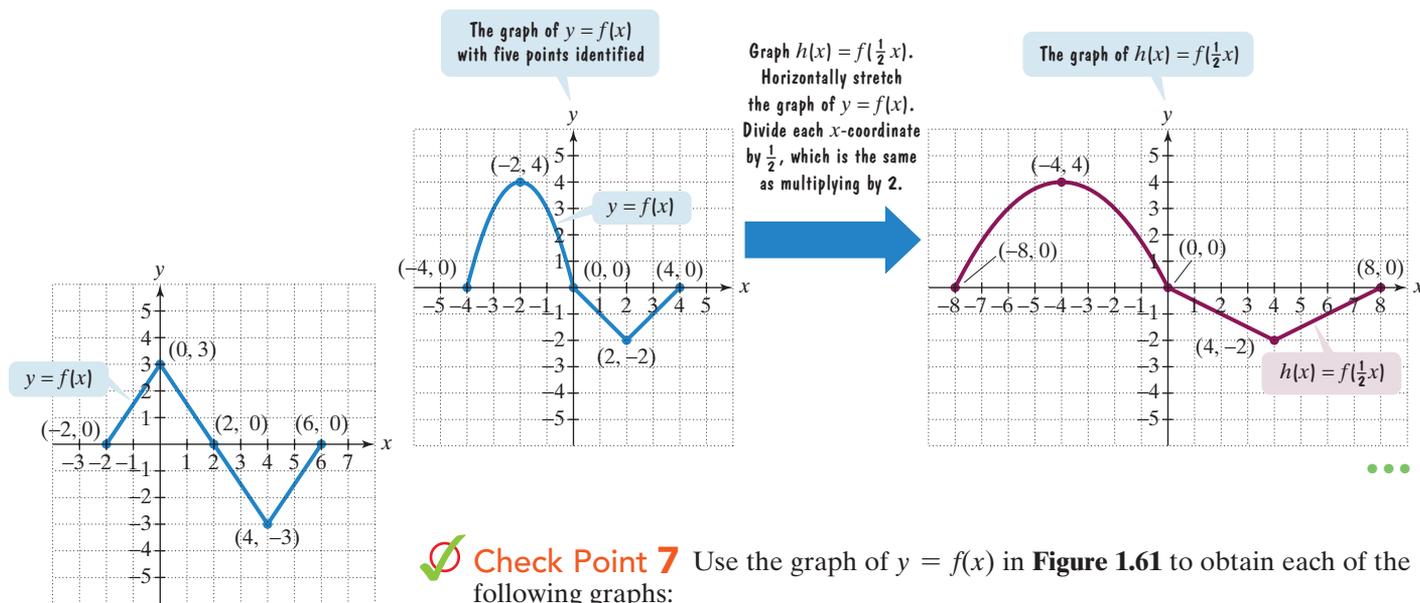

FIGURE 1.61

**Check Point 7** Use the graph of  $y = f(x)$  in **Figure 1.61** to obtain each of the following graphs:

a.  $g(x) = f(2x)$

b.  $h(x) = f(\frac{1}{2}x)$ .

- 7** Graph functions involving a sequence of transformations.

### Sequences of Transformations

**Table 1.4** summarizes the procedures for transforming the graph of  $y = f(x)$ .

**Table 1.4** Summary of Transformations

In each case,  $c$  represents a positive real number.

To Graph:	Draw the Graph of $f$ and:	Changes in the Equation of $y = f(x)$
Vertical shifts $y = f(x) + c$ $y = f(x) - c$	Raise the graph of $f$ by $c$ units. Lower the graph of $f$ by $c$ units.	$c$ is added to $f(x)$ . $c$ is subtracted from $f(x)$ .
Horizontal shifts $y = f(x + c)$ $y = f(x - c)$	Shift the graph of $f$ to the left $c$ units. Shift the graph of $f$ to the right $c$ units.	$x$ is replaced with $x + c$ . $x$ is replaced with $x - c$ .
Reflection about the $x$ -axis $y = -f(x)$	Reflect the graph of $f$ about the $x$ -axis.	$f(x)$ is multiplied by $-1$ .
Reflection about the $y$ -axis $y = f(-x)$	Reflect the graph of $f$ about the $y$ -axis.	$x$ is replaced with $-x$ .
Vertical stretching or shrinking $y = cf(x), c > 1$ $y = cf(x), 0 < c < 1$	Multiply each $y$ -coordinate of $y = f(x)$ by $c$ , vertically stretching the graph of $f$ . Multiply each $y$ -coordinate of $y = f(x)$ by $c$ , vertically shrinking the graph of $f$ .	$f(x)$ is multiplied by $c, c > 1$ . $f(x)$ is multiplied by $c, 0 < c < 1$ .
Horizontal stretching or shrinking $y = f(cx), c > 1$ $y = f(cx), 0 < c < 1$	Divide each $x$ -coordinate of $y = f(x)$ by $c$ , horizontally shrinking the graph of $f$ . Divide each $x$ -coordinate of $y = f(x)$ by $c$ , horizontally stretching the graph of $f$ .	$x$ is replaced with $cx, c > 1$ . $x$ is replaced with $cx, 0 < c < 1$ .

A function involving more than one transformation can be graphed by performing transformations in the following order:

1. Horizontal shifting
2. Stretching or shrinking
3. Reflecting
4. Vertical shifting

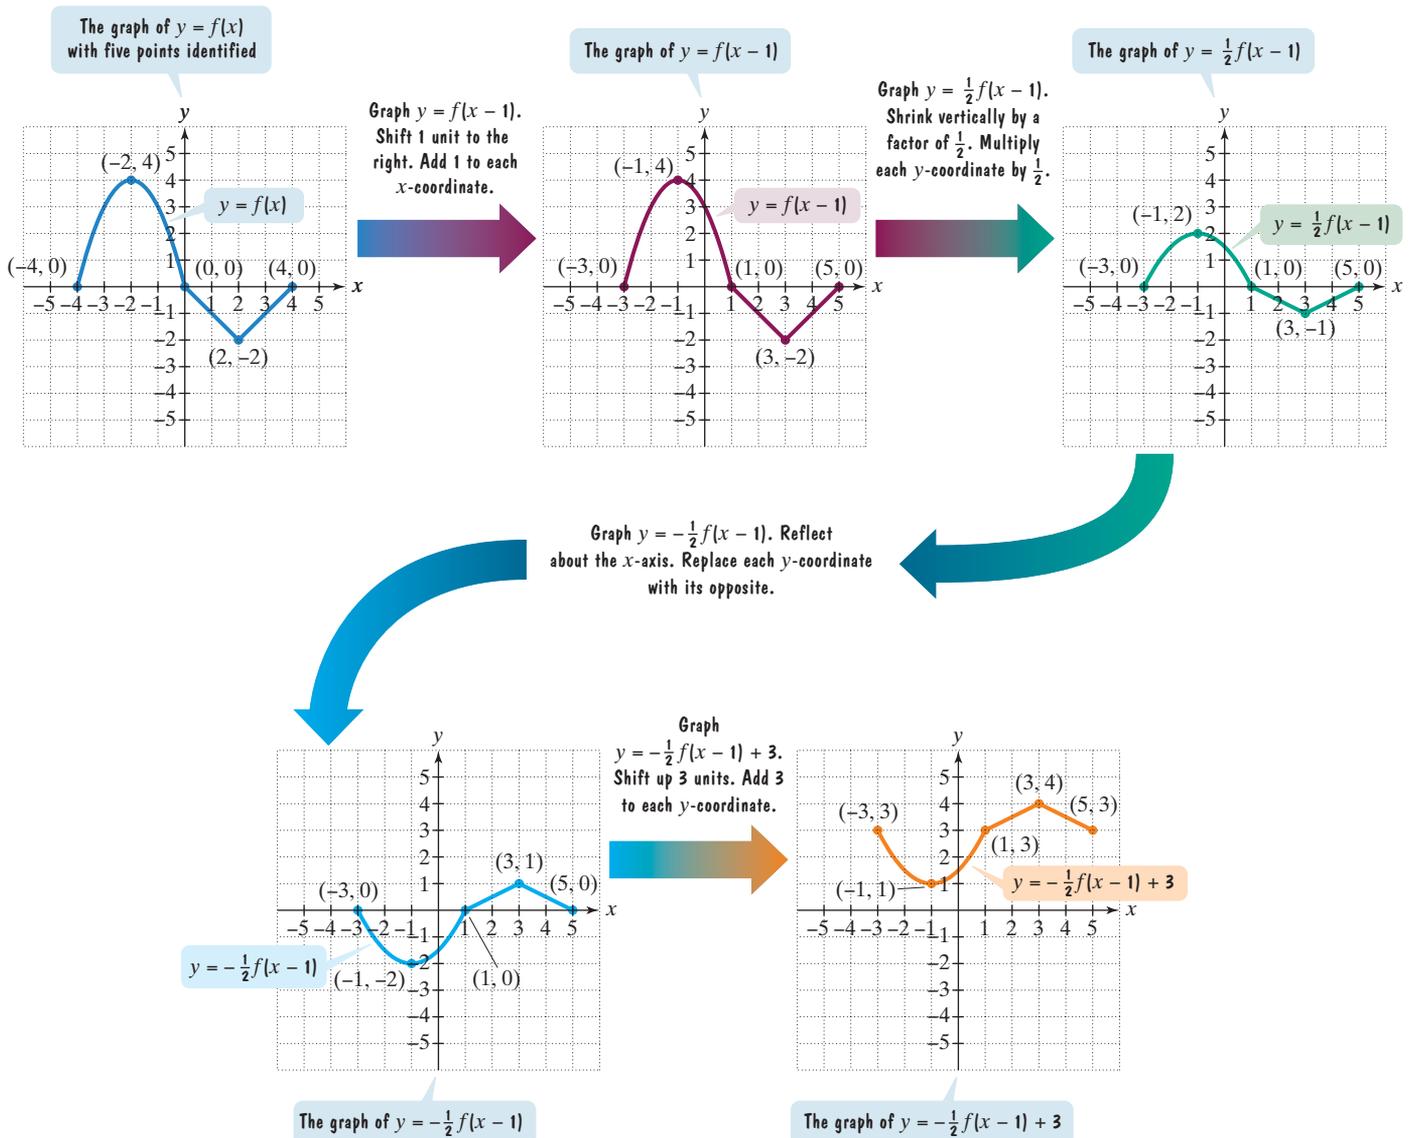

### EXAMPLE 8 Graphing Using a Sequence of Transformations

Use the graph of  $y = f(x)$  given in **Figure 1.60** of Example 7 on page 223, and repeated below, to graph  $y = -\frac{1}{2}f(x - 1) + 3$ .

### SOLUTION

Our graphs will evolve in the following order:

1. Horizontal shifting: Graph  $y = f(x - 1)$  by shifting the graph of  $y = f(x)$  1 unit to the right.
2. Shrinking: Graph  $y = \frac{1}{2}f(x - 1)$  by shrinking the previous graph by a factor of  $\frac{1}{2}$ .
3. Reflecting: Graph  $y = -\frac{1}{2}f(x - 1)$  by reflecting the previous graph about the  $x$ -axis.
4. Vertical shifting: Graph  $y = -\frac{1}{2}f(x - 1) + 3$  by shifting the previous graph up 3 units.

 **Check Point 8** Use the graph of  $y = f(x)$  given in **Figure 1.61** of Check Point 7 on page 224 to graph  $y = -\frac{1}{3}f(x + 1) - 2$ .

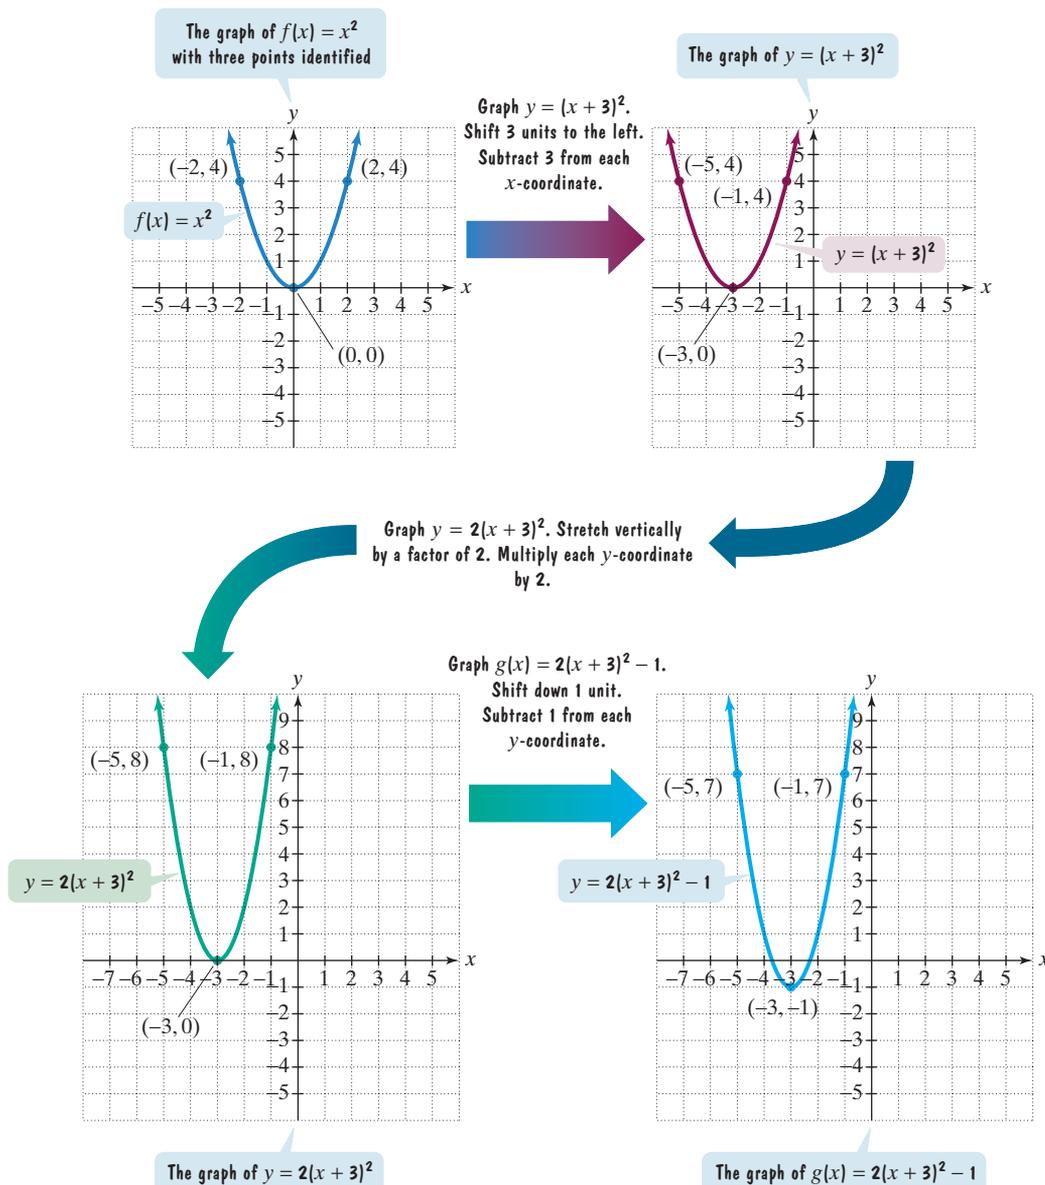

### EXAMPLE 9 Graphing Using a Sequence of Transformations

Use the graph of  $f(x) = x^2$  to graph  $g(x) = 2(x + 3)^2 - 1$ .

#### SOLUTION

Our graphs will evolve in the following order:

1. Horizontal shifting: Graph  $y = (x + 3)^2$  by shifting the graph of  $f(x) = x^2$  three units to the left.
2. Stretching: Graph  $y = 2(x + 3)^2$  by stretching the previous graph by a factor of 2.
3. Vertical shifting: Graph  $g(x) = 2(x + 3)^2 - 1$  by shifting the previous graph down 1 unit.

 **Check Point 9** Use the graph of  $f(x) = x^2$  to graph  $g(x) = 2(x - 1)^2 + 3$ .

## CONCEPT AND VOCABULARY CHECK

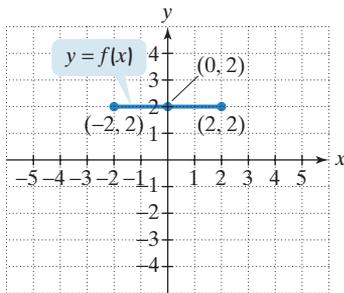

Fill in each blank so that the resulting statement is true.

- The graph of  $y = f(x) - 5$  is obtained by a/an \_\_\_\_\_ shift of the graph of  $y = f(x)$  \_\_\_\_\_ a distance of 5 units.
- The graph of  $y = f(x - 5)$  is obtained by a/an \_\_\_\_\_ shift of the graph of  $y = f(x)$  \_\_\_\_\_ a distance of 5 units.
- The graph of  $y = -f(x)$  is the graph of  $y = f(x)$  reflected about the \_\_\_\_\_.
- The graph of  $y = f(-x)$  is the graph of  $y = f(x)$  reflected about the \_\_\_\_\_.
- The graph of  $y = 5f(x)$  is obtained by a/an \_\_\_\_\_ stretch of the graph of  $y = f(x)$  by multiplying each of its \_\_\_\_\_-coordinates by 5.
- The graph of  $y = f(\frac{1}{5}x)$  is obtained by a/an \_\_\_\_\_ stretch of the graph of  $y = f(x)$  by multiplying each of its \_\_\_\_\_-coordinates by 5.
- True or false: The graph of  $g(x) = \sqrt{x + 4}$  is the graph of  $f(x) = \sqrt{x}$  shifted horizontally to the right by 4 units. \_\_\_\_\_

## EXERCISE SET 1.6

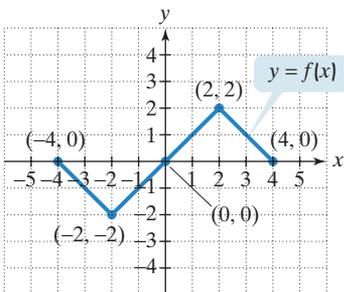

### Practice Exercises

In Exercises 1–16, use the graph of  $y = f(x)$  to graph each function  $g$ .

- $g(x) = f(x) + 1$
- $g(x) = f(x) - 1$
- $g(x) = f(x + 1)$
- $g(x) = f(x - 1)$
- $g(x) = f(x - 1) - 2$
- $g(x) = f(x + 1) + 2$
- $g(x) = f(-x)$
- $g(x) = -f(x)$
- $g(x) = -f(x) + 3$
- $g(x) = f(-x) + 3$
- $g(x) = \frac{1}{2}f(x)$
- $g(x) = 2f(x)$
- $g(x) = f(\frac{1}{2}x)$
- $g(x) = f(2x)$
- $g(x) = -f(\frac{1}{2}x) + 1$
- $g(x) = -f(2x) - 1$

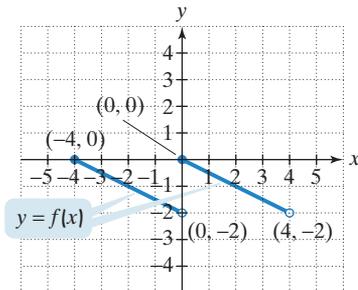

In Exercises 17–32, use the graph of  $y = f(x)$  to graph each function  $g$ .

- $g(x) = f(x) - 1$
- $g(x) = f(x) + 1$
- $g(x) = f(x - 1)$
- $g(x) = f(x + 1)$
- $g(x) = f(x - 1) + 2$
- $g(x) = f(x + 1) - 2$
- $g(x) = -f(x)$
- $g(x) = f(-x)$

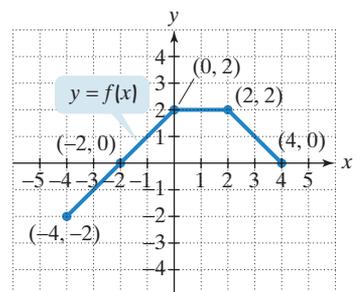

- $g(x) = f(-x) + 1$
- $g(x) = -f(x) + 1$
- $g(x) = 2f(x)$
- $g(x) = \frac{1}{2}f(x)$
- $g(x) = f(2x)$
- $g(x) = f(\frac{1}{2}x)$
- $g(x) = 2f(x + 2) + 1$
- $g(x) = 2f(x + 2) - 1$

In Exercises 33–44, use the graph of  $y = f(x)$  to graph each function  $g$ .

- $g(x) = f(x) + 2$
- $g(x) = f(x) - 2$
- $g(x) = f(x + 2)$
- $g(x) = f(x - 2)$
- $g(x) = -f(x + 2)$
- $g(x) = -f(x - 2)$
- $g(x) = -\frac{1}{2}f(x + 2)$
- $g(x) = -\frac{1}{2}f(x - 2)$
- $g(x) = -\frac{1}{2}f(x + 2) - 2$
- $g(x) = -\frac{1}{2}f(x - 2) + 2$
- $g(x) = \frac{1}{2}f(2x)$
- $g(x) = 2f(\frac{1}{2}x)$

In Exercises 45–52, use the graph of  $y = f(x)$  to graph each function  $g$ .

- $g(x) = f(x - 1) - 1$
- $g(x) = f(x + 1) + 1$
- $g(x) = -f(x - 1) + 1$
- $g(x) = -f(x + 1) - 1$

49.  $g(x) = 2f(\frac{1}{2}x)$       50.  $g(x) = \frac{1}{2}f(2x)$   
 51.  $g(x) = \frac{1}{2}f(x + 1)$       52.  $g(x) = 2f(x - 1)$

In Exercises 53–66, begin by graphing the standard quadratic function,  $f(x) = x^2$ . Then use transformations of this graph to graph the given function.

53.  $g(x) = x^2 - 2$       54.  $g(x) = x^2 - 1$   
 55.  $g(x) = (x - 2)^2$       56.  $g(x) = (x - 1)^2$   
 57.  $h(x) = -(x - 2)^2$       58.  $h(x) = -(x - 1)^2$   
 59.  $h(x) = (x - 2)^2 + 1$       60.  $h(x) = (x - 1)^2 + 2$   
 61.  $g(x) = 2(x - 2)^2$       62.  $g(x) = \frac{1}{2}(x - 1)^2$   
 63.  $h(x) = 2(x - 2)^2 - 1$       64.  $h(x) = \frac{1}{2}(x - 1)^2 - 1$   
 65.  $h(x) = -2(x + 1)^2 + 1$       66.  $h(x) = -2(x + 2)^2 + 1$

In Exercises 67–80, begin by graphing the square root function,  $f(x) = \sqrt{x}$ . Then use transformations of this graph to graph the given function.

67.  $g(x) = \sqrt{x} + 2$       68.  $g(x) = \sqrt{x} + 1$   
 69.  $g(x) = \sqrt{x + 2}$       70.  $g(x) = \sqrt{x + 1}$   
 71.  $h(x) = -\sqrt{x + 2}$       72.  $h(x) = -\sqrt{x + 1}$   
 73.  $h(x) = \sqrt{-x + 2}$       74.  $h(x) = \sqrt{-x + 1}$   
 75.  $g(x) = \frac{1}{2}\sqrt{x + 2}$       76.  $g(x) = 2\sqrt{x + 1}$   
 77.  $h(x) = \sqrt{x + 2} - 2$       78.  $h(x) = \sqrt{x + 1} - 1$   
 79.  $g(x) = 2\sqrt{x + 2} - 2$       80.  $g(x) = 2\sqrt{x + 1} - 1$

In Exercises 81–94, begin by graphing the absolute value function,  $f(x) = |x|$ . Then use transformations of this graph to graph the given function.

81.  $g(x) = |x| + 4$       82.  $g(x) = |x| + 3$   
 83.  $g(x) = |x + 4|$       84.  $g(x) = |x + 3|$   
 85.  $h(x) = |x + 4| - 2$       86.  $h(x) = |x + 3| - 2$   
 87.  $h(x) = -|x + 4|$       88.  $h(x) = -|x + 3|$   
 89.  $g(x) = -|x + 4| + 1$       90.  $g(x) = -|x + 4| + 2$   
 91.  $h(x) = 2|x + 4|$       92.  $h(x) = 2|x + 3|$   
 93.  $g(x) = -2|x + 4| + 1$       94.  $g(x) = -2|x + 3| + 2$

In Exercises 95–106, begin by graphing the standard cubic function,  $f(x) = x^3$ . Then use transformations of this graph to graph the given function.

95.  $g(x) = x^3 - 3$       96.  $g(x) = x^3 - 2$   
 97.  $g(x) = (x - 3)^3$       98.  $g(x) = (x - 2)^3$   
 99.  $h(x) = -x^3$       100.  $h(x) = -(x - 2)^3$   
 101.  $h(x) = \frac{1}{2}x^3$       102.  $h(x) = \frac{1}{4}x^3$   
 103.  $r(x) = (x - 3)^3 + 2$       104.  $r(x) = (x - 2)^3 + 1$   
 105.  $h(x) = \frac{1}{2}(x - 3)^3 - 2$       106.  $h(x) = \frac{1}{2}(x - 2)^3 - 1$

In Exercises 107–118, begin by graphing the cube root function,  $f(x) = \sqrt[3]{x}$ . Then use transformations of this graph to graph the given function.

107.  $g(x) = \sqrt[3]{x} + 2$       108.  $g(x) = \sqrt[3]{x} - 2$   
 109.  $g(x) = \sqrt[3]{x + 2}$       110.  $g(x) = \sqrt[3]{x - 2}$   
 111.  $h(x) = \frac{1}{2}\sqrt[3]{x + 2}$       112.  $h(x) = \frac{1}{2}\sqrt[3]{x - 2}$   
 113.  $r(x) = \frac{1}{2}\sqrt[3]{x + 2} - 2$       114.  $r(x) = \frac{1}{2}\sqrt[3]{x - 2} + 2$

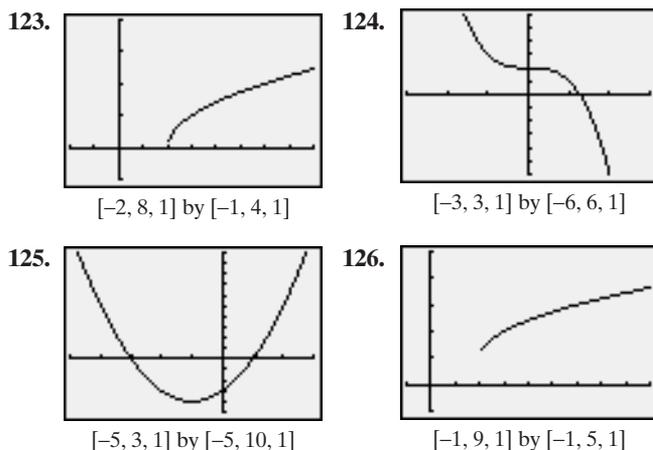

115.  $h(x) = -\sqrt[3]{x + 2}$       116.  $h(x) = -\sqrt[3]{x - 2}$   
 117.  $g(x) = \sqrt[3]{-x - 2}$       118.  $g(x) = \sqrt[3]{-x + 2}$

**Practice Plus**

In Exercises 119–122, use transformations of the graph of the greatest integer function,  $f(x) = \text{int}(x)$ , to graph each function. (The graph of  $f(x) = \text{int}(x)$  is shown in **Figure 1.35** on page 180.)

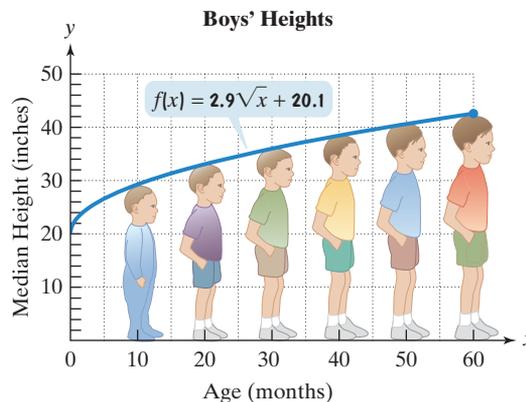

119.  $g(x) = 2 \text{int}(x + 1)$       120.  $g(x) = 3 \text{int}(x - 1)$   
 121.  $h(x) = \text{int}(-x) + 1$       122.  $h(x) = \text{int}(-x) - 1$

In Exercises 123–126, write a possible equation for the function whose graph is shown. Each graph shows a transformation of a common function.

**Application Exercises**

127. The function  $f(x) = 2.9\sqrt{x} + 20.1$  models the median height,  $f(x)$ , in inches, of boys who are  $x$  months of age. The graph of  $f$  is shown.

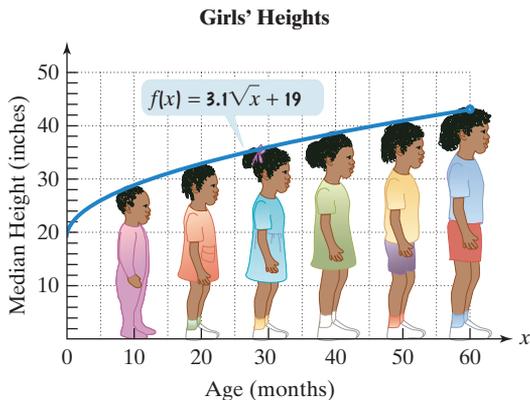

Source: Laura Walther Nathanson, *The Portable Pediatrician for Parents*

- Describe how the graph can be obtained using transformations of the square root function  $f(x) = \sqrt{x}$ .
- According to the model, what is the median height of boys who are 48 months, or four years, old? Use a calculator and round to the nearest tenth of an inch. The actual median height for boys at 48 months is 40.8 inches. How well does the model describe the actual height?

(This exercise continues on the next page.)

- c. Use the model to find the average rate of change, in inches per month, between birth and 10 months. Round to the nearest tenth.
- d. Use the model to find the average rate of change, in inches per month, between 50 and 60 months. Round to the nearest tenth. How does this compare with your answer in part (c)? How is this difference shown by the graph?
128. The function  $f(x) = 3.1\sqrt{x} + 19$  models the median height,  $f(x)$ , in inches, of girls who are  $x$  months of age. The graph of  $f$  is shown.

- a. Describe how the graph can be obtained using transformations of the square root function  $f(x) = \sqrt{x}$ .
- b. According to the model, what is the median height of girls who are 48 months, or 4 years, old? Use a calculator and round to the nearest tenth of an inch. The actual median height for girls at 48 months is 40.2 inches. How well does the model describe the actual height?
- c. Use the model to find the average rate of change, in inches per month, between birth and 10 months. Round to the nearest tenth.
- d. Use the model to find the average rate of change, in inches per month, between 50 and 60 months. Round to the nearest tenth. How does this compare with your answer in part (c)? How is this difference shown by the graph?

### Writing in Mathematics

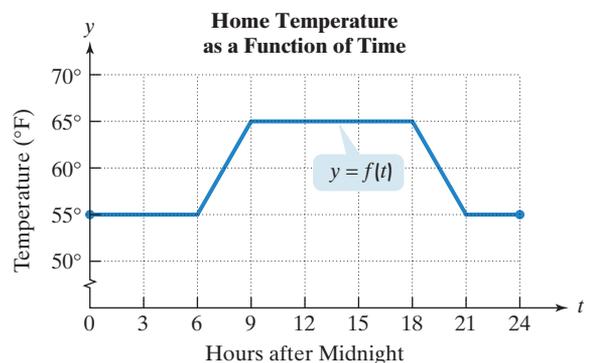

129. What must be done to a function's equation so that its graph is shifted vertically upward?
130. What must be done to a function's equation so that its graph is shifted horizontally to the right?
131. What must be done to a function's equation so that its graph is reflected about the  $x$ -axis?
132. What must be done to a function's equation so that its graph is reflected about the  $y$ -axis?
133. What must be done to a function's equation so that its graph is stretched vertically?
134. What must be done to a function's equation so that its graph is shrunk horizontally?

### Technology Exercises

135. a. Use a graphing utility to graph  $f(x) = x^2 + 1$ .
- b. Graph  $f(x) = x^2 + 1$ ,  $g(x) = f(2x)$ ,  $h(x) = f(3x)$ , and  $k(x) = f(4x)$  in the same viewing rectangle.
- c. Describe the relationship among the graphs of  $f$ ,  $g$ ,  $h$ , and  $k$ , with emphasis on different values of  $x$  for points on all four graphs that give the same  $y$ -coordinate.
- d. Generalize by describing the relationship between the graph of  $f$  and the graph of  $g$ , where  $g(x) = f(cx)$  for  $c > 1$ .
- e. Try out your generalization by sketching the graphs of  $f(cx)$  for  $c = 1$ ,  $c = 2$ ,  $c = 3$ , and  $c = 4$  for a function of your choice.
136. a. Use a graphing utility to graph  $f(x) = x^2 + 1$ .
- b. Graph  $f(x) = x^2 + 1$ ,  $g(x) = f(\frac{1}{2}x)$ , and  $h(x) = f(\frac{1}{4}x)$  in the same viewing rectangle.
- c. Describe the relationship among the graphs of  $f$ ,  $g$ , and  $h$ , with emphasis on different values of  $x$  for points on all three graphs that give the same  $y$ -coordinate.
- d. Generalize by describing the relationship between the graph of  $f$  and the graph of  $g$ , where  $g(x) = f(cx)$  for  $0 < c < 1$ .
- e. Try out your generalization by sketching the graphs of  $f(cx)$  for  $c = 1$ , and  $c = \frac{1}{2}$ , and  $c = \frac{1}{4}$  for a function of your choice.

### Critical Thinking Exercises

**Make Sense?** During the winter, you program your home thermostat so that at midnight, the temperature is  $55^\circ$ . This temperature is maintained until 6 A.M. Then the house begins to warm up so that by 9 A.M. the temperature is  $65^\circ$ . At 6 P.M. the house begins to cool. By 9 P.M., the temperature is again  $55^\circ$ . The graph illustrates home temperature,  $f(t)$ , as a function of hours after midnight,  $t$ .

In Exercises 137–140, determine whether each statement makes sense or does not make sense, and explain your reasoning. If the statement makes sense, graph the new function on the domain  $[0, 24]$ . If the statement does not make sense, correct the function in the statement and graph the corrected function on the domain  $[0, 24]$ .

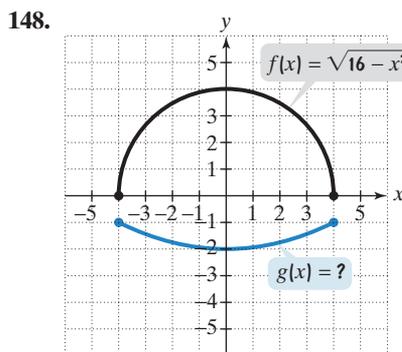

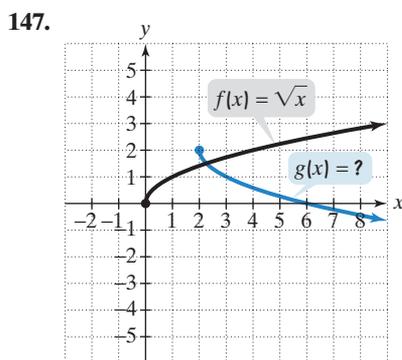

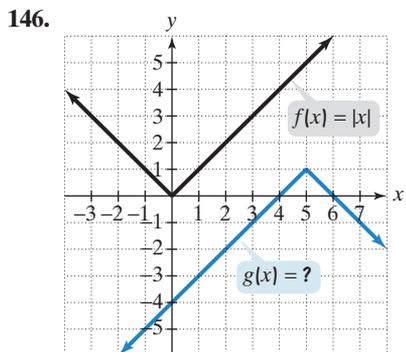

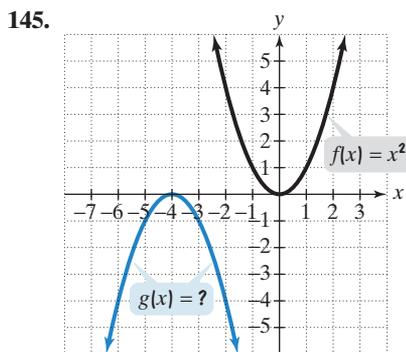

137. I decided to keep the house  $5^\circ$  warmer than before, so I reprogrammed the thermostat to  $y = f(t) + 5$ .
138. I decided to keep the house  $5^\circ$  cooler than before, so I reprogrammed the thermostat to  $y = f(t) - 5$ .

139. I decided to change the heating schedule to start one hour earlier than before, so I reprogrammed the thermostat to  $y = f(t - 1)$ .
140. I decided to change the heating schedule to start one hour later than before, so I reprogrammed the thermostat to  $y = f(t + 1)$ .

In Exercises 141–144, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

141. If  $f(x) = |x|$  and  $g(x) = |x + 3| + 3$ , then the graph of  $g$  is a translation of the graph of  $f$  three units to the right and three units upward.
142. If  $f(x) = -\sqrt{x}$  and  $g(x) = \sqrt{-x}$ , then  $f$  and  $g$  have identical graphs.
143. If  $f(x) = x^2$  and  $g(x) = 5(x^2 - 2)$ , then the graph of  $g$  can be obtained from the graph of  $f$  by stretching  $f$  five units followed by a downward shift of two units.
144. If  $f(x) = x^3$  and  $g(x) = -(x - 3)^3 - 4$ , then the graph of  $g$  can be obtained from the graph of  $f$  by moving  $f$  three units to the right, reflecting about the  $x$ -axis, and then moving the resulting graph down four units.

In Exercises 145–148, functions  $f$  and  $g$  are graphed in the same rectangular coordinate system. If  $g$  is obtained from  $f$  through a sequence of transformations, find an equation for  $g$ .

For Exercises 149–152, assume that  $(a, b)$  is a point on the graph of  $f$ . What is the corresponding point on the graph of each of the following functions?

149.  $y = f(-x)$
150.  $y = 2f(x)$
151.  $y = f(x - 3)$
152.  $y = f(x) - 3$

### Preview Exercises

Exercises 153–155 will help you prepare for the material covered in the next section.

In Exercises 153–154, perform the indicated operation or operations.

153.  $(2x - 1)(x^2 + x - 2)$
154.  $(f(x))^2 - 2f(x) + 6$ , where  $f(x) = 3x - 4$
155. Simplify:  $\frac{2}{\frac{3}{x} - 1}$ .

## SECTION 1.7

## Combinations of Functions; Composite Functions

*Objectives*

- 1 Find the domain of a function.
- 2 Combine functions using the algebra of functions, specifying domains.
- 3 Form composite functions.
- 4 Determine domains for composite functions.
- 5 Write functions as compositions.

We're born. We die. **Figure 1.62** quantifies these statements by showing the number of births and deaths in the United States from 2000 through 2009.

Number of Births and Deaths in the United States

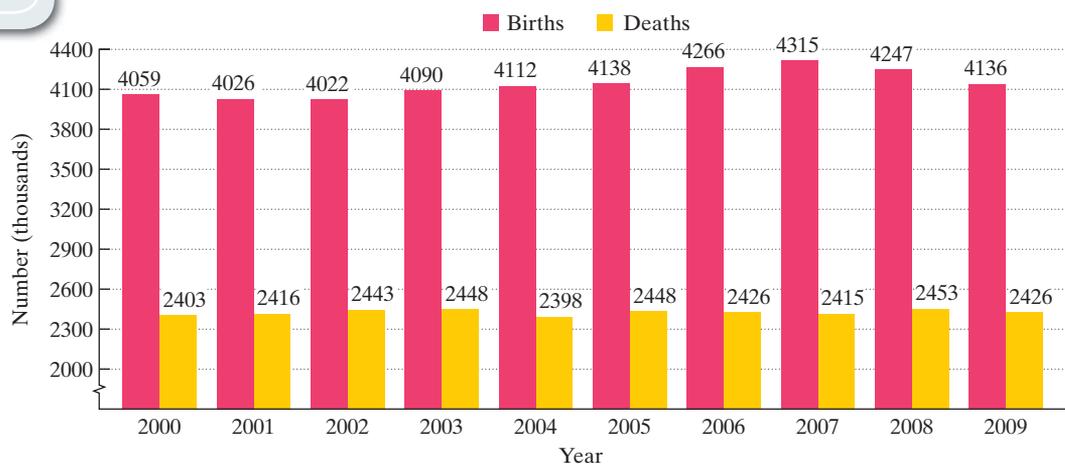

FIGURE 1.62

Source: U.S. Department of Health and Human Services

In this section, we look at these data from the perspective of functions. By considering the yearly change in the U.S. population, you will see that functions can be subtracted using procedures that will remind you of combining algebraic expressions.

- 1 Find the domain of a function.

**The Domain of a Function**

We begin with two functions that model the data in **Figure 1.62**.

$$B(x) = -2.6x^2 + 49x + 3994 \quad D(x) = -0.6x^2 + 7x + 2412$$

Number of births,  $B(x)$ , in thousands,  $x$  years after 2000

Number of deaths,  $D(x)$ , in thousands,  $x$  years after 2000

The years in **Figure 1.62** extend from 2000 through 2009. Because  $x$  represents the number of years after 2000,

$$\text{Domain of } B = \{0, 1, 2, 3, \dots, 9\}$$

and

$$\text{Domain of } D = \{0, 1, 2, 3, \dots, 9\}.$$

Functions that model data often have their domains explicitly given with the function's equation. However, for most functions, only an equation is given and the domain is not specified. In cases like this, the domain of a function  $f$  is the largest set of real numbers for which the value of  $f(x)$  is a real number. For example, consider the function

$$f(x) = \frac{1}{x - 3}.$$

Because division by 0 is undefined, the denominator,  $x - 3$ , cannot be 0. Thus,  $x$  cannot equal 3. The domain of the function consists of all real numbers other than 3, represented by

$$\text{Domain of } f = \{x \mid x \text{ is a real number and } x \neq 3\}.$$

Using interval notation,

$$\text{Domain of } f = (-\infty, 3) \cup (3, \infty).$$

Now consider a function involving a square root:

$$g(x) = \sqrt{x - 3}.$$

Because only nonnegative numbers have square roots that are real numbers, the expression under the square root sign,  $x - 3$ , must be nonnegative. We can use inspection to see that  $x - 3 \geq 0$  if  $x \geq 3$ . The domain of  $g$  consists of all real numbers that are greater than or equal to 3:

$$\text{Domain of } g = \{x \mid x \geq 3\} \text{ or } [3, \infty).$$

## GREAT QUESTION!

**Despite the voice balloons, the notation for the domain of  $f$  on the right is a mouthful! Will you be using set operations with interval notation in this section? What should I already know?**

Yes, you'll be seeing the intersection and the union of sets that are expressed in interval notation. Recall that the intersection of sets  $A$  and  $B$ , written  $A \cap B$ , is the set of elements common to both set  $A$  and set  $B$ . When sets  $A$  and  $B$  are in interval notation, to find the intersection, graph each interval and take the portion of the number line that the two graphs have in common. We will also be using notation involving the union of sets  $A$  and  $B$ ,  $A \cup B$ , meaning the set of elements in  $A$  or in  $B$  or in both. For more detail, see Section P.1, pages 5–6 and Section P.9, pages 121–122.

### Finding a Function's Domain

If a function  $f$  does not model data or verbal conditions, its domain is the largest set of real numbers for which the value of  $f(x)$  is a real number. Exclude from a function's domain real numbers that cause division by zero and real numbers that result in an even root, such as a square root, of a negative number.

### EXAMPLE 1 Finding the Domain of a Function

Find the domain of each function:

$$\begin{array}{ll} \text{a. } f(x) = x^2 - 7x & \text{b. } g(x) = \frac{3x + 2}{x^2 - 2x - 3} \\ \text{c. } h(x) = \sqrt{3x + 12} & \text{d. } j(x) = \frac{3x + 2}{\sqrt{14 - 2x}} \end{array}$$

### SOLUTION

The domain is the set of all real numbers,  $(-\infty, \infty)$ , unless  $x$  appears in a denominator or in an even root, such as a square root.

- a.** The function  $f(x) = x^2 - 7x$  contains neither division nor a square root. For every real number,  $x$ , the algebraic expression  $x^2 - 7x$  represents a real number. Thus, the domain of  $f$  is the set of all real numbers.

$$\text{Domain of } f = (-\infty, \infty)$$

- b.** The function  $g(x) = \frac{3x + 2}{x^2 - 2x - 3}$  contains division. Because division by 0 is undefined, we must exclude from the domain the values of  $x$  that cause the denominator,  $x^2 - 2x - 3$ , to be 0. We can identify these values by setting  $x^2 - 2x - 3$  equal to 0.

$$\begin{aligned}x^2 - 2x - 3 &= 0 && \text{Set the function's denominator equal to 0.} \\(x + 1)(x - 3) &= 0 && \text{Factor.} \\x + 1 = 0 \text{ or } x - 3 &= 0 && \text{Set each factor equal to 0.} \\x = -1 \quad \quad \quad x &= 3 && \text{Solve the resulting equations.}\end{aligned}$$

We must exclude  $-1$  and  $3$  from the domain of  $g(x) = \frac{3x + 2}{x^2 - 2x - 3}$ .

$$\text{Domain of } g = (-\infty, -1) \cup (-1, 3) \cup (3, \infty)$$

## GREAT QUESTION!

**When finding the domain of a function, when do I have to factor?**

In parts (a) and (b), observe when to factor and when not to factor a polynomial.

$$\bullet f(x) = x^2 - 7x$$

**Do not factor  $x^2 - 7x$  and set it equal to zero.**  
No values of  $x$  need be excluded from the domain.

$$\bullet g(x) = \frac{3x + 2}{x^2 - 2x - 3}$$

**Do factor  $x^2 - 2x - 3$  and set it equal to zero.**  
We must exclude values of  $x$  that cause this denominator to be zero.

- c. The function  $h(x) = \sqrt{3x + 12}$  contains an even root. Because only nonnegative numbers have real square roots, the quantity under the radical sign,  $3x + 12$ , must be greater than or equal to 0.

$$\begin{aligned}3x + 12 &\geq 0 && \text{Set the function's radicand greater than or equal to 0.} \\3x &\geq -12 && \text{Subtract 12 from both sides.} \\x &\geq -4 && \text{Divide both sides by 3. Division by a positive number} \\ &&& \text{preserves the sense of the inequality.}\end{aligned}$$

The domain of  $h$  consists of all real numbers greater than or equal to  $-4$ .

$$\text{Domain of } h = [-4, \infty)$$

The domain is highlighted on the  $x$ -axis in **Figure 1.63**.

- d. The function  $j(x) = \frac{3x + 2}{\sqrt{14 - 2x}}$  contains both an even root and division.

Because only nonnegative numbers have real square roots, the quantity under the radical sign,  $14 - 2x$ , must be greater than or equal to 0. But wait, there's more! Because division by 0 is undefined,  $14 - 2x$  cannot equal 0. Thus,  $14 - 2x$  must be strictly greater than 0.

$$\begin{aligned}14 - 2x &> 0 && \text{Set the function's radicand greater than 0.} \\-2x &> -14 && \text{Subtract 14 from both sides.} \\x &< 7 && \text{Divide both sides by } -2. \text{ Division by a negative} \\ &&& \text{number reverses the direction of the inequality.}\end{aligned}$$

The domain of  $j$  consists of all real numbers less than 7.

$$\text{Domain of } j = (-\infty, 7)$$

 **Check Point 1** Find the domain of each function:

a.  $f(x) = x^2 + 3x - 17$

b.  $g(x) = \frac{5x}{x^2 - 49}$

c.  $h(x) = \sqrt{9x - 27}$

d.  $j(x) = \frac{5x}{\sqrt{24 - 3x}}$

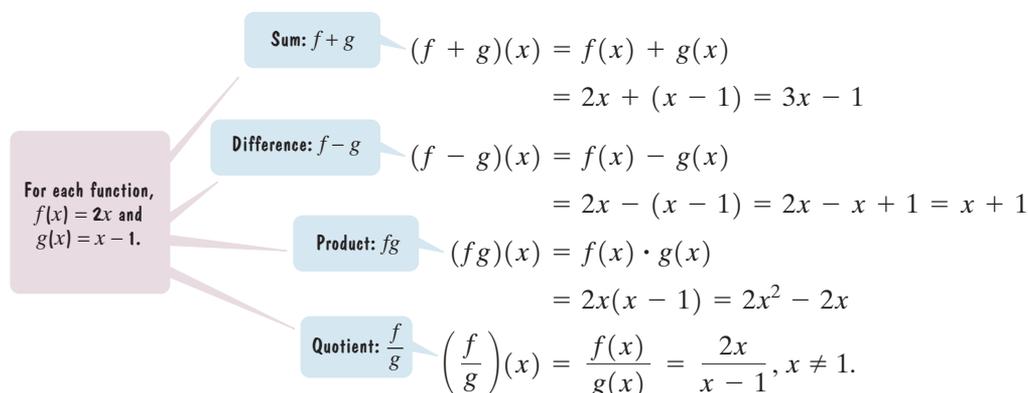

$[-10, 10, 1]$  by  $[-10, 10, 1]$

FIGURE 1.63

**2** Combine functions using the algebra of functions, specifying domains.

## The Algebra of Functions

We can combine functions using addition, subtraction, multiplication, and division by performing operations with the algebraic expressions that appear on the right side of the equations. For example, the functions  $f(x) = 2x$  and  $g(x) = x - 1$  can be combined to form the sum, difference, product, and quotient of  $f$  and  $g$ . Here's how it's done:

The domain for each of these functions consists of all real numbers that are common to the domains of  $f$  and  $g$ . Using  $D_f$  to represent the domain of  $f$  and  $D_g$  to represent the domain of  $g$ , the domain for each function is  $D_f \cap D_g$ . In the case of the quotient function  $\frac{f(x)}{g(x)}$ , we must remember not to divide by 0, so we add the further restriction that  $g(x) \neq 0$ .

### The Algebra of Functions: Sum, Difference, Product, and Quotient of Functions

Let  $f$  and  $g$  be two functions. The **sum**  $f + g$ , the **difference**  $f - g$ , the **product**  $fg$ , and the **quotient**  $\frac{f}{g}$  are functions whose domains are the set of all real numbers common to the domains of  $f$  and  $g$  ( $D_f \cap D_g$ ), defined as follows:

1. Sum:  $(f + g)(x) = f(x) + g(x)$
2. Difference:  $(f - g)(x) = f(x) - g(x)$
3. Product:  $(fg)(x) = f(x) \cdot g(x)$
4. Quotient:  $\left(\frac{f}{g}\right)(x) = \frac{f(x)}{g(x)}$ , provided  $g(x) \neq 0$ .

### EXAMPLE 2 Combining Functions

Let  $f(x) = 2x - 1$  and  $g(x) = x^2 + x - 2$ . Find each of the following functions:

a.  $(f + g)(x)$       b.  $(f - g)(x)$       c.  $(fg)(x)$       d.  $\left(\frac{f}{g}\right)(x)$ .

Determine the domain for each function.

### SOLUTION

- a.  $(f + g)(x) = f(x) + g(x)$   
 $= (2x - 1) + (x^2 + x - 2)$   
 $= x^2 + 3x - 3$   
*This is the definition of the sum  $f + g$ .  
 Substitute the given functions.  
 Remove parentheses and combine like terms.*
- b.  $(f - g)(x) = f(x) - g(x)$   
 $= (2x - 1) - (x^2 + x - 2)$   
 $= 2x - 1 - x^2 - x + 2$   
 $= -x^2 + x + 1$   
*This is the definition of the difference  $f - g$ .  
 Substitute the given functions.  
 Remove parentheses and change the sign of each term in the second set of parentheses.  
 Combine like terms and arrange terms in descending powers of  $x$ .*

$$\text{c. } (fg)(x) = f(x) \cdot g(x)$$

$$= (2x - 1)(x^2 + x - 2)$$

$$= 2x(x^2 + x - 2) - 1(x^2 + x - 2)$$

$$= 2x^3 + 2x^2 - 4x - x^2 - x + 2$$

$$= 2x^3 + (2x^2 - x^2) + (-4x - x) + 2$$

$$= 2x^3 + x^2 - 5x + 2$$

$$\text{d. } \left(\frac{f}{g}\right)(x) = \frac{f(x)}{g(x)}$$

$$= \frac{2x - 1}{x^2 + x - 2}$$

This is the definition of the product  $fg$ .

Substitute the given functions.

Multiply each term in the second factor by  $2x$  and  $-1$ , respectively.

Use the distributive property.

Rearrange terms so that like terms are adjacent.

Combine like terms.

This is the definition of the quotient  $\frac{f}{g}$ .

Substitute the given functions. This rational expression cannot be simplified.

## GREAT QUESTION!

**Should I simplify a quotient function before finding its domain?**

No. If the function  $\frac{f}{g}$  can be simplified, determine the domain *before* simplifying. All values of  $x$  for which  $g(x) = 0$  must be excluded from the domain.

**Example:**

$$f(x) = x^2 - 4 \text{ and } g(x) = x - 2$$

$$\left(\frac{f}{g}\right)(x) = \frac{x^2 - 4}{x - 2}$$

$x \neq 2$ . The domain of  $\frac{f}{g}$  is  $(-\infty, 2) \cup (2, \infty)$ .

$$= \frac{(x+2)(\cancel{x-2})}{(\cancel{x-2})} = x + 2$$

Because the equations for  $f$  and  $g$  do not involve division or contain even roots, the domain of both  $f$  and  $g$  is the set of all real numbers. Thus, the domain of  $f + g$ ,  $f - g$ , and  $fg$  is the set of all real numbers,  $(-\infty, \infty)$ .

The function  $\frac{f}{g}$  contains division. We must exclude from its domain values of  $x$  that cause the denominator,  $x^2 + x - 2$ , to be 0. Let's identify these values.

$$x^2 + x - 2 = 0 \quad \text{Set the denominator of } \frac{f}{g} \text{ equal to 0.}$$

$$(x + 2)(x - 1) = 0 \quad \text{Factor.}$$

$$x + 2 = 0 \quad \text{or} \quad x - 1 = 0 \quad \text{Set each factor equal to 0.}$$

$$x = -2 \quad \quad \quad x = 1 \quad \text{Solve the resulting equations.}$$

We must exclude  $-2$  and  $1$  from the domain of  $\frac{f}{g}$ .

$$\text{Domain of } \frac{f}{g} = (-\infty, -2) \cup (-2, 1) \cup (1, \infty) \quad \dots$$

 **Check Point 2** Let  $f(x) = x - 5$  and  $g(x) = x^2 - 1$ . Find each of the following functions:

$$\text{a. } (f + g)(x) \quad \text{b. } (f - g)(x) \quad \text{c. } (fg)(x) \quad \text{d. } \left(\frac{f}{g}\right)(x).$$

Determine the domain for each function.

### EXAMPLE 3 Adding Functions and Determining the Domain

Let  $f(x) = \sqrt{x + 3}$  and  $g(x) = \sqrt{x - 2}$ . Find each of the following:

$$\text{a. } (f + g)(x) \quad \text{b. the domain of } f + g.$$

### SOLUTION

$$\text{a. } (f + g)(x) = f(x) + g(x) = \sqrt{x + 3} + \sqrt{x - 2}$$

**b.** The domain of  $f + g$  is the set of all real numbers that are common to the domain of  $f$  and the domain of  $g$ . Thus, we must find the domains of  $f$  and  $g$  before finding their intersection.

$$\bullet f(x) = \sqrt{x + 3}$$

$x + 3$  must be nonnegative:  
 $x + 3 \geq 0$ .  $D_f = [-3, \infty)$

$$\bullet g(x) = \sqrt{x - 2}$$

$x - 2$  must be nonnegative:  
 $x - 2 \geq 0$ .  $D_g = [2, \infty)$

- b. Because 2008 is 8 years after 2000, we substitute 8 for  $x$  in the difference function  $(B - D)(x)$ .

$$\begin{aligned} (B - D)(x) &= -2x^2 + 42x + 1582 && \text{Use the difference function } B - D. \\ (B - D)(8) &= -2(8)^2 + 42(8) + 1582 && \text{Substitute 8 for } x. \\ &= -2(64) + 42(8) + 1582 && \text{Evaluate the exponential expression: } 8^2 = 64. \\ &= -128 + 336 + 1582 && \text{Perform the multiplications.} \\ &= 1790 && \text{Add from left to right.} \end{aligned}$$

We see that  $(B - D)(8) = 1790$ . The model indicates that there was a population increase of 1790 thousand, or approximately 1,790,000 people, in 2008.

- c. The data for 2008 in **Figure 1.62** on page 231 show 4247 thousand births and 2453 thousand deaths.

$$\begin{aligned} \text{population change} &= \text{births} - \text{deaths} \\ &= 4247 - 2453 = 1794 \end{aligned}$$

The actual population increase was 1794 thousand, or 1,794,000. Our model gave us an increase of 1790 thousand. Thus, the model underestimates the actual increase by  $1794 - 1790$ , or 4 thousand people. ●●●

 **Check Point 4** Use the birth and death models from Example 4.

- Write a function that models the total number of births and deaths in the United States for the years from 2000 through 2009.
- Use the function from part (a) to find the total number of births and deaths in the United States in 2003.
- Does the result in part (b) overestimate or underestimate the actual number of total births and deaths in 2003 obtained from the data in **Figure 1.62** on page 231? By how much?

### 3 Form composite functions.

#### Composite Functions

There is another way of combining two functions. To help understand this new combination, suppose that your local computer store is having a sale. The models that are on sale cost either \$300 less than the regular price or 85% of the regular price. If  $x$  represents the computer's regular price, the discounts can be modeled with the following functions:

$$f(x) = x - 300 \qquad g(x) = 0.85x.$$

The computer is on sale for \$300 less than its regular price.

The computer is on sale for 85% of its regular price.

At the store, you bargain with the salesperson. Eventually, she makes an offer you can't refuse. The sale price will be 85% of the regular price followed by a \$300 reduction:

$$0.85x - 300.$$

85% of the regular price followed by a \$300 reduction

In terms of the functions  $f$  and  $g$ , this offer can be obtained by taking the output of  $g(x) = 0.85x$ , namely,  $0.85x$ , and using it as the input of  $f$ :

$$f(x) = x - 300$$

Replace  $x$  with  $0.85x$ , the output of  $g(x) = 0.85x$ .

$$f(0.85x) = 0.85x - 300.$$

Because  $0.85x$  is  $g(x)$ , we can write this last equation as

$$f(g(x)) = 0.85x - 300.$$

We read this equation as “ $f$  of  $g$  of  $x$  is equal to  $0.85x - 300$ .” We call  $f(g(x))$  the **composition of the function  $f$  with  $g$** , or a **composite function**. This composite function is written  $f \circ g$ . Thus,

$$(f \circ g)(x) = f(g(x)) = 0.85x - 300.$$

This can be read “ $f$  of  $g$  of  $x$ ” or “ $f$  composed with  $g$  of  $x$ .”

Like all functions, we can evaluate  $f \circ g$  for a specified value of  $x$  in the function’s domain. For example, here’s how to find the value of the composite function describing the offer you cannot refuse at 1400:

$$(f \circ g)(x) = 0.85x - 300$$

Replace  $x$  with 1400.

$$(f \circ g)(1400) = 0.85(1400) - 300 = 1190 - 300 = 890.$$

This means that a computer that regularly sells for \$1400 is on sale for \$890 subject to both discounts. We can use a partial table of coordinates for each of the discount functions,  $g$  and  $f$ , to verify this result numerically.

Computer's regular price	85% of the regular price	85% of the regular price	\$300 reduction
$x$	$g(x) = 0.85x$	$x$	$f(x) = x - 300$
1200	1020	1020	720
1300	1105	1105	805
1400	1190	1190	890

Using these tables, we can find  $(f \circ g)(1400)$ :

$$(f \circ g)(1400) = f(g(1400)) = f(1190) = 890.$$

The table for  $g$  shows that  $g(1400) = 1190$ .

The table for  $f$  shows that  $f(1190) = 890$ .

This verifies that a computer that regularly sells for \$1400 is on sale for \$890 subject to both discounts.

Before you run out to buy a computer, let’s generalize our discussion of the computer’s double discount and define the composition of any two functions.

### The Composition of Functions

The **composition of the function  $f$  with  $g$**  is denoted by  $f \circ g$  and is defined by the equation

$$(f \circ g)(x) = f(g(x)).$$

The **domain of the composite function  $f \circ g$**  is the set of all  $x$  such that

1.  $x$  is in the domain of  $g$  and
2.  $g(x)$  is in the domain of  $f$ .

The composition of  $f$  with  $g$ ,  $f \circ g$ , is illustrated in **Figure 1.65**.

**Step 1** Input  $x$  into  $g$ .

**Step 2** Input  $g(x)$  into  $f$ .

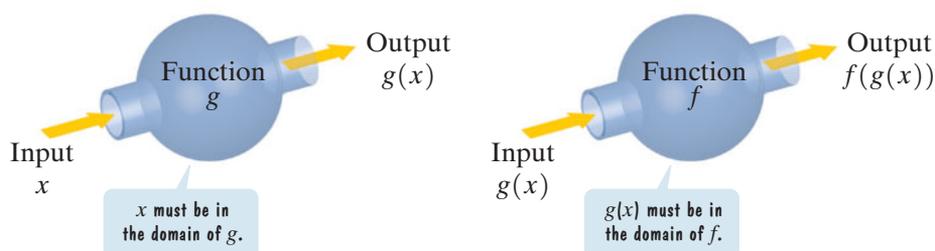

FIGURE 1.65

The figure reinforces the fact that the inside function  $g$  in  $f(g(x))$  is done first.

### EXAMPLE 5 Forming Composite Functions

Given  $f(x) = 3x - 4$  and  $g(x) = x^2 - 2x + 6$ , find each of the following:

- a.  $(f \circ g)(x)$
- b.  $(g \circ f)(x)$
- c.  $(g \circ f)(1)$ .

#### SOLUTION

- a. We begin with  $(f \circ g)(x)$ , the composition of  $f$  with  $g$ . Because  $(f \circ g)(x)$  means  $f(g(x))$ , we must replace each occurrence of  $x$  in the equation for  $f$  with  $g(x)$ .

$$f(x) = 3x - 4$$

This is the given equation for  $f$ .

Replace  $x$  with  $g(x)$ .

$$\begin{aligned} (f \circ g)(x) &= f(g(x)) = 3g(x) - 4 \\ &= 3(x^2 - 2x + 6) - 4 \\ &= 3x^2 - 6x + 18 - 4 \\ &= 3x^2 - 6x + 14 \end{aligned}$$

Because  $g(x) = x^2 - 2x + 6$ , replace  $g(x)$  with  $x^2 - 2x + 6$ .

Use the distributive property.

Simplify.

$$\text{Thus, } (f \circ g)(x) = 3x^2 - 6x + 14.$$

- b. Next, we find  $(g \circ f)(x)$ , the composition of  $g$  with  $f$ . Because  $(g \circ f)(x)$  means  $g(f(x))$ , we must replace each occurrence of  $x$  in the equation for  $g$  with  $f(x)$ .

$$g(x) = x^2 - 2x + 6$$

This is the equation for  $g$ .

Replace  $x$  with  $f(x)$ .

$$\begin{aligned} (g \circ f)(x) &= g(f(x)) = (f(x))^2 - 2f(x) + 6 \\ &= (3x - 4)^2 - 2(3x - 4) + 6 \end{aligned}$$

Because  $f(x) = 3x - 4$ , replace  $f(x)$  with  $3x - 4$ .

$$= 9x^2 - 24x + 16 - 6x + 8 + 6$$

$$= 9x^2 - 30x + 30$$

Use  $(A - B)^2 = A^2 - 2AB + B^2$  to square  $3x - 4$ .  
Simplify:  
 $-24x - 6x = -30x$   
and  $16 + 8 + 6 = 30$ .

Thus,  $(g \circ f)(x) = 9x^2 - 30x + 30$ . **Notice that  $(f \circ g)(x)$  is not the same function as  $(g \circ f)(x)$ .**

c. We can use  $(g \circ f)(x)$  to find  $(g \circ f)(1)$ .

$$(g \circ f)(x) = 9x^2 - 30x + 30$$

Replace  $x$  with 1.

$$(g \circ f)(1) = 9 \cdot 1^2 - 30 \cdot 1 + 30 = 9 - 30 + 30 = 9$$

It is also possible to find  $(g \circ f)(1)$  without determining  $(g \circ f)(x)$ .

$$(g \circ f)(1) = g(f(1)) = g(-1) = 9$$

First find  $f(1)$ .  
 $f(x) = 3x - 4$ , so  
 $f(1) = 3 \cdot 1 - 4 = -1$ .

Next find  $g(-1)$ .  
 $g(x) = x^2 - 2x + 6$ , so  
 $g(-1) = (-1)^2 - 2(-1) + 6$   
 $= 1 + 2 + 6 = 9$ .

...

**Check Point 5** Given  $f(x) = 5x + 6$  and  $g(x) = 2x^2 - x - 1$ , find each of the following:

- a.  $(f \circ g)(x)$       b.  $(g \circ f)(x)$       c.  $(f \circ g)(-1)$ .

**4** Determine domains for composite functions.

We need to be careful in determining the domain for a composite function.

### Excluding Values from the Domain of $(f \circ g)(x) = f(g(x))$

The following values must be excluded from the input  $x$ :

- If  $x$  is not in the domain of  $g$ , it must not be in the domain of  $f \circ g$ .
- Any  $x$  for which  $g(x)$  is not in the domain of  $f$  must not be in the domain of  $f \circ g$ .

### EXAMPLE 6 Forming a Composite Function and Finding Its Domain

Given  $f(x) = \frac{2}{x-1}$  and  $g(x) = \frac{3}{x}$ , find each of the following:

- a.  $(f \circ g)(x)$       b. the domain of  $f \circ g$ .

#### SOLUTION

a. Because  $(f \circ g)(x)$  means  $f(g(x))$ , we must replace  $x$  in  $f(x) = \frac{2}{x-1}$  with  $g(x)$ .

$$(f \circ g)(x) = f(g(x)) = \frac{2}{g(x) - 1} = \frac{2}{\frac{3}{x} - 1} = \frac{2}{\frac{3}{x} - 1} \cdot \frac{x}{x} = \frac{2x}{3 - x}$$

$g(x) = \frac{3}{x}$

Simplify the complex fraction by multiplying by  $\frac{x}{x}$ , or 1.

$$\text{Thus, } (f \circ g)(x) = \frac{2x}{3 - x}.$$

### GREAT QUESTION!

**Can you remind me of how you simplified the complex fraction on the right?**

One method for simplifying complex fractions is to find the least common denominator of all the rational expressions in the numerator and the denominator. Then multiply each term in the numerator and denominator by this least common denominator. The procedures for simplifying complex fractions can be found in Section P.6, pages 78–80.

b. We determine values to exclude from the domain of  $(f \circ g)(x)$  in two steps.

Rules for Excluding Numbers from the Domain of $(f \circ g)(x) = f(g(x))$	Applying the Rules to $f(x) = \frac{2}{x-1}$ and $g(x) = \frac{3}{x}$
If $x$ is not in the domain of $g$ , it must not be in the domain of $f \circ g$ .	Because $g(x) = \frac{3}{x}$ , 0 is not in the domain of $g$ . Thus, 0 must be excluded from the domain of $f \circ g$ .
Any $x$ for which $g(x)$ is not in the domain of $f$ must not be in the domain of $f \circ g$ .	Because $f(g(x)) = \frac{2}{g(x)-1}$ , we must exclude from the domain of $f \circ g$ any $x$ for which $g(x) = 1$ . $\frac{3}{x} = 1$ Set $g(x)$ equal to 1. $3 = x$ Multiply both sides by $x$ . 3 must be excluded from the domain of $f \circ g$ .

We see that 0 and 3 must be excluded from the domain of  $f \circ g$ . The domain of  $f \circ g$  is

$$(-\infty, 0) \cup (0, 3) \cup (3, \infty).$$

...

 **Check Point 6** Given  $f(x) = \frac{4}{x+2}$  and  $g(x) = \frac{1}{x}$ , find each of the following:

a.  $(f \circ g)(x)$

b. the domain of  $f \circ g$ .

## 5 Write functions as compositions.

### Decomposing Functions

When you form a composite function, you “compose” two functions to form a new function. It is also possible to reverse this process. That is, you can “decompose” a given function and express it as a composition of two functions. Although there is more than one way to do this, there is often a “natural” selection that comes to mind first. For example, consider the function  $h$  defined by

$$h(x) = (3x^2 - 4x + 1)^5.$$

The function  $h$  takes  $3x^2 - 4x + 1$  and raises it to the power 5. A natural way to write  $h$  as a composition of two functions is to raise the function  $g(x) = 3x^2 - 4x + 1$  to the power 5. Thus, if we let

$$f(x) = x^5 \text{ and } g(x) = 3x^2 - 4x + 1, \text{ then}$$

$$(f \circ g)(x) = f(g(x)) = f(3x^2 - 4x + 1) = (3x^2 - 4x + 1)^5.$$

### GREAT QUESTION!

**Is there a procedure I can use to write a function as a composition?**

Yes. Suppose the form of function  $h$  is  $h(x) = (\text{algebraic expression})^{\text{power}}$ . Function  $h$  can be expressed as a composition,  $f \circ g$ , using

$$f(x) = x^{\text{power}}$$

$$g(x) = \text{algebraic expression.}$$

### EXAMPLE 7 Writing a Function as a Composition

Express  $h(x)$  as a composition of two functions:

$$h(x) = \sqrt[3]{x^2 + 1}.$$

### SOLUTION

The function  $h$  takes  $x^2 + 1$  and takes its cube root. A natural way to write  $h$  as a composition of two functions is to take the cube root of the function  $g(x) = x^2 + 1$ . Thus, we let

$$f(x) = \sqrt[3]{x} \text{ and } g(x) = x^2 + 1.$$

We can check this composition by finding  $(f \circ g)(x)$ . This should give the original function, namely,  $h(x) = \sqrt[3]{x^2 + 1}$ .

$$(f \circ g)(x) = f(g(x)) = f(x^2 + 1) = \sqrt[3]{x^2 + 1} = h(x) \quad \dots$$

 **Check Point 7** Express  $h(x)$  as a composition of two functions:

$$h(x) = \sqrt{x^2 + 5}.$$

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- We exclude from a function's domain real numbers that cause division by \_\_\_\_\_.
- We exclude from a function's domain real numbers that result in a square root of a/an \_\_\_\_\_ number.
- $(f + g)(x) =$  \_\_\_\_\_
- $(f - g)(x) =$  \_\_\_\_\_
- $(fg)(x) =$  \_\_\_\_\_
- $\frac{f}{g}(x) =$  \_\_\_\_\_, provided \_\_\_\_\_  $\neq 0$
- The domain of  $f(x) = 5x + 7$  consists of all real numbers, represented in interval notation as \_\_\_\_\_.
- The domain of  $g(x) = \frac{3}{x - 2}$  consists of all real numbers except 2, represented in interval notation as  $(-\infty, 2) \cup$  \_\_\_\_\_.
- The domain of  $h(x) = \frac{1}{x} + \frac{7}{x - 3}$  consists of all real numbers except 0 and 3, represented in interval notation as  $(-\infty, 0) \cup$  \_\_\_\_\_  $\cup$  \_\_\_\_\_.
- The notation  $f \circ g$ , called the \_\_\_\_\_ of the function  $f$  with  $g$ , is defined by  $(f \circ g)(x) =$  \_\_\_\_\_.
- I find  $(f \circ g)(x)$  by replacing each occurrence of  $x$  in the equation for \_\_\_\_\_ with \_\_\_\_\_.
- The notation  $g \circ f$ , called the \_\_\_\_\_ of the function  $g$  with  $f$ , is defined by  $(g \circ f)(x) =$  \_\_\_\_\_.
- I find  $(g \circ f)(x)$  by replacing each occurrence of  $x$  in the equation for \_\_\_\_\_ with \_\_\_\_\_.
- True or false:  $f \circ g$  is the same function as  $g \circ f$ . \_\_\_\_\_
- True or false:  $f(g(x)) = f(x) \cdot g(x)$ . \_\_\_\_\_
- If  $f(g(x)) = \frac{3}{g(x) - 4}$  and  $g(x) = \frac{8}{x}$ , then 0 and \_\_\_\_\_ must be excluded from the domain of  $f \circ g$ .

## EXERCISE SET 1.7

### Practice Exercises

In Exercises 1–30, find the domain of each function.

- $f(x) = 3(x - 4)$
- $f(x) = 2(x + 5)$
- $g(x) = \frac{3}{x - 4}$
- $g(x) = \frac{2}{x + 5}$
- $f(x) = x^2 - 2x - 15$
- $f(x) = x^2 + x - 12$
- $g(x) = \frac{3}{x^2 - 2x - 15}$
- $g(x) = \frac{2}{x^2 + x - 12}$
- $f(x) = \frac{1}{x + 7} + \frac{3}{x - 9}$
- $f(x) = \frac{1}{x + 8} + \frac{3}{x - 10}$
- $g(x) = \frac{1}{x^2 + 1} - \frac{1}{x^2 - 1}$
- $g(x) = \frac{1}{x^2 + 4} - \frac{1}{x^2 - 4}$
- $h(x) = \frac{4}{\frac{3}{x} - 1}$
- $h(x) = \frac{5}{\frac{4}{x} - 1}$
- $f(x) = \frac{1}{\frac{4}{x - 1} - 2}$
- $f(x) = \frac{1}{\frac{4}{x - 2} - 3}$
- $f(x) = \sqrt{x - 3}$
- $f(x) = \sqrt{x + 2}$

- $g(x) = \frac{1}{\sqrt{x - 3}}$
- $g(x) = \frac{1}{\sqrt{x + 2}}$
- $g(x) = \sqrt{5x + 35}$
- $g(x) = \sqrt{7x - 70}$
- $f(x) = \sqrt{24 - 2x}$
- $f(x) = \sqrt{84 - 6x}$
- $h(x) = \sqrt{x - 2} + \sqrt{x + 3}$
- $h(x) = \sqrt{x - 3} + \sqrt{x + 4}$
- $g(x) = \frac{\sqrt{x - 2}}{x - 5}$
- $g(x) = \frac{\sqrt{x - 3}}{x - 6}$
- $f(x) = \frac{2x + 7}{x^3 - 5x^2 - 4x + 20}$
- $f(x) = \frac{7x + 2}{x^3 - 2x^2 - 9x + 18}$

In Exercises 31–50, find  $f + g$ ,  $f - g$ ,  $fg$ , and  $\frac{f}{g}$ . Determine the domain for each function.

- $f(x) = 2x + 3$ ,  $g(x) = x - 1$
- $f(x) = 3x - 4$ ,  $g(x) = x + 2$
- $f(x) = x - 5$ ,  $g(x) = 3x^2$
- $f(x) = x - 6$ ,  $g(x) = 5x^2$
- $f(x) = 2x^2 - x - 3$ ,  $g(x) = x + 1$
- $f(x) = 6x^2 - x - 1$ ,  $g(x) = x - 1$

37.  $f(x) = 3 - x^2, g(x) = x^2 + 2x - 15$   
 38.  $f(x) = 5 - x^2, g(x) = x^2 + 4x - 12$   
 39.  $f(x) = \sqrt{x}, g(x) = x - 4$   
 40.  $f(x) = \sqrt{x}, g(x) = x - 5$   
 41.  $f(x) = 2 + \frac{1}{x}, g(x) = \frac{1}{x}$   
 42.  $f(x) = 6 - \frac{1}{x}, g(x) = \frac{1}{x}$   
 43.  $f(x) = \frac{5x + 1}{x^2 - 9}, g(x) = \frac{4x - 2}{x^2 - 9}$   
 44.  $f(x) = \frac{3x + 1}{x^2 - 25}, g(x) = \frac{2x - 4}{x^2 - 25}$   
 45.  $f(x) = \frac{8x}{x - 2}, g(x) = \frac{6}{x + 3}$   
 46.  $f(x) = \frac{9x}{x - 4}, g(x) = \frac{7}{x + 8}$   
 47.  $f(x) = \sqrt{x + 4}, g(x) = \sqrt{x - 1}$   
 48.  $f(x) = \sqrt{x + 6}, g(x) = \sqrt{x - 3}$   
 49.  $f(x) = \sqrt{x - 2}, g(x) = \sqrt{2 - x}$   
 50.  $f(x) = \sqrt{x - 5}, g(x) = \sqrt{5 - x}$

In Exercises 51–66, find

a.  $(f \circ g)(x)$     b.  $(g \circ f)(x)$     c.  $(f \circ g)(2)$     d.  $(g \circ f)(2)$ .

51.  $f(x) = 2x, g(x) = x + 7$   
 52.  $f(x) = 3x, g(x) = x - 5$   
 53.  $f(x) = x + 4, g(x) = 2x + 1$   
 54.  $f(x) = 5x + 2, g(x) = 3x - 4$   
 55.  $f(x) = 4x - 3, g(x) = 5x^2 - 2$   
 56.  $f(x) = 7x + 1, g(x) = 2x^2 - 9$   
 57.  $f(x) = x^2 + 2, g(x) = x^2 - 2$   
 58.  $f(x) = x^2 + 1, g(x) = x^2 - 3$   
 59.  $f(x) = 4 - x, g(x) = 2x^2 + x + 5$   
 60.  $f(x) = 5x - 2, g(x) = -x^2 + 4x - 1$   
 61.  $f(x) = \sqrt{x}, g(x) = x - 1$   
 62.  $f(x) = \sqrt{x}, g(x) = x + 2$   
 63.  $f(x) = 2x - 3, g(x) = \frac{x + 3}{2}$   
 64.  $f(x) = 6x - 3, g(x) = \frac{x + 3}{6}$   
 65.  $f(x) = \frac{1}{x}, g(x) = \frac{1}{x}$   
 66.  $f(x) = \frac{2}{x}, g(x) = \frac{2}{x}$

In Exercises 67–74, find

a.  $(f \circ g)(x)$     b. the domain of  $f \circ g$ .

67.  $f(x) = \frac{2}{x + 3}, g(x) = \frac{1}{x}$   
 68.  $f(x) = \frac{5}{x + 4}, g(x) = \frac{1}{x}$   
 69.  $f(x) = \frac{x}{x + 1}, g(x) = \frac{4}{x}$   
 70.  $f(x) = \frac{x}{x + 5}, g(x) = \frac{6}{x}$   
 71.  $f(x) = \sqrt{x}, g(x) = x - 2$

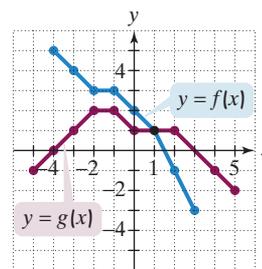

72.  $f(x) = \sqrt{x}, g(x) = x - 3$   
 73.  $f(x) = x^2 + 4, g(x) = \sqrt{1 - x}$   
 74.  $f(x) = x^2 + 1, g(x) = \sqrt{2 - x}$

In Exercises 75–82, express the given function  $h$  as a composition of two functions  $f$  and  $g$  so that  $h(x) = (f \circ g)(x)$ .

75.  $h(x) = (3x - 1)^4$     76.  $h(x) = (2x - 5)^3$   
 77.  $h(x) = \sqrt[3]{x^2 - 9}$     78.  $h(x) = \sqrt{5x^2 + 3}$   
 79.  $h(x) = |2x - 5|$     80.  $h(x) = |3x - 4|$   
 81.  $h(x) = \frac{1}{2x - 3}$     82.  $h(x) = \frac{1}{4x + 5}$

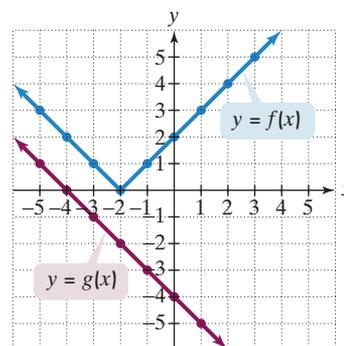

### Practice Plus

Use the graphs of  $f$  and  $g$  to solve Exercises 83–90.

83. Find  $(f + g)(-3)$ .    84. Find  $(g - f)(-2)$ .  
 85. Find  $(fg)(2)$ .    86. Find  $\left(\frac{g}{f}\right)(3)$ .  
 87. Find the domain of  $f + g$ .    88. Find the domain of  $\frac{f}{g}$ .  
 89. Graph  $f + g$ .    90. Graph  $f - g$ .

In Exercises 91–94, use the graphs of  $f$  and  $g$  to evaluate each composite function.

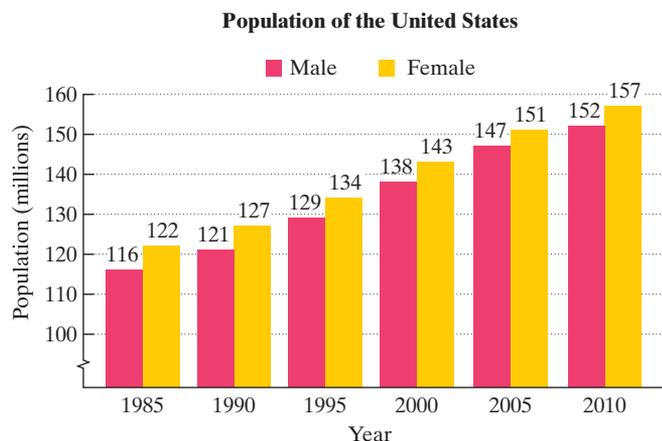

91.  $(f \circ g)(-1)$     92.  $(f \circ g)(1)$   
 93.  $(g \circ f)(0)$     94.  $(g \circ f)(-1)$

In Exercises 95–96, find all values of  $x$  satisfying the given conditions.

95.  $f(x) = 2x - 5, g(x) = x^2 - 3x + 8$ , and  $(f \circ g)(x) = 7$ .  
 96.  $f(x) = 1 - 2x, g(x) = 3x^2 + x - 1$ , and  $(f \circ g)(x) = -5$ .

## Application Exercises

The bar graph shows the population of the United States, in millions, for six selected years.

Source: U.S. Census Bureau

Here are two functions that model the data:

$$M(x) = 1.53x + 114.8$$

Male U.S. population,  
 $M(x)$ , in millions,  
 $x$  years after 1985

$$F(x) = 1.46x + 120.7$$

Female U.S. population,  
 $F(x)$ , in millions,  
 $x$  years after 1985

Use the functions to solve Exercises 97–98.

97. a. Write a function that models the total U.S. population for the years shown in the bar graph.  
b. Use the function from part (a) to find the total U.S. population in 2005.  
c. Does the result in part (b) overestimate or underestimate the actual total U.S. population in 2005 shown by the bar graph? By how much?
98. a. Write a function that models the difference between the female U.S. population and the male U.S. population for the years shown in the bar graph.  
b. Use the function from part (a) to find how many more women than men there were in the U.S. population in 2005.  
c. Does the result in part (b) overestimate or underestimate the actual difference between the female and male population in 2005 shown by the bar graph? By how much?
99. A company that sells radios has yearly fixed costs of \$600,000. It costs the company \$45 to produce each radio. Each radio will sell for \$65. The company's costs and revenue are modeled by the following functions, where  $x$  represents the number of radios produced and sold:
- $C(x) = 600,000 + 45x$  This function models the company's costs.  
 $R(x) = 65x$  This function models the company's revenue.
- Find and interpret  $(R - C)(20,000)$ ,  $(R - C)(30,000)$ , and  $(R - C)(40,000)$ .
100. A department store has two locations in a city. From 2008 through 2012, the profits for each of the store's two branches are modeled by the functions  $f(x) = -0.44x + 13.62$  and  $g(x) = 0.51x + 11.14$ . In each model,  $x$  represents the number of years after 2008, and  $f$  and  $g$  represent the profit, in millions of dollars.
- a. What is the slope of  $f$ ? Describe what this means.  
b. What is the slope of  $g$ ? Describe what this means.  
c. Find  $f + g$ . What is the slope of this function? What does this mean?
101. The regular price of a computer is  $x$  dollars. Let  $f(x) = x - 400$  and  $g(x) = 0.75x$ .
- a. Describe what the functions  $f$  and  $g$  model in terms of the price of the computer.  
b. Find  $(f \circ g)(x)$  and describe what this models in terms of the price of the computer.  
c. Repeat part (b) for  $(g \circ f)(x)$ .  
d. Which composite function models the greater discount on the computer,  $f \circ g$  or  $g \circ f$ ? Explain.
102. The regular price of a pair of jeans is  $x$  dollars. Let  $f(x) = x - 5$  and  $g(x) = 0.6x$ .
- a. Describe what functions  $f$  and  $g$  model in terms of the price of the jeans.  
b. Find  $(f \circ g)(x)$  and describe what this models in terms of the price of the jeans.  
c. Repeat part (b) for  $(g \circ f)(x)$ .  
d. Which composite function models the greater discount on the jeans,  $f \circ g$  or  $g \circ f$ ? Explain.

## Writing in Mathematics

103. If a function is defined by an equation, explain how to find its domain.  
104. If equations for  $f$  and  $g$  are given, explain how to find  $f - g$ .  
105. If equations for two functions are given, explain how to obtain the quotient function and its domain.  
106. Describe a procedure for finding  $(f \circ g)(x)$ . What is the name of this function?  
107. Describe the values of  $x$  that must be excluded from the domain of  $(f \circ g)(x)$ .

## Technology Exercises

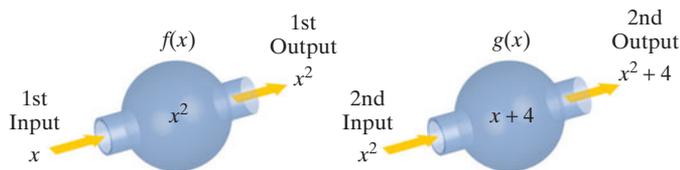

108. Graph  $y_1 = x^2 - 2x$ ,  $y_2 = x$ , and  $y_3 = y_1 \div y_2$  in the same  $[-10, 10, 1]$  by  $[-10, 10, 1]$  viewing rectangle. Then use the TRACE feature to trace along  $y_3$ . What happens at  $x = 0$ ? Explain why this occurs.  
109. Graph  $y_1 = \sqrt{2 - x}$ ,  $y_2 = \sqrt{x}$ , and  $y_3 = \sqrt{2 - y_2}$  in the same  $[-4, 4, 1]$  by  $[0, 2, 1]$  viewing rectangle. If  $y_1$  represents  $f$  and  $y_2$  represents  $g$ , use the graph of  $y_3$  to find the domain of  $f \circ g$ . Then verify your observation algebraically.

## Critical Thinking Exercises

**Make Sense?** In Exercises 110–113, determine whether each statement makes sense or does not make sense, and explain your reasoning.

110. I used a function to model data from 1980 through 2005. The independent variable in my model represented the number of years after 1980, so the function's domain was  $\{x \mid x = 0, 1, 2, 3, \dots, 25\}$ .

111. I have two functions. Function  $f$  models total world population  $x$  years after 2000 and function  $g$  models population of the world's more-developed regions  $x$  years after 2000. I can use  $f - g$  to determine the population of the world's less-developed regions for the years in both function's domains.
112. I must have made a mistake in finding the composite functions  $f \circ g$  and  $g \circ f$ , because I notice that  $f \circ g$  is not the same function as  $g \circ f$ .
113. This diagram illustrates that  $f(g(x)) = x^2 + 4$ .

In Exercises 114–119, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

114. If  $f(x) = x^2 - 4$  and  $g(x) = \sqrt{x^2 - 4}$ , then  $(f \circ g)(x) = -x^2$  and  $(f \circ g)(5) = -25$ .
115. There can never be two functions  $f$  and  $g$ , where  $f \neq g$ , for which  $(f \circ g)(x) = (g \circ f)(x)$ .
116. If  $f(7) = 5$  and  $g(4) = 7$ , then  $(f \circ g)(4) = 35$ .
117. If  $f(x) = \sqrt{x}$  and  $g(x) = 2x - 1$ , then  $(f \circ g)(5) = g(2)$ .
118. Prove that if  $f$  and  $g$  are even functions, then  $fg$  is also an even function.
119. Define two functions  $f$  and  $g$  so that  $f \circ g = g \circ f$ .

### Preview Exercises

Exercises 120–122 will help you prepare for the material covered in the next section.

120. Consider the function defined by

$$\{(-2, 4), (-1, 1), (1, 1), (2, 4)\}.$$

Reverse the components of each ordered pair and write the resulting relation. Is this relation a function?

121. Solve for  $y$ :  $x = \frac{5}{y} + 4$ .
122. Solve for  $y$ :  $x = y^2 - 1, y \geq 0$ .

## SECTION 1.8

## Inverse Functions

### Objectives

- 1 Verify inverse functions.
- 2 Find the inverse of a function.
- 3 Use the horizontal line test to determine if a function has an inverse function.
- 4 Use the graph of a one-to-one function to graph its inverse function.
- 5 Find the inverse of a function and graph both functions on the same axes.

Based on Shakespeare's *Romeo and Juliet*, the film *West Side Story* swept the 1961 Academy Awards with ten Oscars. The top four movies to win the most Oscars are shown in **Table 1.5**.

Table 1.5 Films Winning the Most Oscars

Movie	Year	Number of Academy Awards
<i>Ben-Hur</i>	1960	11
<i>Titanic</i>	1998	11
<i>The Lord of the Rings: The Return of the King</i>	2003	11
<i>West Side Story</i>	1961	10

Source: Russell Ash, *The Top 10 of Everything*, 2011

We can use the information in **Table 1.5** to define a function. Let the domain of the function be the set of four movies shown in the table. Let the range be the number of Academy Awards for each of the respective films. The function can be written as follows:

$$f: \{(Ben-Hur, 11), (Titanic, 11), (The Lord of the Rings, 11), (West Side Story, 10)\}.$$

Now let's “undo”  $f$  by interchanging the first and second components in each of the ordered pairs. Switching the inputs and outputs of  $f$ , we obtain the following relation:

Can you see that this relation is not a function? Three of its ordered pairs have the same first component and different second components. This violates the definition of a function.

If a function  $f$  is a set of ordered pairs,  $(x, y)$ , then the changes produced by  $f$  can be “undone” by reversing the components of all the ordered pairs. The resulting relation,  $(y, x)$ , may or may not be a function. In this section, we will develop these ideas by studying functions whose compositions have a special “undoing” relationship.

### Inverse Functions

Here are two functions that describe situations related to the price of a computer,  $x$ :

$$f(x) = x - 300 \quad g(x) = x + 300.$$

Function  $f$  subtracts \$300 from the computer's price and function  $g$  adds \$300 to the computer's price. Let's see what  $f(g(x))$  does. Put  $g(x)$  into  $f$ :

$$f(x) = x - 300 \quad \text{This is the given equation for } f.$$

Replace  $x$  with  $g(x)$ .

$$f(g(x)) = g(x) - 300$$

$$= x + 300 - 300 \quad \text{Because } g(x) = x + 300, \text{ replace } g(x) \text{ with } x + 300.$$

$$= x. \quad \text{This is the computer's original price.}$$

Using  $f(x) = x - 300$  and  $g(x) = x + 300$ , we see that  $f(g(x)) = x$ . By putting  $g(x)$  into  $f$  and finding  $f(g(x))$ , the computer's price,  $x$ , went through two changes: the first, an increase; the second, a decrease:

$$x + 300 - 300.$$

The final price of the computer,  $x$ , is identical to its starting price,  $x$ .

In general, if the changes made to  $x$  by a function  $g$  are undone by the changes made by a function  $f$ , then

$$f(g(x)) = x.$$

Assume, also, that this “undoing” takes place in the other direction:

$$g(f(x)) = x.$$

Under these conditions, we say that each function is the *inverse function* of the other. The fact that  $g$  is the inverse of  $f$  is expressed by renaming  $g$  as  $f^{-1}$ , read “ $f$ -inverse.” For example, the inverse functions

$$f(x) = x - 300 \quad g(x) = x + 300$$

are usually named as follows:

$$f(x) = x - 300 \quad f^{-1}(x) = x + 300.$$

We can use partial tables of coordinates for  $f$  and  $f^{-1}$  to gain numerical insight into the relationship between a function and its inverse function.

Computer's regular price		\$300 reduction		Price with \$300 reduction		\$300 price increase	
$x$	$f(x) = x - 300$	$x$	$f^{-1}(x) = x + 300$	$x$	$f^{-1}(x) = x + 300$	$x$	$f^{-1}(x) = x + 300$
1200	900	900	1200	1000	1000	1300	1400
1300	1000	1000	1300	1100	1100	1400	
1400	1100	1100	1400				

Ordered pairs for  $f$ : (1200, 900), (1300, 1000), (1400, 1100)

Ordered pairs for  $f^{-1}$ : (900, 1200), (1000, 1300), (1100, 1400)

The tables illustrate that if a function  $f$  is the set of ordered pairs  $(x, y)$ , then its inverse,  $f^{-1}$ , is the set of ordered pairs  $(y, x)$ . Using these tables, we can see how one function's changes to  $x$  are undone by the other function:

$$(f^{-1} \circ f)(1300) = f^{-1}(f(1300)) = f^{-1}(1000) = 1300.$$

The table for  $f$  shows that  $f(1300) = 1000$ .

The table for  $f^{-1}$  shows that  $f^{-1}(1000) = 1300$ .

The final price of the computer, \$1300, is identical to its starting price, \$1300.

With these ideas in mind, we present the formal definition of the inverse of a function:

## GREAT QUESTION!

**Is the  $-1$  in  $f^{-1}$  an exponent?**

The notation  $f^{-1}$  represents the inverse function of  $f$ . The  $-1$  is *not* an exponent. The notation  $f^{-1}$  does *not* mean  $\frac{1}{f}$ .

$$f^{-1} \neq \frac{1}{f}.$$

## Definition of the Inverse of a Function

Let  $f$  and  $g$  be two functions such that

$$f(g(x)) = x \quad \text{for every } x \text{ in the domain of } g$$

and

$$g(f(x)) = x \quad \text{for every } x \text{ in the domain of } f.$$

The function  $g$  is the **inverse of the function  $f$**  and is denoted by  $f^{-1}$  (read “ $f$ -inverse”). Thus,  $f(f^{-1}(x)) = x$  and  $f^{-1}(f(x)) = x$ . The domain of  $f$  is equal to the range of  $f^{-1}$ , and vice versa.

## 1 Verify inverse functions.

## EXAMPLE 1 Verifying Inverse Functions

Show that each function is the inverse of the other:

$$f(x) = 3x + 2 \quad \text{and} \quad g(x) = \frac{x - 2}{3}.$$

## SOLUTION

To show that  $f$  and  $g$  are inverses of each other, we must show that  $f(g(x)) = x$  and  $g(f(x)) = x$ . We begin with  $f(g(x))$ .

$$f(x) = 3x + 2 \quad \text{This is the equation for } f.$$

Replace  $x$  with  $g(x)$ .

$$f(g(x)) = 3g(x) + 2 = 3\left(\frac{x-2}{3}\right) + 2 = x - 2 + 2 = x$$

$$g(x) = \frac{x-2}{3}$$

Next, we find  $g(f(x))$ .

$$g(x) = \frac{x-2}{3} \quad \text{This is the equation for } g.$$

Replace  $x$  with  $f(x)$ .

$$g(f(x)) = \frac{f(x)-2}{3} = \frac{(3x+2)-2}{3} = \frac{3x}{3} = x$$

$$f(x) = 3x + 2$$

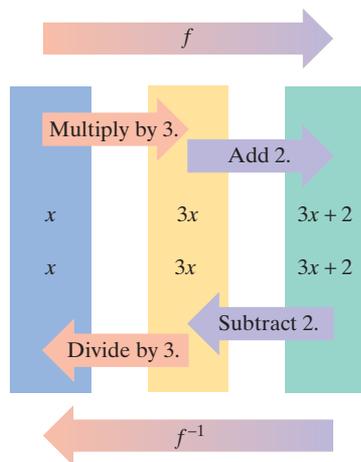

FIGURE 1.66  $f^{-1}$  undoes the changes produced by  $f$ .

Because  $g$  is the inverse of  $f$  (and vice versa), we can use inverse notation and write

$$f(x) = 3x + 2 \quad \text{and} \quad f^{-1}(x) = \frac{x-2}{3}.$$

Notice how  $f^{-1}$  undoes the changes produced by  $f$ :  $f$  changes  $x$  by *multiplying* by 3 and *adding* 2, and  $f^{-1}$  undoes this by *subtracting* 2 and *dividing* by 3. This “undoing” process is illustrated in **Figure 1.66**. ●●●

**Check Point 1** Show that each function is the inverse of the other:

$$f(x) = 4x - 7 \quad \text{and} \quad g(x) = \frac{x+7}{4}.$$

## 2 Find the inverse of a function.

### Finding the Inverse of a Function

The definition of the inverse of a function tells us that the domain of  $f$  is equal to the range of  $f^{-1}$ , and vice versa. This means that if the function  $f$  is the set of ordered pairs  $(x, y)$ , then the inverse of  $f$  is the set of ordered pairs  $(y, x)$ . If a function is defined by an equation, we can obtain the equation for  $f^{-1}$ , the inverse of  $f$ , by interchanging the role of  $x$  and  $y$  in the equation for the function  $f$ .

#### Finding the Inverse of a Function

The equation for the inverse of a function  $f$  can be found as follows:

1. Replace  $f(x)$  with  $y$  in the equation for  $f(x)$ .
2. Interchange  $x$  and  $y$ .
3. Solve for  $y$ . If this equation does not define  $y$  as a function of  $x$ , the function  $f$  does not have an inverse function and this procedure ends. If this equation does define  $y$  as a function of  $x$ , the function  $f$  has an inverse function.
4. If  $f$  has an inverse function, replace  $y$  in step 3 by  $f^{-1}(x)$ . We can verify our result by showing that  $f(f^{-1}(x)) = x$  and  $f^{-1}(f(x)) = x$ .

The procedure for finding a function’s inverse uses a *switch-and-solve* strategy. Switch  $x$  and  $y$ , and then solve for  $y$ .

**EXAMPLE 2** Finding the Inverse of a FunctionFind the inverse of  $f(x) = 7x - 5$ .**SOLUTION****Step 1** Replace  $f(x)$  with  $y$ :

$$y = 7x - 5.$$

**Step 2** Interchange  $x$  and  $y$ :

$$x = 7y - 5. \quad \text{This is the inverse function.}$$

**Step 3** Solve for  $y$ :

$$\begin{aligned} x + 5 &= 7y && \text{Add 5 to both sides.} \\ \frac{x + 5}{7} &= y. && \text{Divide both sides by 7.} \end{aligned}$$

**Step 4** Replace  $y$  with  $f^{-1}(x)$ :

$$f^{-1}(x) = \frac{x + 5}{7}. \quad \text{The equation is written with } f^{-1} \text{ on the left.}$$

Thus, the inverse of  $f(x) = 7x - 5$  is  $f^{-1}(x) = \frac{x + 5}{7}$ .

The inverse function,  $f^{-1}$ , undoes the changes produced by  $f$ .  $f$  changes  $x$  by multiplying by 7 and subtracting 5.  $f^{-1}$  undoes this by adding 5 and dividing by 7. ...

**DISCOVERY**

In Example 2, we found that if  $f(x) = 7x - 5$ , then

$$f^{-1}(x) = \frac{x + 5}{7}.$$

Verify this result by showing that

$$f(f^{-1}(x)) = x$$

and

$$f^{-1}(f(x)) = x.$$

 **Check Point 2** Find the inverse of  $f(x) = 2x + 7$ .

**EXAMPLE 3** Finding the Inverse of a FunctionFind the inverse of  $f(x) = x^3 + 1$ .**SOLUTION****Step 1** Replace  $f(x)$  with  $y$ :  $y = x^3 + 1$ .**Step 2** Interchange  $x$  and  $y$ :  $x = y^3 + 1$ .**Step 3** Solve for  $y$ :

$$\begin{aligned} x - 1 &= y^3 && \text{Subtract 1 from both sides.} \\ \sqrt[3]{x - 1} &= \sqrt[3]{y^3} && \text{Take the cube root on both sides.} \\ \sqrt[3]{x - 1} &= y. && \text{Simplify.} \end{aligned}$$

Our goal is to isolate  $y$ . Because  $\sqrt[3]{y^3} = y$ , we will take the cube root of both sides of the equation.

**Step 4** Replace  $y$  with  $f^{-1}(x)$ :  $f^{-1}(x) = \sqrt[3]{x - 1}$ .Thus, the inverse of  $f(x) = x^3 + 1$  is  $f^{-1}(x) = \sqrt[3]{x - 1}$ . ...

 **Check Point 3** Find the inverse of  $f(x) = 4x^3 - 1$ .

**EXAMPLE 4** Finding the Inverse of a Function

Find the inverse of  $f(x) = \frac{5}{x} + 4$ .

**SOLUTION**

**Step 1** Replace  $f(x)$  with  $y$ :

$$y = \frac{5}{x} + 4.$$

**Step 2** Interchange  $x$  and  $y$ :

$$x = \frac{5}{y} + 4.$$

Our goal is to isolate  $y$ . To get  $y$  out of the denominator, we will multiply both sides of the equation by  $y$ ,  $y \neq 0$ .

**Step 3** Solve for  $y$ :

$$x = \frac{5}{y} + 4 \quad \text{This is the equation from step 2.}$$

$$xy = \left(\frac{5}{y} + 4\right)y \quad \text{Multiply both sides by } y, y \neq 0.$$

$$xy = \frac{5}{y} \cdot y + 4y \quad \text{Use the distributive property.}$$

$$xy = 5 + 4y \quad \text{Simplify: } \frac{5}{y} \cdot y = 5.$$

$$xy - 4y = 5 \quad \text{Subtract } 4y \text{ from both sides.}$$

$$y(x - 4) = 5 \quad \text{Factor out } y \text{ from } xy - 4y \text{ to obtain a single occurrence of } y.$$

$$\frac{y(x - 4)}{x - 4} = \frac{5}{x - 4} \quad \text{Divide both sides by } x - 4, x \neq 4.$$

$$y = \frac{5}{x - 4}. \quad \text{Simplify.}$$

**Step 4** Replace  $y$  with  $f^{-1}(x)$ :

$$f^{-1}(x) = \frac{5}{x - 4}.$$

Thus, the inverse of  $f(x) = \frac{5}{x} + 4$  is  $f^{-1}(x) = \frac{5}{x - 4}$ . ...

 **Check Point 4** Find the inverse of  $f(x) = \frac{3}{x} - 1$ .

**3** Use the horizontal line test to determine if a function has an inverse function.

**The Horizontal Line Test and One-to-One Functions**

Let's see what happens if we try to find the inverse of the standard quadratic function,  $f(x) = x^2$ .

**Step 1** Replace  $f(x)$  with  $y$ :  $y = x^2$ .

**Step 2** Interchange  $x$  and  $y$ :  $x = y^2$ .

**Step 3** Solve for  $y$ : We apply the square root property to solve  $y^2 = x$  for  $y$ . We obtain

$$y = \pm \sqrt{x}.$$

The  $\pm$  in  $y = \pm \sqrt{x}$  shows that for certain values of  $x$  (all positive real numbers), there are two values of  $y$ . Because this equation does not represent  $y$  as a function of  $x$ , the standard quadratic function  $f(x) = x^2$  does not have an inverse function.

We can use a few of the solutions of  $y = x^2$  to illustrate numerically that this function does not have an inverse:

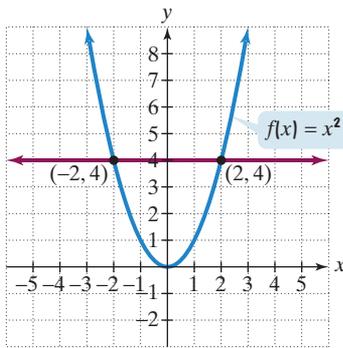

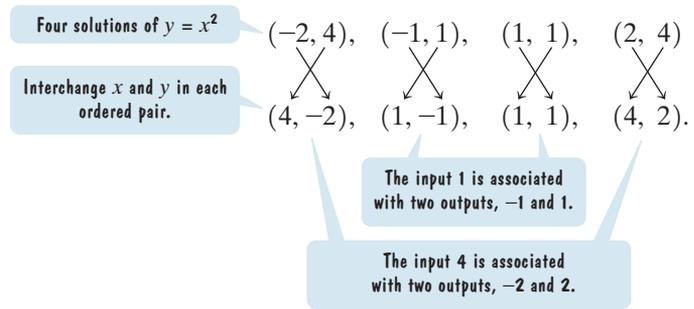

FIGURE 1.67 The horizontal line intersects the graph twice.

### DISCOVERY

How might you restrict the domain of  $f(x) = x^2$ , graphed in Figure 1.67, so that the remaining portion of the graph passes the horizontal line test?

A function provides exactly one output for each input. Thus, the ordered pairs in the bottom row do not define a function.

Can we look at the graph of a function and tell if it represents a function with an inverse? Yes. The graph of the standard quadratic function  $f(x) = x^2$  is shown in Figure 1.67. Four units above the  $x$ -axis, a horizontal line is drawn. This line intersects the graph at two of its points,  $(-2, 4)$  and  $(2, 4)$ . Inverse functions have ordered pairs with the coordinates reversed. We just saw what happened when we interchanged  $x$  and  $y$ . We obtained  $(4, -2)$  and  $(4, 2)$ , and these ordered pairs do not define a function.

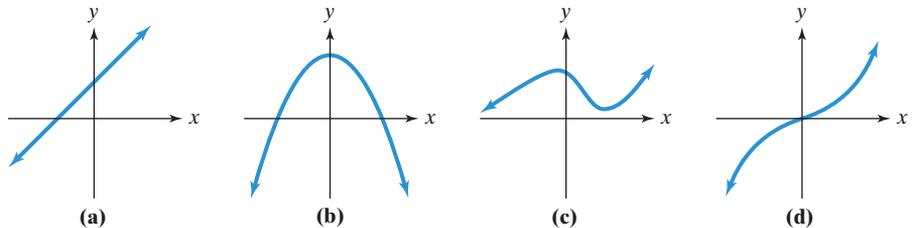

If any horizontal line, such as the one in Figure 1.67, intersects a graph at two or more points, the set of these points will not define a function when their coordinates are reversed. This suggests the **horizontal line test** for inverse functions.

### The Horizontal Line Test for Inverse Functions

A function  $f$  has an inverse that is a function,  $f^{-1}$ , if there is no horizontal line that intersects the graph of the function  $f$  at more than one point.

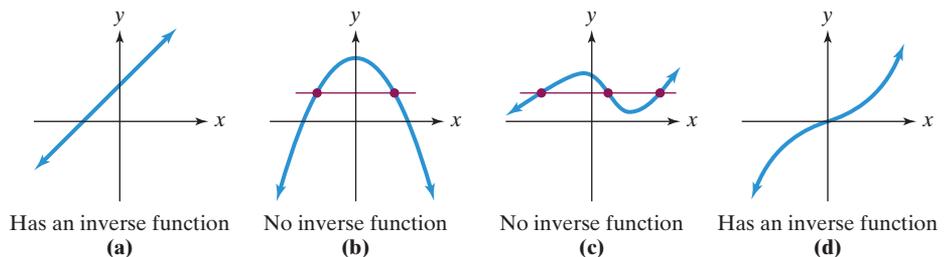

### EXAMPLE 5 Applying the Horizontal Line Test

Which of the following graphs represent functions that have inverse functions?

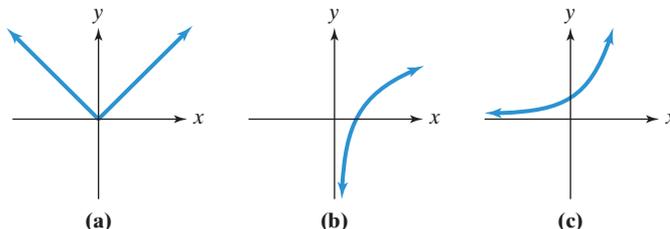

### SOLUTION

Notice that horizontal lines can be drawn in graphs (b) and (c) that intersect the graphs more than once. These graphs do not pass the horizontal line test. These are not the graphs of functions with inverse functions. By contrast, no horizontal line can be drawn in graphs (a) and (d) that intersects the graphs more than once. These graphs pass the horizontal line test. Thus, the graphs in parts (a) and (d) represent functions that have inverse functions.

 **Check Point 5** Which of the following graphs represent functions that have inverse functions?

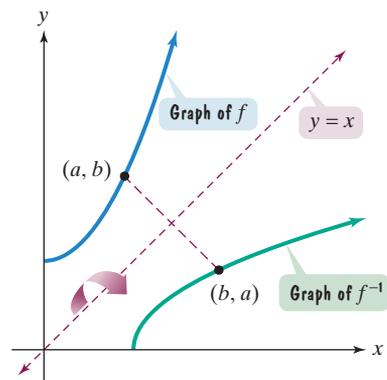

A function passes the horizontal line test when no two different ordered pairs have the same second component. This means that if  $x_1 \neq x_2$ , then  $f(x_1) \neq f(x_2)$ . Such a function is called a **one-to-one function**. Thus, **a one-to-one function is a function in which no two different ordered pairs have the same second component. Only one-to-one functions have inverse functions.** Any function that passes the horizontal line test is a one-to-one function. Any one-to-one function has a graph that passes the horizontal line test.

**4** Use the graph of a one-to-one function to graph its inverse function.

**Graphs of  $f$  and  $f^{-1}$**

There is a relationship between the graph of a one-to-one function,  $f$ , and its inverse,  $f^{-1}$ . Because inverse functions have ordered pairs with the coordinates interchanged, if the point  $(a, b)$  is on the graph of  $f$ , then the point  $(b, a)$  is on the graph of  $f^{-1}$ . The points  $(a, b)$  and  $(b, a)$  are symmetric with respect to the line  $y = x$ . Thus, **the graph of  $f^{-1}$  is a reflection of the graph of  $f$  about the line  $y = x$ .** This is illustrated in **Figure 1.68**.

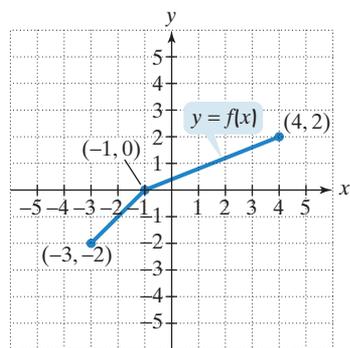

**FIGURE 1.68** The graph of  $f^{-1}$  is a reflection of the graph of  $f$  about  $y = x$ .

**EXAMPLE 6** Graphing the Inverse Function

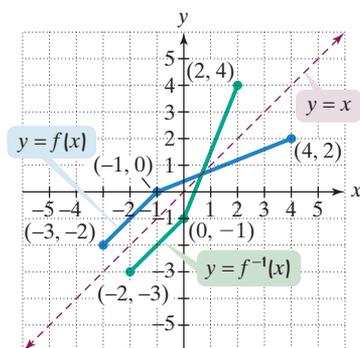

Use the graph of  $f$  in **Figure 1.69** to draw the graph of its inverse function.

**SOLUTION**

We begin by noting that no horizontal line intersects the graph of  $f$  at more than one point, so  $f$  does have an inverse function. Because the points  $(-3, -2)$ ,  $(-1, 0)$ , and  $(4, 2)$  are on the graph of  $f$ , the graph of the inverse function,  $f^{-1}$ , has points with these ordered pairs reversed. Thus,  $(-2, -3)$ ,  $(0, -1)$ , and  $(2, 4)$  are on the graph of  $f^{-1}$ . We can use these points to graph  $f^{-1}$ . The graph of  $f^{-1}$  is shown in green in **Figure 1.70**. Note that the green graph of  $f^{-1}$  is the reflection of the blue graph of  $f$  about the line  $y = x$ .

**FIGURE 1.69**

**FIGURE 1.70** The graphs of  $f$  and  $f^{-1}$

 **Check Point 6** The graph of function  $f$  consists of two line segments, one segment from  $(-2, -2)$  to  $(-1, 0)$  and a second segment from  $(-1, 0)$  to  $(1, 2)$ . Graph  $f$  and use the graph to draw the graph of its inverse function.

- 5 Find the inverse of a function and graph both functions on the same axes.

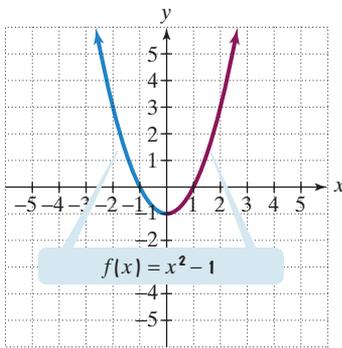

FIGURE 1.71

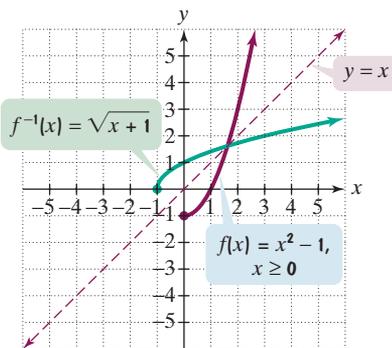

FIGURE 1.72

In our final example, we will first find  $f^{-1}$ . Then we will graph  $f$  and  $f^{-1}$  in the same rectangular coordinate system.

### EXAMPLE 7 Finding the Inverse of a Domain-Restricted Function

Find the inverse of  $f(x) = x^2 - 1$  if  $x \geq 0$ . Graph  $f$  and  $f^{-1}$  in the same rectangular coordinate system.

#### SOLUTION

The graph of  $f(x) = x^2 - 1$  is the graph of the standard quadratic function shifted vertically down 1 unit. **Figure 1.71** shows the function's graph. This graph fails the horizontal line test, so the function  $f(x) = x^2 - 1$  does not have an inverse function. By restricting the domain to  $x \geq 0$ , as given, we obtain a new function whose graph is shown in red in **Figure 1.71**. This red portion of the graph is increasing on the interval  $(0, \infty)$  and passes the horizontal line test. This tells us that  $f(x) = x^2 - 1$  has an inverse function if we restrict its domain to  $x \geq 0$ . We use our four-step procedure to find this inverse function. Begin with  $f(x) = x^2 - 1, x \geq 0$ .

**Step 1 Replace  $f(x)$  with  $y$ :**  $y = x^2 - 1, x \geq 0$ .

**Step 2 Interchange  $x$  and  $y$ :**  $x = y^2 - 1, y \geq 0$ .

**Step 3 Solve for  $y$ :**

$$x = y^2 - 1, y \geq 0 \quad \text{This is the equation from step 2.}$$

$$x + 1 = y^2 \quad \text{Add 1 to both sides.}$$

$$\sqrt{x + 1} = y \quad \text{Apply the square root property.}$$

Because  $y \geq 0$ , take only the principal square root and not the negative square root.

**Step 4 Replace  $y$  with  $f^{-1}(x)$ :**  $f^{-1}(x) = \sqrt{x + 1}$ .

Thus, the inverse of  $f(x) = x^2 - 1, x \geq 0$ , is  $f^{-1}(x) = \sqrt{x + 1}$ . The graphs of  $f$  and  $f^{-1}$  are shown in **Figure 1.72**. We obtained the graph of  $f^{-1}(x) = \sqrt{x + 1}$  by shifting the graph of the square root function,  $y = \sqrt{x}$ , horizontally to the left 1 unit. Note that the green graph of  $f^{-1}$  is the reflection of the red graph of  $f$  about the line  $y = x$ . ...

**Check Point 7** Find the inverse of  $f(x) = x^2 + 1$  if  $x \geq 0$ . Graph  $f$  and  $f^{-1}$  in the same rectangular coordinate system.

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- The notation  $f^{-1}$  means the \_\_\_\_\_ of the function  $f$ .
- If the function  $g$  is the inverse of the function  $f$ , then  $f(g(x)) = \underline{\hspace{2cm}}$  and  $g(f(x)) = \underline{\hspace{2cm}}$ .
- A function  $f$  has an inverse that is a function if there is no \_\_\_\_\_ line that intersects the graph of  $f$  at more than one point. Such a function is called a/an \_\_\_\_\_ function.
- The graph of  $f^{-1}$  is a reflection of the graph of  $f$  about the line whose equation is \_\_\_\_\_.

**EXERCISE SET 1.8**

**Practice Exercises**

In Exercises 1–10, find  $f(g(x))$  and  $g(f(x))$  and determine whether each pair of functions  $f$  and  $g$  are inverses of each other.

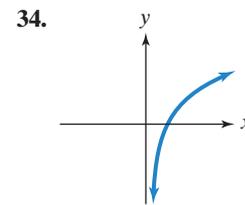

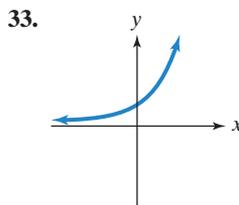

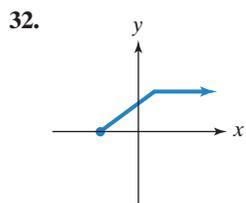

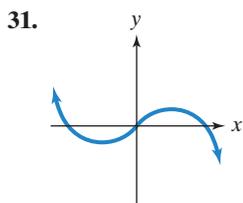

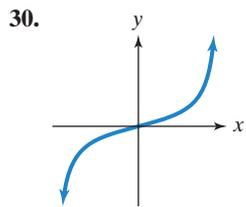

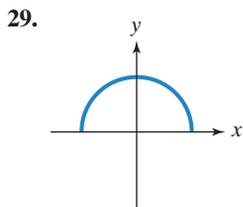

1.  $f(x) = 4x$  and  $g(x) = \frac{x}{4}$
2.  $f(x) = 6x$  and  $g(x) = \frac{x}{6}$
3.  $f(x) = 3x + 8$  and  $g(x) = \frac{x - 8}{3}$
4.  $f(x) = 4x + 9$  and  $g(x) = \frac{x - 9}{4}$
5.  $f(x) = 5x - 9$  and  $g(x) = \frac{x + 5}{9}$
6.  $f(x) = 3x - 7$  and  $g(x) = \frac{x + 3}{7}$
7.  $f(x) = \frac{3}{x - 4}$  and  $g(x) = \frac{3}{x} + 4$
8.  $f(x) = \frac{2}{x - 5}$  and  $g(x) = \frac{2}{x} + 5$
9.  $f(x) = -x$  and  $g(x) = -x$
10.  $f(x) = \sqrt[3]{x - 4}$  and  $g(x) = x^3 + 4$

The functions in Exercises 11–28 are all one-to-one. For each function,

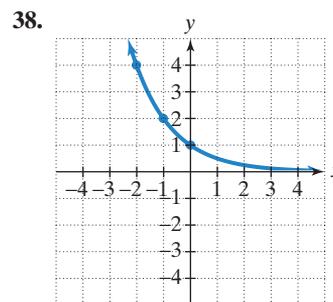

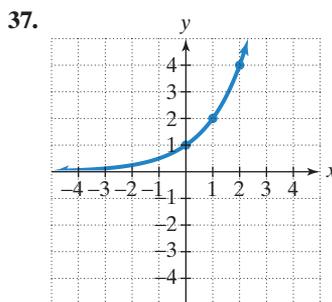

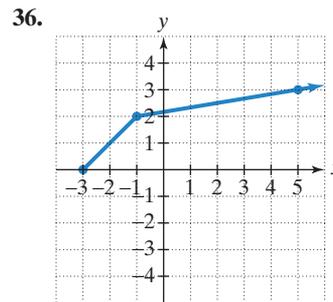

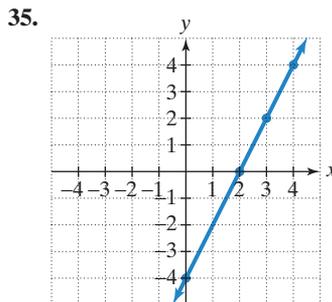

- a. Find an equation for  $f^{-1}(x)$ , the inverse function.
- b. Verify that your equation is correct by showing that  $f(f^{-1}(x)) = x$  and  $f^{-1}(f(x)) = x$ .

- |                                   |                                   |

**Practice Plus**

In Exercises 53–58,  $f$  and  $g$  are defined by the following tables. Use the tables to evaluate each composite function.

$x$	$f(x)$
-1	1
0	4
1	5
2	-1

$x$	$g(x)$
-1	0
1	1
4	2
10	-1

53.  $f(g(1))$
54.  $f(g(4))$
55.  $(g \circ f)(-1)$
56.  $(g \circ f)(0)$
57.  $f^{-1}(g(10))$
58.  $f^{-1}(g(1))$

In Exercises 59–64, let

$$f(x) = 2x - 5$$

$$g(x) = 4x - 1$$

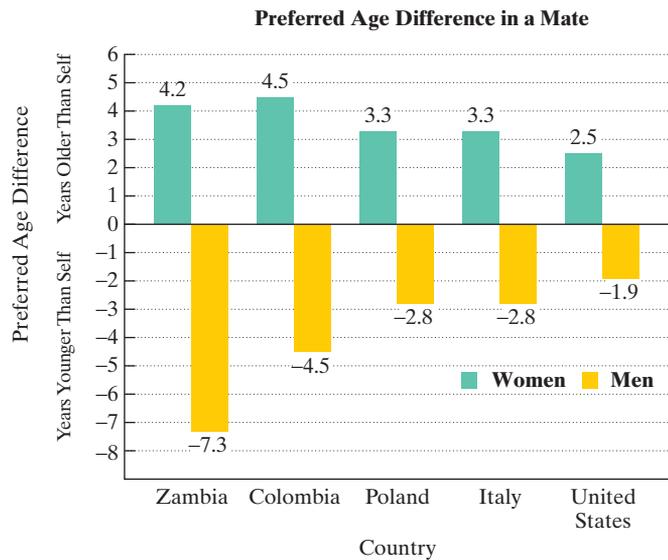

$$h(x) = x^2 + x + 2.$$

Evaluate the indicated function without finding an equation for the function.

59.  $(f \circ g)(0)$       60.  $(g \circ f)(0)$       61.  $f^{-1}(1)$   
 62.  $g^{-1}(7)$       63.  $g(f[h(1)])$       64.  $f(g[h(1)])$

### Application Exercises

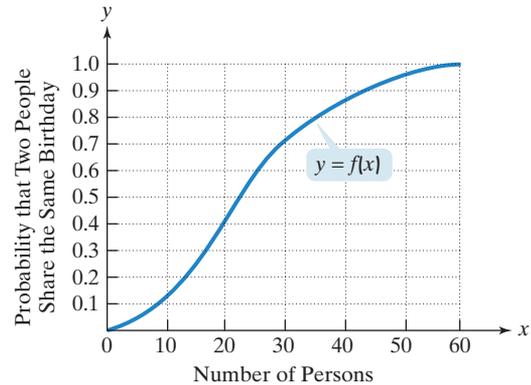

In most societies, women say they prefer to marry men who are older than themselves, whereas men say they prefer women who are younger. The bar graph shows the preferred age difference in a mate in five selected countries. Use this information to solve Exercises 65–66.

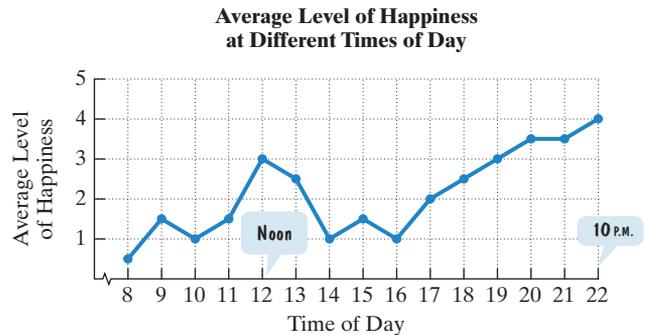

Source: Carole Wade and Carol Tavris, *Psychology*, 6th Edition, Prentice Hall, 2000.

65. a. Consider a function,  $f$ , whose domain is the set of the five countries shown in the graph. Let the range be the set of the average number of years women in each of the respective countries prefer men who are older than themselves. Write the function  $f$  as a set of ordered pairs.  
 b. Write the relation that is the inverse of  $f$  as a set of ordered pairs. Based on these ordered pairs, is  $f$  a one-to-one function? Explain your answer.
66. a. Consider a function,  $g$ , whose domain is the set of the five countries shown in the graph. Let the range be the set of negative numbers representing the average number of years men in each of the respective countries prefer women who are younger than themselves. Write the function  $g$  as a set of ordered pairs.  
 b. Write the relation that is the inverse of  $g$  as a set of ordered pairs. Based on these ordered pairs, is  $g$  a one-to-one function? Explain your answer.

67. The graph represents the probability of two people in the same room sharing a birthday as a function of the number of people in the room. Call the function  $f$ .

- a. Explain why  $f$  has an inverse that is a function.  
 b. Describe in practical terms the meaning of  $f^{-1}(0.25)$ ,  $f^{-1}(0.5)$ , and  $f^{-1}(0.7)$ .
68. A study of 900 working women in Texas showed that their feelings changed throughout the day. As the graph indicates, the women felt better as time passed, except for a blip (that's slang for relative maximum) at lunchtime.

Source: D. Kahneman et al., "A Survey Method for Characterizing Daily Life Experience," *Science*.

- a. Does the graph have an inverse that is a function? Explain your answer.  
 b. Identify two or more times of day when the average happiness level is 3. Express your answers as ordered pairs.  
 c. Do the ordered pairs in part (b) indicate that the graph represents a one-to-one function? Explain your answer.
69. The formula

$$y = f(x) = \frac{9}{5}x + 32$$

is used to convert from  $x$  degrees Celsius to  $y$  degrees Fahrenheit. The formula

$$y = g(x) = \frac{5}{9}(x - 32)$$

is used to convert from  $x$  degrees Fahrenheit to  $y$  degrees Celsius. Show that  $f$  and  $g$  are inverse functions.

### Writing in Mathematics

70. Explain how to determine if two functions are inverses of each other.  
 71. Describe how to find the inverse of a one-to-one function.

72. What is the horizontal line test and what does it indicate?
73. Describe how to use the graph of a one-to-one function to draw the graph of its inverse function.
74. How can a graphing utility be used to visually determine if two functions are inverses of each other?
75. What explanations can you offer for the trends shown by the graph in Exercise 68?

### Technology Exercises

In Exercises 76–83, use a graphing utility to graph the function. Use the graph to determine whether the function has an inverse that is a function (that is, whether the function is one-to-one).

76.  $f(x) = x^2 - 1$
77.  $f(x) = \sqrt[3]{2 - x}$
78.  $f(x) = \frac{x^3}{2}$
79.  $f(x) = \frac{x^4}{4}$
80.  $f(x) = \text{int}(x - 2)$
81.  $f(x) = |x - 2|$
82.  $f(x) = (x - 1)^3$
83.  $f(x) = -\sqrt{16 - x^2}$

In Exercises 84–86, use a graphing utility to graph  $f$  and  $g$  in the same viewing rectangle. In addition, graph the line  $y = x$  and visually determine if  $f$  and  $g$  are inverses.

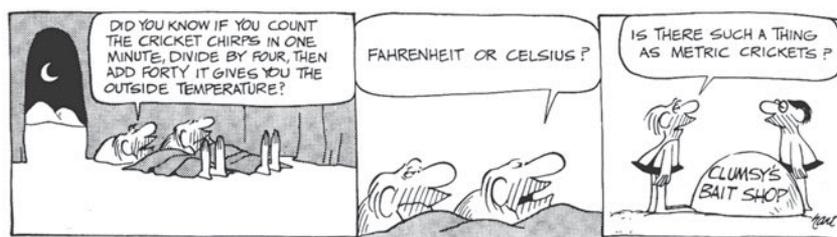

84.  $f(x) = 4x + 4$ ,  $g(x) = 0.25x - 1$
85.  $f(x) = \frac{1}{x} + 2$ ,  $g(x) = \frac{1}{x - 2}$
86.  $f(x) = \sqrt[3]{x} - 2$ ,  $g(x) = (x + 2)^3$

### Critical Thinking Exercises

**Make Sense?** In Exercises 87–90, determine whether each statement makes sense or does not make sense, and explain your reasoning.

87. I found the inverse of  $f(x) = 5x - 4$  in my head: The reverse of multiplying by 5 and subtracting 4 is adding 4 and dividing by 5, so  $f^{-1}(x) = \frac{x + 4}{5}$ .
88. I'm working with the linear function  $f(x) = 3x + 5$  and I do not need to find  $f^{-1}$  in order to determine the value of  $(f \circ f^{-1})(17)$ .

Exercises 89–90 are based on the following cartoon.

© John L. Hart FLP. All rights reserved.

89. Assuming that there is no such thing as metric crickets, I modeled the information in the first frame of the cartoon with the function

$$T(n) = \frac{n}{4} + 40,$$

where  $T(n)$  is the temperature, in degrees Fahrenheit, and  $n$  is the number of cricket chirps per minute.

90. I used the function in Exercise 89 and found an equation for  $T^{-1}$ , which expresses the number of cricket chirps per minute as a function of Fahrenheit temperature.

In Exercises 91–94, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

91. The inverse of  $\{(1, 4), (2, 7)\}$  is  $\{(2, 7), (1, 4)\}$ .
92. The function  $f(x) = 5$  is one-to-one.
93. If  $f(x) = 3x$ , then  $f^{-1}(x) = \frac{1}{3x}$ .
94. The domain of  $f$  is the same as the range of  $f^{-1}$ .
95. If  $f(x) = 3x$  and  $g(x) = x + 5$ , find  $(f \circ g)^{-1}(x)$  and  $(g^{-1} \circ f^{-1})(x)$ .
96. Show that

$$f(x) = \frac{3x - 2}{5x - 3}$$

is its own inverse.

97. *Freedom 7* was the spacecraft that carried the first American into space in 1961. Total flight time was 15 minutes and the spacecraft reached a maximum height of 116 miles. Consider a function,  $s$ , that expresses *Freedom 7*'s height,  $s(t)$ , in miles, after  $t$  minutes. Is  $s$  a one-to-one function? Explain your answer.
98. If  $f(2) = 6$ , and  $f$  is one-to-one, find  $x$  satisfying  $8 + f^{-1}(x - 1) = 10$ .

### Group Exercise

99. In Tom Stoppard's play *Arcadia*, the characters dream and talk about mathematics, including ideas involving graphing, composite functions, symmetry, and lack of symmetry in things that are tangled, mysterious, and unpredictable. Group members should read the play. Present a report on the ideas discussed by the characters that are related to concepts that we studied in this chapter. Bring in a copy of the play and read appropriate excerpts.

### Preview Exercises

Exercises 100–102 will help you prepare for the material covered in the next section.

100. Let  $(x_1, y_1) = (7, 2)$  and  $(x_2, y_2) = (1, -1)$ . Find  $\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$ . Express the answer in simplified radical form.
101. Use a rectangular coordinate system to graph the circle with center  $(1, -1)$  and radius 1.
102. Solve by completing the square:  $y^2 - 6y - 4 = 0$ .

## SECTION 1.9

## Distance and Midpoint Formulas; Circles

*Objectives*

- 1 Find the distance between two points.
- 2 Find the midpoint of a line segment.
- 3 Write the standard form of a circle's equation.
- 4 Give the center and radius of a circle whose equation is in standard form.
- 5 Convert the general form of a circle's equation to standard form.

- 1 Find the distance between two points.

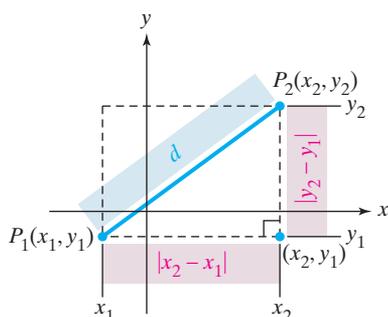

FIGURE 1.73

It's a good idea to know your way around a circle. Clocks, angles, maps, and compasses are based on circles. Circles occur everywhere in nature: in ripples on water, patterns on a butterfly's wings, and cross sections of trees. Some consider the circle to be the most pleasing of all shapes.

The rectangular coordinate system gives us a unique way of knowing a circle. It enables us to translate a circle's geometric definition into an algebraic equation. To do this, we must first develop a formula for the distance between any two points in rectangular coordinates.

**The Distance Formula**

Using the Pythagorean Theorem, we can find the distance between the two points  $P_1(x_1, y_1)$  and  $P_2(x_2, y_2)$  in the rectangular coordinate system. The two points are illustrated in **Figure 1.73**.

The distance that we need to find is represented by  $d$  and shown in blue. Notice that the distance between the two points on the dashed horizontal line is the absolute value of the difference between the  $x$ -coordinates of the points. This distance,  $|x_2 - x_1|$ , is shown in pink. Similarly, the distance between the two points on the dashed vertical line is the absolute value of the difference between the  $y$ -coordinates of the points. This distance,  $|y_2 - y_1|$ , is also shown in pink.

Because the dashed lines are horizontal and vertical, a right triangle is formed. Thus, we can use the Pythagorean Theorem to find the distance  $d$ . Squaring the lengths of the triangle's sides results in positive numbers, so absolute value notation is not necessary.

$$d^2 = (x_2 - x_1)^2 + (y_2 - y_1)^2$$

Apply the Pythagorean Theorem to the right triangle in Figure 1.73.

$$d = \pm \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

Apply the square root property.

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

Because distance is nonnegative, write only the principal square root.

This result is called the **distance formula**.

**The Distance Formula**

The distance,  $d$ , between the points  $(x_1, y_1)$  and  $(x_2, y_2)$  in the rectangular coordinate system is

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}.$$

To compute the distance between two points, find the square of the difference between the  $x$ -coordinates plus the square of the difference between the  $y$ -coordinates. The principal square root of this sum is the distance.

When using the distance formula, it does not matter which point you call  $(x_1, y_1)$  and which you call  $(x_2, y_2)$ .

### EXAMPLE 1 Using the Distance Formula

Find the distance between  $(-1, 4)$  and  $(3, -2)$ . Express the answer in simplified radical form and then round to two decimal places.

### SOLUTION

We will let  $(x_1, y_1) = (-1, 4)$  and  $(x_2, y_2) = (3, -2)$ .

$$\begin{aligned}
 d &= \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2} && \text{Use the distance formula.} \\
 &= \sqrt{[3 - (-1)]^2 + (-2 - 4)^2} && \text{Substitute the given values.} \\
 &= \sqrt{4^2 + (-6)^2} && \text{Perform operations inside grouping symbols:} \\
 & && \text{3 - (-1) = 3 + 1 = 4 and -2 - 4 = -6.} \\
 &= \sqrt{16 + 36} && \text{Square 4 and -6.} \\
 &= \sqrt{52} && \text{Add.} \\
 &= \sqrt{4 \cdot 13} = 2\sqrt{13} \approx 7.21 && \sqrt{52} = \sqrt{4 \cdot 13} = \sqrt{4} \sqrt{13} = 2\sqrt{13}
 \end{aligned}$$

Caution: This does not equal  $\sqrt{16} + \sqrt{36}$ .

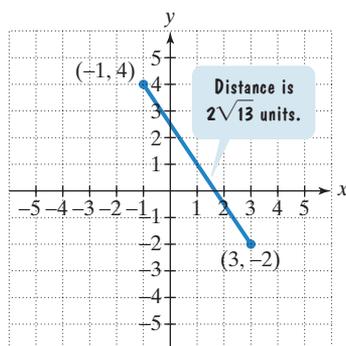

FIGURE 1.74 Finding the distance between two points

The distance between the given points is  $2\sqrt{13}$  units, or approximately 7.21 units. The situation is illustrated in **Figure 1.74**. ●●●

**Check Point 1** Find the distance between  $(-1, -3)$  and  $(2, 3)$ . Express the answer in simplified radical form and then round to two decimal places.

- 2 Find the midpoint of a line segment.

### The Midpoint Formula

The distance formula can be used to derive a formula for finding the midpoint of a line segment between two given points. The formula is given as follows:

#### The Midpoint Formula

Consider a line segment whose endpoints are  $(x_1, y_1)$  and  $(x_2, y_2)$ . The coordinates of the segment's midpoint are

$$\left( \frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2} \right).$$

To find the midpoint, take the average of the two  $x$ -coordinates and the average of the two  $y$ -coordinates.

### GREAT QUESTION!

**Do I add or subtract coordinates when applying the midpoint and distance formulas?**

The midpoint formula requires finding the *sum* of coordinates. By contrast, the distance formula requires finding the *difference* of coordinates:

Midpoint: Sum of coordinates	Distance: Difference of coordinates
$\left( \frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2} \right)$	$\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$

It's easy to confuse the two formulas. Be sure to use addition, not subtraction, when applying the midpoint formula.

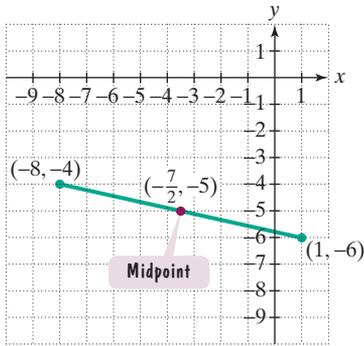

FIGURE 1.75 Finding a line segment's midpoint

### EXAMPLE 2 Using the Midpoint Formula

Find the midpoint of the line segment with endpoints  $(1, -6)$  and  $(-8, -4)$ .

#### SOLUTION

To find the coordinates of the midpoint, we average the coordinates of the endpoints.

$$\text{Midpoint} = \left( \frac{1 + (-8)}{2}, \frac{-6 + (-4)}{2} \right) = \left( \frac{-7}{2}, \frac{-10}{2} \right) = \left( -\frac{7}{2}, -5 \right)$$

Average the  
x-coordinates.

Average the  
y-coordinates.

Figure 1.75 illustrates that the point  $(-\frac{7}{2}, -5)$  is midway between the points  $(1, -6)$  and  $(-8, -4)$ . ...

**Check Point 2** Find the midpoint of the line segment with endpoints  $(1, 2)$  and  $(7, -3)$ .

### Circles

Our goal is to translate a circle's geometric definition into an equation. We begin with this geometric definition.

#### Definition of a Circle

A **circle** is the set of all points in a plane that are equidistant from a fixed point, called the **center**. The fixed distance from the circle's center to any point on the circle is called the **radius**.

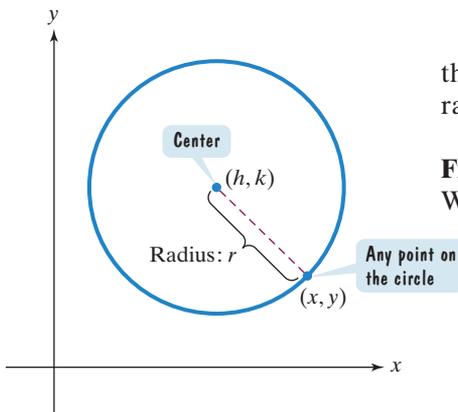

FIGURE 1.76 A circle centered at  $(h, k)$  with radius  $r$

Figure 1.76 is our starting point for obtaining a circle's equation. We've placed the circle into a rectangular coordinate system. The circle's center is  $(h, k)$  and its radius is  $r$ . We let  $(x, y)$  represent the coordinates of any point on the circle.

What does the geometric definition of a circle tell us about the point  $(x, y)$  in Figure 1.76? The point is on the circle if and only if its distance from the center is  $r$ . We can use the distance formula to express this idea algebraically:

$$\sqrt{(x - h)^2 + (y - k)^2} = r.$$

The distance between  $(x, y)$  and  $(h, k)$ 
is always
 $r$ .

Squaring both sides of  $\sqrt{(x - h)^2 + (y - k)^2} = r$  yields the *standard form of the equation of a circle*.

- 3 Write the standard form of a circle's equation.

#### The Standard Form of the Equation of a Circle

The **standard form of the equation of a circle** with center  $(h, k)$  and radius  $r$  is

$$(x - h)^2 + (y - k)^2 = r^2.$$

### EXAMPLE 3 Finding the Standard Form of a Circle's Equation

Write the standard form of the equation of the circle with center  $(0, 0)$  and radius 2. Graph the circle.

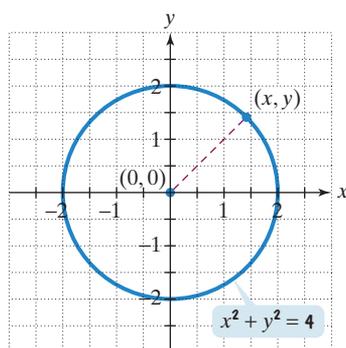

FIGURE 1.77 The graph of  $x^2 + y^2 = 4$

### SOLUTION

The center is  $(0, 0)$ . Because the center is represented as  $(h, k)$  in the standard form of the equation,  $h = 0$  and  $k = 0$ . The radius is 2, so we will let  $r = 2$  in the equation.

$$(x - h)^2 + (y - k)^2 = r^2 \quad \text{This is the standard form of a circle's equation.}$$

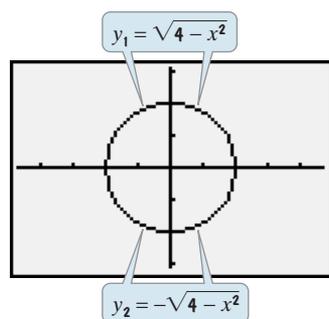

$$(x - 0)^2 + (y - 0)^2 = 2^2 \quad \text{Substitute 0 for } h, 0 \text{ for } k, \text{ and } 2 \text{ for } r.$$

$$x^2 + y^2 = 4 \quad \text{Simplify.}$$

The standard form of the equation of the circle is  $x^2 + y^2 = 4$ . **Figure 1.77** shows the graph. ●●●

 **Check Point 3** Write the standard form of the equation of the circle with center  $(0, 0)$  and radius 4.

### TECHNOLOGY

To graph a circle with a graphing utility, first solve the equation for  $y$ .

$$x^2 + y^2 = 4$$

$$y^2 = 4 - x^2$$

$$y = \pm\sqrt{4 - x^2}$$

$y$  is not a function of  $x$ .

Graph the two equations

$$y_1 = \sqrt{4 - x^2} \quad \text{and} \quad y_2 = -\sqrt{4 - x^2}$$

in the same viewing rectangle. The graph of  $y_1 = \sqrt{4 - x^2}$  is the top semicircle because  $y$  is always positive. The graph of  $y_2 = -\sqrt{4 - x^2}$  is the bottom semicircle because  $y$  is always negative. Use a **ZOOM SQUARE** setting so that the circle looks like a circle. (Many graphing utilities have problems connecting the two semicircles because the segments directly to the left and to the right of the center become nearly vertical.)

Example 3 and Check Point 3 involved circles centered at the origin. The standard form of the equation of all such circles is  $x^2 + y^2 = r^2$ , where  $r$  is the circle's radius. Now, let's consider a circle whose center is not at the origin.

### EXAMPLE 4 Finding the Standard Form of a Circle's Equation

Write the standard form of the equation of the circle with center  $(-2, 3)$  and radius 4.

### SOLUTION

The center is  $(-2, 3)$ . Because the center is represented as  $(h, k)$  in the standard form of the equation,  $h = -2$  and  $k = 3$ . The radius is 4, so we will let  $r = 4$  in the equation.

$$(x - h)^2 + (y - k)^2 = r^2 \quad \text{This is the standard form of a circle's equation.}$$

$$[x - (-2)]^2 + (y - 3)^2 = 4^2 \quad \text{Substitute } -2 \text{ for } h, 3 \text{ for } k, \text{ and } 4 \text{ for } r.$$

$$(x + 2)^2 + (y - 3)^2 = 16 \quad \text{Simplify.}$$

The standard form of the equation of the circle is  $(x + 2)^2 + (y - 3)^2 = 16$ . ●●●

 **Check Point 4** Write the standard form of the equation of the circle with center  $(0, -6)$  and radius 10.

- 4 Give the center and radius of a circle whose equation is in standard form.

### EXAMPLE 5 Using the Standard Form of a Circle's Equation to Graph the Circle

- a. Find the center and radius of the circle whose equation is

$$(x - 2)^2 + (y + 4)^2 = 9.$$

- b. Graph the equation.  
c. Use the graph to identify the relation's domain and range.

#### SOLUTION

- a. We begin by finding the circle's center,  $(h, k)$ , and its radius,  $r$ . We can find the values for  $h$ ,  $k$ , and  $r$  by comparing the given equation to the standard form of the equation of a circle,  $(x - h)^2 + (y - k)^2 = r^2$ .

$$(x - 2)^2 + (y + 4)^2 = 9$$

$$(x - 2)^2 + (y - (-4))^2 = 3^2$$

This is  $(x - h)^2$ ,  
with  $h = 2$ .

This is  $(y - k)^2$ ,  
with  $k = -4$ .

This is  $r^2$ ,  
with  $r = 3$ .

We see that  $h = 2$ ,  $k = -4$ , and  $r = 3$ . Thus, the circle has center  $(h, k) = (2, -4)$  and a radius of 3 units.

- b. To graph this circle, first locate the center  $(2, -4)$ . Because the radius is 3, you can locate at least four points on the circle by going out three units to the right, to the left, up, and down from the center.

The points three units to the right and to the left of  $(2, -4)$  are  $(5, -4)$  and  $(-1, -4)$ , respectively. The points three units up and down from  $(2, -4)$  are  $(2, -1)$  and  $(2, -7)$ , respectively.

Using these points, we obtain the graph in **Figure 1.78**.

- c. The four points that we located on the circle can be used to determine the relation's domain and range. The points  $(-1, -4)$  and  $(5, -4)$  show that values of  $x$  extend from  $-1$  to  $5$ , inclusive:

$$\text{Domain} = [-1, 5].$$

The points  $(2, -7)$  and  $(2, -1)$  show that values of  $y$  extend from  $-7$  to  $-1$ , inclusive:

$$\text{Range} = [-7, -1].$$

...

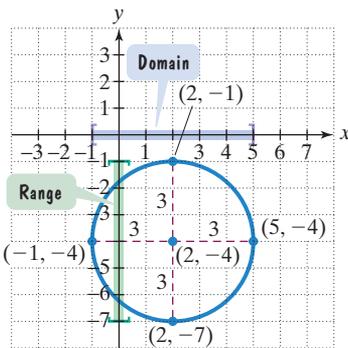

FIGURE 1.78 The graph of  $(x - 2)^2 + (y + 4)^2 = 9$

### GREAT QUESTION!

**What's the bottom line when identifying  $h$  and  $k$  in the standard form of a circle's equation?**

It's easy to make sign errors when finding  $h$  and  $k$ , the coordinates of a circle's center,  $(h, k)$ . Keep in mind that  $h$  and  $k$  are the numbers that *follow the subtraction signs* in a circle's equation:

$$(x - 2)^2 + (y + 4)^2 = 9$$

$$(x - 2)^2 + (y - (-4))^2 = 9.$$

The number after the  
subtraction is 2:  $h = 2$ .

The number after the  
subtraction is  $-4$ :  $k = -4$ .

### Check Point 5

- a. Find the center and radius of the circle whose equation is

$$(x + 3)^2 + (y - 1)^2 = 4.$$

- b. Graph the equation.  
c. Use the graph to identify the relation's domain and range.

If we square  $x - 2$  and  $y + 4$  in the standard form of the equation in Example 5, we obtain another form for the circle's equation.

$$(x - 2)^2 + (y + 4)^2 = 9 \quad \text{This is the standard form of the equation in Example 5.}$$

$$x^2 - 4x + 4 + y^2 + 8y + 16 = 9 \quad \text{Square } x - 2 \text{ and } y + 4.$$

$$x^2 + y^2 - 4x + 8y + 20 = 9 \quad \text{Combine constants and rearrange terms.}$$

$$x^2 + y^2 - 4x + 8y + 11 = 0 \quad \text{Subtract 9 from both sides.}$$

This result suggests that an equation in the form  $x^2 + y^2 + Dx + Ey + F = 0$  can represent a circle. This is called the *general form of the equation of a circle*.

#### The General Form of the Equation of a Circle

The **general form of the equation of a circle** is

$$x^2 + y^2 + Dx + Ey + F = 0,$$

where  $D$ ,  $E$ , and  $F$  are real numbers.

- 5 Convert the general form of a circle's equation to standard form.

We can convert the general form of the equation of a circle to the standard form  $(x - h)^2 + (y - k)^2 = r^2$ . We do so by completing the square on  $x$  and  $y$ . Let's see how this is done.

### GREAT QUESTION!

**Egad! I forgot how to complete the square. Any suggestions?**

To complete the square, on  $x^2 + bx$ , take half the coefficient of  $x$ . Then square this number. By adding the square of half the coefficient of  $x$ , a perfect square trinomial will result. For more detail, see Section P.7, page 96.

#### EXAMPLE 6 Converting the General Form of a Circle's Equation to Standard Form and Graphing the Circle

Write in standard form and graph:  $x^2 + y^2 + 4x - 6y - 23 = 0$ .

#### SOLUTION

Because we plan to complete the square on both  $x$  and  $y$ , let's rearrange the terms so that  $x$ -terms are arranged in descending order,  $y$ -terms are arranged in descending order, and the constant term appears on the right.

$$\begin{aligned} x^2 + y^2 + 4x - 6y - 23 &= 0 \\ (x^2 + 4x \quad) + (y^2 - 6y \quad) &= 23 \end{aligned}$$

$$(x^2 + 4x + 4) + (y^2 - 6y + 9) = 23 + 4 + 9$$

Remember that numbers added on the left side must also be added on the right side.

$$(x + 2)^2 + (y - 3)^2 = 36$$

This is the given equation.

Rewrite in anticipation of completing the square.

Complete the square on  $x$ :  $\frac{1}{2} \cdot 4 = 2$  and  $2^2 = 4$ , so add 4 to both sides. Complete the square on  $y$ :  $\frac{1}{2}(-6) = -3$  and  $(-3)^2 = 9$ , so add 9 to both sides.

Factor on the left and add on the right.

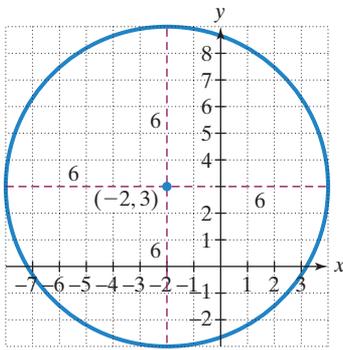

FIGURE 1.79 The graph of  $(x + 2)^2 + (y - 3)^2 = 36$

This last equation,  $(x + 2)^2 + (y - 3)^2 = 36$ , is in standard form. We can identify the circle's center and radius by comparing this equation to the standard form of the equation of a circle,  $(x - h)^2 + (y - k)^2 = r^2$ .

$$(x + 2)^2 + (y - 3)^2 = 36$$

$$(x - (-2))^2 + (y - 3)^2 = 6^2$$

This is  $(x - h)^2$ ,  
with  $h = -2$ .

This is  $(y - k)^2$ ,  
with  $k = 3$ .

This is  $r^2$ ,  
with  $r = 6$ .

We use the center,  $(h, k) = (-2, 3)$ , and the radius,  $r = 6$ , to graph the circle. The graph is shown in **Figure 1.79**. ● ● ●

## TECHNOLOGY

To graph  $x^2 + y^2 + 4x - 6y - 23 = 0$ , the general form of the circle's equation given in Example 6, rewrite the equation as a quadratic equation in  $y$ .

$$y^2 - 6y + (x^2 + 4x - 23) = 0$$

Now solve for  $y$  using the quadratic formula, with  $a = 1$ ,  $b = -6$ , and  $c = x^2 + 4x - 23$ .

$$y = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} = \frac{-(-6) \pm \sqrt{(-6)^2 - 4 \cdot 1(x^2 + 4x - 23)}}{2 \cdot 1} = \frac{6 \pm \sqrt{36 - 4(x^2 + 4x - 23)}}{2}$$

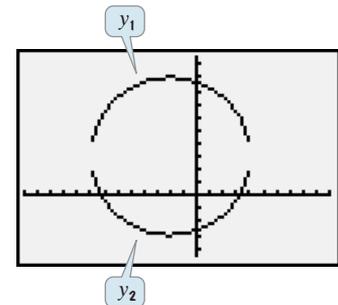

Because we will enter these equations, there is no need to simplify. Enter

$$y_1 = \frac{6 + \sqrt{36 - 4(x^2 + 4x - 23)}}{2}$$

and

$$y_2 = \frac{6 - \sqrt{36 - 4(x^2 + 4x - 23)}}{2}$$

Use a **ZOOM SQUARE** setting. The graph is shown on the right.

**Check Point 6** Write in standard form and graph:

$$x^2 + y^2 + 4x - 4y - 1 = 0.$$

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- The distance,  $d$ , between the points  $(x_1, y_1)$  and  $(x_2, y_2)$  in the rectangular coordinate system is  
 $d =$  \_\_\_\_\_.
- The midpoint of a line segment whose endpoints are  $(x_1, y_1)$  and  $(x_2, y_2)$  is (\_\_\_\_\_, \_\_\_\_\_).
- The set of all points in a plane that are equidistant from a fixed point is a/an \_\_\_\_\_. The fixed point is called the \_\_\_\_\_. The distance from this fixed point to any point on the geometric figure is called the \_\_\_\_\_.
- The standard form of the equation of a circle with center  $(h, k)$  and radius  $r$  is \_\_\_\_\_.
- The equation  $x^2 + y^2 + Dx + Ey + F = 0$  is called the \_\_\_\_\_ form of the equation of a circle.
- In the equation  $(x^2 + 4x \quad) + (y^2 - 8y \quad) = 5$ , we complete the square on  $x$  by adding \_\_\_\_\_ to both sides. We complete the square on  $y$  by adding \_\_\_\_\_ to both sides.

## EXERCISE SET 1.9

## Practice Exercises

In Exercises 1–18, find the distance between each pair of points. If necessary, round answers to two decimal places.

1. (2, 3) and (14, 8)
2. (5, 1) and (8, 5)
3. (4, -1) and (-6, 3)
4. (2, -3) and (-1, 5)
5. (0, 0) and (-3, 4)
6. (0, 0) and (3, -4)
7. (-2, -6) and (3, -4)
8. (-4, -1) and (2, -3)
9. (0, -3) and (4, 1)
10. (0, -2) and (4, 3)
11. (3.5, 8.2) and (-0.5, 6.2)
12. (2.6, 1.3) and (1.6, -5.7)
13.  $(0, -\sqrt{3})$  and  $(\sqrt{5}, 0)$
14.  $(0, -\sqrt{2})$  and  $(\sqrt{7}, 0)$
15.  $(3\sqrt{3}, \sqrt{5})$  and  $(-\sqrt{3}, 4\sqrt{5})$
16.  $(2\sqrt{3}, \sqrt{6})$  and  $(-\sqrt{3}, 5\sqrt{6})$
17.  $(\frac{7}{3}, \frac{1}{5})$  and  $(\frac{1}{3}, \frac{6}{5})$
18.  $(-\frac{1}{4}, -\frac{1}{7})$  and  $(\frac{3}{4}, \frac{6}{7})$

In Exercises 19–30, find the midpoint of each line segment with the given endpoints.

19. (6, 8) and (2, 4)
20. (10, 4) and (2, 6)
21. (-2, -8) and (-6, -2)
22. (-4, -7) and (-1, -3)
23. (-3, -4) and (6, -8)
24. (-2, -1) and (-8, 6)
25.  $(-\frac{7}{2}, \frac{3}{2})$  and  $(-\frac{5}{2}, -\frac{11}{2})$
26.  $(-\frac{2}{5}, \frac{7}{15})$  and  $(-\frac{2}{5}, -\frac{4}{15})$
27.  $(8, 3\sqrt{5})$  and  $(-6, 7\sqrt{5})$
28.  $(7\sqrt{3}, -6)$  and  $(3\sqrt{3}, -2)$
29.  $(\sqrt{18}, -4)$  and  $(\sqrt{2}, 4)$
30.  $(\sqrt{50}, -6)$  and  $(\sqrt{2}, 6)$

In Exercises 31–40, write the standard form of the equation of the circle with the given center and radius.

31. Center (0, 0),  $r = 7$
32. Center (0, 0),  $r = 8$
33. Center (3, 2),  $r = 5$
34. Center (2, -1),  $r = 4$
35. Center (-1, 4),  $r = 2$
36. Center (-3, 5),  $r = 3$
37. Center (-3, -1),  $r = \sqrt{3}$
38. Center (-5, -3),  $r = \sqrt{5}$
39. Center (-4, 0),  $r = 10$
40. Center (-2, 0),  $r = 6$

In Exercises 41–52, give the center and radius of the circle described by the equation and graph each equation. Use the graph to identify the relation's domain and range.

41.  $x^2 + y^2 = 16$
42.  $x^2 + y^2 = 49$
43.  $(x - 3)^2 + (y - 1)^2 = 36$
44.  $(x - 2)^2 + (y - 3)^2 = 16$
45.  $(x + 3)^2 + (y - 2)^2 = 4$
46.  $(x + 1)^2 + (y - 4)^2 = 25$
47.  $(x + 2)^2 + (y + 2)^2 = 4$
48.  $(x + 4)^2 + (y + 5)^2 = 36$
49.  $x^2 + (y - 1)^2 = 1$
50.  $x^2 + (y - 2)^2 = 4$
51.  $(x + 1)^2 + y^2 = 25$
52.  $(x + 2)^2 + y^2 = 16$

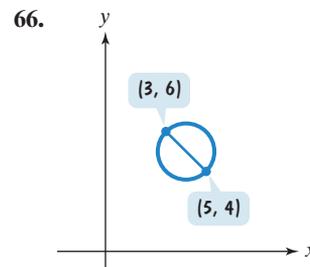

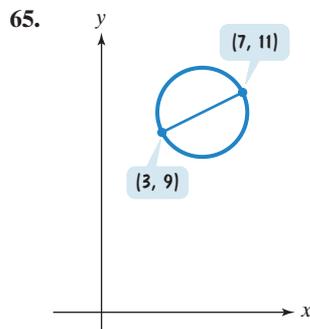

In Exercises 53–64, complete the square and write the equation in standard form. Then give the center and radius of each circle and graph the equation.

53.  $x^2 + y^2 + 6x + 2y + 6 = 0$
54.  $x^2 + y^2 + 8x + 4y + 16 = 0$
55.  $x^2 + y^2 - 10x - 6y - 30 = 0$
56.  $x^2 + y^2 - 4x - 12y - 9 = 0$
57.  $x^2 + y^2 + 8x - 2y - 8 = 0$
58.  $x^2 + y^2 + 12x - 6y - 4 = 0$
59.  $x^2 - 2x + y^2 - 15 = 0$
60.  $x^2 + y^2 - 6y - 7 = 0$
61.  $x^2 + y^2 - x + 2y + 1 = 0$
62.  $x^2 + y^2 + x + y - \frac{1}{2} = 0$
63.  $x^2 + y^2 + 3x - 2y - 1 = 0$
64.  $x^2 + y^2 + 3x + 5y + \frac{9}{4} = 0$

## Practice Plus

In Exercises 65–66, a line segment through the center of each circle intersects the circle at the points shown.

- a. Find the coordinates of the circle's center.
- b. Find the radius of the circle.
- c. Use your answers from parts (a) and (b) to write the standard form of the circle's equation.

In Exercises 67–70, graph both equations in the same rectangular coordinate system and find all points of intersection. Then show that these ordered pairs satisfy the equations.

67.  $x^2 + y^2 = 16$   
 $x - y = 4$
68.  $x^2 + y^2 = 9$   
 $x - y = 3$
69.  $(x - 2)^2 + (y + 3)^2 = 4$   
 $y = x - 3$
70.  $(x - 3)^2 + (y + 1)^2 = 9$   
 $y = x - 1$

**Application Exercises**

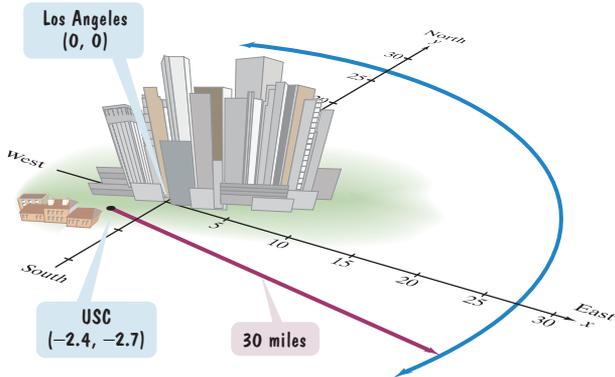

The cellphone screen shows coordinates of six cities from a rectangular coordinate system placed on North America by long-distance telephone companies. Each unit in this system represents  $\sqrt{0.1}$  mile.

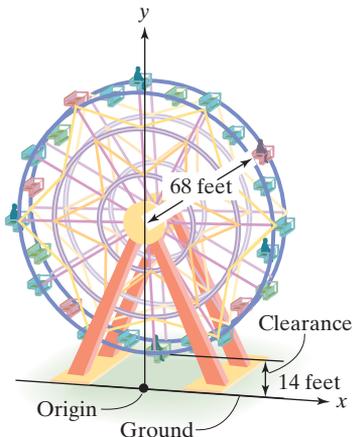

Source: Peter H. Dana

In Exercises 71–72, use this information to find the distance, to the nearest mile, between each pair of cities.

- 71. Boston and San Francisco
- 72. New Orleans and Houston
- 73. A rectangular coordinate system with coordinates in miles is placed with the origin at the center of Los Angeles. The figure indicates that the University of Southern California is located 2.4 miles west and 2.7 miles south of central Los Angeles. A seismograph on the campus shows that a small earthquake occurred. The quake's epicenter is estimated to be approximately 30 miles from the university. Write the standard form of the equation for the set of points that could be the epicenter of the quake.

- 74. The Ferris wheel in the figure has a radius of 68 feet. The clearance between the wheel and the ground is 14 feet. The rectangular coordinate system shown has its origin on the ground directly below the center of the wheel. Use the coordinate system to write the equation of the circular wheel.

**Writing in Mathematics**

- 75. In your own words, describe how to find the distance between two points in the rectangular coordinate system.
- 76. In your own words, describe how to find the midpoint of a line segment if its endpoints are known.
- 77. What is a circle? Without using variables, describe how the definition of a circle can be used to obtain a form of its equation.
- 78. Give an example of a circle's equation in standard form. Describe how to find the center and radius for this circle.
- 79. How is the standard form of a circle's equation obtained from its general form?
- 80. Does  $(x - 3)^2 + (y - 5)^2 = 0$  represent the equation of a circle? If not, describe the graph of this equation.
- 81. Does  $(x - 3)^2 + (y - 5)^2 = -25$  represent the equation of a circle? What sort of set is the graph of this equation?
- 82. Write and solve a problem about the flying time between a pair of cities shown on the cellphone screen for Exercises 71–72. Do not use the pairs in Exercise 71 or Exercise 72. Begin by determining a reasonable average speed, in miles per hour, for a jet flying between the cities.

**Technology Exercises**

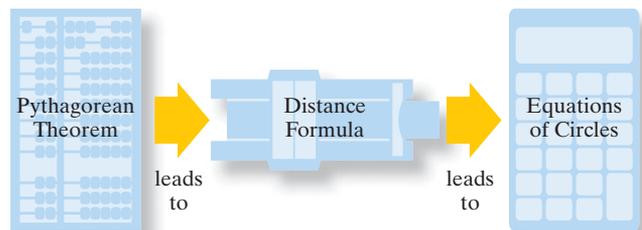

In Exercises 83–85, use a graphing utility to graph each circle whose equation is given.

- 83.  $x^2 + y^2 = 25$
- 84.  $(y + 1)^2 = 36 - (x - 3)^2$
- 85.  $x^2 + 10x + y^2 - 4y - 20 = 0$

**Critical Thinking Exercises**

**Make Sense?** In Exercises 86–89, determine whether each statement makes sense or does not make sense, and explain your reasoning.

- 86. I've noticed that in mathematics, one topic often leads logically to a new topic:

- 87. To avoid sign errors when finding  $h$  and  $k$ , I place parentheses around the numbers that follow the subtraction signs in a circle's equation.
- 88. I used the equation  $(x + 1)^2 + (y - 5)^2 = -4$  to identify the circle's center and radius.
- 89. My graph of  $(x - 2)^2 + (y + 1)^2 = 16$  is my graph of  $x^2 + y^2 = 16$  translated two units right and one unit down.

In Exercises 90–93, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

- 90. The equation of the circle whose center is at the origin with radius 16 is  $x^2 + y^2 = 16$ .
- 91. The graph of  $(x - 3)^2 + (y + 5)^2 = 36$  is a circle with radius 6 centered at  $(-3, 5)$ .

92. The graph of  $(x - 4) + (y + 6) = 25$  is a circle with radius 5 centered at  $(4, -6)$ .
93. The graph of  $(x - 3)^2 + (y + 5)^2 = -36$  is a circle with radius 6 centered at  $(3, -5)$ .
94. Show that the points  $A(1, 1 + d)$ ,  $B(3, 3 + d)$ , and  $C(6, 6 + d)$  are collinear (lie along a straight line) by showing that the distance from  $A$  to  $B$  plus the distance from  $B$  to  $C$  equals the distance from  $A$  to  $C$ .
95. Prove the midpoint formula by using the following procedure.
- Show that the distance between  $(x_1, y_1)$  and  $\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right)$  is equal to the distance between  $(x_2, y_2)$  and  $\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right)$ .
  - Use the procedure from Exercise 94 and the distances from part (a) to show that the points  $(x_1, y_1)$ ,  $\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right)$ , and  $(x_2, y_2)$  are collinear.
96. Find the area of the donut-shaped region bounded by the graphs of  $(x - 2)^2 + (y + 3)^2 = 25$  and  $(x - 2)^2 + (y + 3)^2 = 36$ .
97. A **tangent line** to a circle is a line that intersects the circle at exactly one point. The tangent line is perpendicular to the radius of the circle at this point of contact. Write an equation in point-slope form for the line tangent to the circle whose equation is  $x^2 + y^2 = 25$  at the point  $(3, -4)$ .

### Preview Exercises

Exercises 98–100 will help you prepare for the material covered in the next section.

98. Write an algebraic expression for the fare increase if a \$200 plane ticket is increased to  $x$  dollars.
99. Find the perimeter and the area of each rectangle with the given dimensions:
- 40 yards by 30 yards
  - 50 yards by 20 yards.
100. Solve for  $h$ :  $\pi r^2 h = 22$ . Then rewrite  $2\pi r^2 + 2\pi r h$  in terms of  $r$ .

## SECTION 1.10

### Modeling with Functions

#### Objectives

- Construct functions from verbal descriptions.
- Construct functions from formulas.

### GREAT QUESTION!

**Will I be using the modeling techniques in this section when I take calculus?**

Yes. In calculus, you will solve problems involving maximum or minimum values of functions. Such problems often require creating the function that is to be maximized or minimized. Quite often, the calculus is fairly routine. It is the algebraic setting up of the function that causes difficulty. That is why the material in this section is so important.

A can of Coca-Cola is sold every six seconds throughout the world.

In 2005, to curb consumption of sugared soda, the Center for Science in the Public Interest (CSPI) urged the FDA to slap cigarette-style warning labels on these drinks, calling them “liquid candy.” Despite the variety of its reputations throughout the world, the soft drink industry has spent far more time reducing the amount of aluminum in its cylindrical cans than addressing the problems of the nutritional disaster floating within its packaging. In the 1960s, one pound of aluminum made fewer than 20 cans; today, almost 30 cans come out of the same amount. The thickness of the can wall is less than five-thousandths of an inch, about the same as a magazine cover.

Many real-world problems involve constructing mathematical models that are functions. The problem of minimizing the amount of aluminum needed to manufacture a 12-ounce soft-drink can first requires that we express the surface area of all such cans as a function of their radius. In constructing such a function, we must be able to translate a verbal description into a mathematical representation—that is, a mathematical model.

In Chapter P, Section P.8, we reviewed how to obtain equations that modeled problems' verbal conditions. Earlier in this chapter, we used real-world data to obtain models that were linear functions. In this section, you will learn to use verbal descriptions and formulas to obtain models involving both linear and nonlinear functions.

- 1 Construct functions from verbal descriptions.

### Functions from Verbal Descriptions

There is no rigid step-by-step procedure that can be used to construct a function from a verbal description. Read the problem carefully. Attempt to write a critical sentence that describes the function's conditions in terms of its independent variable,  $x$ . In the following examples, we will use voice balloons that show these critical sentences, or **verbal models**. Then translate the verbal model into the algebraic notation used to represent a function's equation.

#### EXAMPLE 1 Modeling Costs of Text Message Plans

You are choosing between two texting plans. Plan A has a monthly fee of \$20 with a charge of \$0.05 per text. Plan B has a monthly fee of \$5 with a charge of \$0.10 per text.

- Express the monthly cost for plan A,  $f$ , as a function of the number of text messages in a month,  $x$ .
- Express the monthly cost for plan B,  $g$ , as a function of the number of text messages in a month,  $x$ .
- For how many text messages will the costs for the two plans be the same?

#### SOLUTION

- The monthly cost for plan A is the monthly fee, \$20, plus the per-text charge, \$0.05, times the number of text messages,  $x$ .

Monthly cost for plan A equals monthly fee plus per-text charge times the number of text messages.

$$f(x) = 20 + 0.05 \cdot x$$

The function  $f(x) = 0.05x + 20$ , expressed in slope-intercept form, models the monthly cost, in dollars, in terms of the number of text messages,  $x$ .

- The monthly cost for plan B is the monthly fee, \$5, plus the per-text charge, \$0.10, times the number of text messages,  $x$ .

Monthly cost for plan B equals monthly fee plus per-text charge times the number of text messages.

$$g(x) = 5 + 0.10 \cdot x$$

The function  $g(x) = 0.10x + 5$ , expressed in slope-intercept form, models the monthly cost,  $g$ , in dollars, in terms of the number of text messages,  $x$ .

- c. We are interested in how many text messages,  $x$ , result in the same monthly costs,  $f$  and  $g$ , for the two plans. Thus, we must set the equations for  $f$  and  $g$  equal to each other. We then solve the resulting linear equation for  $x$ .

The monthly cost for plan A     must equal     the monthly cost for plan B.

$$20 + 0.05x = 5 + 0.10x$$

*This equation models equal monthly costs.*

$$20 = 5 + 0.05x$$

*Subtract 0.05x from both sides.*

$$15 = 0.05x$$

*Subtract 5 from both sides.*

$$300 = x$$

*Divide both sides by 0.05:  $\frac{15}{0.05} = 300$ .*

The costs for the two plans will be the same with 300 text messages. Take a moment to verify that  $f(300) = g(300) = 35$ . Thus, the cost for each plan will be \$35. ●●●

In Example 1, the functions modeling the costs for the two plans are both linear functions of the form  $f(x) = mx + b$ . Based on the meaning of the functions' variables, we can interpret the slopes and y-intercepts as follows:

**Plan A**

$$f(x) = 0.05x + 20$$

*The slope indicates that the rate of change in the plan's cost is \$0.05 per text.*

*The y-intercept indicates the starting cost with no text messages is \$20.*

**Plan B**

$$g(x) = 0.10x + 5$$

*The slope indicates that the rate of change in the plan's cost is \$0.10 per text.*

*The y-intercept indicates the starting cost with no text messages is \$5.*

## TECHNOLOGY

### Numeric and Graphic Connections

We can use a graphing utility to numerically or graphically verify our work in Example 1(c). Enter the linear functions that model the costs for the two plans.

The monthly cost for plan A     must equal     the monthly cost for plan B.

$$20 + 0.05x = 5 + 0.10x$$

*Enter  $y_1 = 20 + .05x$ .*

*Enter  $y_2 = 5 + .10x$ .*

### Numeric Check

Display a table for  $y_1$  and  $y_2$ .

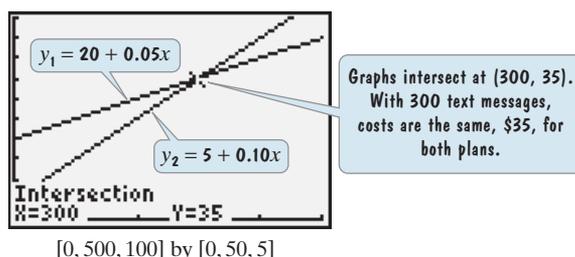

X	$Y_1$	$Y_2$
100	25	15
150	27.5	20
200	30	25
250	32.5	30
300	35	35
350	37.5	40
400	40	45

$X=300$

*When  $x = 300$ ,  $y_1$  and  $y_2$  have the same value, 35. With 300 text messages, costs are the same, \$35, for both plans.*

### Graphic Check

Display graphs for  $y_1$  and  $y_2$ . Use the intersection feature.

 **Check Point 1** You are choosing between two texting plans. Plan A has a monthly fee of \$15 with a charge of \$0.08 per text. Plan B has a monthly fee of \$3 with a charge of \$0.12 per text.

- Express the monthly cost for plan A,  $f$ , as a function of the number of text messages in a month,  $x$ .
- Express the monthly cost for plan B,  $g$ , as a function of the number of text messages in a month,  $x$ .
- For how many text messages will the costs for the two plans be the same?

### EXAMPLE 2 Modeling the Number of Customers and Revenue

On a certain route, an airline carries 6000 passengers per month, each paying \$200. A market survey indicates that for each \$1 increase in the ticket price, the airline will lose 100 passengers.

- Express the number of passengers per month,  $N$ , as a function of the ticket price,  $x$ .
- The airline's monthly revenue for the route is the product of the number of passengers and the ticket price. Express the monthly revenue,  $R$ , as a function of the ticket price,  $x$ .

### SOLUTION

- The number of passengers,  $N$ , depends on the ticket price,  $x$ . In particular, the number of passengers is the original number, 6000, minus the number lost to the fare increase. The following table shows how to find the number lost to the fare increase:

English Phrase	Algebraic Translation
<b>Ticket price</b>	$x$
<b>Amount of fare increase:</b> ticket price minus original ticket price	$x - 200$ 
<b>Decrease in passengers due to the fare increase:</b> 100 times the dollar amount of the fare increase	$100(x - 200)$ 

The number of passengers per month,  $N$ , is the original number of passengers, 6000, minus the decrease due to the fare increase.

$$\begin{array}{l}
 \begin{array}{c} \text{Number of} \\ \text{passengers per} \\ \text{month} \end{array} \\
 N(x)
 \end{array}
 =
 \begin{array}{c} \text{the original} \\ \text{number of} \\ \text{passengers} \end{array}
 \begin{array}{c} \text{equals} \\ = \end{array}
 6000
 \begin{array}{c} \text{minus} \\ - \end{array}
 \begin{array}{c} \text{the decrease in} \\ \text{passengers due} \\ \text{to the fare} \\ \text{increase.} \end{array}
 100(x - 200)$$

$$\begin{aligned}
 &= 6000 - 100x + 20,000 \\
 &= -100x + 26,000
 \end{aligned}$$

The linear function  $N(x) = -100x + 26,000$  models the number of passengers per month,  $N$ , in terms of the price per ticket,  $x$ . The linear function's slope,  $-100$ , indicates that the rate of change is a loss of 100 passengers per dollar of fare increase.

- b. The monthly revenue for the route is the number of passengers,  $-100x + 26,000$ , times the ticket price,  $x$ .

$$R(x) = (-100x + 26,000) \cdot x$$

$$= -100x^2 + 26,000x$$

The function  $R(x) = -100x^2 + 26,000x$  models the airline's monthly revenue for the route,  $R$ , in terms of the ticket price,  $x$ . ●●●

The revenue function in Example 2 is of the form  $f(x) = ax^2 + bx + c$ . Any function of this form, where  $a \neq 0$ , is called a **quadratic function**. In this chapter, we used the bowl-shaped graph of the standard quadratic function,  $f(x) = x^2$ , to graph various transformations. In the next chapter, you will study quadratic functions in detail, including where maximum or minimum values occur.

**Check Point 2** On a certain route, an airline carries 8000 passengers per month, each paying \$100. A market survey indicates that for each \$1 increase in ticket price, the airline will lose 100 passengers.

- Express the number of passengers per month,  $N$ , as a function of the ticket price,  $x$ .
- Express the monthly revenue for the route,  $R$ , as a function of the ticket price,  $x$ .

## 2 Construct functions from formulas.

### GREAT QUESTION!

#### Should I draw pictures when modeling with geometric figures?

When developing functions that model geometric situations, it is helpful to draw a diagram. Label the given and variable quantities on the diagram.

### Functions from Formulas

In Chapter P, Section P.8, we used basic geometric formulas to obtain equations that modeled geometric situations. Formulas for area, perimeter, and volume are given in **Table P.6** on page 111. Obtaining functions that model geometric situations requires a knowledge of these formulas. Take a moment to turn to page 111 and be sure that you are familiar with the 13 formulas given in the table.

In our next example, we will obtain a function using the formula for the volume of a rectangular solid,  $V = lwh$ . A rectangular solid's volume is the product of its length, width, and height.

#### EXAMPLE 3 Obtaining a Function from a Geometric Formula

A machine produces open boxes using square sheets of metal measuring 12 inches on each side. The machine cuts equal-sized squares from each corner. Then it shapes the metal into an open box by turning up the sides.

- Express the volume of the box,  $V$ , in cubic inches, as a function of the length of the side of the square cut from each corner,  $x$ , in inches.
- Find the domain of  $V$ .

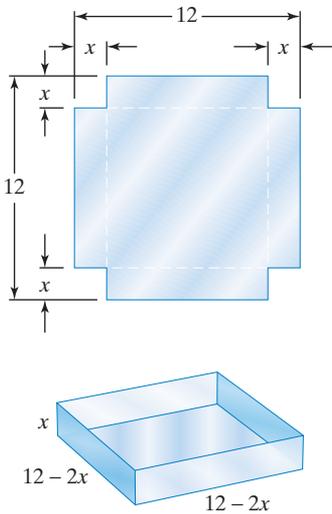

FIGURE 1.80 Producing open boxes using square sheets of metal

## SOLUTION

- a. The situation is illustrated in **Figure 1.80**. The volume of the box in the lower portion of the figure is the product of its length, width, and height. The height of the box is the same as the side of the square cut from each corner,  $x$ . Because the 12-inch square has  $x$  inches cut from each corner, the length of the resulting box is  $12 - x - x$ , or  $12 - 2x$ . Similarly, the width of the resulting box is also  $12 - 2x$ .

$$\begin{array}{ccccccc} \text{Volume of} & & \text{length of} & & \text{width of} & & \text{height of} \\ \text{the box} & \text{equals} & \text{the box} & \text{times} & \text{the box} & \text{times} & \text{the box.} \\ V(x) & = & (12 - 2x) & \cdot & (12 - 2x) & \cdot & x \end{array}$$

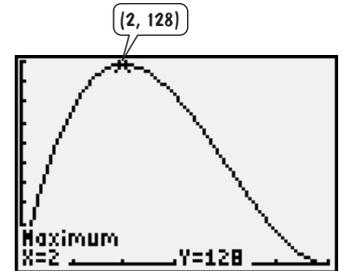

The function  $V(x) = x(12 - 2x)^2$  models the volume of the box,  $V$ , in terms of the length of the side of the square cut from each corner,  $x$ .

- b. The formula for  $V$  involves a polynomial,  $x(12 - 2x)^2$ , which is defined for any real number,  $x$ . However, in the function  $V(x) = x(12 - 2x)^2$ ,  $x$  represents the number of inches cut from each corner of the 12-inch square. Thus,  $x > 0$ . To produce an open box, the machine must cut less than 6 inches from each corner of the 12-inch square. Thus,  $x < 6$ . The domain of  $V$  is  $\{x \mid 0 < x < 6\}$ , or, in interval notation,  $(0, 6)$ . ●●●

## TECHNOLOGY

### Graphic Connections

The graph of the function  $V(x) = x(12 - 2x)^2$ , the model for the volume of the box in **Figure 1.80**, is shown in a  $[0, 6, 1]$  by  $[0, 130, 13]$  viewing rectangle. The graphing utility's maximum function feature indicates that the volume of the box is a maximum, 128 cubic inches, when the side of the square cut from each corner of the metal sheet is 2 inches.

 **Check Point 3** A machine produces open boxes using rectangular sheets of metal measuring 15 inches by 8 inches. The machine cuts equal-sized squares from each corner. Then it shapes the metal into an open box by turning up the sides.

- Express the volume of the box,  $V$ , in cubic inches, as a function of the length of the side of the square cut from each corner,  $x$ , in inches.
- Find the domain of  $V$ .

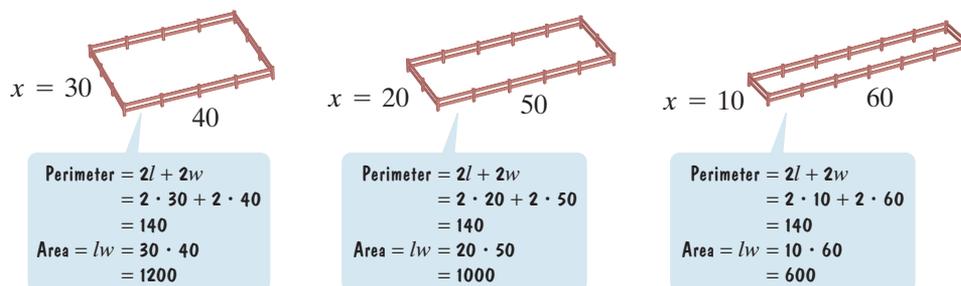

In many situations, the conditions of the problem result in a function whose equation contains more than one variable. If this occurs, use the given information to write an equation among these variables. Then use this equation to eliminate all but one of the variables in the function's expression.

### EXAMPLE 4 Modeling the Area of a Rectangle with a Fixed Perimeter

You have 140 yards of fencing to enclose a rectangular garden. Express the area of the garden,  $A$ , as a function of one of its dimensions,  $x$ .

## SOLUTION

Because you have 140 yards of fencing, **Figure 1.81** illustrates three of your options for enclosing the garden. In each case, the perimeter of the rectangle, twice the length plus twice the width, is 140 yards. By contrast, the area, length times width, varies according to the length of a side,  $x$ .

**FIGURE 1.81** Rectangles with a fixed perimeter and varying areas

As specified,  $x$  represents one of the dimensions of the rectangle. In particular, let

$$\begin{aligned}x &= \text{the length of the garden} \\ y &= \text{the width of the garden.}\end{aligned}$$

The area,  $A$ , of the garden is the product of its length and its width:

$$A = xy.$$

There are two variables in this formula—the garden's length,  $x$ , and its width,  $y$ . We need to transform this into a function in which  $A$  is represented by one variable,  $x$ , the garden's length. Thus, we must express the width,  $y$ , in terms of the length,  $x$ . We do this using the information that you have 140 yards of fencing.

$$\begin{aligned}2x + 2y &= 140 && \text{The perimeter, twice the length plus twice the width, is 140 yards.} \\ 2y &= 140 - 2x && \text{Subtract } 2x \text{ from both sides.} \\ y &= \frac{140 - 2x}{2} && \text{Divide both sides by 2.} \\ y &= 70 - x && \text{Divide each term in the numerator by 2.}\end{aligned}$$

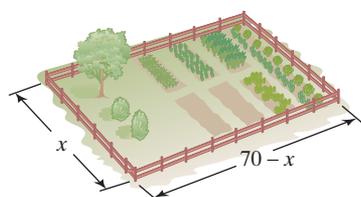

Now we substitute  $70 - x$  for  $y$  in the formula for area.

$$A = xy = x(70 - x)$$

The rectangle and its dimensions are illustrated in **Figure 1.82**. Because  $A$  is a function of  $x$ , we can write

$$A(x) = x(70 - x) \quad \text{or} \quad A(x) = 70x - x^2.$$

This function models the area,  $A$ , of a rectangular garden with a perimeter of 140 yards in terms of the length of a side,  $x$ . ...

**FIGURE 1.82**

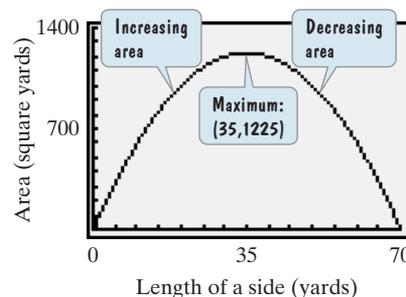

## TECHNOLOGY

## Graphic Connections

The graph of the function

$$A(x) = x(70 - x),$$

the model for the area of the garden in Example 4, is shown in a  $[0, 70, 5]$  by  $[0, 1400, 100]$  viewing rectangle. The graph shows that as the length of a side increases, the enclosed area increases, then decreases. The area of the garden is a maximum, 1225 square yards, when the length of one of its sides is 35 yards.

 **Check Point 4** You have 200 feet of fencing to enclose a rectangular garden. Express the area of the garden,  $A$ , as a function of one of its dimensions,  $x$ .

In order to save on production costs, manufacturers need to use the least amount of material for containers that are required to hold a specified volume of their product. Using the least amount of material involves minimizing the surface area of the container. Formulas for surface area,  $A$ , are given in **Table 1.6**.

**Table 1.6** Common Formulas for Surface Area

Cube	Rectangular Solid	Circular Cylinder	Sphere
$A = 6s^2$	$A = 2lw + 2lh + 2wh$	$A = 2\pi r^2 + 2\pi rh$	$A = 4\pi r^2$
			

## TECHNOLOGY

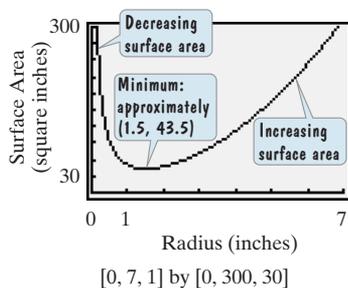

### Graphic Connections

The graph of the function

$$A(r) = 2\pi r^2 + \frac{44}{r}, \text{ or}$$

$$y = 2\pi x^2 + \frac{44}{x},$$

the model for the surface area of the soft-drink can in **Figure 1.83**, was obtained with a graphing utility.

As the radius increases, the can's surface area decreases, then increases. Using a graphing utility's minimum function feature, it can be shown that when  $x \approx 1.5$ , the value of  $y$  is smallest ( $y \approx 43.5$ ). Thus, the least amount of material needed to manufacture the can, approximately 43.5 square inches, occurs when its radius is approximately 1.5 inches. In calculus, you will learn techniques that give the exact radius needed to minimize the can's surface area.

### EXAMPLE 5 Modeling the Surface Area of a Soft-Drink Can with Fixed Volume

**Figure 1.83** shows a cylindrical soft-drink can. The can is to have a volume of 12 fluid ounces, approximately 22 cubic inches. Express the surface area of the can,  $A$ , in square inches, as a function of its radius,  $r$ , in inches.

**FIGURE 1.83**

### SOLUTION

The surface area,  $A$ , of the cylindrical can in **Figure 1.83** is given by

$$A = 2\pi r^2 + 2\pi rh.$$

There are two variables in this formula—the can's radius,  $r$ , and its height,  $h$ . We need to transform this into a function in which  $A$  is represented by one variable,  $r$ , the radius of the can. Thus, we must express the height,  $h$ , in terms of the radius,  $r$ . We do this using the information that the can's volume,  $V = \pi r^2 h$ , must be 22 cubic inches.

$$\pi r^2 h = 22 \quad \text{The volume of the can is 22 cubic inches.}$$

$$h = \frac{22}{\pi r^2} \quad \text{Divide both sides by } \pi r^2 \text{ and solve for } h.$$

Now we substitute  $\frac{22}{\pi r^2}$  for  $h$  in the formula for surface area.

$$A = 2\pi r^2 + 2\pi rh = 2\pi r^2 + 2\pi r \left( \frac{22}{\pi r^2} \right) = 2\pi r^2 + \frac{44}{r}$$

Because  $A$  is a function of  $r$ , the can's radius, we can express the surface area of the can as

$$A(r) = 2\pi r^2 + \frac{44}{r}. \quad \dots$$

 **Check Point 5** A cylindrical can is to hold 1 liter, or 1000 cubic centimeters, of oil. Express the surface area of the can,  $A$ , in square centimeters, as a function of its radius,  $r$ , in centimeters.

Our next example involves constructing a function that models simple interest. The annual simple interest that an investment earns is given by the formula

$$I = Pr,$$

where  $I$  is the simple interest,  $P$  is the principal, and  $r$  is the simple interest rate, expressed in decimal form. Suppose, for example, that you deposit \$2000 ( $P = 2000$ ) in an account that has a simple interest rate of 3% ( $r = 0.03$ ). The annual simple interest is computed as follows:

$$I = Pr = (2000)(0.03) = 60.$$

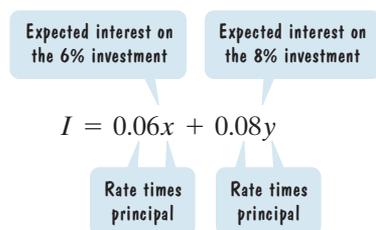

The annual interest is \$60.

### EXAMPLE 6 Modeling Simple Interest

You inherit \$16,000 with the stipulation that for the first year the money must be placed in two investments expected to pay 6% and 8% annual interest. Express the expected interest,  $I$ , as a function of the amount of money invested at 6%,  $x$ .

#### SOLUTION

As specified,  $x$  represents the amount invested at 6%. We will let  $y$  represent the amount invested at 8%. The expected interest,  $I$ , on the two investments combined is the expected interest on the 6% investment plus the expected interest on the 8% investment.

There are two variables in this formula—the amount invested at 6%,  $x$ , and the amount invested at 8%,  $y$ . We need to transform this into a function in which  $I$  is represented by one variable,  $x$ , the amount invested at 6%. Thus, we must express the amount invested at 8%,  $y$ , in terms of the amount invested at 6%,  $x$ . We do this using the information that you have \$16,000 to invest.

$$x + y = 16,000 \quad \text{The sum of the amounts invested at each rate must be \$16,000.}$$

$$y = 16,000 - x \quad \text{Subtract } x \text{ from both sides and solve for } y.$$

Now we substitute  $16,000 - x$  for  $y$  in the formula for interest.

$$I = 0.06x + 0.08y = 0.06x + 0.08(16,000 - x).$$

Because  $I$  is now a function of  $x$ , the amount invested at 6%, the expected interest can be expressed as

$$I(x) = 0.06x + 0.08(16,000 - x). \quad \dots$$

**Check Point 6** You place \$25,000 in two investments expected to pay 7% and 9% annual interest. Express the expected interest,  $I$ , as a function of the amount of money invested at 7%,  $x$ .

Our next example involves constructing a function using the distance formula. In the previous section, we saw that the distance between two points in the rectangular coordinate system is the square root of the difference between their  $x$ -coordinates squared plus the difference between their  $y$ -coordinates squared.

## TECHNOLOGY

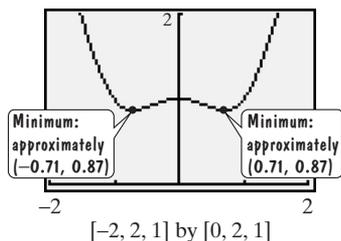

### Graphic Connections

The graph of the function

$$d(x) = \sqrt{x^4 - x^2 + 1}, \text{ or}$$

$$y = \sqrt{x^4 - x^2 + 1},$$

the model for the distance,  $d$ , shown in **Figure 1.84**, was obtained with a graphing utility.

Using a graphing utility's minimum function feature, it can be shown that when  $x \approx -0.71$  and when  $x \approx 0.71$ , the value of  $d$  is smallest ( $d \approx 0.87$  is a relative minimum). Examine **Figure 1.84**. The graph's  $y$ -axis symmetry indicates that there are two points on  $y = 1 - x^2$  whose distance to the origin is smallest.

### EXAMPLE 7 Modeling the Distance from the Origin to a Point on a Graph

**Figure 1.84** shows that  $P(x, y)$  is a point on the graph of  $y = 1 - x^2$ . Express the distance,  $d$ , from  $P$  to the origin as a function of the point's  $x$ -coordinate.

### SOLUTION

We use the distance formula to find the distance,  $d$ , from  $P(x, y)$  to the origin,  $(0, 0)$ .

$$d = \sqrt{(x - 0)^2 + (y - 0)^2} = \sqrt{x^2 + y^2}$$

There are two variables in this formula—the point's  $x$ -coordinate and its  $y$ -coordinate. We need to transform this into a function in which  $d$  is represented by one variable,  $x$ , the point's  $x$ -coordinate. Thus, we must express  $y$  in terms of  $x$ . We do this using the information shown in **Figure 1.84**, namely that  $P(x, y)$  is a point on the graph of  $y = 1 - x^2$ . This means that we can replace  $y$  with  $1 - x^2$  in our formula for  $d$ .

$$d = \sqrt{x^2 + y^2} = \sqrt{x^2 + (1 - x^2)^2} = \sqrt{x^2 + 1 - 2x^2 + x^4} = \sqrt{x^4 - x^2 + 1}$$

Square  $1 - x^2$  using  $(A - B)^2 = A^2 - 2AB + B^2$ .

The distance,  $d$ , from  $P(x, y)$  to the origin can be expressed as a function of the point's  $x$ -coordinate as

$$d(x) = \sqrt{x^4 - x^2 + 1}.$$

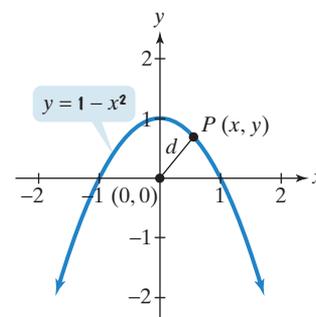

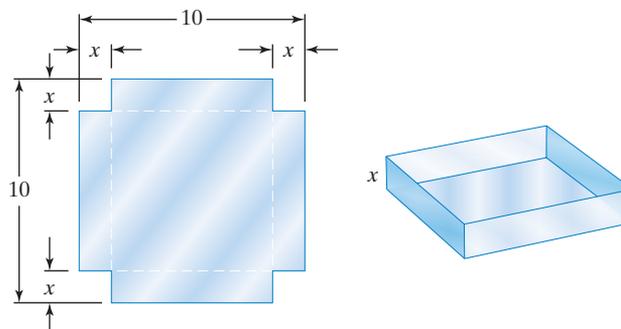

FIGURE 1.84

 **Check Point 7** Let  $P(x, y)$  be a point on the graph of  $y = x^3$ . Express the distance,  $d$ , from  $P$  to the origin as a function of the point's  $x$ -coordinate.

## CONCEPT AND VOCABULARY CHECK

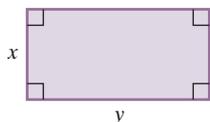

Fill in each blank so that the resulting statement is true.

- A text message plan costs \$4 per month plus \$0.15 per text. The monthly cost,  $f(x)$ , for  $x$  text messages can be modeled by the function  $f(x) = \underline{\hspace{2cm}}$ .
- An airline increases its ticket price from \$300 to  $x$  dollars. The dollar amount of the fare increase can be represented by  $\underline{\hspace{2cm}}$ . For each \$1 increase in the ticket price, the airline will lose 50 passengers, so the decrease in passengers due to the fare increase can be represented by  $\underline{\hspace{2cm}}$ . If the airline carried 5000 passengers per month before the fare increase, the number of passengers per month,  $N(x)$ , after the fare increase can be represented by the function  $N(x) = \underline{\hspace{2cm}} - \underline{\hspace{2cm}}$ .
- A machine produces open boxes using square sheets of metal measuring 10 inches on each side. The machine cuts equal squares from each corner. Then it shapes the metal into an open box by turning up the sides. The figure shows that the length of the side of the square cut from each corner is represented by  $x$  inches.

The length of the box on the right is represented by  $\underline{\hspace{2cm}}$ . Its width is represented by  $\underline{\hspace{2cm}}$ . Its height is represented by  $\underline{\hspace{2cm}}$ . The volume of the box,  $V(x)$ , in cubic inches is  $V(x) = \underline{\hspace{2cm}} \cdot \underline{\hspace{2cm}} \cdot \underline{\hspace{2cm}}$ .

4. Consider a rectangle with length  $x$  and width  $y$ .

The area,  $A$ , of the rectangle is  $A = \underline{\hspace{2cm}}$ . The perimeter of the rectangle,  $P$ , is  $P = \underline{\hspace{2cm}}$ . If the perimeter of the rectangle is 180 inches, then  $y = \underline{\hspace{2cm}}$ . Substituting this expression for  $y$  in the formula for area, the area of the rectangle can be expressed as  $A(x) = \underline{\hspace{2cm}}$ .

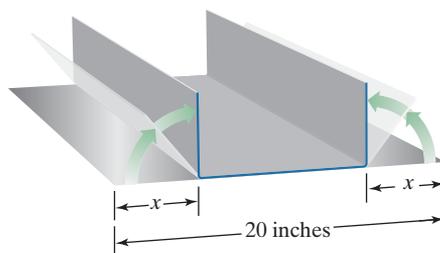

5. The combined interest on  $x$  dollars invested at 12% and  $y$  dollars invested at 9% is  $I = \underline{\hspace{2cm}}$ . If you have \$30,000 to invest, then  $x + y = 30,000$ . Solving for  $y$ , we obtain  $y = \underline{\hspace{2cm}}$ . Substituting this expression for  $y$  in the formula for combined interest, the interest can be expressed as  $I(x) = \underline{\hspace{2cm}}$ .
6. The distance,  $d$ , from  $(x, y)$  to the origin is  $d = \underline{\hspace{2cm}}$ . If  $(x, y)$  lies on the graph of  $y = x^3$ , we can replace  $y$  with  $x^3$  in the formula for  $d$ . Thus,  $d(x) = \underline{\hspace{2cm}}$ .

## EXERCISE SET 1.10

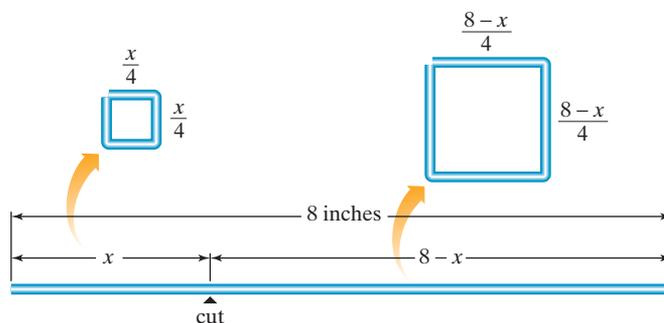

### Practice and Application Exercises

- A car rental agency charges \$200 per week plus \$0.15 per mile to rent a car.
  - Express the weekly cost to rent the car,  $f$ , as a function of the number of miles driven during the week,  $x$ .
  - How many miles did you drive during the week if the weekly cost to rent the car was \$320?
- A car rental agency charges \$180 per week plus \$0.25 per mile to rent a car.
  - Express the weekly cost to rent the car,  $f$ , as a function of the number of miles driven during the week,  $x$ .
  - How many miles did you drive during the week if the weekly cost to rent the car was \$395?
- One yardstick for measuring how steadily—if slowly—athletic performance has improved is the mile run. In 1954, Roger Bannister of Britain cracked the 4-minute mark, setting the record for running a mile in 3 minutes, 59.4 seconds, or 239.4 seconds. In the half-century since then, the record has decreased by 0.3 second per year.
  - Express the record time for the mile run,  $M$ , as a function of the number of years after 1954,  $x$ .
  - If this trend continues, in which year will someone run a 3-minute, or 180-second, mile?
- According to the National Center for Health Statistics, in 1990, 28% of babies in the United States were born to parents who were not married. Throughout the 1990s, this percentage increased by approximately 0.6 per year.
  - Express the percentage of babies born out of wedlock,  $P$ , as a function of the number of years after 1990,  $x$ .
  - If this trend continues, in which year will 40% of babies be born out of wedlock?
- The bus fare in a city is \$1.25. People who use the bus have the option of purchasing a monthly discount pass for \$21.00. With the discount pass, the fare is reduced to \$0.50.
  - Express the total monthly cost to use the bus without a discount pass,  $f$ , as a function of the number of times in a month the bus is used,  $x$ .
  - Express the total monthly cost to use the bus with a discount pass,  $g$ , as a function of the number of times in a month the bus is used,  $x$ .
- Determine the number of times in a month the bus must be used so that the total monthly cost without the discount pass is the same as the total monthly cost with the discount pass. What will be the monthly cost for each option?
  - Express the total monthly cost to use the bridge without a discount pass,  $f$ , as a function of the number of times in a month the bridge is crossed,  $x$ .
  - Express the total monthly cost to use the bridge with a discount pass,  $g$ , as a function of the number of times in a month the bridge is crossed,  $x$ .
- A discount pass for a bridge costs \$21 per month. The toll for the bridge is normally \$2.50, but it is reduced to \$1 for people who have purchased the discount pass.
  - Express the total monthly cost to use the bridge without a discount pass,  $f$ , as a function of the number of times in a month the bridge is crossed,  $x$ .
  - Express the total monthly cost to use the bridge with a discount pass,  $g$ , as a function of the number of times in a month the bridge is crossed,  $x$ .
- Determine the number of times in a month the bridge must be crossed so that the total monthly cost without the discount pass is the same as the total monthly cost with the discount pass. What will be the monthly cost for each option?
  - Express the total yearly amount paid to the warehouse under plan A,  $f$ , as a function of the dollars of merchandise purchased during the year,  $x$ .
  - Express the total yearly amount paid to the warehouse under plan B,  $g$ , as a function of the dollars of merchandise purchased during the year,  $x$ .
  - How many dollars of merchandise would you have to purchase in a year to pay the same amount under both plans? What will be the total yearly amount paid to the warehouse for each plan?
- You are choosing between two plans at a discount warehouse. Plan A offers an annual membership of \$100 and you pay 80% of the manufacturer's recommended list price. Plan B offers an annual membership fee of \$40 and you pay 90% of the manufacturer's recommended list price.
  - Express the total yearly amount paid to the warehouse under plan A,  $f$ , as a function of the dollars of merchandise purchased during the year,  $x$ .
  - Express the total yearly amount paid to the warehouse under plan B,  $g$ , as a function of the dollars of merchandise purchased during the year,  $x$ .
  - How many dollars of merchandise would you have to purchase in a year to pay the same amount under both plans? What will be the total yearly amount paid to the warehouse for each plan?

- b. Express the total yearly amount paid to the warehouse under plan B,  $g$ , as a function of the dollars of merchandise purchased during the year,  $x$ .
- c. How many dollars of merchandise would you have to purchase in a year to pay the same amount under both plans? What will be the total yearly amount paid to the warehouse for each plan?
9. A football team plays in a large stadium. With a ticket price of \$20, the average attendance at recent games has been 30,000. A market survey indicates that for each \$1 increase in the ticket price, attendance decreases by 500.
- Express the number of spectators at a football game,  $N$ , as a function of the ticket price,  $x$ .
  - Express the revenue from a football game,  $R$ , as a function of the ticket price,  $x$ .
10. A baseball team plays in a large stadium. With a ticket price of \$15, the average attendance at recent games has been 20,000. A market survey indicates that for each \$1 increase in the ticket price, attendance decreases by 400.
- Express the number of spectators at a baseball game,  $N$ , as a function of the ticket price,  $x$ .
  - Express the revenue from a baseball game,  $R$ , as a function of the ticket price,  $x$ .
11. On a certain route, an airline carries 9000 passengers per month, each paying \$150. A market survey indicates that for each \$1 decrease in the ticket price, the airline will gain 50 passengers.
- Express the number of passengers per month,  $N$ , as a function of the ticket price,  $x$ .
  - Express the monthly revenue for the route,  $R$ , as a function of the ticket price,  $x$ .
12. On a certain route, an airline carries 7000 passengers per month, each paying \$90. A market survey indicates that for each \$1 decrease in the ticket price, the airline will gain 60 passengers.
- Express the number of passengers per month,  $N$ , as a function of the ticket price,  $x$ .
  - Express the monthly revenue for the route,  $R$ , as a function of the ticket price,  $x$ .
13. The annual yield per lemon tree is fairly constant at 320 pounds per tree when the number of trees per acre is 50 or fewer. For each additional tree over 50, the annual yield per tree for all trees on the acre decreases by 4 pounds due to overcrowding.
- Express the yield per tree,  $Y$ , in pounds, as a function of the number of lemon trees per acre,  $x$ .
  - Express the total yield for an acre,  $T$ , in pounds, as a function of the number of lemon trees per acre,  $x$ .
14. The annual yield per orange tree is fairly constant at 270 pounds per tree when the number of trees per acre is 30 or fewer. For each additional tree over 30, the annual yield per tree for all trees on the acre decreases by 3 pounds due to overcrowding.
- Express the yield per tree,  $Y$ , in pounds, as a function of the number of orange trees per acre,  $x$ .
  - Express the total yield for an acre,  $T$ , in pounds, as a function of the number of orange trees per acre,  $x$ .
15. An open box is made from a square piece of cardboard 24 inches on a side by cutting identical squares from the corners and turning up the sides.
- Express the volume of the box,  $V$ , as a function of the length of the side of the square cut from each corner,  $x$ .
  - Find and interpret  $V(2)$ ,  $V(3)$ ,  $V(4)$ ,  $V(5)$ , and  $V(6)$ . What is happening to the volume of the box as the length of the side of the square cut from each corner increases?
  - Find the domain of  $V$ .
16. An open box is made from a square piece of cardboard 30 inches on a side by cutting identical squares from the corners and turning up the sides.
- Express the volume of the box,  $V$ , as a function of the length of the side of the square cut from each corner,  $x$ .
  - Find and interpret  $V(3)$ ,  $V(4)$ ,  $V(5)$ ,  $V(6)$ , and  $V(7)$ . What is happening to the volume of the box as the length of the side of the square cut from each corner increases?
  - Find the domain of  $V$ .
17. A rain gutter is made from sheets of aluminum that are 20 inches wide. As shown in the figure, the edges are turned up to form right angles. Express the cross-sectional area of the gutter,  $A$ , as a function of its depth,  $x$ .

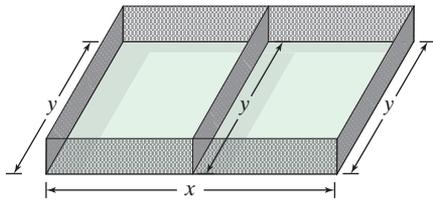

18. A piece of wire is 8 inches long. The wire is cut into two pieces and then each piece is bent into a square. Express the sum of the areas of these squares,  $A$ , as a function of the length of the cut,  $x$ .

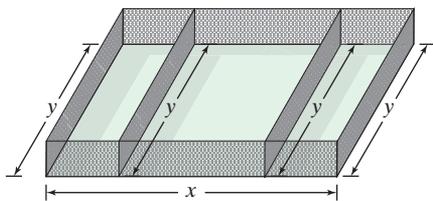

19. The sum of two numbers is 66. Express the product of the numbers,  $P$ , as a function of one of the numbers,  $x$ .
20. The sum of two numbers is 50. Express the product of the numbers,  $P$ , as a function of one of the numbers,  $x$ .
21. You have 800 feet of fencing to enclose a rectangular field. Express the area of the field,  $A$ , as a function of one of its dimensions,  $x$ .
22. You have 600 feet of fencing to enclose a rectangular field. Express the area of the field,  $A$ , as a function of one of its dimensions,  $x$ .

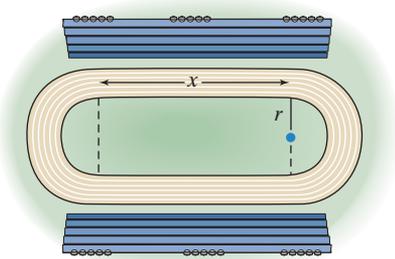

23. As in Exercise 21, you have 800 feet of fencing to enclose a rectangular field. However, one side of the field lies along a canal and requires no fencing. Express the area of the field,  $A$ , as a function of one of its dimensions,  $x$ .
24. As in Exercise 22, you have 600 feet of fencing to enclose a rectangular field. However, one side of the field lies along a canal and requires no fencing. Express the area of the field,  $A$ , as a function of one of its dimensions,  $x$ .
25. You have 1000 feet of fencing to enclose a rectangular playground and subdivide it into two smaller playgrounds by placing the fencing parallel to one of the sides. Express the area of the playground,  $A$ , as a function of one of its dimensions,  $x$ .

26. You have 1200 feet of fencing to enclose a rectangular region and subdivide it into three smaller rectangular regions by placing two fences parallel to one of the sides. Express the area of the enclosed rectangular region,  $A$ , as a function of one of its dimensions,  $x$ .

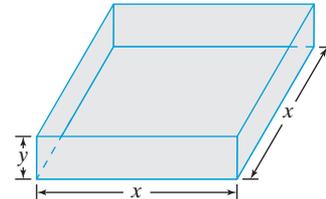

27. A new running track is to be constructed in the shape of a rectangle with semicircles at each end. The track is to be 440 yards long. Express the area of the region enclosed by the track,  $A$ , as a function of its radius,  $r$ .

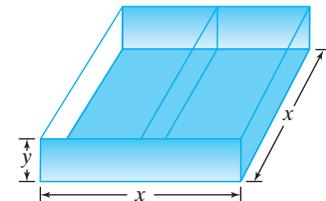

28. Work Exercise 27 if the length of the track is increased to 880 yards.
29. A contractor is to build a warehouse whose rectangular floor will have an area of 4000 square feet. The warehouse will be separated into two rectangular rooms by an interior wall. The cost of the exterior walls is \$175 per linear foot and the cost of the interior wall is \$125 per linear foot. Express the contractor's cost for building the walls,  $C$ , as a function of one of the dimensions of the warehouse's rectangular floor,  $x$ .

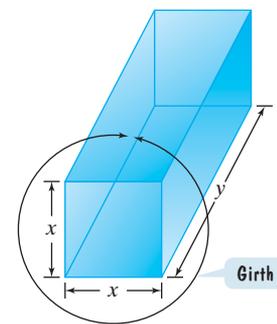

30. The area of a rectangular garden is 125 square feet. The garden is to be enclosed on three sides by a brick wall costing \$20 per foot and on one side by a fence costing \$9 per foot. Express the cost to enclose the garden,  $C$ , as a function of one of its dimensions,  $x$ .
31. The figure shows an open box with a square base. The box is to have a volume of 10 cubic feet. Express the amount of material needed to construct the box,  $A$ , as a function of the length of a side of its square base,  $x$ .

32. The figure shows an open box with a square base and a partition down the middle. The box is to have a volume of 400 cubic inches. Express the amount of material needed to construct the box,  $A$ , as a function of the length of a side of its square base,  $x$ .

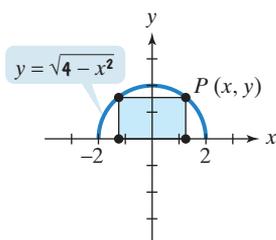

33. The figure shows a package whose front is a square. The length plus girth (the distance around) of the package is 300 inches. (This is the maximum length plus girth permitted by Federal Express for its overnight service.) Express the volume of the package,  $V$ , as a function of the length of a side of its square front,  $x$ .

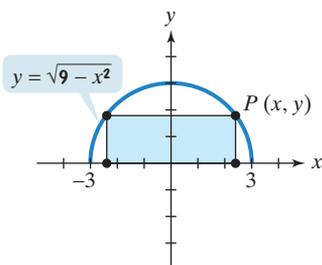

34. Work Exercise 33 if the length plus girth of the package is 108 inches.
35. Your grandmother needs your help. She has \$50,000 to invest. Part of this money is to be invested in noninsured bonds paying 15% annual interest. The rest of this money is to be invested in a government-insured certificate of deposit paying 7% annual interest.
- Express the interest from both investments,  $I$ , as a function of the amount of money invested in noninsured bonds,  $x$ .
  - Your grandmother told you that she requires \$6000 per year in extra income from both these investments. How much money should be placed in each investment?

36. You inherit \$18,750 with the stipulation that for the first year the money must be placed in two investments expected to pay 10% and 12% annual interest.
- Express the expected interest from both investments,  $I$ , as a function of the amount of money invested at 10%,  $x$ .
  - If the total interest earned for the year was \$2117, how much money was invested at each rate?
37. You invested \$8000, part of it in a stock that paid 12% annual interest. However, the rest of the money suffered a 5% loss. Express the total annual income from both investments,  $I$ , as a function of the amount invested in the 12% stock,  $x$ .
38. You invested \$12,000, part of it in a stock that paid 14% annual interest. However, the rest of the money suffered a 6% loss. Express the total annual income from both investments,  $I$ , as a function of the amount invested in the 14% stock,  $x$ .
39. Let  $P(x, y)$  be a point on the graph of  $y = x^2 - 4$ . Express the distance,  $d$ , from  $P$  to the origin as a function of the point's  $x$ -coordinate.
40. Let  $P(x, y)$  be a point on the graph of  $y = x^2 - 8$ . Express the distance,  $d$ , from  $P$  to the origin as a function of the point's  $x$ -coordinate.
41. Let  $P(x, y)$  be a point on the graph of  $y = \sqrt{x}$ . Express the distance,  $d$ , from  $P$  to  $(1, 0)$  as a function of the point's  $x$ -coordinate.
42. Let  $P(x, y)$  be a point on the graph of  $y = \sqrt{x}$ . Express the distance,  $d$ , from  $P$  to  $(2, 0)$  as a function of the point's  $x$ -coordinate.
43. The figure shows a rectangle with two vertices on a semicircle of radius 2 and two vertices on the  $x$ -axis. Let  $P(x, y)$  be the vertex that lies in the first quadrant.

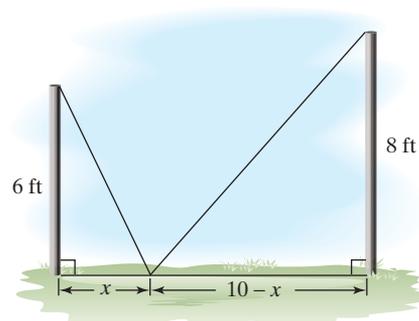

- Express the area of the rectangle,  $A$ , as a function of  $x$ .
  - Express the perimeter of the rectangle,  $P$ , as a function of  $x$ .
44. The figure shows a rectangle with two vertices on a semicircle of radius 3 and two vertices on the  $x$ -axis. Let  $P(x, y)$  be the vertex that lies in the first quadrant.

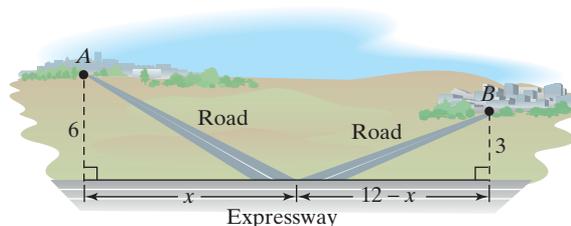

- Express the area of the rectangle,  $A$ , as a function of  $x$ .
- Express the perimeter of the rectangle,  $P$ , as a function of  $x$ .

45. Two vertical poles of length 6 feet and 8 feet, respectively, stand 10 feet apart. A cable reaches from the top of one pole to some point on the ground between the poles and then to the top of the other pole. Express the amount of cable used,  $f$ , as a function of the distance from the 6-foot pole to the point where the cable touches the ground,  $x$ .

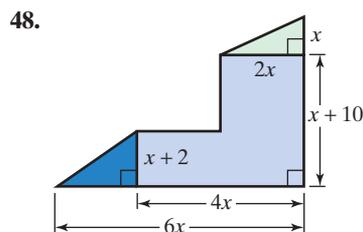

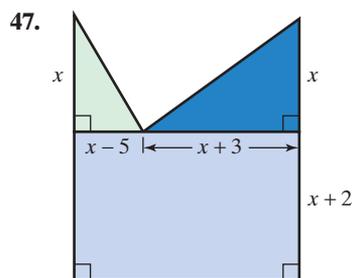

46. Towns  $A$  and  $B$  are located 6 miles and 3 miles, respectively, from a major expressway. The point on the expressway closest to town  $A$  is 12 miles from the point on the expressway closest to town  $B$ . Two new roads are to be built from  $A$  to the expressway and then to  $B$ . Express the combined lengths of the new roads,  $f$ , as a function of  $x$  as shown in the figure.

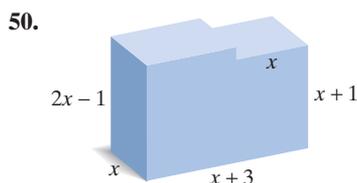

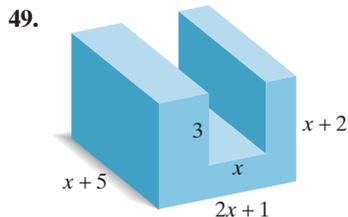

### Practice Plus

In Exercises 47–48, express the area of each figure,  $A$ , as a function of one of its dimensions,  $x$ . Write the function's equation as a polynomial in standard form.

In Exercises 49–50, express the volume of each figure,  $V$ , as a function of one of its dimensions,  $x$ . Write the function's equation as a polynomial in standard form.

### Writing in Mathematics

- Throughout this section, we started with familiar formulas and created functions by substitution. Describe a specific situation in which we obtained a function using this technique.
- Describe what should be displayed on the screen of a graphing utility to illustrate the solution that you obtained in Exercise 5(c) or Exercise 6(c).
- In Exercise 9(b) or Exercise 10(b), describe what important information the team owners could learn from the revenue function.
- In Exercise 13(b) or 14(b), describe what important information the growers could learn from the total-yield function.
- In Exercise 31 or 32, describe what important information the box manufacturer could learn from the surface area function.
- In calculus, you will learn powerful tools that reveal how functions behave. However, before applying these tools, there will be situations in which you are first required to obtain these functions from verbal descriptions. This is why your work in this section is so important. Because there is no rigid step-by-step procedure for modeling from verbal conditions, you might have had some difficulties obtaining functions for the assigned exercises. Discuss what you did if this happened to you. Did your course of action enhance your ability to model with functions?

### Technology Exercises

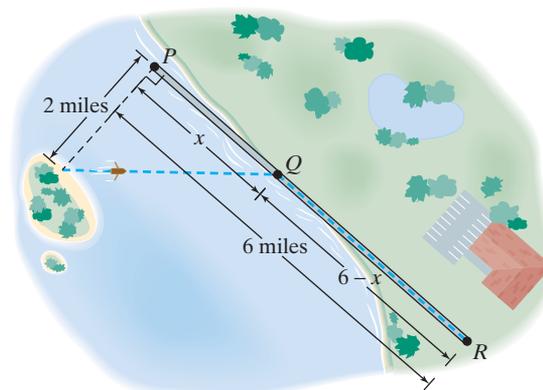

- Use a graphing utility to graph the function that you obtained in Exercise 1 or Exercise 2. Then use the **TRACE** or **ZOOM** feature to verify your answer in part (b) of the exercise.
- Use a graphing utility to graph the two functions,  $f$  and  $g$ , that you obtained in any one exercise from Exercises 5–8. Then use the **TRACE** or **INTERSECTION** feature to verify your answer in part (c) of the exercise.
- Use a graphing utility to graph the volume-of-the-box function,  $V$ , that you obtained in Exercise 15 or Exercise 16. Then use the **TRACE** or maximum function feature to find the length of the side of the square that should be cut from each corner of the cardboard to create a box with the greatest possible volume. What is the maximum volume of the open box?

- Use a graphing utility to graph the area function,  $A$ , that you obtained in Exercise 21 or Exercise 22. Then use an appropriate feature on your graphing utility to find the dimensions of the field that result in the greatest possible area. What is the maximum area?
- Use a graphing utility to graph the area function,  $A$ , that you obtained in Exercise 25 or Exercise 26. Then use an appropriate feature on your graphing utility to find the dimensions that result in the greatest possible area. What is the maximum area?
- Use the maximum or minimum function feature of a graphing utility to provide useful numerical information to any one of the following: the manufacturer of the rain gutters in Exercise 17; the person enclosing the playground in Exercise 25; the contractor in Exercise 29; the manufacturer of the cylindrical cans in Check Point 5 (page 273).

### Critical Thinking Exercises

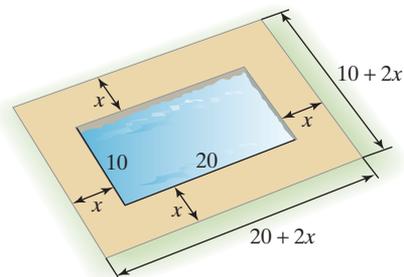

**Make Sense?** In Exercises 63–66, determine whether each statement makes sense or does not make sense, and explain your reasoning.

- The function  $f(x) = 30x + 0.08$  is a reasonable model for the monthly cost,  $f$ , in dollars, for a text message plan in terms of the number of monthly text messages,  $x$ .
- For each \$1 increase in the price of a \$300 plane ticket, an airline will lose 60 passengers, so if the ticket price is increased to \$ $x$ , the decrease in passengers is modeled by  $60(300 - x)$ .
- I know the perimeter of a rectangle, so I also know its area.
- I encountered a number of problems where I had to solve an equation for a variable in order to express a function's equation in one variable.
- You are on an island 2 miles from the nearest point  $P$  on a straight shoreline, as shown in the figure. Six miles down the shoreline from point  $P$  is a restaurant, shown as point  $R$ . To reach the restaurant, you first row from the island to point  $Q$ , averaging 2 miles per hour. Then you jog the distance from  $Q$  to  $R$ , averaging 5 miles per hour. Express the time,  $T$ , it takes to go from the island to the restaurant as a function of the distance,  $x$ , from  $P$ , where you land the boat.

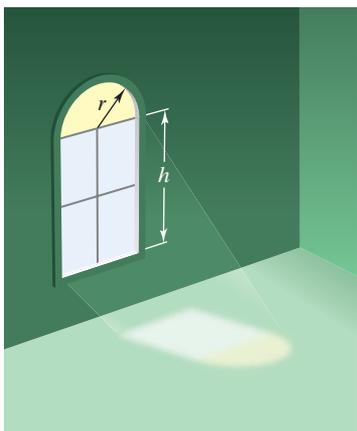

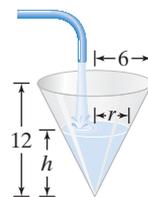

68. A pool measuring 20 meters by 10 meters is surrounded by a path of uniform width, as shown in the figure. Express the area of the path,  $A$ , in square meters, as a function of its width,  $x$ , in meters.

69. The figure shows a Norman window that has the shape of a rectangle with a semicircle attached at the top. The diameter of the semicircle is equal to the width of the rectangle. The window has a perimeter of 12 feet. Express the area of the window,  $A$ , as a function of its radius,  $r$ .

70. The figure shows water running into a container in the shape of a cone. The radius of the cone is 6 feet and its height is 12 feet. Express the volume of the water in the cone,  $V$ , as a function of the height of the water,  $h$ .

### Preview Exercises

Exercises 71–73 will help you prepare for the material covered in the first section of the next chapter.

71. Multiply:  $(7 - 3x)(-2 - 5x)$ .  
 72. Simplify:  $\sqrt{18} - \sqrt{8}$ .  
 73. Rationalize the denominator:  $\frac{7 + 4\sqrt{2}}{2 - 5\sqrt{2}}$

## CHAPTER 1

## Summary, Review, and Test

### SUMMARY

#### DEFINITIONS AND CONCEPTS

##### 1.1 Graphs and Graphing Utilities

- |  |   |
|--|---|
| <p>a. The rectangular coordinate system consists of a horizontal number line, the <math>x</math>-axis, and a vertical number line, the <math>y</math>-axis, intersecting at their zero points, the origin. Each point in the system corresponds to an ordered pair of real numbers <math>(x, y)</math>. The first number in the pair is the <math>x</math>-coordinate; the second number is the <math>y</math>-coordinate. See Figure 1.1 on page 142.</p>                           | <p>Ex. 1, p. 143</p>                    |
| <p>b. An ordered pair is a solution of an equation in two variables if replacing the variables by the corresponding coordinates results in a true statement. The ordered pair is said to satisfy the equation. The graph of the equation is the set of all points whose coordinates satisfy the equation. One method for graphing an equation is to plot ordered-pair solutions and connect them with a smooth curve or line.</p>  | <p>Ex. 2, p. 144;<br/>Ex. 3, p. 144</p> |
| <p>c. An <math>x</math>-intercept of a graph is the <math>x</math>-coordinate of a point where the graph intersects the <math>x</math>-axis. The <math>y</math>-coordinate corresponding to an <math>x</math>-intercept is always zero.<br/><br/>A <math>y</math>-intercept of a graph is the <math>y</math>-coordinate of a point where the graph intersects the <math>y</math>-axis. The <math>x</math>-coordinate corresponding to a <math>y</math>-intercept is always zero.</p> | <p>Ex. 5, p. 147</p>                    |

#### EXAMPLES

## DEFINITIONS AND CONCEPTS

## EXAMPLES

## 1.2 Basics of Functions and Their Graphs

- a. A relation is any set of ordered pairs. The set of first components is the domain of the relation and the set of second components is the range. Ex. 1, p. 155
- b. A function is a correspondence from a first set, called the domain, to a second set, called the range, such that each element in the domain corresponds to exactly one element in the range. If any element in a relation's domain corresponds to more than one element in the range, the relation is not a function. Ex. 2, p. 157
- c. Functions are usually given in terms of equations involving  $x$  and  $y$ , in which  $x$  is the independent variable and  $y$  is the dependent variable. If an equation is solved for  $y$  and more than one value of  $y$  can be obtained for a given  $x$ , then the equation does not define  $y$  as a function of  $x$ . If an equation defines a function, the value of the function at  $x$ ,  $f(x)$ , often replaces  $y$ . Ex. 3, p. 158;  
Ex. 4, p. 160
- d. The graph of a function is the graph of its ordered pairs. Ex. 5, p. 161
- e. The vertical line test for functions: If any vertical line intersects a graph in more than one point, the graph does not define  $y$  as a function of  $x$ . Ex. 6, p. 162
- f. The graph of a function can be used to determine the function's domain and its range. To find the domain, look for all the inputs on the  $x$ -axis that correspond to points on the graph. To find the range, look for all the outputs on the  $y$ -axis that correspond to points on the graph. Ex. 8, p. 165
- g. The zeros of a function,  $f$ , are the values of  $x$  for which  $f(x) = 0$ . At the real zeros, the graph of  $f$  has  $x$ -intercepts. The graph of a function can have more than one  $x$ -intercept but at most one  $y$ -intercept. Figure 1.27,  
p. 167

## 1.3 More on Functions and Their Graphs

- a. A function is increasing on intervals where its graph rises, decreasing on intervals where it falls, and constant on intervals where it neither rises nor falls. Precise definitions are given in the box on page 174. Ex. 1, p. 175
- b. If the graph of a function is given, we can often visually locate the number(s) at which the function has a relative maximum or relative minimum. Precise definitions are given in the box on page 175. Figure 1.29,  
p. 176
- c. The graph of an even function in which  $f(-x) = f(x)$  is symmetric with respect to the  $y$ -axis. The graph of an odd function in which  $f(-x) = -f(x)$  is symmetric with respect to the origin. Ex. 2, p. 176
- d. Piecewise functions are defined by two (or more) equations over a specified domain. Some piecewise functions are called step functions because their graphs form discontinuous steps. An example is  $f(x) = \text{int}(x)$ , where  $\text{int}(x)$  is the greatest integer that is less than or equal to  $x$ . Ex. 3, p. 178;  
Ex. 4, p. 179;  
Figure 1.35,  
p. 180
- e. The difference quotient of a function  $f$  is Ex. 5, p. 180

$$\frac{f(x+h) - f(x)}{h}, h \neq 0.$$

## 1.4 Linear Functions and Slope

- a. The slope,  $m$ , of the line through  $(x_1, y_1)$  and  $(x_2, y_2)$  is  $m = \frac{y_2 - y_1}{x_2 - x_1}$ . Ex. 1, p. 189
- b. Equations of lines include point-slope form,  $y - y_1 = m(x - x_1)$ , slope-intercept form,  $y = mx + b$ , and general form,  $Ax + By + C = 0$ . The equation of a horizontal line is  $y = b$ ; a vertical line is  $x = a$ . A vertical line is not a linear function. Ex. 2, p. 191;  
Ex. 3, p. 191;  
Ex. 5, p. 193;  
Ex. 6, p. 194
- c. Linear functions in the form  $f(x) = mx + b$  can be graphed using the slope,  $m$ , and the  $y$ -intercept,  $b$ . (See the box on page 192.) Linear equations in the general form  $Ax + By + C = 0$  can be solved for  $y$  and graphed using the slope and the  $y$ -intercept. Intercepts can also be used to graph  $Ax + By + C = 0$ . (See the box at the bottom of page 195.) Ex. 4, p. 192;  
Ex. 7, p. 195;  
Ex. 8, p. 196

## 1.5 More on Slope

- a. Parallel lines have equal slopes. Perpendicular lines have slopes that are negative reciprocals. Ex. 1, p. 203;  
Ex. 2, p. 205
- b. The slope of a linear function is the rate of change of the dependent variable per unit change of the independent variable. Ex. 3, p. 206
- c. The average rate of change of  $f$  from  $x_1$  to  $x_2$  is Ex. 4, p. 208;  
Ex. 5, p. 209
- $$\frac{\Delta y}{\Delta x} = \frac{f(x_2) - f(x_1)}{x_2 - x_1}.$$
- d. If a function expresses an object's position,  $s(t)$ , in terms of time,  $t$ , the average velocity of the object from  $t_1$  to  $t_2$  is Ex. 6, p. 210
- $$\frac{\Delta s}{\Delta t} = \frac{s(t_2) - s(t_1)}{t_2 - t_1}.$$

## DEFINITIONS AND CONCEPTS

## EXAMPLES

## 1.6 Transformations of Functions

- a. Table 1.3 on page 216 shows the graphs of the constant function,  $f(x) = c$ , the identity function,  $f(x) = x$ , the absolute value function,  $f(x) = |x|$ , the standard quadratic function,  $f(x) = x^2$ , the square root function,  $f(x) = \sqrt{x}$ , the standard cubic function,  $f(x) = x^3$ , and the cube root function,  $f(x) = \sqrt[3]{x}$ . The table also lists characteristics of each function.
- b. Table 1.4 on page 224 summarizes how to graph a function using vertical shifts,  $y = f(x) \pm c$ , horizontal shifts,  $y = f(x \pm c)$ , reflections about the  $x$ -axis,  $y = -f(x)$ , reflections about the  $y$ -axis,  $y = f(-x)$ , vertical stretching,  $y = cf(x)$ ,  $c > 1$ , vertical shrinking,  $y = cf(x)$ ,  $0 < c < 1$ , horizontal shrinking,  $y = f(cx)$ ,  $c > 1$ , and horizontal stretching,  $y = f(cx)$ ,  $0 < c < 1$ .
- c. A function involving more than one transformation can be graphed in the following order: (1) horizontal shifting; (2) stretching or shrinking; (3) reflecting; (4) vertical shifting.

Ex. 1, p. 217;  
Ex. 2, p. 219;  
Ex. 3, p. 220;  
Ex. 4, p. 221;  
Ex. 5, p. 221;  
Ex. 6, p. 222;  
Ex. 7, p. 223  
Ex. 8, p. 225;  
Ex. 9, p. 226

## 1.7 Combinations of Functions; Composite Functions

- a. If a function  $f$  does not model data or verbal conditions, its domain is the largest set of real numbers for which the value of  $f(x)$  is a real number. Exclude from a function's domain real numbers that cause division by zero and real numbers that result in an even root of a negative number.
- b. When functions are given as equations, they can be added, subtracted, multiplied, or divided by performing operations with the algebraic expressions that appear on the right side of the equations. Definitions for the sum  $f + g$ , the difference  $f - g$ , the product  $fg$ , and the quotient  $\frac{f}{g}$  functions, with domains  $D_f \cap D_g$ , and  $g(x) \neq 0$  for the quotient function, are given in the box on page 234.
- c. The composition of functions  $f$  and  $g$ ,  $f \circ g$ , is defined by  $(f \circ g)(x) = f(g(x))$ . The domain of the composite function  $f \circ g$  is given in the box on page 239. This composite function is obtained by replacing each occurrence of  $x$  in the equation for  $f$  with  $g(x)$ .
- d. Expressing a given function as a composition of two functions is called decomposing the given function.

Ex. 1, p. 232  
Ex. 2, p. 234;  
Ex. 3, p. 235;  
Ex. 4, p. 236  
Ex. 5, p. 239;  
Ex. 6, p. 240  
Ex. 7, p. 241

## 1.8 Inverse Functions

- a. If  $f(g(x)) = x$  and  $g(f(x)) = x$ , function  $g$  is the inverse of function  $f$ , denoted  $f^{-1}$  and read “ $f$ -inverse.” Thus, to show that  $f$  and  $g$  are inverses of each other, one must show that  $f(g(x)) = x$  and  $g(f(x)) = x$ .
- b. The procedure for finding a function's inverse uses a switch-and-solve strategy. Switch  $x$  and  $y$ , and then solve for  $y$ . The procedure is given in the box on page 248.
- c. The horizontal line test for inverse functions: A function  $f$  has an inverse that is a function,  $f^{-1}$ , if there is no horizontal line that intersects the graph of the function  $f$  at more than one point.
- d. A one-to-one function is one in which no two different ordered pairs have the same second component. Only one-to-one functions have inverse functions.
- e. If the point  $(a, b)$  is on the graph of  $f$ , then the point  $(b, a)$  is on the graph of  $f^{-1}$ . The graph of  $f^{-1}$  is a reflection of the graph of  $f$  about the line  $y = x$ .

Ex. 1, p. 247  
Ex. 2, p. 249;  
Ex. 3, p. 249;  
Ex. 4, p. 250  
Ex. 5, p. 251  
Ex. 6, p. 252;  
Ex. 7, p. 253

## 1.9 Distance and Midpoint Formulas; Circles

- a. The distance,  $d$ , between the points  $(x_1, y_1)$  and  $(x_2, y_2)$  is given by  $d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$ .
- b. The midpoint of the line segment whose endpoints are  $(x_1, y_1)$  and  $(x_2, y_2)$  is the point with coordinates  $\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right)$ .
- c. The standard form of the equation of a circle with center  $(h, k)$  and radius  $r$  is  $(x - h)^2 + (y - k)^2 = r^2$ .
- d. The general form of the equation of a circle is  $x^2 + y^2 + Dx + Ey + F = 0$ .
- e. To convert from the general form to the standard form of a circle's equation, complete the square on  $x$  and  $y$ .

Ex. 2, p. 259  
Ex. 3, p. 259;  
Ex. 4, p. 260;  
Ex. 5, p. 261  
Ex. 6, p. 262

## DEFINITIONS AND CONCEPTS

## EXAMPLES

### 1.10 Modeling with Functions

- a. Verbal models are often helpful in obtaining functions from verbal descriptions. Ex. 1, p. 267;  
Ex. 2, p. 269
- b. Functions can be constructed from formulas, such as formulas for area, perimeter and volume (Table P.6 on page 111) and formulas for surface area (Table 1.6 on page 273). Ex. 3, p. 270
- c. If a problem's conditions are modeled by a function whose equation contains more than one variable, use the given information to write an equation among these variables. Then use this equation to eliminate all but one of the variables in the function's expression. Ex. 4, p. 271;  
Ex. 5, p. 273;  
Ex. 6, p. 274;  
Ex. 7, p. 275

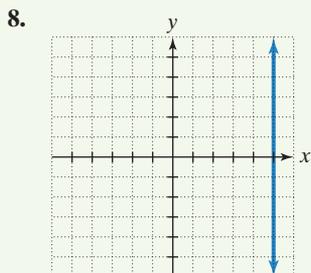

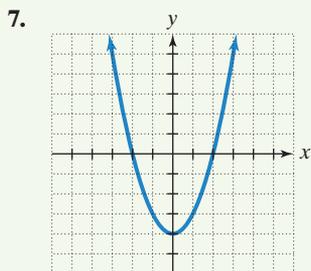

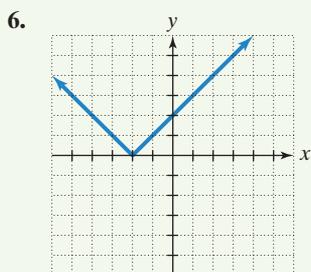

## REVIEW EXERCISES

### 1.1

Graph each equation in Exercises 1–4. Let  $x = -3, -2, -1, 0, 1, 2,$  and  $3$ .

- 1.  $y = 2x - 2$
- 2.  $y = x^2 - 3$
- 3.  $y = x$
- 4.  $y = |x| - 2$
- 5. What does a  $[-20, 40, 10]$  by  $[-5, 5, 1]$  viewing rectangle mean? Draw axes with tick marks and label the tick marks to illustrate this viewing rectangle.

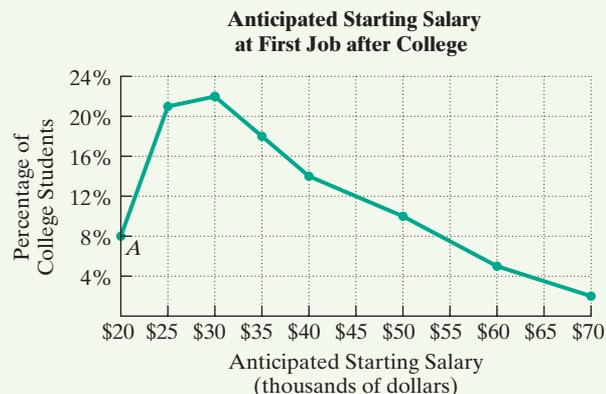

In Exercises 6–8, use the graph and determine the  $x$ -intercepts if any, and the  $y$ -intercepts if any. For each graph, tick marks along the axes represent one unit each.

**Salary after College.** In 2010, MonsterCollege surveyed 1250 U.S. college students expecting to graduate in the next several years. Respondents were asked the following question:

What do you think your starting salary will be at your first job after college?

The line graph shows the percentage of college students who anticipated various starting salaries. Use the graph to solve Exercises 9–14.

Source: MonsterCollege™

- 9. What are the coordinates of point A? What does this mean in terms of the information given by the graph?
- 10. What starting salary was anticipated by the greatest percentage of college students? Estimate the percentage of students who anticipated this salary.
- 11. What starting salary was anticipated by the least percentage of college students? Estimate the percentage of students who anticipated this salary.
- 12. What starting salaries were anticipated by more than 20% of college students?
- 13. Estimate the percentage of students who anticipated a starting salary of \$40 thousand.
- 14. The mathematical model

$$p = -0.01s^2 + 0.8s + 3.7$$

describes the percentage of college students,  $p$ , who anticipated a starting salary  $s$ , in thousands of dollars. Use this formula to find the percentage of students who anticipated a starting salary of \$40 thousand. How does this compare with your estimate in Exercise 13?

**1.2 and 1.3**

In Exercises 15–17, determine whether each relation is a function. Give the domain and range for each relation.

15.  $\{(2, 7), (3, 7), (5, 7)\}$       16.  $\{(1, 10), (2, 500), (13, \pi)\}$   
 17.  $\{(12, 13), (14, 15), (12, 19)\}$

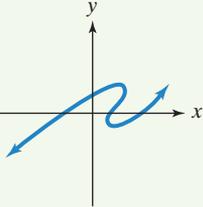

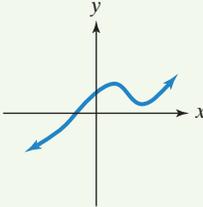

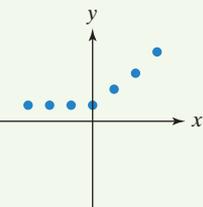

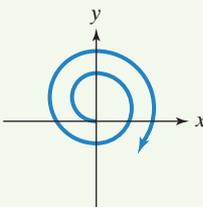

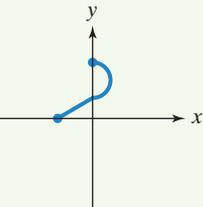

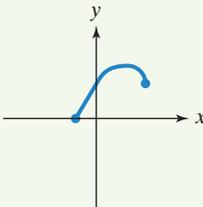

In Exercises 18–20, determine whether each equation defines  $y$  as a function of  $x$ .

18.  $2x + y = 8$                       19.  $3x^2 + y = 14$   
 20.  $2x + y^2 = 6$

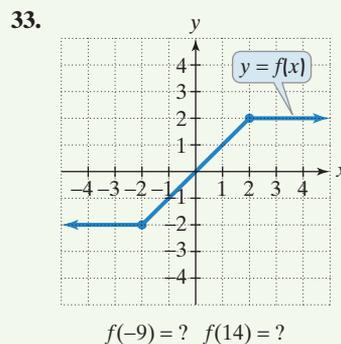

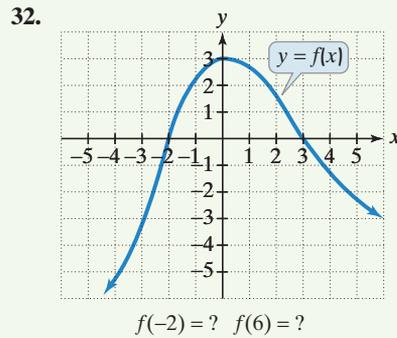

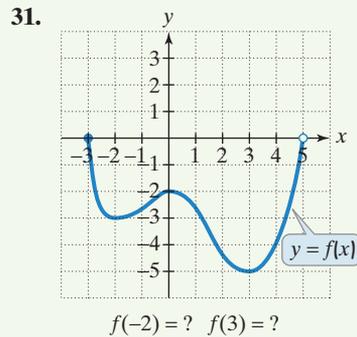

In Exercises 21–24, evaluate each function at the given values of the independent variable and simplify.

21.  $f(x) = 5 - 7x$   
 a.  $f(4)$                       b.  $f(x + 3)$                       c.  $f(-x)$   
 22.  $g(x) = 3x^2 - 5x + 2$   
 a.  $g(0)$                       b.  $g(-2)$   
 c.  $g(x - 1)$                       d.  $g(-x)$   
 23.  $g(x) = \begin{cases} \sqrt{x - 4} & \text{if } x \geq 4 \\ 4 - x & \text{if } x < 4 \end{cases}$   
 a.  $g(13)$                       b.  $g(0)$                       c.  $g(-3)$   
 24.  $f(x) = \begin{cases} \frac{x^2 - 1}{x - 1} & \text{if } x \neq 1 \\ 12 & \text{if } x = 1 \end{cases}$   
 a.  $f(-2)$                       b.  $f(1)$                       c.  $f(2)$

In Exercises 25–30, use the vertical line test to identify graphs in which  $y$  is a function of  $x$ .

25.       26.   
 27.       28.   
 29.       30. 

In Exercises 31–33, use the graph to determine **a.** the function's domain; **b.** the function's range; **c.** the  $x$ -intercepts if any; **d.** the  $y$ -intercept, if there is one; **e.** intervals on which the function is increasing, decreasing, or constant; and **f.** the missing function values, indicated by question marks, below each graph.

In Exercises 34–35, find each of the following:

- a.** The numbers, if any, at which  $f$  has a relative maximum. What are these relative maxima?  
**b.** The numbers, if any, at which  $f$  has a relative minimum. What are these relative minima?

34. Use the graph in Exercise 31.  
 35. Use the graph in Exercise 32.

In Exercises 36–38, determine whether each function is even, odd, or neither. State each function's symmetry. If you are using a graphing utility, graph the function and verify its possible symmetry.

36.  $f(x) = x^3 - 5x$   
 37.  $f(x) = x^4 - 2x^2 + 1$   
 38.  $f(x) = 2x\sqrt{1 - x^2}$

In Exercises 39–40, the domain of each piecewise function is  $(-\infty, \infty)$ .

- a. Graph each function.
- b. Use the graph to determine the function's range.

39.  $f(x) = \begin{cases} 5 & \text{if } x \leq -1 \\ -3 & \text{if } x > -1 \end{cases}$

40.  $f(x) = \begin{cases} 2x & \text{if } x < 0 \\ -x & \text{if } x \geq 0 \end{cases}$

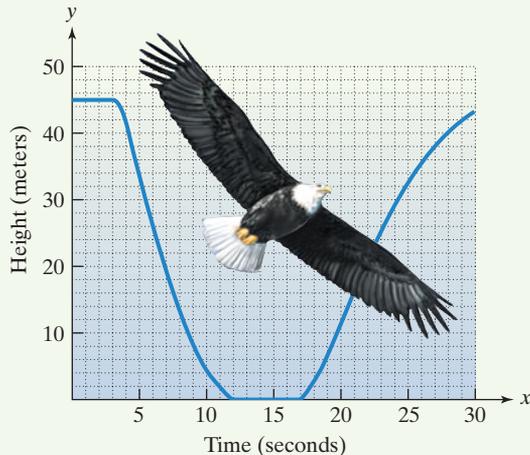

In Exercises 41–42, find and simplify the difference quotient

$$\frac{f(x+h) - f(x)}{h}, \quad h \neq 0$$

for the given function.

41.  $f(x) = 8x - 11$                       42.  $f(x) = -2x^2 + x + 10$

43. The graph shows the height, in meters, of an eagle in terms of its time, in seconds, in flight.

- a. Is the eagle's height a function of time? Use the graph to explain why or why not.
  - b. On which interval is the function decreasing? Describe what this means in practical terms.
  - c. On which intervals is the function constant? What does this mean for each of these intervals?
  - d. On which interval is the function increasing? What does this mean?
44. A cargo service charges a flat fee of \$5 plus \$1.50 for each pound or fraction of a pound. Graph shipping cost,  $C(x)$ , in dollars, as a function of weight,  $x$ , in pounds, for  $0 < x \leq 5$ .

### 1.4 and 1.5

In Exercises 45–48, find the slope of the line passing through each pair of points or state that the slope is undefined. Then indicate whether the line through the points rises, falls, is horizontal, or is vertical.

45.  $(3, 2)$  and  $(5, 1)$                       46.  $(-1, -2)$  and  $(-3, -4)$   
 47.  $(-3, \frac{1}{4})$  and  $(6, \frac{1}{4})$                       48.  $(-2, 5)$  and  $(-2, 10)$

In Exercises 49–52, use the given conditions to write an equation for each line in point-slope form and slope-intercept form.

49. Passing through  $(-3, 2)$  with slope  $-6$
50. Passing through  $(1, 6)$  and  $(-1, 2)$
51. Passing through  $(4, -7)$  and parallel to the line whose equation is  $3x + y - 9 = 0$
52. Passing through  $(-3, 6)$  and perpendicular to the line whose equation is  $y = \frac{1}{3}x + 4$
53. Write an equation in general form for the line passing through  $(-12, -1)$  and perpendicular to the line whose equation is  $6x - y - 4 = 0$ .

In Exercises 54–57, give the slope and y-intercept of each line whose equation is given. Then graph the line.

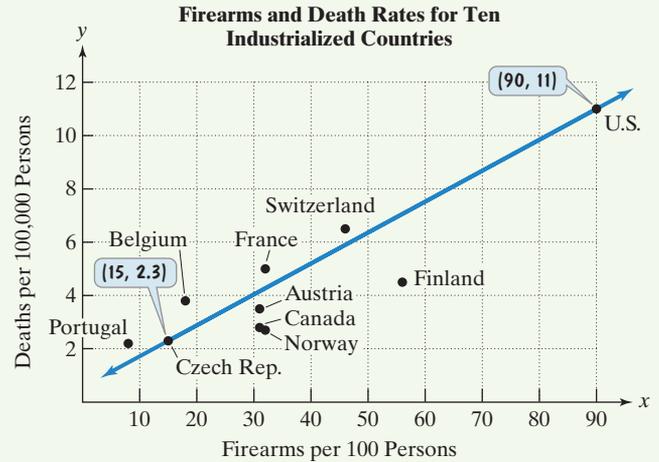

54.  $y = \frac{2}{5}x - 1$                       55.  $f(x) = -4x + 5$

56.  $2x + 3y + 6 = 0$                       57.  $2y - 8 = 0$

58. Graph using intercepts:  $2x - 5y - 10 = 0$ .

59. Graph:  $2x - 10 = 0$ .

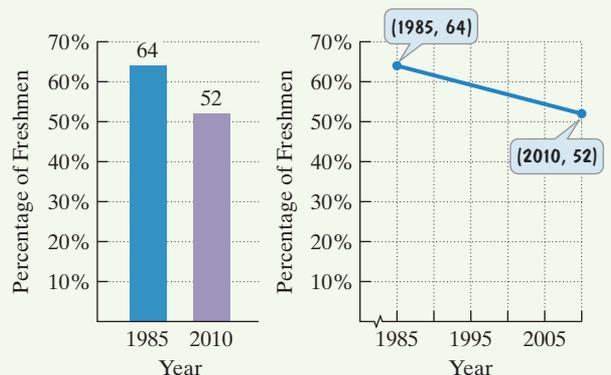

60. The points in the scatter plot show the number of firearms per 100 persons and the number of deaths per 100,000 persons for industrialized countries with the highest death rates.

Source: International Action Network on Small Arms

- a. Use the two points whose coordinates are shown by the voice balloons to find an equation in point-slope form for the line that models deaths per 100,000 persons,  $y$ , as a function of firearms per 100 persons,  $x$ .
  - b. Write the equation in part (a) in slope-intercept form. Use function notation.
  - c. France has 32 firearms per 100 persons. Use the appropriate point in the scatter plot to estimate that country's deaths per 100,000 persons.
  - d. Use the function from part (b) to find the number of deaths per 100,000 persons for France. Round to one decimal place. Does the function underestimate or overestimate the deaths per 100,000 persons that you estimated in part (c)? How is this shown by the line in the scatter plot?
61. In a 2010 survey of more than 200,000 freshmen at 279 colleges, only 52% rated their emotional health high or above average, a drop from 64% in 1985.

Percentage of U.S. College Freshmen Rating Their Emotional Health High or Above Average

Source: UCLA Higher Education Research Institute

- a. Find the slope of the line passing through the two points shown by the voice balloons at the bottom of the previous page.
- b. Use your answer from part (a) to complete this statement:  
For each year from 1985 through 2010, the percentage of U.S. college freshmen rating their emotional health high or above average decreased by \_\_\_\_\_. The rate of change was \_\_\_\_\_ per \_\_\_\_\_.

62. Find the average rate of change of  $f(x) = x^2 - 4x$  from  $x_1 = 5$  to  $x_2 = 9$ .

63. A person standing on the roof of a building throws a ball directly upward. The ball misses the rooftop on its way down and eventually strikes the ground. The function

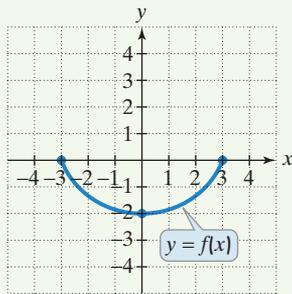

$$s(t) = -16t^2 + 64t + 80$$

describes the ball's height above the ground,  $s(t)$ , in feet,  $t$  seconds after it was thrown.

- a. Find the ball's average velocity between the time it was thrown and 2 seconds later.
- b. Find the ball's average velocity between 2 and 4 seconds after it was thrown.
- c. What do the signs in your answers to parts (a) and (b) mean in terms of the direction of the ball's motion?

### 1.6

In Exercises 64–68, use the graph of  $y = f(x)$  to graph each function  $g$ .

64.  $g(x) = f(x + 2) + 3$       65.  $g(x) = \frac{1}{2}f(x - 1)$   
 66.  $g(x) = -f(2x)$       67.  $g(x) = 2f(\frac{1}{2}x)$   
 68.  $g(x) = -f(-x) - 1$

In Exercises 69–72, begin by graphing the standard quadratic function,  $f(x) = x^2$ . Then use transformations of this graph to graph the given function.

69.  $g(x) = x^2 + 2$       70.  $h(x) = (x + 2)^2$   
 71.  $r(x) = -(x + 1)^2$       72.  $y(x) = \frac{1}{2}(x - 1)^2 + 1$

In Exercises 73–75, begin by graphing the square root function,  $f(x) = \sqrt{x}$ . Then use transformations of this graph to graph the given function.

73.  $g(x) = \sqrt{x + 3}$       74.  $h(x) = \sqrt{3 - x}$   
 75.  $r(x) = 2\sqrt{x + 2}$

In Exercises 76–78, begin by graphing the absolute value function,  $f(x) = |x|$ . Then use transformations of this graph to graph the given function.

76.  $g(x) = |x + 2| - 3$       77.  $h(x) = -|x - 1| + 1$   
 78.  $r(x) = \frac{1}{2}|x + 2|$

In Exercises 79–81, begin by graphing the standard cubic function,  $f(x) = x^3$ . Then use transformations of this graph to graph the given function.

79.  $g(x) = \frac{1}{2}(x - 1)^3$       80.  $h(x) = -(x + 1)^3$   
 81.  $r(x) = \frac{1}{4}x^3 - 1$

In Exercises 82–84, begin by graphing the cube root function,  $f(x) = \sqrt[3]{x}$ . Then use transformations of this graph to graph the given function.

82.  $g(x) = \sqrt[3]{x + 2} - 1$       83.  $h(x) = -\sqrt[3]{2x}$   
 84.  $r(x) = -2\sqrt[3]{-x}$

### 1.7

In Exercises 85–90, find the domain of each function.

85.  $f(x) = x^2 + 6x - 3$       86.  $g(x) = \frac{4}{x - 7}$   
 87.  $h(x) = \sqrt{8 - 2x}$       88.  $f(x) = \frac{x}{x^2 + 4x - 21}$   
 89.  $g(x) = \frac{\sqrt{x - 2}}{x - 5}$   
 90.  $f(x) = \sqrt{x - 1} + \sqrt{x + 5}$

In Exercises 91–93, find  $f + g$ ,  $f - g$ ,  $fg$ , and  $\frac{f}{g}$ . Determine the domain for each function.

91.  $f(x) = 3x - 1$ ,  $g(x) = x - 5$   
 92.  $f(x) = x^2 + x + 1$ ,  $g(x) = x^2 - 1$   
 93.  $f(x) = \sqrt{x + 7}$ ,  $g(x) = \sqrt{x - 2}$

In Exercises 94–95, find a.  $(f \circ g)(x)$ ; b.  $(g \circ f)(x)$ ; c.  $(f \circ g)(3)$ .

94.  $f(x) = x^2 + 3$ ,  $g(x) = 4x - 1$   
 95.  $f(x) = \sqrt{x}$ ,  $g(x) = x + 1$

In Exercises 96–97, find a.  $(f \circ g)(x)$ ; b. the domain of  $(f \circ g)$ .

96.  $f(x) = \frac{x + 1}{x - 2}$ ,  $g(x) = \frac{1}{x}$   
 97.  $f(x) = \sqrt{x - 1}$ ,  $g(x) = x + 3$

In Exercises 98–99, express the given function  $h$  as a composition of two functions  $f$  and  $g$  so that  $h(x) = (f \circ g)(x)$ .

98.  $h(x) = (x^2 + 2x - 1)^4$       99.  $h(x) = \sqrt[3]{7x + 4}$

### 1.8

In Exercises 100–101, find  $f(g(x))$  and  $g(f(x))$  and determine whether each pair of functions  $f$  and  $g$  are inverses of each other.

100.  $f(x) = \frac{3}{5}x + \frac{1}{2}$  and  $g(x) = \frac{5}{3}x - 2$   
 101.  $f(x) = 2 - 5x$  and  $g(x) = \frac{2 - x}{5}$

The functions in Exercises 102–104 are all one-to-one. For each function,

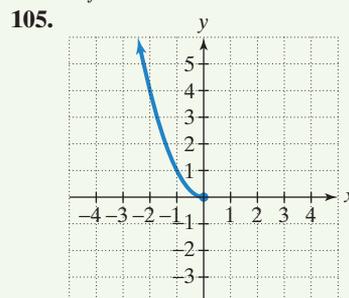

- a. Find an equation for  $f^{-1}(x)$ , the inverse function.  
 b. Verify that your equation is correct by showing that  $f(f^{-1}(x)) = x$  and  $f^{-1}(f(x)) = x$ .

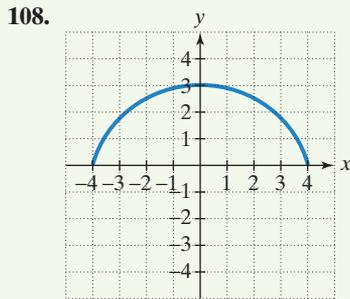

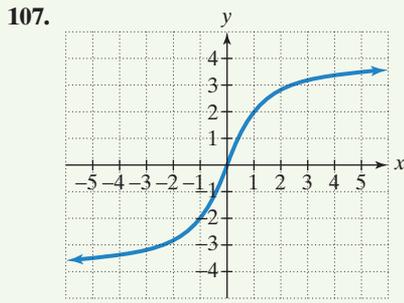

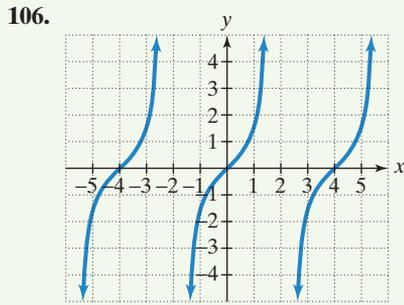

102.  $f(x) = 4x - 3$

103.  $f(x) = 8x^3 + 1$

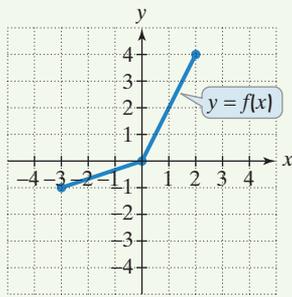

104.  $f(x) = \frac{2}{x} + 5$

Which graphs in Exercises 105–108 represent functions that have inverse functions?

109. Use the graph of  $f$  in the figure shown to draw the graph of its inverse function.

In Exercises 110–111, find an equation for  $f^{-1}(x)$ . Then graph  $f$  and  $f^{-1}$  in the same rectangular coordinate system.

110.  $f(x) = 1 - x^2, x \geq 0$     111.  $f(x) = \sqrt{x} + 1$

**1.9**

In Exercises 112–113, find the distance between each pair of points. If necessary, round answers to two decimal places.

112.  $(-2, 3)$  and  $(3, -9)$     113.  $(-4, 3)$  and  $(-2, 5)$

In Exercises 114–115, find the midpoint of each line segment with the given endpoints.

114.  $(2, 6)$  and  $(-12, 4)$     115.  $(4, -6)$  and  $(-15, 2)$

In Exercises 116–117, write the standard form of the equation of the circle with the given center and radius.

116. Center  $(0, 0), r = 3$     117. Center  $(-2, 4), r = 6$

In Exercises 118–120, give the center and radius of each circle and graph its equation. Use the graph to identify the relation's domain and range.

118.  $x^2 + y^2 = 1$     119.  $(x + 2)^2 + (y - 3)^2 = 9$   
 120.  $x^2 + y^2 - 4x + 2y - 4 = 0$

**1.10**

121. In 2000, the average weekly salary for workers in the United States was \$567. This amount has increased by approximately \$15 per year.

- a. Express the average weekly salary for U.S. workers,  $W$ , as a function of the number of years after 2000,  $x$ .
- b. If this trend continues, in which year will the average weekly salary be \$702?

122. You are choosing between two texting plans. Plan A has a monthly fee of \$15 with a charge of \$0.05 per text. Plan B has a monthly fee of \$5 with a charge of \$0.07 per text.

- a. Express the monthly cost for plan A,  $f$ , as a function of the number of text messages in a month,  $x$ .
- b. Express the monthly cost for plan B,  $g$ , as a function of the number of text messages in a month,  $x$ .
- c. For how many text messages will the costs for the two plans be the same?

123. A 400-room hotel can rent every one of its rooms at \$120 per room. For each \$1 increase in rent, two fewer rooms are rented.

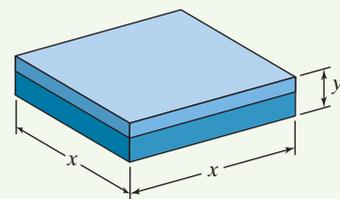

- a. Express the number of rooms rented,  $N$ , as a function of the rent,  $x$ .
- b. Express the hotel's revenue,  $R$ , as a function of the rent,  $x$ .

124. An open box is made by cutting identical squares from the corners of a 16-inch by 24-inch piece of cardboard and then turning up the sides.

- a. Express the volume of the box,  $V$ , as a function of the length of the side of the square cut from each corner,  $x$ .
- b. Find the domain of  $V$ .

125. You have 400 feet of fencing to enclose a rectangular lot and divide it in two by another fence that is parallel to one side of the lot. Express the area of the rectangular lot,  $A$ , as a function of the length of the fence that divides the rectangular lot,  $x$ .

126. The figure shows a box with a square base and a square top. The box is to have a volume of 8 cubic feet. Express the surface area of the box,  $A$ , as a function of the length of a side of its square base,  $x$ .

127. You inherit \$10,000 with the stipulation that for the first year the money must be placed in two investments expected to earn 8% and 12% annual interest. Express the expected interest from both investments,  $I$ , as a function of the amount of money invested at 8%,  $x$ .

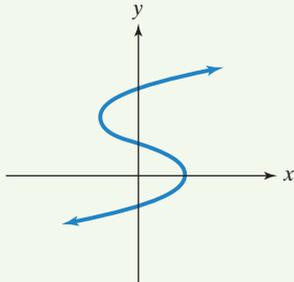

# CHAPTER 1 TEST

1. List by letter all relations that are not functions.

a.  $\{(7, 5), (8, 5), (9, 5)\}$

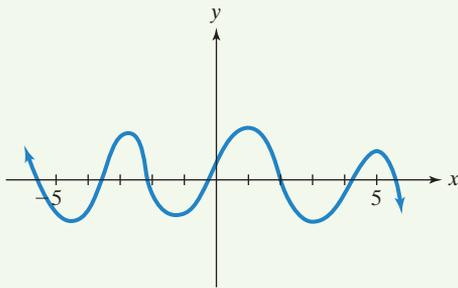

b.  $\{(5, 7), (5, 8), (5, 9)\}$

c.

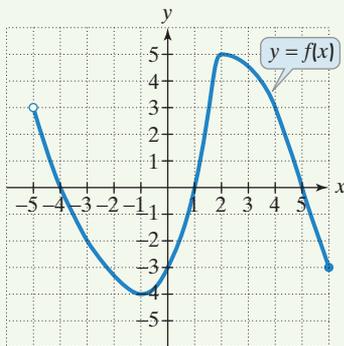

d.  $x^2 + y^2 = 100$

e.

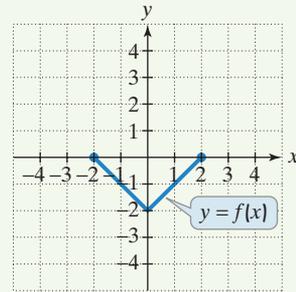

2. Use the graph of  $y = f(x)$  to solve this exercise.

- What is  $f(4) - f(-3)$ ?
- What is the domain of  $f$ ?
- What is the range of  $f$ ?
- On which interval or intervals is  $f$  increasing?
- On which interval or intervals is  $f$  decreasing?
- For what number does  $f$  have a relative maximum? What is the relative maximum?
- For what number does  $f$  have a relative minimum? What is the relative minimum?
- What are the  $x$ -intercepts?
- What is the  $y$ -intercept?

3. Use the graph of  $y = f(x)$  to solve this exercise.

- What are the zeros of  $f$ ?
- Find the value(s) of  $x$  for which  $f(x) = -1$ .
- Find the value(s) of  $x$  for which  $f(x) = -2$ .
- Is  $f$  even, odd, or neither?
- Does  $f$  have an inverse function?
- Is  $f(0)$  a relative maximum, a relative minimum, or neither?
- Graph  $g(x) = f(x + 1) - 1$ .
- Graph  $h(x) = \frac{1}{2}f(\frac{1}{2}x)$ .
- Graph  $r(x) = -f(-x) + 1$ .
- Find the average rate of change of  $f$  from  $x_1 = -2$  to  $x_2 = 1$ .

In Exercises 4–15, graph each equation in a rectangular coordinate system. If two functions are indicated, graph both in the same system. Then use your graphs to identify each relation's domain and range.

4.  $x + y = 4$

5.  $x^2 + y^2 = 4$

6.  $f(x) = 4$

7.  $f(x) = -\frac{1}{3}x + 2$

8.  $(x + 2)^2 + (y - 1)^2 = 9$

9.  $f(x) = \begin{cases} 2 & \text{if } x \leq 0 \\ -1 & \text{if } x > 0 \end{cases}$

10.  $x^2 + y^2 + 4x - 6y - 3 = 0$

11.  $f(x) = |x|$  and  $g(x) = \frac{1}{2}|x + 1| - 2$

12.  $f(x) = x^2$  and  $g(x) = -(x - 1)^2 + 4$

13.  $f(x) = 2x - 4$  and  $f^{-1}$

14.  $f(x) = x^3 - 1$  and  $f^{-1}$

15.  $f(x) = x^2 - 1, x \geq 0$ , and  $f^{-1}$

In Exercises 16–23, let  $f(x) = x^2 - x - 4$  and  $g(x) = 2x - 6$ .

16. Find  $f(x - 1)$ .

17. Find  $\frac{f(x + h) - f(x)}{h}$ .

18. Find  $(g - f)(x)$ .

19. Find  $\left(\frac{f}{g}\right)(x)$  and its domain.

20. Find  $(f \circ g)(x)$ .

21. Find  $(g \circ f)(x)$ .

22. Find  $g(f(-1))$ .

23. Find  $f(-x)$ . Is  $f$  even, odd, or neither?

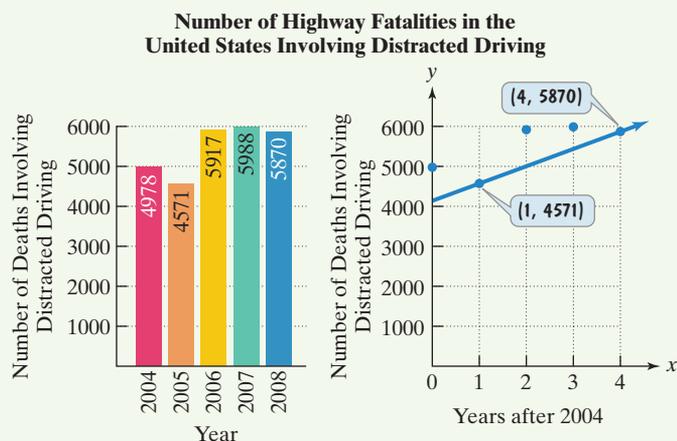

In Exercises 24–25, use the given conditions to write an equation for each line in point-slope form and slope-intercept form.

24. Passing through  $(2, 1)$  and  $(-1, -8)$

25. Passing through  $(-4, 6)$  and perpendicular to the line whose equation is  $y = -\frac{1}{4}x + 5$

26. Write an equation in general form for the line passing through  $(-7, -10)$  and parallel to the line whose equation is  $4x + 2y - 5 = 0$ .

27. Studies show that texting while driving is as risky as driving with a 0.08 blood alcohol level, the standard for drunk driving. The bar graph shows the number of fatalities in the United States involving distracted driving from 2004 through 2008. Although the distracted category involves such activities as talking on cellphones, conversing with passengers, and eating, experts at the National Highway Traffic Safety Administration claim that texting while driving is the clearest menace because it requires looking away from the road.

Source: National Highway Traffic Safety Administration

- Shown to the right of the bar graph is a scatter plot with a line passing through two of the data points. Use the two points whose coordinates are shown by the voice balloons to write the point-slope form of an equation that models the number of highway fatalities involving distracted driving,  $y$ , in the United States  $x$  years after 2004.
- Write the equation from part (a) in slope-intercept form. Use function notation.
- In 2010, surveys showed overwhelming public support to ban texting while driving, although at that time only 19 states and Washington, D.C., outlawed the practice. Without additional laws that penalize texting drivers, use the linear function you obtained from part (b) to project the number of fatalities in the United States in 2014 involving distracted driving.

28. Find the average rate of change of  $f(x) = 3x^2 - 5$  from  $x_1 = 6$  to  $x_2 = 10$ .

29. If  $g(x) = \begin{cases} \sqrt{x-3} & \text{if } x \geq 3 \\ 3-x & \text{if } x < 3 \end{cases}$ , find  $g(-1)$  and  $g(7)$ .

In Exercises 30–31, find the domain of each function.

30.  $f(x) = \frac{3}{x+5} + \frac{7}{x-1}$

31.  $f(x) = 3\sqrt{x+5} + 7\sqrt{x-1}$

32. If  $f(x) = \frac{7}{x-4}$  and  $g(x) = \frac{2}{x}$ , find  $(f \circ g)(x)$  and the domain of  $f \circ g$ .

33. Express  $h(x) = (2x + 3)^7$  as a composition of two functions  $f$  and  $g$  so that  $h(x) = (f \circ g)(x)$ .

34. Find the length and the midpoint of the line segment whose endpoints are  $(2, -2)$  and  $(5, 2)$ .

35. In 1980, the winning time for women in the Olympic 500-meter speed skating event was 41.78 seconds. The average rate of decrease in the winning time has been about 0.19 second per year.

- Express the winning time,  $T$ , in this event as a function of the number of years after 1980,  $x$ .
- According to the function, when was winning time 35.7 seconds?

36. The annual yield per walnut tree is fairly constant at 50 pounds per tree when the number of trees per acre is 30 or fewer. For each additional tree over 30, the annual yield per tree for all trees on the acre decreases by 1.5 pounds due to overcrowding.

- Express the yield per tree,  $Y$ , in pounds, as a function of the number of walnut trees per acre,  $x$ .
- Express the total yield for an acre,  $T$ , in pounds, as a function of the number of walnut trees per acre,  $x$ .

37. You have 600 yards of fencing to enclose a rectangular field. Express the area of the field,  $A$ , as a function of one of its dimensions,  $x$ .

38. A closed rectangular box with a square base has a volume of 8000 cubic centimeters. Express the surface area of the box,  $A$ , as a function of the length of a side of its square base,  $x$ .

# POLYNOMIAL AND RATIONAL FUNCTIONS

## CHAPTER

# 2

### *We are surrounded by evidence*

that the world is profoundly mathematical. After turning a somersault, a diver's path can be modeled by a quadratic function,  $f(x) = ax^2 + bx + c$ , as can the path of a football tossed from quarterback to receiver or the path of a flipped coin. Even if you throw an object directly upward, although its path is straight and vertical, its changing height over time is described by a quadratic function. And tailgaters beware: Whether you're driving a car, a motorcycle, or a truck on dry or wet roads, an array of quadratic functions that model your required stopping distances at various speeds are available to help you become a safer driver.

#### **HERE'S WHERE YOU'LL FIND THESE APPLICATIONS:**

The quadratic functions surrounding our long history of throwing things appear throughout the chapter, including Example 5 in Section 2.2 and Example 5 in Section 2.7.

Tailgaters should pay close attention to the Section 2.7 opener, Exercises 77–78 and 92–93 in Exercise Set 2.7, and Exercise 91 in the Chapter Review Exercises.

## SECTION 2.1

## Complex Numbers

## Objectives

- 1 Add and subtract complex numbers.
- 2 Multiply complex numbers.
- 3 Divide complex numbers.
- 4 Perform operations with square roots of negative numbers.
- 5 Solve quadratic equations with complex imaginary solutions.

Who is this kid warning us about our eyeballs turning black if we attempt to find the square root of  $-9$ ? Don't believe what you hear on the street. Although square roots of negative numbers are not real numbers, they do play a significant role in algebra. In this section, we move beyond the real numbers and discuss square roots with negative radicands.

The Imaginary Unit  $i$ 

In this section, we will study equations whose solutions may involve the square roots of negative numbers. Because the square of a real number is never negative, there is no real number  $x$  such that  $x^2 = -1$ . To provide a setting in which such equations have solutions, mathematicians have invented an expanded system of numbers, the complex numbers. The *imaginary number*  $i$ , defined to be a solution of the equation  $x^2 = -1$ , is the basis of this new number system.

© Roz Chast/The New Yorker Collection/Cartoonbank

The Imaginary Unit  $i$ 

The **imaginary unit**  $i$  is defined as

$$i = \sqrt{-1}, \quad \text{where } i^2 = -1.$$

Using the imaginary unit  $i$ , we can express the square root of any negative number as a real multiple of  $i$ . For example,

$$\sqrt{-25} = \sqrt{-1} \sqrt{25} = i\sqrt{25} = 5i.$$

We can check this result by squaring  $5i$  and obtaining  $-25$ .

$$(5i)^2 = 5^2 i^2 = 25(-1) = -25$$

A new system of numbers, called *complex numbers*, is based on adding multiples of  $i$ , such as  $5i$ , to real numbers.

## Complex Numbers and Imaginary Numbers

The set of all numbers in the form

$$a + bi,$$

with real numbers  $a$  and  $b$ , and  $i$ , the imaginary unit, is called the set of **complex numbers**. The real number  $a$  is called the **real part** and the real number  $b$  is called the **imaginary part** of the complex number  $a + bi$ . If  $b \neq 0$ , then the complex number is called an **imaginary number** (Figure 2.1). An imaginary number in the form  $bi$  is called a **pure imaginary number**.

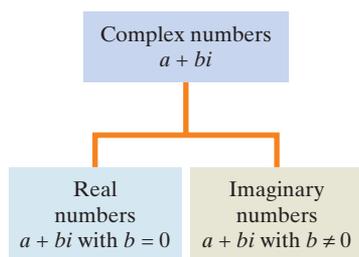

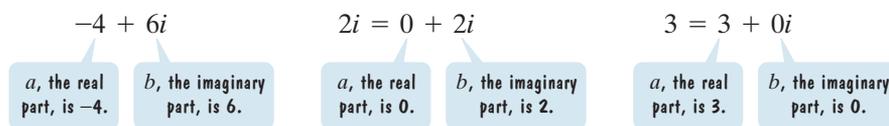

FIGURE 2.1 The complex number system

Here are some examples of complex numbers. Each number can be written in the form  $a + bi$ .

Can you see that  $b$ , the imaginary part, is not zero in the first two complex numbers? Because  $b \neq 0$ , these complex numbers are imaginary numbers. Furthermore, the imaginary number  $2i$  is a pure imaginary number. By contrast, the imaginary part of the complex number on the right is zero. This complex number is not an imaginary number. The number 3, or  $3 + 0i$ , is a real number.

A complex number is said to be **simplified** if it is expressed in the **standard form**  $a + bi$ . If  $b$  contains a radical, we usually write  $i$  before the radical. For example, we write  $7 + 3i\sqrt{5}$  rather than  $7 + 3\sqrt{5}i$ , which could easily be confused with  $7 + 3\sqrt{5}i$ .

Expressed in standard form, two complex numbers are equal if and only if their real parts are equal and their imaginary parts are equal.

### Equality of Complex Numbers

$a + bi = c + di$  if and only if  $a = c$  and  $b = d$ .

- 1** Add and subtract complex numbers.

### Operations with Complex Numbers

The form of a complex number  $a + bi$  is like the binomial  $a + bx$ . Consequently, we can add, subtract, and multiply complex numbers using the same methods we used for binomials, remembering that  $i^2 = -1$ .

#### Adding and Subtracting Complex Numbers

**1.**  $(a + bi) + (c + di) = (a + c) + (b + d)i$

In words, this says that you add complex numbers by adding their real parts, adding their imaginary parts, and expressing the sum as a complex number.

**2.**  $(a + bi) - (c + di) = (a - c) + (b - d)i$

In words, this says that you subtract complex numbers by subtracting their real parts, subtracting their imaginary parts, and expressing the difference as a complex number.

#### EXAMPLE 1 Adding and Subtracting Complex Numbers

Perform the indicated operations, writing the result in standard form:

**a.**  $(5 - 11i) + (7 + 4i)$       **b.**  $(-5 + i) - (-11 - 6i)$

#### SOLUTION

**a.**  $(5 - 11i) + (7 + 4i)$   
 $= 5 - 11i + 7 + 4i$   
 $= 5 + 7 - 11i + 4i$   
 $= (5 + 7) + (-11 + 4)i$   
 $= 12 - 7i$

**b.**  $(-5 + i) - (-11 - 6i)$   
 $= -5 + i + 11 + 6i$   
 $= -5 + 11 + i + 6i$   
 $= (-5 + 11) + (1 + 6)i$   
 $= 6 + 7i$

Remove the parentheses.

### GREAT QUESTION!

**Are operations with complex numbers similar to operations with polynomials?**

Yes. The following examples, using the same integers as in Example 1, show how operations with complex numbers are just like operations with polynomials.

**a.**  $(5 - 11x) + (7 + 4x)$   
 $= 12 - 7x$

**b.**  $(-5 + x) - (-11 - 6x)$   
 $= -5 + x + 11 + 6x$   
 $= 6 + 7x$

 **Check Point 1** Perform the indicated operations, writing the result in standard form:

a.  $(5 - 2i) + (3 + 3i)$

b.  $(2 + 6i) - (12 - i)$ .

Multiplication of complex numbers is performed the same way as multiplication of polynomials, using the distributive property and the FOIL method. After completing the multiplication, we replace any occurrences of  $i^2$  with  $-1$ . This idea is illustrated in the next example.

**2** Multiply complex numbers.

**EXAMPLE 2** Multiplying Complex Numbers

Find the products:

a.  $4i(3 - 5i)$

b.  $(7 - 3i)(-2 - 5i)$ .

**SOLUTION**

a.  $4i(3 - 5i)$

$$= 4i \cdot 3 - 4i \cdot 5i$$

$$= 12i - 20i^2$$

$$= 12i - 20(-1)$$

$$= 20 + 12i$$

Distribute  $4i$  throughout the parentheses.

Multiply.

Replace  $i^2$  with  $-1$ .

Simplify to  $12i + 20$  and write in standard form.

b.  $(7 - 3i)(-2 - 5i)$

**F O I L**

$$= -14 - 35i + 6i + 15i^2$$

$$= -14 - 35i + 6i + 15(-1) \quad i^2 = -1$$

$$= -14 - 15 - 35i + 6i \quad \text{Group real and imaginary terms.}$$

$$= -29 - 29i \quad \text{Combine real and imaginary terms.} \quad \dots$$

 **Check Point 2** Find the products:

a.  $7i(2 - 9i)$

b.  $(5 + 4i)(6 - 7i)$ .

**3** Divide complex numbers.

**Complex Conjugates and Division**

It is possible to multiply imaginary numbers and obtain a real number. This occurs when we multiply  $a + bi$  and  $a - bi$ .

$$\begin{aligned} (a + bi)(a - bi) &= a^2 - abi + abi - b^2i^2 && \text{Use the FOIL method.} \\ &= a^2 - b^2(-1) && i^2 = -1 \\ &= a^2 + b^2 && \text{Notice that this product eliminates } i. \end{aligned}$$

For the complex number  $a + bi$ , we define its *complex conjugate* to be  $a - bi$ . The multiplication of complex conjugates results in a real number.

**Conjugate of a Complex Number**

The **complex conjugate** of the number  $a + bi$  is  $a - bi$ , and the complex conjugate of  $a - bi$  is  $a + bi$ . The multiplication of complex conjugates gives a real number.

$$(a + bi)(a - bi) = a^2 + b^2$$

$$(a - bi)(a + bi) = a^2 + b^2$$

Complex conjugates are used to divide complex numbers. The goal of the division procedure is to obtain a real number in the denominator. This real number becomes the denominator of  $a$  and  $b$  in the quotient  $a + bi$ . By multiplying the numerator and the denominator of the division by the complex conjugate of the denominator, you will obtain this real number in the denominator.

### EXAMPLE 3 Using Complex Conjugates to Divide Complex Numbers

Divide and express the result in standard form:  $\frac{7 + 4i}{2 - 5i}$ .

#### SOLUTION

The complex conjugate of the denominator,  $2 - 5i$ , is  $2 + 5i$ . Multiplication of both the numerator and the denominator by  $2 + 5i$  will eliminate  $i$  from the denominator while maintaining the value of the expression.

$$\frac{7 + 4i}{2 - 5i} = \frac{(7 + 4i)(2 + 5i)}{(2 - 5i)(2 + 5i)}$$

Multiply the numerator and the denominator by the complex conjugate of the denominator.

$$= \frac{\overset{\text{F}}{14} + \overset{\text{O}}{35i} + \overset{\text{I}}{8i} + \overset{\text{L}}{20i^2}}{2^2 + 5^2}$$

Use the FOIL method in the numerator and  $(a - bi)(a + bi) = a^2 + b^2$  in the denominator.

$$= \frac{14 + 43i + 20(-1)}{29}$$

In the numerator, combine imaginary terms and replace  $i^2$  with  $-1$ . In the denominator,  $2^2 + 5^2 = 4 + 25 = 29$ .

$$= \frac{-6 + 43i}{29}$$

Combine real terms in the numerator:  $14 + 20(-1) = 14 - 20 = -6$ .

$$= -\frac{6}{29} + \frac{43}{29}i$$

Express the answer in standard form.

Observe that the quotient is expressed in the standard form  $a + bi$ , with  $a = -\frac{6}{29}$  and  $b = \frac{43}{29}$ . ...

**Check Point 3** Divide and express the result in standard form:  $\frac{5 + 4i}{4 - i}$ .

- 4** Perform operations with square roots of negative numbers.

### Roots of Negative Numbers

The square of  $4i$  and the square of  $-4i$  both result in  $-16$ :

$$(4i)^2 = 16i^2 = 16(-1) = -16 \quad (-4i)^2 = 16i^2 = 16(-1) = -16.$$

Consequently, in the complex number system  $-16$  has two square roots, namely,  $4i$  and  $-4i$ . We call  $4i$  the **principal square root** of  $-16$ .

#### Principal Square Root of a Negative Number

For any positive real number  $b$ , the **principal square root** of the negative number  $-b$  is defined by

$$\sqrt{-b} = i\sqrt{b}.$$

Consider the multiplication problem

$$5i \cdot 2i = 10i^2 = 10(-1) = -10.$$

This problem can also be given in terms of principal square roots of negative numbers:

$$\sqrt{-25} \cdot \sqrt{-4}.$$

Because the product rule for radicals only applies to real numbers, multiplying radicands is incorrect. **When performing operations with square roots of negative numbers, begin by expressing all square roots in terms of  $i$ .** Then perform the indicated operation.

**Correct:**

$$\begin{aligned}\sqrt{-25} \cdot \sqrt{-4} &= i\sqrt{25} \cdot i\sqrt{4} \\ &= 5i \cdot 2i \\ &= 10i^2 = 10(-1) = -10\end{aligned}$$

**Incorrect:**

$$\begin{aligned}\sqrt{-25} \cdot \sqrt{-4} &= \sqrt{(-25)(-4)} \\ &= \sqrt{100} \\ &= 10\end{aligned}$$

#### EXAMPLE 4 Operations Involving Square Roots of Negative Numbers

Perform the indicated operations and write the result in standard form:

a.  $\sqrt{-18} - \sqrt{-8}$       b.  $(-1 + \sqrt{-5})^2$       c.  $\frac{-25 + \sqrt{-50}}{15}$ .

#### SOLUTION

Begin by expressing all square roots of negative numbers in terms of  $i$ .

a. 
$$\begin{aligned}\sqrt{-18} - \sqrt{-8} &= i\sqrt{18} - i\sqrt{8} = i\sqrt{9 \cdot 2} - i\sqrt{4 \cdot 2} \\ &= 3i\sqrt{2} - 2i\sqrt{2} = i\sqrt{2}\end{aligned}$$

$$(A + B)^2 = A^2 + 2AB + B^2$$

b. 
$$\begin{aligned}(-1 + \sqrt{-5})^2 &= (-1 + i\sqrt{5})^2 = (-1)^2 + 2(-1)(i\sqrt{5}) + (i\sqrt{5})^2 \\ &= 1 - 2i\sqrt{5} + 5i^2 \\ &= 1 - 2i\sqrt{5} + 5(-1) \\ &= -4 - 2i\sqrt{5}\end{aligned}$$

c. 
$$\begin{aligned}\frac{-25 + \sqrt{-50}}{15} &= \frac{-25 + i\sqrt{50}}{15} && \sqrt{-b} = i\sqrt{b} \\ &= \frac{-25 + 5i\sqrt{2}}{15} && \sqrt{50} = \sqrt{25 \cdot 2} = 5\sqrt{2} \\ &= \frac{-25}{15} + \frac{5i\sqrt{2}}{15} && \text{Write the complex number in standard form.} \\ &= -\frac{5}{3} + i\frac{\sqrt{2}}{3} && \text{Simplify.}\end{aligned}$$

 **Check Point 4** Perform the indicated operations and write the result in standard form:

a.  $\sqrt{-27} + \sqrt{-48}$       b.  $(-2 + \sqrt{-3})^2$       c.  $\frac{-14 + \sqrt{-12}}{2}$ .

- 5 Solve quadratic equations with complex imaginary solutions.

### GREAT QUESTION!

Where can I review quadratic equations and how to solve them?

Read Section P.7, beginning on page 93.

### Quadratic Equations with Complex Imaginary Solutions

We have seen that a quadratic equation can be expressed in the general form

$$ax^2 + bx + c = 0, \quad a \neq 0.$$

All quadratic equations can be solved by the quadratic formula:

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}.$$

Recall that the quantity  $b^2 - 4ac$ , which appears under the radical sign in the quadratic formula, is called the discriminant. If the discriminant is negative, a quadratic equation has no real solutions. However, quadratic equations with negative discriminants do have two solutions. These solutions are imaginary numbers that are complex conjugates.

#### EXAMPLE 5 A Quadratic Equation with Imaginary Solutions

Solve using the quadratic formula:  $3x^2 - 2x + 4 = 0$ .

#### SOLUTION

The given equation is in general form. Begin by identifying the values for  $a$ ,  $b$ , and  $c$ .

$$3x^2 - 2x + 4 = 0$$

$$a = 3$$

$$b = -2$$

$$c = 4$$

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

Use the quadratic formula.

$$= \frac{-(-2) \pm \sqrt{(-2)^2 - 4(3)(4)}}{2(3)}$$

Substitute the values for  $a$ ,  $b$ , and  $c$ :  
 $a = 3$ ,  $b = -2$ , and  $c = 4$ .

$$= \frac{2 \pm \sqrt{4 - 48}}{6}$$

$$-(-2) = 2 \text{ and } (-2)^2 = (-2)(-2) = 4.$$

$$= \frac{2 \pm \sqrt{-44}}{6}$$

Subtract under the radical. Because the number under the radical sign is negative, the solutions will not be real numbers.

$$= \frac{2 \pm 2i\sqrt{11}}{6}$$

$$\sqrt{-44} = \sqrt{4(11)(-1)} = 2i\sqrt{11}$$

$$= \frac{2(1 \pm i\sqrt{11})}{6}$$

Factor 2 from the numerator.

$$= \frac{1 \pm i\sqrt{11}}{3}$$

Divide numerator and denominator by 2.

$$= \frac{1}{3} \pm i \frac{\sqrt{11}}{3}$$

Write the complex numbers in standard form.

The solutions are complex conjugates, and the solution set is

$$\left\{ \frac{1}{3} + i \frac{\sqrt{11}}{3}, \frac{1}{3} - i \frac{\sqrt{11}}{3} \right\} \text{ or } \left\{ \frac{1}{3} \pm i \frac{\sqrt{11}}{3} \right\}.$$

...

 **Check Point 5** Solve using the quadratic formula:

$$x^2 - 2x + 2 = 0.$$

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- The imaginary unit  $i$  is defined as  $i = \underline{\hspace{2cm}}$ , where  $i^2 = \underline{\hspace{2cm}}$ .
- The set of all numbers in the form  $a + bi$  is called the set of            numbers. If  $b \neq 0$ , then the number is also called a/an            number. If  $b = 0$ , then the number is also called a/an            number.

3.  $-9i + 3i = \underline{\hspace{2cm}}$

4.  $10i - (-4i) = \underline{\hspace{2cm}}$

5. Consider the following multiplication problem:

$$(3 + 2i)(6 - 5i).$$

Using the FOIL method, the product of the first terms is           , the product of the outside terms is           , and

the product of the inside terms is           . The product of the last terms in terms of  $i^2$  is           , which simplifies to           .

6. The conjugate of  $2 - 9i$  is           .

7. The division

$$\frac{7 + 4i}{2 - 5i}$$

is performed by multiplying the numerator and denominator by           .

8.  $\sqrt{-20} = \underline{\hspace{1cm}}\sqrt{20} = \underline{\hspace{1cm}}\sqrt{4 \cdot 5} = \underline{\hspace{2cm}}$

9.  $x = \frac{-4 \pm \sqrt{4^2 - 4 \cdot 2 \cdot 5}}{2 \cdot 2}$  simplifies to  $x = \underline{\hspace{2cm}}$ .

## EXERCISE SET 2.1

### Practice Exercises

In Exercises 1–8, add or subtract as indicated and write the result in standard form.

- $(7 + 2i) + (1 - 4i)$
- $(-2 + 6i) + (4 - i)$
- $(3 + 2i) - (5 - 7i)$
- $(-7 + 5i) - (-9 - 11i)$
- $6 - (-5 + 4i) - (-13 - i)$
- $7 - (-9 + 2i) - (-17 - i)$
- $8i - (14 - 9i)$
- $15i - (12 - 11i)$

In Exercises 9–20, find each product and write the result in standard form.

- $-3i(7i - 5)$
- $-8i(2i - 7)$
- $(-5 + 4i)(3 + i)$
- $(-4 - 8i)(3 + i)$
- $(7 - 5i)(-2 - 3i)$
- $(8 - 4i)(-3 + 9i)$
- $(3 + 5i)(3 - 5i)$
- $(2 + 7i)(2 - 7i)$
- $(-5 + i)(-5 - i)$
- $(-7 - i)(-7 + i)$
- $(2 + 3i)^2$
- $(5 - 2i)^2$

In Exercises 21–28, divide and express the result in standard form.

- $\frac{2}{3 - i}$
- $\frac{3}{4 + i}$
- $\frac{2i}{1 + i}$
- $\frac{5i}{2 - i}$
- $\frac{8i}{4 - 3i}$
- $\frac{-6i}{3 + 2i}$
- $\frac{2 + 3i}{2 + i}$
- $\frac{3 - 4i}{4 + 3i}$

In Exercises 29–44, perform the indicated operations and write the result in standard form.

- $\sqrt{-64} - \sqrt{-25}$
- $\sqrt{-81} - \sqrt{-144}$
- $5\sqrt{-16} + 3\sqrt{-81}$
- $5\sqrt{-8} + 3\sqrt{-18}$
- $(-2 + \sqrt{-4})^2$
- $(-5 - \sqrt{-9})^2$

35.  $(-3 - \sqrt{-7})^2$

36.  $(-2 + \sqrt{-11})^2$

37.  $\frac{-8 + \sqrt{-32}}{24}$

38.  $\frac{-12 + \sqrt{-28}}{32}$

39.  $\frac{-6 - \sqrt{-12}}{48}$

40.  $\frac{-15 - \sqrt{-18}}{33}$

41.  $\sqrt{-8}(\sqrt{-3} - \sqrt{5})$

42.  $\sqrt{-12}(\sqrt{-4} - \sqrt{2})$

43.  $(3\sqrt{-5})(-4\sqrt{-12})$

44.  $(3\sqrt{-7})(2\sqrt{-8})$

In Exercises 45–50, solve each quadratic equation using the quadratic formula. Express solutions in standard form.

45.  $x^2 - 6x + 10 = 0$

46.  $x^2 - 2x + 17 = 0$

47.  $4x^2 + 8x + 13 = 0$

48.  $2x^2 + 2x + 3 = 0$

49.  $3x^2 = 8x - 7$

50.  $3x^2 = 4x - 6$

### Practice Plus

In Exercises 51–56, perform the indicated operation(s) and write the result in standard form.

51.  $(2 - 3i)(1 - i) - (3 - i)(3 + i)$

52.  $(8 + 9i)(2 - i) - (1 - i)(1 + i)$

53.  $(2 + i)^2 - (3 - i)^2$

54.  $(4 - i)^2 - (1 + 2i)^2$

55.  $5\sqrt{-16} + 3\sqrt{-81}$

56.  $5\sqrt{-8} + 3\sqrt{-18}$

57. Evaluate  $x^2 - 2x + 2$  for  $x = 1 + i$ .

58. Evaluate  $x^2 - 2x + 5$  for  $x = 1 - 2i$ .

59. Evaluate  $\frac{x^2 + 19}{2 - x}$  for  $x = 3i$ .

60. Evaluate  $\frac{x^2 + 11}{3 - x}$  for  $x = 4i$ .

### Application Exercises

Complex numbers are used in electronics to describe the current in an electric circuit. Ohm's law relates the current in a circuit,  $I$ , in amperes, the voltage of the circuit,  $E$ , in volts, and the resistance of the circuit,  $R$ , in ohms, by the formula  $E = IR$ . Use this formula to solve Exercises 61–62.

61. Find  $E$ , the voltage of a circuit, if  $I = (4 - 5i)$  amperes and  $R = (3 + 7i)$  ohms.
62. Find  $E$ , the voltage of a circuit, if  $I = (2 - 3i)$  amperes and  $R = (3 + 5i)$  ohms.
63. The mathematician Girolamo Cardano is credited with the first use (in 1545) of negative square roots in solving the now-famous problem, "Find two numbers whose sum is 10 and whose product is 40." Show that the complex numbers  $5 + i\sqrt{15}$  and  $5 - i\sqrt{15}$  satisfy the conditions of the problem. (Cardano did not use the symbolism  $i\sqrt{15}$  or even  $\sqrt{-15}$ . He wrote R.m 15 for  $\sqrt{-15}$ , meaning "radix minus 15." He regarded the numbers  $5 + \text{R.m } 15$  and  $5 - \text{R.m } 15$  as "fictitious" or "ghost numbers," and considered the problem "manifestly impossible." But in a mathematically adventurous spirit, he exclaimed, "Nevertheless, we will operate.")

### Writing in Mathematics

64. What is  $i$ ?
65. Explain how to add complex numbers. Provide an example with your explanation.
66. Explain how to multiply complex numbers and give an example.
67. What is the complex conjugate of  $2 + 3i$ ? What happens when you multiply this complex number by its complex conjugate?
68. Explain how to divide complex numbers. Provide an example with your explanation.
69. Explain each of the three jokes in the cartoon on page 292.
70. A stand-up comedian uses algebra in some jokes, including one about a telephone recording that announces "You have just reached an imaginary number. Please multiply by  $i$  and dial again." Explain the joke.

Explain the error in Exercises 71–72.

71.  $\sqrt{-9} + \sqrt{-16} = \sqrt{-25} = i\sqrt{25} = 5i$

72.  $(\sqrt{-9})^2 = \sqrt{-9} \cdot \sqrt{-9} = \sqrt{81} = 9$

### Critical Thinking Exercises

**Make Sense?** In Exercises 73–76, determine whether each statement makes sense or does not make sense, and explain your reasoning.

73. The humor in the cartoon at the top of the next column is based on the fact that "rational" and "real" have different meanings in mathematics and in everyday speech.

© 2007 GJ Caulkins

74. The word *imaginary* in imaginary numbers tells me that these numbers are undefined.
75. By writing the imaginary number  $5i$ , I can immediately see that 5 is the constant and  $i$  is the variable.
76. When I add or subtract complex numbers, I am basically combining like terms.

In Exercises 77–80, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

77. Some irrational numbers are not complex numbers.
78.  $(3 + 7i)(3 - 7i)$  is an imaginary number.
79.  $\frac{7 + 3i}{5 + 3i} = \frac{7}{5}$
80. In the complex number system,  $x^2 + y^2$  (the sum of two squares) can be factored as  $(x + yi)(x - yi)$ .

In Exercises 81–83, perform the indicated operations and write the result in standard form.

81.  $\frac{4}{(2 + i)(3 - i)}$

82.  $\frac{1 + i}{1 + 2i} + \frac{1 - i}{1 - 2i}$

83.  $\frac{8}{1 + \frac{2}{i}}$

### Preview Exercises

Exercises 84–86 will help you prepare for the material covered in the next section.

In Exercises 84–85, solve each quadratic equation by the method of your choice.

84.  $0 = -2(x - 3)^2 + 8$

85.  $-x^2 - 2x + 1 = 0$

86. Use the graph of  $f(x) = x^2$  to graph  $g(x) = (x + 3)^2 + 1$ .

## SECTION 2.2

## Quadratic Functions

## Objectives

- 1 Recognize characteristics of parabolas.
- 2 Graph parabolas.
- 3 Determine a quadratic function's minimum or maximum value.
- 4 Solve problems involving a quadratic function's minimum or maximum value.

- 1 Recognize characteristics of parabolas.

Many sports involve objects that are thrown, kicked, or hit, and then proceed with no additional force of their own. Such objects are called **projectiles**. Paths of projectiles, as well as their heights over time, can be modeled by quadratic functions. We have seen that a **quadratic function** is any function of the form

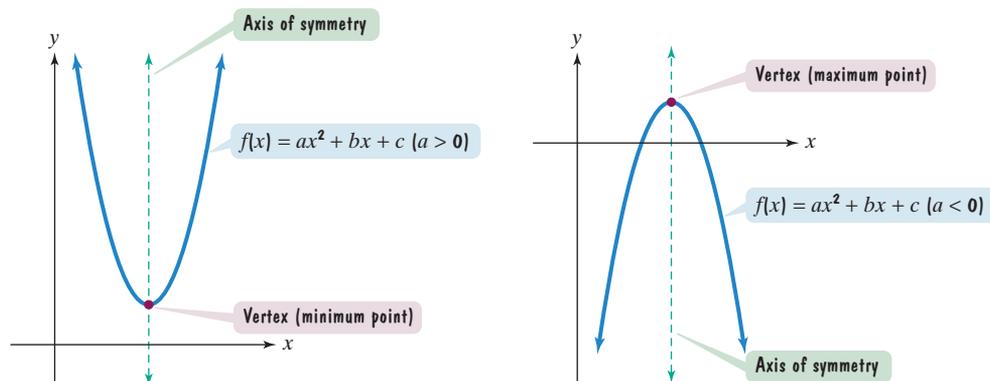

$$f(x) = ax^2 + bx + c,$$

where  $a$ ,  $b$ , and  $c$  are real numbers, with  $a \neq 0$ . A quadratic function is a polynomial function whose greatest exponent is 2. In this section, you will learn to use graphs of quadratic functions to gain a visual understanding of the algebra that describes football, baseball, basketball, the shot put, and other projectile sports.

## Graphs of Quadratic Functions

The graph of any quadratic function is called a **parabola**. Parabolas are shaped like bowls or inverted bowls, as shown in **Figure 2.2**. If the coefficient of  $x^2$  (the value of  $a$  in  $ax^2 + bx + c$ ) is positive, the parabola opens upward. If the coefficient of  $x^2$  is negative, the parabola opens downward. The **vertex** (or turning point) of the parabola is the lowest point on the graph when it opens upward and the highest point on the graph when it opens downward.

$a > 0$ : Parabola opens upward.

$a < 0$ : Parabola opens downward.

**FIGURE 2.2** Characteristics of graphs of quadratic functions

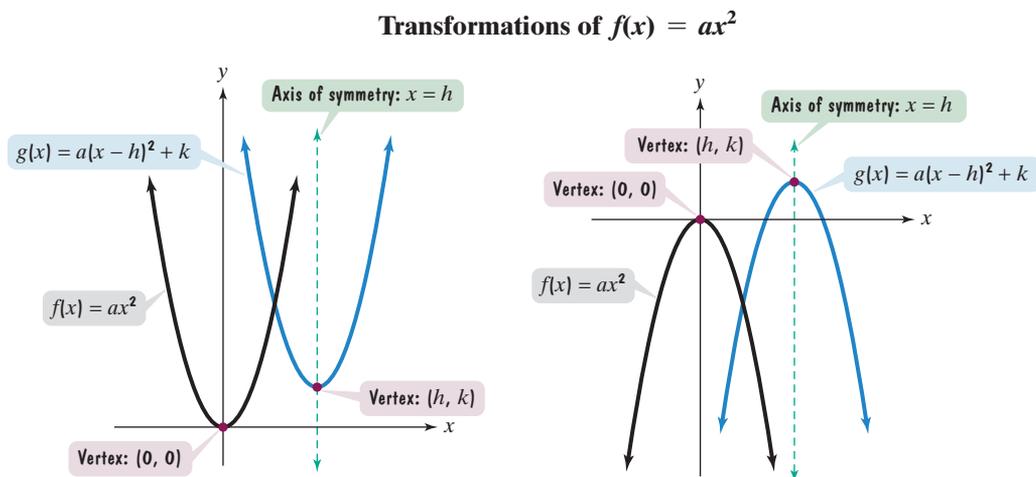

Look at the unusual image of the word *mirror* shown here. The artist, Scott Kim, has created the image so that the two halves of the whole are mirror images of each other. A parabola shares this kind of symmetry, in which a vertical line through the vertex divides the figure in half. Parabolas are symmetric with respect to this line, called the **axis of symmetry**. If a parabola is folded along its axis of symmetry, the two halves match exactly.

## 2 Graph parabolas.

## Graphing Quadratic Functions in Standard Form

In our earlier work with transformations, we applied a series of transformations to the graph of  $f(x) = x^2$ . The graph of this function is a parabola. The vertex for this parabola is  $(0, 0)$ . In **Figure 2.3(a)**, the graph of  $f(x) = ax^2$  for  $a > 0$  is shown in black; it opens *upward*. In **Figure 2.3(b)**, the graph of  $f(x) = ax^2$  for  $a < 0$  is shown in black; it opens *downward*.

**FIGURE 2.3(a)**  $a > 0$ : Parabola opens upward.

**FIGURE 2.3(b)**  $a < 0$ : Parabola opens downward.

**Figure 2.3(a)** and **2.3(b)** also show the graph of  $g(x) = a(x - h)^2 + k$  in blue. Compare these graphs to those of  $f(x) = ax^2$ . Observe that  $h$  determines a horizontal shift and  $k$  determines a vertical shift of the graph of  $f(x) = ax^2$ :

$$g(x) = a(x - h)^2 + k.$$

If  $h > 0$ , the graph of  $f(x) = ax^2$  is shifted  $h$  units to the right.

If  $k > 0$ , the graph of  $y = a(x - h)^2$  is shifted  $k$  units up.

Consequently, the vertex  $(0, 0)$  on the black graph of  $f(x) = ax^2$  moves to the point  $(h, k)$  on the blue graph of  $g(x) = a(x - h)^2 + k$ . The axis of symmetry is the vertical line whose equation is  $x = h$ .

The form of the expression for  $g$  is convenient because it immediately identifies the vertex of the parabola as  $(h, k)$ . This is the **standard form** of a quadratic function.

### The Standard Form of a Quadratic Function

The quadratic function

$$f(x) = a(x - h)^2 + k, \quad a \neq 0$$

is in **standard form**. The graph of  $f$  is a parabola whose vertex is the point  $(h, k)$ . The parabola is symmetric with respect to the line  $x = h$ . If  $a > 0$ , the parabola opens upward; if  $a < 0$ , the parabola opens downward.

The sign of  $a$  in  $f(x) = a(x - h)^2 + k$  determines whether the parabola opens upward or downward. Furthermore, if  $|a|$  is small, the parabola opens more flatly than if  $|a|$  is large. Here is a general procedure for graphing parabolas whose equations are in standard form:

### Graphing Quadratic Functions with Equations in Standard Form

To graph  $f(x) = a(x - h)^2 + k$ ,

1. Determine whether the parabola opens upward or downward. If  $a > 0$ , it opens upward. If  $a < 0$ , it opens downward.
2. Determine the vertex of the parabola. The vertex is  $(h, k)$ .
3. Find any  $x$ -intercepts by solving  $f(x) = 0$ . The function's real zeros are the  $x$ -intercepts.
4. Find the  $y$ -intercept by computing  $f(0)$ .
5. Plot the intercepts, the vertex, and additional points as necessary. Connect these points with a smooth curve that is shaped like a bowl or an inverted bowl.

In the graphs that follow, we will show each axis of symmetry as a dashed vertical line. Because this vertical line passes through the vertex,  $(h, k)$ , its equation is  $x = h$ . The line is dashed because it is not part of the parabola.

### EXAMPLE 1 Graphing a Quadratic Function in Standard Form

Graph the quadratic function  $f(x) = -2(x - 3)^2 + 8$ .

#### SOLUTION

We can graph this function by following the steps in the preceding box. We begin by identifying values for  $a$ ,  $h$ , and  $k$ .

$$\begin{array}{l} \text{Standard form} \quad f(x) = a(x - h)^2 + k \\ \qquad \qquad \qquad a = -2 \quad h = 3 \quad k = 8 \\ \text{Given function} \quad f(x) = -2(x - 3)^2 + 8 \end{array}$$

**Step 1 Determine how the parabola opens.** Note that  $a$ , the coefficient of  $x^2$ , is  $-2$ . Thus,  $a < 0$ ; this negative value tells us that the parabola opens downward.

**Step 2 Find the vertex.** The vertex of the parabola is at  $(h, k)$ . Because  $h = 3$  and  $k = 8$ , the parabola has its vertex at  $(3, 8)$ .

**Step 3 Find the  $x$ -intercepts by solving  $f(x) = 0$ .** Replace  $f(x)$  with 0 in  $f(x) = -2(x - 3)^2 + 8$ .

$$0 = -2(x - 3)^2 + 8$$

$$2(x - 3)^2 = 8$$

$$(x - 3)^2 = 4$$

$$x - 3 = \sqrt{4} \quad \text{or} \quad x - 3 = -\sqrt{4}$$

$$x - 3 = 2 \qquad \qquad x - 3 = -2$$

$$x = 5 \qquad \qquad \qquad x = 1$$

Find  $x$ -intercepts, setting  $f(x)$  equal to 0. Solve for  $x$ . Add  $2(x - 3)^2$  to both sides of the equation.

Divide both sides by 2.

Apply the square root property.

$$\sqrt{4} = 2$$

Add 3 to both sides in each equation.

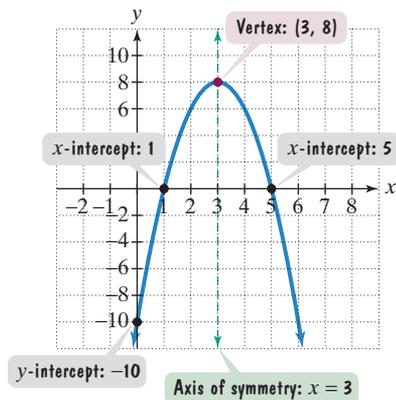

The  $x$ -intercepts are 1 and 5. The parabola passes through  $(1, 0)$  and  $(5, 0)$ .

**Step 4 Find the  $y$ -intercept by computing  $f(0)$ .** Replace  $x$  with 0 in  $f(x) = -2(x - 3)^2 + 8$ .

$$f(0) = -2(0 - 3)^2 + 8 = -2(-3)^2 + 8 = -2(9) + 8 = -10$$

The  $y$ -intercept is  $-10$ . The parabola passes through  $(0, -10)$ .

**Step 5 Graph the parabola.** With a vertex at  $(3, 8)$ ,  $x$ -intercepts at 5 and 1, and a  $y$ -intercept at  $-10$ , the graph of  $f$  is shown in **Figure 2.4**. The axis of symmetry is the vertical line whose equation is  $x = 3$ .

**FIGURE 2.4** The graph of  $f(x) = -2(x - 3)^2 + 8$

 **Check Point 1** Graph the quadratic function  $f(x) = -(x - 1)^2 + 4$ .

### EXAMPLE 2 Graphing a Quadratic Function in Standard Form

Graph the quadratic function  $f(x) = (x + 3)^2 + 1$ .

#### SOLUTION

We begin by finding values for  $a$ ,  $h$ , and  $k$ .

$$f(x) = a(x - h)^2 + k \quad \text{Standard form of quadratic function}$$

$$f(x) = (x + 3)^2 + 1 \quad \text{Given function}$$

$$f(x) = 1(x - (-3))^2 + 1$$

$$a = 1$$

$$h = -3$$

$$k = 1$$

**Step 1 Determine how the parabola opens.** Note that  $a$ , the coefficient of  $x^2$ , is 1. Thus,  $a > 0$ ; this positive value tells us that the parabola opens upward.

**Step 2 Find the vertex.** The vertex of the parabola is at  $(h, k)$ . Because  $h = -3$  and  $k = 1$ , the parabola has its vertex at  $(-3, 1)$ .

**Step 3 Find the  $x$ -intercepts by solving  $f(x) = 0$ .** Replace  $f(x)$  with 0 in  $f(x) = (x + 3)^2 + 1$ . Because the vertex is at  $(-3, 1)$ , which lies above the  $x$ -axis, and the parabola opens upward, it appears that this parabola has no  $x$ -intercepts. We can verify this observation algebraically.

$$0 = (x + 3)^2 + 1$$

$$-1 = (x + 3)^2$$

$$x + 3 = \sqrt{-1} \quad \text{or} \quad x + 3 = -\sqrt{-1}$$

$$x + 3 = i \quad \quad \quad x + 3 = -i$$

$$x = -3 + i \quad \quad \quad x = -3 - i$$

Find possible  $x$ -intercepts, setting  $f(x)$  equal to 0.

Solve for  $x$ . Subtract 1 from both sides.

Apply the square root property.

$$\sqrt{-1} = i$$

The solutions are  $-3 \pm i$ .

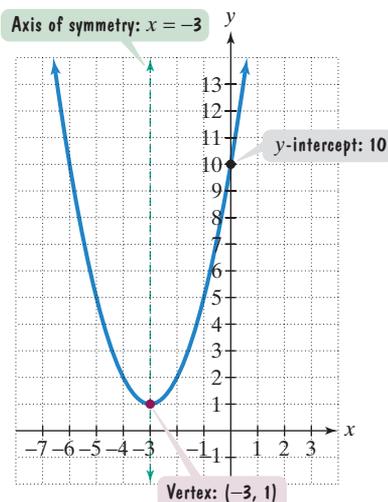

Because this equation has no real solutions, the parabola has no  $x$ -intercepts.

**Step 4 Find the  $y$ -intercept by computing  $f(0)$ .** Replace  $x$  with 0 in  $f(x) = (x + 3)^2 + 1$ .

$$f(0) = (0 + 3)^2 + 1 = 3^2 + 1 = 9 + 1 = 10$$

The  $y$ -intercept is 10. The parabola passes through  $(0, 10)$ .

**Step 5 Graph the parabola.** With a vertex at  $(-3, 1)$ , no  $x$ -intercepts, and a  $y$ -intercept at 10, the graph of  $f$  is shown in **Figure 2.5**. The axis of symmetry is the vertical line whose equation is  $x = -3$ . ●●●

**FIGURE 2.5** The graph of  $f(x) = (x + 3)^2 + 1$

### GREAT QUESTION!

**I'm confused about finding  $h$  from the equation  $f(x) = a(x - h)^2 + k$ . Can you help me out?**

It's easy to make a sign error when finding  $h$ , the  $x$ -coordinate of the vertex. In

$$f(x) = a(x - h)^2 + k,$$

$h$  is the number that follows the subtraction sign.

$$\bullet f(x) = -2(x - 3)^2 + 8$$

The number after the subtraction is 3:  $h = 3$ .

$$\bullet f(x) = (x + 3)^2 + 1 = (x - (-3))^2 + 1$$

The number after the subtraction is  $-3$ :  $h = -3$ .

## Graphing Quadratic Functions with Equations in the Form

$$f(x) = ax^2 + bx + c$$

To graph  $f(x) = ax^2 + bx + c$ ,

1. Determine whether the parabola opens upward or downward. If  $a > 0$ , it opens upward. If  $a < 0$ , it opens downward.
2. Determine the vertex of the parabola. The vertex is  $\left(-\frac{b}{2a}, f\left(-\frac{b}{2a}\right)\right)$ .
3. Find any  $x$ -intercepts by solving  $f(x) = 0$ . The real solutions of  $ax^2 + bx + c = 0$  are the  $x$ -intercepts.
4. Find the  $y$ -intercept by computing  $f(0)$ . Because  $f(0) = c$  (the constant term in the function's equation), the  $y$ -intercept is  $c$  and the parabola passes through  $(0, c)$ .
5. Plot the intercepts, the vertex, and additional points as necessary. Connect these points with a smooth curve.

**EXAMPLE 3** Graphing a Quadratic Function in the Form

$$f(x) = ax^2 + bx + c$$

Graph the quadratic function  $f(x) = -x^2 - 2x + 1$ . Use the graph to identify the function's domain and its range.

**SOLUTION**

**Step 1 Determine how the parabola opens.** Note that  $a$ , the coefficient of  $x^2$ , is  $-1$ . Thus,  $a < 0$ ; this negative value tells us that the parabola opens downward.

**Step 2 Find the vertex.** We know that the  $x$ -coordinate of the vertex is  $x = -\frac{b}{2a}$ . We identify  $a$ ,  $b$ , and  $c$  in  $f(x) = ax^2 + bx + c$ .

$$f(x) = -x^2 - 2x + 1$$

$a = -1$ 
 $b = -2$ 
 $c = 1$

Substitute the values of  $a$  and  $b$  into the equation for the  $x$ -coordinate:

$$x = -\frac{b}{2a} = -\frac{-2}{2(-1)} = -\left(\frac{-2}{-2}\right) = -1.$$

The  $x$ -coordinate of the vertex is  $-1$ . We substitute  $-1$  for  $x$  in the equation of the function,  $f(x) = -x^2 - 2x + 1$ , to find the  $y$ -coordinate:

$$f(-1) = -(-1)^2 - 2(-1) + 1 = -1 + 2 + 1 = 2.$$

The vertex is at  $(-1, 2)$ .

**Step 3 Find the  $x$ -intercepts by solving  $f(x) = 0$ .** Replace  $f(x)$  with  $0$  in  $f(x) = -x^2 - 2x + 1$ . We obtain  $0 = -x^2 - 2x + 1$ . This equation cannot be solved by factoring. We will use the quadratic formula to solve it.

$$-x^2 - 2x + 1 = 0$$

$a = -1$ 
 $b = -2$ 
 $c = 1$

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} = \frac{-(-2) \pm \sqrt{(-2)^2 - 4(-1)(1)}}{2(-1)} = \frac{2 \pm \sqrt{4 - (-4)}}{-2}$$

To locate the  $x$ -intercepts, we need decimal approximations. Thus, there is no need to simplify the radical form of the solutions.

$$x = \frac{2 + \sqrt{8}}{-2} \approx -2.4 \quad \text{or} \quad x = \frac{2 - \sqrt{8}}{-2} \approx 0.4$$

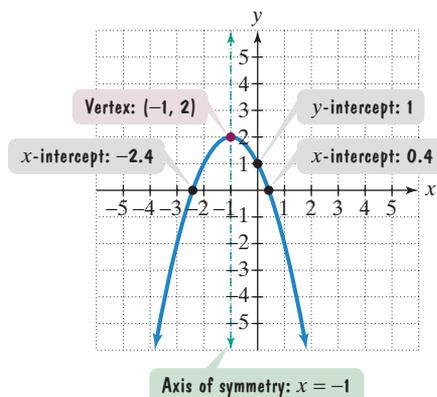

The  $x$ -intercepts are approximately  $-2.4$  and  $0.4$ . The parabola passes through  $(-2.4, 0)$  and  $(0.4, 0)$ .

**Step 4 Find the y-intercept by computing  $f(0)$ .** Replace  $x$  with 0 in  $f(x) = -x^2 - 2x + 1$ .

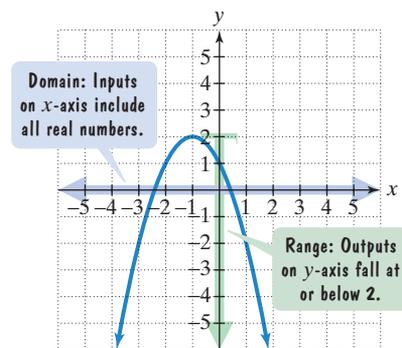

$$f(0) = -0^2 - 2 \cdot 0 + 1 = 1$$

The y-intercept is 1, which is the constant term in the function's equation. The parabola passes through  $(0, 1)$ .

**Step 5 Graph the parabola.** With a vertex at  $(-1, 2)$ , x-intercepts at approximately  $-2.4$  and  $0.4$ , and a y-intercept at 1, the graph of  $f$  is shown in **Figure 2.6(a)**. The axis of symmetry is the vertical line whose equation is  $x = -1$ .

**FIGURE 2.6(a)** The graph of  $f(x) = -x^2 - 2x + 1$

**FIGURE 2.6(b)** Determining the domain and range of  $f(x) = -x^2 - 2x + 1$

## GREAT QUESTION!

### Are there rules to find domains and ranges of quadratic functions?

Yes. The domain of any quadratic function includes all real numbers. If the vertex is the graph's highest point, the range includes all real numbers at or below the y-coordinate of the vertex. If the vertex is the graph's lowest point, the range includes all real numbers at or above the y-coordinate of the vertex.

Now we are ready to determine the domain and range of  $f(x) = -x^2 - 2x + 1$ . We can use the parabola, shown again in **Figure 2.6(b)**, to do so. To find the domain, look for all the inputs on the  $x$ -axis that correspond to points on the graph. As the graph widens and continues to fall at both ends, can you see that these inputs include all real numbers?

Domain of  $f$  is  $\{x \mid x \text{ is a real number}\}$  or  $(-\infty, \infty)$ .

To find the range, look for all the outputs on the  $y$ -axis that correspond to points on the graph. **Figure 2.6(b)** shows that the parabola's vertex,  $(-1, 2)$ , is the highest point on the graph. Because the  $y$ -coordinate of the vertex is 2, outputs on the  $y$ -axis fall at or below 2.

Range of  $f$  is  $\{y \mid y \leq 2\}$  or  $(-\infty, 2]$ . ...

**Check Point 3** Graph the quadratic function  $f(x) = -x^2 + 4x + 1$ . Use the graph to identify the function's domain and its range.

- 3** Determine a quadratic function's minimum or maximum value.

## Minimum and Maximum Values of Quadratic Functions

Consider the quadratic function  $f(x) = ax^2 + bx + c$ . If  $a > 0$ , the parabola opens upward and the vertex is its lowest point. If  $a < 0$ , the parabola opens downward and the vertex is its highest point. The  $x$ -coordinate of the vertex is  $-\frac{b}{2a}$ . Thus, we can find the minimum or maximum value of  $f$  by evaluating the quadratic function at  $x = -\frac{b}{2a}$ .

### Minimum and Maximum: Quadratic Functions

Consider the quadratic function  $f(x) = ax^2 + bx + c$ .

1. If  $a > 0$ , then  $f$  has a minimum that occurs at  $x = -\frac{b}{2a}$ . This minimum value is  $f\left(-\frac{b}{2a}\right)$ .
2. If  $a < 0$ , then  $f$  has a maximum that occurs at  $x = -\frac{b}{2a}$ . This maximum value is  $f\left(-\frac{b}{2a}\right)$ .

In each case, the value of  $x$  gives the location of the minimum or maximum value. The value of  $y$ , or  $f\left(-\frac{b}{2a}\right)$ , gives that minimum or maximum value.

### EXAMPLE 4 Obtaining Information about a Quadratic Function from Its Equation

Consider the quadratic function  $f(x) = -3x^2 + 6x - 13$ .

- a. Determine, without graphing, whether the function has a minimum value or a maximum value.
- b. Find the minimum or maximum value and determine where it occurs.
- c. Identify the function's domain and its range.

### SOLUTION

We begin by identifying  $a$ ,  $b$ , and  $c$  in the function's equation:

$$f(x) = -3x^2 + 6x - 13.$$

$$a = -3$$

$$b = 6$$

$$c = -13$$

- a. Because  $a < 0$ , the function has a maximum value.
- b. The maximum value occurs at

$$x = -\frac{b}{2a} = -\frac{6}{2(-3)} = -\frac{6}{-6} = -(-1) = 1.$$

The maximum value occurs at  $x = 1$  and the maximum value of  $f(x) = -3x^2 + 6x - 13$  is

$$f(1) = -3 \cdot 1^2 + 6 \cdot 1 - 13 = -3 + 6 - 13 = -10.$$

We see that the maximum is  $-10$  at  $x = 1$ .

- c. Like all quadratic functions, the domain is  $(-\infty, \infty)$ . Because the function's maximum value is  $-10$ , the range includes all real numbers at or below  $-10$ . The range is  $(-\infty, -10]$ . ...

We can use the graph of  $f(x) = -3x^2 + 6x - 13$  to visualize the results of Example 4. **Figure 2.7** shows the graph in a  $[-6, 6, 1]$  by  $[-50, 20, 10]$  viewing rectangle. The maximum function feature verifies that the function's maximum is  $-10$  at  $x = 1$ . Notice that  $x$  gives the location of the maximum and  $y$  gives the maximum value. Notice, too, that the maximum value is  $-10$  and not the ordered pair  $(1, -10)$ .

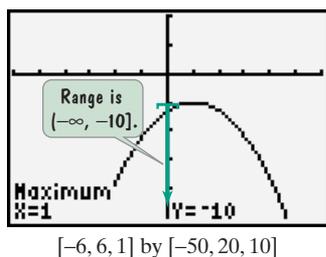

FIGURE 2.7

**Check Point 4** Repeat parts (a) through (c) of Example 4 using the quadratic function  $f(x) = 4x^2 - 16x + 1000$ .

- 4 Solve problems involving a quadratic function's minimum or maximum value.

### Applications of Quadratic Functions

Many applied problems involve finding the maximum or minimum value of a quadratic function, as well as where this value occurs.

#### EXAMPLE 5 The Parabolic Path of a Punted Football

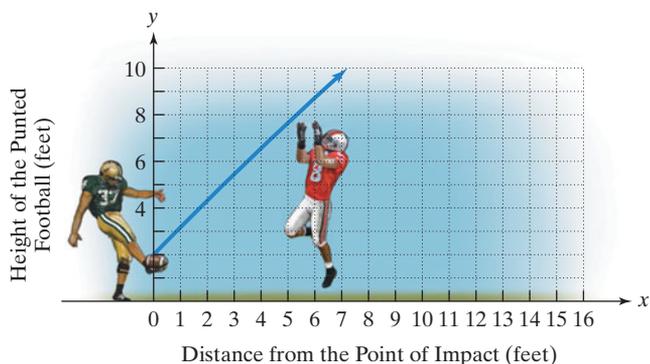

FIGURE 2.8

**Figure 2.8** shows that when a football is kicked, the nearest defensive player is 6 feet from the point of impact with the kicker's foot. The height of the punted football,  $f(x)$ , in feet, can be modeled by

$$f(x) = -0.01x^2 + 1.18x + 2,$$

where  $x$  is the ball's horizontal distance, in feet, from the point of impact with the kicker's foot.

- What is the maximum height of the punt and how far from the point of impact does this occur?
- How far must the nearest defensive player, who is 6 feet from the kicker's point of impact, reach to block the punt?
- If the ball is not blocked by the defensive player, how far down the field will it go before hitting the ground?
- Graph the function that models the football's parabolic path.

### SOLUTION

- a.** We begin by identifying the numbers  $a$ ,  $b$ , and  $c$  in the function's equation.

$$f(x) = -0.01x^2 + 1.18x + 2$$

$a = -0.01$ 
 $b = 1.18$ 
 $c = 2$

Because  $a < 0$ , the function has a maximum that occurs at  $x = -\frac{b}{2a}$ .

$$x = -\frac{b}{2a} = -\frac{1.18}{2(-0.01)} = -(-59) = 59$$

This means that the maximum height of the punt occurs 59 feet from the kicker's point of impact. The maximum height of the punt is

$$f(59) = -0.01(59)^2 + 1.18(59) + 2 = 36.81,$$

or 36.81 feet.

- b.** **Figure 2.8** shows that the defensive player is 6 feet from the kicker's point of impact. To block the punt, he must touch the football along its parabolic path. This means that we must find the height of the ball 6 feet from the kicker. Replace  $x$  with 6 in the given function,  $f(x) = -0.01x^2 + 1.18x + 2$ .

$$f(6) = -0.01(6)^2 + 1.18(6) + 2 = -0.36 + 7.08 + 2 = 8.72$$

The defensive player must reach 8.72 feet above the ground to block the punt.

- c.** Assuming that the ball is not blocked by the defensive player, we are interested in how far down the field it will go before hitting the ground. We are looking for the ball's horizontal distance,  $x$ , when its height above the ground,  $f(x)$ , is 0 feet. To find this  $x$ -intercept, replace  $f(x)$  with 0 in  $f(x) = -0.01x^2 + 1.18x + 2$ . We obtain  $0 = -0.01x^2 + 1.18x + 2$ , or  $-0.01x^2 + 1.18x + 2 = 0$ . The equation cannot be solved by factoring. We will use the quadratic formula to solve it.

$$-0.01x^2 + 1.18x + 2 = 0$$

$$a = -0.01$$

$$b = 1.18$$

$$c = 2$$

The equation for determining the ball's maximum horizontal distance

Use a calculator to evaluate the radicand.

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} = \frac{-1.18 \pm \sqrt{(1.18)^2 - 4(-0.01)(2)}}{2(-0.01)} = \frac{-1.18 \pm \sqrt{1.4724}}{-0.02}$$

$$x = \frac{-1.18 + \sqrt{1.4724}}{-0.02} \quad \text{or} \quad x = \frac{-1.18 - \sqrt{1.4724}}{-0.02}$$

$$x \approx -1.7$$

$$x \approx 119.7$$

Use a calculator and round to the nearest tenth.

Reject this value. We are interested in the football's height corresponding to horizontal distances from its point of impact onward, or  $x \geq 0$ .

If the football is not blocked by the defensive player, it will go approximately 119.7 feet down the field before hitting the ground.

- d. In terms of graphing the model for the football's parabolic path,  $f(x) = -0.01x^2 + 1.18x + 2$ , we have already determined the vertex and the approximate  $x$ -intercept.

vertex: (59, 36.81)

The ball's maximum height, 36.81 feet, occurs at a horizontal distance of 59 feet.

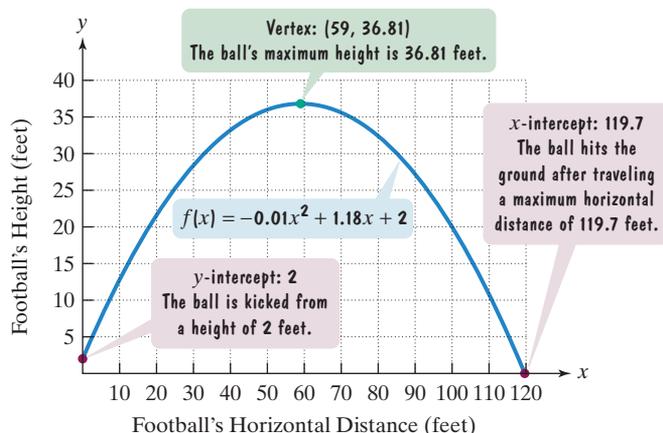

$x$ -intercept: 119.7

The ball's maximum horizontal distance is approximately 119.7 feet.

**Figure 2.8** indicates that the  $y$ -intercept is 2, meaning that the ball is kicked from a height of 2 feet. Let's verify this value by replacing  $x$  with 0 in  $f(x) = -0.01x^2 + 1.18x + 2$ .

$$f(0) = -0.01 \cdot 0^2 + 1.18 \cdot 0 + 2 = 0 + 0 + 2 = 2$$

Using the vertex, (59, 36.81), the  $x$ -intercept, 119.7, and the  $y$ -intercept, 2, the graph of the equation that models the football's parabolic path is shown in **Figure 2.9**. The graph is shown only for  $x \geq 0$ , indicating horizontal distances that begin at the football's impact with the kicker's foot and end with the ball hitting the ground.

**FIGURE 2.9** The parabolic path of a punted football

 **Check Point 5** An archer's arrow follows a parabolic path. The height of the arrow,  $f(x)$ , in feet, can be modeled by

$$f(x) = -0.005x^2 + 2x + 5,$$

where  $x$  is the arrow's horizontal distance, in feet.

- What is the maximum height of the arrow and how far from its release does this occur?
- Find the horizontal distance the arrow travels before it hits the ground. Round to the nearest foot.
- Graph the function that models the arrow's parabolic path.

Quadratic functions can also be used to model verbal conditions. Once we have obtained a quadratic function, we can then use the  $x$ -coordinate of the vertex to determine its maximum or minimum value. Here is a step-by-step strategy for solving these kinds of problems:

### Strategy for Solving Problems Involving Maximizing or Minimizing Quadratic Functions

- Read the problem carefully and decide which quantity is to be maximized or minimized.
- Use the conditions of the problem to express the quantity as a function in one variable.
- Rewrite the function in the form  $f(x) = ax^2 + bx + c$ .
- Calculate  $-\frac{b}{2a}$ . If  $a > 0$ ,  $f$  has a minimum at  $x = -\frac{b}{2a}$ . This minimum value is  $f\left(-\frac{b}{2a}\right)$ . If  $a < 0$ ,  $f$  has a maximum at  $x = -\frac{b}{2a}$ . This maximum value is  $f\left(-\frac{b}{2a}\right)$ .
- Answer the question posed in the problem.

### EXAMPLE 6 Minimizing a Product

Among all pairs of numbers whose difference is 10, find a pair whose product is as small as possible. What is the minimum product?

#### SOLUTION

**Step 1 Decide what must be maximized or minimized.** We must minimize the product of two numbers. Calling the numbers  $x$  and  $y$ , and calling the product  $P$ , we must minimize

$$P = xy.$$

**Step 2 Express this quantity as a function in one variable.** In the formula  $P = xy$ ,  $P$  is expressed in terms of two variables,  $x$  and  $y$ . However, because the difference of the numbers is 10, we can write

$$x - y = 10.$$

We can solve this equation for  $y$  in terms of  $x$  (or vice versa), substitute the result into  $P = xy$ , and obtain  $P$  as a function of one variable.

$$-y = -x + 10 \quad \text{Subtract } x \text{ from both sides of } x - y = 10.$$

$$y = x - 10 \quad \text{Multiply both sides of the equation by } -1 \text{ and solve for } y.$$

Now we substitute  $x - 10$  for  $y$  in  $P = xy$ .

$$P = xy = x(x - 10)$$

Because  $P$  is now a function of  $x$ , we can write

$$P(x) = x(x - 10)$$

**Step 3** Write the function in the form  $f(x) = ax^2 + bx + c$ . We apply the distributive property to obtain

$$P(x) = x(x - 10) = x^2 - 10x.$$

$$a = 1$$

$$b = -10$$

## TECHNOLOGY

### Numeric Connections

The **TABLE** feature of a graphing utility can be used to verify our work in Example 6.

Enter  $y_1 = x^2 - 10x$ , the function for the product, when one of the numbers is  $x$ .

X	Y1
-2	-16
-1	-11
0	-0
1	-9
2	-16
3	-21
4	-24
5	-25
6	-24
7	-21
8	-16

The product is a minimum,  $-25$ , when one of the numbers is 5.

**Step 4** Calculate  $-\frac{b}{2a}$ . If  $a > 0$ , the function has a minimum at this value. The voice balloons show that  $a = 1$  and  $b = -10$ .

$$x = -\frac{b}{2a} = -\frac{-10}{2(1)} = -(-5) = 5$$

This means that the product,  $P$ , of two numbers whose difference is 10 is a minimum when one of the numbers,  $x$ , is 5.

**Step 5** Answer the question posed by the problem. The problem asks for the two numbers and the minimum product. We found that one of the numbers,  $x$ , is 5. Now we must find the second number,  $y$ .

$$y = x - 10 = 5 - 10 = -5$$

The number pair whose difference is 10 and whose product is as small as possible is 5,  $-5$ . The minimum product is  $5(-5)$ , or  $-25$ .

 **Check Point 6** Among all pairs of numbers whose difference is 8, find a pair whose product is as small as possible. What is the minimum product?

### EXAMPLE 7 Maximizing Area

You have 100 yards of fencing to enclose a rectangular region. Find the dimensions of the rectangle that maximize the enclosed area. What is the maximum area?

#### SOLUTION

**Step 1** Decide what must be maximized or minimized. We must maximize area. What we do not know are the rectangle's dimensions,  $x$  and  $y$ .

**Step 2** Express this quantity as a function in one variable. Because we must maximize the area of a rectangle, we have  $A = xy$ . We need to transform this into a function in which  $A$  is represented by one variable. Because you have 100 yards of fencing, the perimeter of the rectangle is 100 yards. This means that

$$2x + 2y = 100.$$

We can solve this equation for  $y$  in terms of  $x$ , substitute the result into  $A = xy$ , and obtain  $A$  as a function in one variable. We begin by solving for  $y$ .

$$2y = 100 - 2x \quad \text{Subtract } 2x \text{ from both sides of } 2x + 2y = 100.$$

$$y = \frac{100 - 2x}{2} \quad \text{Divide both sides by 2.}$$

$$y = 50 - x \quad \text{Divide each term in the numerator by 2.}$$

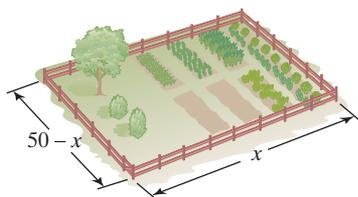

Now we substitute  $50 - x$  for  $y$  in  $A = xy$ .

$$A = xy = x(50 - x)$$

The rectangle and its dimensions are illustrated in **Figure 2.10**. Because  $A$  is now a function of  $x$ , we can write

$$A(x) = x(50 - x).$$

This function models the area,  $A(x)$ , of any rectangle whose perimeter is 100 yards in terms of one of its dimensions,  $x$ .

**FIGURE 2.10** What value of  $x$  will maximize the rectangle's area?

**Step 3** Write the function in the form  $f(x) = ax^2 + bx + c$ . We apply the distributive property to obtain

$$A(x) = x(50 - x) = 50x - x^2 = -x^2 + 50x.$$

$$a = -1$$

$$b = 50$$

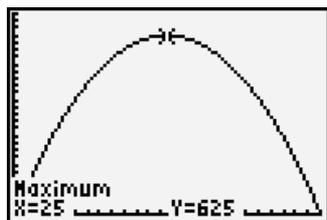

## TECHNOLOGY

### Graphic Connections

The graph of the area function

$$A(x) = x(50 - x)$$

was obtained with a graphing utility using a  $[0, 50, 2]$  by  $[0, 700, 25]$  viewing rectangle. The maximum function feature verifies that a maximum area of 625 square yards occurs when one of the dimensions is 25 yards.

**Step 4** Calculate  $-\frac{b}{2a}$ . If  $a < 0$ , the function has a maximum at this value. The voice balloons show that  $a = -1$  and  $b = 50$ .

$$x = -\frac{b}{2a} = -\frac{50}{2(-1)} = 25$$

This means that the area,  $A(x)$ , of a rectangle with perimeter 100 yards is a maximum when one of the rectangle's dimensions,  $x$ , is 25 yards.

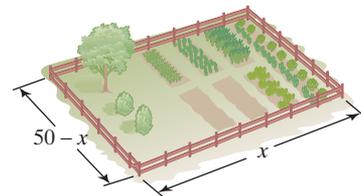

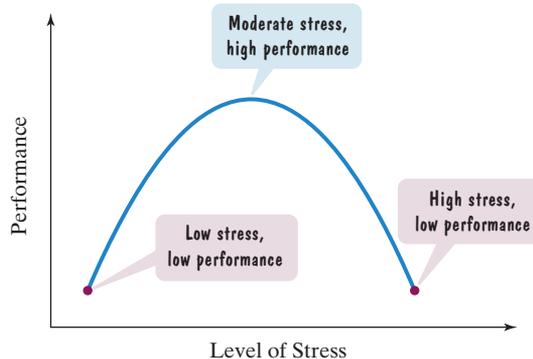

FIGURE 2.10 (repeated)

**Step 5** Answer the question posed by the problem. We found that  $x = 25$ . Figure 2.10 shows that the rectangle's other dimension is  $50 - x = 50 - 25 = 25$ . The dimensions of the rectangle that maximize the enclosed area are 25 yards by 25 yards. The rectangle that gives the maximum area is actually a square with an area of 25 yards  $\cdot$  25 yards, or 625 square yards. ●●●

**Check Point 7** You have 120 feet of fencing to enclose a rectangular region. Find the dimensions of the rectangle that maximize the enclosed area. What is the maximum area?

The ability to express a quantity to be maximized or minimized as a function in one variable plays a critical role in solving max-min problems. In calculus, you will learn a technique for maximizing or minimizing all functions, not only quadratic functions.

## Blitzer Bonus || Addressing Stress Parabolically

Stress levels can help or hinder performance. The parabola in Figure 2.11 serves as a model that shows people under both low stress and high stress perform worse than their moderate-stress counterparts.

FIGURE 2.11

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- The quadratic function  $f(x) = a(x - h)^2 + k$ ,  $a \neq 0$ , is in \_\_\_\_\_ form. The graph of  $f$  is called a/an \_\_\_\_\_ whose vertex is the point \_\_\_\_\_. The graph opens upward if  $a$  \_\_\_\_\_ and opens downward if  $a$  \_\_\_\_\_.
- Consider the quadratic function  $f(x) = ax^2 + bx + c$ ,  $a \neq 0$ . If  $a > 0$ , then  $f$  has a minimum that occurs at  $x =$  \_\_\_\_\_. This minimum

value is \_\_\_\_\_. If  $a < 0$ , then  $f$  has a maximum that occurs at  $x =$  \_\_\_\_\_. This maximum value is \_\_\_\_\_.

- True or false: The graph of  $f(x) = (x - 2)^2 + 1$  opens upward. \_\_\_\_\_
- True or false: The graph of  $f(x) = (x + 5)^2 + 3$  has its vertex at  $(5, 3)$ . \_\_\_\_\_

- True or false: The  $y$ -coordinate of the vertex of  $f(x) = 4x^2 - 16x + 300$  is  $f(2)$ .
- The difference between two numbers is 8. If one number is represented by  $x$ , the other number can be expressed as \_\_\_\_\_. The product of the numbers,  $P(x)$ , expressed in the form  $P(x) = ax^2 + bx + c$ , is  $P(x) =$  \_\_\_\_\_.
- The perimeter of a rectangle is 80 feet. If the length of the rectangle is represented by  $x$ , its width can be expressed as \_\_\_\_\_. The area of the rectangle,  $A(x)$ , expressed in the form  $A(x) = ax^2 + bx + c$ , is  $A(x) =$  \_\_\_\_\_.

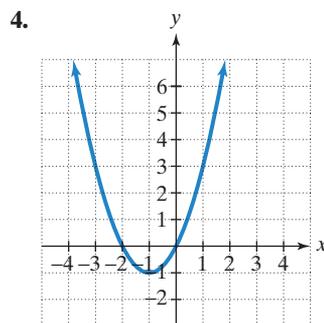

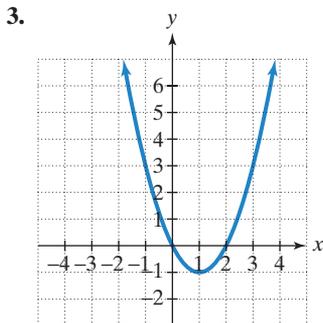

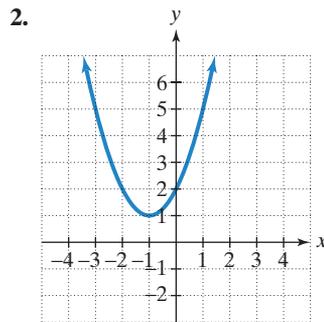

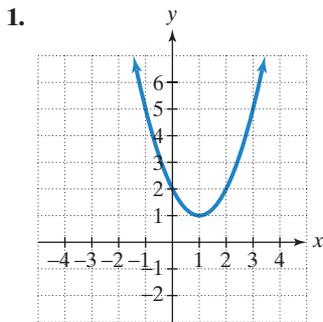

### EXERCISE SET 2.2

#### Practice Exercises

In Exercises 1–4, the graph of a quadratic function is given. Write the function's equation, selecting from the following options.

$$f(x) = (x + 1)^2 - 1 \qquad g(x) = (x + 1)^2 + 1$$

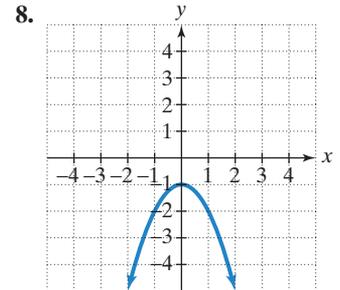

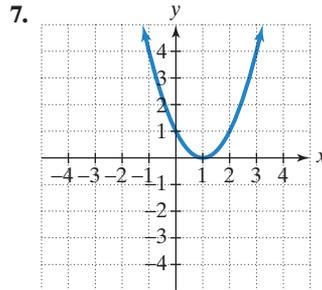

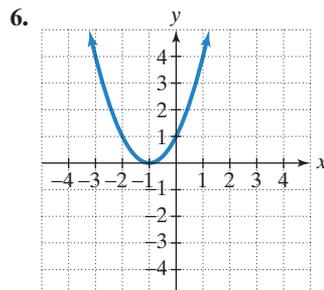

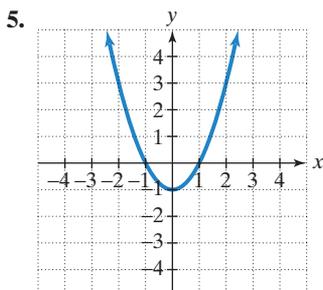

$$h(x) = (x - 1)^2 + 1 \qquad j(x) = (x - 1)^2 - 1$$

In Exercises 5–8, the graph of a quadratic function is given. Write the function's equation, selecting from the following options.

$$f(x) = x^2 + 2x + 1 \qquad g(x) = x^2 - 2x + 1$$

$$h(x) = x^2 - 1 \qquad j(x) = -x^2 - 1$$

In Exercises 9–16, find the coordinates of the vertex for the parabola defined by the given quadratic function.

- $f(x) = 2(x - 3)^2 + 1$
- $f(x) = -3(x - 2)^2 + 12$
- $f(x) = -2(x + 1)^2 + 5$
- $f(x) = -2(x + 4)^2 - 8$
- $f(x) = 2x^2 - 8x + 3$
- $f(x) = 3x^2 - 12x + 1$
- $f(x) = -x^2 - 2x + 8$
- $f(x) = -2x^2 + 8x - 1$

In Exercises 17–38, use the vertex and intercepts to sketch the graph of each quadratic function. Give the equation of the parabola's axis of symmetry. Use the graph to determine the function's domain and range.

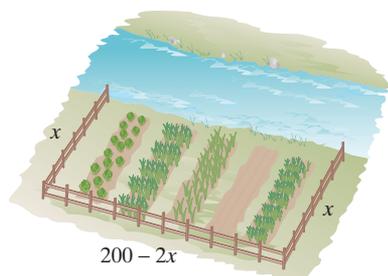

- $f(x) = (x - 4)^2 - 1$
- $f(x) = (x - 1)^2 - 2$
- $f(x) = (x - 1)^2 + 2$
- $f(x) = (x - 3)^2 + 2$
- $y - 1 = (x - 3)^2$
- $y - 3 = (x - 1)^2$
- $f(x) = 2(x + 2)^2 - 1$
- $f(x) = \frac{5}{4} - (x - \frac{1}{2})^2$
- $f(x) = 4 - (x - 1)^2$
- $f(x) = 1 - (x - 3)^2$
- $f(x) = x^2 - 2x - 3$
- $f(x) = x^2 - 2x - 15$
- $f(x) = x^2 + 3x - 10$
- $f(x) = 2x^2 - 7x - 4$
- $f(x) = 2x - x^2 + 3$
- $f(x) = 5 - 4x - x^2$
- $f(x) = x^2 + 6x + 3$
- $f(x) = x^2 + 4x - 1$
- $f(x) = 2x^2 + 4x - 3$
- $f(x) = 3x^2 - 2x - 4$
- $f(x) = 2x - x^2 - 2$
- $f(x) = 6 - 4x + x^2$

In Exercises 39–44, an equation of a quadratic function is given.

- Determine, without graphing, whether the function has a minimum value or a maximum value.
  - Find the minimum or maximum value and determine where it occurs.
  - Identify the function's domain and its range.
- $f(x) = 3x^2 - 12x - 1$
  - $f(x) = 2x^2 - 8x - 3$
  - $f(x) = -4x^2 + 8x - 3$
  - $f(x) = -2x^2 - 12x + 3$
  - $f(x) = 5x^2 - 5x$
  - $f(x) = 6x^2 - 6x$

66. You have 200 feet of fencing to enclose a rectangular plot that borders on a river. If you do not fence the side along the river, find the length and width of the plot that will maximize the area. What is the largest area that can be enclosed?

67. You have 50 yards of fencing to enclose a rectangular region. Find the dimensions of the rectangle that maximize the enclosed area. What is the maximum area?
68. You have 80 yards of fencing to enclose a rectangular region. Find the dimensions of the rectangle that maximize the enclosed area. What is the maximum area?
69. A rectangular playground is to be fenced off and divided in two by another fence parallel to one side of the playground. Six hundred feet of fencing is used. Find the dimensions of the playground that maximize the total enclosed area. What is the maximum area?
70. A rectangular playground is to be fenced off and divided in two by another fence parallel to one side of the playground. Four hundred feet of fencing is used. Find the dimensions of the playground that maximize the total enclosed area. What is the maximum area?
71. A rain gutter is made from sheets of aluminum that are 20 inches wide by turning up the edges to form right angles. Determine the depth of the gutter that will maximize its cross-sectional area and allow the greatest amount of water to flow. What is the maximum cross-sectional area?
72. A rain gutter is made from sheets of aluminum that are 12 inches wide by turning up the edges to form right angles. Determine the depth of the gutter that will maximize its cross-sectional area and allow the greatest amount of water to flow. What is the maximum cross-sectional area?
- If you have difficulty obtaining the functions to be maximized in Exercises 73–76, read Example 2 in Section 1.10 on pages 269–270.
73. On a certain route, an airline carries 8000 passengers per month, each paying \$50. A market survey indicates that for each \$1 increase in the ticket price, the airline will lose 100 passengers. Find the ticket price that will maximize the airline's monthly revenue for the route. What is the maximum monthly revenue?
74. A car rental agency can rent every one of its 200 cars at \$30 per day. For each \$1 increase in rate, five fewer cars are rented. Find the rental amount that will maximize the agency's daily revenue. What is the maximum daily revenue?
75. The annual yield per walnut tree is fairly constant at 60 pounds per tree when the number of trees per acre is 20 or fewer. For each additional tree over 20, the annual yield per tree for all trees on the acre decreases by 2 pounds due to overcrowding. How many walnut trees should be planted per acre to maximize the annual yield for the acre? What is the maximum number of pounds of walnuts per acre?
76. The annual yield per cherry tree is fairly constant at 50 pounds per tree when the number of trees per acre is 30 or fewer. For each additional tree over 30, the annual yield per tree for all trees on the acre decreases by 1 pound due to overcrowding. How many cherry trees should be planted per acre to maximize the annual yield for the acre? What is the maximum number of pounds of cherries per acre?

### Writing in Mathematics

77. What is a quadratic function?
78. What is a parabola? Describe its shape.
79. Explain how to decide whether a parabola opens upward or downward.
80. Describe how to find a parabola's vertex if its equation is expressed in standard form. Give an example.
81. Describe how to find a parabola's vertex if its equation is in the form  $f(x) = ax^2 + bx + c$ . Use  $f(x) = x^2 - 6x + 8$  as an example.
82. A parabola that opens upward has its vertex at  $(1, 2)$ . Describe as much as you can about the parabola based on this information. Include in your discussion the number of  $x$ -intercepts (if any) for the parabola.

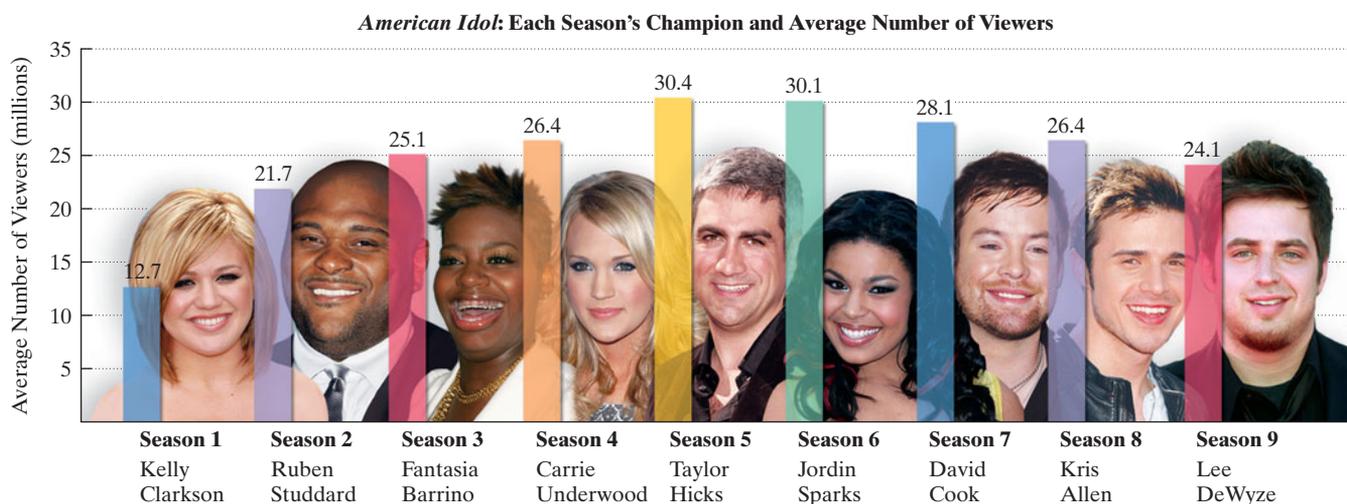

### Technology Exercises

83. Use a graphing utility to verify any five of your hand-drawn graphs in Exercises 17–38.
84. a. Use a graphing utility to graph  $y = 2x^2 - 82x + 720$  in a standard viewing rectangle. What do you observe?
- b. Find the coordinates of the vertex for the given quadratic function.
- c. The answer to part (b) is  $(20.5, -120.5)$ . Because the leading coefficient, 2, of the given function is positive, the vertex is a minimum point on the graph. Use this fact to help find a viewing rectangle that will give a relatively complete picture of the parabola. With an axis of symmetry at  $x = 20.5$ , the setting for  $x$  should extend past this, so try  $X_{\min} = 0$  and  $X_{\max} = 30$ . The setting for  $y$  should include (and probably go below) the  $y$ -coordinate of the graph's minimum  $y$ -value, so try  $Y_{\min} = -130$ . Experiment with  $Y_{\max}$  until your utility shows the parabola's major features.
- d. In general, explain how knowing the coordinates of a parabola's vertex can help determine a reasonable viewing rectangle on a graphing utility for obtaining a complete picture of the parabola.

*In Exercises 85–88, find the vertex for each parabola. Then determine a reasonable viewing rectangle on your graphing utility and use it to graph the quadratic function.*

85.  $y = -0.25x^2 + 40x$
86.  $y = -4x^2 + 20x + 160$
87.  $y = 5x^2 + 40x + 600$
88.  $y = 0.01x^2 + 0.6x + 100$

89. The bar graph shows the ratings of *American Idol* from season 1 (2002) through season 9 (2010).

Source: Nielsen

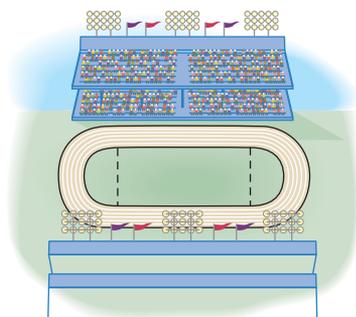

- Let  $x$  represent *American Idol*'s season number and let  $y$  represent the average number of viewers, in millions. Use a graphing utility to draw a scatter plot of the data. Explain why a quadratic function is appropriate for modeling these data.
- Use the quadratic regression feature to find the quadratic function that best fits the data. Round all numbers to two decimal places.
- Use the model in part (b) to determine the season in which *American Idol* had the greatest number of viewers. Round to the nearest whole number. According to the model, how many millions of viewers were there in that season? Round to one decimal place.
- How do the results obtained from the model in part (c) compare with the data displayed by the graph?
- Use a graphing utility to draw a scatter plot of the data and graph the quadratic function of best fit on the scatter plot. Can you see why projections based on the graph have the producers of *American Idol* looking for a shake-up?

### Critical Thinking Exercises

**Make Sense?** In Exercises 90–93, determine whether each statement makes sense or does not make sense, and explain your reasoning.

- I must have made an error when graphing this parabola because its axis of symmetry is the  $y$ -axis.
  - I like to think of a parabola's vertex as the point where it intersects its axis of symmetry.
  - I threw a baseball vertically upward and its path was a parabola.
  - Figure 2.8** on page 308 shows that a linear function provides a better description of the football's path than a quadratic function.
- In Exercises 94–97, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.
- No quadratic functions have a range of  $(-\infty, \infty)$ .
  - The vertex of the parabola described by  $f(x) = 2(x - 5)^2 - 1$  is at  $(5, 1)$ .
  - The graph of  $f(x) = -2(x + 4)^2 - 8$  has one  $y$ -intercept and two  $x$ -intercepts.
  - The maximum value of  $y$  for the quadratic function  $f(x) = -x^2 + x + 1$  is 1.
- In Exercises 98–99, find the axis of symmetry for each parabola whose equation is given. Use the axis of symmetry to find a second point on the parabola whose  $y$ -coordinate is the same as the given point.
- $f(x) = 3(x + 2)^2 - 5$ ;  $(-1, -2)$
  - $f(x) = (x - 3)^2 + 2$ ;  $(6, 11)$
- In Exercises 100–101, write the equation of each parabola in standard form.
- Vertex:  $(-3, -4)$ ; The graph passes through the point  $(1, 4)$ .
  - Vertex:  $(-3, -1)$ ; The graph passes through the point  $(-2, -3)$ .
  - Find the point on the line whose equation is  $2x + y - 2 = 0$  that is closest to the origin. *Hint:* Minimize the distance function by minimizing the expression under the square root.
  - A 300-room hotel can rent every one of its rooms at \$80 per room. For each \$1 increase in rent, three fewer rooms are rented. Each rented room costs the hotel \$10 to service per day. How much should the hotel charge for each room to maximize its daily profit? What is the maximum daily profit?

104. A track and field area is to be constructed in the shape of a rectangle with semicircles at each end. The inside perimeter of the track is to be 440 yards. Find the dimensions of the rectangle that maximize the area of the rectangular portion of the field.

### Group Exercise

105. Each group member should consult an almanac, newspaper, magazine, or the Internet to find data that initially increase and then decrease, or vice versa, and therefore can be modeled by a quadratic function. Group members should select the two sets of data that are most interesting and relevant. For each data set selected,
- Use the quadratic regression feature of a graphing utility to find the quadratic function that best fits the data.
  - Use the equation of the quadratic function to make a prediction from the data. What circumstances might affect the accuracy of your prediction?
  - Use the equation of the quadratic function to write and solve a problem involving maximizing or minimizing the function.

### Preview Exercises

Exercises 106–108 will help you prepare for the material covered in the next section.

106. Factor:  $x^3 + 3x^2 - x - 3$ .
107. If  $f(x) = x^3 - 2x - 5$ , find  $f(2)$  and  $f(3)$ . Then explain why the continuous graph of  $f$  must cross the  $x$ -axis between 2 and 3.
108. Determine whether  $f(x) = x^4 - 2x^2 + 1$  is even, odd, or neither. Describe the symmetry, if any, for the graph of  $f$ .

## SECTION 2.3

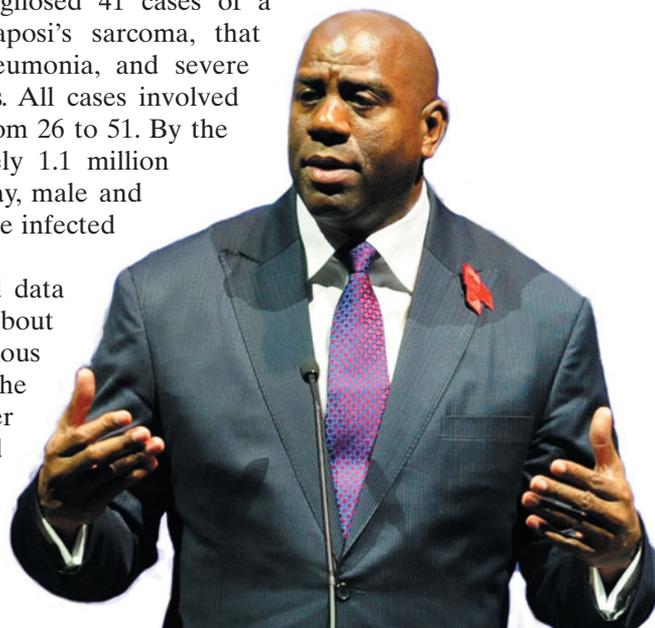

## Polynomial Functions and Their Graphs

### Objectives

- Identify polynomial functions.
- Recognize characteristics of graphs of polynomial functions.
- Determine end behavior.
- Use factoring to find zeros of polynomial functions.
- Identify zeros and their multiplicities.
- Use the Intermediate Value Theorem.
- Understand the relationship between degree and turning points.
- Graph polynomial functions.

In 1980, U.S. doctors diagnosed 41 cases of a rare form of cancer, Kaposi's sarcoma, that involved skin lesions, pneumonia, and severe immunological deficiencies. All cases involved gay men ranging in age from 26 to 51. By the end of 2008, approximately 1.1 million Americans, straight and gay, male and female, old and young, were infected with the HIV virus.

Modeling AIDS-related data and making predictions about the epidemic's havoc is serious business. **Figure 2.12** on the next page shows the number of AIDS cases diagnosed in the United States from 1983 through 2008.

Basketball player Magic Johnson (1959– ) tested positive for HIV in 1991.

AIDS Cases Diagnosed in the United States, 1983–2008

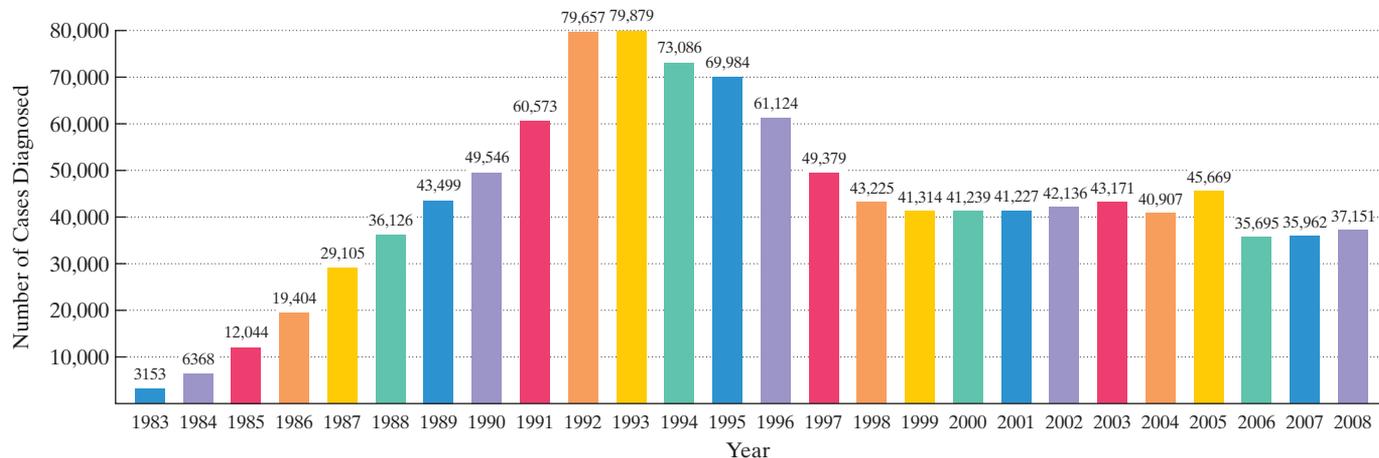

FIGURE 2.12

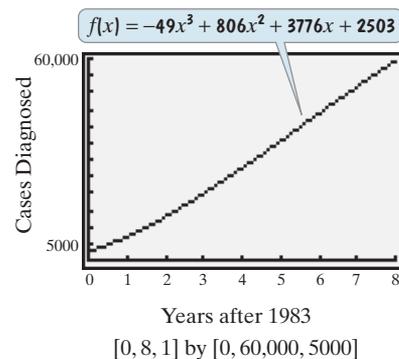

Source: Department of Health and Human Services

### 1 Identify polynomial functions.

Changing circumstances and unforeseen events can result in models for AIDS-related data that are not particularly useful over long periods of time. For example, the function

$$f(x) = -49x^3 + 806x^2 + 3776x + 2503$$

models the number of AIDS cases diagnosed in the United States  $x$  years after 1983. The model was obtained using a portion of the data shown in **Figure 2.12**, namely cases diagnosed from 1983 through 1991, inclusive. **Figure 2.13** shows the graph of  $f$  from 1983 through 1991. This function is an example of a *polynomial function of degree 3*.

**FIGURE 2.13** The graph of a function modeling the number of AIDS diagnoses from 1983 through 1991

### Definition of a Polynomial Function

Let  $n$  be a nonnegative integer and let  $a_n, a_{n-1}, \dots, a_2, a_1, a_0$  be real numbers, with  $a_n \neq 0$ . The function defined by

$$f(x) = a_n x^n + a_{n-1} x^{n-1} + \dots + a_2 x^2 + a_1 x + a_0$$

is called a **polynomial function of degree  $n$** . The number  $a_n$ , the coefficient of the variable to the highest power, is called the **leading coefficient**.

#### Polynomial Functions

$$f(x) = -3x^5 + \sqrt{2}x^2 + 5$$

Polynomial function of degree 5

$$\begin{aligned} g(x) &= -3x^4(x-2)(x+3) \\ &= -3x^4(x^2+x-6) \\ &= -3x^6 - 3x^5 + 18x^4 \end{aligned}$$

Polynomial function of degree 6

#### Not Polynomial Functions

$$\begin{aligned} F(x) &= -3\sqrt{x} + \sqrt{2}x^2 + 5 \\ &= -3x^{\frac{1}{2}} + \sqrt{2}x^2 + 5 \end{aligned}$$

The exponent on the variable is not an integer.

$$\begin{aligned} G(x) &= -\frac{3}{x^2} + \sqrt{2}x^2 + 5 \\ &= -3x^{-2} + \sqrt{2}x^2 + 5 \end{aligned}$$

The exponent on the variable is not a nonnegative integer.

- 2 Recognize characteristics of graphs of polynomial functions.

### Smooth, Continuous Graphs

Polynomial functions of degree 2 or higher have graphs that are *smooth* and *continuous*. By **smooth**, we mean that the graphs contain only rounded curves with no sharp corners. By **continuous**, we mean that the graphs have no breaks and can be drawn without lifting your pencil from the rectangular coordinate system. These ideas are illustrated in **Figure 2.14**.

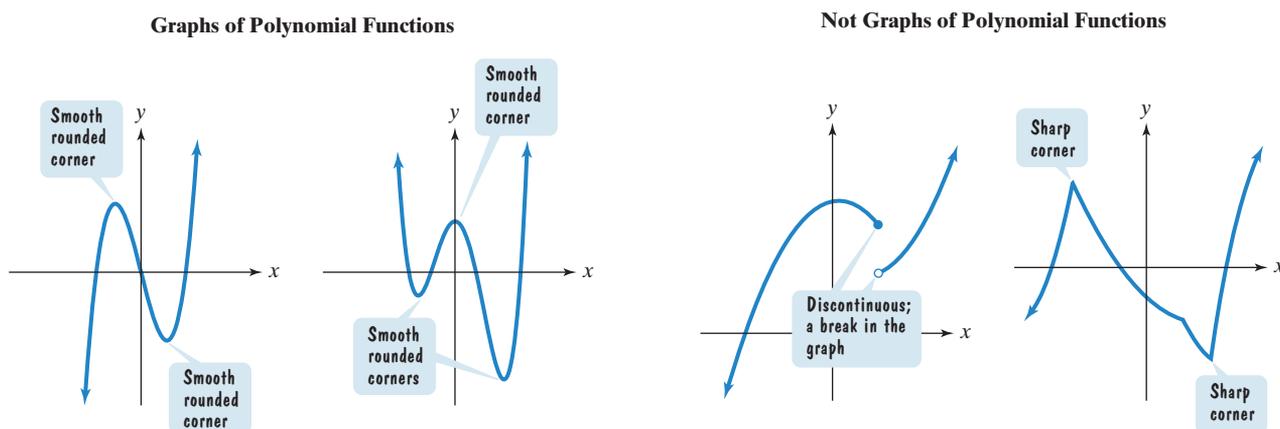

FIGURE 2.14 Recognizing graphs of polynomial functions

- 3 Determine end behavior.

### End Behavior of Polynomial Functions

**Figure 2.15** shows the graph of the function

$$f(x) = -49x^3 + 806x^2 + 3776x + 2503,$$

which models the number of U.S. AIDS diagnoses from 1983 through 1991. Look what happens to the graph when we extend the year up through 2005. By year 21 (2004), the values of  $y$  are negative and the function no longer models AIDS diagnoses. We've added an arrow to the graph at the far right to emphasize that it continues to decrease without bound. It is this far-right *end behavior* of the graph that makes it inappropriate for modeling AIDS cases into the future.

The behavior of the graph of a function to the far left or the far right is called its **end behavior**. Although the graph of a polynomial function may have intervals where it increases or decreases, the graph will eventually rise or fall without bound as it moves far to the left or far to the right.

How can you determine whether the graph of a polynomial function goes up or down at each end? The end behavior of a polynomial function

$$f(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_1 x + a_0$$

depends upon the leading term  $a_n x^n$ , because when  $|x|$  is large, the other terms are relatively insignificant in size. In particular, the sign of the leading coefficient,  $a_n$ , and the degree,  $n$ , of the polynomial function reveal its end behavior. In terms of end behavior, only the term of highest degree counts, as summarized by the **Leading Coefficient Test**.

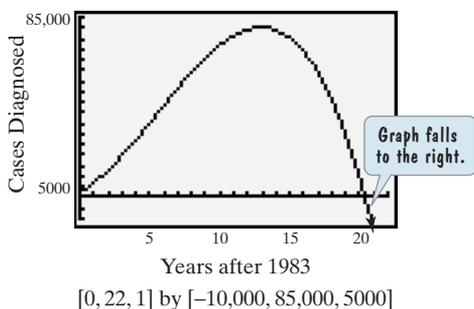

FIGURE 2.15 By extending the viewing rectangle, we see that  $y$  is eventually negative and the function no longer models the number of AIDS cases.

### The Leading Coefficient Test

As  $x$  increases or decreases without bound, the graph of the polynomial function

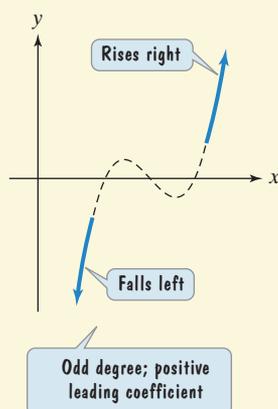

$$f(x) = a_n x^n + a_{n-1} x^{n-1} + a_{n-2} x^{n-2} + \cdots + a_1 x + a_0 \quad (a_n \neq 0)$$

eventually rises or falls. In particular,

#### 1. For $n$ odd:

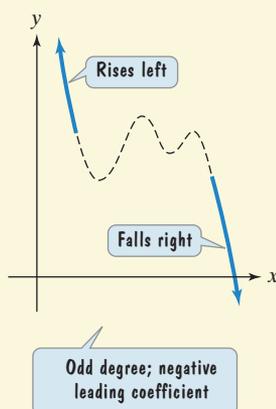

If the leading coefficient is positive, the graph falls to the left and rises to the right. ( $\swarrow$ ,  $\nearrow$ )

$$a_n > 0$$

If the leading coefficient is negative, the graph rises to the left and falls to the right. ( $\nwarrow$ ,  $\searrow$ )

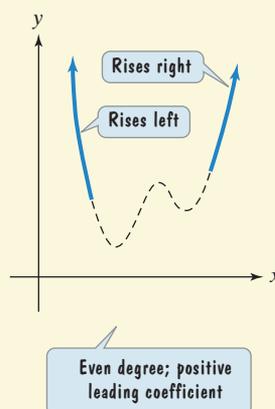

$$a_n < 0$$

#### 2. For $n$ even:

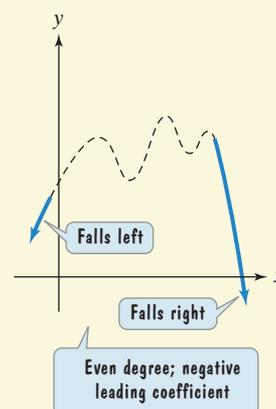

If the leading coefficient is positive, the graph rises to the left and rises to the right. ( $\nwarrow$ ,  $\nearrow$ )

$$a_n > 0$$

If the leading coefficient is negative, the graph falls to the left and falls to the right. ( $\swarrow$ ,  $\searrow$ )

$$a_n < 0$$

### DISCOVERY

Verify each of the four cases of the Leading Coefficient Test by using a graphing utility to graph  $f(x) = x^3$ ,  $f(x) = -x^3$ ,  $f(x) = x^2$ , and  $f(x) = -x^2$ .

### GREAT QUESTION!

**What's the bottom line on the Leading Coefficient Test?**

Odd-degree polynomial functions have graphs with opposite behavior at each end. Even-degree polynomial functions have graphs with the same behavior at each end. Here's a table to help you remember the details:

Leading Term:  $a_n x^n$

	Odd $n$	Even $n$
$a_n > 0$	$\swarrow$ $\nearrow$	$\nwarrow$ $\nearrow$
$a_n < 0$	$\nwarrow$ $\searrow$	$\swarrow$ $\searrow$

Opposite behavior at each end

Same behavior at each end

### EXAMPLE 1 Using the Leading Coefficient Test

Use the Leading Coefficient Test to determine the end behavior of the graph of

$$f(x) = x^3 + 3x^2 - x - 3.$$

### SOLUTION

We begin by identifying the sign of the leading coefficient and the degree of the polynomial.

$$f(x) = x^3 + 3x^2 - x - 3$$

The leading coefficient, 1, is positive.

The degree of the polynomial, 3, is odd.

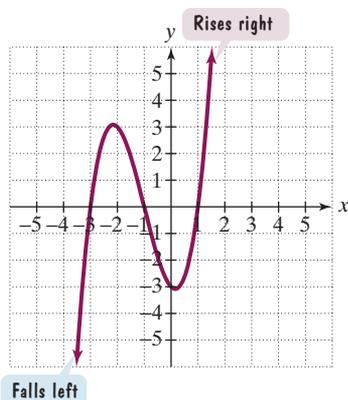

FIGURE 2.16 The graph of  $f(x) = x^3 + 3x^2 - x - 3$

The degree of the function  $f$  is 3, which is odd. Odd-degree polynomial functions have graphs with opposite behavior at each end. The leading coefficient, 1, is positive. Thus, the graph falls to the left and rises to the right ( $\swarrow$ ,  $\nearrow$ ). The graph of  $f$  is shown in **Figure 2.16**. ●●●

 **Check Point 1** Use the Leading Coefficient Test to determine the end behavior of the graph of  $f(x) = x^4 - 4x^2$ .

### EXAMPLE 2 Using the Leading Coefficient Test

Use the Leading Coefficient Test to determine the end behavior of the graph of

$$f(x) = -4x^3(x - 1)^2(x + 5).$$

#### SOLUTION

Although the equation for  $f$  is in factored form, it is not necessary to multiply to determine the degree of the function.

$$f(x) = -4x^3(x - 1)^2(x + 5)$$

Degree of this factor is 3.

Degree of this factor is 2.

Degree of this factor is 1.

When multiplying exponential expressions with the same base, we add the exponents. This means that the degree of  $f$  is  $3 + 2 + 1$ , or 6, which is even. Even-degree polynomial functions have graphs with the same behavior at each end. Without multiplying out, you can see that the leading coefficient is  $-4$ , which is negative. Thus, the graph of  $f$  falls to the left and falls to the right ( $\swarrow$ ,  $\searrow$ ). ●●●

 **Check Point 2** Use the Leading Coefficient Test to determine the end behavior of the graph of  $f(x) = 2x^3(x - 1)(x + 5)$ .

### EXAMPLE 3 Using the Leading Coefficient Test

Use end behavior to explain why

$$f(x) = -49x^3 + 806x^2 + 3776x + 2503$$

is only an appropriate model for AIDS diagnoses for a limited time period.

#### SOLUTION

We begin by identifying the sign of the leading coefficient and the degree of the polynomial.

$$f(x) = -49x^3 + 806x^2 + 3776x + 2503$$

The leading coefficient,  $-49$ , is negative.

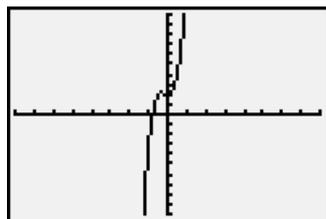

The degree of the polynomial, 3, is odd.

The degree of  $f$  is 3, which is odd. Odd-degree polynomial functions have graphs with opposite behavior at each end. The leading coefficient,  $-49$ , is negative. Thus, the graph rises to the left and falls to the right ( $\nwarrow$ ,  $\searrow$ ). The fact that the graph falls to the right indicates that at some point the number of AIDS diagnoses will be negative, an impossibility. If a function has a graph that decreases without bound over time, it will not be capable of modeling nonnegative phenomena over long time periods. Model breakdown will eventually occur. ●●●

 **Check Point 3** The polynomial function

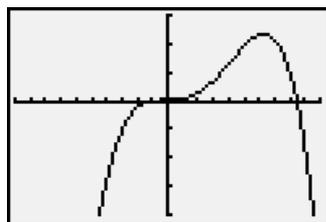

$$f(x) = -0.27x^3 + 9.2x^2 - 102.9x + 400$$

models the ratio of students to computers in U.S. public schools  $x$  years after 1980. Use end behavior to determine whether this function could be an appropriate model for computers in the classroom well into the twenty-first century. Explain your answer.

$[-8, 8, 1]$  by  $[-10, 10, 1]$

FIGURE 2.17

FIGURE 2.18

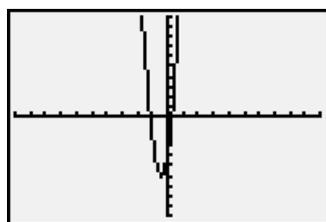

FIGURE 2.19

- 4 Use factoring to find zeros of polynomial functions.

If you use a graphing utility to graph a polynomial function, it is important to select a viewing rectangle that accurately reveals the graph's end behavior. If the viewing rectangle, or window, is too small, it may not accurately show a complete graph with the appropriate end behavior.

**EXAMPLE 4** Using the Leading Coefficient Test

The graph of  $f(x) = -x^4 + 8x^3 + 4x^2 + 2$  was obtained with a graphing utility using a  $[-8, 8, 1]$  by  $[-10, 10, 1]$  viewing rectangle. The graph is shown in **Figure 2.17**. Is this a complete graph that shows the end behavior of the function?

**SOLUTION**

We begin by identifying the sign of the leading coefficient and the degree of the polynomial.

$$f(x) = -x^4 + 8x^3 + 4x^2 + 2$$

The leading coefficient,  $-1$ , is negative.

The degree of the polynomial,  $4$ , is even.

The degree of  $f$  is  $4$ , which is even. Even-degree polynomial functions have graphs with the same behavior at each end. The leading coefficient,  $-1$ , is negative. Thus, the graph should fall to the left and fall to the right ( $\swarrow$ ,  $\searrow$ ). The graph in **Figure 2.17** is falling to the left, but it is not falling to the right. Therefore, the graph is not complete enough to show end behavior. A more complete graph of the function is shown in a larger viewing rectangle in **Figure 2.18**. ●●●

-  **Check Point 4** The graph of  $f(x) = x^3 + 13x^2 + 10x - 4$  is shown in a standard viewing rectangle in **Figure 2.19**. Use the Leading Coefficient Test to determine whether this is a complete graph that shows the end behavior of the function. Explain your answer.

**Zeros of Polynomial Functions**

If  $f$  is a polynomial function, then the values of  $x$  for which  $f(x)$  is equal to  $0$  are called the **zeros** of  $f$ . These values of  $x$  are the **roots**, or **solutions**, of the polynomial equation  $f(x) = 0$ . Each real root of the polynomial equation appears as an  $x$ -intercept of the graph of the polynomial function.

**EXAMPLE 5** Finding Zeros of a Polynomial Function

Find all zeros of  $f(x) = x^3 + 3x^2 - x - 3$ .

**SOLUTION**

By definition, the zeros are the values of  $x$  for which  $f(x)$  is equal to  $0$ . Thus, we set  $f(x)$  equal to  $0$ :

$$f(x) = x^3 + 3x^2 - x - 3 = 0.$$

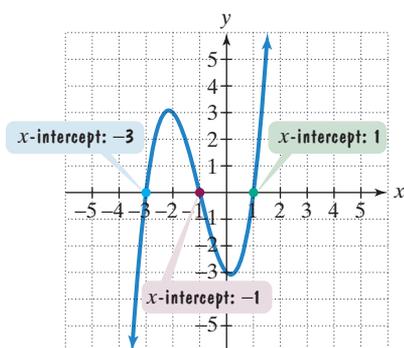

FIGURE 2.20

We solve the polynomial equation  $x^3 + 3x^2 - x - 3 = 0$  for  $x$  as follows:

$$\begin{aligned} x^3 + 3x^2 - x - 3 &= 0 && \text{This is the equation needed to find the} \\ &&& \text{function's zeros.} \\ x^2(x + 3) - 1(x + 3) &= 0 && \text{Factor } x^2 \text{ from the first two terms and } -1 \\ &&& \text{from the last two terms.} \\ (x + 3)(x^2 - 1) &= 0 && \text{A common factor of } x + 3 \text{ is factored from} \\ &&& \text{the expression.} \\ x + 3 = 0 \text{ or } x^2 - 1 = 0 &&& \text{Set each factor equal to 0.} \\ x = -3 \qquad x^2 = 1 &&& \text{Solve for } x. \\ x = \pm 1 &&& \text{Remember that if } x^2 = d, \text{ then } x = \pm\sqrt{d}. \end{aligned}$$

The zeros of  $f$  are  $-3$ ,  $-1$ , and  $1$ . The graph of  $f$  in **Figure 2.20** shows that each zero is an  $x$ -intercept. The graph passes through the points  $(-3, 0)$ ,  $(-1, 0)$ , and  $(1, 0)$ . ●●●

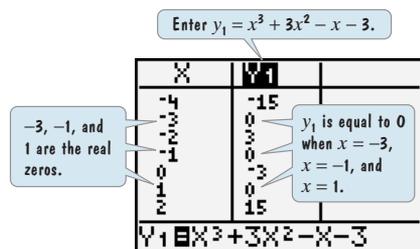

## TECHNOLOGY

### Graphic and Numeric Connections

A graphing utility can be used to verify that  $-3$ ,  $-1$ , and  $1$  are the three real zeros of  $f(x) = x^3 + 3x^2 - x - 3$ .

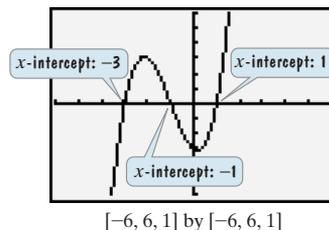

#### Numeric Check

Display a table for the function.

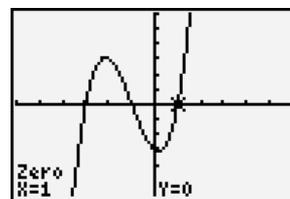

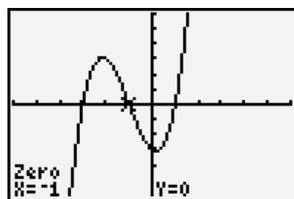

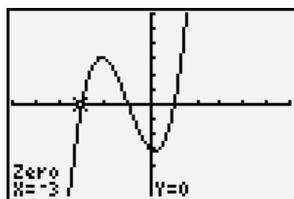

#### Graphic Check

Display a graph for the function. The  $x$ -intercepts indicate that  $-3$ ,  $-1$ , and  $1$  are the real zeros.

The utility's **ZERO** feature on the graph of  $f$  also verifies that  $-3$ ,  $-1$ , and  $1$  are the function's real zeros.

**Check Point 5** Find all zeros of  $f(x) = x^3 + 2x^2 - 4x - 8$ .

### EXAMPLE 6 Finding Zeros of a Polynomial Function

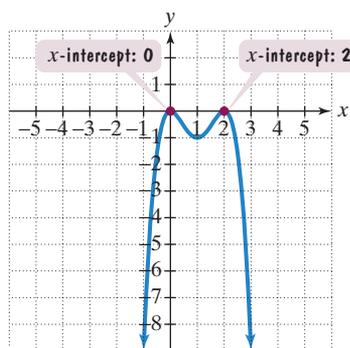

Find all zeros of  $f(x) = -x^4 + 4x^3 - 4x^2$ .

#### SOLUTION

We find the zeros of  $f$  by setting  $f(x)$  equal to 0 and solving the resulting equation.

$$\begin{aligned} -x^4 + 4x^3 - 4x^2 &= 0 && \text{We now have a polynomial equation.} \\ x^4 - 4x^3 + 4x^2 &= 0 && \text{Multiply both sides by } -1. \text{ This step is optional.} \\ x^2(x^2 - 4x + 4) &= 0 && \text{Factor out } x^2. \\ x^2(x - 2)^2 &= 0 && \text{Factor completely.} \\ x^2 = 0 \text{ or } (x - 2)^2 = 0 &&& \text{Set each factor equal to 0.} \\ x = 0 \qquad x = 2 &&& \text{Solve for } x. \end{aligned}$$

The zeros of  $f(x) = -x^4 + 4x^3 - 4x^2$  are 0 and 2. The graph of  $f$ , shown in **Figure 2.21**, has  $x$ -intercepts at 0 and 2. The graph passes through the points  $(0, 0)$  and  $(2, 0)$ . ●●●

**FIGURE 2.21** The zeros of  $f(x) = -x^4 + 4x^3 - 4x^2$ , namely 0 and 2, are the  $x$ -intercepts for the graph of  $f$ .

 **Check Point 6** Find all zeros of  $f(x) = x^4 - 4x^2$ .

### GREAT QUESTION!

**Can zeros of polynomial functions always be found using one or more of the factoring techniques that were reviewed in Section P.5?**

No. You'll be learning additional strategies for finding zeros of polynomial functions in the next two sections of this chapter.

- 5 Identify zeros and their multiplicities.

### Multiplicities of Zeros

We can use the results of factoring to express a polynomial as a product of factors. For instance, in Example 6, we can use our factoring to express the function's equation as follows:

$$f(x) = -x^4 + 4x^3 - 4x^2 = -(x^4 - 4x^3 + 4x^2) = -x^2(x - 2)^2.$$

The factor  $x$   
occurs twice:  
 $x^2 = x \cdot x$ .

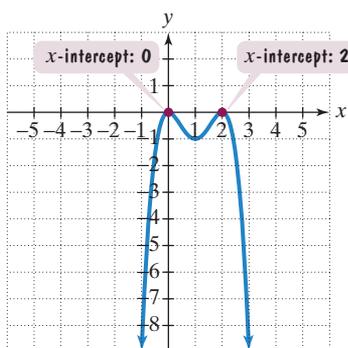

The factor  $(x - 2)$   
occurs twice:  
 $(x - 2)^2 = (x - 2)(x - 2)$ .

Notice that each factor occurs twice. In factoring the equation for the polynomial function  $f$ , if the same factor  $x - r$  occurs  $k$  times, but not  $k + 1$  times, we call  $r$  a **zero with multiplicity  $k$** . For the polynomial function

$$f(x) = -x^2(x - 2)^2,$$

0 and 2 are both zeros with multiplicity 2.

Multiplicity provides another connection between zeros and graphs. The multiplicity of a zero tells us whether the graph of a polynomial function touches the  $x$ -axis at the zero and turns around or if the graph crosses the  $x$ -axis at the zero. For example, look again at the graph of  $f(x) = -x^4 + 4x^3 - 4x^2$  in **Figure 2.21**. Each zero, 0 and 2, is a zero with multiplicity 2. The graph of  $f$  touches, but does not cross, the  $x$ -axis at each of these zeros of even multiplicity. By contrast, a graph crosses the  $x$ -axis at zeros of odd multiplicity.

**FIGURE 2.21** (repeated) The graph of  $f(x) = -x^4 + 4x^3 - 4x^2$

### Multiplicity and $x$ -Intercepts

If  $r$  is a zero of **even multiplicity**, then the graph **touches** the  $x$ -axis **and turns around** at  $r$ . If  $r$  is a zero of **odd multiplicity**, then the graph **crosses** the  $x$ -axis at  $r$ . Regardless of whether the multiplicity of a zero is even or odd, graphs tend to flatten out near zeros with multiplicity greater than one.

### GREAT QUESTION!

**If  $r$  is a zero of even multiplicity, how come the graph of  $f$  doesn't just cross the  $x$ -axis at  $r$ ?**

Because  $r$  is a zero of even multiplicity, the sign of  $f(x)$  does not change from one side of  $r$  to the other side of  $r$ . This means that the graph must turn around at  $r$ . On the other hand, if  $r$  is a zero of odd multiplicity, the sign of  $f(x)$  changes from one side of  $r$  to the other side. That's why the graph crosses the  $x$ -axis at  $r$ .

If a polynomial function's equation is expressed as a product of linear factors, we can quickly identify zeros and their multiplicities.

### EXAMPLE 7 Finding Zeros and Their Multiplicities

Find the zeros of  $f(x) = \frac{1}{2}(x + 1)(2x - 3)^2$  and give the multiplicity of each zero. State whether the graph crosses the  $x$ -axis or touches the  $x$ -axis and turns around at each zero.

### SOLUTION

We find the zeros of  $f$  by setting  $f(x)$  equal to 0:

$$\frac{1}{2}(x + 1)(2x - 3)^2 = 0.$$

Set each variable factor equal to 0.

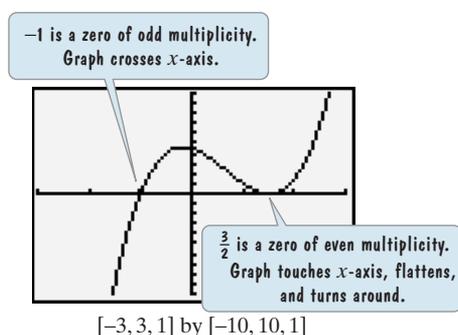

$$x + 1 = 0 \quad 2x - 3 = 0$$

$$x = -1 \quad x = \frac{3}{2}$$

$$\frac{1}{2}(x + 1)^1(2x - 3)^2 = 0$$

This exponent is 1.  
Thus, the multiplicity of  $-1$  is 1.

This exponent is 2.  
Thus, the multiplicity of  $\frac{3}{2}$  is 2.

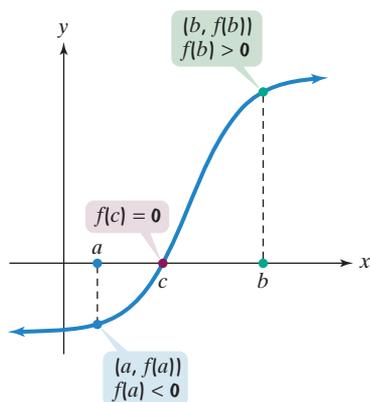

The zeros of  $f(x) = \frac{1}{2}(x + 1)(2x - 3)^2$  are  $-1$ , with multiplicity 1, and  $\frac{3}{2}$ , with multiplicity 2. Because the multiplicity of  $-1$  is odd, the graph crosses the  $x$ -axis at this zero. Because the multiplicity of  $\frac{3}{2}$  is even, the graph touches the  $x$ -axis and turns around at this zero. These relationships are illustrated by the graph of  $f$  in **Figure 2.22**.

**FIGURE 2.22** The graph of  $f(x) = \frac{1}{2}(x + 1)(2x - 3)^2$

**Check Point 7** Find the zeros of  $f(x) = -4(x + \frac{1}{2})^2(x - 5)^3$  and give the multiplicity of each zero. State whether the graph crosses the  $x$ -axis or touches the  $x$ -axis and turns around at each zero.

**6** Use the Intermediate Value Theorem.

**FIGURE 2.23** The graph must cross the  $x$ -axis at some value between  $a$  and  $b$ .

### The Intermediate Value Theorem

The *Intermediate Value Theorem* tells us of the existence of real zeros. The idea behind the theorem is illustrated in **Figure 2.23**. The figure shows that if  $(a, f(a))$  lies below the  $x$ -axis and  $(b, f(b))$  lies above the  $x$ -axis, the smooth, continuous graph of the polynomial function  $f$  must cross the  $x$ -axis at some value  $c$  between  $a$  and  $b$ . This value is a real zero for the function.

These observations are summarized in the **Intermediate Value Theorem**.

#### The Intermediate Value Theorem for Polynomial Functions

Let  $f$  be a polynomial function with real coefficients. If  $f(a)$  and  $f(b)$  have opposite signs, then there is at least one value of  $c$  between  $a$  and  $b$  for which  $f(c) = 0$ . Equivalently, the equation  $f(x) = 0$  has at least one real root between  $a$  and  $b$ .

#### EXAMPLE 8 Using the Intermediate Value Theorem

Show that the polynomial function  $f(x) = x^3 - 2x - 5$  has a real zero between 2 and 3.

#### SOLUTION

Let us evaluate  $f$  at 2 and at 3. If  $f(2)$  and  $f(3)$  have opposite signs, then there is at least one real zero between 2 and 3. Using  $f(x) = x^3 - 2x - 5$ , we obtain

$$f(2) = 2^3 - 2 \cdot 2 - 5 = 8 - 4 - 5 = -1$$

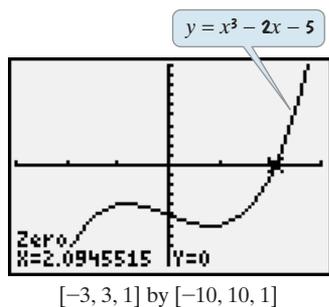

$f(2)$  is negative.

and

$$f(3) = 3^3 - 2 \cdot 3 - 5 = 27 - 6 - 5 = 16.$$

$f(3)$  is positive.

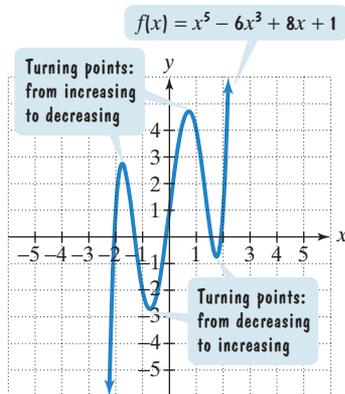

Because  $f(2) = -1$  and  $f(3) = 16$ , the sign change shows that the polynomial function has a real zero between 2 and 3. This zero is actually irrational and is approximated using a graphing utility's **ZERO** feature as 2.0945515 in **Figure 2.24**.

**FIGURE 2.24**

 **Check Point 8** Show that the polynomial function  $f(x) = 3x^3 - 10x + 9$  has a real zero between  $-3$  and  $-2$ .

- 7** Understand the relationship between degree and turning points.

**FIGURE 2.25** Graph with four turning points

- 8** Graph polynomial functions.

## GREAT QUESTION!

**When graphing a polynomial function, how do I determine the location of its turning points?**

Without calculus, it is often impossible to give the exact location of turning points. However, you can obtain additional points satisfying the function to estimate how high the graph rises or how low it falls. To obtain these points, use values of  $x$  between (and to the left and right of) the  $x$ -intercepts.

## Turning Points of Polynomial Functions

The graph of  $f(x) = x^5 - 6x^3 + 8x + 1$  is shown in **Figure 2.25**. The graph has four smooth **turning points**.

At each turning point in **Figure 2.25**, the graph changes direction from increasing to decreasing or vice versa. The given equation has 5 as its greatest exponent and is therefore a polynomial function of degree 5. Notice that the graph has four turning points. In general, **if  $f$  is a polynomial function of degree  $n$ , then the graph of  $f$  has at most  $n - 1$  turning points.**

**Figure 2.25** illustrates that the  $y$ -coordinate of each turning point is either a relative maximum or a relative minimum of  $f$ . Without the aid of a graphing utility or a knowledge of calculus, it is difficult and often impossible to locate turning points of polynomial functions with degrees greater than 2. If necessary, test values can be taken between the  $x$ -intercepts to get a general idea of how high the graph rises or how low the graph falls. For the purpose of graphing in this section, a general estimate is sometimes appropriate and necessary.

## A Strategy for Graphing Polynomial Functions

Here's a general strategy for graphing a polynomial function. A graphing utility is a valuable complement, but not a necessary component, to this strategy. If you are using a graphing utility, some of the steps listed in the following box will help you to select a viewing rectangle that shows the important parts of the graph.

### Graphing a Polynomial Function

$$f(x) = a_n x^n + a_{n-1} x^{n-1} + a_{n-2} x^{n-2} + \cdots + a_1 x + a_0, a_n \neq 0$$

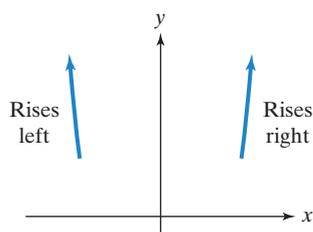

- Use the Leading Coefficient Test to determine the graph's end behavior.
- Find  $x$ -intercepts by setting  $f(x) = 0$  and solving the resulting polynomial equation. If there is an  $x$ -intercept at  $r$  as a result of  $(x - r)^k$  in the complete factorization of  $f(x)$ , then
  - If  $k$  is even, the graph touches the  $x$ -axis at  $r$  and turns around.
  - If  $k$  is odd, the graph crosses the  $x$ -axis at  $r$ .
  - If  $k > 1$ , the graph flattens out near  $(r, 0)$ .
- Find the  $y$ -intercept by computing  $f(0)$ .
- Use symmetry, if applicable, to help draw the graph:
  - $y$ -axis symmetry:  $f(-x) = f(x)$
  - Origin symmetry:  $f(-x) = -f(x)$ .
- Use the fact that the maximum number of turning points of the graph is  $n - 1$ , where  $n$  is the degree of the polynomial function, to check whether it is drawn correctly.

### EXAMPLE 9 Graphing a Polynomial Function

Graph:  $f(x) = x^4 - 2x^2 + 1$ .

### SOLUTION

**Step 1 Determine end behavior.** Identify the sign of  $a_n$ , the leading coefficient, and the degree,  $n$ , of the polynomial function.

$$f(x) = x^4 - 2x^2 + 1$$

The leading coefficient, 1, is positive.

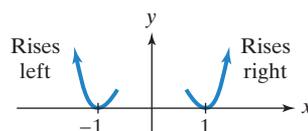

The degree of the polynomial function, 4, is even.

Because the degree, 4, is even, the graph has the same behavior at each end. The leading coefficient, 1, is positive. Thus, the graph rises to the left and rises to the right.

**Step 2 Find  $x$ -intercepts (zeros of the function) by setting  $f(x) = 0$ .**

$$\begin{aligned} x^4 - 2x^2 + 1 &= 0 && \text{Set } f(x) \text{ equal to } 0. \\ (x^2 - 1)(x^2 - 1) &= 0 && \text{Factor.} \\ (x + 1)(x - 1)(x + 1)(x - 1) &= 0 && \text{Factor completely.} \\ (x + 1)^2(x - 1)^2 &= 0 && \text{Express the factorization in a more compact form.} \\ (x + 1)^2 = 0 &\text{ or } (x - 1)^2 = 0 && \text{Set each factorization equal to } 0. \\ x = -1 &\qquad\qquad x = 1 && \text{Solve for } x. \end{aligned}$$

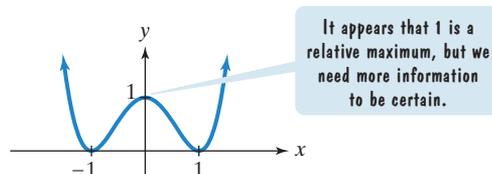

We see that  $-1$  and  $1$  are both repeated zeros with multiplicity 2. Because of the even multiplicity, the graph touches the  $x$ -axis at  $-1$  and  $1$  and turns around. Furthermore, the graph tends to flatten out near these zeros with multiplicity greater than one.

**Step 3 Find the  $y$ -intercept by computing  $f(0)$ .** We use  $f(x) = x^4 - 2x^2 + 1$  and compute  $f(0)$ .

$$f(0) = 0^4 - 2 \cdot 0^2 + 1 = 1$$

There is a  $y$ -intercept at 1, so the graph passes through  $(0, 1)$ .

**Step 4 Use possible symmetry to help draw the graph.** Our partial graph suggests  $y$ -axis symmetry. Let's verify this by finding  $f(-x)$ .

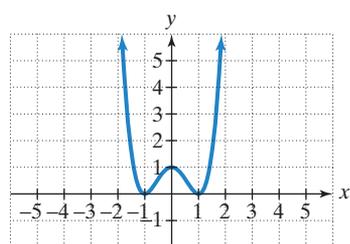

$$f(x) = x^4 - 2x^2 + 1$$

Replace  $x$  with  $-x$ .

$$f(-x) = (-x)^4 - 2(-x)^2 + 1 = x^4 - 2x^2 + 1$$

Because  $f(-x) = f(x)$ , the graph of  $f$  is symmetric with respect to the  $y$ -axis. **Figure 2.26** shows the graph of  $f(x) = x^4 - 2x^2 + 1$ .

**Step 5 Use the fact that the maximum number of turning points of the graph is  $n - 1$  to check whether it is drawn correctly.** Because  $n = 4$ , the maximum number of turning points is  $4 - 1$ , or 3. Because the graph in **Figure 2.26** has three turning points, we have not violated the maximum number possible. Can you see how this verifies that 1 is indeed a relative maximum and  $(0, 1)$  is a turning point? If the graph rose above 1 on either side of  $x = 0$ , it would have to rise above 1 on the other side as well because of symmetry. This would require additional turning points to smoothly curve back to the  $x$ -intercepts. The graph already has three turning points, which is the maximum number for a fourth-degree polynomial function. ●●●

**FIGURE 2.26** The graph of  $f(x) = x^4 - 2x^2 + 1$

 **Check Point 9** Use the five-step strategy to graph  $f(x) = x^3 - 3x^2$ .

### EXAMPLE 10 Graphing a Polynomial Function

Graph:  $f(x) = -2(x - 1)^2(x + 2)$ .

#### SOLUTION

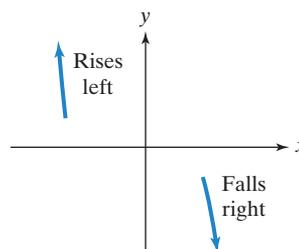

**Step 1 Determine end behavior.** Identify the sign of  $a_n$ , the leading coefficient, and the degree,  $n$ , of the polynomial function.

$$f(x) = \underbrace{-2(x - 1)^2(x + 2)}_{\text{The leading term is } -2x^2 \cdot x, \text{ or } -2x^3.}$$

The leading coefficient,  $-2$ , is negative.

The degree of the polynomial function,  $3$ , is odd.

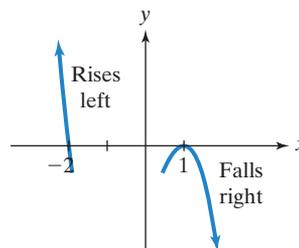

Because the degree,  $3$ , is odd, the graph has opposite behavior at each end. The leading coefficient,  $-2$ , is negative. Thus, the graph rises to the left and falls to the right.

**Step 2 Find  $x$ -intercepts (zeros of the function) by setting  $f(x) = 0$ .**

$$\begin{aligned} -2(x - 1)^2(x + 2) &= 0 && \text{Set } f(x) \text{ equal to } 0. \\ (x - 1)^2 = 0 &\text{ or } x + 2 = 0 && \text{Set each variable factor equal to } 0. \\ x = 1 &\qquad\qquad x = -2 && \text{Solve for } x. \end{aligned}$$

We see that the zeros are  $1$  and  $-2$ . The multiplicity of  $1$  is even, so the graph touches the  $x$ -axis at  $1$ , flattens, and turns around. The multiplicity of  $-2$  is odd, so the graph crosses the  $x$ -axis at  $-2$ .

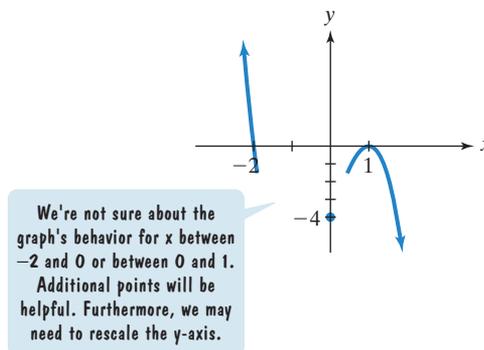

**Step 3 Find the  $y$ -intercept by computing  $f(0)$ .** We use  $f(x) = -2(x - 1)^2(x + 2)$  and compute  $f(0)$ .

$$f(0) = -2(0 - 1)^2(0 + 2) = -2(1)(2) = -4$$

There is a  $y$ -intercept at  $-4$ , so the graph passes through  $(0, -4)$ .

Based on the note in the voice balloon, let's evaluate the function at  $-1.5$ ,  $-1$ ,  $-0.5$ , and  $0.5$ , as well as at  $-3$ ,  $2$ , and  $3$ .

$x$	$-3$	$-1.5$	$-1$	$-0.5$	$0.5$	$2$	$3$
$f(x) = -2(x - 1)^2(x + 2)$	$32$	$-6.25$	$-8$	$-6.75$	$-1.25$	$-8$	$-40$

In order to accommodate these points, we'll scale the  $y$ -axis from  $-50$  to  $50$ , with each tick mark representing  $10$  units.

**Step 4 Use possible symmetry to help draw the graph.** Our partial graph illustrates that we have neither  $y$ -axis symmetry nor origin symmetry. Using end behavior, intercepts, and the points from our table, **Figure 2.27** shows the graph of  $f(x) = -2(x - 1)^2(x + 2)$ .

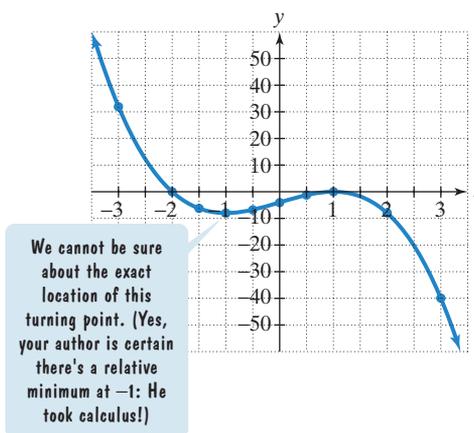

FIGURE 2.27 The graph of  $f(x) = -2(x - 1)^2(x + 2)$

**Step 5 Use the fact that the maximum number of turning points of the graph is  $n - 1$  to check whether it is drawn correctly.** The leading term is  $-2x^3$ , so  $n = 3$ . The maximum number of turning points is  $3 - 1$ , or  $2$ . Because the graph in **Figure 2.27** has two turning points, we have not violated the maximum number possible. ●●●

 **Check Point 10** Use the five-step strategy to graph  $f(x) = 2(x + 2)^2(x - 3)$ .

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

1. The degree of the polynomial function  $f(x) = -2x^3(x - 1)(x + 5)$  is \_\_\_\_\_. The leading coefficient is \_\_\_\_\_.
2. True or false: Some polynomial functions of degree 2 or higher have breaks in their graphs. \_\_\_\_\_
3. The behavior of the graph of a polynomial function to the far left or the far right is called its \_\_\_\_\_ behavior, which depends upon the \_\_\_\_\_ term.
4. The graph of  $f(x) = x^3$  \_\_\_\_\_ to the left and \_\_\_\_\_ to the right.
5. The graph of  $f(x) = -x^3$  \_\_\_\_\_ to the left and \_\_\_\_\_ to the right.
6. The graph of  $f(x) = x^2$  \_\_\_\_\_ to the left and \_\_\_\_\_ to the right.
7. The graph of  $f(x) = -x^2$  \_\_\_\_\_ to the left and \_\_\_\_\_ to the right.
8. True or false: Odd-degree polynomial functions have graphs with opposite behavior at each end. \_\_\_\_\_
9. True or false: Even-degree polynomial functions have graphs with the same behavior at each end. \_\_\_\_\_
10. Every real zero of a polynomial function appears as a/an \_\_\_\_\_ of the graph.
11. If  $r$  is a zero of even multiplicity, then the graph touches the  $x$ -axis and \_\_\_\_\_ at  $r$ . If  $r$  is a zero of odd multiplicity, then the graph \_\_\_\_\_ the  $x$ -axis at  $r$ .
12. If  $f$  is a polynomial function and  $f(a)$  and  $f(b)$  have opposite signs, then there must be at least one value of  $c$  between  $a$  and  $b$  for which  $f(c) =$  \_\_\_\_\_. This result is called the \_\_\_\_\_ Theorem.
13. If  $f$  is a polynomial function of degree  $n$ , then the graph of  $f$  has at most \_\_\_\_\_ turning points.

## EXERCISE SET 2.3

### Practice Exercises

In Exercises 1–10, determine which functions are polynomial functions. For those that are, identify the degree.

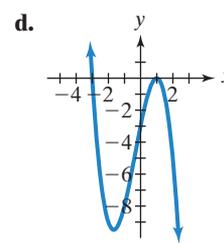

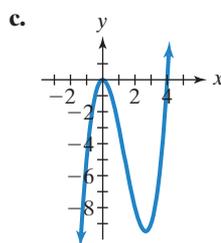

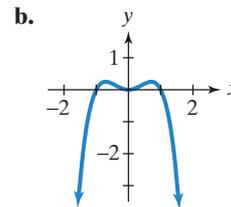

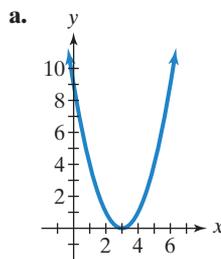

1.  $f(x) = 5x^2 + 6x^3$
2.  $f(x) = 7x^2 + 9x^4$
3.  $g(x) = 7x^5 - \pi x^3 + \frac{1}{5}x$
4.  $g(x) = 6x^7 + \pi x^5 + \frac{2}{3}x$
5.  $h(x) = 7x^3 + 2x^2 + \frac{1}{x}$
6.  $h(x) = 8x^3 - x^2 + \frac{2}{x}$
7.  $f(x) = x^{\frac{1}{2}} - 3x^2 + 5$
8.  $f(x) = x^{\frac{1}{3}} - 4x^2 + 7$
9.  $f(x) = \frac{x^2 + 7}{x^3}$
10.  $f(x) = \frac{x^2 + 7}{3}$

In Exercises 11–14, identify which graphs are not those of polynomial functions.

- 11.
- 12.
- 13.
- 14.

In Exercises 15–18, use the Leading Coefficient Test to determine the end behavior of the graph of the given polynomial function. Then use this end behavior to match the polynomial function with its graph. [The graphs are labeled (a) through (d).]

15.  $f(x) = -x^4 + x^2$
16.  $f(x) = x^3 - 4x^2$
17.  $f(x) = (x - 3)^2$
18.  $f(x) = -x^3 - x^2 + 5x - 3$

In Exercises 19–24, use the Leading Coefficient Test to determine the end behavior of the graph of the polynomial function.

19.  $f(x) = 5x^3 + 7x^2 - x + 9$
20.  $f(x) = 11x^3 - 6x^2 + x + 3$
21.  $f(x) = 5x^4 + 7x^2 - x + 9$
22.  $f(x) = 11x^4 - 6x^2 + x + 3$
23.  $f(x) = -5x^4 + 7x^2 - x + 9$
24.  $f(x) = -11x^4 - 6x^2 + x + 3$

In Exercises 25–32, find the zeros for each polynomial function and give the multiplicity for each zero. State whether the graph crosses the  $x$ -axis, or touches the  $x$ -axis and turns around, at each zero.

25.  $f(x) = 2(x - 5)(x + 4)^2$

26.  $f(x) = 3(x + 5)(x + 2)^2$

27.  $f(x) = 4(x - 3)(x + 6)^3$

28.  $f(x) = -3(x + \frac{1}{2})(x - 4)^3$

29.  $f(x) = x^3 - 2x^2 + x$

30.  $f(x) = x^3 + 4x^2 + 4x$

31.  $f(x) = x^3 + 7x^2 - 4x - 28$

32.  $f(x) = x^3 + 5x^2 - 9x - 45$

In Exercises 33–40, use the Intermediate Value Theorem to show that each polynomial has a real zero between the given integers.

33.  $f(x) = x^3 - x - 1$ ; between 1 and 2

34.  $f(x) = x^3 - 4x^2 + 2$ ; between 0 and 1

35.  $f(x) = 2x^4 - 4x^2 + 1$ ; between  $-1$  and 0

36.  $f(x) = x^4 + 6x^3 - 18x^2$ ; between 2 and 3

37.  $f(x) = x^3 + x^2 - 2x + 1$ ; between  $-3$  and  $-2$

38.  $f(x) = x^5 - x^3 - 1$ ; between 1 and 2

39.  $f(x) = 3x^3 - 10x + 9$ ; between  $-3$  and  $-2$

40.  $f(x) = 3x^3 - 8x^2 + x + 2$ ; between 2 and 3

In Exercises 41–64,

- Use the Leading Coefficient Test to determine the graph's end behavior.
- Find the  $x$ -intercepts. State whether the graph crosses the  $x$ -axis, or touches the  $x$ -axis and turns around, at each intercept.
- Find the  $y$ -intercept.
- Determine whether the graph has  $y$ -axis symmetry, origin symmetry, or neither.
- If necessary, find a few additional points and graph the function. Use the maximum number of turning points to check whether it is drawn correctly.

41.  $f(x) = x^3 + 2x^2 - x - 2$

42.  $f(x) = x^3 + x^2 - 4x - 4$

43.  $f(x) = x^4 - 9x^2$

44.  $f(x) = x^4 - x^2$

45.  $f(x) = -x^4 + 16x^2$

46.  $f(x) = -x^4 + 4x^2$

47.  $f(x) = x^4 - 2x^3 + x^2$

48.  $f(x) = x^4 - 6x^3 + 9x^2$

49.  $f(x) = -2x^4 + 4x^3$

50.  $f(x) = -2x^4 + 2x^3$

51.  $f(x) = 6x^3 - 9x - x^5$

52.  $f(x) = 6x - x^3 - x^5$

53.  $f(x) = 3x^2 - x^3$

54.  $f(x) = \frac{1}{2} - \frac{1}{2}x^4$

55.  $f(x) = -3(x - 1)^2(x^2 - 4)$

56.  $f(x) = -2(x - 4)^2(x^2 - 25)$

57.  $f(x) = x^2(x - 1)^3(x + 2)$

58.  $f(x) = x^3(x + 2)^2(x + 1)$

59.  $f(x) = -x^2(x - 1)(x + 3)$

60.  $f(x) = -x^2(x + 2)(x - 2)$

61.  $f(x) = -2x^3(x - 1)^2(x + 5)$

62.  $f(x) = -3x^3(x - 1)^2(x + 3)$

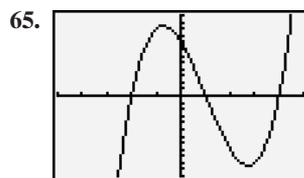

63.  $f(x) = (x - 2)^2(x + 4)(x - 1)$

64.  $f(x) = (x + 3)(x + 1)^3(x + 4)$

### Practice Plus

In Exercises 65–72, complete graphs of polynomial functions whose zeros are integers are shown.

- Find the zeros and state whether the multiplicity of each zero is even or odd.
- Write an equation, expressed as the product of factors, of a polynomial function that might have each graph. Use a leading coefficient of 1 or  $-1$ , and make the degree of  $f$  as small as possible.
- Use both the equation in part (b) and the graph to find the  $y$ -intercept.

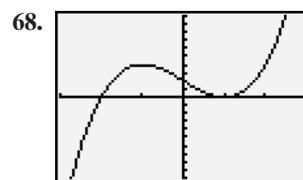

$[-5, 5, 1]$  by  $[-12, 12, 1]$

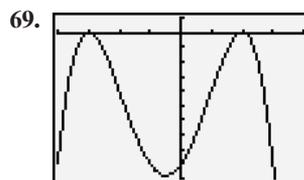

$[-6, 6, 1]$  by  $[-40, 40, 10]$

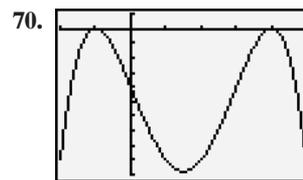

$[-3, 6, 1]$  by  $[-10, 10, 1]$

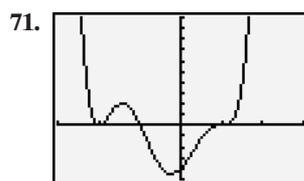

$[-3, 3, 1]$  by  $[-10, 10, 1]$

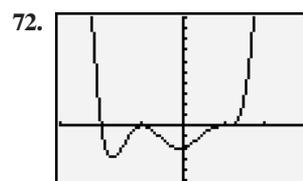

$[-4, 4, 1]$  by  $[-40, 4, 4]$

$[-2, 5, 1]$  by  $[-40, 4, 4]$

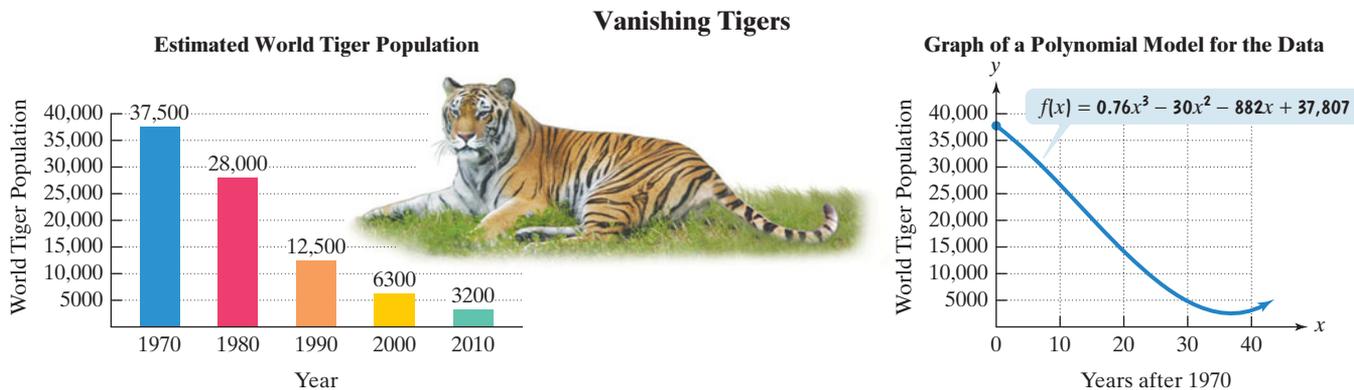

$[-3, 3, 1]$  by  $[-5, 10, 1]$

$[-3, 3, 1]$  by  $[-5, 10, 1]$

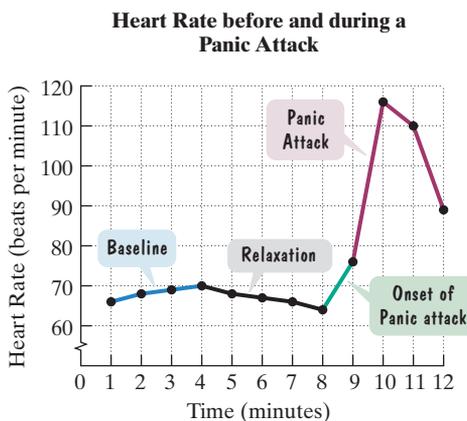

Application Exercises

Experts fear that without conservation efforts, tigers could disappear from the wild by 2022. Just one hundred years ago, there were at least 100,000 wild tigers. By 2010, the estimated world tiger population was 3200. The bar graph shows the estimated world tiger population for selected years from 1970 through 2010. Also shown is a polynomial function, with its graph, that models the data. Use this information to solve Exercises 73–74.

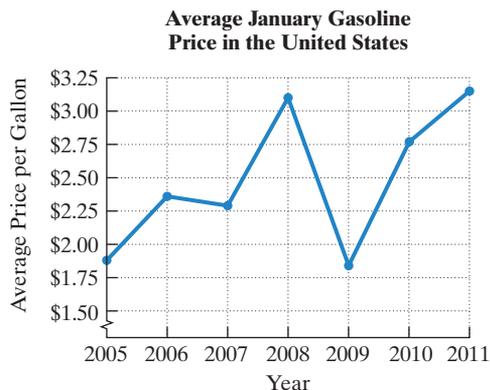

Source: World Wildlife Fund

73. a. Find and interpret  $f(40)$ . Identify this information as a point on the graph of  $f$ .
  - b. Does  $f(40)$  overestimate or underestimate the actual data shown by the bar graph? By how much?
  - c. Use the Leading Coefficient Test to determine the end behavior to the right for the graph of  $f$ . Will this function be useful in modeling the world tiger population if conservation efforts to save wild tigers fail? Explain your answer.
74. a. Find and interpret  $f(10)$ . Identify this information as a point on the graph of  $f$ .
  - d. Does  $f(10)$  overestimate or underestimate the actual data shown by the bar graph? By how much?
  - c. Use the Leading Coefficient Test to determine the end behavior to the right for the graph of  $f$ . Might this function be useful in modeling the world tiger population if conservation efforts to save wild tigers are successful? Explain your answer.
75. During a diagnostic evaluation, a 33-year-old woman experienced a panic attack a few minutes after she had been asked to relax her whole body. The graph shows the rapid increase in heart rate during the panic attack.

Source: U.S. Energy Information Administration

- For which years was the average price per gallon in January increasing?
- For which years was the average price per gallon in January decreasing?
- How many turning points (from increasing to decreasing or from decreasing to increasing) does the graph have for the period shown?
- Suppose that a polynomial function is used to model the data displayed by the graph using

(number of years after 2005, average January price per gallon).

Use the number of turning points to determine the degree of the polynomial function of best fit.

- For the model in part (d), should the leading coefficient of the polynomial function be positive or negative? Explain your answer.
- Use the graph to estimate the maximum average January price per gallon. In which year did this occur?
- Use the graph to estimate the minimum average January price per gallon. In which year did this occur?

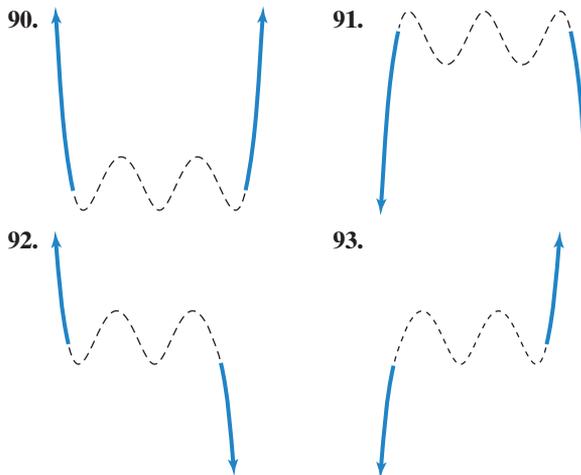

### Writing in Mathematics

- What is a polynomial function?
- What do we mean when we describe the graph of a polynomial function as smooth and continuous?
- What is meant by the end behavior of a polynomial function?
- Explain how to use the Leading Coefficient Test to determine the end behavior of a polynomial function.
- Why is a third-degree polynomial function with a negative leading coefficient not appropriate for modeling nonnegative real-world phenomena over a long period of time?
- What are the zeros of a polynomial function and how are they found?
- Explain the relationship between the multiplicity of a zero and whether or not the graph crosses or touches the  $x$ -axis at that zero.
- If  $f$  is a polynomial function, and  $f(a)$  and  $f(b)$  have opposite signs, what must occur between  $a$  and  $b$ ? If  $f(a)$  and  $f(b)$  have the same sign, does it necessarily mean that this will not occur? Explain your answer.
- Explain the relationship between the degree of a polynomial function and the number of turning points on its graph.
- Can the graph of a polynomial function have no  $x$ -intercepts? Explain.
- Can the graph of a polynomial function have no  $y$ -intercept? Explain.
- Describe a strategy for graphing a polynomial function. In your description, mention intercepts, the polynomial's degree, and turning points.

### Technology Exercises

- Use a graphing utility to verify any five of the graphs that you drew by hand in Exercises 41–64.

Write a polynomial function that imitates the end behavior of each graph in Exercises 90–93. The dashed portions of the graphs indicate that you should focus only on imitating the left and right behavior of the graph and can be flexible about what occurs between the left and right ends. Then use your graphing utility to graph the polynomial function and verify that you imitated the end behavior shown in the given graph.

In Exercises 94–97, use a graphing utility with a viewing rectangle large enough to show end behavior to graph each polynomial function.

- $f(x) = x^3 + 13x^2 + 10x - 4$
- $f(x) = -2x^3 + 6x^2 + 3x - 1$
- $f(x) = -x^4 + 8x^3 + 4x^2 + 2$
- $f(x) = -x^5 + 5x^4 - 6x^3 + 2x + 20$

In Exercises 98–99, use a graphing utility to graph  $f$  and  $g$  in the same viewing rectangle. Then use the **ZOOM OUT** feature to show that  $f$  and  $g$  have identical end behavior.

- $f(x) = x^3 - 6x + 1$ ,  $g(x) = x^3$
- $f(x) = -x^4 + 2x^3 - 6x$ ,  $g(x) = -x^4$

### Critical Thinking Exercises

**Make Sense?** In Exercises 100–103, determine whether each statement makes sense or does not make sense, and explain your reasoning.

- When I'm trying to determine end behavior, it's the coefficient of the leading term of a polynomial function that I should inspect.
- I graphed  $f(x) = (x + 2)^3(x - 4)^2$ , and the graph touched the  $x$ -axis and turned around at  $-2$ .
- I'm graphing a fourth-degree polynomial function with four turning points.
- Although I have not yet learned techniques for finding the  $x$ -intercepts of  $f(x) = x^3 + 2x^2 - 5x - 6$ , I can easily determine the  $y$ -intercept.

In Exercises 104–107, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

- If  $f(x) = -x^3 + 4x$ , then the graph of  $f$  falls to the left and falls to the right.
- A mathematical model that is a polynomial of degree  $n$  whose leading term is  $a_n x^n$ ,  $n$  odd and  $a_n < 0$ , is ideally suited to describe phenomena that have positive values over unlimited periods of time.

106. There is more than one third-degree polynomial function with the same three  $x$ -intercepts.
107. The graph of a function with origin symmetry can rise to the left and rise to the right.

Use the descriptions in Exercises 108–109 to write an equation of a polynomial function with the given characteristics. Use a graphing utility to graph your function to see if you are correct. If not, modify the function's equation and repeat this process.

108. Crosses the  $x$ -axis at  $-4, 0$ , and  $3$ ; lies above the  $x$ -axis between  $-4$  and  $0$ ; lies below the  $x$ -axis between  $0$  and  $3$
109. Touches the  $x$ -axis at  $0$  and crosses the  $x$ -axis at  $2$ ; lies below the  $x$ -axis between  $0$  and  $2$

### Preview Exercises

Exercises 110–112 will help you prepare for the material covered in the next section.

110. Divide  $737$  by  $21$  without using a calculator. Write the answer as

$$\text{quotient} + \frac{\text{remainder}}{\text{divisor}}.$$

111. Rewrite  $4 - 5x - x^2 + 6x^3$  in descending powers of  $x$ .

112. Use

$$\frac{2x^3 - 3x^2 - 11x + 6}{x - 3} = 2x^2 + 3x - 2$$

to factor  $2x^3 - 3x^2 - 11x + 6$  completely.

## SECTION 2.4

### Dividing Polynomials; Remainder and Factor Theorems

#### Objectives

- 1 Use long division to divide polynomials.
- 2 Use synthetic division to divide polynomials.
- 3 Evaluate a polynomial using the Remainder Theorem.
- 4 Use the Factor Theorem to solve a polynomial equation.

A moth has moved into your closet. She appeared in your bedroom at night, but somehow her relatively stout body escaped your clutches. Within a few weeks, swarms of moths in your tattered wardrobe suggest that Mama Moth was in the family way. There must be at least 200 critters nesting in every crevice of your clothing.

Two hundred plus moth-tykes from one female moth—is this possible? Indeed it is. The number of eggs,  $f(x)$ , in a female moth is a function of her abdominal width,  $x$ , in millimeters, modeled by

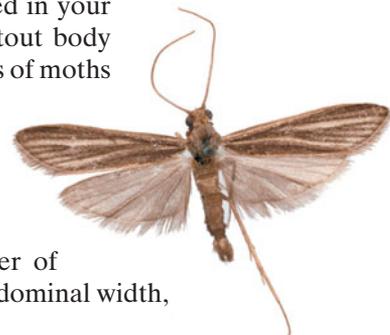

$$f(x) = 14x^3 - 17x^2 - 16x + 34, \quad 1.5 \leq x \leq 3.5.$$

Because there are 200 moths feasting on your favorite sweaters, Mama's abdominal width can be estimated by finding the solutions of the polynomial equation

$$14x^3 - 17x^2 - 16x + 34 = 200.$$

How can we solve such an equation? You might begin by subtracting 200 from both sides to obtain zero on one side. But then what? The factoring that we used in the previous section will not work in this situation.

In Section 2.5, we will present techniques for solving certain kinds of polynomial equations. These techniques will further enhance your ability to manipulate algebraically the polynomial functions that model your world. Because these techniques are based on understanding polynomial division, in this section we look at two methods for dividing polynomials. (We'll return to Mama Moth's abdominal width in the Exercise Set.)

- 1 Use long division to divide polynomials.

### Long Division of Polynomials and the Division Algorithm

We begin by looking at division by a polynomial containing more than one term, such as

$$x + 3 \overline{)x^2 + 10x + 21}.$$

Divisor has two terms and is a binomial.

The polynomial dividend has three terms and is a trinomial.

When a divisor has more than one term, the four steps used to divide whole numbers—**divide, multiply, subtract, bring down the next term**—form the repetitive procedure for polynomial long division.

**EXAMPLE 1** Long Division of Polynomials

Divide  $x^2 + 10x + 21$  by  $x + 3$ .

**SOLUTION**

The following steps illustrate how polynomial division is very similar to numerical division.

$$x + 3 \overline{)x^2 + 10x + 21}$$

Arrange the terms of the dividend ( $x^2 + 10x + 21$ ) and the divisor ( $x + 3$ ) in descending powers of  $x$ .

$$x + 3 \overline{)x^2 + 10x + 21}$$

Divide  $x^2$  (the first term in the dividend) by  $x$  (the first term in the divisor):  $\frac{x^2}{x} = x$ . Align like terms.

$$x(x + 3) = x^2 + 3x$$

$$x + 3 \overline{)x^2 + 10x + 21}$$

Multiply each term in the divisor ( $x + 3$ ) by  $x$ , aligning terms of the product under like terms in the dividend.

$$x + 3 \overline{)x^2 + 10x + 21}$$

$$\begin{array}{r} x \\ \ominus x^2 + 3x \\ \hline 7x \end{array}$$

Change signs of the polynomial being subtracted.

Subtract  $x^2 + 3x$  from  $x^2 + 10x$  by changing the sign of each term in the lower expression and adding.

$$x + 3 \overline{)x^2 + 10x + 21}$$

$$\begin{array}{r} x \\ \ominus x^2 + 3x \\ \hline 7x + 21 \end{array}$$

Bring down 21 from the original dividend and add algebraically to form a new dividend.

$$x + 3 \overline{)x^2 + 10x + 21}$$

$$\begin{array}{r} x + 7 \\ \ominus x^2 + 3x \\ \hline 7x + 21 \end{array}$$

Find the second term of the quotient. Divide the first term of  $7x + 21$  by  $x$ , the first term of the divisor:  $\frac{7x}{x} = 7$ .

$$7(x + 3) = 7x + 21$$

$$x + 3 \overline{)x^2 + 10x + 21}$$

$$\begin{array}{r} x + 7 \\ \ominus x^2 + 3x \\ \hline 7x + 21 \\ \ominus 7x + 21 \\ \hline 0 \end{array}$$

Remainder

Multiply the divisor ( $x + 3$ ) by 7, aligning under like terms in the new dividend. Then subtract to obtain the remainder of 0.

The quotient is  $x + 7$ . Because the remainder is 0, we can conclude that  $x + 3$  is a factor of  $x^2 + 10x + 21$  and

$$\frac{x^2 + 10x + 21}{x + 3} = x + 7.$$

 **Check Point 1** Divide  $x^2 + 14x + 45$  by  $x + 9$ .

Before considering additional examples, let's summarize the general procedure for dividing one polynomial by another.

### Long Division of Polynomials

1. Arrange the terms of both the dividend and the divisor in descending powers of any variable.
2. **Divide** the first term in the dividend by the first term in the divisor. The result is the first term of the quotient.
3. **Multiply** every term in the divisor by the first term in the quotient. Write the resulting product beneath the dividend with like terms lined up.
4. **Subtract** the product from the dividend.
5. **Bring down** the next term in the original dividend and write it next to the remainder to form a new dividend.
6. Use this new expression as the dividend and repeat this process until the remainder can no longer be divided. This will occur when the degree of the remainder (the highest exponent on a variable in the remainder) is less than the degree of the divisor.

In our next long division, we will obtain a nonzero remainder.

### EXAMPLE 2 Long Division of Polynomials

Divide  $4 - 5x - x^2 + 6x^3$  by  $3x - 2$ .

#### SOLUTION

We begin by writing the dividend in descending powers of  $x$ .

$$4 - 5x - x^2 + 6x^3 = 6x^3 - x^2 - 5x + 4$$

Change signs of the polynomial being subtracted.

Divide:  $\frac{6x^3}{3x} = 2x^2$ .

Multiply:  $2x^2(3x - 2) = 6x^3 - 4x^2$ . Subtract  $6x^3 - 4x^2$  from  $6x^3 - x^2$  and bring down  $-5x$ .

Now we divide  $3x^2$  by  $3x$  to obtain  $x$ , multiply  $x$  and the divisor, and subtract.

Change signs of the polynomial being subtracted.

Divide:  $\frac{3x^2}{3x} = x$ .

Multiply:  $x(3x - 2) = 3x^2 - 2x$ . Subtract  $3x^2 - 2x$  from  $3x^2 - 5x$  and bring down 4.

Now we divide  $-3x$  by  $3x$  to obtain  $-1$ , multiply  $-1$  and the divisor, and subtract.

$$\begin{array}{r} 2x^2 + x - 1 \\ 3x - 2 \overline{) 6x^3 - x^2 - 5x + 4} \\ \underline{6x^3 - 4x^2} \phantom{+ 4} \\ 3x^2 - 5x \phantom{+ 4} \\ \underline{3x^2 - 2x} \phantom{+ 4} \\ -3x + 4 \\ \oplus \phantom{-} \underline{-3x + 2} \\ 2 \end{array}$$

Divide:  $\frac{-3x}{3x} = -1$ .  
 Multiply:  $-1(3x - 2) = -3x + 2$ .  
 Subtract  $-3x + 2$  from  $-3x + 4$ , leaving a remainder of 2.

Change signs of the polynomial being subtracted.

Remainder

The quotient is  $2x^2 + x - 1$  and the remainder is 2. When there is a nonzero remainder, as in this example, list the quotient, plus the remainder above the divisor. Thus,

$$\frac{6x^3 - x^2 - 5x + 4}{3x - 2} = \underbrace{2x^2 + x - 1}_{\text{Quotient}} + \frac{2}{3x - 2} \quad \text{Remainder above divisor}$$

An important property of division can be illustrated by clearing fractions in the equation that concluded Example 2. Multiplying both sides of this equation by  $3x - 2$  results in the following equation:

$$\underbrace{6x^3 - x^2 - 5x + 4}_{\text{Dividend}} = \underbrace{(3x - 2)}_{\text{Divisor}} \underbrace{(2x^2 + x - 1)}_{\text{Quotient}} + \underbrace{2}_{\text{Remainder}}$$

Polynomial long division is checked by multiplying the divisor with the quotient and then adding the remainder. This should give the dividend. The process illustrates the **Division Algorithm**.

**The Division Algorithm**

If  $f(x)$  and  $d(x)$  are polynomials, with  $d(x) \neq 0$ , and the degree of  $d(x)$  is less than or equal to the degree of  $f(x)$ , then there exist unique polynomials  $q(x)$  and  $r(x)$  such that

$$\underbrace{f(x)}_{\text{Dividend}} = \underbrace{d(x)}_{\text{Divisor}} \cdot \underbrace{q(x)}_{\text{Quotient}} + \underbrace{r(x)}_{\text{Remainder}}$$

The remainder,  $r(x)$ , equals 0 or it is of degree less than the degree of  $d(x)$ . If  $r(x) = 0$ , we say that  $d(x)$  **divides evenly** into  $f(x)$  and that  $d(x)$  and  $q(x)$  are **factors** of  $f(x)$ .

**Check Point 2** Divide  $7 - 11x - 3x^2 + 2x^3$  by  $x - 3$ . Express the result in the form quotient, plus remainder divided by divisor.

If a power of  $x$  is missing in either a dividend or a divisor, add that power of  $x$  with a coefficient of 0 and then divide. In this way, like terms will be aligned as you carry out the long division.

**EXAMPLE 3** Long Division of Polynomials  
Divide  $6x^4 + 5x^3 + 3x - 5$  by  $3x^2 - 2x$ .

**SOLUTION**

We write the dividend,  $6x^4 + 5x^3 + 3x - 5$ , as  $6x^4 + 5x^3 + 0x^2 + 3x - 5$  to keep all like terms aligned.

Multiply.

$$\begin{array}{r}
 2x^2 + 3x + 2 \\
 3x^2 - 2x \overline{) 6x^4 + 5x^3 + 0x^2 + 3x - 5} \\
 \underline{6x^4 - 4x^3} \phantom{+ 0x^2 + 3x - 5} \\
 9x^3 + 0x^2 \phantom{+ 3x - 5} \\
 \underline{9x^3 - 6x^2} \phantom{+ 3x - 5} \\
 6x^2 + 3x - 5 \\
 \underline{6x^2 - 4x} \phantom{- 5} \\
 7x - 5
 \end{array}$$

$2x^2(3x^2 - 2x) = 6x^4 - 4x^3$   
 $3x(3x^2 - 2x) = 9x^3 - 6x^2$   
 $2(3x^2 - 2x) = 6x^2 - 4x$

Remainder  $7x - 5$

The division process is finished because the degree of  $7x - 5$ , which is 1, is less than the degree of the divisor  $3x^2 - 2x$ , which is 2. The answer is

$$\frac{6x^4 + 5x^3 + 3x - 5}{3x^2 - 2x} = 2x^2 + 3x + 2 + \frac{7x - 5}{3x^2 - 2x}. \quad \dots$$

**Check Point 3** Divide  $2x^4 + 3x^3 - 7x - 10$  by  $x^2 - 2x$ .

**2** Use synthetic division to divide polynomials.

**Dividing Polynomials Using Synthetic Division**

We can use **synthetic division** to divide polynomials if the divisor is of the form  $x - c$ . This method provides a quotient more quickly than long division. Let's compare the two methods showing  $x^3 + 4x^2 - 5x + 5$  divided by  $x - 3$ .

Long Division	Synthetic Division
<div style="display: flex; justify-content: space-between;"> <div style="border: 1px solid gray; padding: 2px;">Divisor <math>x - c</math>; <math>c = 3</math></div> <div style="text-align: center;"> <math display="block">  \begin{array}{r}  x^2 + 7x + 16 \\  x - 3 \overline{) x^3 + 4x^2 - 5x + 5} \\  \underline{x^3 - 3x^2} \phantom{- 5x + 5} \\  7x^2 - 5x \phantom{+ 5} \\  \underline{7x^2 - 21x} \phantom{+ 5} \\  16x + 5 \\  \underline{16x - 48} \\  53  \end{array}  </math> </div> <div style="border: 1px solid gray; padding: 2px;">Quotient</div> </div> <div style="text-align: center; margin-top: 10px;"> <math display="block">  \begin{array}{r}  3 \overline{) 1 \ 4 \ -5 \ 5} \\  \underline{3 \ 12 \ 48} \\  1 \ 7 \ 16 \ 53  \end{array}  </math> </div> <div style="border: 1px solid gray; padding: 2px; margin-top: 10px; text-align: center;">Remainder</div>	<div style="text-align: center;"> <math display="block">  \begin{array}{r}  3 \overline{) 1 \ 4 \ -5 \ 5} \\  \underline{3 \ 12 \ 48} \\  1 \ 7 \ 16 \ 53  \end{array}  </math> </div>

Notice the relationship between the polynomials in the long division process and the numbers that appear in synthetic division.

These are the coefficients of the dividend  $x^3 + 4x^2 - 5x + 5$ .  
 The divisor is  $x - 3$ . This is 3, or  $c$ , in  $x - c$ .  
 These are the coefficients of the quotient  $x^2 + 7x + 16$ .  
 This is the remainder.

Now let's look at the steps involved in synthetic division.

### Synthetic Division

To divide a polynomial by  $x - c$ :

#### Example

1. Arrange the polynomial in descending powers, with a 0 coefficient for any missing term.
2. Write  $c$  for the divisor,  $x - c$ . To the right, write the coefficients of the dividend.
3. Write the leading coefficient of the dividend on the bottom row.
4. Multiply  $c$  (in this case, 3) times the value just written on the bottom row. Write the product in the next column in the second row.
5. Add the values in this new column, writing the sum in the bottom row.
6. Repeat this series of multiplications and additions until all columns are filled in.
7. Use the numbers in the last row to write the quotient, plus the remainder above the divisor. **The degree of the first term of the quotient is one less than the degree of the first term of the dividend.** The final value in this row is the remainder.

$$x - 3 \overline{) x^3 + 4x^2 - 5x + 5}$$

$$\begin{array}{r|rrrr} 3 & 1 & 4 & -5 & 5 \end{array}$$

$$\begin{array}{r|rrrr} 3 & 1 & 4 & -5 & 5 \\ & \downarrow & & & \\ & \text{Bring down 1.} & & & \end{array}$$

$$\begin{array}{r|rrrr} 3 & 1 & 4 & -5 & 5 \\ & & 3 & & \\ \hline & 1 & & & \end{array}$$

Multiply by 3:  $3 \cdot 1 = 3$ .

$$\begin{array}{r|rrrr} 3 & 1 & 4 & -5 & 5 \\ & & 3 & & \\ \hline & 1 & 7 & & \end{array}$$

Add.

$$\begin{array}{r|rrrr} 3 & 1 & 4 & -5 & 5 \\ & & 3 & 21 & \\ \hline & 1 & 7 & 16 & \end{array}$$

Multiply by 3:  $3 \cdot 7 = 21$ .

$$\begin{array}{r|rrrr} 3 & 1 & 4 & -5 & 5 \\ & & 3 & 21 & 48 \\ \hline & 1 & 7 & 16 & 53 \end{array}$$

Add.

Multiply by 3:  $3 \cdot 16 = 48$ .

Written from the last row of the synthetic division

$$1x^2 + 7x + 16 + \frac{53}{x - 3}$$

$$x - 3 \overline{) x^3 + 4x^2 - 5x + 5}$$

### EXAMPLE 4 Using Synthetic Division

Use synthetic division to divide  $5x^3 + 6x + 8$  by  $x + 2$ .

#### SOLUTION

The divisor must be in the form  $x - c$ . Thus, we write  $x + 2$  as  $x - (-2)$ . This means that  $c = -2$ . Writing a 0 coefficient for the missing  $x^2$ -term in the dividend, we can express the division as follows:

$$x - (-2) \overline{) 5x^3 + 0x^2 + 6x + 8}$$

Now we are ready to set up the problem so that we can use synthetic division.

$$x - (-2) \overline{) 5x^3 + 0x^2 + 6x + 8}$$

The given division problem (repeated)

Use the coefficients of the dividend  $5x^3 + 0x^2 + 6x + 8$  in descending powers of  $x$ .

This is  $c$  in  $x - (-2)$ .

We begin the synthetic division process by bringing down 5. This is followed by a series of multiplications and additions.

**1. Bring down 5.**

$$\begin{array}{r|rrrr} -2 & 5 & 0 & 6 & 8 \\ & \downarrow & & & \\ & 5 & & & \end{array}$$

**2. Multiply:  $-2(5) = -10$ .**

$$\begin{array}{r|rrrr} -2 & 5 & 0 & 6 & 8 \\ & \downarrow & -10 & & \\ & 5 & & & \end{array}$$

Multiply 5 by  $-2$ .

**3. Add:  $0 + (-10) = -10$ .**

$$\begin{array}{r|rrrr} -2 & 5 & 0 & 6 & 8 \\ & \downarrow & -10 & & \text{Add.} \\ & 5 & -10 & & \end{array}$$

**4. Multiply:  $-2(-10) = 20$ .**

$$\begin{array}{r|rrrr} -2 & 5 & 0 & 6 & 8 \\ & \downarrow & -10 & 20 & \\ & 5 & -10 & & \end{array}$$

Multiply  $-10$  by  $-2$ .

**5. Add:  $6 + 20 = 26$ .**

$$\begin{array}{r|rrrr} -2 & 5 & 0 & 6 & 8 \\ & \downarrow & -10 & 20 & \text{Add.} \\ & 5 & -10 & 26 & \end{array}$$

**6. Multiply:  $-2(26) = -52$ .**

$$\begin{array}{r|rrrr} -2 & 5 & 0 & 6 & 8 \\ & \downarrow & -10 & 20 & -52 \\ & 5 & -10 & 26 & \end{array}$$

Multiply 26 by  $-2$ .

**7. Add:  $8 + (-52) = -44$ .**

$$\begin{array}{r|rrrr} -2 & 5 & 0 & 6 & 8 \\ & \downarrow & -10 & 20 & -52 \\ & 5 & -10 & 26 & -44 \end{array}$$

The numbers in the last row represent the coefficients of the quotient and the remainder. The degree of the first term of the quotient is one less than that of the dividend. Because the degree of the dividend,  $5x^3 + 6x + 8$ , is 3, the degree of the quotient is 2. This means that the 5 in the last row represents  $5x^2$ .

$$\begin{array}{r|rrrr} -2 & 5 & 0 & 6 & 8 \\ & \downarrow & -10 & 20 & -52 \\ & 5 & -10 & 26 & -44 \end{array}$$

The quotient is  $5x^2 - 10x + 26$ .

The remainder is  $-44$ .

Thus,

$$\frac{5x^2 - 10x + 26 - \frac{44}{x + 2}}{x + 2 \overline{) 5x^3 + 6x + 8}}$$

**Check Point 4** Use synthetic division to divide  $x^3 - 7x - 6$  by  $x + 2$ .

**3** Evaluate a polynomial using the Remainder Theorem.

### The Remainder Theorem

Let's consider the Division Algorithm when the dividend,  $f(x)$ , is divided by  $x - c$ . In this case, the remainder must be a constant because its degree is less than one, the degree of  $x - c$ .

$$f(x) = (x - c)q(x) + r$$

Dividend

Divisor

Quotient

The remainder,  $r$ , is a constant when dividing by  $x - c$ .

Now let's evaluate  $f$  at  $c$ .

$$\begin{aligned} f(c) &= (c - c)q(c) + r && \text{Find } f(c) \text{ by letting } x = c \text{ in } f(x) = (x - c)q(x) + r. \\ &&& \text{This will give an expression for } r. \\ f(c) &= 0 \cdot q(c) + r && c - c = 0 \\ f(c) &= r && 0 \cdot q(c) = 0 \text{ and } 0 + r = r. \end{aligned}$$

What does this last equation mean? If a polynomial is divided by  $x - c$ , the remainder is the value of the polynomial at  $c$ . This result is called the **Remainder Theorem**.

### The Remainder Theorem

If the polynomial  $f(x)$  is divided by  $x - c$ , then the remainder is  $f(c)$ .

Example 5 shows how we can use the Remainder Theorem to evaluate a polynomial function at 2. Rather than substituting 2 for  $x$ , we divide the function by  $x - 2$ . The remainder is  $f(2)$ .

### EXAMPLE 5 Using the Remainder Theorem to Evaluate a Polynomial Function

Given  $f(x) = x^3 - 4x^2 + 5x + 3$ , use the Remainder Theorem to find  $f(2)$ .

#### SOLUTION

By the Remainder Theorem, if  $f(x)$  is divided by  $x - 2$ , then the remainder is  $f(2)$ . We'll use synthetic division to divide.

$$\begin{array}{r|rrrr} 2 & 1 & -4 & 5 & 3 \\ & & 2 & -4 & 2 \\ \hline & 1 & -2 & 1 & 5 \end{array}$$

Remainder

The remainder, 5, is the value of  $f(2)$ . Thus,  $f(2) = 5$ . We can verify that this is correct by evaluating  $f(2)$  directly. Using  $f(x) = x^3 - 4x^2 + 5x + 3$ , we obtain

$$f(2) = 2^3 - 4 \cdot 2^2 + 5 \cdot 2 + 3 = 8 - 16 + 10 + 3 = 5. \quad \dots$$

 **Check Point 5** Given  $f(x) = 3x^3 + 4x^2 - 5x + 3$ , use the Remainder Theorem to find  $f(-4)$ .

- 4 Use the Factor Theorem to solve a polynomial equation.

### The Factor Theorem

Let's look again at the Division Algorithm when the divisor is of the form  $x - c$ .

$$f(x) = (x - c)q(x) + r$$

Dividend
Divisor
Quotient
Constant remainder

By the Remainder Theorem, the remainder  $r$  is  $f(c)$ , so we can substitute  $f(c)$  for  $r$ :

$$f(x) = (x - c)q(x) + f(c).$$

Notice that if  $f(c) = 0$ , then

$$f(x) = (x - c)q(x)$$

so that  $x - c$  is a factor of  $f(x)$ . This means that for the polynomial function  $f(x)$ , if  $f(c) = 0$ , then  $x - c$  is a factor of  $f(x)$ .

Let's reverse directions and see what happens if  $x - c$  is a factor of  $f(x)$ . This means that

$$f(x) = (x - c)q(x).$$

If we replace  $x$  in  $f(x) = (x - c)q(x)$  with  $c$ , we obtain

$$f(c) = (c - c)q(c) = 0 \cdot q(c) = 0.$$

Thus, if  $x - c$  is a factor of  $f(x)$ , then  $f(c) = 0$ .

We have proved a result known as the **Factor Theorem**.

### The Factor Theorem

Let  $f(x)$  be a polynomial.

- If  $f(c) = 0$ , then  $x - c$  is a factor of  $f(x)$ .
- If  $x - c$  is a factor of  $f(x)$ , then  $f(c) = 0$ .

The example that follows shows how the Factor Theorem can be used to solve a polynomial equation.

### EXAMPLE 6 Using the Factor Theorem

Solve the equation  $2x^3 - 3x^2 - 11x + 6 = 0$  given that 3 is a zero of  $f(x) = 2x^3 - 3x^2 - 11x + 6$ .

### SOLUTION

We are given that 3 is a zero of  $f(x) = 2x^3 - 3x^2 - 11x + 6$ . This means that  $f(3) = 0$ . Because  $f(3) = 0$ , the Factor Theorem tells us that  $x - 3$  is a factor of  $f(x)$ . We'll use synthetic division to divide  $f(x)$  by  $x - 3$ .

$$\begin{array}{r|rrrr} 3 & 2 & -3 & -11 & 6 \\ & & 6 & 9 & -6 \\ \hline & 2 & 3 & -2 & 0 \end{array} \quad x - 3 \overline{) 2x^3 - 3x^2 - 11x + 6}$$

Equivalently,

$$2x^3 - 3x^2 - 11x + 6 = (x - 3)(2x^2 + 3x - 2).$$

The remainder, 0, verifies that  $x - 3$  is a factor of  $2x^3 - 3x^2 - 11x + 6$ .

Now we can solve the polynomial equation.

$$\begin{aligned} 2x^3 - 3x^2 - 11x + 6 &= 0 \\ (x - 3)(2x^2 + 3x - 2) &= 0 \\ (x - 3)(2x - 1)(x + 2) &= 0 \\ x - 3 = 0 \quad \text{or} \quad 2x - 1 = 0 \quad \text{or} \quad x + 2 = 0 \\ x = 3 \quad \quad \quad x = \frac{1}{2} \quad \quad \quad x = -2 \end{aligned}$$

This is the given equation.

Factor using the result from the synthetic division.

Factor the trinomial.

Set each factor equal to 0.

Solve for  $x$ .

The solution set is  $\{-2, \frac{1}{2}, 3\}$ .

## TECHNOLOGY

### Graphic Connections

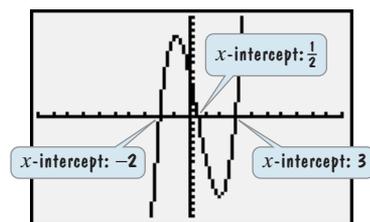

Because the solution set of

$$2x^3 - 3x^2 - 11x + 6 = 0$$

is  $\{-2, \frac{1}{2}, 3\}$ , this implies that the polynomial function

$$f(x) = 2x^3 - 3x^2 - 11x + 6$$

has  $x$ -intercepts (or zeros) at  $-2$ ,  $\frac{1}{2}$ , and 3. This is verified by the graph of  $f$ .

$[-10, 10, 1]$  by  $[-15, 15, 1]$

Based on the Factor Theorem, the following statements are useful in solving polynomial equations:

1. If  $f(x)$  is divided by  $x - c$  and the remainder is zero, then  $c$  is a zero of  $f$  and  $c$  is a root of the polynomial equation  $f(x) = 0$ .
2. If  $f(x)$  is divided by  $x - c$  and the remainder is zero, then  $x - c$  is a factor of  $f(x)$ .

 **Check Point 6** Solve the equation  $15x^3 + 14x^2 - 3x - 2 = 0$  given that  $-1$  is a zero of  $f(x) = 15x^3 + 14x^2 - 3x - 2$ .

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

1. Consider the following long division problem:

$$x + 4 \overline{)6x - 4 + 2x^3}$$

We begin the division process by rewriting the dividend as \_\_\_\_\_.

2. Consider the following long division problem:

$$3x - 1 \overline{)6x^3 + 7x^2 + 12x - 5}$$

We begin the division process by dividing \_\_\_\_\_ by \_\_\_\_\_. We obtain \_\_\_\_\_. We write this result above \_\_\_\_\_ in the dividend.

3. In the following long division problem, the first step has been completed:

$$5x - 2 \overline{)10x^3 + 6x^2 - 9x + 10} \quad \begin{array}{r} 2x^2 \\ \hline \end{array}$$

The next step is to multiply \_\_\_\_\_ and \_\_\_\_\_. We obtain \_\_\_\_\_. We write this result below \_\_\_\_\_.

4. In the following long division problem, the first two steps have been completed:

$$3x - 5 \overline{)6x^2 + 8x - 4} \quad \begin{array}{r} 2x \\ \hline 6x^2 - 10x \\ \hline \end{array}$$

The next step is to subtract \_\_\_\_\_ from \_\_\_\_\_. We obtain \_\_\_\_\_. Then we bring down \_\_\_\_\_ and form the new dividend \_\_\_\_\_.

5. In the following long division problem, most of the steps have been completed:

$$2x + 1 \overline{)6x^2 - 7x + 4} \quad \begin{array}{r} 3x - 5 \\ \hline 6x^2 + 3x \\ \hline -10x + 4 \\ \hline -10x - 5 \\ \hline ? \end{array}$$

Completing the step designated by the question mark, we obtain \_\_\_\_\_. Thus, the quotient is \_\_\_\_\_ and the remainder is \_\_\_\_\_. The answer to this long division problem is \_\_\_\_\_.

6. After performing polynomial long division, the answer may be checked by multiplying the \_\_\_\_\_ by the \_\_\_\_\_, and then adding the \_\_\_\_\_. You should obtain the \_\_\_\_\_.
7. To divide  $x^3 + 5x^2 - 7x + 1$  by  $x - 4$  using synthetic division, the first step is to write

$$\begin{array}{r} \phantom{0} \\ \phantom{0} \\ \phantom{0} \\ \phantom{0} \\ \hline \end{array} \quad \begin{array}{r} \phantom{0} \\ \phantom{0} \\ \phantom{0} \\ \phantom{0} \\ \phantom{0} \end{array}$$

8. To divide  $4x^3 - 8x - 2$  by  $x + 5$  using synthetic division, the first step is to write

$$\begin{array}{r} \phantom{0} \\ \phantom{0} \\ \phantom{0} \\ \phantom{0} \\ \hline \end{array} \quad \begin{array}{r} \phantom{0} \\ \phantom{0} \\ \phantom{0} \\ \phantom{0} \\ \phantom{0} \end{array}$$

9. True or false:

$$\begin{array}{r} -1 \\ \hline 3 \quad -4 \quad 2 \quad -1 \\ \phantom{0} \quad -3 \quad 7 \quad -9 \\ \hline 3 \quad -7 \quad 9 \quad -10 \end{array} \text{ means}$$

$$\frac{3x^3 - 4x^2 + 2x - 1}{x + 1} = 3x^2 - 7x + 9 - \frac{10}{x + 1}$$

10. The Remainder Theorem states that if the polynomial  $f(x)$  is divided by  $x - c$ , then the remainder is \_\_\_\_\_.
11. The Factor Theorem states that if  $f$  is a polynomial function and  $f(c) = 0$ , then \_\_\_\_\_ is a factor of  $f(x)$ .

## EXERCISE SET 2.4

### Practice Exercises

In Exercises 1–16, divide using long division. State the quotient,  $q(x)$ , and the remainder,  $r(x)$ .

1.  $(x^2 + 8x + 15) \div (x + 5)$
2.  $(x^2 + 3x - 10) \div (x - 2)$
3.  $(x^3 + 5x^2 + 7x + 2) \div (x + 2)$

4.  $(x^3 - 2x^2 - 5x + 6) \div (x - 3)$
5.  $(6x^3 + 7x^2 + 12x - 5) \div (3x - 1)$
6.  $(6x^3 + 17x^2 + 27x + 20) \div (3x + 4)$
7.  $(12x^2 + x - 4) \div (3x - 2)$
8.  $(4x^2 - 8x + 6) \div (2x - 1)$

9.  $\frac{2x^3 + 7x^2 + 9x - 20}{x + 3}$       10.  $\frac{3x^2 - 2x + 5}{x - 3}$   
 11.  $\frac{4x^4 - 4x^2 + 6x}{x - 4}$       12.  $\frac{x^4 - 81}{x - 3}$   
 13.  $\frac{6x^3 + 13x^2 - 11x - 15}{3x^2 - x - 3}$       14.  $\frac{x^4 + 2x^3 - 4x^2 - 5x - 6}{x^2 + x - 2}$   
 15.  $\frac{18x^4 + 9x^3 + 3x^2}{3x^2 + 1}$       16.  $\frac{2x^5 - 8x^4 + 2x^3 + x^2}{2x^3 + 1}$

In Exercises 17–32, divide using synthetic division.

17.  $(2x^2 + x - 10) \div (x - 2)$       18.  $(x^2 + x - 2) \div (x - 1)$   
 19.  $(3x^2 + 7x - 20) \div (x + 5)$   
 20.  $(5x^2 - 12x - 8) \div (x + 3)$   
 21.  $(4x^3 - 3x^2 + 3x - 1) \div (x - 1)$   
 22.  $(5x^3 - 6x^2 + 3x + 11) \div (x - 2)$   
 23.  $(6x^5 - 2x^3 + 4x^2 - 3x + 1) \div (x - 2)$   
 24.  $(x^5 + 4x^4 - 3x^2 + 2x + 3) \div (x - 3)$   
 25.  $(x^2 - 5x - 5x^3 + x^4) \div (5 + x)$   
 26.  $(x^2 - 6x - 6x^3 + x^4) \div (6 + x)$   
 27.  $\frac{x^5 + x^3 - 2}{x - 1}$       28.  $\frac{x^7 + x^5 - 10x^3 + 12}{x + 2}$   
 29.  $\frac{x^4 - 256}{x - 4}$       30.  $\frac{x^7 - 128}{x - 2}$   
 31.  $\frac{2x^5 - 3x^4 + x^3 - x^2 + 2x - 1}{x + 2}$   
 32.  $\frac{x^5 - 2x^4 - x^3 + 3x^2 - x + 1}{x - 2}$

In Exercises 33–40, use synthetic division and the Remainder Theorem to find the indicated function value.

33.  $f(x) = 2x^3 - 11x^2 + 7x - 5$ ;  $f(4)$   
 34.  $f(x) = x^3 - 7x^2 + 5x - 6$ ;  $f(3)$   
 35.  $f(x) = 3x^3 - 7x^2 - 2x + 5$ ;  $f(-3)$   
 36.  $f(x) = 4x^3 + 5x^2 - 6x - 4$ ;  $f(-2)$   
 37.  $f(x) = x^4 + 5x^3 + 5x^2 - 5x - 6$ ;  $f(3)$   
 38.  $f(x) = x^4 - 5x^3 + 5x^2 + 5x - 6$ ;  $f(2)$   
 39.  $f(x) = 2x^4 - 5x^3 - x^2 + 3x + 2$ ;  $f\left(-\frac{1}{2}\right)$   
 40.  $f(x) = 6x^4 + 10x^3 + 5x^2 + x + 1$ ;  $f\left(-\frac{2}{3}\right)$   
 41. Use synthetic division to divide  
 $f(x) = x^3 - 4x^2 + x + 6$  by  $x + 1$ .  
 Use the result to find all zeros of  $f$ .  
 42. Use synthetic division to divide  
 $f(x) = x^3 - 2x^2 - x + 2$  by  $x + 1$ .

Use the result to find all zeros of  $f$ .

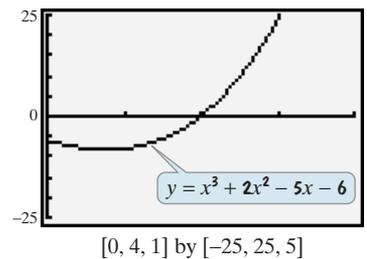

43. Solve the equation  $2x^3 - 5x^2 + x + 2 = 0$  given that 2 is a zero of  $f(x) = 2x^3 - 5x^2 + x + 2$ .  
 44. Solve the equation  $2x^3 - 3x^2 - 11x + 6 = 0$  given that  $-2$  is a zero of  $f(x) = 2x^3 - 3x^2 - 11x + 6$ .

45. Solve the equation  $12x^3 + 16x^2 - 5x - 3 = 0$  given that  $-\frac{3}{2}$  is a root.  
 46. Solve the equation  $3x^3 + 7x^2 - 22x - 8 = 0$  given that  $-\frac{1}{3}$  is a root.

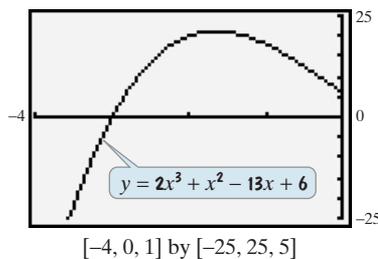

**Practice Plus**

In Exercises 47–50, use the graph or the table to determine a solution of each equation. Use synthetic division to verify that this number is a solution of the equation. Then solve the polynomial equation.

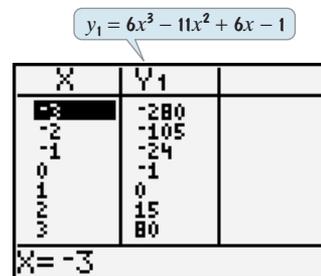

47.  $x^3 + 2x^2 - 5x - 6 = 0$

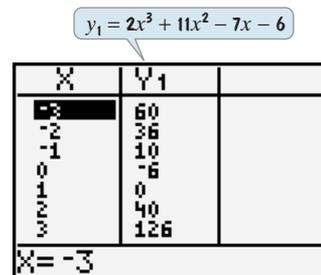

48.  $2x^3 + x^2 - 13x + 6 = 0$

49.  $6x^3 - 11x^2 + 6x - 1 = 0$

50.  $2x^3 + 11x^2 - 7x - 6 = 0$

**Application Exercises**

51. a. Use synthetic division to show that 3 is a solution of the polynomial equation  
 $14x^3 - 17x^2 - 16x - 177 = 0$ .

- b. Use the solution from part (a) to solve this problem. The number of eggs,  $f(x)$ , in a female moth is a function of her abdominal width,  $x$ , in millimeters, modeled by

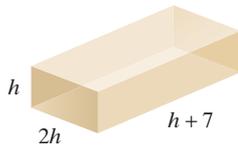

$$f(x) = 14x^3 - 17x^2 - 16x + 34.$$

What is the abdominal width when there are 211 eggs?

52. a. Use synthetic division to show that 2 is a solution of the polynomial equation

$$2h^3 + 14h^2 - 72 = 0.$$

- b. Use the solution from part (a) to solve this problem. The width of a rectangular box is twice the height and the length is 7 inches more than the height. If the volume is 72 cubic inches, find the dimensions of the box.

In Exercises 53–54, write a polynomial that represents the length of each rectangle.

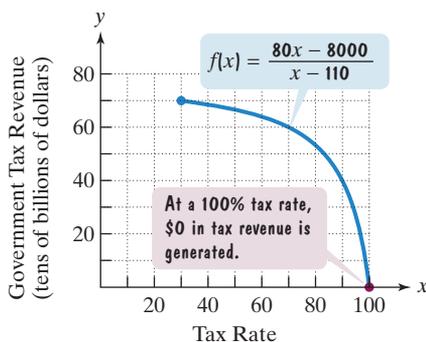

53. The diagram shows a light blue rectangle. A callout box points to the right side and says "The width is  $x + 0.2$  units." Another callout box points to the bottom side and says "The area is  $0.5x^3 - 0.3x^2 + 0.22x + 0.06$  square units."

54. The diagram shows a light blue rectangle. A callout box points to the right side and says "The width is  $x + \frac{3}{4}$  units." Another callout box points to the bottom side and says "The area is  $8x^3 - 6x^2 - 5x + 3$  square units."

During the 1980s, the controversial economist Arthur Laffer promoted the idea that tax increases lead to a reduction in government revenue. Called supply-side economics, the theory uses functions such as

$$f(x) = \frac{80x - 8000}{x - 110}, 30 \leq x \leq 100.$$

This function models the government tax revenue,  $f(x)$ , in tens of billions of dollars, in terms of the tax rate,  $x$ . The graph of the function is shown. It illustrates tax revenue decreasing quite dramatically as the tax rate increases. At a tax rate of (gasp) 100%, the government takes all our money and no one has an incentive to work. With no income earned, zero dollars in tax revenue is generated.

Use function  $f$  and its graph to solve Exercises 55–56.

55. a. Find and interpret  $f(30)$ . Identify the solution as a point on the graph of the function.

- b. Rewrite the function by using long division to perform  $(80x - 8000) \div (x - 110)$ .

Then use this new form of the function to find  $f(30)$ . Do you obtain the same answer as you did in part (a)?

- c. Is  $f$  a polynomial function? Explain your answer.

56. a. Find and interpret  $f(40)$ . Identify the solution as a point on the graph of the function.

- b. Rewrite the function by using long division to perform  $(80x - 8000) \div (x - 110)$ .

Then use this new form of the function to find  $f(40)$ . Do you obtain the same answer as you did in part (a)?

- c. Is  $f$  a polynomial function? Explain your answer.

### Writing in Mathematics

57. Explain how to perform long division of polynomials. Use  $2x^3 - 3x^2 - 11x + 7$  divided by  $x - 3$  in your explanation.

58. In your own words, state the Division Algorithm.

59. How can the Division Algorithm be used to check the quotient and remainder in a long division problem?

60. Explain how to perform synthetic division. Use the division problem in Exercise 57 to support your explanation.

61. State the Remainder Theorem.

62. Explain how the Remainder Theorem can be used to find  $f(-6)$  if  $f(x) = x^4 + 7x^3 + 8x^2 + 11x + 5$ . What advantage is there to using the Remainder Theorem in this situation rather than evaluating  $f(-6)$  directly?

63. How can the Factor Theorem be used to determine if  $x - 1$  is a factor of  $x^3 - 2x^2 - 11x + 12$ ?

64. If you know that  $-2$  is a zero of

$$f(x) = x^3 + 7x^2 + 4x - 12,$$

explain how to solve the equation

$$x^3 + 7x^2 + 4x - 12 = 0.$$

### Technology Exercise

65. For each equation that you solved in Exercises 43–46, use a graphing utility to graph the polynomial function defined by the left side of the equation. Use end behavior to obtain a complete graph. Then use the graph's  $x$ -intercepts to verify your solutions.

### Critical Thinking Exercises

**Make Sense?** In Exercises 66–69, determine whether each statement makes sense or does not make sense, and explain your reasoning.

66. When performing the division  $(x^5 + 1) \div (x + 1)$ , there's no need for me to follow all the steps involved in polynomial long division because I can work the problem in my head and see that the quotient must be  $x^4 + 1$ .

67. Every time I divide polynomials using synthetic division, I am using a highly condensed form of the long division procedure where omitting the variables and exponents does not involve the loss of any essential data.

68. The only nongraphic method that I have for evaluating a function at a given value is to substitute that value into the function's equation.
69. I found the zeros of function  $f$ , but I still need to find the solutions of the equation  $f(x) = 0$ .

*In Exercises 70–73, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.*

70. If a trinomial in  $x$  of degree 6 is divided by a trinomial in  $x$  of degree 3, the degree of the quotient is 2.
71. Synthetic division can be used to find the quotient of  $10x^3 - 6x^2 + 4x - 1$  and  $x - \frac{1}{2}$ .
72. Any problem that can be done by synthetic division can also be done by the method for long division of polynomials.
73. If a polynomial long-division problem results in a remainder that is a whole number, then the divisor is a factor of the dividend.
74. Find  $k$  so that  $4x + 3$  is a factor of  $20x^3 + 23x^2 - 10x + k$ .

75. When  $2x^2 - 7x + 9$  is divided by a polynomial, the quotient is  $2x - 3$  and the remainder is 3. Find the polynomial.
76. Find the quotient of  $x^{3n} + 1$  and  $x^n + 1$ .
77. Synthetic division is a process for dividing a polynomial by  $x - c$ . The coefficient of  $x$  in the divisor is 1. How might synthetic division be used if you are dividing by  $2x - 4$ ?
78. Use synthetic division to show that 5 is a solution of

$$x^4 - 4x^3 - 9x^2 + 16x + 20 = 0.$$

Then solve the polynomial equation.

### Preview Exercises

*Exercises 79–81 will help you prepare for the material covered in the next section.*

79. Solve:  $x^2 + 4x - 1 = 0$ .
80. Solve:  $x^2 + 4x + 6 = 0$ .
81. Let  $f(x) = a_n(x^4 - 3x^2 - 4)$ . If  $f(3) = -150$ , determine the value of  $a_n$ .

## SECTION 2.5

### Zeros of Polynomial Functions

#### Objectives

- 1 Use the Rational Zero Theorem to find possible rational zeros.
- 2 Find zeros of a polynomial function.
- 3 Solve polynomial equations.
- 4 Use the Linear Factorization Theorem to find polynomials with given zeros.
- 5 Use Descartes's Rule of Signs.

HIERONYMVS CARDANVS.

You stole my formula!

#### Tartaglia's Secret Formula for One Solution of $x^3 + mx = n$

$$x = \sqrt[3]{\sqrt{\left(\frac{n}{2}\right)^2 + \left(\frac{m}{3}\right)^3} + \frac{n}{2}} - \sqrt[3]{\sqrt{\left(\frac{n}{2}\right)^2 + \left(\frac{m}{3}\right)^3} - \frac{n}{2}}$$

Popularizers of mathematics are sharing bizarre stories that are giving math a secure place in popular culture. One episode, able to compete with the wildest fare served up by television talk shows and the tabloids, involves three Italian mathematicians and, of all things, zeros of polynomial functions.

Tartaglia (1499–1557), poor and starving, has found a formula that gives a root for a third-degree polynomial equation. Cardano (1501–1576) begs Tartaglia to reveal the secret formula, wheedling it from him with the promise he will find the impoverished Tartaglia a patron. Then Cardano publishes his famous work *Ars Magna*, in which he presents Tartaglia's formula as his own. Cardano uses his most talented student, Ferrari (1522–1565), who derived a formula for a root of a fourth-degree polynomial equation, to falsely accuse Tartaglia of plagiarism. The dispute becomes violent and Tartaglia is fortunate to escape alive.

The noise from this “You Stole My Formula” episode is quieted by the work of French mathematician Evariste Galois (1811–1832). Galois proved that there is no general formula for finding roots of polynomial equations of degree 5 or higher. There are, however, methods for finding roots. In this section, we study methods for finding zeros of polynomial functions. We begin with a theorem that plays an important role in this process.

### GREAT QUESTION!

**When finding zeros of polynomial functions, what kinds of numbers can I get?**

Here’s a quick example that involves all possible kinds of zeros:

$$f(x) = (x + 3)(2x - 1)(x + \sqrt{2})(x - \sqrt{2})(x - 4 + 5i)(x - 4 - 5i).$$

**Zeros:**  $-3, \frac{1}{2}, -\sqrt{2}, \sqrt{2}, 4 - 5i, 4 + 5i$

Rational zeros
Irrational zeros
Complex imaginary zeros

Real zeros
Nonreal zeros

- 1 Use the Rational Zero Theorem to find possible rational zeros.

### The Rational Zero Theorem

The *Rational Zero Theorem* provides us with a tool that we can use to make a list of all possible rational zeros of a polynomial function. Equivalently, the theorem gives all possible rational roots of a polynomial equation. Not every number in the list will be a zero of the function, but every rational zero of the polynomial function will appear somewhere in the list.

#### The Rational Zero Theorem

If  $f(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_1 x + a_0$  has integer coefficients and  $\frac{p}{q}$  (where  $\frac{p}{q}$  is reduced to lowest terms) is a rational zero of  $f$ , then  $p$  is a factor of the constant term,  $a_0$ , and  $q$  is a factor of the leading coefficient,  $a_n$ .

You can explore the “why” behind the Rational Zero Theorem in Exercise 92 of Exercise Set 2.5. For now, let’s see if we can figure out what the theorem tells us about possible rational zeros. To use the theorem, list all the integers that are factors of the constant term,  $a_0$ . Then list all the integers that are factors of the leading coefficient,  $a_n$ . Finally, list all possible rational zeros:

$$\text{Possible rational zeros} = \frac{\text{Factors of the constant term}}{\text{Factors of the leading coefficient}}.$$

#### EXAMPLE 1 Using the Rational Zero Theorem

List all possible rational zeros of  $f(x) = -x^4 + 3x^2 + 4$ .

#### SOLUTION

The constant term is 4. We list all of its factors:  $\pm 1, \pm 2, \pm 4$ . The leading coefficient is  $-1$ . Its factors are  $\pm 1$ .

Factors of the constant term, 4:  $\pm 1, \pm 2, \pm 4$

Factors of the leading coefficient,  $-1$ :  $\pm 1$

Because

$$\text{Possible rational zeros} = \frac{\text{Factors of the constant term}}{\text{Factors of the leading coefficient}},$$

we must take each number in the first row,  $\pm 1$ ,  $\pm 2$ ,  $\pm 4$ , and divide by each number in the second row,  $\pm 1$ .

$$\text{Possible rational zeros} = \frac{\text{Factors of 4}}{\text{Factors of } -1} = \frac{\pm 1, \pm 2, \pm 4}{\pm 1} = \pm 1, \pm 2, \pm 4$$

Divide  $\pm 1$   
by  $\pm 1$ .

Divide  $\pm 2$   
by  $\pm 1$ .

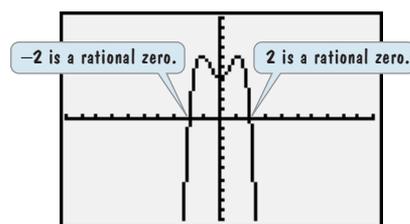

Divide  $\pm 4$   
by  $\pm 1$ .

## GREAT QUESTION!

**What's the relationship among zeros, roots, and  $x$ -intercepts?**

The zeros of a function  $f$  are the roots, or solutions, of the equation  $f(x) = 0$ . Furthermore, the real zeros, or real roots, are the  $x$ -intercepts of the graph of  $f$ .

There are six possible rational zeros. The graph of  $f(x) = -x^4 + 3x^2 + 4$  is shown in **Figure 2.28**. The  $x$ -intercepts are  $-2$  and  $2$ . Thus,  $-2$  and  $2$  are the actual rational zeros. ●●●

**FIGURE 2.28** The graph of  $f(x) = -x^4 + 3x^2 + 4$  shows that  $-2$  and  $2$  are rational zeros.

**Check Point 1** List all possible rational zeros of

$$f(x) = x^3 + 2x^2 - 5x - 6.$$

### EXAMPLE 2 Using the Rational Zero Theorem

List all possible rational zeros of  $f(x) = 15x^3 + 14x^2 - 3x - 2$ .

#### SOLUTION

The constant term is  $-2$  and the leading coefficient is  $15$ .

$$\begin{aligned} \text{Possible rational zeros} &= \frac{\text{Factors of the constant term, } -2}{\text{Factors of the leading coefficient, } 15} = \frac{\pm 1, \pm 2}{\pm 1, \pm 3, \pm 5, \pm 15} \\ &= \pm 1, \pm 2, \pm \frac{1}{3}, \pm \frac{2}{3}, \pm \frac{1}{5}, \pm \frac{2}{5}, \pm \frac{1}{15}, \pm \frac{2}{15} \end{aligned}$$

Divide  $\pm 1$   
and  $\pm 2$   
by  $\pm 1$ .

Divide  $\pm 1$   
and  $\pm 2$   
by  $\pm 3$ .

Divide  $\pm 1$   
and  $\pm 2$   
by  $\pm 5$ .

Divide  $\pm 1$   
and  $\pm 2$   
by  $\pm 15$ .

There are 16 possible rational zeros. The actual solution set of

$$15x^3 + 14x^2 - 3x - 2 = 0$$

is  $\{-1, -\frac{1}{3}, \frac{2}{5}\}$ , which contains three of the 16 possible zeros. ●●●

**Check Point 2** List all possible rational zeros of

$$f(x) = 4x^5 + 12x^4 - x - 3.$$

**2** Find zeros of a polynomial function.

How do we determine which (if any) of the possible rational zeros are rational zeros of the polynomial function? To find the first rational zero, we can use a trial-and-error process involving synthetic division: If  $f(x)$  is divided by  $x - c$  and the remainder is zero, then  $c$  is a zero of  $f$ . After we identify the first rational zero, we use the result of the synthetic division to factor the original polynomial. Then we set each factor equal to zero to identify any additional rational zeros.

### EXAMPLE 3 Finding Zeros of a Polynomial Function

Find all zeros of  $f(x) = x^3 + 2x^2 - 5x - 6$ .

**SOLUTION**

We begin by listing all possible rational zeros.

Possible rational zeros

$$= \frac{\text{Factors of the constant term, } -6}{\text{Factors of the leading coefficient, } 1} = \frac{\pm 1, \pm 2, \pm 3, \pm 6}{\pm 1} = \pm 1, \pm 2, \pm 3, \pm 6$$

Divide the eight numbers in the numerator by  $\pm 1$ .

Now we will use synthetic division to see if we can find a rational zero among the possible rational zeros  $\pm 1, \pm 2, \pm 3, \pm 6$ . Keep in mind that if  $f(x)$  is divided by  $x - c$  and the remainder is zero, then  $c$  is a zero of  $f$ . Let's start by testing 1. If 1 is not a rational zero, then we will test other possible rational zeros.

**Test 1.**

Possible rational zero  $\underline{1}$  |

Coefficients of $f(x) = x^3 + 2x^2 - 5x - 6$	1	2	-5	-6
		1	3	-2
	1	3	-2	-8

The nonzero remainder shows that 1 is not a zero.

**Test 2.**

Possible rational zero  $\underline{2}$  |

Coefficients of $f(x) = x^3 + 2x^2 - 5x - 6$	1	2	-5	-6
		2	8	6
	1	4	3	0

The zero remainder shows that 2 is a zero.

The zero remainder tells us that 2 is a zero of the polynomial function  $f(x) = x^3 + 2x^2 - 5x - 6$ . Equivalently, 2 is a solution, or root, of the polynomial equation  $x^3 + 2x^2 - 5x - 6 = 0$ . Thus,  $x - 2$  is a factor of the polynomial. The first three numbers in the bottom row of the synthetic division on the right, 1, 4, and 3, give the coefficients of the other factor. This factor is  $x^2 + 4x + 3$ .

$$x^3 + 2x^2 - 5x - 6 = 0 \quad \text{Finding the zeros of } f(x) = x^3 + 2x^2 - 5x - 6 \text{ is the same as finding the roots of this equation.}$$

$$(x - 2)(x^2 + 4x + 3) = 0 \quad \text{Factor using the result from the synthetic division.}$$

$$(x - 2)(x + 3)(x + 1) = 0 \quad \text{Factor completely.}$$

$$x - 2 = 0 \quad \text{or} \quad x + 3 = 0 \quad \text{or} \quad x + 1 = 0 \quad \text{Set each factor equal to zero.}$$

$$x = 2 \qquad x = -3 \qquad x = -1 \quad \text{Solve for } x.$$

The solution set is  $\{-3, -1, 2\}$ . The zeros of  $f$  are  $-3, -1$ , and  $2$ . ...

**Check Point 3** Find all zeros of

$$f(x) = x^3 + 8x^2 + 11x - 20.$$

Our work in Example 3 involved finding zeros of a third-degree polynomial function. The Rational Zero Theorem is a tool that allows us to rewrite such functions as products of two factors, one linear and one quadratic. Zeros of the quadratic factor are found by factoring, the quadratic formula, or the square root property.

**EXAMPLE 4** Finding Zeros of a Polynomial Function

Find all zeros of  $f(x) = x^3 + 7x^2 + 11x - 3$ .

**SOLUTION**

We begin by listing all possible rational zeros.

$$\text{Possible rational zeros} = \frac{\text{Factors of the constant term, } -3}{\text{Factors of the leading coefficient, } 1} = \frac{\pm 1, \pm 3}{\pm 1} = \pm 1, \pm 3$$

Now we will use synthetic division to see if we can find a rational zero among the four possible rational zeros,  $\pm 1, \pm 3$ , of  $f(x) = x^3 + 7x^2 + 11x - 3$ .

Test 1.	Test -1.	Test 3.	Test -3.
$\begin{array}{r rrrr} 1 & 1 & 7 & 11 & -3 \\ & & 1 & 8 & 19 \\ \hline & 1 & 8 & 19 & 16 \end{array}$	$\begin{array}{r rrrr} -1 & 1 & 7 & 11 & -3 \\ & & -1 & -6 & -5 \\ \hline & 1 & 6 & 5 & -8 \end{array}$	$\begin{array}{r rrrr} 3 & 1 & 7 & 11 & -3 \\ & & 3 & 30 & 123 \\ \hline & 1 & 10 & 41 & 120 \end{array}$	$\begin{array}{r rrrr} -3 & 1 & 7 & 11 & -3 \\ & & -3 & -12 & 3 \\ \hline & 1 & 4 & -1 & 0 \end{array}$

The zero remainder when testing  $-3$  tells us that  $-3$  is a zero of the polynomial function  $f(x) = x^3 + 7x^2 + 11x - 3$ . To find all zeros of  $f$ , we proceed as follows:

$$x^3 + 7x^2 + 11x - 3 = 0$$

$$(x + 3)(x^2 + 4x - 1) = 0$$

$$x + 3 = 0 \quad \text{or} \quad x^2 + 4x - 1 = 0$$

$$x = -3.$$

Finding the zeros of  $f$  is the same thing as finding the roots of  $f(x) = 0$ .

This result is from the last synthetic division, shown above. The first three numbers in the bottom row, 1, 4, and  $-1$ , give the coefficients of the second factor.

Set each factor equal to 0.

Solve the linear equation.

We can use the quadratic formula to solve  $x^2 + 4x - 1 = 0$ .

$$\begin{aligned} x &= \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \\ &= \frac{-4 \pm \sqrt{4^2 - 4(1)(-1)}}{2(1)} \\ &= \frac{-4 \pm \sqrt{20}}{2} \\ &= \frac{-4 \pm 2\sqrt{5}}{2} \\ &= -2 \pm \sqrt{5} \end{aligned}$$

We use the quadratic formula because  $x^2 + 4x - 1$  cannot be factored.

Let  $a = 1$ ,  $b = 4$ , and  $c = -1$ .

Multiply and subtract under the radical:  
 $4^2 - 4(1)(-1) = 16 - (-4) = 16 + 4 = 20$ .

$$\sqrt{20} = \sqrt{4 \cdot 5} = 2\sqrt{5}$$

Divide the numerator and the denominator by 2.

The solution set is  $\{-3, -2 - \sqrt{5}, -2 + \sqrt{5}\}$ . The zeros of  $f(x) = x^3 + 7x^2 + 11x - 3$  are  $-3, -2 - \sqrt{5}$ , and  $-2 + \sqrt{5}$ . Among these three real zeros, one zero is rational and two are irrational. ...

 **Check Point 4** Find all zeros of  $f(x) = x^3 + x^2 - 5x - 2$ .

If the degree of a polynomial function or equation is 4 or higher, it is often necessary to find more than one linear factor by synthetic division.

One way to speed up the process of finding the first zero is to graph the function. Any  $x$ -intercept is a zero.

**3** Solve polynomial equations.

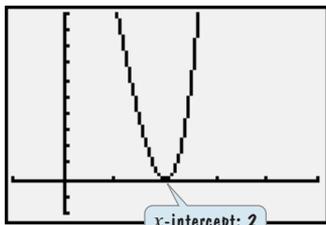

### EXAMPLE 5 Solving a Polynomial Equation

Solve:  $x^4 - 6x^2 - 8x + 24 = 0$ .

#### SOLUTION

Recall that we refer to the *zeros* of a polynomial function and the *roots* of a polynomial equation. Because we are given an equation, we will use the word “roots,” rather than “zeros,” in the solution process. We begin by listing all possible rational roots.

$$\begin{aligned} \text{Possible rational roots} &= \frac{\text{Factors of the constant term, 24}}{\text{Factors of the leading coefficient, 1}} \\ &= \frac{\pm 1, \pm 2, \pm 3, \pm 4, \pm 6, \pm 8, \pm 12, \pm 24}{\pm 1} \\ &= \pm 1, \pm 2, \pm 3, \pm 4, \pm 6, \pm 8, \pm 12, \pm 24 \end{aligned}$$

**FIGURE 2.29** The graph of  $f(x) = x^4 - 6x^2 - 8x + 24$  in a  $[-1, 5, 1]$  by  $[-2, 10, 1]$  viewing rectangle

Part of the graph of  $f(x) = x^4 - 6x^2 - 8x + 24$  is shown in **Figure 2.29**. Because the  $x$ -intercept is 2, we will test 2 by synthetic division and show that it is a root of the given equation. Without the graph, the procedure would be to start the trial-and-error synthetic division with 1 and proceed until a zero remainder is found, as we did in Example 4.

$$\begin{array}{r|rrrrr} 2 & 1 & 0 & -6 & -8 & 24 \\ & & 2 & 4 & -4 & -24 \\ \hline & 1 & 2 & -2 & -12 & 0 \end{array}$$

**Careful!**  
 $x^4 - 6x^2 - 8x + 24 = x^4 + 0x^3 - 6x^2 - 8x + 24$

The zero remainder indicates that 2 is a root of  $x^4 - 6x^2 - 8x + 24 = 0$ .

Now we can rewrite the given equation in factored form.

$$\begin{aligned} x^4 - 6x^2 - 8x + 24 &= 0 && \text{This is the given equation.} \\ (x - 2)(x^3 + 2x^2 - 2x - 12) &= 0 && \text{This is the result obtained from the synthetic division. The first four numbers in the bottom row, 1, 2, -2, and -12, give the coefficients of the second factor.} \end{aligned}$$

$$x - 2 = 0 \quad \text{or} \quad x^3 + 2x^2 - 2x - 12 = 0 \quad \text{Set each factor equal to 0.}$$

We can use the same approach to look for rational roots of the polynomial equation  $x^3 + 2x^2 - 2x - 12 = 0$ , listing all possible rational roots. Without the graph in **Figure 2.29**, the procedure would be to start testing possible rational roots by trial-and-error synthetic division. However, take a second look at the graph in **Figure 2.29**. Because the graph turns around at 2, this means that 2 is a root of even multiplicity. Thus, 2 must also be a root of  $x^3 + 2x^2 - 2x - 12 = 0$ , confirmed by the following synthetic division.

$$\begin{array}{r|rrrr} 2 & 1 & 2 & -2 & -12 \\ & & 2 & 8 & 12 \\ \hline & 1 & 4 & 6 & 0 \end{array}$$

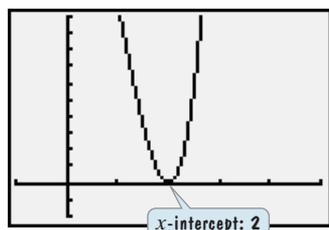

These are the coefficients of  $x^3 + 2x^2 - 2x - 12 = 0$ .

The zero remainder indicates that 2 is a root of  $x^3 + 2x^2 - 2x - 12 = 0$ .

Now we can solve the original equation as follows:

$$\begin{aligned} x^4 - 6x^2 - 8x + 24 &= 0 && \text{This is the given equation.} \\ (x - 2)(x^3 + 2x^2 - 2x - 12) &= 0 && \text{This factorization was obtained from the first synthetic division.} \\ (x - 2)(x - 2)(x^2 + 4x + 6) &= 0 && \text{This factorization was obtained from the second synthetic division. The first three numbers in the bottom row, 1, 4, and 6, give the coefficients of the third factor.} \end{aligned}$$

$$\begin{aligned} x - 2 = 0 \quad \text{or} \quad x - 2 = 0 \quad \text{or} \quad x^2 + 4x + 6 &= 0 && \text{Set each factor equal to 0.} \\ x = 2 \quad \quad \quad x = 2. &&& \text{Solve the linear equations.} \end{aligned}$$

**FIGURE 2.29** (repeated) The graph of  $f(x) = x^4 - 6x^2 - 8x + 24$  in a  $[-1, 5, 1]$  by  $[-2, 10, 1]$  viewing rectangle

We can use the quadratic formula to solve  $x^2 + 4x + 6 = 0$ .

$$\begin{aligned} x &= \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \\ &= \frac{-4 \pm \sqrt{4^2 - 4(1)(6)}}{2(1)} \\ &= \frac{-4 \pm \sqrt{-8}}{2} \\ &= \frac{-4 \pm 2i\sqrt{2}}{2} \\ &= -2 \pm i\sqrt{2} \end{aligned}$$

We use the quadratic formula because  $x^2 + 4x + 6$  cannot be factored.

Let  $a = 1$ ,  $b = 4$ , and  $c = 6$ .

Multiply and subtract under the radical:  
 $4^2 - 4(1)(6) = 16 - 24 = -8$ .

$$\sqrt{-8} = \sqrt{4(2)(-1)} = 2i\sqrt{2}$$

Simplify.

The solution set of the original equation,  $x^4 - 6x^2 - 8x + 24 = 0$ , is  $\{2, -2 - i\sqrt{2}, -2 + i\sqrt{2}\}$ . **Figure 2.29**, repeated in the margin, shows that a graphing utility does not reveal the two imaginary roots. ●●●

In Example 5, 2 is a repeated root of the equation with multiplicity 2. Counting this multiple root separately, the fourth-degree equation  $x^4 - 6x^2 - 8x + 24 = 0$  has four roots: 2, 2,  $-2 + i\sqrt{2}$ , and  $-2 - i\sqrt{2}$ . The equation and its roots illustrate two general properties:

### Properties of Roots of Polynomial Equations

1. If a polynomial equation is of degree  $n$ , then counting multiple roots separately, the equation has  $n$  roots.
2. If  $a + bi$  is a root of a polynomial equation with real coefficients ( $b \neq 0$ ), then the imaginary number  $a - bi$  is also a root. Imaginary roots, if they exist, occur in conjugate pairs.

**Check Point 5** Solve:  $x^4 - 6x^3 + 22x^2 - 30x + 13 = 0$ .

### The Fundamental Theorem of Algebra

The fact that a polynomial equation of degree  $n$  has  $n$  roots is a consequence of a theorem proved in 1799 by a 22-year-old student named Carl Friedrich Gauss in his doctoral dissertation. His result is called the **Fundamental Theorem of Algebra**.

#### The Fundamental Theorem of Algebra

If  $f(x)$  is a polynomial of degree  $n$ , where  $n \geq 1$ , then the equation  $f(x) = 0$  has at least one complex root.

Suppose, for example, that  $f(x) = 0$  represents a polynomial equation of degree  $n$ . By the Fundamental Theorem of Algebra, we know that this equation has at least one complex root; we'll call it  $c_1$ . By the Factor Theorem, we know that  $x - c_1$  is a factor of  $f(x)$ . Therefore, we obtain

$$\begin{aligned} (x - c_1)q_1(x) &= 0 && \text{The degree of the polynomial } q_1(x) \text{ is } n - 1. \\ x - c_1 = 0 \text{ or } q_1(x) &= 0. && \text{Set each factor equal to 0.} \end{aligned}$$

If the degree of  $q_1(x)$  is at least 1, by the Fundamental Theorem of Algebra, the equation  $q_1(x) = 0$  has at least one complex root. We'll call it  $c_2$ . The Factor Theorem gives us

$$\begin{aligned} q_1(x) &= 0 && \text{The degree of } q_1(x) \text{ is } n - 1. \\ (x - c_2)q_2(x) &= 0 && \text{The degree of } q_2(x) \text{ is } n - 2. \\ x - c_2 = 0 \text{ or } q_2(x) &= 0. && \text{Set each factor equal to 0.} \end{aligned}$$

### GREAT QUESTION!

**Do all polynomial equations have at least one imaginary root?**

No. As you read the Fundamental Theorem of Algebra, don't confuse *complex root* with *imaginary root* and conclude that every polynomial equation has at least one imaginary root. Recall that complex numbers,  $a + bi$ , include both real numbers ( $b = 0$ ) and imaginary numbers ( $b \neq 0$ ).

Let's see what we have up to this point and then continue the process.

$$\begin{aligned} f(x) &= 0 && \text{This is the original polynomial equation of degree } n. \\ (x - c_1)q_1(x) &= 0 && \text{This is the result from our first application of the} \\ &&& \text{Fundamental Theorem.} \\ (x - c_1)(x - c_2)q_2(x) &= 0 && \text{This is the result from our second application of} \\ &&& \text{the Fundamental Theorem.} \end{aligned}$$

By continuing this process, we will obtain the product of  $n$  linear factors. Setting each of these linear factors equal to zero results in  $n$  complex roots. Thus, if  $f(x)$  is a polynomial of degree  $n$ , where  $n \geq 1$ , then  $f(x) = 0$  has exactly  $n$  roots, where roots are counted according to their multiplicity.

- 4 Use the Linear Factorization Theorem to find polynomials with given zeros.

### The Linear Factorization Theorem

In Example 5, we found that  $x^4 - 6x^2 - 8x + 24 = 0$  has  $\{2, -2 \pm i\sqrt{2}\}$  as a solution set, where 2 is a repeated root with multiplicity 2. The polynomial can be factored over the complex nonreal numbers as follows:

$$\begin{aligned} f(x) &= x^4 - 6x^2 - 8x + 24 && \text{These are the four zeros.} \\ &= [x - (-2 + i\sqrt{2})][x - (-2 - i\sqrt{2})](x - 2)(x - 2). \end{aligned}$$

These are the linear factors.

This fourth-degree polynomial has four linear factors. Just as an  $n$ th-degree polynomial equation has  $n$  roots, an  $n$ th-degree polynomial has  $n$  linear factors. This is formally stated as the **Linear Factorization Theorem**.

#### The Linear Factorization Theorem

If  $f(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_1 x + a_0$ , where  $n \geq 1$  and  $a_n \neq 0$ , then

$$f(x) = a_n(x - c_1)(x - c_2) \cdots (x - c_n),$$

where  $c_1, c_2, \dots, c_n$  are complex numbers (possibly real and not necessarily distinct). In words: An  $n$ th-degree polynomial can be expressed as the product of a nonzero constant and  $n$  linear factors, where each linear factor has a leading coefficient of 1.

Many of our problems involving polynomial functions and polynomial equations dealt with the process of finding zeros and roots. The Linear Factorization Theorem enables us to reverse this process, finding a polynomial function when the zeros are given.

#### EXAMPLE 6 Finding a Polynomial Function with Given Zeros

Find a fourth-degree polynomial function  $f(x)$  with real coefficients that has  $-2$ ,  $2$ , and  $i$  as zeros and such that  $f(3) = -150$ .

#### SOLUTION

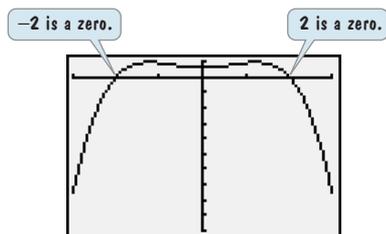

Because  $i$  is a zero and the polynomial has real coefficients, the conjugate,  $-i$ , must also be a zero. We can now use the Linear Factorization Theorem.

$$\begin{aligned} f(x) &= a_n(x - c_1)(x - c_2)(x - c_3)(x - c_4) && \text{This is the linear factorization for a} \\ &&& \text{fourth-degree polynomial.} \\ &= a_n(x + 2)(x - 2)(x - i)(x + i) && \text{Use the given zeros:} \\ &&& c_1 = -2, c_2 = 2, c_3 = i, \text{ and, from above,} \\ &&& c_4 = -i. \\ &= a_n(x^2 - 4)(x^2 + 1) && \text{Multiply: } (x - i)(x + i) = x^2 - i^2 = \\ &&& x^2 - (-1) = x^2 + 1. \end{aligned}$$

## TECHNOLOGY

### Graphic Connections

The graph of  $f(x) = -3x^4 + 9x^2 + 12$ , shown in a  $[-3, 3, 1]$  by  $[-200, 20, 20]$  viewing rectangle, verifies that  $-2$  and  $2$  are real zeros. By tracing along the curve, we can check that  $f(3) = -150$ .

$$f(x) = a_n(x^4 - 3x^2 - 4)$$

$$f(3) = a_n(3^4 - 3 \cdot 3^2 - 4) = -150$$

$$a_n(81 - 27 - 4) = -150$$

$$50a_n = -150$$

$$a_n = -3$$

Substituting  $-3$  for  $a_n$  in the formula for  $f(x)$ , we obtain

$$f(x) = -3(x^4 - 3x^2 - 4).$$

Equivalently,

$$f(x) = -3x^4 + 9x^2 + 12. \quad \dots$$

Complete the multiplication for  $f(x) = a_n(x^2 - 4)(x^2 + 1)$ .

To find  $a_n$ , use the fact that  $f(3) = -150$ .

Solve for  $a_n$ .

Simplify:  $81 - 27 - 4 = 50$ .

Divide both sides by 50.

 **Check Point 6** Find a third-degree polynomial function  $f(x)$  with real coefficients that has  $-3$  and  $i$  as zeros and such that  $f(1) = 8$ .

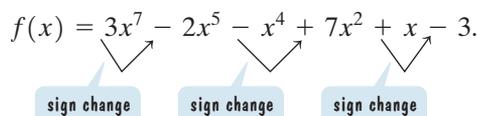

### 5 Use Descartes's Rule of Signs.

### Descartes's Rule of Signs

Because an  $n$ th-degree polynomial equation might have roots that are imaginary numbers, we should note that such an equation can have *at most*  $n$  real roots.

**Descartes's Rule of Signs** provides even more specific information about the number of real zeros that a polynomial can have. The rule is based on considering *variations in sign* between consecutive coefficients. For example, the function  $f(x) = 3x^7 - 2x^5 - x^4 + 7x^2 + x - 3$  has three sign changes:

$$f(x) = 3x^7 - 2x^5 - x^4 + 7x^2 + x - 3.$$

“An equation can have as many true [positive] roots as it contains changes of sign, from plus to minus or from minus to plus.” René Descartes (1596–1650) in *La Géométrie* (1637)

## GREAT QUESTION!

**Does Descartes's Rule of Signs include both rational and irrational zeros?**

Yes. The number of real zeros given by Descartes's Rule of Signs includes rational zeros from a list of possible rational zeros, as well as irrational zeros not on the list. It does not include any imaginary zeros.

### Descartes's Rule of Signs

Let  $f(x) = a_nx^n + a_{n-1}x^{n-1} + \cdots + a_2x^2 + a_1x + a_0$  be a polynomial with real coefficients.

1. The number of *positive real zeros* of  $f$  is either

a. the same as the number of sign changes of  $f(x)$

or

b. less than the number of sign changes of  $f(x)$  by a positive even integer.  
If  $f(x)$  has only one variation in sign, then  $f$  has exactly one positive real zero.

2. The number of *negative real zeros* of  $f$  is either

a. the same as the number of sign changes of  $f(-x)$

or

b. less than the number of sign changes of  $f(-x)$  by a positive even integer.  
If  $f(-x)$  has only one variation in sign, then  $f$  has exactly one negative real zero.

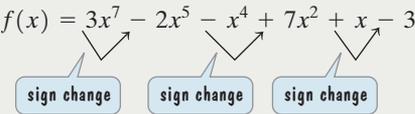

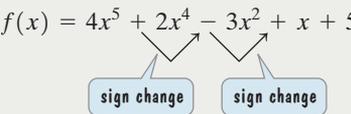

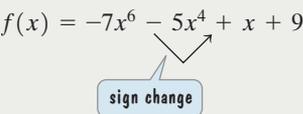

**GREAT QUESTION!**

Does a polynomial function have to be written in descending powers of  $x$  when counting sign changes?

Yes. Be sure that the function's equation is in this form before using Descartes's Rule of signs.

**Table 2.1** illustrates what Descartes's Rule of Signs tells us about the positive real zeros of various polynomial functions.

**Table 2.1** Descartes's Rule of Signs and Positive Real Zeros

Polynomial Function	Sign Changes	Conclusion
$f(x) = 3x^7 - 2x^5 - x^4 + 7x^2 + x - 3$ 	3	There are 3 positive real zeros. or There is $3 - 2 = 1$ positive real zero.
$f(x) = 4x^5 + 2x^4 - 3x^2 + x + 5$ 	2	There are 2 positive real zeros. or There are $2 - 2 = 0$ positive real zeros.
$f(x) = -7x^6 - 5x^4 + x + 9$ 	1	There is 1 positive real zero.

**EXAMPLE 7** Using Descartes's Rule of Signs

Determine the possible numbers of positive and negative real zeros of  $f(x) = x^3 + 2x^2 + 5x + 4$ .

**SOLUTION**

- To find possibilities for positive real zeros, count the number of sign changes in the equation for  $f(x)$ . Because all the coefficients are positive, there are no variations in sign. Thus, there are no positive real zeros.
- To find possibilities for negative real zeros, count the number of sign changes in the equation for  $f(-x)$ . We obtain this equation by replacing  $x$  with  $-x$  in the given function.

$$f(x) = x^3 + 2x^2 + 5x + 4$$

Replace  $x$  with  $-x$ .

$$\begin{aligned} f(-x) &= (-x)^3 + 2(-x)^2 + 5(-x) + 4 \\ &= -x^3 + 2x^2 - 5x + 4 \end{aligned}$$

Now count the sign changes.

$$f(-x) = -x^3 + 2x^2 - 5x + 4$$

There are three variations in sign. The number of negative real zeros of  $f$  is either equal to the number of sign changes, 3, or is less than this number by an even integer. This means that either there are 3 negative real zeros or there is  $3 - 2 = 1$  negative real zero. ...

What do the results of Example 7 mean in terms of solving

$$x^3 + 2x^2 + 5x + 4 = 0?$$

Without using Descartes's Rule of Signs, we list the possible rational roots as follows:

Possible rational roots

$$= \frac{\text{Factors of the constant term, 4}}{\text{Factors of the leading coefficient, 1}} = \frac{\pm 1, \pm 2, \pm 4}{\pm 1} = \pm 1, \pm 2, \pm 4.$$

We see that the possible rational roots of  $x^3 + 2x^2 + 5x + 4 = 0$  are  $\pm 1$ ,  $\pm 2$ , and  $\pm 4$ . However, Descartes's Rule of Signs informed us that  $f(x) = x^3 + 2x^2 + 5x + 4$  has no positive real zeros. Thus, the polynomial equation  $x^3 + 2x^2 + 5x + 4 = 0$  has no positive real roots. This means that we can eliminate the positive numbers 1, 2, and 4 from our list of possible rational roots. Possible rational roots include only  $-1$ ,  $-2$ , and  $-4$ . We can use synthetic division and test the first of these three possible rational roots of  $x^3 + 2x^2 + 5x + 4 = 0$  as follows:

Test -1.	$-1 \mid$	1	2	5	4
			-1	-1	-4
		1	1	4	0.

The zero remainder shows that  $-1$  is a root.

By solving the equation  $x^3 + 2x^2 + 5x + 4 = 0$ , you will find that this equation of degree 3 has three roots. One root is  $-1$  and the other two roots are imaginary numbers in a conjugate pair. Verify this by completing the solution process.

**Check Point 7** Determine the possible numbers of positive and negative real zeros of  $f(x) = x^4 - 14x^3 + 71x^2 - 154x + 120$ .

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

1. Consider the polynomial function with integer coefficients

$$f(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_1 x + a_0, a_n \neq 0.$$

The Rational Zero Theorem states that if  $\frac{p}{q}$  is a rational zero of  $f$  (where  $\frac{p}{q}$  is reduced to lowest terms), then  $p$  is a factor of \_\_\_\_\_ and  $q$  is a factor of \_\_\_\_\_.

2. True or false:  $\frac{3}{2}$  is a possible rational zero of  $f(x) = 2x^3 + 11x^2 - 7x - 6$ . \_\_\_\_\_
3. True or false:  $\frac{1}{2}$  is a possible rational zero of  $f(x) = 3x^4 - 3x^3 + x^2 - x + 1$ . \_\_\_\_\_
4. If a polynomial equation is of degree  $n$ , then counting multiple roots separately, the equation has \_\_\_\_\_ roots.
5. If  $a + bi$  is a root of a polynomial equation with real coefficients,  $b \neq 0$ , then \_\_\_\_\_ is also a root of the equation.

6. Consider solving  $2x^3 + 11x^2 - 7x - 6 = 0$ . The synthetic division shown below indicates that \_\_\_\_\_ is a root.

$-6 \mid$	2	11	-7	-6
		-12	6	6
	2	-1	-1	0

Based on the synthetic division,  $2x^3 + 11x^2 - 7x - 6 = 0$  can be written in factored form as \_\_\_\_\_.

7. The Linear Factorization Theorem states that an  $n$ th-degree polynomial can be expressed as the product of a nonzero constant and \_\_\_\_\_ linear factors, where each linear factor has a leading coefficient of \_\_\_\_\_.

Use Descartes's Rule of Signs to determine whether each statement is true or false.

8. A polynomial function with four sign changes must have four positive real zeros. \_\_\_\_\_
9. A polynomial function with one sign change must have one positive real zero. \_\_\_\_\_
10. A polynomial function with seven sign changes can have one, three, five, or seven positive real zeros. \_\_\_\_\_

## EXERCISE SET 2.5

### Practice Exercises

In Exercises 1–8, use the Rational Zero Theorem to list all possible rational zeros for each given function.

1.  $f(x) = x^3 + x^2 - 4x - 4$
2.  $f(x) = x^3 + 3x^2 - 6x - 8$
3.  $f(x) = 3x^4 - 11x^3 - x^2 + 19x + 6$

4.  $f(x) = 2x^4 + 3x^3 - 11x^2 - 9x + 15$
5.  $f(x) = 4x^4 - x^3 + 5x^2 - 2x - 6$
6.  $f(x) = 3x^4 - 11x^3 - 3x^2 - 6x + 8$
7.  $f(x) = x^5 - x^4 - 7x^3 + 7x^2 - 12x - 12$
8.  $f(x) = 4x^5 - 8x^4 - x + 2$

In Exercises 9–16,

- List all possible rational zeros.
- Use synthetic division to test the possible rational zeros and find an actual zero.
- Use the quotient from part (b) to find the remaining zeros of the polynomial function.

- $f(x) = x^3 + x^2 - 4x - 4$
- $f(x) = x^3 - 2x^2 - 11x + 12$
- $f(x) = 2x^3 - 3x^2 - 11x + 6$
- $f(x) = 2x^3 - 5x^2 + x + 2$
- $f(x) = x^3 + 4x^2 - 3x - 6$
- $f(x) = 2x^3 + x^2 - 3x + 1$
- $f(x) = 2x^3 + 6x^2 + 5x + 2$
- $f(x) = x^3 - 4x^2 + 8x - 5$

In Exercises 17–24,

- List all possible rational roots.
- Use synthetic division to test the possible rational roots and find an actual root.
- Use the quotient from part (b) to find the remaining roots and solve the equation.

- $x^3 - 2x^2 - 11x + 12 = 0$
- $x^3 - 2x^2 - 7x - 4 = 0$
- $x^3 - 10x - 12 = 0$
- $x^3 - 5x^2 + 17x - 13 = 0$
- $6x^3 + 25x^2 - 24x + 5 = 0$
- $2x^3 - 5x^2 - 6x + 4 = 0$
- $x^4 - 2x^3 - 5x^2 + 8x + 4 = 0$
- $x^4 - 2x^2 - 16x - 15 = 0$

In Exercises 25–32, find an  $n$ th-degree polynomial function with real coefficients satisfying the given conditions. If you are using a graphing utility, use it to graph the function and verify the real zeros and the given function value.

- $n = 3$ ; 1 and  $5i$  are zeros;  $f(-1) = -104$
- $n = 3$ ; 4 and  $2i$  are zeros;  $f(-1) = -50$
- $n = 3$ ;  $-5$  and  $4 + 3i$  are zeros;  $f(2) = 91$
- $n = 3$ ; 6 and  $-5 + 2i$  are zeros;  $f(2) = -636$
- $n = 4$ ;  $i$  and  $3i$  are zeros;  $f(-1) = 20$
- $n = 4$ ;  $-2$ ,  $-\frac{1}{2}$ , and  $i$  are zeros;  $f(1) = 18$
- $n = 4$ ;  $-2$ , 5, and  $3 + 2i$  are zeros;  $f(1) = -96$
- $n = 4$ ;  $-4$ ,  $\frac{1}{3}$ , and  $2 + 3i$  are zeros;  $f(1) = 100$

In Exercises 33–38, use Descartes's Rule of Signs to determine the possible number of positive and negative real zeros for each given function.

- $f(x) = x^3 + 2x^2 + 5x + 4$
- $f(x) = x^3 + 7x^2 + x + 7$
- $f(x) = 5x^3 - 3x^2 + 3x - 1$
- $f(x) = -2x^3 + x^2 - x + 7$
- $f(x) = 2x^4 - 5x^3 - x^2 - 6x + 4$
- $f(x) = 4x^4 - x^3 + 5x^2 - 2x - 6$

In Exercises 39–52, find all zeros of the polynomial function or solve the given polynomial equation. Use the Rational Zero Theorem, Descartes's Rule of Signs, and possibly the graph of the polynomial function shown by a graphing utility as an aid in obtaining the first zero or the first root.

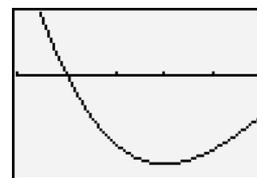

- $f(x) = x^3 - 4x^2 - 7x + 10$
- $f(x) = x^3 + 12x^2 + 21x + 10$
- $2x^3 - x^2 - 9x - 4 = 0$
- $3x^3 - 8x^2 - 8x + 8 = 0$
- $f(x) = x^4 - 2x^3 + x^2 + 12x + 8$
- $f(x) = x^4 - 4x^3 - x^2 + 14x + 10$
- $x^4 - 3x^3 - 20x^2 - 24x - 8 = 0$
- $x^4 - x^3 + 2x^2 - 4x - 8 = 0$
- $f(x) = 3x^4 - 11x^3 - x^2 + 19x + 6$
- $f(x) = 2x^4 + 3x^3 - 11x^2 - 9x + 15$
- $4x^4 - x^3 + 5x^2 - 2x - 6 = 0$
- $3x^4 - 11x^3 - 3x^2 - 6x + 8 = 0$
- $2x^5 + 7x^4 - 18x^2 - 8x + 8 = 0$
- $4x^5 + 12x^4 - 41x^3 - 99x^2 + 10x + 24 = 0$

### Practice Plus

Exercises 53–60 show incomplete graphs of given polynomial functions.

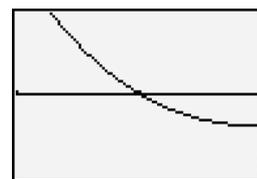

- Find all the zeros of each function.
- Without using a graphing utility, draw a complete graph of the function.

53.  $f(x) = -x^3 + x^2 + 16x - 16$

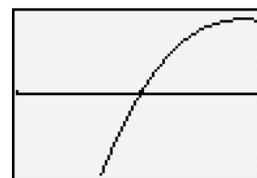

$[-5, 0, 1]$  by  $[-40, 25, 5]$

54.  $f(x) = -x^3 + 3x^2 - 4$

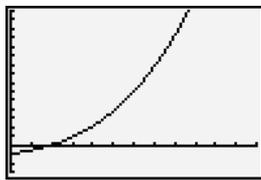

$[-2, 0, 1]$  by  $[-10, 10, 1]$

55.  $f(x) = 4x^3 - 8x^2 - 3x + 9$

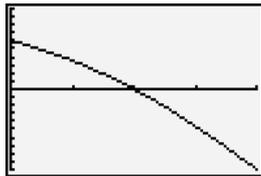

$[-2, 0, 1]$  by  $[-10, 10, 1]$

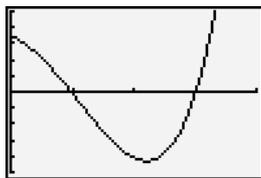

56.  $f(x) = 3x^3 + 2x^2 + 2x - 1$

 $[0, 2, \frac{1}{6}]$  by  $[-3, 15, 1]$ 

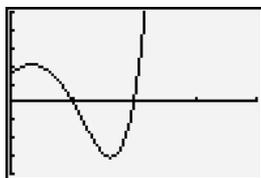

57.  $f(x) = 2x^4 - 3x^3 - 7x^2 - 8x + 6$

 $[0, 1, \frac{1}{4}]$  by  $[-10, 10, 1]$ 

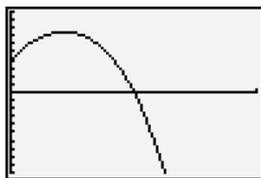

58.  $f(x) = 2x^4 + 2x^3 - 22x^2 - 18x + 36$

 $[0, 4, 1]$  by  $[-50, 50, 10]$ 

59.  $f(x) = 3x^5 + 2x^4 - 15x^3 - 10x^2 + 12x + 8$

 $[0, 4, 1]$  by  $[-20, 25, 5]$ 

60.  $f(x) = -5x^4 + 4x^3 - 19x^2 + 16x + 4$

 $[0, 2, 1]$  by  $[-10, 10, 1]$ 

### Application Exercises

A popular model of carry-on luggage has a length that is 10 inches greater than its depth. Airline regulations require that the sum of the length, width, and depth cannot exceed 40 inches. These conditions, with the assumption that this sum is 40 inches, can be modeled by a function that gives the volume of the luggage,  $V$ , in cubic inches, in terms of its depth,  $x$ , in inches.

$$\text{Volume} = \text{depth} \cdot \text{length} \cdot \text{width: } 40 - (\text{depth} + \text{length})$$

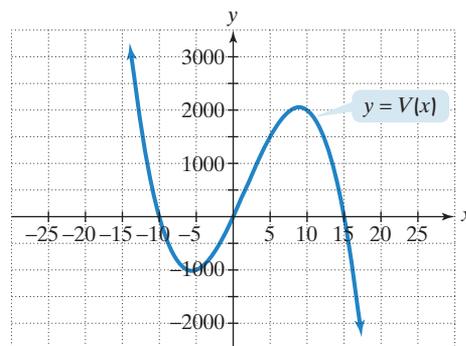

$$V(x) = x \cdot (x + 10) \cdot [40 - (x + x + 10)]$$

$$V(x) = x(x + 10)(30 - 2x)$$

Use function  $V$  to solve Exercises 61–62.

61. If the volume of the carry-on luggage is 2000 cubic inches, determine two possibilities for its depth. Where necessary, round to the nearest tenth of an inch.
62. If the volume of the carry-on luggage is 1500 cubic inches, determine two possibilities for its depth. Where necessary, round to the nearest tenth of an inch.

Use the graph of the function modeling the volume of the carry-on luggage to solve Exercises 63–64.

63. a. Identify your answers from Exercise 61 as points on the graph.  
b. Use the graph to describe a realistic domain,  $x$ , for the volume function, where  $x$  represents the depth of the carry-on luggage.
64. a. Identify your answers from Exercise 62 as points on the graph.  
b. Use the graph to describe a realistic domain,  $x$ , for the volume function, where  $x$  represents the depth of the carry-on luggage.

### Writing in Mathematics

65. Describe how to find the possible rational zeros of a polynomial function.
66. How does the linear factorization of  $f(x)$ , that is,
 
$$f(x) = a_n(x - c_1)(x - c_2) \cdots (x - c_n),$$
 show that a polynomial equation of degree  $n$  has  $n$  roots?
67. Describe how to use Descartes's Rule of Signs to determine the possible number of positive real zeros of a polynomial function.
68. Describe how to use Descartes's Rule of Signs to determine the possible number of negative roots of a polynomial equation.
69. Why must every polynomial equation with real coefficients of degree 3 have at least one real root?
70. Explain why the equation  $x^4 + 6x^2 + 2 = 0$  has no rational roots.
71. Suppose  $\frac{3}{4}$  is a root of a polynomial equation. What does this tell us about the leading coefficient and the constant term in the equation?

## Technology Exercises

The equations in Exercises 72–75 have real roots that are rational. Use the Rational Zero Theorem to list all possible rational roots. Then graph the polynomial function in the given viewing rectangle to determine which possible rational roots are actual roots of the equation.

72.  $2x^3 - 15x^2 + 22x + 15 = 0$ ;  $[-1, 6, 1]$  by  $[-50, 50, 10]$   
 73.  $6x^3 - 19x^2 + 16x - 4 = 0$ ;  $[0, 2, 1]$  by  $[-3, 2, 1]$   
 74.  $2x^4 + 7x^3 - 4x^2 - 27x - 18 = 0$ ;  $[-4, 3, 1]$  by  $[-45, 45, 15]$   
 75.  $4x^4 + 4x^3 + 7x^2 - x - 2 = 0$ ;  $[-2, 2, 1]$  by  $[-5, 5, 1]$   
 76. Use Descartes's Rule of Signs to determine the possible number of positive and negative real zeros of  $f(x) = 3x^4 + 5x^2 + 2$ . What does this mean in terms of the graph of  $f$ ? Verify your result by using a graphing utility to graph  $f$ .  
 77. Use Descartes's Rule of Signs to determine the possible number of positive and negative real zeros of  $f(x) = x^5 - x^4 + x^3 - x^2 + x - 8$ . Verify your result by using a graphing utility to graph  $f$ .  
 78. Write equations for several polynomial functions of odd degree and graph each function. Is it possible for the graph to have no real zeros? Explain. Try doing the same thing for polynomial functions of even degree. Now is it possible to have no real zeros?

Use a graphing utility to obtain a complete graph for each polynomial function in Exercises 79–82. Then determine the number of real zeros and the number of imaginary zeros for each function.

79.  $f(x) = x^3 - 6x - 9$   
 80.  $f(x) = 3x^5 - 2x^4 + 6x^3 - 4x^2 - 24x + 16$   
 81.  $f(x) = 3x^4 + 4x^3 - 7x^2 - 2x - 3$   
 82.  $f(x) = x^6 - 64$

## Critical Thinking Exercises

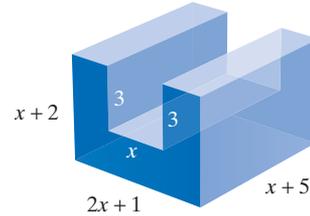

**Make Sense?** In Exercises 83–86, determine whether each statement makes sense or does not make sense, and explain your reasoning.

83. I've noticed that  $f(-x)$  is used to explore the number of negative real zeros of a polynomial function, as well as to determine whether a function is even, odd, or neither.  
 84. By using the quadratic formula, I do not need to bother with synthetic division when solving polynomial equations of degree 3 or higher.  
 85. I'm working with a fourth-degree polynomial function with integer coefficients and zeros at 1 and  $3 + \sqrt{5}$ . I'm certain that  $3 + \sqrt{2}$  cannot also be a zero of this function.  
 86. I'm working with the polynomial function  $f(x) = x^4 + 3x^2 + 2$  that has four possible rational zeros but no actual rational zeros.

In Exercises 87–90, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

87. The equation  $x^3 + 5x^2 + 6x + 1 = 0$  has one positive real root.  
 88. Descartes's Rule of Signs gives the exact number of positive and negative real roots for a polynomial equation.

89. Every polynomial equation of degree 3 with integer coefficients has at least one rational root.  
 90. Every polynomial equation of degree  $n$  has  $n$  distinct solutions.  
 91. If the volume of the solid shown in the figure is 208 cubic inches, find the value of  $x$ .

92. In this exercise, we lead you through the steps involved in the proof of the Rational Zero Theorem. Consider the polynomial equation

$$a_n x^n + a_{n-1} x^{n-1} + a_{n-2} x^{n-2} + \cdots + a_1 x + a_0 = 0,$$

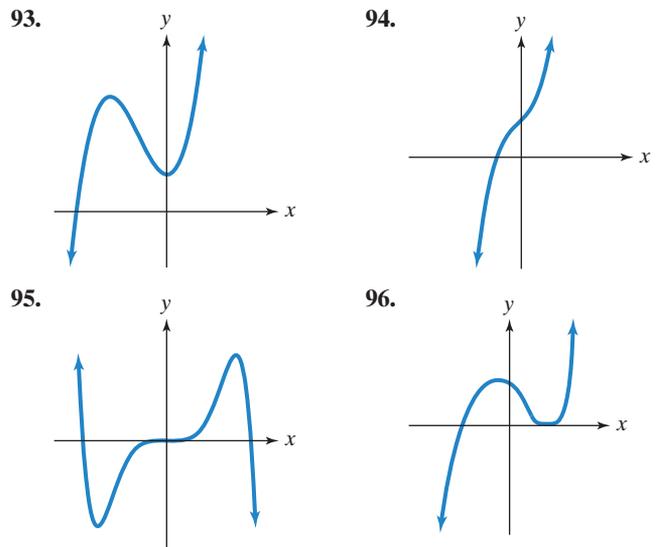

and let  $\frac{p}{q}$  be a rational root reduced to lowest terms.

- a. Substitute  $\frac{p}{q}$  for  $x$  in the equation and show that the equation can be written as

$$a_n p^n + a_{n-1} p^{n-1} q + a_{n-2} p^{n-2} q^2 + \cdots + a_1 p q^{n-1} = -a_0 q^n.$$

- b. Why is  $p$  a factor of the left side of the equation?  
 c. Because  $p$  divides the left side, it must also divide the right side. However, because  $\frac{p}{q}$  is reduced to lowest terms,  $p$  and  $q$  have no common factors other than  $-1$  and  $1$ . Because  $p$  does divide the right side and has no factors in common with  $q^n$ , what can you conclude?  
 d. Rewrite the equation from part (a) with all terms containing  $q$  on the left and the term that does not have a factor of  $q$  on the right. Use an argument that parallels parts (b) and (c) to conclude that  $q$  is a factor of  $a_n$ .

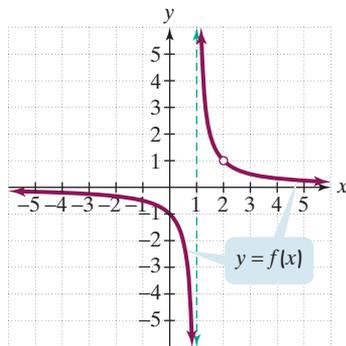

In Exercises 93–96, the graph of a polynomial function is given. What is the smallest degree that each polynomial could have?

97. Explain why a polynomial function of degree 20 cannot cross the  $x$ -axis exactly once.

## Preview Exercises

Exercises 98–100 will help you prepare for the material covered in the next section. Use the graph of function  $f$  to solve each exercise.

98. For what values of  $x$  is the function undefined?
99. Write the equation of the vertical asymptote, or the vertical line that the graph of  $f$  approaches but does not touch.
100. Write the equation of the horizontal asymptote, or the horizontal line that the graph of  $f$  approaches but does not touch.

## CHAPTER 2

## Mid-Chapter Check Point

**WHAT YOU KNOW:** We performed operations with complex numbers and used the imaginary unit  $i$  ( $i = \sqrt{-1}$ , where  $i^2 = -1$ ) to represent solutions of quadratic equations with negative discriminants. Only real solutions correspond to  $x$ -intercepts. We graphed quadratic functions using vertices, intercepts, and additional points, as necessary. We learned that the vertex of  $f(x) = a(x - h)^2 + k$  is  $(h, k)$  and the vertex of  $f(x) = ax^2 + bx + c$  is  $(-\frac{b}{2a}, f(-\frac{b}{2a}))$ . We used the vertex to solve problems that involved minimizing or maximizing quadratic functions. We learned a number of techniques for finding the zeros of a polynomial function  $f$  of degree 3 or higher or, equivalently, finding the roots, or solutions, of the equation  $f(x) = 0$ . For some functions, the zeros were found by factoring  $f(x)$ . For other functions, we listed possible rational zeros and used synthetic division and the Factor Theorem to determine the zeros. We saw that graphs cross the  $x$ -axis at zeros of odd multiplicity and touch the  $x$ -axis and turn around at zeros of even multiplicity. We learned to graph polynomial functions using zeros, the Leading Coefficient Test, intercepts, and symmetry. We checked graphs using the fact that a polynomial function of degree  $n$  has a graph with at most  $n - 1$  turning points. After finding zeros of polynomial functions, we reversed directions by using the Linear Factorization Theorem to find functions with given zeros.

In Exercises 1–6, perform the indicated operations and write the result in standard form.

- $(6 - 2i) - (7 - i)$
- $3i(2 + i)$
- $(1 + i)(4 - 3i)$
- $\frac{1 + i}{1 - i}$
- $\sqrt{-75} - \sqrt{-12}$
- $(2 - \sqrt{-3})^2$
- Solve and express solutions in standard form:  $x(2x - 3) = -4$ .

In Exercises 8–11, graph the given quadratic function. Give each function's domain and range.

- $f(x) = (x - 3)^2 - 4$
- $f(x) = 5 - (x + 2)^2$
- $f(x) = -x^2 - 4x + 5$
- $f(x) = 3x^2 - 6x + 1$

In Exercises 12–20, find all zeros of each polynomial function. Then graph the function.

12.  $f(x) = (x - 2)^2(x + 1)^3$

- $f(x) = -(x - 2)^2(x + 1)^2$
- $f(x) = x^3 - x^2 - 4x + 4$
- $f(x) = x^4 - 5x^2 + 4$
- $f(x) = -(x + 1)^6$
- $f(x) = -6x^3 + 7x^2 - 1$
- $f(x) = 2x^3 - 2x$
- $f(x) = x^3 - 2x^2 + 26x$
- $f(x) = -x^3 + 5x^2 - 5x - 3$

In Exercises 21–26, solve each polynomial equation.

- $x^3 - 3x + 2 = 0$
- $6x^3 - 11x^2 + 6x - 1 = 0$
- $(2x + 1)(3x - 2)^3(2x - 7) = 0$
- $2x^3 + 5x^2 - 200x - 500 = 0$
- $x^4 - x^3 - 11x^2 = x + 12$
- $2x^4 + x^3 - 17x^2 - 4x + 6 = 0$
- A company manufactures and sells bath cabinets. The function

$$P(x) = -x^2 + 150x - 4425$$

models the company's daily profit,  $P(x)$ , when  $x$  cabinets are manufactured and sold per day. How many cabinets should be manufactured and sold per day to maximize the company's profit? What is the maximum daily profit?

- Among all pairs of numbers whose sum is  $-18$ , find a pair whose product is as large as possible. What is the maximum product?
- The base of a triangle measures 40 inches minus twice the measure of its height. For what measure of the height does the triangle have a maximum area? What is the maximum area?

In Exercises 30–31, divide, using synthetic division if possible.

- $(6x^4 - 3x^3 - 11x^2 + 2x + 4) \div (3x^2 - 1)$
- $(2x^4 - 13x^3 + 17x^2 + 18x - 24) \div (x - 4)$

In Exercises 32–33, find an  $n$ th-degree polynomial function with real coefficients satisfying the given conditions.

- $n = 3$ ; 1 and  $i$  are zeros;  $f(-1) = 8$
- $n = 4$ ; 2 (with multiplicity 2) and  $3i$  are zeros;  $f(0) = 36$
- Does  $f(x) = x^3 - x - 5$  have a real zero between 1 and 2?

## SECTION 2.6

## Rational Functions and Their Graphs

## Objectives

- 1 Find the domains of rational functions.
- 2 Use arrow notation.
- 3 Identify vertical asymptotes.
- 4 Identify horizontal asymptotes.
- 5 Use transformations to graph rational functions.
- 6 Graph rational functions.
- 7 Identify slant asymptotes.
- 8 Solve applied problems involving rational functions.

- 1 Find the domains of rational functions.

Your grandmother appears to be slowing down. Enter ... Mechanical-Grandma! Japanese researchers have developed the robotic exoskeleton shown here to help the elderly and disabled walk and even lift heavy objects like the three 22-pound bags of rice in the photo. It's called the Hybrid Assistive Limb, or HAL. (The inventor has obviously never seen *2001: A Space Odyssey*.) HAL's brain is a computer housed in a backpack that learns to mimic the wearer's gait and posture. Bioelectric sensors pick up signals transmitted from the brain to the muscles, so it can anticipate movements the moment the wearer thinks of them. A commercial version is available at a hefty cost ranging between \$14,000 and \$20,000. (Source: sanlab.kz.tsukuba.ac.jp)

The cost of manufacturing robotic exoskeletons can be modeled by rational functions. In this section, you will see that high production levels of HAL can eventually make this amazing invention more affordable for the elderly and people with disabilities.

## Rational Functions

**Rational functions** are quotients of polynomial functions.

This means that rational functions can be expressed as

$$f(x) = \frac{p(x)}{q(x)},$$

where  $p$  and  $q$  are polynomial functions and  $q(x) \neq 0$ . The **domain** of a rational function is the set of all real numbers except the  $x$ -values that make the denominator zero. For example, the domain of the rational function

$$f(x) = \frac{x^2 + 7x + 9}{x(x - 2)(x + 5)}$$

This is  $p(x)$ .

This is  $q(x)$ .

is the set of all real numbers except 0, 2, and  $-5$ .

## EXAMPLE 1 Finding the Domain of a Rational Function

Find the domain of each rational function:

$$\text{a. } f(x) = \frac{x^2 - 9}{x - 3} \qquad \text{b. } g(x) = \frac{x}{x^2 - 9} \qquad \text{c. } h(x) = \frac{x + 3}{x^2 + 9}.$$

## SOLUTION

Rational functions contain division. Because division by 0 is undefined, we must exclude from the domain of each function values of  $x$  that cause the polynomial function in the denominator to be 0.

- a. The denominator of  $f(x) = \frac{x^2 - 9}{x - 3}$  is 0 if  $x = 3$ . Thus,  $x$  cannot equal 3.

The domain of  $f$  consists of all real numbers except 3. We can express the domain in set-builder or interval notation:

$$\text{Domain of } f = \{x \mid x \neq 3\}$$

$$\text{Domain of } f = (-\infty, 3) \cup (3, \infty).$$

**GREAT QUESTION!**

**Other than observing the denominator, is there a procedure I can use to find the domain of a rational function?**

Yes. Because the domain of a rational function is the set of all real numbers except those for which the denominator is 0, you can identify such numbers by setting the denominator equal to 0 and solving for  $x$ . Exclude the resulting real values of  $x$  from the domain.

- b. The denominator of  $g(x) = \frac{x}{x^2 - 9}$  is 0 if  $x = -3$  or  $x = 3$ . Thus, the domain of  $g$  consists of all real numbers except  $-3$  and  $3$ . We can express the domain in set-builder or interval notation:

$$\text{Domain of } g = \{x \mid x \neq -3, x \neq 3\}$$

$$\text{Domain of } g = (-\infty, -3) \cup (-3, 3) \cup (3, \infty).$$

- c. No real numbers cause the denominator of  $h(x) = \frac{x + 3}{x^2 + 9}$  to equal 0. The domain of  $h$  consists of all real numbers.

$$\text{Domain of } h = (-\infty, \infty)$$

...

 **Check Point 1** Find the domain of each rational function:

a.  $f(x) = \frac{x^2 - 25}{x - 5}$

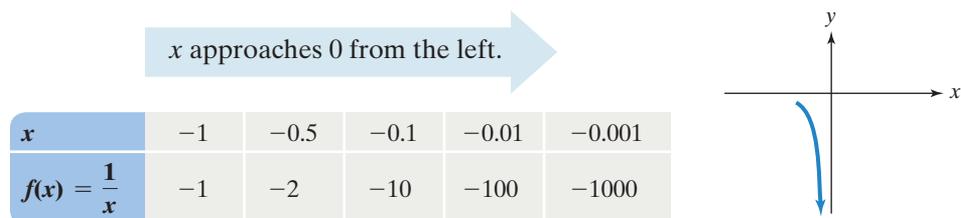

b.  $g(x) = \frac{x}{x^2 - 25}$

c.  $h(x) = \frac{x + 5}{x^2 + 25}$

**2** Use arrow notation.

The most basic rational function is the **reciprocal function**, defined by  $f(x) = \frac{1}{x}$ . The denominator of the reciprocal function is zero when  $x = 0$ , so the domain of  $f$  is the set of all real numbers except 0.

Let's look at the behavior of  $f$  near the excluded value 0. We start by evaluating  $f(x)$  to the left of 0.

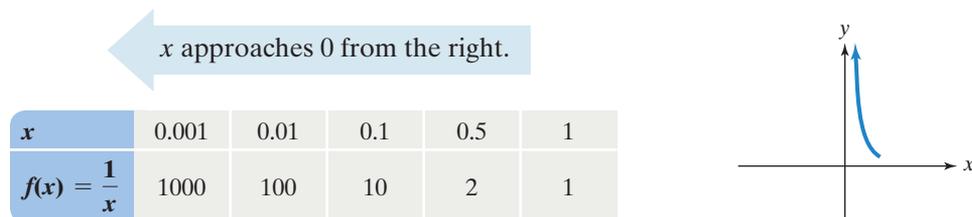

Mathematically, we say that “ $x$  approaches 0 from the left.” From the table and the accompanying graph, it appears that as  $x$  approaches 0 from the left, the function values,  $f(x)$ , decrease without bound. We say that “ $f(x)$  approaches negative infinity.” We use a special arrow notation to describe this situation symbolically:

$$\text{As } x \rightarrow 0^-, f(x) \rightarrow -\infty.$$

As  $x$  approaches 0 from the left,  $f(x)$  approaches negative infinity (that is, the graph falls).

Observe that the minus ( $-$ ) superscript on the 0 ( $x \rightarrow 0^-$ ) is read “from the left.”

Next, we evaluate  $f(x)$  to the right of 0.

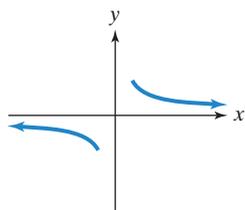

Mathematically, we say that “ $x$  approaches 0 from the right.” From the table and the accompanying graph, it appears that as  $x$  approaches 0 from the right, the function values,  $f(x)$ , increase without bound. We say that “ $f(x)$  approaches infinity.” We again use a special arrow notation to describe this situation symbolically:

$$\text{As } x \rightarrow 0^+, f(x) \rightarrow \infty.$$

As  $x$  approaches 0 from the right,  $f(x)$  approaches infinity (that is, the graph rises).

Observe that the plus ( $+$ ) superscript on the 0 ( $x \rightarrow 0^+$ ) is read “from the right.”

Now let's see what happens to the function values of  $f(x) = \frac{1}{x}$  as  $x$  gets farther away from the origin. The following tables suggest what happens to  $f(x)$  as  $x$  increases or decreases without bound.

**FIGURE 2.30**  $f(x)$  approaches 0 as  $x$  increases or decreases without bound.

x increases without bound:				
$x$	1	10	100	1000
$f(x) = \frac{1}{x}$	1	0.1	0.01	0.001

x decreases without bound:				
$x$	-1	-10	-100	-1000
$f(x) = \frac{1}{x}$	-1	-0.1	-0.01	-0.001

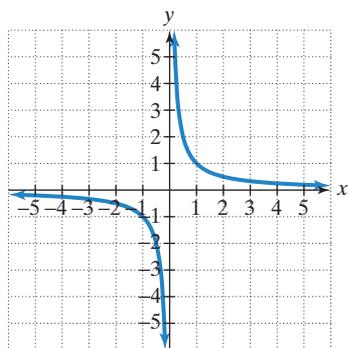

It appears that as  $x$  increases or decreases without bound, the function values,  $f(x)$ , are getting progressively closer to 0.

**Figure 2.30** illustrates the end behavior of  $f(x) = \frac{1}{x}$  as  $x$  increases or decreases without bound. The graph shows that the function values,  $f(x)$ , are approaching 0. This means that as  $x$  increases or decreases without bound, the graph of  $f$  is approaching the horizontal line  $y = 0$  (that is, the  $x$ -axis). We use arrow notation to describe this situation:

$$\text{As } x \rightarrow \infty, f(x) \rightarrow 0 \quad \text{and} \quad \text{as } x \rightarrow -\infty, f(x) \rightarrow 0.$$

As  $x$  approaches infinity  
(that is, increases without bound),  
 $f(x)$  approaches 0.

As  $x$  approaches negative infinity  
(that is, decreases without bound),  
 $f(x)$  approaches 0.

**FIGURE 2.31** The graph of the reciprocal function  $f(x) = \frac{1}{x}$

Thus, as  $x$  approaches infinity ( $x \rightarrow \infty$ ) or as  $x$  approaches negative infinity ( $x \rightarrow -\infty$ ), the function values are approaching zero:  $f(x) \rightarrow 0$ .

The graph of the reciprocal function  $f(x) = \frac{1}{x}$  is shown in **Figure 2.31**. Unlike the graph of a polynomial function, the graph of the reciprocal function has a break and is composed of two branches.

### GREAT QUESTION!

What is the relationship between  $x$  and  $\frac{1}{x}$  when  $x$  is far from 0? What happens if  $x$  is close to 0?

If  $x$  is far from 0, then  $\frac{1}{x}$  is close to 0. By contrast, if  $x$  is close to 0, then  $\frac{1}{x}$  is far from 0.

### Blitzer Bonus || The Reciprocal Function as a Knuckle Tattoo

*"I got the tattoo because I like the idea of math not being well behaved. That sounds lame and I really don't mean that in some kind of anarchy-type way. I just think that it's kind of nice that something as perfectly functional as math can kink up around the edges."*

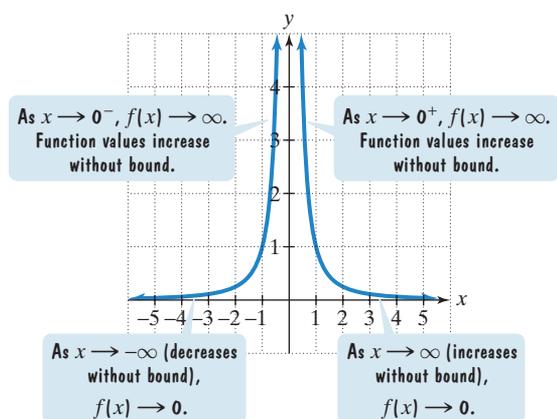

Kink up around the edges? On the next page, we'll describe the graphic behavior of the reciprocal function using *asymptotes* rather than kink. Asymptotes are lines that graphs approach but never touch. *Asymptote* comes from the Greek word *asymptotos*, meaning "not meeting."

The arrow notation used throughout our discussion of the reciprocal function is summarized in the following box:

### Arrow Notation

Symbol	Meaning
$x \rightarrow a^+$	$x$ approaches $a$ from the right.
$x \rightarrow a^-$	$x$ approaches $a$ from the left.
$x \rightarrow \infty$	$x$ approaches infinity; that is, $x$ increases without bound.
$x \rightarrow -\infty$	$x$ approaches negative infinity; that is, $x$ decreases without bound.

Another basic rational function is  $f(x) = \frac{1}{x^2}$ . The graph of this even function, with  $y$ -axis symmetry and positive function values, is shown in **Figure 2.32**. Like the reciprocal function, the graph has a break and is composed of two distinct branches.

In calculus, you will use **limits** to convey a function's end behavior or possible asymptotic behavior. In **Figure 2.32**, we can use limit notation to express end behavior to the right:

$$\lim_{x \rightarrow \infty} f(x) = 0.$$

The limit of  $f(x)$  as  $x$  approaches infinity = zero.

**FIGURE 2.32** The graph of  $f(x) = \frac{1}{x^2}$

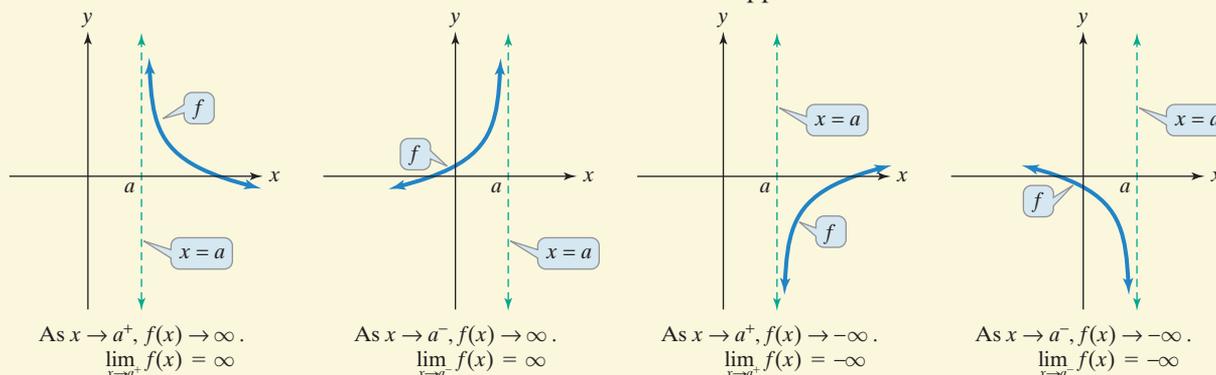

### 3 Identify vertical asymptotes.

### Vertical Asymptotes of Rational Functions

Look again at the graph of  $f(x) = \frac{1}{x^2}$  in **Figure 2.32**. The curve approaches, but does not touch, the  $y$ -axis. The  $y$ -axis, or  $x = 0$ , is said to be a *vertical asymptote* of the graph. A rational function may have no vertical asymptotes, one vertical asymptote, or several vertical asymptotes. The graph of a rational function never intersects a vertical asymptote. We will use dashed lines to show asymptotes.

### Definition of a Vertical Asymptote

The line  $x = a$  is a **vertical asymptote** of the graph of a function  $f$  if  $f(x)$  increases or decreases without bound as  $x$  approaches  $a$ .

Thus, as  $x$  approaches  $a$  from either the left or the right,  $f(x) \rightarrow \infty$  or  $f(x) \rightarrow -\infty$ .

If the graph of a rational function has vertical asymptotes, they can be located using the following theorem:

**Locating Vertical Asymptotes**

If  $f(x) = \frac{p(x)}{q(x)}$  is a rational function in which  $p(x)$  and  $q(x)$  have no common factors and  $a$  is a zero of  $q(x)$ , the denominator, then  $x = a$  is a vertical asymptote of the graph of  $f$ .

**EXAMPLE 2 Finding the Vertical Asymptotes of a Rational Function**

Find the vertical asymptotes, if any, of the graph of each rational function:

a.  $f(x) = \frac{x}{x^2 - 9}$       b.  $g(x) = \frac{x + 3}{x^2 - 9}$       c.  $h(x) = \frac{x + 3}{x^2 + 9}$ .

**SOLUTION**

Factoring is usually helpful in identifying zeros of denominators and any common factors in the numerators and denominators.

a.  $f(x) = \frac{x}{x^2 - 9} = \frac{x}{(x + 3)(x - 3)}$

This factor is 0 if  $x = -3$ .      This factor is 0 if  $x = 3$ .

There are no common factors in the numerator and the denominator. The zeros of the denominator are  $-3$  and  $3$ . Thus, the lines  $x = -3$  and  $x = 3$  are the vertical asymptotes for the graph of  $f$ . [See Figure 2.33(a).]

b. We will use factoring to see if there are common factors.

$g(x) = \frac{x + 3}{x^2 - 9} = \frac{(x + 3)}{(x + 3)(x - 3)} = \frac{1}{x - 3}$ , provided  $x \neq -3$

There is a common factor,  $x + 3$ , so simplify.      This denominator is 0 if  $x = 3$ .

The only zero of the denominator of  $g(x)$  in simplified form is  $3$ . Thus, the line  $x = 3$  is the only vertical asymptote of the graph of  $g$ . [See Figure 2.33(b).]

c. We cannot factor the denominator of  $h(x)$  over the real numbers.

$h(x) = \frac{x + 3}{x^2 + 9}$

No real numbers make this denominator 0.

The denominator has no real zeros. Thus, the graph of  $h$  has no vertical asymptotes. [See Figure 2.33(c).]

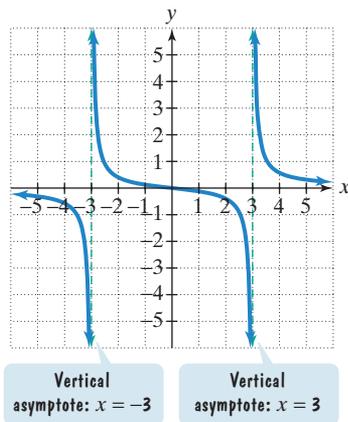

FIGURE 2.33(a) The graph of  $f(x) = \frac{x}{x^2 - 9}$  has two vertical asymptotes.

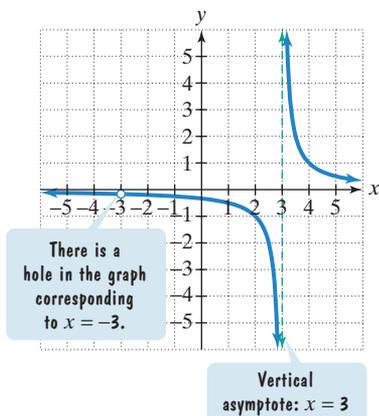

FIGURE 2.33(b) The graph of  $g(x) = \frac{x + 3}{x^2 - 9}$  has one vertical asymptote.

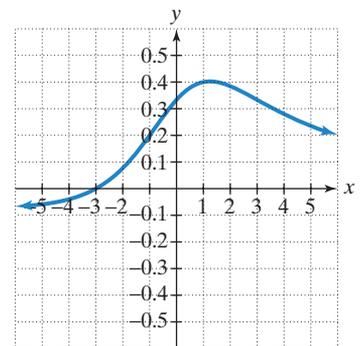

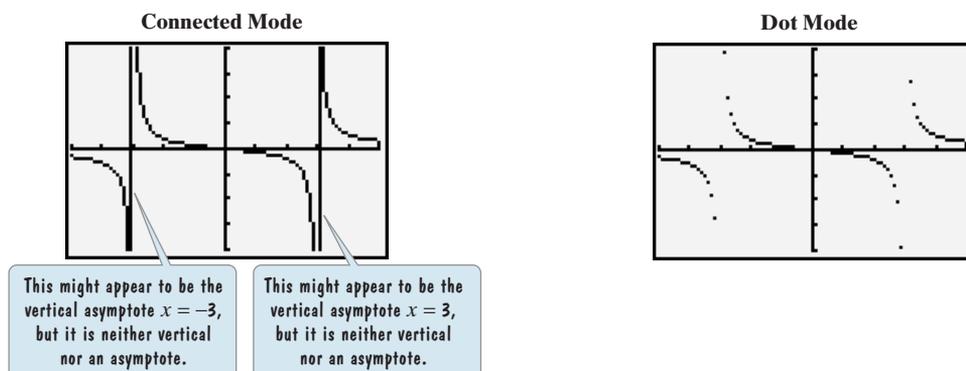

FIGURE 2.33(c) The graph of  $h(x) = \frac{x + 3}{x^2 + 9}$  has no vertical asymptotes.

**Check Point 2** Find the vertical asymptotes, if any, of the graph of each rational function:

a.  $f(x) = \frac{x}{x^2 - 1}$       b.  $g(x) = \frac{x - 1}{x^2 - 1}$       c.  $h(x) = \frac{x - 1}{x^2 + 1}$ .

## TECHNOLOGY

The graph of the rational function  $f(x) = \frac{x}{x^2 - 9}$ , drawn by hand in **Figure 2.33(a)** on the previous page, is graphed below in a  $[-5, 5, 1]$  by  $[-4, 4, 1]$  viewing rectangle. The graph is shown in connected mode and in dot mode. In connected mode, the graphing utility plots many points and connects the points with curves. In dot mode, the utility plots the same points but does not connect them.

The steep lines that may appear on some graphing utilities in connected mode and seem to be the vertical asymptotes  $x = -3$  and  $x = 3$  are not part of the graph and do not represent the vertical asymptotes. The graphing utility has incorrectly connected the last point to the left of  $x = -3$  with the first point to the right of  $x = -3$ . It has also incorrectly connected the last point to the left of  $x = 3$  with the first point to the right of  $x = 3$ . The effect is to create two near-vertical segments that look like asymptotes. This erroneous effect does not appear using dot mode.

## GREAT QUESTION!

**Do I have to factor to identify a rational function's possible vertical asymptotes or holes?**

Yes. It is essential to factor the numerator and the denominator of the rational function.

A value where the denominator of a rational function is zero does not necessarily result in a vertical asymptote. There is a hole corresponding to  $x = a$ , and not a vertical asymptote, in the graph of a rational function under the following conditions: The value  $a$  causes the denominator to be zero, but there is a reduced form of the function's equation in which  $a$  does not cause the denominator to be zero.

Consider, for example, the function

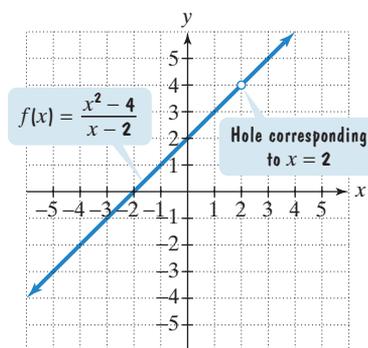

$$f(x) = \frac{x^2 - 4}{x - 2}.$$

Because the denominator is zero when  $x = 2$ , the function's domain is all real numbers except 2. However, there is a reduced form of the equation in which 2 does not cause the denominator to be zero:

$$f(x) = \frac{x^2 - 4}{x - 2} = \frac{(x + 2)(x - 2)}{x - 2} = x + 2, \quad x \neq 2.$$

Denominator is zero at  $x = 2$ .

In this reduced form, 2 does not result in a zero denominator.

**FIGURE 2.34** A graph with a hole corresponding to the denominator's zero

**Figure 2.34** shows that the graph has a hole corresponding to  $x = 2$ . Graphing utilities do not show this feature of the graph.

## 4 Identify horizontal asymptotes.

## Horizontal Asymptotes of Rational Functions

**Figure 2.31**, repeated in the margin at the top of the next page, shows the graph of the reciprocal function  $f(x) = \frac{1}{x}$ . As  $x \rightarrow \infty$  and as  $x \rightarrow -\infty$ , the function values are approaching 0:  $f(x) \rightarrow 0$ . The line  $y = 0$  (that is, the  $x$ -axis) is a *horizontal asymptote* of the graph. Many, but not all, rational functions have horizontal asymptotes.

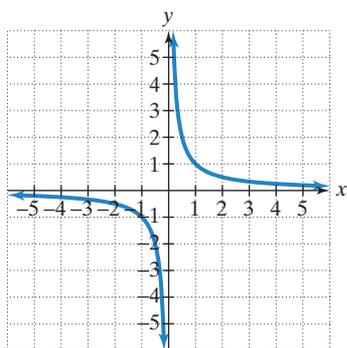

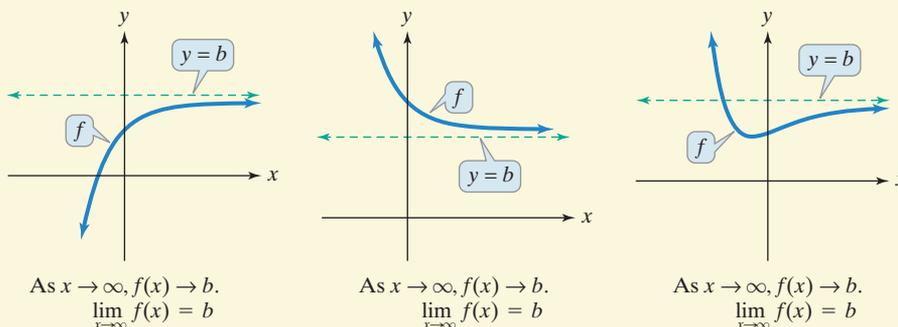

FIGURE 2.31 The graph of  $f(x) = \frac{1}{x}$  (repeated)

### Definition of a Horizontal Asymptote

The line  $y = b$  is a **horizontal asymptote** of the graph of a function  $f$  if  $f(x)$  approaches  $b$  as  $x$  increases or decreases without bound.

As  $x \rightarrow -\infty, f(x) \rightarrow b.$   
 $\lim_{x \rightarrow -\infty} f(x) = b$

As  $x \rightarrow \infty, f(x) \rightarrow b.$   
 $\lim_{x \rightarrow \infty} f(x) = b$

As  $x \rightarrow \infty, f(x) \rightarrow b.$   
 $\lim_{x \rightarrow \infty} f(x) = b$

Recall that a rational function may have several vertical asymptotes. By contrast, it can have at most one horizontal asymptote. Although a graph can never intersect a vertical asymptote, it may cross its horizontal asymptote.

If the graph of a rational function has a horizontal asymptote, it can be located using the following theorem:

### GREAT QUESTION!

**Do I have to factor to identify a rational function's possible horizontal asymptote?**

No. Unlike identifying possible vertical asymptotes or holes, we do not use factoring to determine a possible horizontal asymptote.

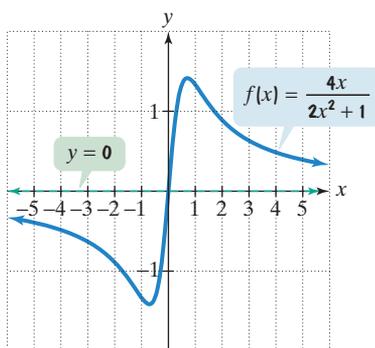

FIGURE 2.35(a) The horizontal asymptote of the graph is  $y = 0$ .

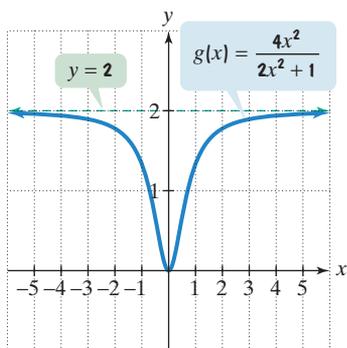

FIGURE 2.35(b) The horizontal asymptote of the graph is  $y = 2$ .

### Locating Horizontal Asymptotes

Let  $f$  be the rational function given by

$$f(x) = \frac{a_n x^n + a_{n-1} x^{n-1} + \cdots + a_1 x + a_0}{b_m x^m + b_{m-1} x^{m-1} + \cdots + b_1 x + b_0}, \quad a_n \neq 0, b_m \neq 0.$$

The degree of the numerator is  $n$ . The degree of the denominator is  $m$ .

1. If  $n < m$ , the  $x$ -axis, or  $y = 0$ , is the horizontal asymptote of the graph of  $f$ .
2. If  $n = m$ , the line  $y = \frac{a_n}{b_m}$  is the horizontal asymptote of the graph of  $f$ .
3. If  $n > m$ , the graph of  $f$  has no horizontal asymptote.

### EXAMPLE 3 Finding the Horizontal Asymptote of a Rational Function

Find the horizontal asymptote, if there is one, of the graph of each rational function:

a.  $f(x) = \frac{4x}{2x^2 + 1}$       b.  $g(x) = \frac{4x^2}{2x^2 + 1}$       c.  $h(x) = \frac{4x^3}{2x^2 + 1}$ .

### SOLUTION

a.  $f(x) = \frac{4x}{2x^2 + 1}$

The degree of the numerator, 1, is less than the degree of the denominator, 2. Thus, the graph of  $f$  has the  $x$ -axis as a horizontal asymptote. [See Figure 2.35(a).] The equation of the horizontal asymptote is  $y = 0$ .

b.  $g(x) = \frac{4x^2}{2x^2 + 1}$

The degree of the numerator, 2, is equal to the degree of the denominator, 2. The leading coefficients of the numerator and denominator, 4 and 2, are used to obtain the equation of the horizontal asymptote. The equation of the horizontal asymptote is  $y = \frac{4}{2}$  or  $y = 2$ . [See Figure 2.35(b).]

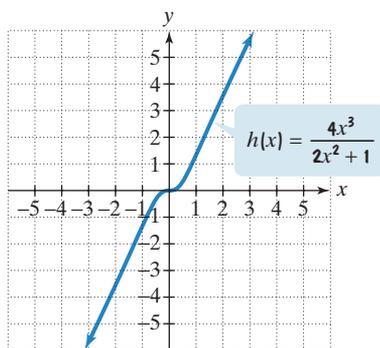

FIGURE 2.35(c) The graph has no horizontal asymptote.

c.  $h(x) = \frac{4x^3}{2x^2 + 1}$

The degree of the numerator, 3, is greater than the degree of the denominator, 2. Thus, the graph of  $h$  has no horizontal asymptote. [See Figure 2.35(c).]

**Check Point 3** Find the horizontal asymptote, if there is one, of the graph of each rational function:

a.  $f(x) = \frac{9x^2}{3x^2 + 1}$

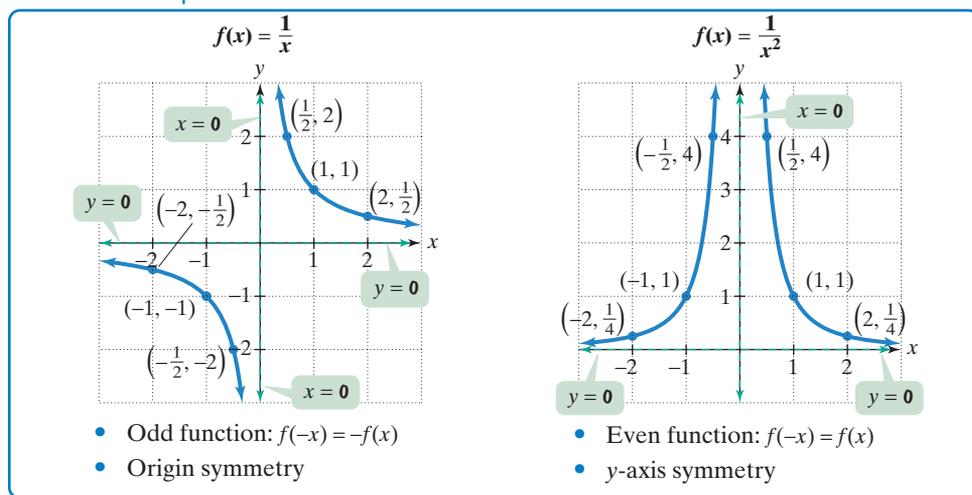

b.  $g(x) = \frac{9x}{3x^2 + 1}$

c.  $h(x) = \frac{9x^3}{3x^2 + 1}$

### Using Transformations to Graph Rational Functions

Table 2.2 shows the graphs of two rational functions,  $f(x) = \frac{1}{x}$  and  $f(x) = \frac{1}{x^2}$ . The dashed green lines indicate the asymptotes.

Table 2.2 Graphs of Common Rational Functions

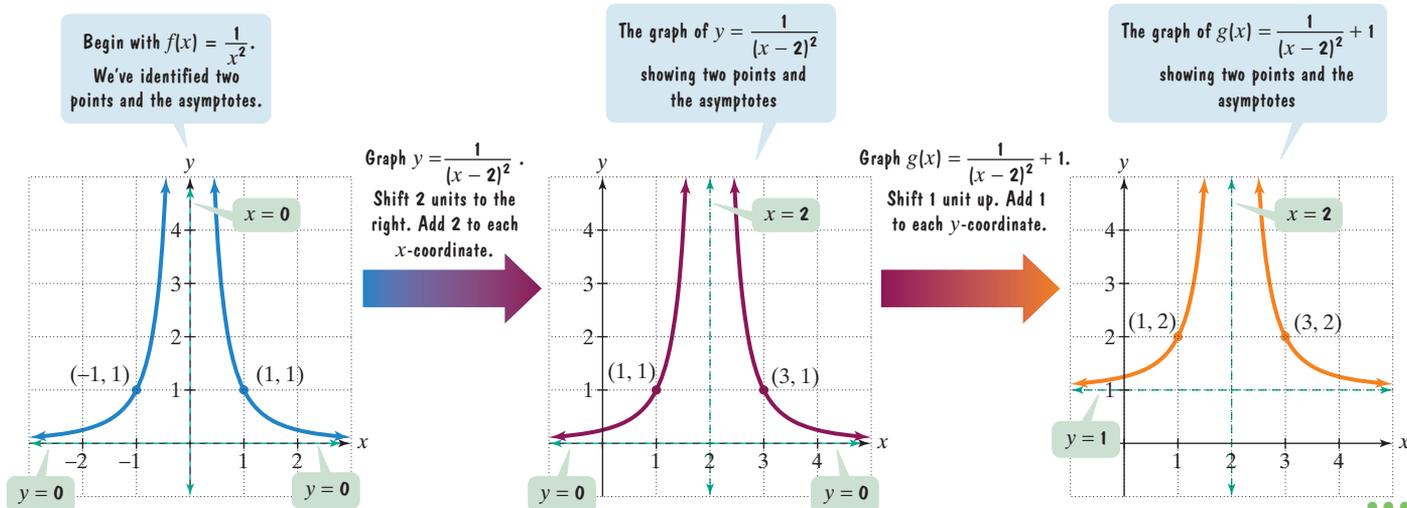

5 Use transformations to graph rational functions.

Some rational functions can be graphed using transformations (horizontal shifting, stretching or shrinking, reflecting, vertical shifting) of these two common graphs.

### EXAMPLE 4 Using Transformations to Graph a Rational Function

Use the graph of  $f(x) = \frac{1}{x^2}$  to graph  $g(x) = \frac{1}{(x - 2)^2} + 1$ .

#### SOLUTION

 **Check Point 4** Use the graph of  $f(x) = \frac{1}{x}$  to graph  $g(x) = \frac{1}{x+2} - 1$ .

**6** Graph rational functions.

### Graphing Rational Functions

Rational functions that are not transformations of  $f(x) = \frac{1}{x}$  or  $f(x) = \frac{1}{x^2}$  can be graphed using the following procedure:

#### Strategy for Graphing a Rational Function

The following strategy can be used to graph

$$f(x) = \frac{p(x)}{q(x)},$$

where  $p$  and  $q$  are polynomial functions with no common factors.

1. Determine whether the graph of  $f$  has symmetry.

$$f(-x) = f(x): \quad y\text{-axis symmetry}$$

$$f(-x) = -f(x): \quad \text{origin symmetry}$$

2. Find the  $y$ -intercept (if there is one) by evaluating  $f(0)$ .
3. Find the  $x$ -intercepts (if there are any) by solving the equation  $p(x) = 0$ .
4. Find any vertical asymptote(s) by solving the equation  $q(x) = 0$ .
5. Find the horizontal asymptote (if there is one) using the rule for determining the horizontal asymptote of a rational function.
6. Plot at least one point between and beyond each  $x$ -intercept and vertical asymptote.
7. Use the information obtained previously to graph the function between and beyond the vertical asymptotes.

#### EXAMPLE 5 Graphing a Rational Function

Graph:  $f(x) = \frac{2x - 1}{x - 1}$ .

#### SOLUTION

**Step 1 Determine symmetry.**

$$f(-x) = \frac{2(-x) - 1}{-x - 1} = \frac{-2x - 1}{-x - 1} = \frac{2x + 1}{x + 1}$$

Because  $f(-x)$  does not equal either  $f(x)$  or  $-f(x)$ , the graph has neither  $y$ -axis symmetry nor origin symmetry.

**Step 2 Find the  $y$ -intercept.** Evaluate  $f(0)$ .

$$f(0) = \frac{2 \cdot 0 - 1}{0 - 1} = \frac{-1}{-1} = 1$$

The  $y$ -intercept is 1, so the graph passes through  $(0, 1)$ .

**Step 3 Find  $x$ -intercept(s).** This is done by solving  $p(x) = 0$ , where  $p(x)$  is the numerator of  $f(x)$ .

$$\begin{aligned} 2x - 1 &= 0 && \text{Set the numerator equal to 0.} \\ 2x &= 1 && \text{Add 1 to both sides.} \\ x &= \frac{1}{2} && \text{Divide both sides by 2.} \end{aligned}$$

The  $x$ -intercept is  $\frac{1}{2}$ , so the graph passes through  $(\frac{1}{2}, 0)$ .

**Step 4 Find the vertical asymptote(s).** Solve  $q(x) = 0$ , where  $q(x)$  is the denominator of  $f(x)$ , thereby finding zeros of the denominator. (Note that the numerator and denominator of  $f(x) = \frac{2x - 1}{x - 1}$  have no common factors.)

$$\begin{aligned}x - 1 &= 0 && \text{Set the denominator equal to 0.} \\x &= 1 && \text{Add 1 to both sides.}\end{aligned}$$

The equation of the vertical asymptote is  $x = 1$ .

**Step 5 Find the horizontal asymptote.** Because the numerator and denominator of  $f(x) = \frac{2x - 1}{x - 1}$  have the same degree, 1, the leading coefficients of the numerator and denominator, 2 and 1, respectively, are used to obtain the equation of the horizontal asymptote. The equation is

$$y = \frac{2}{1} = 2.$$

The equation of the horizontal asymptote is  $y = 2$ .

**Step 6 Plot points between and beyond each  $x$ -intercept and vertical asymptote.** With an  $x$ -intercept at  $\frac{1}{2}$  and a vertical asymptote at  $x = 1$ , we evaluate the function at  $-2, -1, \frac{3}{4}, 2$ , and  $4$ .

$x$	-2	-1	$\frac{3}{4}$	2	4
$f(x) = \frac{2x - 1}{x - 1}$	$\frac{5}{3}$	$\frac{3}{2}$	-2	3	$\frac{7}{3}$

Figure 2.36 shows these points, the  $y$ -intercept, the  $x$ -intercept, and the asymptotes.

**Step 7 Graph the function.** The graph of  $f(x) = \frac{2x - 1}{x - 1}$  is shown in Figure 2.37.

## TECHNOLOGY

The graph of  $y = \frac{2x - 1}{x - 1}$ , obtained using the dot mode in a  $[-6, 6, 1]$  by  $[-6, 6, 1]$  viewing rectangle, verifies that our hand-drawn graph in Figure 2.37 is correct.

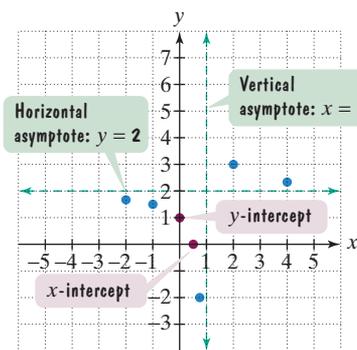

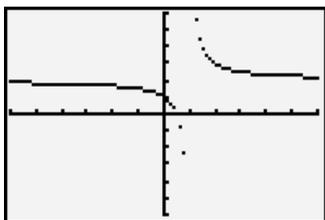

FIGURE 2.36 Preparing to graph the rational function  $f(x) = \frac{2x - 1}{x - 1}$

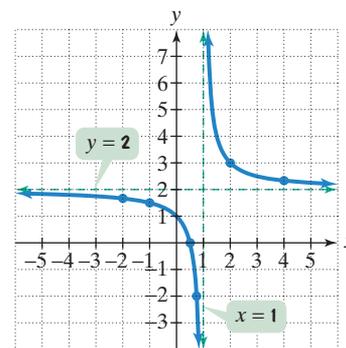

FIGURE 2.37 The graph of  $f(x) = \frac{2x - 1}{x - 1}$

 **Check Point 5** Graph:  $f(x) = \frac{3x - 3}{x - 2}$ .

## EXAMPLE 6 Graphing a Rational Function

Graph:  $f(x) = \frac{3x^2}{x^2 - 4}$ .

### SOLUTION

**Step 1 Determine symmetry.**  $f(-x) = \frac{3(-x)^2}{(-x)^2 - 4} = \frac{3x^2}{x^2 - 4} = f(x)$ : The graph of  $f$  is symmetric with respect to the  $y$ -axis.

**Step 2 Find the y-intercept.**  $f(0) = \frac{3 \cdot 0^2}{0^2 - 4} = \frac{0}{-4} = 0$ : The y-intercept is 0, so the graph passes through the origin.

**Step 3 Find the x-intercept(s).**  $3x^2 = 0$ , so  $x = 0$ : The x-intercept is 0, verifying that the graph passes through the origin.

**Step 4 Find the vertical asymptote(s).** Set  $q(x) = 0$ . (Note that the numerator and denominator of  $f(x) = \frac{3x^2}{x^2 - 4}$  have no common factors.)

$$\begin{aligned} x^2 - 4 &= 0 && \text{Set the denominator equal to 0.} \\ x^2 &= 4 && \text{Add 4 to both sides.} \\ x &= \pm 2 && \text{Use the square root property.} \end{aligned}$$

The vertical asymptotes are  $x = -2$  and  $x = 2$ .

**Step 5 Find the horizontal asymptote.** Because the numerator and denominator of  $f(x) = \frac{3x^2}{x^2 - 4}$  have the same degree, 2, their leading coefficients, 3 and 1, are used to determine the equation of the horizontal asymptote. The equation is  $y = \frac{3}{1} = 3$ .

**Step 6 Plot points between and beyond each x-intercept and vertical asymptote.** With an x-intercept at 0 and vertical asymptotes at  $x = -2$  and  $x = 2$ , we evaluate the function at  $-3, -1, 1, 3$ , and  $4$ .

## GREAT QUESTION!

**Do I have to evaluate  $f(x)$  at all five of the values shown in the table for Step 6?**

No. Because the graph has y-axis symmetry, it is not necessary to evaluate the even function at  $-3$  and again at  $3$ .

$$f(-3) = f(3) = \frac{27}{5}$$

This also applies to evaluation at  $-1$  and  $1$ .

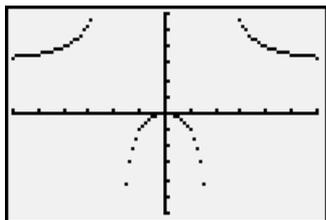

$x$	$-3$	$-1$	$1$	$3$	$4$
$f(x) = \frac{3x^2}{x^2 - 4}$	$\frac{27}{5}$	$-1$	$-1$	$\frac{27}{5}$	$4$

**Figure 2.38** shows the points  $\left(-3, \frac{27}{5}\right)$ ,  $(-1, -1)$ ,  $(1, -1)$ ,  $\left(3, \frac{27}{5}\right)$ , and  $(4, 4)$ , the y-intercept, the x-intercept, and the asymptotes.

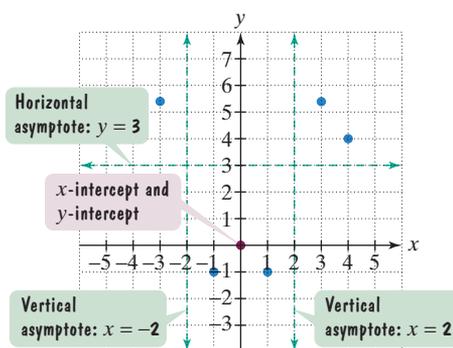

**Step 7 Graph the function.** The graph of  $f(x) = \frac{3x^2}{x^2 - 4}$  is shown in **Figure 2.39**. The y-axis symmetry is now obvious.

## TECHNOLOGY

The graph of  $y = \frac{3x^2}{x^2 - 4}$ , generated by a graphing utility, verifies that our hand-drawn graph is correct.

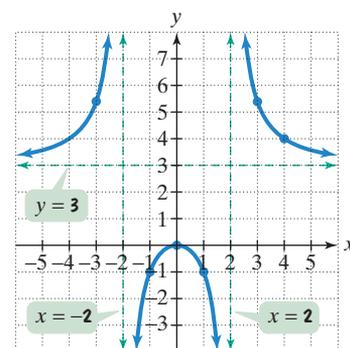

$[-6, 6, 1]$  by  $[-6, 6, 1]$

**FIGURE 2.38** Preparing to graph

$$f(x) = \frac{3x^2}{x^2 - 4}$$

**FIGURE 2.39** The graph of

$$f(x) = \frac{3x^2}{x^2 - 4}$$

 **Check Point 6** Graph:  $f(x) = \frac{2x^2}{x^2 - 9}$ .

Example 7 illustrates that not every rational function has vertical and horizontal asymptotes.

**EXAMPLE 7** Graphing a Rational Function

Graph:  $f(x) = \frac{x^4}{x^2 + 1}$ .

**SOLUTION**

**Step 1 Determine symmetry.**  $f(-x) = \frac{(-x)^4}{(-x)^2 + 1} = \frac{x^4}{x^2 + 1} = f(x)$

The graph of  $f$  is symmetric with respect to the  $y$ -axis.

**Step 2 Find the  $y$ -intercept.**  $f(0) = \frac{0^4}{0^2 + 1} = \frac{0}{1} = 0$ : The  $y$ -intercept is 0.

**Step 3 Find the  $x$ -intercept(s).**  $x^4 = 0$ , so  $x = 0$ : The  $x$ -intercept is 0.

**Step 4 Find the vertical asymptote(s).** Set  $q(x) = 0$ .

$$\begin{aligned} x^2 + 1 &= 0 && \text{Set the denominator equal to 0.} \\ x^2 &= -1 && \text{Subtract 1 from both sides.} \end{aligned}$$

Although this equation has imaginary roots ( $x = \pm i$ ), there are no real roots. Thus, the graph of  $f$  has no vertical asymptotes.

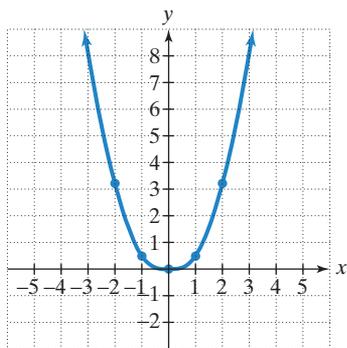

**Step 5 Find the horizontal asymptote.** Because the degree of the numerator, 4, is greater than the degree of the denominator, 2, there is no horizontal asymptote.

**Step 6 Plot points between and beyond each  $x$ -intercept and vertical asymptote.** With an  $x$ -intercept at 0 and no vertical asymptotes, let's look at function values at  $-2, -1, 1,$  and  $2$ . You can evaluate the function at 1 and 2. Use  $y$ -axis symmetry to obtain function values at  $-1$  and  $-2$ :

$$f(-1) = f(1) \text{ and } f(-2) = f(2).$$

$x$	-2	-1	1	2
$f(x) = \frac{x^4}{x^2 + 1}$	$\frac{16}{5}$	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{16}{5}$

**Step 7 Graph the function.** Figure 2.40 shows the graph of  $f$  using the points obtained from the table and  $y$ -axis symmetry. Notice that as  $x$  approaches infinity or negative infinity ( $x \rightarrow \infty$  or  $x \rightarrow -\infty$ ), the function values,  $f(x)$ , are getting larger without bound [ $f(x) \rightarrow \infty$ ].

**FIGURE 2.40** The graph of

$$f(x) = \frac{x^4}{x^2 + 1}$$

**Check Point 7** Graph:  $f(x) = \frac{x^4}{x^2 + 2}$ .

**7** Identify slant asymptotes.

**Slant Asymptotes**

Examine the graph of

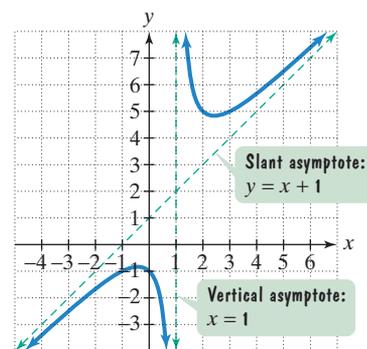

$$f(x) = \frac{x^2 + 1}{x - 1},$$

shown in Figure 2.41. Note that the degree of the numerator, 2, is greater than the degree of the denominator, 1. Thus, the graph of this function has no horizontal asymptote. However, the graph has a **slant asymptote**,  $y = x + 1$ .

**The graph of a rational function has a slant asymptote if the degree of the numerator is one more than the degree of the denominator.** The equation of the slant asymptote can be found by division. For example, to find the slant asymptote

for the graph of  $f(x) = \frac{x^2 + 1}{x - 1}$ , divide  $x - 1$  into  $x^2 + 1$ :

$$\begin{array}{r} 1 \phantom{0} \\ 1 \phantom{0} \overline{) 1 \phantom{0} 0 \phantom{0} 1} \\ \underline{1 \phantom{0} 1} \phantom{0} \\ \phantom{1} \phantom{0} 2 \phantom{0} 1 \\ \phantom{1} \phantom{0} \underline{2 \phantom{0} 0 \phantom{0} 1} \\ \phantom{1} \phantom{0} \phantom{2} \phantom{0} 0 \phantom{0} 0 \phantom{0} 1 \end{array} \quad \begin{array}{l} 1x + 1 + \frac{2}{x - 1} \\ \text{Remainder} \end{array}$$

**FIGURE 2.41** The graph of

$$f(x) = \frac{x^2 + 1}{x - 1}$$

Observe that

$$f(x) = \frac{x^2 + 1}{x - 1} = \underbrace{x + 1} + \frac{2}{x - 1}.$$

The equation of the slant asymptote is  $y = x + 1$ .

As  $|x| \rightarrow \infty$ , the value of  $\frac{2}{x - 1}$  is approximately 0. Thus, when  $|x|$  is large, the function is very close to  $y = x + 1 + 0$ . This means that as  $x \rightarrow \infty$  or as  $x \rightarrow -\infty$ , the graph of  $f$  gets closer and closer to the line whose equation is  $y = x + 1$ . The line  $y = x + 1$  is a slant asymptote of the graph.

In general, if  $f(x) = \frac{p(x)}{q(x)}$ ,  $p$  and  $q$  have no common factors, and the degree of  $p$  is one greater than the degree of  $q$ , find the slant asymptote by dividing  $q(x)$  into  $p(x)$ . The division will take the form

$$\frac{p(x)}{q(x)} = mx + b + \frac{\text{remainder}}{q(x)}.$$

Slant asymptote:  
 $y = mx + b$

The equation of the slant asymptote is obtained by dropping the term with the remainder. Thus, the equation of the slant asymptote is  $y = mx + b$ .

**EXAMPLE 8** Finding the Slant Asymptote of a Rational Function

Find the slant asymptote of  $f(x) = \frac{x^2 - 4x - 5}{x - 3}$ .

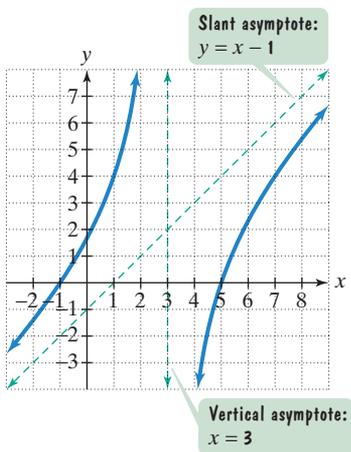

**SOLUTION**

Because the degree of the numerator, 2, is exactly one more than the degree of the denominator, 1, and  $x - 3$  is not a factor of  $x^2 - 4x - 5$ , the graph of  $f$  has a slant asymptote. To find the equation of the slant asymptote, divide  $x - 3$  into  $x^2 - 4x - 5$ :

$$\begin{array}{r} 3 \overline{) 1 \ -4 \ -5} \\ \underline{3 \ -3} \\ 1 \ -1 \ -8 \end{array} \quad \text{Remainder}$$

$$x - 3 \overline{) x^2 - 4x - 5} = 1x - 1 - \frac{8}{x - 3}$$

Drop the remainder term and you'll have the equation of the slant asymptote.

**FIGURE 2.42** The graph of  $f(x) = \frac{x^2 - 4x - 5}{x - 3}$

The equation of the slant asymptote is  $y = x - 1$ . Using our strategy for graphing rational functions, the graph of  $f(x) = \frac{x^2 - 4x - 5}{x - 3}$  is shown in **Figure 2.42**. ●●●

**Check Point 8** Find the slant asymptote of  $f(x) = \frac{2x^2 - 5x + 7}{x - 2}$ .

- 8 Solve applied problems involving rational functions.

### Applications

There are numerous examples of asymptotic behavior in functions that model real-world phenomena. Let's consider an example from the business world. The **cost function**,  $C$ , for a business is the sum of its fixed and variable costs:

$$C(x) = (\text{fixed cost}) + cx.$$

Cost per unit times the number of units produced,  $x$

The **average cost** per unit for a company to produce  $x$  units is the sum of its fixed and variable costs divided by the number of units produced. The **average cost function** is a rational function that is denoted by  $\bar{C}$ . Thus,

Cost of producing  $x$  units: fixed plus variable costs

$$\bar{C}(x) = \frac{(\text{fixed cost}) + cx}{x}.$$

Number of units produced

### EXAMPLE 9 Average Cost for a Business

We return to the robotic exoskeleton described in the section opener. Suppose a company that manufactures this invention has a fixed monthly cost of \$1,000,000 and that it costs \$5000 to produce each robotic system.

- Write the cost function,  $C$ , of producing  $x$  robotic systems.
- Write the average cost function,  $\bar{C}$ , of producing  $x$  robotic systems.
- Find and interpret  $\bar{C}(1000)$ ,  $\bar{C}(10,000)$ , and  $\bar{C}(100,000)$ .
- What is the horizontal asymptote for the graph of the average cost function,  $\bar{C}$ ? Describe what this represents for the company.

### SOLUTION

- a. The cost function,  $C$ , is the sum of the fixed cost and the variable costs.

$$C(x) = 1,000,000 + 5000x$$

Fixed cost is \$1,000,000.

Variable cost: \$5000 for each robotic system produced

- b. The average cost function,  $\bar{C}$ , is the sum of fixed and variable costs divided by the number of robotic systems produced.

$$\bar{C}(x) = \frac{1,000,000 + 5000x}{x} \quad \text{or} \quad \bar{C}(x) = \frac{5000x + 1,000,000}{x}$$

- c. We evaluate  $\bar{C}$  at 1000, 10,000, and 100,000, interpreting the results.

$$\bar{C}(1000) = \frac{5000(1000) + 1,000,000}{1000} = 6000$$

The average cost per robotic system of producing 1000 systems per month is \$6000.

$$\bar{C}(10,000) = \frac{5000(10,000) + 1,000,000}{10,000} = 5100$$

The average cost per robotic system of producing 10,000 systems per month is \$5100.

$$\bar{C}(100,000) = \frac{5000(100,000) + 1,000,000}{100,000} = 5010$$

The average cost per robotic system of producing 100,000 systems per month is \$5010. Notice that with higher production levels, the cost of producing each robotic exoskeleton decreases.

d. We developed the average cost function

$$\bar{C}(x) = \frac{5000x + 1,000,000}{x}$$

in which the degree of the numerator, 1, is equal to the degree of the denominator, 1. The leading coefficients of the numerator and denominator, 5000 and 1, are used to obtain the equation of the horizontal asymptote. The equation of the horizontal asymptote is

$$y = \frac{5000}{1} \quad \text{or} \quad y = 5000.$$

The horizontal asymptote is shown in **Figure 2.43**. This means that the more robotic systems produced each month, the closer the average cost per system for the company comes to \$5000. The least possible cost per robotic exoskeleton is approaching \$5000. Competitively

low prices take place with high production levels, posing a major problem for small businesses. ●●●

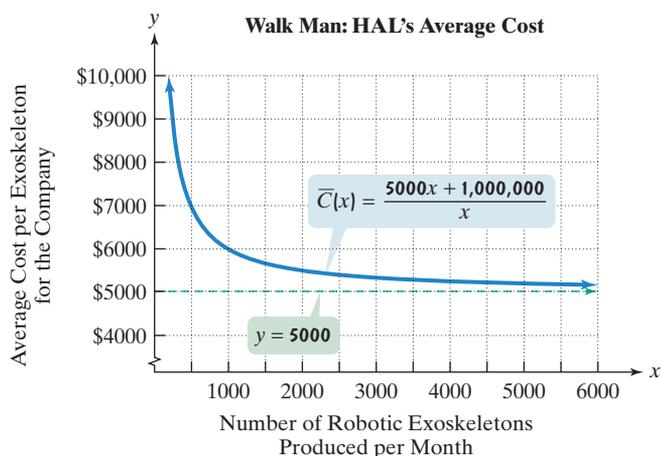

FIGURE 2.43

 **Check Point 9** A company is planning to manufacture wheelchairs that are light, fast, and beautiful. The fixed monthly cost will be \$500,000 and it will cost \$400 to produce each radically innovative chair.

- Write the cost function,  $C$ , of producing  $x$  wheelchairs.
- Write the average cost function,  $\bar{C}$ , of producing  $x$  wheelchairs.
- Find and interpret  $\bar{C}(1000)$ ,  $\bar{C}(10,000)$ , and  $\bar{C}(100,000)$ .
- What is the horizontal asymptote for the graph of the average cost function,  $\bar{C}$ ? Describe what this represents for the company.

If an object moves at an average velocity  $v$ , the distance,  $s$ , covered in time  $t$  is given by the formula

$$s = vt.$$

Thus,  $\text{distance} = \text{velocity} \cdot \text{time}$ . Objects that move in accordance with this formula are said to be in **uniform motion**. In Example 10, we use a rational function to model time,  $t$ , in uniform motion. Solving the uniform motion formula for  $t$ , we obtain

$$t = \frac{s}{v}.$$

Thus, time is the quotient of distance and average velocity.

### EXAMPLE 10 Time Involved in Uniform Motion

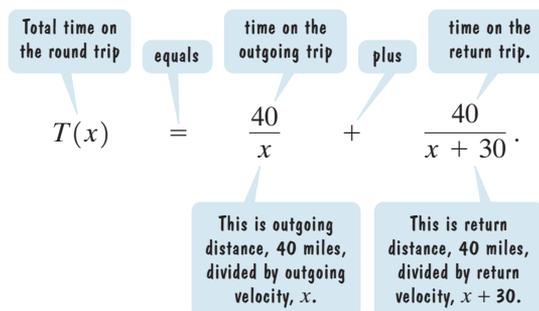

A commuter drove to work a distance of 40 miles and then returned again on the same route. The average velocity on the return trip was 30 miles per hour faster than the average velocity on the outgoing trip. Express the total time required to complete the round trip,  $T$ , as a function of the average velocity on the outgoing trip,  $x$ .

## SOLUTION

As specified, the average velocity on the outgoing trip is represented by  $x$ . Because the average velocity on the return trip was 30 miles per hour faster than the average velocity on the outgoing trip, let

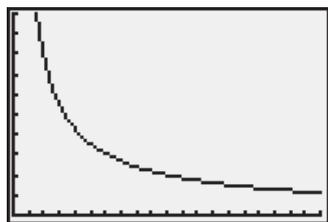

$$x + 30 = \text{the average velocity on the return trip.}$$

The sentence that we use as a verbal model to write our rational function is

The function that expresses the total time required to complete the round trip is

$$T(x) = \frac{40}{x} + \frac{40}{x + 30} \quad \dots$$

**FIGURE 2.44** The graph of  $T(x) = \frac{40}{x} + \frac{40}{x + 30}$ . As average velocity increases, time for the trip decreases:  $\lim_{x \rightarrow \infty} T(x) = 0$ .

Once you have modeled a problem's conditions with a function, you can use a graphing utility to explore the function's behavior. For example, let's graph the function in Example 10. Because it seems unlikely that an average outgoing velocity exceeds 60 miles per hour with an average return velocity that is 30 miles per hour faster, we graph the function for  $0 \leq x \leq 60$ . **Figure 2.44** shows the graph of  $T(x) = \frac{40}{x} + \frac{40}{x + 30}$  in a  $[0, 60, 3]$  by  $[0, 10, 1]$  viewing rectangle. Notice that the function is decreasing on the interval  $(0, 60)$ . This shows decreasing times with increasing average velocities. Can you see that  $x = 0$ , or the  $y$ -axis, is a vertical asymptote? This indicates that close to an outgoing average velocity of zero miles per hour, the round trip will take nearly forever:  $\lim_{x \rightarrow 0^+} T(x) = \infty$ .

**Check Point 10** A commuter drove to work a distance of 20 miles and then returned again on the same route. The average velocity on the return trip was 10 miles per hour slower than the average velocity on the outgoing trip. Express the total time required to complete the round trip,  $T$ , as a function of the average velocity on the outgoing trip,  $x$ .

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

1. All rational functions can be expressed as

$$f(x) = \frac{p(x)}{q(x)},$$

where  $p$  and  $q$  are \_\_\_\_\_ functions and  $q(x) \neq 0$ .

2. True or false: The domain of every rational function is the set of all real numbers. \_\_\_\_\_
3. True or false: The graph of the reciprocal function  $f(x) = \frac{1}{x}$  has a break and is composed of two distinct branches. \_\_\_\_\_

4. If the graph of a function  $f$  increases or decreases without bound as  $x$  approaches  $a$ , then the line  $x = a$  is a/an \_\_\_\_\_ of the graph of  $f$ . The equation of such a line for the graph of  $f(x) = \frac{2}{x + 5}$  is \_\_\_\_\_.
5. If the graph of a function  $f$  approaches  $b$  as  $x$  increases or decreases without bound, then the line  $y = b$  is a/an \_\_\_\_\_ of the graph of  $f$ . The equation of such a line for the graph of  $y = \frac{x - 10}{3x^2 + x + 1}$  is \_\_\_\_\_. The equation of such a line for the graph of  $y = \frac{x^2 - 10}{3x^2 + x + 1}$  is \_\_\_\_\_.

- True or false: If the degree of the numerator of a rational function equals the degree of the denominator, then setting  $y$  equal to the ratio of the leading coefficients gives the equation of the horizontal asymptote. \_\_\_\_\_
- Compared with the graph of  $f(x) = \frac{1}{x}$ , the graph of  $g(x) = \frac{1}{x+2} - 1$  is shifted 2 units \_\_\_\_\_ and 1 unit \_\_\_\_\_.
- The graph of a rational function has a slant asymptote if the degree of the numerator is \_\_\_\_\_ the degree of the denominator.

- Based on the synthetic division shown below, the equation of the slant asymptote of

$$f(x) = \frac{3x^2 - 7x + 5}{x - 4} \text{ is } \underline{\hspace{2cm}}$$

$$\begin{array}{r|rrr} 4 & 3 & -7 & 5 \\ & & 12 & 20 \\ \hline & 3 & 5 & 25 \end{array}$$

- The average velocity on an outgoing trip is  $x$  miles per hour. The average velocity on the return trip is 20 miles per hour slower, so the average velocity on the return trip is \_\_\_\_\_ miles per hour. The distance covered on the return trip is 30 miles, so the time on the return trip is \_\_\_\_\_ hours.

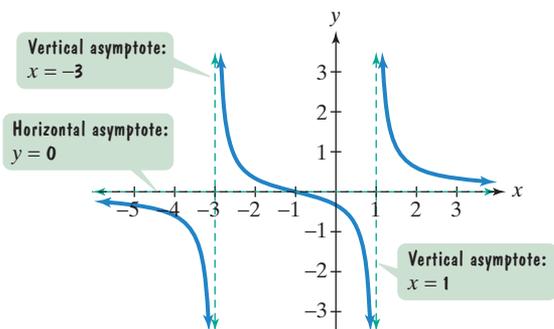

### EXERCISE SET 2.6

#### Practice Exercises

In Exercises 1–8, find the domain of each rational function.

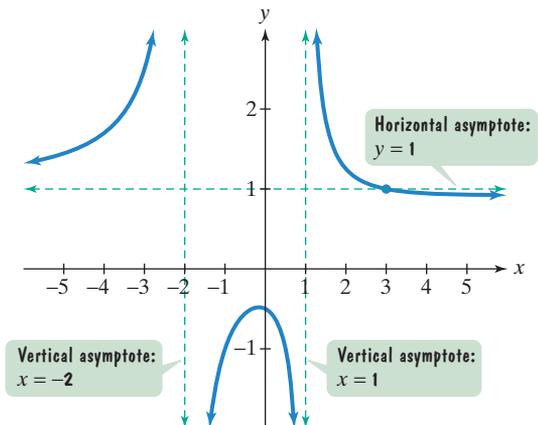

- $f(x) = \frac{5x}{x-4}$
- $f(x) = \frac{7x}{x-8}$
- $g(x) = \frac{3x^2}{(x-5)(x+4)}$
- $g(x) = \frac{2x^2}{(x-2)(x+6)}$
- $h(x) = \frac{x+7}{x^2-49}$
- $h(x) = \frac{x+8}{x^2-64}$
- $f(x) = \frac{x+7}{x^2+49}$
- $f(x) = \frac{x+8}{x^2+64}$

Use the graph of the rational function in the figure shown to complete each statement in Exercises 9–14.

- As  $x \rightarrow -3^-$ ,  $f(x) \rightarrow \underline{\hspace{2cm}}$ .
- As  $x \rightarrow -3^+$ ,  $f(x) \rightarrow \underline{\hspace{2cm}}$ .
- As  $x \rightarrow 1^-$ ,  $f(x) \rightarrow \underline{\hspace{2cm}}$ .
- As  $x \rightarrow 1^+$ ,  $f(x) \rightarrow \underline{\hspace{2cm}}$ .
- As  $x \rightarrow -\infty$ ,  $f(x) \rightarrow \underline{\hspace{2cm}}$ .
- As  $x \rightarrow \infty$ ,  $f(x) \rightarrow \underline{\hspace{2cm}}$ .

Use the graph of the rational function in the figure shown to complete each statement in Exercises 15–20.

- As  $x \rightarrow 1^+$ ,  $f(x) \rightarrow \underline{\hspace{2cm}}$ .
- As  $x \rightarrow 1^-$ ,  $f(x) \rightarrow \underline{\hspace{2cm}}$ .
- As  $x \rightarrow -2^+$ ,  $f(x) \rightarrow \underline{\hspace{2cm}}$ .
- As  $x \rightarrow -2^-$ ,  $f(x) \rightarrow \underline{\hspace{2cm}}$ .
- As  $x \rightarrow \infty$ ,  $f(x) \rightarrow \underline{\hspace{2cm}}$ .
- As  $x \rightarrow -\infty$ ,  $f(x) \rightarrow \underline{\hspace{2cm}}$ .

In Exercises 21–36, find the vertical asymptotes, if any, and the values of  $x$  corresponding to holes, if any, of the graph of each rational function.

- $f(x) = \frac{x}{x+4}$
- $f(x) = \frac{x}{x-3}$
- $g(x) = \frac{x+3}{x(x+4)}$
- $g(x) = \frac{x+3}{x(x-3)}$
- $h(x) = \frac{x}{x(x+4)}$
- $h(x) = \frac{x}{x(x-3)}$

27.  $r(x) = \frac{x}{x^2 + 4}$

28.  $r(x) = \frac{x}{x^2 + 3}$

29.  $f(x) = \frac{x^2 - 9}{x - 3}$

30.  $f(x) = \frac{x^2 - 25}{x - 5}$

31.  $g(x) = \frac{x - 3}{x^2 - 9}$

32.  $g(x) = \frac{x - 5}{x^2 - 25}$

33.  $h(x) = \frac{x + 7}{x^2 + 4x - 21}$

34.  $h(x) = \frac{x + 6}{x^2 + 2x - 24}$

35.  $r(x) = \frac{x^2 + 4x - 21}{x + 7}$

36.  $r(x) = \frac{x^2 + 2x - 24}{x + 6}$

In Exercises 37–44, find the horizontal asymptote, if there is one, of the graph of each rational function.

37.  $f(x) = \frac{12x}{3x^2 + 1}$

38.  $f(x) = \frac{15x}{3x^2 + 1}$

39.  $g(x) = \frac{12x^2}{3x^2 + 1}$

40.  $g(x) = \frac{15x^2}{3x^2 + 1}$

41.  $h(x) = \frac{12x^3}{3x^2 + 1}$

42.  $h(x) = \frac{15x^3}{3x^2 + 1}$

43.  $f(x) = \frac{-2x + 1}{3x + 5}$

44.  $f(x) = \frac{-3x + 7}{5x - 2}$

In Exercises 45–56, use transformations of  $f(x) = \frac{1}{x}$  or  $f(x) = \frac{1}{x^2}$  to graph each rational function.

45.  $g(x) = \frac{1}{x - 1}$

46.  $g(x) = \frac{1}{x - 2}$

47.  $h(x) = \frac{1}{x} + 2$

48.  $h(x) = \frac{1}{x} + 1$

49.  $g(x) = \frac{1}{x + 1} - 2$

50.  $g(x) = \frac{1}{x + 2} - 2$

51.  $g(x) = \frac{1}{(x + 2)^2}$

52.  $g(x) = \frac{1}{(x + 1)^2}$

53.  $h(x) = \frac{1}{x^2} - 4$

54.  $h(x) = \frac{1}{x^2} - 3$

55.  $h(x) = \frac{1}{(x - 3)^2} + 1$

56.  $h(x) = \frac{1}{(x - 3)^2} + 2$

In Exercises 57–80, follow the seven steps on page 369 to graph each rational function.

57.  $f(x) = \frac{4x}{x - 2}$

58.  $f(x) = \frac{3x}{x - 1}$

59.  $f(x) = \frac{2x}{x^2 - 4}$

60.  $f(x) = \frac{4x}{x^2 - 1}$

61.  $f(x) = \frac{2x^2}{x^2 - 1}$

62.  $f(x) = \frac{4x^2}{x^2 - 9}$

63.  $f(x) = \frac{-x}{x + 1}$

64.  $f(x) = \frac{-3x}{x + 2}$

65.  $f(x) = -\frac{1}{x^2 - 4}$

66.  $f(x) = -\frac{2}{x^2 - 1}$

67.  $f(x) = \frac{2}{x^2 + x - 2}$

68.  $f(x) = \frac{-2}{x^2 - x - 2}$

69.  $f(x) = \frac{2x^2}{x^2 + 4}$

70.  $f(x) = \frac{4x^2}{x^2 + 1}$

71.  $f(x) = \frac{x + 2}{x^2 + x - 6}$

72.  $f(x) = \frac{x - 4}{x^2 - x - 6}$

73.  $f(x) = \frac{x - 2}{x^2 - 4}$

74.  $f(x) = \frac{x - 3}{x^2 - 9}$

75.  $f(x) = \frac{x^4}{x^2 + 2}$

76.  $f(x) = \frac{2x^4}{x^2 + 1}$

77.  $f(x) = \frac{x^2 + x - 12}{x^2 - 4}$

78.  $f(x) = \frac{x^2}{x^2 + x - 6}$

79.  $f(x) = \frac{3x^2 + x - 4}{2x^2 - 5x}$

80.  $f(x) = \frac{x^2 - 4x + 3}{(x + 1)^2}$

In Exercises 81–88, **a.** Find the slant asymptote of the graph of each rational function and **b.** Follow the seven-step strategy and use the slant asymptote to graph each rational function.

81.  $f(x) = \frac{x^2 - 1}{x}$

82.  $f(x) = \frac{x^2 - 4}{x}$

83.  $f(x) = \frac{x^2 + 1}{x}$

84.  $f(x) = \frac{x^2 + 4}{x}$

85.  $f(x) = \frac{x^2 + x - 6}{x - 3}$

86.  $f(x) = \frac{x^2 - x + 1}{x - 1}$

87.  $f(x) = \frac{x^3 + 1}{x^2 + 2x}$

88.  $f(x) = \frac{x^3 - 1}{x^2 - 9}$

### Practice Plus

In Exercises 89–94, the equation for  $f$  is given by the simplified expression that results after performing the indicated operation. Write the equation for  $f$  and then graph the function.

89.  $\frac{5x^2}{x^2 - 4} \cdot \frac{x^2 + 4x + 4}{10x^3}$

90.  $\frac{x - 5}{10x - 2} \div \frac{x^2 - 10x + 25}{25x^2 - 1}$

91.  $\frac{x}{2x + 6} - \frac{9}{x^2 - 9}$

92.  $\frac{2}{x^2 + 3x + 2} - \frac{4}{x^2 + 4x + 3}$

93.  $\frac{1 - \frac{3}{x + 2}}{1 + \frac{1}{x - 2}}$

94.  $\frac{x - \frac{1}{x}}{x + \frac{1}{x}}$

In Exercises 95–98, use long division to rewrite the equation for  $g$  in the form

$$\text{quotient} + \frac{\text{remainder}}{\text{divisor}}$$

Then use this form of the function's equation and transformations of  $f(x) = \frac{1}{x}$  to graph  $g$ .

95.  $g(x) = \frac{2x + 7}{x + 3}$

96.  $g(x) = \frac{3x + 7}{x + 2}$

97.  $g(x) = \frac{3x - 7}{x - 2}$

98.  $g(x) = \frac{2x - 9}{x - 4}$

### Application Exercises

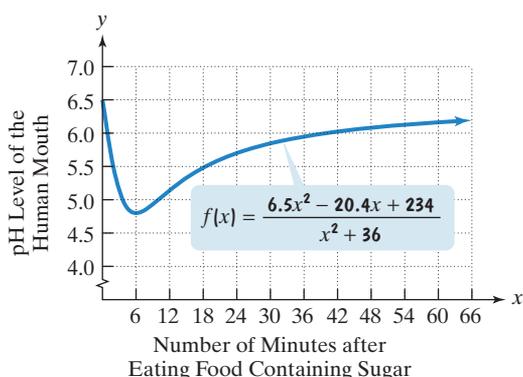

99. A company is planning to manufacture mountain bikes. The fixed monthly cost will be \$100,000 and it will cost \$100 to produce each bicycle.

- Write the cost function,  $C$ , of producing  $x$  mountain bikes.
- Write the average cost function,  $\bar{C}$ , of producing  $x$  mountain bikes.
- Find and interpret  $\bar{C}(500)$ ,  $\bar{C}(1000)$ ,  $\bar{C}(2000)$ , and  $\bar{C}(4000)$ .
- What is the horizontal asymptote for the graph of the average cost function,  $\bar{C}$ ? Describe what this means in practical terms.

100. A company that manufactures running shoes has a fixed monthly cost of \$300,000. It costs \$30 to produce each pair of shoes.
- Write the cost function,  $C$ , of producing  $x$  pairs of shoes.
  - Write the average cost function,  $\bar{C}$ , of producing  $x$  pairs of shoes.
  - Find and interpret  $\bar{C}(1000)$ ,  $\bar{C}(10,000)$ , and  $\bar{C}(100,000)$ .
  - What is the horizontal asymptote for the graph of the average cost function,  $\bar{C}$ ? Describe what this represents for the company.
101. The function

$$f(x) = \frac{6.5x^2 - 20.4x + 234}{x^2 + 36}$$

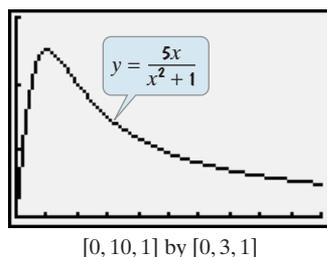

models the pH level,  $f(x)$ , of the human mouth  $x$  minutes after a person eats food containing sugar. The graph of this function is shown in the figure.

- Use the graph to obtain a reasonable estimate, to the nearest tenth, of the pH level of the human mouth 42 minutes after a person eats food containing sugar.
  - After eating sugar, when is the pH level the lowest? Use the function's equation to determine the pH level, to the nearest tenth, at this time.
  - According to the graph, what is the normal pH level of the human mouth?
  - What is the equation of the horizontal asymptote associated with this function? Describe what this means in terms of the mouth's pH level over time.
  - Use the graph to describe what happens to the pH level during the first hour.
102. A drug is injected into a patient and the concentration of the drug in the bloodstream is monitored. The drug's concentration,  $C(t)$ , in milligrams per liter, after  $t$  hours is modeled by

$$C(t) = \frac{5t}{t^2 + 1}$$

The graph of this rational function, obtained with a graphing utility, is shown in the figure.

- Use the preceding graph to obtain a reasonable estimate of the drug's concentration after 3 hours.
- Use the function's equation displayed in the voice balloon by the graph to determine the drug's concentration after 3 hours.
- Use the function's equation to find the horizontal asymptote for the graph. Describe what this means about the drug's concentration in the patient's bloodstream as time increases.

Among all deaths from a particular disease, the percentage that is smoking related (21–39 cigarettes per day) is a function of the disease's **incidence ratio**. The incidence ratio describes the number of times more likely smokers are than nonsmokers to die from the disease. The following table shows the incidence ratios for heart disease and lung cancer for two age groups.

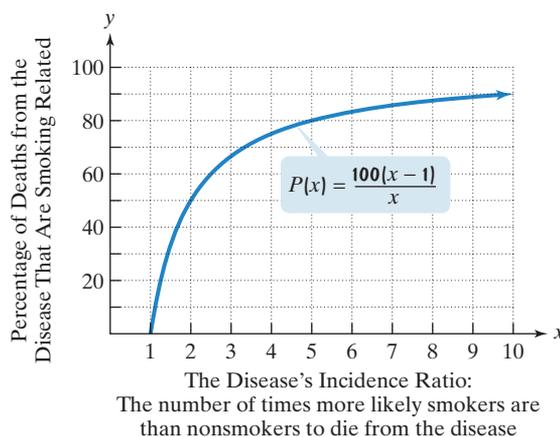

Incidence Ratios		
	Heart Disease	Lung Cancer
Ages 55–64	1.9	10
Ages 65–74	1.7	9

Source: Alexander M. Walker, *Observations and Inference*, Epidemiology Resources Inc., 1991.

For example, the incidence ratio of 9 in the table means that smokers between the ages of 65 and 74 are 9 times more likely than nonsmokers in the same age group to die from lung cancer. The rational function

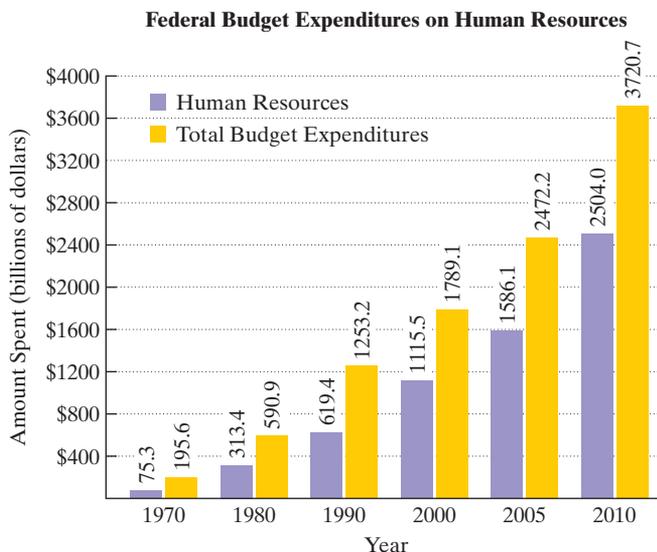

$$P(x) = \frac{100(x - 1)}{x}$$

models the percentage of smoking-related deaths among all deaths from a disease,  $P(x)$ , in terms of the disease's incidence ratio,  $x$ . The graph of the rational function is shown. Use this function to solve Exercises 103–106.

- Find  $P(10)$ . Describe what this means in terms of the incidence ratio, 10, given in the table. Identify your solution as a point on the graph.
- Find  $P(9)$ . Round to the nearest percent. Describe what this means in terms of the incidence ratio, 9, given in the table. Identify your solution as a point on the graph.
- What is the horizontal asymptote of the graph? Describe what this means about the percentage of deaths caused by smoking with increasing incidence ratios.
- According to the model and its graph, is there a disease for which all deaths are caused by smoking? Explain your answer.

107. The bar graph shows the amount, in billions of dollars, that the United States government spent on human resources and total budget outlays for six selected years. (Human resources include education, health, Medicare, Social Security, and veterans benefits and services.)

Source: Office of Management and Budget

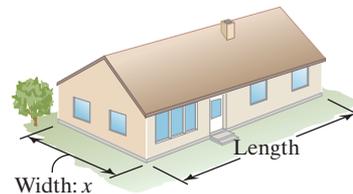

The function  $p(x) = 1.75x^2 - 15.9x + 160$  models the amount,  $p(x)$ , in billions of dollars, that the United States government spent on human resources  $x$  years after 1970. The function  $q(x) = 2.1x^2 - 3.5x + 296$  models total budget expenditures,  $q(x)$ , in billions of dollars,  $x$  years after 1970.

- Use  $p$  and  $q$  to write a rational function that models the fraction of total budget outlays spent on human resources  $x$  years after 1970.
- Use the data displayed by the bar graph to find the percentage of federal expenditures spent on human resources in 2010. Round to the nearest percent.
- Use the rational function from part (a) to find the percentage of federal expenditures spent on human resources in 2010. Round to the nearest percent. Does this underestimate or overestimate the actual percent that you found in part (b)? By how much?
- What is the equation of the horizontal asymptote associated with the rational function in part (a)? If trends modeled by the function continue, what percentage of the federal budget will be spent on human resources over time? Round to the nearest percent.

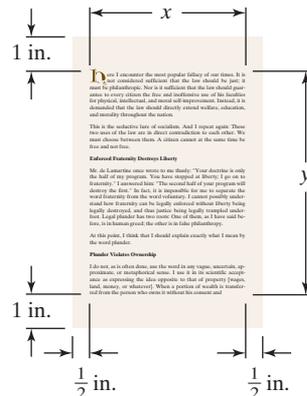

*Exercises 108–111 involve writing a rational function that models a problem's conditions.*

108. You drive from your home to a vacation resort 600 miles away. You return on the same highway. The average velocity on the return trip is 10 miles per hour slower than the average velocity on the outgoing trip. Express the total time required to complete the round trip,  $T$ , as a function of the average velocity on the outgoing trip,  $x$ .
109. A tourist drives 90 miles along a scenic highway and then takes a 5-mile walk along a hiking trail. The average velocity driving is nine times that while hiking. Express the total time for driving and hiking,  $T$ , as a function of the average velocity on the hike,  $x$ .

110. A contractor is constructing the house shown in the figure. The cross section up to the roof is in the shape of a rectangle. The area of the rectangular floor of the house is 2500 square feet. Express the perimeter of the rectangular floor,  $P$ , as a function of the width of the rectangle,  $x$ .

111. The figure shows a page with 1-inch margins at the top and the bottom and half-inch side margins. A publishing company is willing to vary the page dimensions subject to the condition that the printed area of the page is 50 square inches. Express the total area of the page,  $A$ , as a function of the width of the rectangle containing the print,  $x$ .

### Writing in Mathematics

- What is a rational function?
- Use everyday language to describe the graph of a rational function  $f$  such that as  $x \rightarrow -\infty$ ,  $f(x) \rightarrow 3$ .
- Use everyday language to describe the behavior of a graph near its vertical asymptote if  $f(x) \rightarrow \infty$  as  $x \rightarrow -2^-$  and  $f(x) \rightarrow -\infty$  as  $x \rightarrow -2^+$ .
- If you are given the equation of a rational function, explain how to find the vertical asymptotes, if there is one, of the function's graph.
- If you are given the equation of a rational function, explain how to find the horizontal asymptote, if any, of the function's graph.
- Describe how to graph a rational function.
- If you are given the equation of a rational function, how can you tell if the graph has a slant asymptote? If it does, how do you find its equation?
- Is every rational function a polynomial? Why or why not? Does a true statement result if the two adjectives *rational* and *polynomial* are reversed? Explain.
- Although your friend has a family history of heart disease, he smokes, on average, 25 cigarettes per day. He sees the table showing incidence ratios for heart disease (see Exercises 103–106) and feels comfortable that they are less than 2, compared to 9 and 10 for lung cancer. He claims that all family deaths have been from heart disease and decides not to give up smoking. Use the given function and its graph to describe some additional information not given in the table that might influence his decision.

### Technology Exercises

- Use a graphing utility to verify any five of your hand-drawn graphs in Exercises 45–88.
- Use a graphing utility to graph  $y = \frac{1}{x}$ ,  $y = \frac{1}{x^3}$ , and  $\frac{1}{x^5}$  in the same viewing rectangle. For odd values of  $n$ , how does changing  $n$  affect the graph of  $y = \frac{1}{x^n}$ ?

123. Use a graphing utility to graph  $y = \frac{1}{x^2}$ ,  $y = \frac{1}{x^4}$ , and  $y = \frac{1}{x^6}$  in the same viewing rectangle. For even values of  $n$ , how does changing  $n$  affect the graph of  $y = \frac{1}{x^n}$ ?

124. Use a graphing utility to graph

$$f(x) = \frac{x^2 - 4x + 3}{x - 2} \quad \text{and} \quad g(x) = \frac{x^2 - 5x + 6}{x - 2}.$$

What differences do you observe between the graph of  $f$  and the graph of  $g$ ? How do you account for these differences?

125. The rational function

$$f(x) = \frac{27,725(x - 14)}{x^2 + 9} - 5x$$

models the number of arrests,  $f(x)$ , per 100,000 drivers, for driving under the influence of alcohol, as a function of a driver's age,  $x$ .

- Graph the function in a  $[0, 70, 5]$  by  $[0, 400, 20]$  viewing rectangle.
- Describe the trend shown by the graph.
- Use the **ZOOM** and **TRACE** features or the maximum function feature of your graphing utility to find the age that corresponds to the greatest number of arrests. How many arrests, per 100,000 drivers, are there for this age group?

### Critical Thinking Exercises

**Make Sense?** In Exercises 126–129, determine whether each statement makes sense or does not make sense, and explain your reasoning.

126. I've graphed a rational function that has two vertical asymptotes and two horizontal asymptotes.
127. My graph of  $y = \frac{x - 1}{(x - 1)(x - 2)}$  has vertical asymptotes at  $x = 1$  and  $x = 2$ .
128. The function

$$f(x) = \frac{1.96x + 3.14}{3.04x + 21.79}$$

models the fraction of nonviolent prisoners in New York State prisons  $x$  years after 1980. I can conclude from this equation that over time the percentage of nonviolent prisoners will exceed 60%.

129. As production level increases, the average cost for a company to produce each unit of its product also increases.

In Exercises 130–133, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

130. The graph of a rational function cannot have both a vertical asymptote and a horizontal asymptote.
131. It is possible to have a rational function whose graph has no  $y$ -intercept.
132. The graph of a rational function can have three vertical asymptotes.
133. The graph of a rational function can never cross a vertical asymptote.

In Exercises 134–137, write the equation of a rational function

$$f(x) = \frac{p(x)}{q(x)}$$

having the indicated properties, in which the degrees of  $p$  and  $q$  are as small as possible. More than one correct function may be possible. Graph your function using a graphing utility to verify that it has the required properties.

134.  $f$  has a vertical asymptote given by  $x = 3$ , a horizontal asymptote  $y = 0$ ,  $y$ -intercept at  $-1$ , and no  $x$ -intercept.
135.  $f$  has vertical asymptotes given by  $x = -2$  and  $x = 2$ , a horizontal asymptote  $y = 2$ ,  $y$ -intercept at  $\frac{9}{2}$ ,  $x$ -intercepts at  $-3$  and  $3$ , and  $y$ -axis symmetry.
136.  $f$  has a vertical asymptote given by  $x = 1$ , a slant asymptote whose equation is  $y = x$ ,  $y$ -intercept at  $2$ , and  $x$ -intercepts at  $-1$  and  $2$ .
137.  $f$  has no vertical, horizontal, or slant asymptotes, and no  $x$ -intercepts.

### Preview Exercises

Exercises 138–140 will help you prepare for the material covered in the next section.

138. Solve:  $2x^2 + x = 15$ .
139. Solve:  $x^3 + x^2 = 4x + 4$ .
140. Simplify:  $\frac{x + 1}{x + 3} - 2$ .

## SECTION 2.7

## Polynomial and Rational Inequalities

### Objectives

- Solve polynomial inequalities.
- Solve rational inequalities.
- Solve problems modeled by polynomial or rational inequalities.

© Warren Miller/The New Yorker Collection/Caroonbank

Tailgaters beware: If your car is going 35 miles per hour on dry pavement, your required stopping distance is 160 feet, or the width of a football field. At 65 miles per hour, the distance required is 410 feet, or approximately the length of one and one-tenth football fields. **Figure 2.45** at the top of the next page shows stopping distances for cars at various speeds on dry roads and on wet roads.

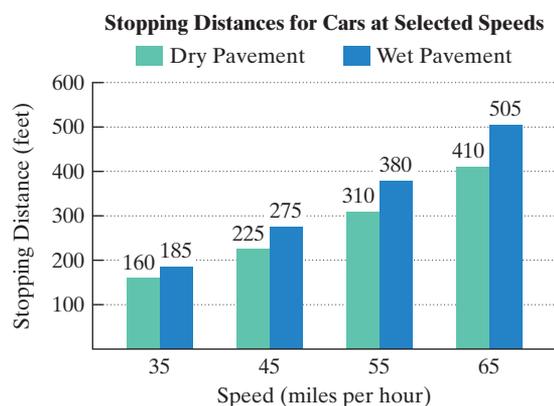

FIGURE 2.45

Source: National Highway Traffic Safety Administration

A car's required stopping distance,  $f(x)$ , in feet, on dry pavement traveling at  $x$  miles per hour can be modeled by the quadratic function

$$f(x) = 0.0875x^2 - 0.4x + 66.6.$$

How can we use this function to determine speeds on dry pavement requiring stopping distances that exceed the length of one and one-half football fields, or 540 feet? We must solve the inequality

$$0.0875x^2 - 0.4x + 66.6 > 540.$$

Required stopping distance

exceeds

540 feet.

## TECHNOLOGY

We used the statistical menu of a graphing utility and the quadratic regression program to obtain the quadratic function that models stopping distance on dry pavement. After entering the appropriate data from **Figure 2.45**, namely,

(35, 160), (45, 225), (55, 310),  
(65, 410),

we obtained the results shown in the screen.

```
QuadReg
y=ax^2+bx+c
a=.0875
b=-.4
c=66.5625
```

We begin by subtracting 540 from both sides. This will give us zero on the right:

$$0.0875x^2 - 0.4x + 66.6 - 540 > 540 - 540$$

$$0.0875x^2 - 0.4x - 473.4 > 0.$$

The form of this inequality is  $ax^2 + bx + c > 0$ . Such a quadratic inequality is called a *polynomial inequality*.

### Definition of a Polynomial Inequality

A polynomial inequality is any inequality that can be put into one of the forms

$$f(x) < 0, \quad f(x) > 0, \quad f(x) \leq 0, \quad \text{or} \quad f(x) \geq 0,$$

where  $f$  is a polynomial function.

In this section, we establish the basic techniques for solving polynomial inequalities. We will also use these techniques to solve inequalities involving rational functions.

### Solving Polynomial Inequalities

Graphs can help us visualize the solutions of polynomial inequalities. For example, the graph of  $f(x) = x^2 - 7x + 10$  is shown in **Figure 2.46**. The  $x$ -intercepts, 2 and 5, are **boundary points** between where the graph lies above the  $x$ -axis, shown in blue, and where the graph lies below the  $x$ -axis, shown in red.

Locating the  $x$ -intercepts of a polynomial function,  $f$ , is an important step in finding the solution set for polynomial inequalities in the form  $f(x) < 0$  or  $f(x) > 0$ . We use the  $x$ -intercepts of  $f$  as boundary points that divide the real number line into intervals. On each interval, the graph of  $f$  is either above the  $x$ -axis [ $f(x) > 0$ ] or below the  $x$ -axis [ $f(x) < 0$ ]. For this reason,  $x$ -intercepts play a fundamental role in solving polynomial inequalities. The  $x$ -intercepts are found by solving the equation  $f(x) = 0$ .

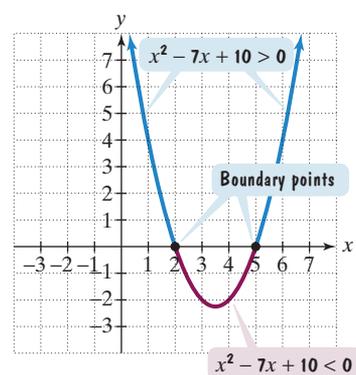

FIGURE 2.46

## 1 Solve polynomial inequalities.

## Procedure for Solving Polynomial Inequalities

1. Express the inequality in the form

$$f(x) < 0 \quad \text{or} \quad f(x) > 0,$$

where  $f$  is a polynomial function.

2. Solve the equation  $f(x) = 0$ . The real solutions are the **boundary points**.
3. Locate these boundary points on a number line, thereby dividing the number line into intervals.
4. Choose one representative number, called a **test value**, within each interval and evaluate  $f$  at that number.
  - a. If the value of  $f$  is positive, then  $f(x) > 0$  for all numbers,  $x$ , in the interval.
  - b. If the value of  $f$  is negative, then  $f(x) < 0$  for all numbers,  $x$ , in the interval.
5. Write the solution set, selecting the interval or intervals that satisfy the given inequality.

This procedure is valid if  $<$  is replaced by  $\leq$  or  $>$  is replaced by  $\geq$ . However, if the inequality involves  $\leq$  or  $\geq$ , include the boundary points [the solutions of  $f(x) = 0$ ] in the solution set.

## EXAMPLE 1 Solving a Polynomial Inequality

Solve and graph the solution set on a real number line:  $2x^2 + x > 15$ .

## SOLUTION

**Step 1 Express the inequality in the form  $f(x) < 0$  or  $f(x) > 0$ .** We begin by rewriting the inequality so that 0 is on the right side.

$$\begin{array}{ll} 2x^2 + x > 15 & \text{This is the given inequality.} \\ 2x^2 + x - 15 > 15 - 15 & \text{Subtract 15 from both sides.} \\ 2x^2 + x - 15 > 0 & \text{Simplify.} \end{array}$$

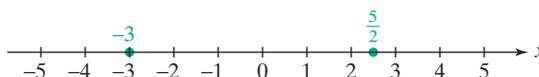

This inequality is equivalent to the one we wish to solve. It is in the form  $f(x) > 0$ , where  $f(x) = 2x^2 + x - 15$ .

**Step 2 Solve the equation  $f(x) = 0$ .** We find the  $x$ -intercepts of  $f(x) = 2x^2 + x - 15$  by solving the equation  $2x^2 + x - 15 = 0$ .

$$\begin{array}{ll} 2x^2 + x - 15 = 0 & \text{This polynomial equation is a} \\ & \text{quadratic equation.} \\ (2x - 5)(x + 3) = 0 & \text{Factor.} \\ 2x - 5 = 0 \quad \text{or} \quad x + 3 = 0 & \text{Set each factor equal to 0.} \\ x = \frac{5}{2} \quad \quad \quad x = -3 & \text{Solve for } x. \end{array}$$

The  $x$ -intercepts of  $f$  are  $-3$  and  $\frac{5}{2}$ . We will use these  $x$ -intercepts as boundary points on a number line.

**Step 3 Locate the boundary points on a number line and separate the line into intervals.** The number line with the boundary points is shown as follows:

The boundary points divide the number line into three intervals:

$$(-\infty, -3) \quad \left(-3, \frac{5}{2}\right) \quad \left(\frac{5}{2}, \infty\right).$$

**Step 4** Choose one test value within each interval and evaluate  $f$  at that number.

Interval	Test Value	Substitute into $f(x) = 2x^2 + x - 15$	Conclusion
$(-\infty, -3)$	-4	$f(-4) = 2(-4)^2 + (-4) - 15$ $= 13$ , positive	$f(x) > 0$ for all $x$ in $(-\infty, -3)$ .
$(-3, \frac{5}{2})$	0	$f(0) = 2 \cdot 0^2 + 0 - 15$ $= -15$ , negative	$f(x) < 0$ for all $x$ in $(-3, \frac{5}{2})$ .
$(\frac{5}{2}, \infty)$	3	$f(3) = 2 \cdot 3^2 + 3 - 15$ $= 6$ , positive	$f(x) > 0$ for all $x$ in $(\frac{5}{2}, \infty)$ .

**TECHNOLOGY****Graphic Connections**

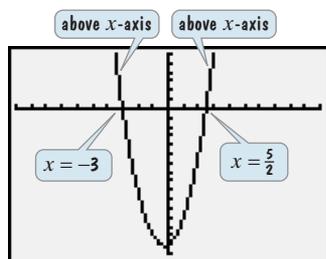

The solution set for

$$2x^2 + x > 15$$

or, equivalently,

$$2x^2 + x - 15 > 0$$

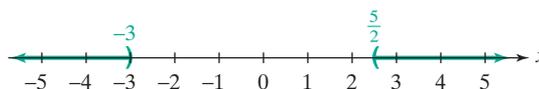

can be verified with a graphing utility. The graph of  $f(x) = 2x^2 + x - 15$  was obtained using a  $[-10, 10, 1]$  by  $[-16, 6, 1]$  viewing rectangle. The graph lies above the  $x$ -axis, representing  $>$ , for all  $x$  in  $(-\infty, -3)$  or  $(\frac{5}{2}, \infty)$ .

**Step 5** Write the solution set, selecting the interval or intervals that satisfy the given inequality. We are interested in solving  $f(x) > 0$ , where  $f(x) = 2x^2 + x - 15$ . Based on our work in step 4, we see that  $f(x) > 0$  for all  $x$  in  $(-\infty, -3)$  or  $(\frac{5}{2}, \infty)$ . Thus, the solution set of the given inequality,  $2x^2 + x > 15$ , or, equivalently,  $2x^2 + x - 15 > 0$ , is

$$(-\infty, -3) \cup (\frac{5}{2}, \infty) \text{ or } \{x \mid x < -3 \text{ or } x > \frac{5}{2}\}.$$

The graph of the solution set on a number line is shown as follows:

**Check Point 1** Solve and graph the solution set:  $x^2 - x > 20$ .

**EXAMPLE 2** Solving a Polynomial Inequality

Solve and graph the solution set on a real number line:  $4x^2 \leq 1 - 2x$ .

**SOLUTION**

**Step 1** Express the inequality in the form  $f(x) \leq 0$  or  $f(x) \geq 0$ . We begin by rewriting the inequality so that 0 is on the right side.

$$4x^2 \leq 1 - 2x \quad \text{This is the given inequality.}$$

$$4x^2 + 2x - 1 \leq 1 - 2x + 2x - 1 \quad \text{Add } 2x \text{ and subtract } 1 \text{ on both sides.}$$

$$4x^2 + 2x - 1 \leq 0 \quad \text{Simplify.}$$

This inequality is equivalent to the one we wish to solve. It is in the form  $f(x) \leq 0$ , where  $f(x) = 4x^2 + 2x - 1$ .

**Step 2** Solve the equation  $f(x) = 0$ . We will find the  $x$ -intercepts of  $f(x) = 4x^2 + 2x - 1$  by solving the equation  $4x^2 + 2x - 1 = 0$ . This equation cannot be solved by factoring. We will use the quadratic formula to solve it.

$$4x^2 + 2x - 1 = 0$$

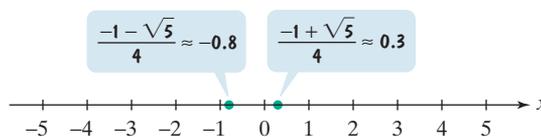

$$a = 4 \quad b = 2 \quad c = -1$$

$$\begin{aligned} x &= \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} = \frac{-2 \pm \sqrt{2^2 - 4 \cdot 4 \cdot (-1)}}{2 \cdot 4} = \frac{-2 \pm \sqrt{4 - (-16)}}{8} \\ &= \frac{-2 \pm \sqrt{20}}{8} = \frac{-2 \pm \sqrt{4} \sqrt{5}}{8} = \frac{-2 \pm 2\sqrt{5}}{8} = \frac{2(-1 \pm \sqrt{5})}{8} = \frac{-1 \pm \sqrt{5}}{4} \\ x &= \frac{-1 + \sqrt{5}}{4} \approx 0.3 \qquad x = \frac{-1 - \sqrt{5}}{4} \approx -0.8 \end{aligned}$$

The  $x$ -intercepts of  $f$  are  $\frac{-1 + \sqrt{5}}{4}$  (approximately 0.3) and  $\frac{-1 - \sqrt{5}}{4}$  (approximately -0.8). We will use these  $x$ -intercepts as boundary points on a number line.

**Step 3** Locate the boundary points on a number line and separate the line into intervals. The number line with the boundary points is shown as follows:

The boundary points divide the number line into three intervals:

$$\left(-\infty, \frac{-1 - \sqrt{5}}{4}\right) \left(\frac{-1 - \sqrt{5}}{4}, \frac{-1 + \sqrt{5}}{4}\right) \left(\frac{-1 + \sqrt{5}}{4}, \infty\right).$$

**Step 4** Choose one test value within each interval and evaluate  $f$  at that number.

Interval	Test Value	Substitute into $f(x) = 4x^2 + 2x - 1$	Conclusion
$\left(-\infty, \frac{-1 - \sqrt{5}}{4}\right)$	-1	$f(-1) = 4(-1)^2 + 2(-1) - 1$ $= 1$ , positive	$f(x) > 0$ for all $x$ in $\left(-\infty, \frac{-1 - \sqrt{5}}{4}\right)$ .
$\left(\frac{-1 - \sqrt{5}}{4}, \frac{-1 + \sqrt{5}}{4}\right)$	0	$f(0) = 4 \cdot 0^2 + 2 \cdot 0 - 1$ $= -1$ , negative	$f(x) < 0$ for all $x$ in $\left(\frac{-1 - \sqrt{5}}{4}, \frac{-1 + \sqrt{5}}{4}\right)$ .
$\left(\frac{-1 + \sqrt{5}}{4}, \infty\right)$	1	$f(1) = 4 \cdot 1^2 + 2 \cdot 1 - 1$ $= 5$ , positive	$f(x) > 0$ for all $x$ in $\left(\frac{-1 + \sqrt{5}}{4}, \infty\right)$ .

## TECHNOLOGY

### Graphic Connections

The solution set for

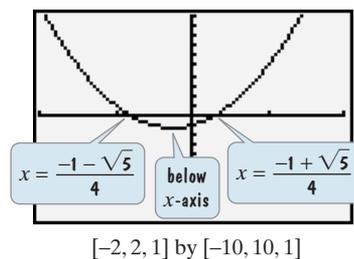

$$4x^2 \leq 1 - 2x$$

or, equivalently,

$$4x^2 + 2x - 1 \leq 0$$

can be verified with a graphing utility. The graph of  $f(x) = 4x^2 + 2x - 1$  was obtained using a  $[-2, 2, 1]$  by  $[-10, 10, 1]$  viewing rectangle. The graph lies on or below the  $x$ -axis, representing  $\leq$ , for all  $x$  in

$$\left[\frac{-1 - \sqrt{5}}{4}, \frac{-1 + \sqrt{5}}{4}\right] \approx [-0.8, 0.3].$$

**Step 5** Write the solution set, selecting the interval or intervals that satisfy the given inequality. We are interested in solving  $f(x) \leq 0$ , where  $f(x) = 4x^2 + 2x - 1$ .

Based on our work in step 4, we see that  $f(x) < 0$  for all  $x$  in  $\left(\frac{-1 - \sqrt{5}}{4}, \frac{-1 + \sqrt{5}}{4}\right)$ .

However, because the inequality involves  $\leq$  (less than or *equal to*), we must also include the solutions of  $4x^2 + 2x - 1 = 0$ , namely,  $\frac{-1 - \sqrt{5}}{4}$  and  $\frac{-1 + \sqrt{5}}{4}$ , in the solution set. Thus, the solution set of the given inequality  $4x^2 \leq 1 - 2x$ , or, equivalently,  $4x^2 + 2x - 1 \leq 0$ , is

$$\left[\frac{-1 - \sqrt{5}}{4}, \frac{-1 + \sqrt{5}}{4}\right] \text{ or } \left\{x \mid \frac{-1 - \sqrt{5}}{4} \leq x \leq \frac{-1 + \sqrt{5}}{4}\right\}.$$

The graph of the solution set on a number line is shown as follows:

**Check Point 2** Solve and graph the solution set on a real number line:  $2x^2 \leq -6x - 1$ .

### EXAMPLE 3 Solving a Polynomial Inequality

Solve and graph the solution set on a real number line:  $x^3 + x^2 \leq 4x + 4$ .

#### SOLUTION

**Step 1** Express the inequality in the form  $f(x) \leq 0$  or  $f(x) \geq 0$ . We begin by rewriting the inequality so that 0 is on the right side.

$$x^3 + x^2 \leq 4x + 4 \quad \text{This is the given inequality.}$$

$$x^3 + x^2 - 4x - 4 \leq 4x + 4 - 4x - 4 \quad \text{Subtract } 4x + 4 \text{ from both sides.}$$

$$x^3 + x^2 - 4x - 4 \leq 0 \quad \text{Simplify.}$$

This inequality is equivalent to the one we wish to solve. It is in the form  $f(x) \leq 0$ , where  $f(x) = x^3 + x^2 - 4x - 4$ .

**Step 2 Solve the equation  $f(x) = 0$ .** We find the  $x$ -intercepts of  $f(x) = x^3 + x^2 - 4x - 4$  by solving the equation  $x^3 + x^2 - 4x - 4 = 0$ .

$$x^3 + x^2 - 4x - 4 = 0 \quad \text{This polynomial equation is of degree 3.}$$

$$x^2(x + 1) - 4(x + 1) = 0 \quad \text{Factor } x^2 \text{ from the first two terms and } -4 \text{ from the last two terms.}$$

$$(x + 1)(x^2 - 4) = 0 \quad \text{A common factor of } x + 1 \text{ is factored from the expression.}$$

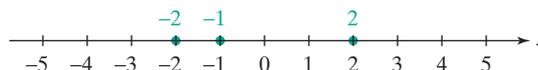

$$(x + 1)(x + 2)(x - 2) = 0 \quad \text{Factor completely.}$$

$$x + 1 = 0 \quad \text{or} \quad x + 2 = 0 \quad \text{or} \quad x - 2 = 0 \quad \text{Set each factor equal to 0.}$$

$$x = -1 \quad x = -2 \quad x = 2 \quad \text{Solve for } x.$$

The  $x$ -intercepts of  $f$  are  $-2$ ,  $-1$ , and  $2$ . We will use these  $x$ -intercepts as boundary points on a number line.

**Step 3 Locate the boundary points on a number line and separate the line into intervals.** The number line with the boundary points is shown as follows:

The boundary points divide the number line into four intervals:

$$(-\infty, -2) \quad (-2, -1) \quad (-1, 2) \quad (2, \infty).$$

**Step 4 Choose one test value within each interval and evaluate  $f$  at that number.**

Interval	Test Value	Substitute into $f(x) = x^3 + x^2 - 4x - 4$	Conclusion
$(-\infty, -2)$	$-3$	$f(-3) = (-3)^3 + (-3)^2 - 4(-3) - 4$ $= -10$ , negative	$f(x) < 0$ for all $x$ in $(-\infty, -2)$ .
$(-2, -1)$	$-1.5$	$f(-1.5) = (-1.5)^3 + (-1.5)^2 - 4(-1.5) - 4$ $= 0.875$ , positive	$f(x) > 0$ for all $x$ in $(-2, -1)$ .
$(-1, 2)$	$0$	$f(0) = 0^3 + 0^2 - 4 \cdot 0 - 4$ $= -4$ , negative	$f(x) < 0$ for all $x$ in $(-1, 2)$ .
$(2, \infty)$	$3$	$f(3) = 3^3 + 3^2 - 4 \cdot 3 - 4$ $= 20$ , positive	$f(x) > 0$ for all $x$ in $(2, \infty)$ .

## TECHNOLOGY

### Graphic Connections

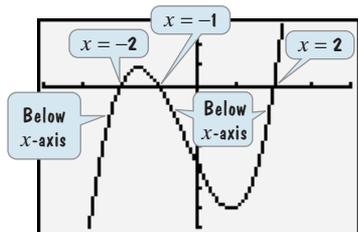

The solution set for

$$x^3 + x^2 \leq 4x + 4$$

or, equivalently,

$$x^3 + x^2 - 4x - 4 \leq 0$$

can be verified with a graphing utility. The graph of  $f(x) = x^3 + x^2 - 4x - 4$  lies on or below the  $x$ -axis, representing  $\leq$ , for all  $x$  in  $(-\infty, -2]$  or  $[-1, 2]$ .

$[-4, 4, 1]$  by  $[-7, 3, 1]$

**Step 5 Write the solution set, selecting the interval or intervals that satisfy the given inequality.** We are interested in solving  $f(x) \leq 0$ , where  $f(x) = x^3 + x^2 - 4x - 4$ . Based on our work in step 4, we see that  $f(x) < 0$  for all  $x$  in  $(-\infty, -2)$  or  $(-1, 2)$ . However, because the inequality involves  $\leq$  (less than or equal to), we must also include the solutions of  $x^3 + x^2 - 4x - 4 = 0$ , namely  $-2$ ,  $-1$ , and  $2$ , in the solution set. Thus, the solution set of the given inequality,  $x^3 + x^2 \leq 4x + 4$ , or, equivalently,  $x^3 + x^2 - 4x - 4 \leq 0$ , is

$$(-\infty, -2] \cup [-1, 2]$$

$$\text{or } \{x \mid x \leq -2 \text{ or } -1 \leq x \leq 2\}.$$

The graph of the solution set on a number line is shown as follows:

**Check Point 3** Solve and graph the solution set on a real number line:  $x^3 + 3x^2 \leq x + 3$ .

## 2 Solve rational inequalities.

## Solving Rational Inequalities

A **rational inequality** is any inequality that can be put into one of the forms

$$f(x) < 0, \quad f(x) > 0, \quad f(x) \leq 0, \quad \text{or} \quad f(x) \geq 0,$$

where  $f$  is a rational function. An example of a rational inequality is

$$\frac{3x + 3}{2x + 4} > 0.$$

This inequality is in the form  $f(x) > 0$ , where  $f$  is the rational function given by

$$f(x) = \frac{3x + 3}{2x + 4}.$$

The graph of  $f$  is shown in **Figure 2.47**.

We can find the  $x$ -intercept of  $f$  by setting the numerator equal to 0:

$$3x + 3 = 0$$

$$3x = -3$$

$$x = -1.$$

$f$  has an  $x$ -intercept at  $-1$  and passes through  $(-1, 0)$ .

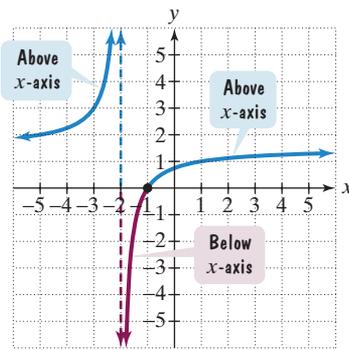

We can determine where  $f$  is undefined by setting the denominator equal to 0:

$$2x + 4 = 0$$

$$2x = -4$$

$$x = -2.$$

$f$  is undefined at  $-2$ . **Figure 3.45** shows that the function's vertical asymptote is  $x = -2$ .

**FIGURE 2.47** The graph of

$$f(x) = \frac{3x + 3}{2x + 4}$$

## GREAT QUESTION!

Can I begin solving

$$\frac{x + 1}{x + 3} \geq 2$$

by multiplying both sides by  $x + 3$ ?

No. We do not know if  $x + 3$  is positive or negative. Thus, we do not know whether or not to change the sense of the inequality.

By setting both the numerator and the denominator of  $f$  equal to 0, we obtained  $-2$  and  $-1$ . These numbers separate the  $x$ -axis into three intervals:  $(-\infty, -2)$ ,  $(-2, -1)$ , and  $(-1, \infty)$ . On each interval, the graph of  $f$  is either above the  $x$ -axis [ $f(x) > 0$ ] or below the  $x$ -axis [ $f(x) < 0$ ].

Examine the graph in **Figure 2.47** carefully. Can you see that it is above the  $x$ -axis for all  $x$  in  $(-\infty, -2)$  or  $(-1, \infty)$ , shown in blue? Thus, the solution set of  $\frac{3x + 3}{2x + 4} > 0$  is  $(-\infty, -2) \cup (-1, \infty)$ . By contrast, the graph of  $f$  lies below the  $x$ -axis for all  $x$  in  $(-2, -1)$ , shown in red. Thus, the solution set of  $\frac{3x + 3}{2x + 4} < 0$  is  $(-2, -1)$ .

The first step in solving a rational inequality is to bring all terms to one side, obtaining zero on the other side. Then express the rational function on the nonzero side as a single quotient. The second step is to set the numerator and the denominator of the rational function  $f$  equal to zero. The solutions of these equations serve as boundary points that separate the real number line into intervals. At this point, the procedure is the same as the one we used for solving polynomial inequalities.

### EXAMPLE 4 Solving a Rational Inequality

Solve and graph the solution set:  $\frac{x + 1}{x + 3} \geq 2$ .

#### SOLUTION

**Step 1 Express the inequality so that one side is zero and the other side is a single quotient.** We subtract 2 from both sides to obtain zero on the right.

$$\begin{aligned} \frac{x+1}{x+3} &\geq 2 && \text{This is the given inequality.} \\ \frac{x+1}{x+3} - 2 &\geq 0 && \text{Subtract 2 from both sides, obtaining 0} \\ &&& \text{on the right.} \\ \frac{x+1}{x+3} - \frac{2(x+3)}{x+3} &\geq 0 && \text{The least common denominator is } x+3. \\ &&& \text{Express 2 in terms of this denominator.} \\ \frac{x+1-2(x+3)}{x+3} &\geq 0 && \text{Subtract rational expressions.} \\ \frac{x+1-2x-6}{x+3} &\geq 0 && \text{Apply the distributive property.} \\ \frac{-x-5}{x+3} &\geq 0 && \text{Simplify.} \end{aligned}$$

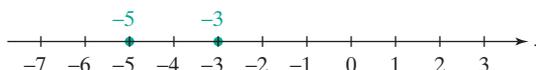

This inequality is equivalent to the one we wish to solve. It is in the form  $f(x) \geq 0$ , where  $f(x) = \frac{-x-5}{x+3}$ .

**Step 2 Set the numerator and the denominator of  $f$  equal to zero.** The real solutions are the boundary points.

$$\begin{aligned} -x - 5 = 0 & \quad x + 3 = 0 && \text{Set the numerator and denominator equal} \\ &&& \text{to 0. These are the values that make the} \\ &&& \text{previous quotient zero or undefined.} \\ x = -5 & \quad x = -3 && \text{Solve for } x. \end{aligned}$$

We will use these solutions as boundary points on a number line.

**Step 3 Locate the boundary points on a number line and separate the line into intervals.** The number line with the boundary points is shown as follows:

The boundary points divide the number line into three intervals:

$$(-\infty, -5) \quad (-5, -3) \quad (-3, \infty).$$

**Step 4 Choose one test value within each interval and evaluate  $f$  at that number.**

Interval	Test Value	Substitute into $f(x) = \frac{-x-5}{x+3}$	Conclusion
$(-\infty, -5)$	-6	$f(-6) = \frac{-(-6)-5}{-6+3}$ $= -\frac{1}{3}$ , negative	$f(x) < 0$ for all $x$ in $(-\infty, -5)$ .
$(-5, -3)$	-4	$f(-4) = \frac{-(-4)-5}{-4+3}$ $= 1$ , positive	$f(x) > 0$ for all $x$ in $(-5, -3)$ .
$(-3, \infty)$	0	$f(0) = \frac{-0-5}{0+3}$ $= -\frac{5}{3}$ , negative	$f(x) < 0$ for all $x$ in $(-3, \infty)$ .

## GREAT QUESTION!

**Which boundary points must I always exclude from the solution set of a rational inequality?**

Never include values that cause a rational function's denominator to equal zero. Division by zero is undefined.

**Step 5 Write the solution set, selecting the interval or intervals that satisfy the given inequality.** We are interested in solving  $f(x) \geq 0$ , where  $f(x) = \frac{-x-5}{x+3}$ .

Based on our work in step 4, we see that  $f(x) > 0$  for all  $x$  in  $(-5, -3)$ . However, because the inequality involves  $\geq$  (greater than or equal to), we must also include the solution of  $f(x) = 0$ , namely, the value that we obtained when we set the

## TECHNOLOGY

### Graphic Connections

can be verified with a graphing

utility. The graph of  $f(x) = \frac{-x - 5}{x + 3}$

lies on or above the  $x$ -axis, representing  $\geq$ , for all  $x$  in  $[-5, -3)$ .

numerator of  $f$  equal to zero. Thus, we must include  $-5$  in the solution set. The solution set of the given inequality is

$$[-5, -3) \text{ or } \{x \mid -5 \leq x < -3\}.$$

$-3$  causes the denominator of  $f$  to equal zero. It must be excluded from the solution set.

The graph of the solution set on a number line is shown as follows:

**Check Point 4** Solve and graph the solution set:  $\frac{2x}{x + 1} \geq 1$ .

### Applications

If you throw an object directly upward, although its path is straight and vertical, its changing height over time can be described by a quadratic function.

#### The Position Function for a Free-Falling Object Near Earth's Surface

An object that is falling or vertically projected into the air has its height above the ground,  $s(t)$ , in feet, given by

$$s(t) = -16t^2 + v_0t + s_0,$$

where  $v_0$  is the original velocity (initial velocity) of the object, in feet per second,  $t$  is the time that the object is in motion, in seconds, and  $s_0$  is the original height (initial height) of the object, in feet.

In Example 5, we solve a polynomial inequality in a problem about the position of a free-falling object.

#### EXAMPLE 5 Using the Position Function

A ball is thrown vertically upward from the top of the Leaning Tower of Pisa (190 feet high) with an initial velocity of 96 feet per second (**Figure 2.48**). During which time period will the ball's height exceed that of the tower?

#### SOLUTION

$$s(t) = -16t^2 + v_0t + s_0 \quad \text{This is the position function for a free-falling object.}$$

$$s(t) = -16t^2 + 96t + 190 \quad \text{Because } v_0 \text{ (initial velocity)} = 96 \text{ and } s_0 \text{ (initial position)} = 190, \text{ substitute these values into the formula.}$$

When will  $s(t)$ , the ball's height, exceed that of the tower?

$$-16t^2 + 96t + 190 > 190$$

$$-16t^2 + 96t + 190 > 190 \quad \text{This is the inequality that models the problem's question. We must find } t.$$

$$-16t^2 + 96t > 0 \quad \text{Subtract 190 from both sides. This inequality is in the form } f(t) > 0, \text{ where } f(t) = -16t^2 + 96t.$$

$$-16t^2 + 96t = 0 \quad \text{Solve the equation } f(t) = 0.$$

$$-16t(t - 6) = 0 \quad \text{Factor.}$$

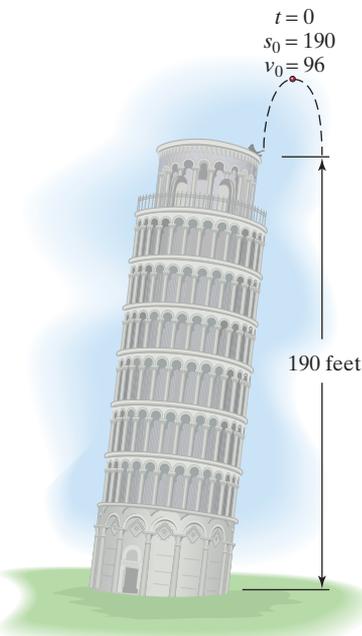

$$-16t = 0 \quad \text{or} \quad t - 6 = 0 \quad \text{Set each factor equal to 0.}$$

$$t = 0 \quad \text{or} \quad t = 6 \quad \text{Solve for } t. \text{ The boundary points are 0 and 6.}$$

Locate these values on a number line.

- 3** Solve problems modeled by polynomial or rational inequalities.

**FIGURE 2.48** Throwing a ball from 190 feet with a velocity of 96 feet per second

The intervals are  $(-\infty, 0)$ ,  $(0, 6)$ , and  $(6, \infty)$ . For our purposes, the mathematical model is useful only from  $t = 0$  until the ball hits the ground. (By setting  $-16t^2 + 96t + 190$  equal to zero, we find  $t \approx 7.57$ ; the ball hits the ground after approximately 7.57 seconds.) Thus, we use  $(0, 6)$  and  $(6, 7.57)$  for our intervals.

Interval	Test Value	Substitute into $f(t) = -16t^2 + 96t$	Conclusion
$(0, 6)$	1	$f(1) = -16 \cdot 1^2 + 96 \cdot 1$ $= 80$ , positive	$f(t) > 0$ for all $t$ in $(0, 6)$ .
$(6, 7.57)$	7	$f(7) = -16 \cdot 7^2 + 96 \cdot 7$ $= -112$ , negative	$f(t) < 0$ for all $t$ in $(6, 7.57)$ .

We are interested in solving  $f(t) > 0$ , where  $f(t) = -16t^2 + 96t$ . We see that  $f(t) > 0$  for all  $t$  in  $(0, 6)$ . This means that the ball's height exceeds that of the tower between 0 and 6 seconds. ●●●

 **Check Point 5** An object is propelled straight up from ground level with an initial velocity of 80 feet per second. Its height at time  $t$  is modeled by

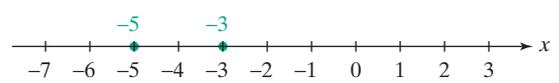

$$s(t) = -16t^2 + 80t,$$

where the height,  $s(t)$ , is measured in feet and the time,  $t$ , is measured in seconds. In which time interval will the object be more than 64 feet above the ground?

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

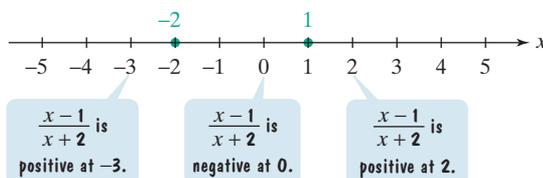

- We solve the polynomial inequality  $x^2 + 8x + 15 > 0$  by first solving the equation \_\_\_\_\_. The real solutions of this equation,  $-5$  and  $-3$ , shown on the number line, are called \_\_\_\_\_ points.
 

- The points at  $-5$  and  $-3$  shown in Exercise 1 divide the number line into three intervals: \_\_\_\_\_, \_\_\_\_\_, \_\_\_\_\_.
- True or false: A test value for the leftmost interval on the number line shown in Exercise 1 could be  $-10$ . \_\_\_\_\_
- True or false: A test value for the rightmost interval on the number line shown in Exercise 1 could be  $0$ . \_\_\_\_\_

5. Consider the rational inequality

$$\frac{x-1}{x+2} \geq 0.$$

Setting the numerator and the denominator of  $\frac{x-1}{x+2}$  equal to zero, we obtain  $x = 1$  and  $x = -2$ . These values are shown as points on the number line. Also shown is information about three test values.

Based on the information shown above, the solution set of  $\frac{x-1}{x+2} \geq 0$  is \_\_\_\_\_.

## EXERCISE SET 2.7

### Practice Exercises

Solve each polynomial inequality in Exercises 1–42 and graph the solution set on a real number line. Express each solution set in interval notation.

- |  |   |
|--|---|
| 1. $(x-4)(x+2) > 0$                            | 2. $(x+3)(x-5) > 0$                             |
| 3. $(x-7)(x+3) \leq 0$                         | 4. $(x+1)(x-7) \leq 0$                          |
| 5. $x^2 - 5x + 4 > 0$                          | 6. $x^2 - 4x + 3 < 0$                           |
| 7. $x^2 + 5x + 4 > 0$                          | 8. $x^2 + x - 6 > 0$                            |
| 9. $x^2 - 6x + 9 < 0$                          | 10. $x^2 - 2x + 1 > 0$                          |
| 11. $3x^2 + 10x - 8 \leq 0$                    | 12. $9x^2 + 3x - 2 \geq 0$                      |
| 13. $2x^2 + x < 15$                            | 14. $6x^2 + x > 1$                              |
| 15. $4x^2 + 7x < -3$                           | 16. $3x^2 + 16x < -5$                           |
| 17. $5x \leq 2 - 3x^2$                         | 18. $4x^2 + 1 \geq 4x$                          |
| 19. $x^2 - 4x \geq 0$                          | 20. $x^2 + 2x < 0$                              |
| 21. $2x^2 + 3x > 0$                            | 22. $3x^2 - 5x \leq 0$                          |
| 23. $-x^2 + x \geq 0$                          | 24. $-x^2 + 2x \geq 0$                          |
| 25. $x^2 \leq 4x - 2$                          | 26. $x^2 \leq 2x + 2$                           |
| 27. $9x^2 - 6x + 1 < 0$                        | 28. $4x^2 - 4x + 1 \geq 0$                      |
| 29. $(x-1)(x-2)(x-3) \geq 0$                   |   |
| 30. $(x+1)(x+2)(x+3) \geq 0$                   |   |
| 31. $x(3-x)(x-5) \leq 0$                       | 32. $x(4-x)(x-6) \leq 0$                        |
| 33. $(2-x)^2 \left(x - \frac{7}{2}\right) < 0$ | 34. $(5-x)^2 \left(x - \frac{13}{2}\right) < 0$ |
| 35. $x^3 + 2x^2 - x - 2 \geq 0$                | 36. $x^3 + 2x^2 - 4x - 8 \geq 0$                |
| 37. $x^3 - 3x^2 - 9x + 27 < 0$                 | 38. $x^3 + 7x^2 - x - 7 < 0$                    |
| 39. $x^3 + x^2 + 4x + 4 > 0$                   | 40. $x^3 - x^2 + 9x - 9 > 0$                    |
| 41. $x^3 \geq 9x^2$                            | 42. $x^3 \leq 4x^2$                             |

Solve each rational inequality in Exercises 43–60 and graph the solution set on a real number line. Express each solution set in interval notation.

- |                                     |                                     |
|-------------------------------------|-------------------------------------|
| 43. $\frac{x-4}{x+3} > 0$           | 44. $\frac{x+5}{x-2} > 0$           |
| 45. $\frac{x+3}{x+4} < 0$           | 46. $\frac{x+5}{x+2} < 0$           |
| 47. $\frac{-x+2}{x-4} \geq 0$       | 48. $\frac{-x-3}{x+2} \leq 0$       |
| 49. $\frac{4-2x}{3x+4} \leq 0$      | 50. $\frac{3x+5}{6-2x} \geq 0$      |
| 51. $\frac{x}{x-3} > 0$             | 52. $\frac{x+4}{x} > 0$             |
| 53. $\frac{(x+4)(x-1)}{x+2} \leq 0$ | 54. $\frac{(x+3)(x-2)}{x+1} \leq 0$ |
| 55. $\frac{x+1}{x+3} < 2$           | 56. $\frac{x}{x-1} > 2$             |

57.  $\frac{x+4}{2x-1} \leq 3$

59.  $\frac{x-2}{x+2} \leq 2$

58.  $\frac{1}{x-3} < 1$

60.  $\frac{x}{x+2} \geq 2$

### Practice Plus

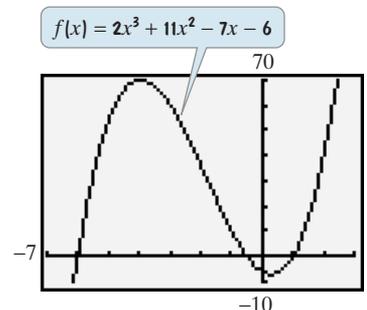

In Exercises 61–64, find the domain of each function.

- |  |   |
|--|---|
| 61. $f(x) = \sqrt{2x^2 - 5x + 2}$      | 62. $f(x) = \frac{1}{\sqrt{4x^2 - 9x + 2}}$ |
| 63. $f(x) = \sqrt{\frac{2x}{x+1}} - 1$ | 64. $f(x) = \sqrt{\frac{x}{2x-1}} - 1$      |

Solve each inequality in Exercises 65–70 and graph the solution set on a real number line.

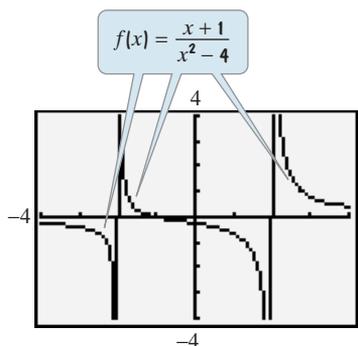

- |  |   |
|--|---|
| 65. $ x^2 + 2x - 36  > 12$                 | 66. $ x^2 + 6x + 1  > 8$                    |
| 67. $\frac{3}{x+3} > \frac{3}{x-2}$        | 68. $\frac{1}{x+1} > \frac{2}{x-1}$         |
| 69. $\frac{x^2 - x - 2}{x^2 - 4x + 3} > 0$ | 70. $\frac{x^2 - 3x + 2}{x^2 - 2x - 3} > 0$ |

In Exercises 71–72, use the graph of the polynomial function to solve each inequality.

- |                                |                             |
|--------------------------------|-----------------------------|
| 71. $2x^3 + 11x^2 \geq 7x + 6$ | 72. $2x^3 + 11x^2 < 7x + 6$ |
|--------------------------------|-----------------------------|

In Exercises 73–74, use the graph of the rational function to solve each inequality.

- |   |
|---|
| 73. $\frac{1}{4(x+2)} \leq -\frac{3}{4(x-2)}$ |
| 74. $\frac{1}{4(x+2)} > -\frac{3}{4(x-2)}$    |

### Application Exercises

Use the position function

$$s(t) = -16t^2 + v_0t + s_0$$

( $v_0$  = initial velocity,  $s_0$  = initial position,  $t$  = time)

to answer Exercises 75–76.

**75.** Divers in Acapulco, Mexico, dive headfirst at 8 feet per second from the top of a cliff 87 feet above the Pacific Ocean. During which time period will a diver's height exceed that of the cliff?

**76.** You throw a ball straight up from a rooftop 160 feet high with an initial velocity of 48 feet per second. During which time period will the ball's height exceed that of the rooftop?

The functions

$$f(x) = 0.0875x^2 - 0.4x + 66.6$$

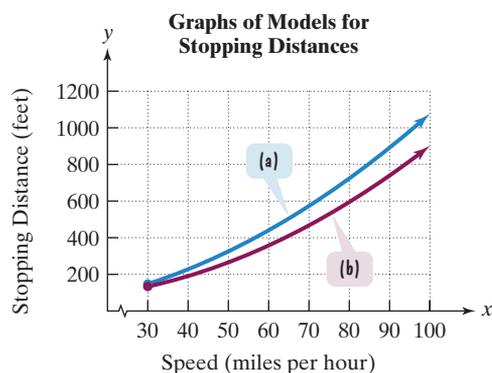

Dry pavement

and

Wet pavement

$$g(x) = 0.0875x^2 + 1.9x + 11.6$$

model a car's stopping distance,  $f(x)$  or  $g(x)$ , in feet, traveling at  $x$  miles per hour. Function  $f$  models stopping distance on dry pavement and function  $g$  models stopping distance on wet pavement. The graphs of these functions are shown for  $\{x | x \geq 30\}$ . Notice that the figure does not specify which graph is the model for dry roads and which is the model for wet roads. Use this information to solve Exercises 77–78.

- 77. a.** Use the given functions to find the stopping distance on dry pavement and the stopping distance on wet pavement for a car traveling at 35 miles per hour. Round to the nearest foot.
- b.** Based on your answers to part (a), which rectangular coordinate graph shows stopping distances on dry pavement and which shows stopping distances on wet pavement?
- c.** How well do your answers to part (a) model the actual stopping distances shown in **Figure 2.45** on page 382?
- d.** Determine speeds on dry pavement requiring stopping distances that exceed the length of one and one-half football fields, or 540 feet. Round to the nearest mile per hour. How is this shown on the appropriate graph of the models?

- 78. a.** Use the given functions to find the stopping distance on dry pavement and the stopping distance on wet pavement for a car traveling at 55 miles per hour. Round to the nearest foot.
- b.** Based on your answers to part (a), which rectangular coordinate graph shows stopping distances on dry pavement and which shows stopping distances on wet pavement?
- c.** How well do your answers to part (a) model the actual stopping distances shown in **Figure 2.45** on page 382?
- d.** Determine speeds on wet pavement requiring stopping distances that exceed the length of one and one-half football fields, or 540 feet. Round to the nearest mile per hour. How is this shown on the appropriate graph of the models?
- 79.** The perimeter of a rectangle is 50 feet. Describe the possible lengths of a side if the area of the rectangle is not to exceed 114 square feet.
- 80.** The perimeter of a rectangle is 180 feet. Describe the possible lengths of a side if the area of the rectangle is not to exceed 800 square feet.

### Writing in Mathematics

- 81.** What is a polynomial inequality?
- 82.** What is a rational inequality?
- 83.** If  $f$  is a polynomial or rational function, explain how the graph of  $f$  can be used to visualize the solution set of the inequality  $f(x) < 0$ .

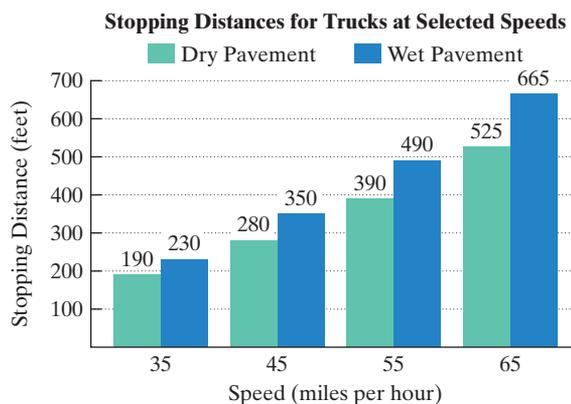

### Technology Exercises

- 84.** Use a graphing utility to verify your solution sets to any three of the polynomial inequalities that you solved algebraically in Exercises 1–42.
- 85.** Use a graphing utility to verify your solution sets to any three of the rational inequalities that you solved algebraically in Exercises 43–60.

Solve each inequality in Exercises 86–91 using a graphing utility.

- 86.**  $x^2 + 3x - 10 > 0$       **87.**  $2x^2 + 5x - 3 \leq 0$
- 88.**  $x^3 + x^2 - 4x - 4 > 0$       **89.**  $\frac{x-4}{x-1} \leq 0$
- 90.**  $\frac{x+2}{x-3} \leq 2$       **91.**  $\frac{1}{x+1} \leq \frac{2}{x+4}$

The graph shows stopping distances for trucks at various speeds on dry roads and on wet roads. Use this information to solve Exercises 92–93.

Source: National Highway Traffic Safety Administration

(In Exercises 92–93, be sure to refer to the graph at the bottom of the previous page.)

92. a. Use the statistical menu of your graphing utility and the quadratic regression program to obtain the quadratic function that models a truck's stopping distance,  $f(x)$ , in feet, on dry pavement traveling at  $x$  miles per hour. Round the  $x$ -coefficient and the constant term to one decimal place.
- b. Use the function from part (a) to determine speeds on dry pavement requiring stopping distances that exceed 455 feet. Round to the nearest mile per hour.
93. a. Use the statistical menu of your graphing utility and the quadratic regression program to obtain the quadratic function that models a truck's stopping distance,  $f(x)$ , in feet, on wet pavement traveling at  $x$  miles per hour. Round the  $x$ -coefficient and the constant term to one decimal place.
- b. Use the function from part (a) to determine speeds on wet pavement requiring stopping distances that exceed 446 feet.

### Critical Thinking Exercises

**Make Sense?** In Exercises 94–97, determine whether each statement makes sense or does not make sense, and explain your reasoning.

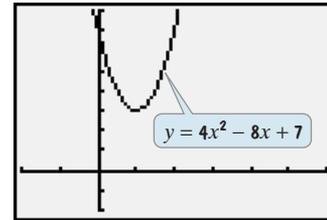

94. When solving  $f(x) > 0$ , where  $f$  is a polynomial function, I only pay attention to the sign of  $f$  at each test value and not the actual function value.
95. I'm solving a polynomial inequality that has a value for which the polynomial function is undefined.
96. Because it takes me longer to come to a stop on a wet road than on a dry road, graph (a) for Exercises 77–78 is the model for stopping distances on wet pavement and graph (b) is the model for stopping distances on dry pavement.
97. I began the solution of the rational inequality  $\frac{x+1}{x+3} \geq 2$  by setting both  $x+1$  and  $x+3$  equal to zero.

In Exercises 98–101, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

98. The solution set of  $x^2 > 25$  is  $(5, \infty)$ .
99. The inequality  $\frac{x-2}{x+3} < 2$  can be solved by multiplying both sides by  $x+3$ , resulting in the equivalent inequality  $x-2 < 2(x+3)$ .
100.  $(x+3)(x-1) \geq 0$  and  $\frac{x+3}{x-1} \geq 0$  have the same solution set.
101. The inequality  $\frac{x-2}{x+3} < 2$  can be solved by multiplying both sides by  $(x+3)^2$ ,  $x \neq -3$ , resulting in the equivalent inequality  $(x-2)(x+3) < 2(x+3)^2$ .
102. Write a polynomial inequality whose solution set is  $[-3, 5]$ .
103. Write a rational inequality whose solution set is  $(-\infty, -4) \cup [3, \infty)$ .

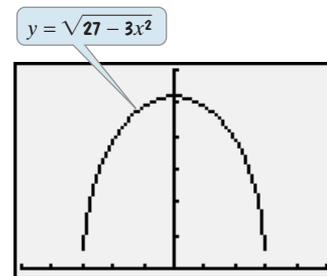

In Exercises 104–107, use inspection to describe each inequality's solution set. Do not solve any of the inequalities.

104.  $(x-2)^2 > 0$
105.  $(x-2)^2 \leq 0$
106.  $(x-2)^2 < -1$
107.  $\frac{1}{(x-2)^2} > 0$
108. The graphing utility screen shows the graph of  $y = 4x^2 - 8x + 7$ .

$[-2, 6, 1]$  by  $[-2, 8, 1]$

- a. Use the graph to describe the solution set of  $4x^2 - 8x + 7 > 0$ .
- b. Use the graph to describe the solution set of  $4x^2 - 8x + 7 < 0$ .
- c. Use an algebraic approach to verify each of your descriptions in parts (a) and (b).
109. The graphing utility screen shows the graph of  $y = \sqrt{27 - 3x^2}$ . Write and solve a quadratic inequality that explains why the graph only appears for  $-3 \leq x \leq 3$ .

$[-5, 5, 1]$  by  $[0, 6, 1]$

### Preview Exercises

Exercises 110–112 will help you prepare for the material covered in the next section.

110. a. If  $y = kx^2$ , find the value of  $k$  using  $x = 2$  and  $y = 64$ .
- b. Substitute the value for  $k$  into  $y = kx^2$  and write the resulting equation.
- c. Use the equation from part (b) to find  $y$  when  $x = 5$ .
111. a. If  $y = \frac{k}{x}$ , find the value of  $k$  using  $x = 8$  and  $y = 12$ .
- b. Substitute the value for  $k$  into  $y = \frac{k}{x}$  and write the resulting equation.
- c. Use the equation from part (b) to find  $y$  when  $x = 3$ .
112. If  $S = \frac{kA}{P}$ , find the value of  $k$  using  $A = 60,000$ ,  $P = 40$ , and  $S = 12,000$ .

## SECTION 2.8

## Modeling Using Variation

## Objectives

- 1 Solve direct variation problems.
- 2 Solve inverse variation problems.
- 3 Solve combined variation problems.
- 4 Solve problems involving joint variation.

Have you ever wondered how telecommunication companies estimate the number of phone calls expected per day between two cities? The formula

$$C = \frac{0.02P_1P_2}{d^2}$$

shows that the daily number of phone calls,  $C$ , increases as the populations of the cities,  $P_1$  and  $P_2$ , in thousands, increase and decreases as the distance,  $d$ , between the cities increases.

Certain formulas occur so frequently in applied situations that they are given special names. Variation formulas show how one quantity changes in relation to other quantities. Quantities can vary *directly*, *inversely*, or *jointly*. In this section, we look at situations that can be modeled by each of these kinds of variation.

- 1 Solve direct variation problems.

## Direct Variation

When you swim underwater, the pressure in your ears depends on the depth at which you are swimming. The formula

$$p = 0.43d$$

describes the water pressure,  $p$ , in pounds per square inch, at a depth of  $d$  feet. We can use this linear function to determine the pressure in your ears at various depths:

If  $d = 20$ ,  $p = 0.43(20) = 8.6$ . At a depth of 20 feet, water pressure is 8.6 pounds per square inch.

Doubling the depth doubles the pressure.

If  $d = 40$ ,  $p = 0.43(40) = 17.2$ . At a depth of 40 feet, water pressure is 17.2 pounds per square inch.

Doubling the depth doubles the pressure.

If  $d = 80$ ,  $p = 0.43(80) = 34.4$ . At a depth of 80 feet, water pressure is 34.4 pounds per square inch.

The formula  $p = 0.43d$  illustrates that water pressure is a constant multiple of your underwater depth. If your depth is doubled, the pressure is doubled; if your depth is tripled, the pressure is tripled; and so on. Because of this, the pressure in your ears is said to **vary directly** as your underwater depth. The **equation of variation** is

$$p = 0.43d.$$

Generalizing our discussion of pressure and depth, we obtain the following statement:

## Direct Variation

If a situation is described by an equation in the form

$$y = kx,$$

where  $k$  is a nonzero constant, we say that  **$y$  varies directly as  $x$**  or  **$y$  is directly proportional to  $x$** . The number  $k$  is called the **constant of variation** or the **constant of proportionality**.

Can you see that the **direct variation equation**,  $y = kx$ , is a **special case of the linear function**  $y = mx + b$ ? When  $m = k$  and  $b = 0$ ,  $y = mx + b$  becomes  $y = kx$ . Thus, the slope of a direct variation equation is  $k$ , the constant of variation. Because  $b$ , the  $y$ -intercept, is 0, the graph of a variation equation is a line passing through the origin. This is illustrated in **Figure 2.49**, which shows the graph of  $p = 0.43d$ : Water pressure varies directly as depth.

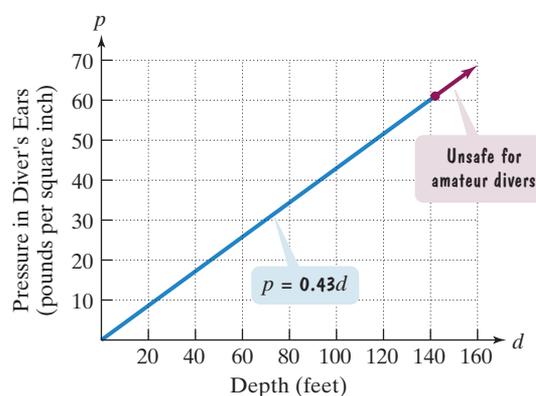

FIGURE 2.49 Water pressure at various depths

Problems involving direct variation can be solved using the following procedure. This procedure applies to direct variation problems, as well as to the other kinds of variation problems that we will discuss.

### Solving Variation Problems

1. Write an equation that models the given English statement.
2. Substitute the given pair of values into the equation in step 1 and find the value of  $k$ , the constant of variation.
3. Substitute the value of  $k$  into the equation in step 1.
4. Use the equation from step 3 to answer the problem's question.

### EXAMPLE 1 Solving a Direct Variation Problem

The volume of blood,  $B$ , in a person's body varies directly as body weight,  $W$ . A person who weighs 160 pounds has approximately 5 quarts of blood. Estimate the number of quarts of blood in a person who weighs 200 pounds.

#### SOLUTION

**Step 1 Write an equation.** We know that  $y$  varies directly as  $x$  is expressed as

$$y = kx.$$

By changing letters, we can write an equation that models the following English statement: The volume of blood,  $B$ , varies directly as body weight,  $W$ .

$$B = kW$$

**Step 2 Use the given values to find  $k$ .** A person who weighs 160 pounds has approximately 5 quarts of blood. Substitute 160 for  $W$  and 5 for  $B$  in the direct variation equation. Then solve for  $k$ .

$$\begin{aligned} B &= kW \\ 5 &= k \cdot 160 \\ \frac{5}{160} &= \frac{k \cdot 160}{160} \\ 0.03125 &= k \end{aligned}$$

The volume of blood varies directly as body weight. Substitute 160 for  $W$  and 5 for  $B$ .

Divide both sides by 160.

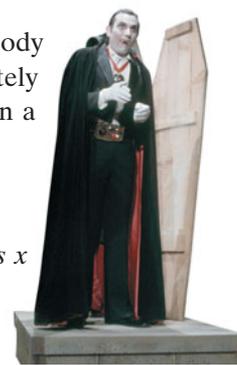

Express  $\frac{5}{160}$ , or  $\frac{1}{32}$ , in decimal form.

**Step 3 Substitute the value of  $k$  into the equation.**

$$\begin{aligned} B &= kW \\ B &= 0.03125W \end{aligned}$$

Use the equation from step 1.

Replace  $k$ , the constant of variation, with 0.03125.

**Step 4 Answer the problem's question.** We are interested in estimating the number of quarts of blood in a person who weighs 200 pounds. Substitute 200 for  $W$  in  $B = 0.03125W$  and solve for  $B$ .

$$\begin{aligned} B &= 0.03125W && \text{This is the equation from step 3.} \\ B &= 0.03125(200) && \text{Substitute 200 for } W. \\ &= 6.25 && \text{Multiply.} \end{aligned}$$

A person who weighs 200 pounds has approximately 6.25 quarts of blood. ●●●

 **Check Point 1** The number of gallons of water,  $W$ , used when taking a shower varies directly as the time,  $t$ , in minutes, in the shower. A shower lasting 5 minutes uses 30 gallons of water. How much water is used in a shower lasting 11 minutes?

**The direct variation equation  $y = kx$  is a linear function. If  $k > 0$ , then the slope of the line is positive. Consequently, as  $x$  increases,  $y$  also increases.**

A direct variation situation can involve variables to higher powers. For example,  $y$  can vary directly as  $x^2$  ( $y = kx^2$ ) or as  $x^3$  ( $y = kx^3$ ).

### Direct Variation with Powers

$y$  varies directly as the  $n$ th power of  $x$  if there exists some nonzero constant  $k$  such that

$$y = kx^n.$$

We also say that  $y$  is **directly proportional to the  $n$ th power of  $x$** .

Direct variation with whole number powers is modeled by polynomial functions. In our next example, the graph of the variation equation is the familiar parabola.

### EXAMPLE 2 Solving a Direct Variation Problem

The distance,  $s$ , that a body falls from rest varies directly as the square of the time,  $t$ , of the fall. If skydivers fall 64 feet in 2 seconds, how far will they fall in 4.5 seconds?

#### SOLUTION

**Step 1 Write an equation.** We know that  $y$  varies directly as the square of  $x$  is expressed as

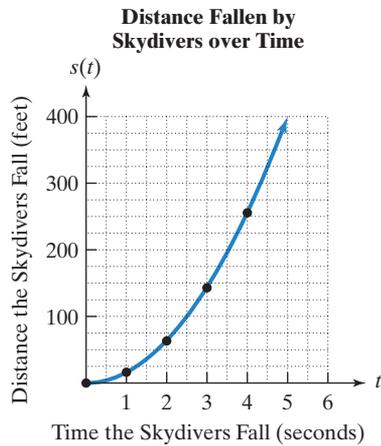

$$y = kx^2.$$

By changing letters, we can write an equation that models the following English statement: Distance,  $s$ , varies directly as the square of time,  $t$ , of the fall.

$$s = kt^2$$

**Step 2 Use the given values to find  $k$ .** Skydivers fall 64 feet in 2 seconds. Substitute 64 for  $s$  and 2 for  $t$  in the direct variation equation. Then solve for  $k$ .

$$\begin{aligned} s &= kt^2 && \text{Distance varies directly as the square of time.} \\ 64 &= k \cdot 2^2 && \text{Skydivers fall 64 feet in 2 seconds.} \\ 64 &= 4k && \text{Simplify: } 2^2 = 4. \\ \frac{64}{4} &= \frac{4k}{4} && \text{Divide both sides by 4.} \\ 16 &= k && \text{Simplify.} \end{aligned}$$

FIGURE 2.50 The graph of  $s(t) = 16t^2$ **Step 3 Substitute the value of  $k$  into the equation.**

$$s = kt^2 \quad \text{Use the equation from step 1.}$$

$$s = 16t^2 \quad \text{Replace } k, \text{ the constant of variation, with } 16.$$

**Step 4 Answer the problem's question.** How far will the skydivers fall in 4.5 seconds? Substitute 4.5 for  $t$  in  $s = 16t^2$  and solve for  $s$ .

$$s = 16(4.5)^2 = 16(20.25) = 324$$

Thus, in 4.5 seconds, the skydivers will fall 324 feet. ...

We can express the variation equation from Example 2 in function notation, writing

$$s(t) = 16t^2.$$

The distance that a body falls from rest is a function of the time,  $t$ , of the fall. The parabola that is the graph of this quadratic function is shown in **Figure 2.50**. The graph increases rapidly from left to right, showing the effects of the acceleration of gravity.

**Check Point 2** The weight of a great white shark varies directly as the cube of its length. A great white shark caught off Catalina Island, California, was 15 feet long and weighed 2025 pounds. What was the weight of the 25-foot-long shark in the novel *Jaws*?

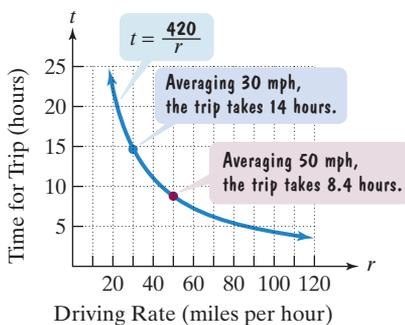

**2** Solve inverse variation problems.

FIGURE 2.51

**Inverse Variation**

The distance from San Francisco to Los Angeles is 420 miles. The time that it takes to drive from San Francisco to Los Angeles depends on the rate at which one drives and is given by

$$\text{Time} = \frac{420}{\text{Rate}}.$$

For example, if you average 30 miles per hour, the time for the drive is

$$\text{Time} = \frac{420}{30} = 14,$$

or 14 hours. If you average 50 miles per hour, the time for the drive is

$$\text{Time} = \frac{420}{50} = 8.4,$$

or 8.4 hours. As your rate (or speed) increases, the time for the trip decreases and vice versa. This is illustrated by the graph in **Figure 2.51**.

We can express the time for the San Francisco–Los Angeles trip using  $t$  for time and  $r$  for rate:

$$t = \frac{420}{r}.$$

This equation is an example of an **inverse variation** equation. Time,  $t$ , **varies inversely** as rate,  $r$ . When two quantities vary inversely, one quantity increases as the other decreases and vice versa.

Generalizing, we obtain the following statement:

**Inverse Variation**

If a situation is described by an equation in the form

$$y = \frac{k}{x},$$

where  $k$  is a nonzero constant, we say that  **$y$  varies inversely as  $x$**  or  **$y$  is inversely proportional to  $x$** . The number  $k$  is called the **constant of variation**.

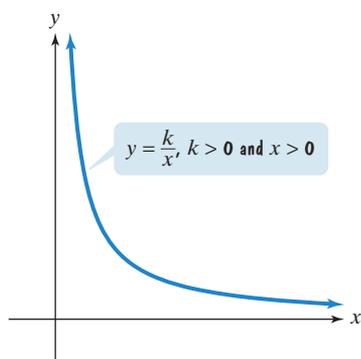

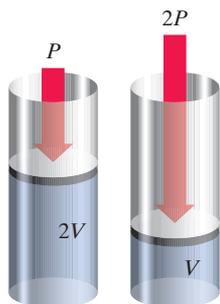

FIGURE 2.52 The graph of the inverse variation equation

Doubling the pressure halves the volume.

Notice that the **inverse variation equation**

$$y = \frac{k}{x}, \quad \text{or} \quad f(x) = \frac{k}{x},$$

**is a rational function.** For  $k > 0$  and  $x > 0$ , the graph of the function takes on the shape shown in **Figure 2.52**.

We use the same procedure to solve inverse variation problems as we did to solve direct variation problems. Example 3 illustrates this procedure.

### EXAMPLE 3 Solving an Inverse Variation Problem

When you use a spray can and press the valve at the top, you decrease the pressure of the gas in the can. This decrease of pressure causes the volume of the gas in the can to increase. Because the gas needs more room than is provided in the can, it expands in spray form through the small hole near the valve. In general, if the temperature is constant, the pressure,  $P$ , of a gas in a container varies inversely as the volume,  $V$ , of the container. The pressure of a gas sample in a container whose volume is 8 cubic inches is 12 pounds per square inch. If the sample expands to a volume of 22 cubic inches, what is the new pressure of the gas?

#### SOLUTION

**Step 1 Write an equation.** We know that  $y$  varies inversely as  $x$  is expressed as

$$y = \frac{k}{x}.$$

By changing letters, we can write an equation that models the following English statement: The pressure,  $P$ , of a gas in a container varies inversely as the volume,  $V$ .

$$P = \frac{k}{V}$$

**Step 2 Use the given values to find  $k$ .** The pressure of a gas sample in a container whose volume is 8 cubic inches is 12 pounds per square inch. Substitute 12 for  $P$  and 8 for  $V$  in the inverse variation equation. Then solve for  $k$ .

$$P = \frac{k}{V} \quad \text{Pressure varies inversely as volume.}$$

$$12 = \frac{k}{8} \quad \text{The pressure in an 8 cubic-inch container is 12 pounds per square inch.}$$

$$12 \cdot 8 = \frac{k}{8} \cdot 8 \quad \text{Multiply both sides by 8.}$$

$$96 = k \quad \text{Simplify.}$$

**Step 3 Substitute the value of  $k$  into the equation.**

$$P = \frac{k}{V} \quad \text{Use the equation from step 1.}$$

$$P = \frac{96}{V} \quad \text{Replace } k, \text{ the constant of variation, with 96.}$$

**Step 4 Answer the problem's question.** We need to find the pressure when the volume expands to 22 cubic inches. Substitute 22 for  $V$  and solve for  $P$ .

$$P = \frac{96}{V} = \frac{96}{22} = \frac{48}{11} = 4\frac{4}{11}$$

When the volume is 22 cubic inches, the pressure of the gas is  $4\frac{4}{11}$  pounds per square inch. ●●●

 **Check Point 3** The length of a violin string varies inversely as the frequency of its vibrations. A violin string 8 inches long vibrates at a frequency of 640 cycles per second. What is the frequency of a 10-inch string?

**3** Solve combined variation problems.

### Combined Variation

In **combined variation**, direct variation and inverse variation occur at the same time. For example, as the advertising budget,  $A$ , of a company increases, its monthly sales,  $S$ , also increase. Monthly sales vary directly as the advertising budget:

$$S = kA.$$

By contrast, as the price of the company's product,  $P$ , increases, its monthly sales,  $S$ , decrease. Monthly sales vary inversely as the price of the product:

$$S = \frac{k}{P}.$$

We can combine these two variation equations into one combined equation:

$$S = \frac{kA}{P}.$$

Monthly sales,  $S$ , vary directly as the advertising budget,  $A$ , and inversely as the price of the product,  $P$ .

The following example illustrates an application of combined variation.

### EXAMPLE 4 Solving a Combined Variation Problem

The owners of Rollerblades Plus determine that the monthly sales,  $S$ , of their skates vary directly as their advertising budget,  $A$ , and inversely as the price of the skates,  $P$ . When \$60,000 is spent on advertising and the price of the skates is \$40, the monthly sales are 12,000 pairs of rollerblades.

- Write an equation of variation that describes this situation.
- Determine monthly sales if the amount of the advertising budget is increased to \$70,000.

### SOLUTION

- Write an equation.

$$S = \frac{kA}{P}$$

Translate "sales vary directly as the advertising budget and inversely as the skates' price."

Use the given values to find  $k$ .

$$12,000 = \frac{k(60,000)}{40}$$

When \$60,000 is spent on advertising ( $A = 60,000$ ) and the price is \$40 ( $P = 40$ ), monthly sales are 12,000 units ( $S = 12,000$ ).

$$12,000 = k \cdot 1500$$

Divide 60,000 by 40.

$$\frac{12,000}{1500} = \frac{k \cdot 1500}{1500}$$

Divide both sides of the equation by 1500.

$$8 = k$$

Simplify.

Therefore, the equation of variation that models monthly sales is

$$S = \frac{8A}{P}.$$

Substitute 8 for  $k$  in  $S = \frac{kA}{P}$ .

- b. The advertising budget is increased to \$70,000, so  $A = 70,000$ . The skates' price is still \$40, so  $P = 40$ .

$$S = \frac{8A}{P} \quad \text{This is the equation from part (a).}$$

$$S = \frac{8(70,000)}{40} \quad \text{Substitute 70,000 for } A \text{ and 40 for } P.$$

$$S = 14,000 \quad \text{Simplify.}$$

With a \$70,000 advertising budget and \$40 price, the company can expect to sell 14,000 pairs of rollerblades in a month (up from 12,000). ●●●

 **Check Point 4** The number of minutes needed to solve an Exercise Set of variation problems varies directly as the number of problems and inversely as the number of people working to solve the problems. It takes 4 people 32 minutes to solve 16 problems. How many minutes will it take 8 people to solve 24 problems?

- 4 Solve problems involving joint variation.

### Joint Variation

Joint variation is a variation in which a variable varies directly as the product of two or more other variables. Thus, the equation  $y = kxz$  is read “ $y$  varies jointly as  $x$  and  $z$ .”

Joint variation plays a critical role in Isaac Newton's formula for gravitation:

$$F = G \frac{m_1 m_2}{d^2}.$$

The formula states that the force of gravitation,  $F$ , between two bodies varies jointly as the product of their masses,  $m_1$  and  $m_2$ , and inversely as the square of the distance between them,  $d$ . ( $G$  is the gravitational constant.) The formula indicates that gravitational force exists between any two objects in the universe, increasing as the distance between the bodies decreases. One practical result is that the pull of the moon on the oceans is greater on the side of Earth closer to the moon. This gravitational imbalance is what produces tides.

### EXAMPLE 5 Modeling Centrifugal Force

The centrifugal force,  $C$ , of a body moving in a circle varies jointly with the radius of the circular path,  $r$ , and the body's mass,  $m$ , and inversely with the square of the time,  $t$ , it takes to move about one full circle. A 6-gram body moving in a circle with radius 100 centimeters at a rate of 1 revolution in 2 seconds has a centrifugal force of 6000 dynes. Find the centrifugal force of an 18-gram body moving in a circle with radius 100 centimeters at a rate of 1 revolution in 3 seconds.

### SOLUTION

$$C = \frac{krm}{t^2}$$

$$6000 = \frac{k(100)(6)}{2^2}$$

$$6000 = 150k$$

$$40 = k$$

$$C = \frac{40rm}{t^2}$$

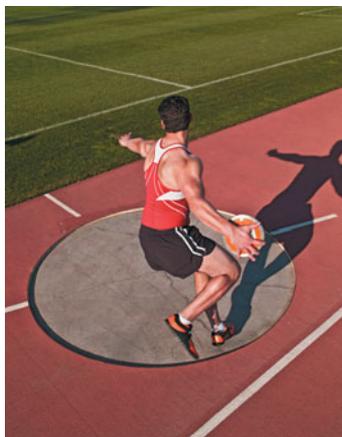

Translate “Centrifugal force,  $C$ , varies jointly with radius,  $r$ , and mass,  $m$ , and inversely with the square of time,  $t$ .”

A 6-gram body ( $m = 6$ ) moving in a circle with radius 100 centimeters ( $r = 100$ ) at 1 revolution in 2 seconds ( $t = 2$ ) has a centrifugal force of 6000 dynes ( $C = 6000$ ).

Simplify.

Divide both sides by 150 and solve for  $k$ .

Substitute 40 for  $k$  in the model for centrifugal force.

$$C = \frac{40(100)(18)}{3^2}$$

Find centrifugal force,  $C$ , of an 18-gram body ( $m = 18$ ) moving in a circle with radius 100 centimeters ( $r = 100$ ) at 1 revolution in 3 seconds ( $t = 3$ ).

$$= 8000$$

Simplify.

The centrifugal force is 8000 dynes. ...

**Check Point 5** The volume of a cone,  $V$ , varies jointly as its height,  $h$ , and the square of its radius,  $r$ . A cone with a radius measuring 6 feet and a height measuring 10 feet has a volume of  $120\pi$  cubic feet. Find the volume of a cone having a radius of 12 feet and a height of 2 feet.

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- $y$  varies directly as  $x$  can be modeled by the equation \_\_\_\_\_, where  $k$  is called the \_\_\_\_\_.
- $y$  varies directly as the  $n$ th power of  $x$  can be modeled by the equation \_\_\_\_\_.
- $y$  varies inversely as  $x$  can be modeled by the equation \_\_\_\_\_.
- $y$  varies directly as  $x$  and inversely as  $z$  can be modeled by the equation \_\_\_\_\_.
- $y$  varies jointly as  $x$  and  $z$  can be modeled by the equation \_\_\_\_\_.
- In the equation  $S = \frac{8A}{P}$ ,  $S$  varies \_\_\_\_\_ as  $A$  and \_\_\_\_\_ as  $P$ .
- In the equation  $C = \frac{0.02P_1P_2}{d^2}$ ,  $C$  varies \_\_\_\_\_ as  $P_1$  and  $P_2$  and \_\_\_\_\_ as the square of  $d$ .

## EXERCISE SET 2.8

### Practice Exercises

Use the four-step procedure for solving variation problems given on page 395 to solve Exercises 1–10.

- $y$  varies directly as  $x$ .  $y = 65$  when  $x = 5$ . Find  $y$  when  $x = 12$ .
- $y$  varies directly as  $x$ .  $y = 45$  when  $x = 5$ . Find  $y$  when  $x = 13$ .
- $y$  varies inversely as  $x$ .  $y = 12$  when  $x = 5$ . Find  $y$  when  $x = 2$ .
- $y$  varies inversely as  $x$ .  $y = 6$  when  $x = 3$ . Find  $y$  when  $x = 9$ .
- $y$  varies directly as  $x$  and inversely as the square of  $z$ .  $y = 20$  when  $x = 50$  and  $z = 5$ . Find  $y$  when  $x = 3$  and  $z = 6$ .
- $a$  varies directly as  $b$  and inversely as the square of  $c$ .  $a = 7$  when  $b = 9$  and  $c = 6$ . Find  $a$  when  $b = 4$  and  $c = 8$ .
- $y$  varies jointly as  $x$  and  $z$ .  $y = 25$  when  $x = 2$  and  $z = 5$ . Find  $y$  when  $x = 8$  and  $z = 12$ .
- $C$  varies jointly as  $A$  and  $T$ .  $C = 175$  when  $A = 2100$  and  $T = 4$ . Find  $C$  when  $A = 2400$  and  $T = 6$ .

- $y$  varies jointly as  $a$  and  $b$  and inversely as the square root of  $c$ .  $y = 12$  when  $a = 3$ ,  $b = 2$ , and  $c = 25$ . Find  $y$  when  $a = 5$ ,  $b = 3$ , and  $c = 9$ .
- $y$  varies jointly as  $m$  and the square of  $n$  and inversely as  $p$ .  $y = 15$  when  $m = 2$ ,  $n = 1$ , and  $p = 6$ . Find  $y$  when  $m = 3$ ,  $n = 4$ , and  $p = 10$ .

### Practice Plus

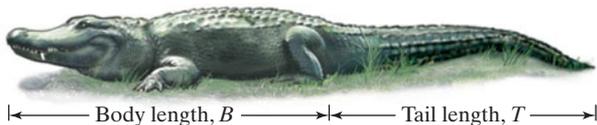

In Exercises 11–20, write an equation that expresses each relationship. Then solve the equation for  $y$ .

- $x$  varies jointly as  $y$  and  $z$ .
- $x$  varies jointly as  $y$  and the square of  $z$ .
- $x$  varies directly as the cube of  $z$  and inversely as  $y$ .
- $x$  varies directly as the cube root of  $z$  and inversely as  $y$ .
- $x$  varies jointly as  $y$  and  $z$  and inversely as the square root of  $w$ .
- $x$  varies jointly as  $y$  and  $z$  and inversely as the square of  $w$ .
- $x$  varies jointly as  $z$  and the sum of  $y$  and  $w$ .
- $x$  varies jointly as  $z$  and the difference between  $y$  and  $w$ .
- $x$  varies directly as  $z$  and inversely as the difference between  $y$  and  $w$ .
- $x$  varies directly as  $z$  and inversely as the sum of  $y$  and  $w$ .

## Application Exercises

Use the four-step procedure for solving variation problems given on page 395 to solve Exercises 21–36.

21. An alligator's tail length,  $T$ , varies directly as its body length,  $B$ . An alligator with a body length of 4 feet has a tail length of 3.6 feet. What is the tail length of an alligator whose body length is 6 feet?

22. An object's weight on the moon,  $M$ , varies directly as its weight on Earth,  $E$ . Neil Armstrong, the first person to step on the moon on July 20, 1969, weighed 360 pounds on Earth (with all of his equipment on) and 60 pounds on the moon. What is the moon weight of a person who weighs 186 pounds on Earth?
23. The height that a ball bounces varies directly as the height from which it was dropped. A tennis ball dropped from 12 inches bounces 8.4 inches. From what height was the tennis ball dropped if it bounces 56 inches?
24. The distance that a spring will stretch varies directly as the force applied to the spring. A force of 12 pounds is needed to stretch a spring 9 inches. What force is required to stretch the spring 15 inches?
25. If all men had identical body types, their weight would vary directly as the cube of their height. Shown below is Robert Wadlow, who reached a record height of 8 feet 11 inches (107 inches) before his death at age 22. If a man who is 5 feet 10 inches tall (70 inches) with the same body type as Mr. Wadlow weighs 170 pounds, what was Robert Wadlow's weight shortly before his death?

26. The number of houses that can be served by a water pipe varies directly as the square of the diameter of the pipe. A water pipe that has a 10-centimeter diameter can supply 50 houses.
- How many houses can be served by a water pipe that has a 30-centimeter diameter?
  - What size water pipe is needed for a new subdivision of 1250 houses?

27. The figure shows that a bicyclist tips the cycle when making a turn. The angle  $B$ , formed by the vertical direction and the bicycle, is called the banking angle. The banking angle varies inversely as the cycle's turning radius. When the turning radius is 4 feet, the banking angle is  $28^\circ$ . What is the banking angle when the turning radius is 3.5 feet?

28. The water temperature of the Pacific Ocean varies inversely as the water's depth. At a depth of 1000 meters, the water temperature is  $4.4^\circ$  Celsius. What is the water temperature at a depth of 5000 meters?
29. Radiation machines, used to treat tumors, produce an intensity of radiation that varies inversely as the square of the distance from the machine. At 3 meters, the radiation intensity is 62.5 milliroentgens per hour. What is the intensity at a distance of 2.5 meters?
30. The illumination provided by a car's headlight varies inversely as the square of the distance from the headlight. A car's headlight produces an illumination of 3.75 foot-candles at a distance of 40 feet. What is the illumination when the distance is 50 feet?
31. Body-mass index, or BMI, takes both weight and height into account when assessing whether an individual is underweight or overweight. BMI varies directly as one's weight, in pounds, and inversely as the square of one's height, in inches. In adults, normal values for the BMI are between 20 and 25, inclusive. Values below 20 indicate that an individual is underweight and values above 30 indicate that an individual is obese. A person who weighs 180 pounds and is 5 feet, or 60 inches, tall has a BMI of 35.15. What is the BMI, to the nearest tenth, for a 170-pound person who is 5 feet 10 inches tall? Is this person overweight?
32. One's intelligence quotient, or IQ, varies directly as a person's mental age and inversely as that person's chronological age. A person with a mental age of 25 and a chronological age of 20 has an IQ of 125. What is the chronological age of a person with a mental age of 40 and an IQ of 80?

33. The heat loss of a glass window varies jointly as the window's area and the difference between the outside and inside temperatures. A window 3 feet wide by 6 feet long loses 1200 Btu per hour when the temperature outside is  $20^\circ$  colder than the temperature inside. Find the heat loss through a glass window that is 6 feet wide by 9 feet long when the temperature outside is  $10^\circ$  colder than the temperature inside.
34. Kinetic energy varies jointly as the mass and the square of the velocity. A mass of 8 grams and velocity of 3 centimeters per second has a kinetic energy of 36 ergs. Find the kinetic energy for a mass of 4 grams and velocity of 6 centimeters per second.
35. Sound intensity varies inversely as the square of the distance from the sound source. If you are in a movie theater and you change your seat to one that is twice as far from the speakers, how does the new sound intensity compare to that of your original seat?
36. Many people claim that as they get older, time seems to pass more quickly. Suppose that the perceived length of a period of time is inversely proportional to your age. How long will a year seem to be when you are three times as old as you are now?
37. The average number of daily phone calls,  $C$ , between two cities varies jointly as the product of their populations,  $P_1$  and  $P_2$ , and inversely as the square of the distance,  $d$ , between them.
- Write an equation that expresses this relationship.
  - The distance between San Francisco (population: 777,000) and Los Angeles (population: 3,695,000) is 420 miles. If the average number of daily phone calls between the cities is 326,000, find the value of  $k$  to two decimal places and write the equation of variation.
  - Memphis (population: 650,000) is 400 miles from New Orleans (population: 490,000). Find the average number of daily phone calls, to the nearest whole number, between these cities.
38. The force of wind blowing on a window positioned at a right angle to the direction of the wind varies jointly as the area of the window and the square of the wind's speed. It is known that a wind of 30 miles per hour blowing on a window measuring 4 feet by 5 feet exerts a force of 150 pounds. During a storm with winds of 60 miles per hour, should hurricane shutters be placed on a window that measures 3 feet by 4 feet and is capable of withstanding 300 pounds of force?
39. The table shows the values for the current,  $I$ , in an electric circuit and the resistance,  $R$ , of the circuit.

$I$ (amperes)	0.5	1.0	1.5	2.0	2.5	3.0	4.0	5.0
$R$ (ohms)	12.0	6.0	4.0	3.0	2.4	2.0	1.5	1.2

- Graph the ordered pairs in the table of values, with values of  $I$  along the  $x$ -axis and values of  $R$  along the  $y$ -axis. Connect the eight points with a smooth curve.
- Does current vary directly or inversely as resistance? Use your graph and explain how you arrived at your answer.
- Write an equation of variation for  $I$  and  $R$ , using one of the ordered pairs in the table to find the constant of variation. Then use your variation equation to verify the other seven ordered pairs in the table.

### Writing in Mathematics

- What does it mean if two quantities vary directly?
- In your own words, explain how to solve a variation problem.
- What does it mean if two quantities vary inversely?
- Explain what is meant by combined variation. Give an example with your explanation.
- Explain what is meant by joint variation. Give an example with your explanation.

In Exercises 45–46, describe in words the variation shown by the given equation.

45.  $z = \frac{k\sqrt{x}}{y^2}$       46.  $z = kx^2\sqrt{y}$

47. We have seen that the daily number of phone calls between two cities varies jointly as their populations and inversely as the square of the distance between them. This model, used by telecommunication companies to estimate the line capacities needed among various cities, is called the *gravity model*. Compare the model to Newton's formula for gravitation on page 400 and describe why the name *gravity model* is appropriate.

### Technology Exercise

48. Use a graphing utility to graph any three of the variation equations in Exercises 21–30. Then **TRACE** along each curve and identify the point that corresponds to the problem's solution.

### Critical Thinking Exercises

**Make Sense?** In Exercises 49–52, determine whether each statement makes sense or does not make sense, and explain your reasoning.

- I'm using an inverse variation equation and I need to determine the value of the dependent variable when the independent variable is zero.
- The graph of this direct variation equation that has a positive constant of variation shows one variable increasing as the other variable decreases.
- When all is said and done, it seems to me that direct variation equations are special kinds of linear functions and inverse variation equations are special kinds of rational functions.
- Using the language of variation, I can now state the formula for the area of a trapezoid,  $A = \frac{1}{2}h(b_1 + b_2)$ , as, "A trapezoid's area varies jointly with its height and the sum of its bases."
- In a hurricane, the wind pressure varies directly as the square of the wind velocity. If wind pressure is a measure of a hurricane's destructive capacity, what happens to this destructive power when the wind speed doubles?
- The illumination from a light source varies inversely as the square of the distance from the light source. If you raise a lamp from 15 inches to 30 inches over your desk, what happens to the illumination?
- The heat generated by a stove element varies directly as the square of the voltage and inversely as the resistance. If the voltage remains constant, what needs to be done to triple the amount of heat generated?

56. Galileo's telescope brought about revolutionary changes in astronomy. A comparable leap in our ability to observe the universe took place as a result of the Hubble Space Telescope. The space telescope was able to see stars and galaxies whose brightness is  $\frac{1}{50}$  of the faintest objects observable using ground-based telescopes. Use the fact that the brightness of a point source, such as a star, varies inversely as the square of its distance from an observer to show that the space telescope was able to see about seven times farther than a ground-based telescope.

### Group Exercise

57. Begin by deciding on a product that interests the group because you are now in charge of advertising this product. Members were told that the demand for the product varies directly as the amount spent on advertising and inversely as the price of the product. However, as more money is spent on advertising, the price of your product rises. Under what conditions would members recommend an increased expense

in advertising? Once you've determined what your product is, write formulas for the given conditions and experiment with hypothetical numbers. What other factors might you take into consideration in terms of your recommendation? How do these factors affect the demand for your product?

### Preview Exercises

Exercises 58–60 will help you prepare for the material covered in the first section of the next chapter.

58. Use point plotting to graph  $f(x) = 2^x$ . Begin by setting up a partial table of coordinates, selecting integers from  $-3$  to  $3$ , inclusive, for  $x$ . Because  $y = 0$  is a horizontal asymptote, your graph should approach, but never touch, the negative portion of the  $x$ -axis.

In Exercises 59–60, use transformations of your graph from Exercise 58 to graph each function.

59.  $g(x) = f(-x) = 2^{-x}$     60.  $h(x) = f(x) + 1 = 2^x + 1$

## CHAPTER 2

## Summary, Review, and Test

### SUMMARY

#### DEFINITIONS AND CONCEPTS

##### 2.1 Complex Numbers

- a. The imaginary unit  $i$  is defined as

$$i = \sqrt{-1}, \text{ where } i^2 = -1.$$

The set of numbers in the form  $a + bi$  is called the set of complex numbers;  $a$  is the real part and  $b$  is the imaginary part. If  $b = 0$ , the complex number is a real number. If  $b \neq 0$ , the complex number is an imaginary number. Complex numbers in the form  $bi$  are called pure imaginary numbers.

- b. Rules for adding and subtracting complex numbers are given in the box on page 293.  
 c. To multiply complex numbers, multiply as if they are polynomials. After completing the multiplication, replace  $i^2$  with  $-1$  and simplify.  
 d. The complex conjugate of  $a + bi$  is  $a - bi$  and vice versa. The multiplication of complex conjugates gives a real number:

$$(a + bi)(a - bi) = a^2 + b^2.$$

- e. To divide complex numbers, multiply the numerator and the denominator by the complex conjugate of the denominator.  
 f. When performing operations with square roots of negative numbers, begin by expressing all square roots in terms of  $i$ . The principal square root of  $-b$  is defined by

$$\sqrt{-b} = i\sqrt{b}.$$

- g. Quadratic equations ( $ax^2 + bx + c = 0, a \neq 0$ ) with negative discriminants ( $b^2 - 4ac < 0$ ) have imaginary solutions that are complex conjugates.

##### 2.2 Quadratic Functions

- a. A quadratic function is of the form  $f(x) = ax^2 + bx + c, a \neq 0$ .  
 b. The standard form of a quadratic function is  $f(x) = a(x - h)^2 + k, a \neq 0$ .  
 c. The graph of a quadratic function is a parabola. The vertex is  $(h, k)$  or  $\left(-\frac{b}{2a}, f\left(-\frac{b}{2a}\right)\right)$ . A procedure for graphing a quadratic function in standard form is given in the box on page 302. A procedure for graphing a quadratic function in the form  $f(x) = ax^2 + bx + c$  is given in the box on page 305.

#### EXAMPLES

Figure 2.1,  
p. 292

Ex. 3, p. 295

Ex. 4, p. 296

Ex. 5, p. 297

Ex. 1, p. 302;  
Ex. 2, p. 303;  
Ex. 3, p. 305

## DEFINITIONS AND CONCEPTS

## EXAMPLES

d. See the box on page 307 for minimum or maximum values of quadratic functions.

Ex. 4, p. 307;

Ex. 5, p. 308

e. A strategy for solving problems involving maximizing or minimizing quadratic functions is given in the box on page 310.

Ex. 6, p. 310;

Ex. 7, p. 311

## 2.3 Polynomial Functions and Their Graphs

a. Polynomial Function of Degree  $n$ :  $f(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_2 x^2 + a_1 x + a_0, a_n \neq 0$

b. The graphs of polynomial functions are smooth and continuous.

Fig. 2.14, p. 319

c. The end behavior of the graph of a polynomial function depends on the leading term, given by the Leading Coefficient Test in the box on page 320. Odd-degree polynomial functions have graphs with opposite behavior at each end. Even-degree polynomial functions have graphs with the same behavior at each end.

Ex. 1, p. 320;

Ex. 2, p. 321;

Ex. 3, p. 321;

Ex. 4, p. 322

d. The values of  $x$  for which  $f(x)$  is equal to 0 are the zeros of the polynomial function  $f$ . These values are the roots, or solutions, of the polynomial equation  $f(x) = 0$ .

Ex. 5, p. 322;

Ex. 6, p. 323

e. If  $x - r$  occurs  $k$  times in a polynomial function's factorization,  $r$  is a repeated zero with multiplicity  $k$ . If  $k$  is even, the graph touches the  $x$ -axis and turns around at  $r$ . If  $k$  is odd, the graph crosses the  $x$ -axis at  $r$ .

Ex. 7, p. 324

f. The Intermediate Value Theorem: If  $f$  is a polynomial function and  $f(a)$  and  $f(b)$  have opposite signs, there is at least one value of  $c$  between  $a$  and  $b$  for which  $f(c) = 0$ .

Ex. 8, p. 325

g. If  $f$  is a polynomial of degree  $n$ , the graph of  $f$  has at most  $n - 1$  turning points.

Fig. 2.25, p. 326

h. A strategy for graphing a polynomial function is given in the box on page 326.

Ex. 9, p. 326;

Ex. 10, p. 328

## 2.4 Dividing Polynomials; Remainder and Factor Theorems

a. Long division of polynomials is performed by dividing, multiplying, subtracting, bringing down the next term, and repeating this process until the degree of the remainder is less than the degree of the divisor. The details are given in the box on page 336.

Ex. 1, p. 335;

Ex. 2, p. 336;

Ex. 3, p. 337

b. The Division Algorithm:  $f(x) = d(x)q(x) + r(x)$ . The dividend is the product of the divisor and the quotient plus the remainder.

c. Synthetic division is used to divide a polynomial by  $x - c$ . The details are given in the box on page 339.

Ex. 4, p. 339

d. The Remainder Theorem: If a polynomial  $f(x)$  is divided by  $x - c$ , then the remainder is  $f(c)$ .

Ex. 5, p. 341

e. The Factor Theorem: If  $x - c$  is a factor of a polynomial function  $f(x)$ , then  $c$  is a zero of  $f$  and a root of  $f(x) = 0$ . If  $c$  is a zero of  $f$  or a root of  $f(x) = 0$ , then  $x - c$  is a factor of  $f(x)$ .

Ex. 6, p. 342

## 2.5 Zeros of Polynomial Functions

a. The Rational Zero Theorem states that the possible rational zeros of a polynomial

Ex. 1, p. 347;

function  $= \frac{\text{Factors of the constant term}}{\text{Factors of the leading coefficient}}$ . The theorem is stated in the box on page 347.

Ex. 2, p. 348;

Ex. 3, p. 348;

Ex. 4, p. 349;

Ex. 5, p. 350

b. Number of roots: If  $f(x)$  is a polynomial of degree  $n \geq 1$ , then, counting multiple roots separately, the equation  $f(x) = 0$  has  $n$  roots.

c. If  $a + bi$  is a root of  $f(x) = 0$  with real coefficients, then  $a - bi$  is also a root.

d. The Linear Factorization Theorem: An  $n$ th-degree polynomial can be expressed as the product of  $n$  linear factors. Thus,  $f(x) = a_n(x - c_1)(x - c_2) \cdots (x - c_n)$ .

Ex. 6, p. 353

e. Descartes's Rule of Signs: The number of positive real zeros of  $f$  equals the number of sign changes of  $f(x)$  or is less than that number by an even integer. The number of negative real zeros of  $f$  applies a similar statement to  $f(-x)$ .

Table 2.1, p. 355;

Ex. 7, p. 355

## 2.6 Rational Functions and Their Graphs

a. Rational function:  $f(x) = \frac{p(x)}{q(x)}$ ;  $p$  and  $q$  are polynomial functions and  $q(x) \neq 0$ . The domain of  $f$  is the set of all real numbers excluding values of  $x$  that make  $q(x)$  zero.

Ex. 1, p. 361

b. Arrow notation is summarized in the box on page 364.

## DEFINITIONS AND CONCEPTS

- c. The line  $x = a$  is a vertical asymptote of the graph of  $f$  if  $f(x)$  increases or decreases without bound as  $x$  approaches  $a$ . Vertical asymptotes are located using the theorem in the box on page 365. Ex. 2, p. 365
- d. The line  $y = b$  is a horizontal asymptote of the graph of  $f$  if  $f(x)$  approaches  $b$  as  $x$  increases or decreases without bound. Horizontal asymptotes are located using the theorem in the lower box on page 367. Ex. 3, p. 367
- e. Table 2.2 on page 368 shows the graphs of  $f(x) = \frac{1}{x}$  and  $f(x) = \frac{1}{x^2}$ . Some rational functions can be graphed using transformations of these common graphs. Ex. 4, p. 368
- f. A strategy for graphing rational functions is given in the box on page 369. Ex. 5, p. 369;  
Ex. 6, p. 370;  
Ex. 7, p. 372
- g. The graph of a rational function has a slant asymptote when the degree of the numerator is one more than the degree of the denominator. The equation of the slant asymptote is found using division and dropping the remainder term. Ex. 8, p. 373

## 2.7 Polynomial and Rational Inequalities

- a. A polynomial inequality can be expressed as  $f(x) < 0$ ,  $f(x) > 0$ ,  $f(x) \leq 0$ , or  $f(x) \geq 0$ , where  $f$  is a polynomial function. A procedure for solving polynomial inequalities is given in the box on page 383. Ex. 1, p. 383;  
Ex. 2, p. 384;  
Ex. 3, p. 385
- b. A rational inequality can be expressed as  $f(x) < 0$ ,  $f(x) > 0$ ,  $f(x) \leq 0$ , or  $f(x) \geq 0$ , where  $f$  is a rational function. The procedure for solving such inequalities begins with expressing them so that one side is zero and the other side is a single quotient. Find boundary points by setting the numerator and denominator equal to zero. Then follow a procedure similar to that for solving polynomial inequalities. Ex. 4, p. 387

## 2.8 Modeling Using Variation

- a. A procedure for solving variation problems is given in the box on page 395.

## b. English Statement

## Equation

$y$  varies directly as  $x$ .

$$y = kx$$

Ex. 1, p. 395

$y$  is directly proportional to  $x$ .

$y$  varies directly as  $x^n$ .

$$y = kx^n$$

Ex. 2, p. 396

$y$  is directly proportional to  $x^n$ .

$y$  varies inversely as  $x$ .

$$y = \frac{k}{x}$$

Ex. 3, p. 398;

$y$  is inversely proportional to  $x$ .

Ex. 4, p. 399

$y$  varies inversely as  $x^n$ .

$$y = \frac{k}{x^n}$$

$y$  is inversely proportional to  $x^n$ .

$y$  varies jointly as  $x$  and  $z$ .

$$y = kxz$$

Ex. 5, p. 400

## REVIEW EXERCISES

## 2.1

In Exercises 1–10 perform the indicated operations and write the result in standard form.

1.  $(8 - 3i) - (17 - 7i)$

2.  $4i(3i - 2)$

3.  $(7 - i)(2 + 3i)$

4.  $(3 - 4i)^2$

5.  $(7 + 8i)(7 - 8i)$

6.  $\frac{6}{5 + i}$

7.  $\frac{3 + 4i}{4 - 2i}$

8.  $\sqrt{-32} - \sqrt{-18}$

9.  $(-2 + \sqrt{-100})^2$

10.  $\frac{4 + \sqrt{-8}}{2}$

In Exercises 11–12, solve each quadratic equation using the quadratic formula. Express solutions in standard form.

11.  $x^2 - 2x + 4 = 0$

12.  $2x^2 - 6x + 5 = 0$

## 2.2

In Exercises 13–16, use the vertex and intercepts to sketch the graph of each quadratic function. Give the equation for the parabola's axis of symmetry. Use the graph to determine the function's domain and range.

13.  $f(x) = -(x + 1)^2 + 4$

14.  $f(x) = (x + 4)^2 - 2$

15.  $f(x) = -x^2 + 2x + 3$

16.  $f(x) = 2x^2 - 4x - 6$

In Exercises 17–18, use the function's equation, and not its graph, to find

a. the minimum or maximum value and where it occurs.

b. the function's domain and its range.

17.  $f(x) = -x^2 + 14x - 106$

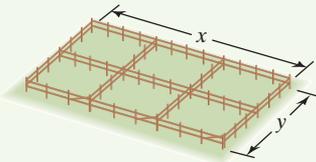

18.  $f(x) = 2x^2 + 12x + 703$

19. A quarterback tosses a football to a receiver 40 yards downfield. The height of the football,  $f(x)$ , in feet, can be modeled by

$$f(x) = -0.025x^2 + x + 6,$$

where  $x$  is the ball's horizontal distance, in yards, from the quarterback.

- What is the ball's maximum height and how far from the quarterback does this occur?
  - From what height did the quarterback toss the football?
  - If the football is not blocked by a defensive player nor caught by the receiver, how far down the field will it go before hitting the ground? Round to the nearest tenth of a yard.
  - Graph the function that models the football's parabolic path.
20. A field bordering a straight stream is to be enclosed. The side bordering the stream is not to be fenced. If 1000 yards of fencing material is to be used, what are the dimensions of the largest rectangular field that can be fenced? What is the maximum area?
21. Among all pairs of numbers whose difference is 14, find a pair whose product is as small as possible. What is the minimum product?
22. You have 1000 feet of fencing to construct six corrals, as shown in the figure. Find the dimensions that maximize the enclosed area. What is the maximum area?

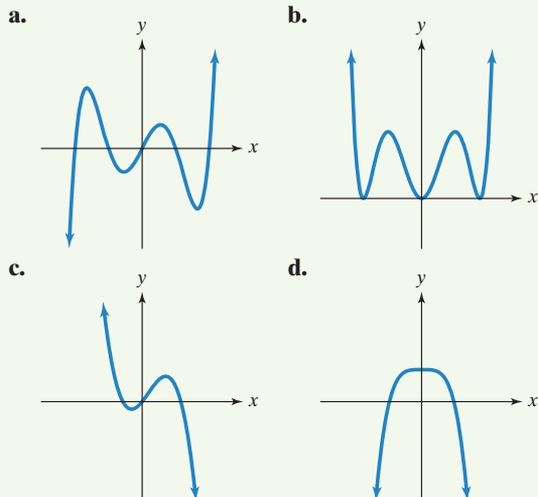

23. The annual yield per fruit tree is fairly constant at 150 pounds per tree when the number of trees per acre is 35 or fewer. For each additional tree over 35, the annual yield per tree for all trees on the acre decreases by 4 pounds due to overcrowding. How many fruit trees should be planted per acre to maximize the annual yield for the acre? What is the maximum number of pounds of fruit per acre?

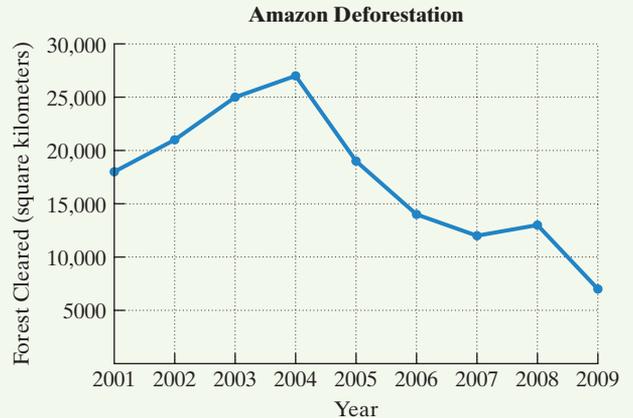

### 2.3

In Exercises 24–27, use the Leading Coefficient Test to determine the end behavior of the graph of the given polynomial function. Then use this end behavior to match the polynomial function with its graph. [The graphs are labeled (a) through (d).]

24.  $f(x) = -x^3 + x^2 + 2x$       25.  $f(x) = x^6 - 6x^4 + 9x^2$   
 26.  $f(x) = x^5 - 5x^3 + 4x$       27.  $f(x) = -x^4 + 1$

28. The Brazilian Amazon rain forest is the world's largest tropical rain forest, with some of the greatest biodiversity of any region. In 2009, the number of trees cut down in the Amazon dropped to its lowest level in 20 years. The line graph shows the number of square kilometers cleared from 2001 through 2009.

Source: Brazil's National Institute for Space Research

The data in the line graph can be modeled by the following third- and fourth-degree polynomial functions:

$$f(x) = 158x^3 - 2845x^2 + 12,926x + 7175$$

$$g(x) = -17x^4 + 508x^3 - 5180x^2 + 18,795x + 2889.$$

Amazon deforestation, in square kilometers,  $x$  years after 2000

- Use the Leading Coefficient Test to determine the end behavior to the right for the graph of  $f$ .
  - Assume that the rate at which the Amazon rain forest is being cut down continues to decline. Based on your answer to part (a), will  $f$  be useful in modeling Amazon deforestation over an extended period of time? Explain your answer.
  - Use the Leading Coefficient Test to determine the end behavior to the right for the graph of  $g$ .
  - Assume that the rate at which the Amazon rain forest is being cut down continues to decline. Based on your answer to part (c), will  $g$  be useful in modeling Amazon deforestation over an extended period of time? Explain your answer.
29. The polynomial function

$$f(x) = -0.87x^3 + 0.35x^2 + 81.62x + 7684.94$$

model the number of thefts,  $f(x)$ , in thousands in the United States  $x$  years after 1987. Will this function be useful in modeling the number of thefts over an extended period of time? Explain your answer.

In Exercises 30–31, find the zeros for each polynomial function and give the multiplicity of each zero. State whether the graph crosses the  $x$ -axis, or touches the  $x$ -axis and turns around, at each zero.

30.  $f(x) = -2(x - 1)(x + 2)^2(x + 5)^3$   
 31.  $f(x) = x^3 - 5x^2 - 25x + 125$   
 32. Show that  $f(x) = x^3 - 2x - 1$  has a real zero between 1 and 2.

In Exercises 33–38,

- a. Use the Leading Coefficient Test to determine the graph's end behavior.
- b. Determine whether the graph has y-axis symmetry, origin symmetry, or neither.
- c. Graph the function.

33.  $f(x) = x^3 - x^2 - 9x + 9$       34.  $f(x) = 4x - x^3$   
 35.  $f(x) = 2x^3 + 3x^2 - 8x - 12$       36.  $f(x) = -x^4 + 25x^2$   
 37.  $f(x) = -x^4 + 6x^3 - 9x^2$       38.  $f(x) = 3x^4 - 15x^3$

In Exercises 39–40, graph each polynomial function.

39.  $f(x) = 2x^2(x - 1)^3(x + 2)$   
 40.  $f(x) = -x^3(x + 4)^2(x - 1)$

### 2.4

In Exercises 41–43, divide using long division.

41.  $(4x^3 - 3x^2 - 2x + 1) \div (x + 1)$   
 42.  $(10x^3 - 26x^2 + 17x - 13) \div (5x - 3)$   
 43.  $(4x^4 + 6x^3 + 3x - 1) \div (2x^2 + 1)$

In Exercises 44–45, divide using synthetic division.

44.  $(3x^4 + 11x^3 - 20x^2 + 7x + 35) \div (x + 5)$   
 45.  $(3x^4 - 2x^2 - 10x) \div (x - 2)$   
 46. Given  $f(x) = 2x^3 - 7x^2 + 9x - 3$ , use the Remainder Theorem to find  $f(-13)$ .  
 47. Use synthetic division to divide  $f(x) = 2x^3 + x^2 - 13x + 6$  by  $x - 2$ . Use the result to find all zeros of  $f$ .  
 48. Solve the equation  $x^3 - 17x + 4 = 0$  given that 4 is a root.

### 2.5

In Exercises 49–50, use the Rational Zero Theorem to list all possible rational zeros for each given function.

49.  $f(x) = x^4 - 6x^3 + 14x^2 - 14x + 5$   
 50.  $f(x) = 3x^5 - 2x^4 - 15x^3 + 10x^2 + 12x - 8$

In Exercises 51–52, use Descartes's Rule of Signs to determine the possible number of positive and negative real zeros for each given function.

51.  $f(x) = 3x^4 - 2x^3 - 8x + 5$   
 52.  $f(x) = 2x^5 - 3x^3 - 5x^2 + 3x - 1$   
 53. Use Descartes's Rule of Signs to explain why  $2x^4 + 6x^2 + 8 = 0$  has no real roots.

For Exercises 54–60,

- a. List all possible rational roots or rational zeros.
- b. Use Descartes's Rule of Signs to determine the possible number of positive and negative real roots or real zeros.
- c. Use synthetic division to test the possible rational roots or zeros and find an actual root or zero.
- d. Use the quotient from part (c) to find all the remaining roots or zeros.

54.  $f(x) = x^3 + 3x^2 - 4$   
 55.  $f(x) = 6x^3 + x^2 - 4x + 1$   
 56.  $8x^3 - 36x^2 + 46x - 15 = 0$   
 57.  $2x^3 + 9x^2 - 7x + 1 = 0$   
 58.  $x^4 - x^3 - 7x^2 + x + 6 = 0$   
 59.  $4x^4 + 7x^2 - 2 = 0$   
 60.  $f(x) = 2x^4 + x^3 - 9x^2 - 4x + 4$

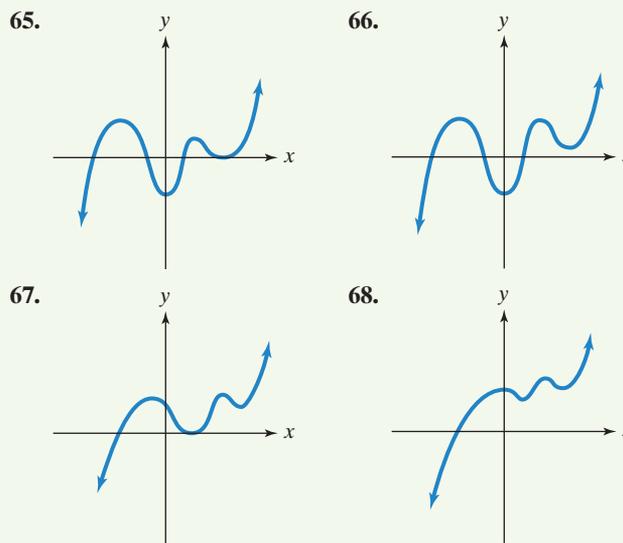

In Exercises 61–62, find an  $n$ th-degree polynomial function with real coefficients satisfying the given conditions. If you are using a graphing utility, graph the function and verify the real zeros and the given function value.

61.  $n = 3$ ; 2 and  $2 - 3i$  are zeros;  $f(1) = -10$   
 62.  $n = 4$ ;  $i$  is a zero;  $-3$  is a zero of multiplicity 2;  $f(-1) = 16$

In Exercises 63–64, find all the zeros of each polynomial function and write the polynomial as a product of linear factors.

63.  $f(x) = 2x^4 + 3x^3 + 3x - 2$   
 64.  $g(x) = x^4 - 6x^3 + x^2 + 24x + 16$

In Exercises 65–68, graphs of fifth-degree polynomial functions are shown. In each case, specify the number of real zeros and the number of imaginary zeros. Indicate whether there are any real zeros with multiplicity other than 1.

### 2.6

In Exercises 69–70, use transformations of  $f(x) = \frac{1}{x}$  or  $f(x) = \frac{1}{x^2}$  to graph each rational function.

69.  $g(x) = \frac{1}{(x + 2)^2} - 1$       70.  $h(x) = \frac{1}{x - 1} + 3$

In Exercises 71–78, find the vertical asymptotes, if any, the horizontal asymptote, if one exists, and the slant asymptote, if there is one, of the graph of each rational function. Then graph the rational function.

71.  $f(x) = \frac{2x}{x^2 - 9}$       72.  $g(x) = \frac{2x - 4}{x + 3}$   
 73.  $h(x) = \frac{x^2 - 3x - 4}{x^2 - x - 6}$       74.  $r(x) = \frac{x^2 + 4x + 3}{(x + 2)^2}$   
 75.  $y = \frac{x^2}{x + 1}$       76.  $y = \frac{x^2 + 2x - 3}{x - 3}$   
 77.  $f(x) = \frac{-2x^3}{x^2 + 1}$       78.  $g(x) = \frac{4x^2 - 16x + 16}{2x - 3}$

79. A company is planning to manufacture affordable graphing calculators. The fixed monthly cost will be \$50,000 and it will cost \$25 to produce each calculator.

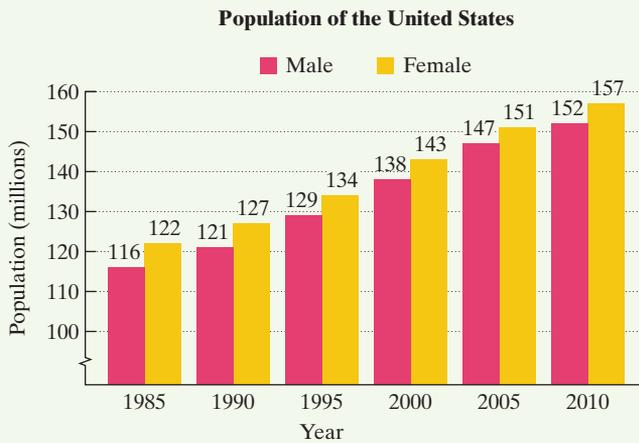

- a. Write the cost function,  $C$ , of producing  $x$  graphing calculators.
- b. Write the average cost function,  $\bar{C}$ , of producing  $x$  graphing calculators.

- c. Find and interpret  $\bar{C}(50)$ ,  $\bar{C}(100)$ ,  $\bar{C}(1000)$ , and  $\bar{C}(100,000)$ .
- d. What is the horizontal asymptote for the graph of this function and what does it represent?

Exercises 80–81 involve rational functions that model the given situations. In each case, find the horizontal asymptote as  $x \rightarrow \infty$  and then describe what this means in practical terms.

- 80.  $f(x) = \frac{150x + 120}{0.05x + 1}$ ; the number of bass,  $f(x)$ , after  $x$  months in a lake that was stocked with 120 bass
- 81.  $P(x) = \frac{72,900}{100x^2 + 729}$ ; the percentage,  $P(x)$ , of people in the United States with  $x$  years of education who are unemployed
- 82. The bar graph shows the population of the United States, in millions, for six selected years.

Source: U.S. Census Bureau

Here are two functions that model the data:

$$M(x) = 1.53x + 114.8$$

Male U.S. population,  $M(x)$ , in millions,  $x$  years after 1985

$$F(x) = 1.46x + 120.7$$

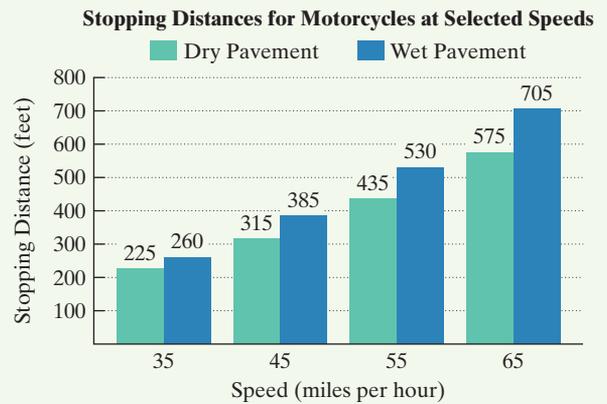

Female U.S. population,  $F(x)$ , in millions,  $x$  years after 1985

- a. Write a function that models the total U.S. population,  $P(x)$ , in millions,  $x$  years after 1985.
- b. Write a rational function that models the fraction of men in the U.S. population,  $R(x)$ ,  $x$  years after 1985.
- c. What is the equation of the horizontal asymptote associated with the function in part (b)? Round to two decimal places. What does this mean about the percentage of men in the U.S. population over time?
- 83. A jogger ran 4 miles and then walked 2 miles. The average velocity running was 3 miles per hour faster than the average velocity walking. Express the total time for running and walking,  $T$ , as a function of the average velocity walking,  $x$ .
- 84. The area of a rectangular floor is 1000 square feet. Express the perimeter of the floor,  $P$ , as a function of the width of the rectangle,  $x$ .

## 2.7

In Exercises 85–90, solve each inequality and graph the solution set on a real number line.

- 85.  $2x^2 + 5x - 3 < 0$
- 86.  $2x^2 + 9x + 4 \geq 0$
- 87.  $x^3 + 2x^2 > 3x$
- 88.  $\frac{x - 6}{x + 2} > 0$
- 89.  $\frac{(x + 1)(x - 2)}{x - 1} \geq 0$
- 90.  $\frac{x + 3}{x - 4} \leq 5$
- 91. The graph shows stopping distances for motorcycles at various speeds on dry roads and on wet roads.

Source: National Highway Traffic Safety Administration

The functions

$$f(x) = 0.125x^2 - 0.8x + 99$$

Dry pavement

and

Wet pavement

$$g(x) = 0.125x^2 + 2.3x + 27$$

model a motorcycle's stopping distance,  $f(x)$  or  $g(x)$ , in feet, traveling at  $x$  miles per hour. Function  $f$  models stopping distance on dry pavement and function  $g$  models stopping distance on wet pavement.

- a. Use function  $g$  to find the stopping distance on wet pavement for a motorcycle traveling at 35 miles per hour. Round to the nearest foot. Does your rounded answer overestimate or underestimate the stopping distance shown by the graph? By how many feet?
- b. Use function  $f$  to determine speeds on dry pavement requiring stopping distances that exceed 267 feet.
- 92. Use the position function

$$s(t) = -16t^2 + v_0t + s_0$$

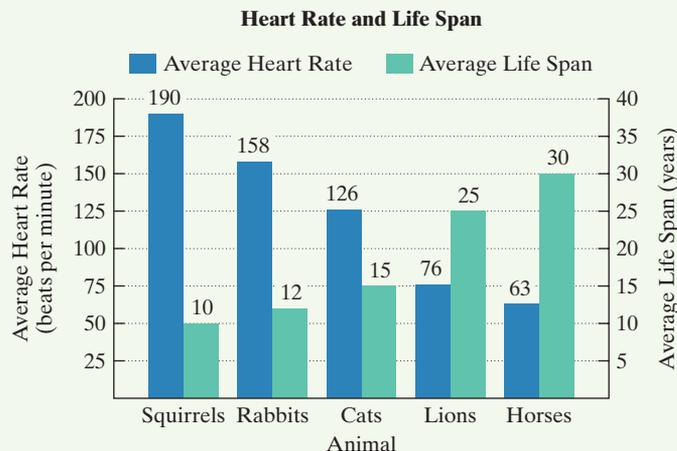

to solve this problem. A projectile is fired vertically upward from ground level with an initial velocity of 48 feet per second. During which time period will the projectile's height exceed 32 feet?

## 2.8

Solve the variation problems in Exercises 93–98.

93. Many areas of Northern California depend on the snowpack of the Sierra Nevada mountain range for their water supply. The volume of water produced from melting snow varies directly as the volume of snow. Meteorologists have determined that 250 cubic centimeters of snow will melt to 28 cubic centimeters of water. How much water does 1200 cubic centimeters of melting snow produce?
94. The distance that a body falls from rest is directly proportional to the square of the time of the fall. If skydivers fall 144 feet in 3 seconds, how far will they fall in 10 seconds?
95. The pitch of a musical tone varies inversely as its wavelength. A tone has a pitch of 660 vibrations per second and a wavelength of 1.6 feet. What is the pitch of a tone that has a wavelength of 2.4 feet?
96. The loudness of a stereo speaker, measured in decibels, varies inversely as the square of your distance from the speaker. When you are 8 feet from the speaker, the loudness is 28 decibels. What is the loudness when you are 4 feet from the speaker?
97. The time required to assemble computers varies directly as the number of computers assembled and inversely as the number of workers. If 30 computers can be assembled by 6 workers in 10 hours, how long would it take 5 workers to assemble 40 computers?
98. The volume of a pyramid varies jointly as its height and the area of its base. A pyramid with a height of 15 feet and a base with an area of 35 square feet has a volume of 175 cubic feet. Find the volume of a pyramid with a height of 20 feet and a base with an area of 120 square feet.

99. Heart rates and life spans of most mammals can be modeled using inverse variation. The bar graph shows the average heart rate and the average life span of five mammals.

Source: *The Handy Science Answer Book*, Visible Ink Press, 2003.

- A mammal's average life span,  $L$ , in years, varies inversely as its average heart rate,  $R$ , in beats per minute. Use the data shown for horses to write the equation that models this relationship.
- Is the inverse variation equation in part (a) an exact model or an approximate model for the data shown for lions?
- Elephants have an average heart rate of 27 beats per minute. Determine their average life span.

## CHAPTER 2 TEST

In Exercises 1–3, perform the indicated operations and write the result in standard form.

1.  $(6 - 7i)(2 + 5i)$       2.  $\frac{5}{2 - i}$

3.  $2\sqrt{-49} + 3\sqrt{-64}$

4. Solve and express solutions in standard form:  $x^2 = 4x - 8$ .

In Exercises 5–6, use the vertex and intercepts to sketch the graph of each quadratic function. Give the equation for the parabola's axis of symmetry. Use the graph to determine the function's domain and range.

5.  $f(x) = (x + 1)^2 + 4$

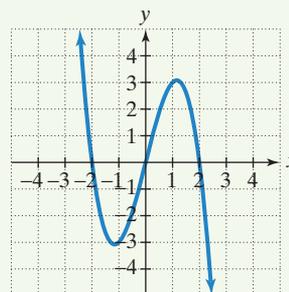

6.  $f(x) = x^2 - 2x - 3$

7. Determine, without graphing, whether the quadratic function  $f(x) = -2x^2 + 12x - 16$  has a minimum value or a maximum value. Then find

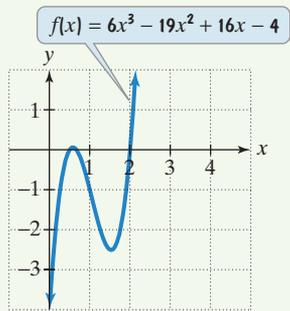

- the minimum or maximum value and where it occurs.
- the function's domain and its range.

8. The function  $f(x) = -x^2 + 46x - 360$  models the daily profit,  $f(x)$ , in hundreds of dollars, for a company that manufactures  $x$  computers daily. How many computers should be manufactured each day to maximize profit? What is the maximum daily profit?

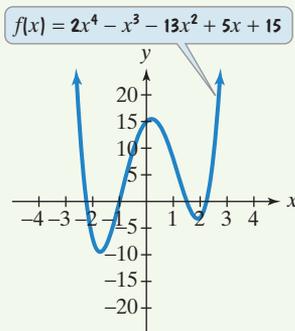

- Among all pairs of numbers whose sum is 14, find a pair whose product is as large as possible. What is the maximum product?
- Consider the function  $f(x) = x^3 - 5x^2 - 4x + 20$ .
  - Use factoring to find all zeros of  $f$ .
  - Use the Leading Coefficient Test and the zeros of  $f$  to graph the function.
- Use end behavior to explain why the following graph cannot be the graph of  $f(x) = x^5 - x$ . Then use intercepts to explain why the graph cannot represent  $f(x) = x^5 - x$ .

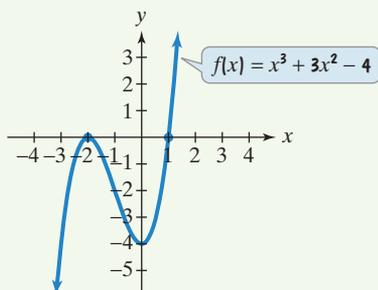

12. The graph of  $f(x) = 6x^3 - 19x^2 + 16x - 4$  is shown in the figure.

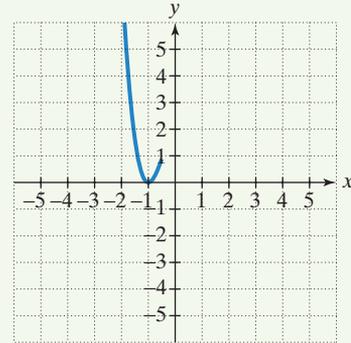

- a. Based on the graph of  $f$ , find the root of the equation  $6x^3 - 19x^2 + 16x - 4 = 0$  that is an integer.
- b. Use synthetic division to find the other two roots of  $6x^3 - 19x^2 + 16x - 4 = 0$ .
13. Use the Rational Zero Theorem to list all possible rational zeros of  $f(x) = 2x^3 + 11x^2 - 7x - 6$ .
14. Use Descartes's Rule of Signs to determine the possible number of positive and negative real zeros of  $f(x) = 3x^5 - 2x^4 - 2x^2 + x - 1$ .
15. Solve:  $x^3 + 9x^2 + 16x - 6 = 0$ .
16. Consider the function whose equation is given by  $f(x) = 2x^4 - x^3 - 13x^2 + 5x + 15$ .
- a. List all possible rational zeros.
- b. Use the graph of  $f$  in the figure shown and synthetic division to find all zeros of the function.

17. Use the graph of  $f(x) = x^3 + 3x^2 - 4$  in the figure shown to factor  $x^3 + 3x^2 - 4$ .

18. Find a fourth-degree polynomial function  $f(x)$  with real coefficients that has  $-1$ ,  $1$ , and  $i$  as zeros and such that  $f(3) = 160$ .
19. The figure shows an incomplete graph of  $f(x) = -3x^3 - 4x^2 + x + 2$ . Find all the zeros of the function. Then draw a complete graph.

In Exercises 20–25, find the domain of each rational function and graph the function.

20.  $f(x) = \frac{1}{(x+3)^2}$

21.  $f(x) = \frac{1}{x-1} + 2$

22.  $f(x) = \frac{x}{x^2 - 16}$

23.  $f(x) = \frac{x^2 - 9}{x - 2}$

24.  $f(x) = \frac{x+1}{x^2 + 2x - 3}$

25.  $f(x) = \frac{4x^2}{x^2 + 3}$

26. A company is planning to manufacture portable satellite radio players. The fixed monthly cost will be \$300,000 and it will cost \$10 to produce each player.

- a. Write the average cost function,  $\bar{C}$ , of producing  $x$  players.
- b. What is the horizontal asymptote for the graph of this function and what does it represent?

Solve each inequality in Exercises 27–28 and graph the solution set on a real number line. Express each solution set in interval notation.

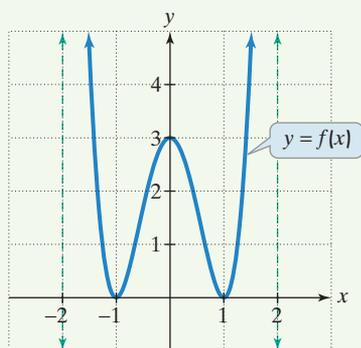

27.  $x^2 < x + 12$

28.  $\frac{2x+1}{x-3} \leq 3$

29. The intensity of light received at a source varies inversely as the square of the distance from the source. A particular light has an intensity of 20 foot-candles at 15 feet. What is the light's intensity at 10 feet?

## CUMULATIVE REVIEW EXERCISES (CHAPTERS P-2)

Use the graph of  $y = f(x)$  to solve Exercises 1–6.

- Find the domain and the range of  $f$ .
- Find the zeros and the least possible multiplicity of each zero.
- Where does the relative maximum occur?
- Find  $(f \circ f)(-1)$ .
- Use arrow notation to complete this statement:  $f(x) \rightarrow \infty$  as \_\_\_\_\_ or as \_\_\_\_\_.
- Graph  $g(x) = f(x + 2) + 1$ .

In Exercises 7–12, solve each equation or inequality.

- $|2x - 1| = 3$
- $3x^2 - 5x + 1 = 0$
- $9 + \frac{3}{x} = \frac{2}{x^2}$
- $x^3 + 2x^2 - 5x - 6 = 0$
- $|2x - 5| > 3$
- $3x^2 > 2x + 5$

In Exercises 13–18, graph each equation in a rectangular coordinate system. If two functions are given, graph both in the same system.

- $f(x) = x^3 - 4x^2 - x + 4$
- $f(x) = x^2 + 2x - 8$
- $f(x) = x^2(x - 3)$
- $f(x) = \frac{x - 1}{x - 2}$
- $f(x) = |x|$  and  $g(x) = -|x| - 1$
- $x^2 + y^2 - 2x + 4y - 4 = 0$

In Exercises 19–20, let  $f(x) = 2x^2 - x - 1$  and  $g(x) = 4x - 1$ .

- Find  $(f \circ g)(x)$ .
- Find  $\frac{f(x + h) - f(x)}{h}$ .

# EXPONENTIAL AND LOGARITHMIC FUNCTIONS

## CHAPTER

# 3

*Can I put aside \$25,000 when I'm 20*

and wind up sitting on half a million dollars by my early fifties? Will population growth lead to a future without comfort or individual choice? Why did I feel I was walking too slowly on my visit to New York City? Are Californians at greater risk from drunk drivers than from earthquakes?

What is the difference between earthquakes measuring 6 and 7 on the Richter scale? Can I live forever?

And what can possibly be causing merchants at our local shopping mall to grin from ear to ear as they watch the browsers?

The functions that you will be learning about in this chapter will provide you with the mathematics for answering these questions.

You will see how these remarkable functions enable us to predict the future and rediscover the past.

### HERE'S WHERE YOU'LL FIND THESE APPLICATIONS:

- You'll be sitting on \$500,000 in Example 10 of Section 3.4.
- World population growth: Section 3.5, Example 6
- Population and walking speed: Section 3.5, Check Point 5
- Alcohol and risk of a car accident: Section 3.4, Example 9
- Earthquake intensity: Section 3.2, Example 9
- Immortality: Blitzer Bonus, page 418

We open the chapter with those grinning merchants and the sound of ka-ching!

## SECTION 3.1

## Exponential Functions

## Objectives

- 1 Evaluate exponential functions.
- 2 Graph exponential functions.
- 3 Evaluate functions with base  $e$ .
- 4 Use compound interest formulas.

Just browsing? Take your time. Researchers know, to the dollar, the average amount the typical consumer spends per minute at the shopping mall. And the longer you stay, the more you spend. So if you say you're just browsing, that's just fine with the mall merchants. Browsing is time and, as shown in **Figure 3.1**, time is money.

The data in **Figure 3.1** can be modeled by the function

$$f(x) = 42.2(1.56)^x,$$

where  $f(x)$  is the average amount spent, in dollars, at a shopping mall after  $x$  hours. Can you see how this function is different

from a polynomial function? The variable  $x$  is in the exponent. Functions whose equations contain a variable in the exponent are called **exponential functions**. Many real-life situations, including population growth, growth of epidemics, radioactive decay, and other changes that involve rapid increase or decrease, can be described using exponential functions.

Mall Browsing Time and Average Amount Spent

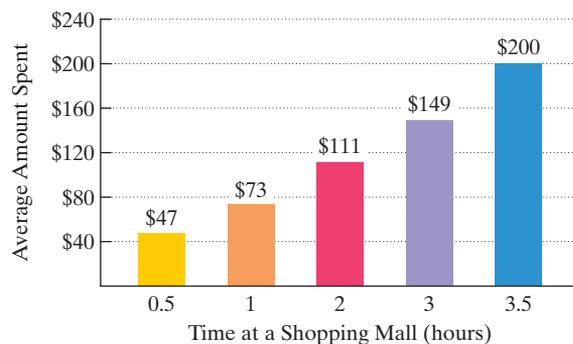

FIGURE 3.1

Source: International Council of Shopping Centers Research, 2006

## Definition of the Exponential Function

The **exponential function  $f$  with base  $b$**  is defined by

$$f(x) = b^x \quad \text{or} \quad y = b^x,$$

where  $b$  is a positive constant other than 1 ( $b > 0$  and  $b \neq 1$ ) and  $x$  is any real number.

Here are some examples of exponential functions:

$$f(x) = 2^x$$

Base is 2.

$$g(x) = 10^x$$

Base is 10.

$$h(x) = 3^{x+1}$$

Base is 3.

$$j(x) = \left(\frac{1}{2}\right)^{x-1}$$

Base is  $\frac{1}{2}$ .

Each of these functions has a constant base and a variable exponent.

By contrast, the following functions are not exponential functions:

$$F(x) = x^2$$

Variable is the base and not the exponent.

$$G(x) = 1^x$$

The base of an exponential function must be a positive constant other than 1.

$$H(x) = (-1)^x$$

The base of an exponential function must be positive.

$$J(x) = x^x.$$

Variable is both the base and the exponent.

Why is  $G(x) = 1^x$  not classified as an exponential function? The number 1 raised to any power is 1. Thus, the function  $G$  can be written as  $G(x) = 1$ , which is a constant function.

Why is  $H(x) = (-1)^x$  not an exponential function? The base of an exponential function must be positive to avoid having to exclude many values of  $x$  from the domain that result in nonreal numbers in the range:

$$H(x) = (-1)^x \quad H\left(\frac{1}{2}\right) = (-1)^{\frac{1}{2}} = \sqrt{-1} = i.$$

Not an exponential function

All values of  $x$  resulting in even roots of negative numbers produce nonreal numbers.

## 1 Evaluate exponential functions.

You will need a calculator to evaluate exponential expressions. Most scientific calculators have a  $y^x$  key. Graphing calculators have a  $\wedge$  key. To evaluate expressions of the form  $b^x$ , enter the base  $b$ , press  $y^x$  or  $\wedge$ , enter the exponent  $x$ , and finally press  $=$  or  $\text{ENTER}$ .

### EXAMPLE 1 Evaluating an Exponential Function

The exponential function  $f(x) = 42.2(1.56)^x$  models the average amount spent,  $f(x)$ , in dollars, at a shopping mall after  $x$  hours. What is the average amount spent, to the nearest dollar, after four hours?

#### SOLUTION

Because we are interested in the amount spent after four hours, substitute 4 for  $x$  and evaluate the function.

$$f(x) = 42.2(1.56)^x \quad \text{This is the given function.}$$

$$f(4) = 42.2(1.56)^4 \quad \text{Substitute 4 for } x.$$

Use a scientific or graphing calculator to evaluate  $f(4)$ . Press the following keys on your calculator to do this:

$$\text{Scientific calculator: } 42.2 \times 1.56 y^x 4 =$$

$$\text{Graphing calculator: } 42.2 \times 1.56 \wedge 4 \text{ ENTER}$$

The display should be approximately 249.925666.

$$f(4) = 42.2(1.56)^4 \approx 249.92566 \approx 250$$

Thus, the average amount spent after four hours at a mall is \$250. ...

**Check Point 1** Use the exponential function in Example 1 to find the average amount spent, to the nearest dollar, after three hours at a shopping mall. Does this rounded function value underestimate or overestimate the amount shown in **Figure 3.1**? By how much?

### Graphing Exponential Functions

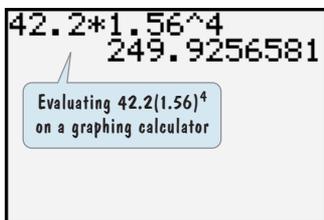

We are familiar with expressions involving  $b^x$ , where  $x$  is a rational number. For example,

$$b^{1.7} = b^{\frac{17}{10}} = \sqrt[10]{b^{17}} \quad \text{and} \quad b^{1.73} = b^{\frac{173}{100}} = \sqrt[100]{b^{173}}.$$

However, note that the definition of  $f(x) = b^x$  includes all real numbers for the domain  $x$ . You may wonder what  $b^x$  means when  $x$  is an irrational number, such as  $b^{\sqrt{3}}$  or  $b^\pi$ . Using closer and closer approximations for  $\sqrt{3}$  ( $\sqrt{3} \approx 1.73205$ ), we can think of  $b^{\sqrt{3}}$  as the value that has the successively closer approximations

$$b^{1.7}, b^{1.73}, b^{1.732}, b^{1.73205}, \dots$$

In this way, we can graph exponential functions with no holes, or points of discontinuity, at the irrational domain values.

## 2 Graph exponential functions.

**EXAMPLE 2** Graphing an Exponential Function

 Graph:  $f(x) = 2^x$ .

**SOLUTION**

We begin by setting up a table of coordinates.

$x$	$f(x) = 2^x$
-3	$f(-3) = 2^{-3} = \frac{1}{8}$
-2	$f(-2) = 2^{-2} = \frac{1}{4}$
-1	$f(-1) = 2^{-1} = \frac{1}{2}$
0	$f(0) = 2^0 = 1$
1	$f(1) = 2^1 = 2$
2	$f(2) = 2^2 = 4$
3	$f(3) = 2^3 = 8$

We selected integers from  $-3$  to  $3$ , inclusive, to include three negative numbers,  $0$ , and three positive numbers. We also wanted to keep the resulting computations for  $y$  relatively simple.

**FIGURE 3.2** The graph of  $f(x) = 2^x$ 

We plot these points, connecting them with a continuous curve. **Figure 3.2** shows the graph of  $f(x) = 2^x$ . Observe that the graph approaches, but never touches, the negative portion of the  $x$ -axis. Thus, the  $x$ -axis, or  $y = 0$ , is a horizontal asymptote. The range is the set of all positive real numbers. Although we used integers for  $x$  in our table of coordinates, you can use a calculator to find additional points. For example,  $f(0.3) = 2^{0.3} \approx 1.231$  and  $f(0.95) = 2^{0.95} \approx 1.932$ . The points  $(0.3, 1.231)$  and  $(0.95, 1.932)$  approximately fit the graph. ...

**Check Point 2** Graph:  $f(x) = 3^x$ .

**EXAMPLE 3** Graphing an Exponential Function

 Graph:  $g(x) = \left(\frac{1}{2}\right)^x$ .

**SOLUTION**

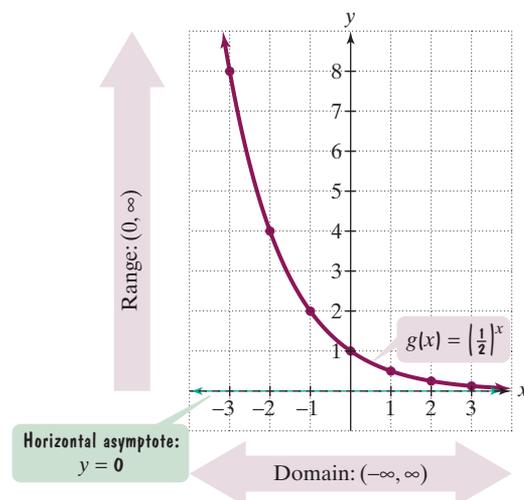

We begin by setting up a table of coordinates. We compute the function values by noting that

$$g(x) = \left(\frac{1}{2}\right)^x = (2^{-1})^x = 2^{-x}.$$

We plot these points, connecting them with a continuous curve.

**Figure 3.3** shows the graph of  $g(x) = \left(\frac{1}{2}\right)^x$ . This time the graph approaches, but never touches, the *positive* portion of the  $x$ -axis. Once again, the  $x$ -axis, or  $y = 0$ , is a horizontal asymptote. The range consists of all positive real numbers. ...

$x$	$g(x) = \left(\frac{1}{2}\right)^x$ or $2^{-x}$
-3	$g(-3) = 2^{-(-3)} = 2^3 = 8$
-2	$g(-2) = 2^{-(-2)} = 2^2 = 4$
-1	$g(-1) = 2^{-(-1)} = 2^1 = 2$
0	$g(0) = 2^{-0} = 1$
1	$g(1) = 2^{-1} = \frac{1}{2^1} = \frac{1}{2}$
2	$g(2) = 2^{-2} = \frac{1}{2^2} = \frac{1}{4}$
3	$g(3) = 2^{-3} = \frac{1}{2^3} = \frac{1}{8}$

**FIGURE 3.3** The graph of  $g(x) = \left(\frac{1}{2}\right)^x$

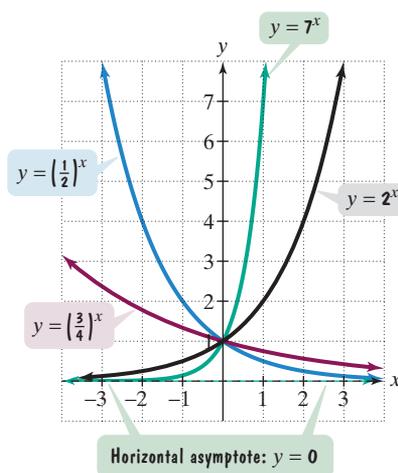

Do you notice a relationship between the graphs of  $f(x) = 2^x$  and  $g(x) = \left(\frac{1}{2}\right)^x$  in **Figures 3.2** and **3.3**? The graph of  $g(x) = \left(\frac{1}{2}\right)^x$  is the graph of  $f(x) = 2^x$  reflected about the  $y$ -axis:

$$g(x) = \left(\frac{1}{2}\right)^x = 2^{-x} = f(-x).$$

Recall that the graph of  $y = f(-x)$  is the graph of  $y = f(x)$  reflected about the  $y$ -axis.

 **Check Point 3** Graph:  $f(x) = \left(\frac{1}{3}\right)^x$ . Note that  $f(x) = \left(\frac{1}{3}\right)^x = (3^{-1})^x = 3^{-x}$ .

Four exponential functions have been graphed in **Figure 3.4**. Compare the black and green graphs, where  $b > 1$ , to those in blue and red, where  $b < 1$ . When  $b > 1$ , the value of  $y$  increases as the value of  $x$  increases. When  $b < 1$ , the value of  $y$  decreases as the value of  $x$  increases. Notice that all four graphs pass through  $(0, 1)$ .

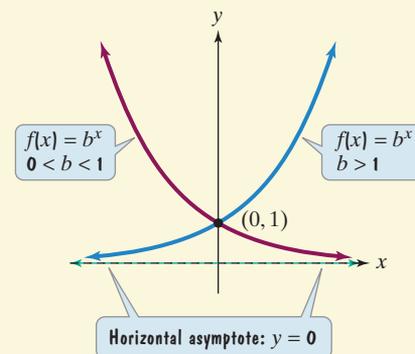

**FIGURE 3.4** Graphs of four exponential functions

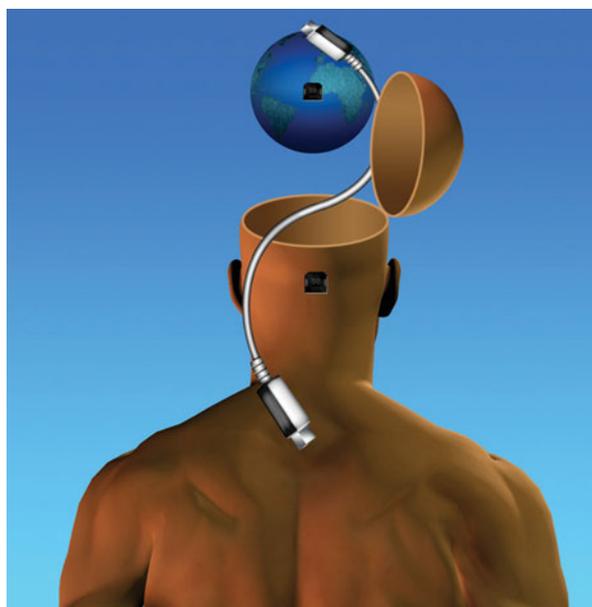

These graphs illustrate the following general characteristics of exponential functions:

#### Characteristics of Exponential Functions of the Form $f(x) = b^x$

1. The domain of  $f(x) = b^x$  consists of all real numbers:  $(-\infty, \infty)$ . The range of  $f(x) = b^x$  consists of all positive real numbers:  $(0, \infty)$ .
2. The graphs of all exponential functions of the form  $f(x) = b^x$  pass through the point  $(0, 1)$  because  $f(0) = b^0 = 1$  ( $b \neq 0$ ). The  $y$ -intercept is 1. There is no  $x$ -intercept.
3. If  $b > 1$ ,  $f(x) = b^x$  has a graph that goes up to the right and is an increasing function. The greater the value of  $b$ , the steeper the increase.
4. If  $0 < b < 1$ ,  $f(x) = b^x$  has a graph that goes down to the right and is a decreasing function. The smaller the value of  $b$ , the steeper the decrease.
5.  $f(x) = b^x$  is one-to-one and has an inverse that is a function.
6. The graph of  $f(x) = b^x$  approaches, but does not touch, the  $x$ -axis. The  $x$ -axis, or  $y = 0$ , is a horizontal asymptote.

## Blitzer Bonus || Exponential Growth: The Year Humans Become Immortal

In 2011, *Jeopardy!* aired a three-night match between a personable computer named Watson and the show's two most successful players. The winner: Watson. In the time it took each human contestant to respond to one trivia question, Watson was able to scan the content of one million books. It was also trained to understand the puns and twists of phrases unique to *Jeopardy!* clues.

Watson's remarkable accomplishments can be thought of as a single data point on an exponential curve that models growth in computing power. According to inventor, author, and computer scientist Ray Kurzweil (1948– ), computer technology is progressing exponentially, doubling in power each year. What does this mean in terms of the accelerating pace of the graph of  $y = 2^x$  that starts slowly and then rockets skyward toward infinity? According to Kurzweil, by 2023, a supercomputer will surpass the brainpower of a human. As progress accelerates exponentially and every hour brings a century's worth of scientific breakthroughs, by 2045, computers will surpass the brainpower equivalent to that of all human brains combined. Here's where it gets exponentially weird: In that year (says Kurzweil), we will be able to scan our consciousness into computers and enter a virtual existence, or swap our bodies for immortal robots. Indefinite life extension will become a reality and people will die only if they choose to.

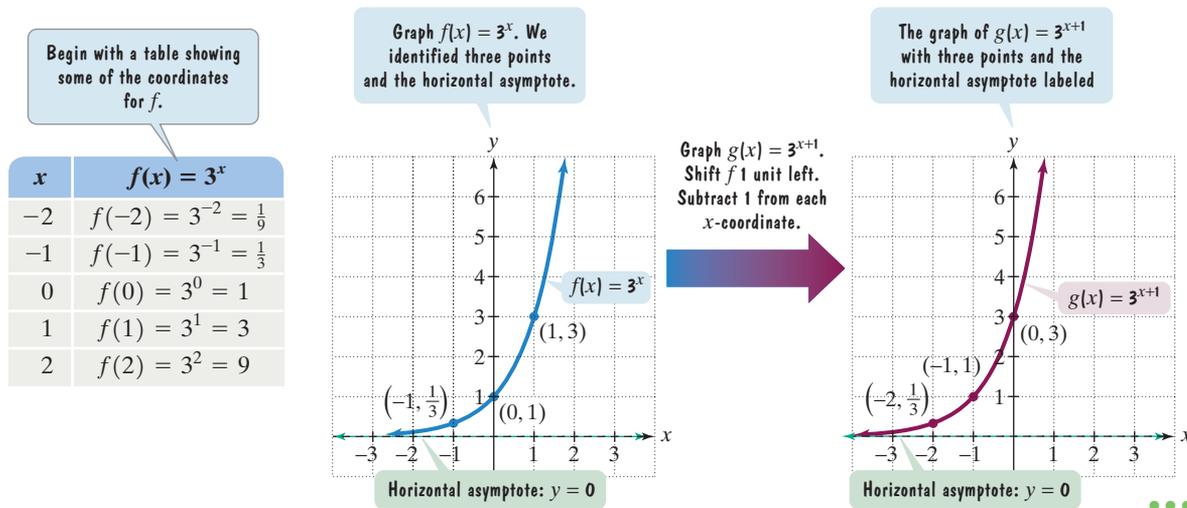

### Transformations of Exponential Functions

The graphs of exponential functions can be translated vertically or horizontally, reflected, stretched, or shrunk. These transformations are summarized in **Table 3.1**.

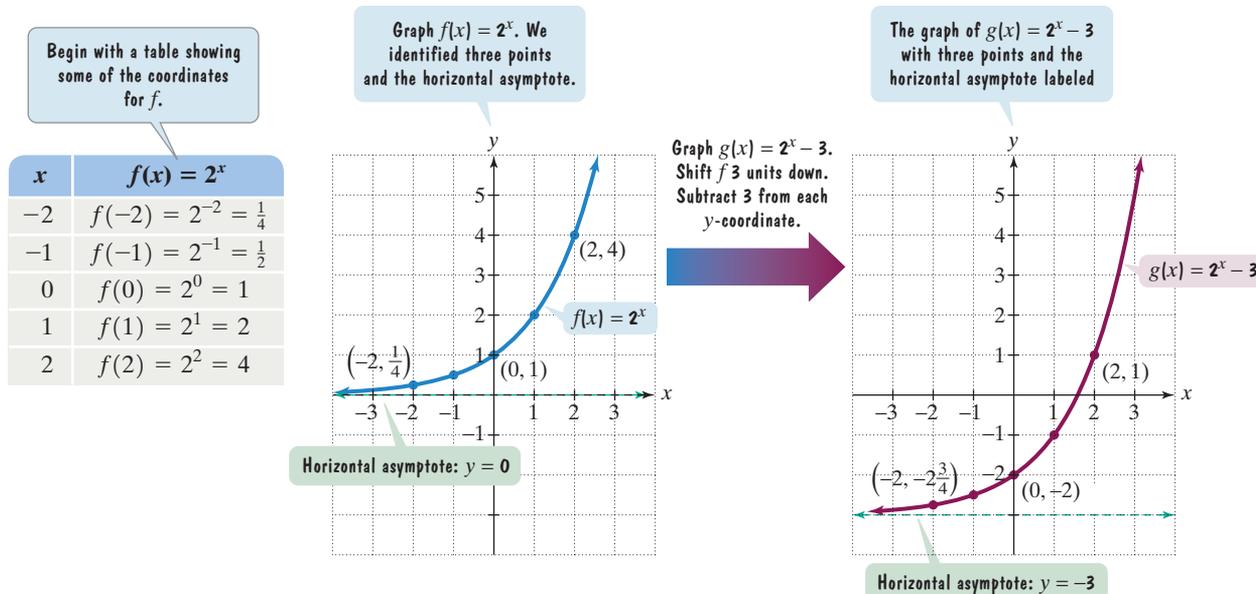

**Table 3.1** Transformations Involving Exponential Functions

In each case,  $c$  represents a positive real number.

Transformation	Equation	Description
Vertical translation	$g(x) = b^x + c$ $g(x) = b^x - c$	<ul style="list-style-type: none"> <li>Shifts the graph of <math>f(x) = b^x</math> upward <math>c</math> units.</li> <li>Shifts the graph of <math>f(x) = b^x</math> downward <math>c</math> units.</li> </ul>
Horizontal translation	$g(x) = b^{x+c}$ $g(x) = b^{x-c}$	<ul style="list-style-type: none"> <li>Shifts the graph of <math>f(x) = b^x</math> to the left <math>c</math> units.</li> <li>Shifts the graph of <math>f(x) = b^x</math> to the right <math>c</math> units.</li> </ul>
Reflection	$g(x) = -b^x$ $g(x) = b^{-x}$	<ul style="list-style-type: none"> <li>Reflects the graph of <math>f(x) = b^x</math> about the <math>x</math>-axis.</li> <li>Reflects the graph of <math>f(x) = b^x</math> about the <math>y</math>-axis.</li> </ul>
Vertical stretching or shrinking	$g(x) = cb^x$	<ul style="list-style-type: none"> <li>Vertically stretches the graph of <math>f(x) = b^x</math> if <math>c &gt; 1</math>.</li> <li>Vertically shrinks the graph of <math>f(x) = b^x</math> if <math>0 &lt; c &lt; 1</math>.</li> </ul>
Horizontal stretching or shrinking	$g(x) = b^{cx}$	<ul style="list-style-type: none"> <li>Horizontally shrinks the graph of <math>f(x) = b^x</math> if <math>c &gt; 1</math>.</li> <li>Horizontally stretches the graph of <math>f(x) = b^x</math> if <math>0 &lt; c &lt; 1</math>.</li> </ul>

**EXAMPLE 4** Transformations Involving Exponential FunctionsUse the graph of  $f(x) = 3^x$  to obtain the graph of  $g(x) = 3^{x+1}$ .**SOLUTION**The graph of  $g(x) = 3^{x+1}$  is the graph of  $f(x) = 3^x$  shifted 1 unit to the left.**Check Point 4** Use the graph of  $f(x) = 3^x$  to obtain the graph of  $g(x) = 3^{x-1}$ .

If an exponential function is translated upward or downward, the horizontal asymptote is shifted by the amount of the vertical shift.

**EXAMPLE 5** Transformations Involving Exponential FunctionsUse the graph of  $f(x) = 2^x$  to obtain the graph of  $g(x) = 2^x - 3$ .**SOLUTION**The graph of  $g(x) = 2^x - 3$  is the graph of  $f(x) = 2^x$  shifted down 3 units.**Check Point 5** Use the graph of  $f(x) = 2^x$  to obtain the graph of  $g(x) = 2^x + 1$ .

3 Evaluate functions with base  $e$ .

**TECHNOLOGY**

**Graphic Connections**

As  $n \rightarrow \infty$ , the graph of  $y = \left(1 + \frac{1}{n}\right)^n$  approaches the graph of  $y = e$ .

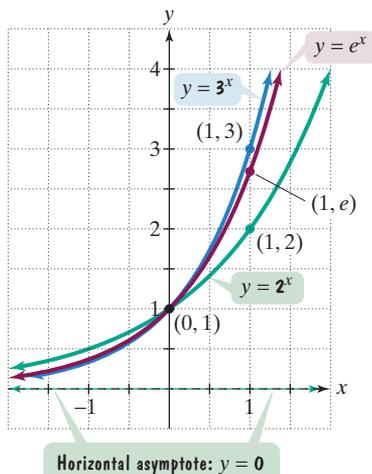

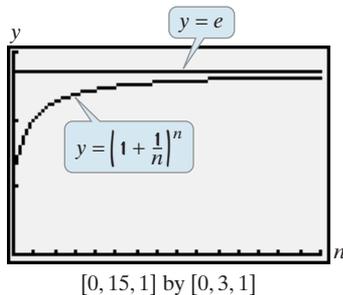

FIGURE 3.5 Graphs of three exponential functions

**The Natural Base  $e$**

An irrational number, symbolized by the letter  $e$ , appears as the base in many applied exponential functions. The number  $e$  is defined as the value that  $\left(1 + \frac{1}{n}\right)^n$  approaches as  $n$  gets larger and larger. **Table 3.2** shows values of  $\left(1 + \frac{1}{n}\right)^n$  for increasingly large values of  $n$ . As  $n \rightarrow \infty$ , the approximate value of  $e$  to nine decimal places is

$$e \approx 2.718281827.$$

The irrational number  $e$ , approximately 2.72, is called the **natural base**. The function  $f(x) = e^x$  is called the **natural exponential function**.

Use a scientific or graphing calculator with an  $e^x$  key to evaluate  $e$  to various powers. For example, to find  $e^2$ , press the following keys on most calculators:

Scientific calculator:  $2 \left[ e^x \right]$

Graphing calculator:  $\left[ e^x \right] 2 \left[ \text{ENTER} \right]$ .

The display should be approximately 7.389.

$$e^2 \approx 7.389$$

The number  $e$  lies between 2 and 3. Because  $2^2 = 4$  and  $3^2 = 9$ , it makes sense that  $e^2$ , approximately 7.389, lies between 4 and 9.

Because  $2 < e < 3$ , the graph of  $y = e^x$  is between the graphs of  $y = 2^x$  and  $y = 3^x$ , shown in **Figure 3.5**.

Table 3.2

$n$	$\left(1 + \frac{1}{n}\right)^n$
1	2
2	2.25
5	2.48832
10	2.59374246
100	2.704813829
1000	2.716923932
10,000	2.718145927
100,000	2.718268237
1,000,000	2.718280469
1,000,000,000	2.718281827
As $n \rightarrow \infty$ , $\left(1 + \frac{1}{n}\right)^n \rightarrow e$ .	

In calculus, this is expressed as  $\lim_{n \rightarrow \infty} \left(1 + \frac{1}{n}\right)^n = e$ .

**EXAMPLE 6 Gray Wolf Population**

Insatiable killer. That's the reputation the gray wolf acquired in the United States in the nineteenth and early twentieth centuries. Although the label was undeserved, an estimated two million wolves were shot, trapped, or poisoned. By 1960, the population was reduced to 800 wolves. **Figure 3.6** shows the rebounding population in two recovery areas after the gray wolf was declared an endangered species and received federal protection. The exponential function

Gray Wolf Population in Two Recovery Areas for Selected Years

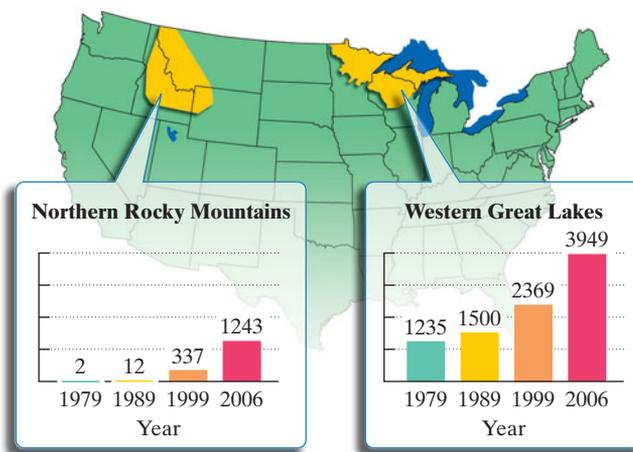

FIGURE 3.6 Source: U.S. Fish and Wildlife Service

$$f(x) = 1.26e^{0.247x}$$

models the gray wolf population of the Northern Rocky Mountains,  $f(x)$ ,  $x$  years after 1978. If the wolf is not removed from the endangered species list and trends shown in **Figure 3.6** continue, project its population in the recovery area in 2010.

### SOLUTION

Because 2010 is 32 years after 1978, we substitute 32 for  $x$  in the given function.

$$f(x) = 1.26e^{0.247x} \quad \text{This is the given function.}$$

$$f(32) = 1.26e^{0.247(32)} \quad \text{Substitute 32 for } x.$$

Perform this computation on your calculator.

Scientific calculator:  $1.26 \times ( .247 \times 32 ) e^x =$

Graphing calculator:  $1.26 \times e^x ( .247 \times 32 ) \text{ ENTER}$

The display should be approximately 3412.1973.

Thus,  $f(32) = 1.26e^{0.247(32)} \approx 3412.$

This parenthesis is given on some calculators.

This indicates that the gray wolf population of the Northern Rocky Mountains in the year 2010 is projected to have been 3412. ●●●

**Check Point 6** The exponential function  $f(x) = 1066e^{0.042x}$  models the gray wolf population of the Western Great Lakes,  $f(x)$ ,  $x$  years after 1978. If trends shown in **Figure 3.6** continue, project the gray wolf's population in the recovery area in 2012.

In 2008, using exponential functions and projections like those in Example 6 and Check Point 6, the U.S. Fish and Wildlife Service removed the gray wolf from the endangered species list, a ruling environmentalists vowed to appeal.

## 4 Use compound interest formulas.

### Compound Interest

We all want a wonderful life with fulfilling work, good health, and loving relationships. And let's be honest: Financial security wouldn't hurt! Achieving this goal depends on understanding how money in savings accounts grows in remarkable ways as a result of *compound interest*. **Compound interest** is interest computed on your original investment as well as on any accumulated interest.

Suppose a sum of money, called the **principal**,  $P$ , is invested at an annual percentage rate  $r$ , in decimal form, compounded once per year. Because the interest is added to the principal at year's end, the accumulated value,  $A$ , is

$$A = P + Pr = P(1 + r).$$

The accumulated amount of money follows this pattern of multiplying the previous principal by  $(1 + r)$  for each successive year, as indicated in **Table 3.3**.

Table 3.3

Time in Years	Accumulated Value after Each Compounding
0	$A = P$
1	$A = P(1 + r)$
2	$A = P(1 + r)(1 + r) = P(1 + r)^2$
3	$A = P(1 + r)^2(1 + r) = P(1 + r)^3$
4	$A = P(1 + r)^3(1 + r) = P(1 + r)^4$
⋮	⋮
$t$	$A = P(1 + r)^t$

This formula gives the balance,  $A$ , that a principal,  $P$ , is worth after  $t$  years at interest rate  $r$ , compounded once a year.

Most savings institutions have plans in which interest is paid more than once a year. If compound interest is paid twice a year, the compounding period is six months. We say that the interest is **compounded semiannually**. When compound interest is paid four times a year, the compounding period is three months and the interest is said to be **compounded quarterly**. Some plans allow for monthly compounding or daily compounding.

In general, when compound interest is paid  $n$  times a year, we say that there are  **$n$  compounding periods per year**. Table 3.4 shows the three most frequently used plans in which interest is paid more than once a year.

Table 3.4 Interest Plans

Name	Number of Compounding Periods per Year	Length of Each Compounding Period
Semiannual Compounding	$n = 2$	6 months
Quarterly Compounding	$n = 4$	3 months
Monthly Compounding	$n = 12$	1 month

The formula  $A = P(1 + r)^t$  can be adjusted to take into account the number of compounding periods in a year. If there are  $n$  compounding periods per year, in each time period the interest rate is  $\frac{r}{n}$  and there are  $nt$  time periods in  $t$  years. This results in the following formula for the balance,  $A$ , after  $t$  years:

$$A = P\left(1 + \frac{r}{n}\right)^{nt}.$$

Some banks use **continuous compounding**, where the number of compounding periods increases infinitely (compounding interest every trillionth of a second, every quadrillionth of a second, etc.). Let's see what happens to the balance,  $A$ , as  $n \rightarrow \infty$ .

$$A = P\left(1 + \frac{r}{n}\right)^{nt} = P\left[\left(1 + \frac{1}{\frac{n}{r}}\right)^{\frac{n}{r} \cdot rt}\right] = P\left[\left(1 + \frac{1}{h}\right)^h\right]^{rt} = Pe^{rt}$$

$\frac{n}{r} \cdot rt = nt$   
 Let  $h = \frac{n}{r}$ .  
 As  $n \rightarrow \infty$ ,  $h \rightarrow \infty$ .  
 As  $h \rightarrow \infty$ , by definition  $\left(1 + \frac{1}{h}\right)^h \rightarrow e$ .

We see that the formula for continuous compounding is  $A = Pe^{rt}$ . Although continuous compounding sounds terrific, it yields only a fraction of a percent more interest over a year than daily compounding.

### Formulas for Compound Interest

After  $t$  years, the balance,  $A$ , in an account with principal  $P$  and annual interest rate  $r$  (in decimal form) is given by the following formulas:

1. For  $n$  compounding periods per year:  $A = P\left(1 + \frac{r}{n}\right)^{nt}$
2. For continuous compounding:  $A = Pe^{rt}$ .

### EXAMPLE 7 Choosing between Investments

You decide to invest \$8000 for 6 years and you have a choice between two accounts. The first pays 7% per year, compounded monthly. The second pays 6.85% per year, compounded continuously. Which is the better investment?

## SOLUTION

The better investment is the one with the greater balance in the account after 6 years. Let's begin with the account with monthly compounding. We use the compound interest model with  $P = 8000$ ,  $r = 7\% = 0.07$ ,  $n = 12$  (monthly compounding means 12 compoundings per year), and  $t = 6$ .

$$A = P\left(1 + \frac{r}{n}\right)^{nt} = 8000\left(1 + \frac{0.07}{12}\right)^{12 \cdot 6} \approx 12,160.84$$

The balance in this account after 6 years is \$12,160.84.

For the second investment option, we use the model for continuous compounding with  $P = 8000$ ,  $r = 6.85\% = 0.0685$ , and  $t = 6$ .

$$A = Pe^{rt} = 8000e^{0.0685(6)} \approx 12,066.60$$

The balance in this account after 6 years is \$12,066.60, slightly less than the previous amount. Thus, the better investment is the 7% monthly compounding option. ●●●

 **Check Point 7** A sum of \$10,000 is invested at an annual rate of 8%. Find the balance in the account after 5 years subject to **a.** quarterly compounding and **b.** continuous compounding.

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- The exponential function  $f$  with base  $b$  is defined by  $f(x) = \underline{\hspace{2cm}}$ ,  $b > 0$  and  $b \neq 1$ . Using interval notation, the domain of this function is  $\underline{\hspace{2cm}}$  and the range is  $\underline{\hspace{2cm}}$ .
- The graph of the exponential function  $f$  with base  $b$  approaches, but does not touch, the  $\underline{\hspace{2cm}}$ -axis. This axis, whose equation is  $\underline{\hspace{2cm}}$ , is a/an  $\underline{\hspace{2cm}}$  asymptote.
- The value that  $\left(1 + \frac{1}{n}\right)^n$  approaches as  $n$  gets larger and larger is the irrational number  $\underline{\hspace{2cm}}$ , called the  $\underline{\hspace{2cm}}$  base. This irrational number is approximately equal to  $\underline{\hspace{2cm}}$ .
- Consider the compound interest formula
 
$$A = P\left(1 + \frac{r}{n}\right)^{nt}.$$
 This formula gives the balance,  $\underline{\hspace{2cm}}$ , in an account with principal  $\underline{\hspace{2cm}}$  and annual interest rate  $\underline{\hspace{2cm}}$ , in decimal form, subject to compound interest paid  $\underline{\hspace{2cm}}$  times per year.
- If compound interest is paid twice a year, we say that the interest is compounded  $\underline{\hspace{2cm}}$ . If compound interest is paid four times a year, we say that the interest is compounded  $\underline{\hspace{2cm}}$ . If the number of compounding periods increases infinitely, we call this  $\underline{\hspace{2cm}}$  compounding.

## EXERCISE SET 3.1

## Practice Exercises

In Exercises 1–10, approximate each number using a calculator. Round your answer to three decimal places.

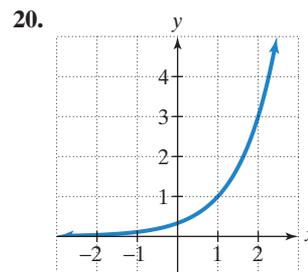

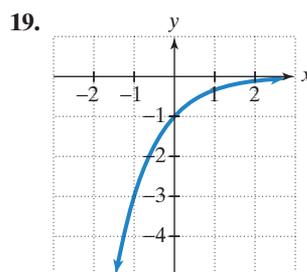

- $2^{3.4}$
- $3^{2.4}$
- $3^{\sqrt{5}}$
- $5^{\sqrt{3}}$
- $4^{-1.5}$
- $6^{-1.2}$
- $e^{2.3}$
- $e^{3.4}$
- $e^{-0.95}$
- $e^{-0.75}$

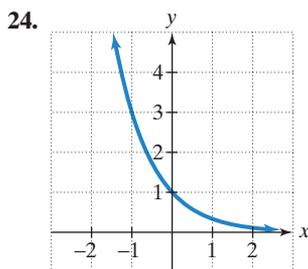

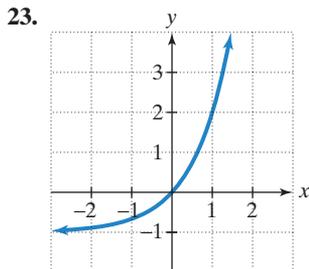

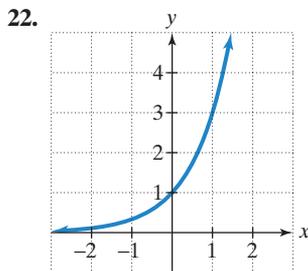

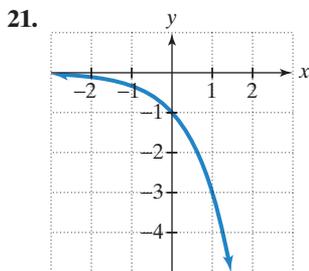

In Exercises 11–18, graph each function by making a table of coordinates. If applicable, use a graphing utility to confirm your hand-drawn graph.

- $f(x) = 4^x$
- $f(x) = 5^x$
- $g(x) = \left(\frac{3}{2}\right)^x$
- $g(x) = \left(\frac{4}{3}\right)^x$
- $h(x) = \left(\frac{1}{2}\right)^x$
- $h(x) = \left(\frac{1}{3}\right)^x$
- $f(x) = (0.6)^x$
- $f(x) = (0.8)^x$

In Exercises 19–24, the graph of an exponential function is given. Select the function for each graph from the following options:

$$f(x) = 3^x, g(x) = 3^{x-1}, h(x) = 3^x - 1, \\ F(x) = -3^x, G(x) = 3^{-x}, H(x) = -3^{-x}.$$

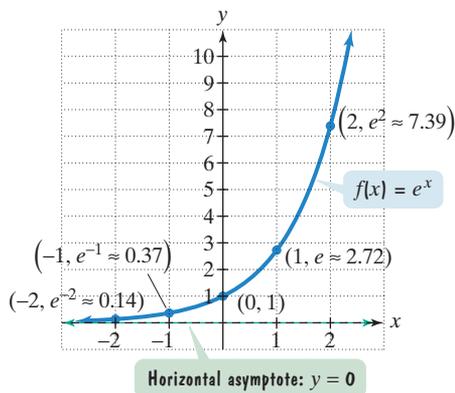

In Exercises 25–34, begin by graphing  $f(x) = 2^x$ . Then use transformations of this graph to graph the given function. Be sure to graph and give equations of the asymptotes. Use the graphs to determine each function's domain and range. If applicable, use a graphing utility to confirm your hand-drawn graphs.

- |                          |                                    |
|--------------------------|------------------------------------|
| 25. $g(x) = 2^{x+1}$     | 26. $g(x) = 2^{x+2}$               |
| 27. $g(x) = 2^x - 1$     | 28. $g(x) = 2^x + 2$               |
| 29. $h(x) = 2^{x+1} - 1$ | 30. $h(x) = 2^{x+2} - 1$           |
| 31. $g(x) = -2^x$        | 32. $g(x) = 2^{-x}$                |
| 33. $g(x) = 2 \cdot 2^x$ | 34. $g(x) = \frac{1}{2} \cdot 2^x$ |

The figure shows the graph of  $f(x) = e^x$ . In Exercises 35–46, use transformations of this graph to graph each function. Be sure to give equations of the asymptotes. Use the graphs to determine each function's domain and range. If applicable, use a graphing utility to confirm your hand-drawn graphs.

- |                          |                                  |
|--------------------------|----------------------------------|
| 35. $g(x) = e^{x-1}$     | 36. $g(x) = e^{x+1}$             |
| 37. $g(x) = e^x + 2$     | 38. $g(x) = e^x - 1$             |
| 39. $h(x) = e^{x-1} + 2$ | 40. $h(x) = e^{x+1} - 1$         |
| 41. $h(x) = e^{-x}$      | 42. $h(x) = -e^x$                |
| 43. $g(x) = 2e^x$        | 44. $g(x) = \frac{1}{2}e^x$      |
| 45. $h(x) = e^{2x} + 1$  | 46. $h(x) = e^{\frac{x}{2}} + 2$ |

In Exercises 47–52, graph functions  $f$  and  $g$  in the same rectangular coordinate system. Graph and give equations of all asymptotes. If applicable, use a graphing utility to confirm your hand-drawn graphs.

47.  $f(x) = 3^x$  and  $g(x) = 3^{-x}$   
 48.  $f(x) = 3^x$  and  $g(x) = -3^x$   
 49.  $f(x) = 3^x$  and  $g(x) = \frac{1}{3} \cdot 3^x$   
 50.  $f(x) = 3^x$  and  $g(x) = 3 \cdot 3^x$   
 51.  $f(x) = (\frac{1}{2})^x$  and  $g(x) = (\frac{1}{2})^{x-1} + 1$   
 52.  $f(x) = (\frac{1}{2})^x$  and  $g(x) = (\frac{1}{2})^{x-1} + 2$

Use the compound interest formulas  $A = P(1 + \frac{r}{n})^{nt}$  and  $A = Pe^{rt}$  to solve Exercises 53–56. Round answers to the nearest cent.

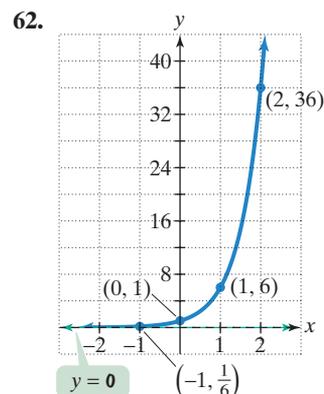

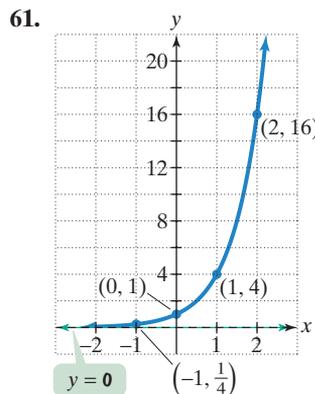

53. Find the accumulated value of an investment of \$10,000 for 5 years at an interest rate of 5.5% if the money is  
**a.** compounded semiannually; **b.** compounded quarterly; **c.** compounded monthly; **d.** compounded continuously.  
 54. Find the accumulated value of an investment of \$5000 for 10 years at an interest rate of 6.5% if the money is  
**a.** compounded semiannually; **b.** compounded quarterly; **c.** compounded monthly; **d.** compounded continuously.  
 55. Suppose that you have \$12,000 to invest. Which investment yields the greater return over 3 years: 7% compounded monthly or 6.85% compounded continuously?  
 56. Suppose that you have \$6000 to invest. Which investment yields the greater return over 4 years: 8.25% compounded quarterly or 8.3% compounded semiannually?

### Practice Plus

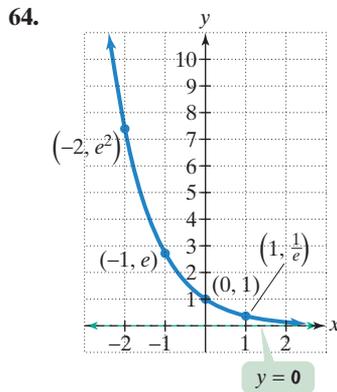

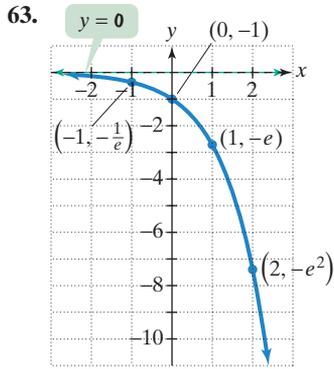

In Exercises 57–58, graph  $f$  and  $g$  in the same rectangular coordinate system. Then find the point of intersection of the two graphs.

57.  $f(x) = 2^x, g(x) = 2^{-x}$   
 58.  $f(x) = 2^{x+1}, g(x) = 2^{-x+1}$   
 59. Graph  $y = 2^x$  and  $x = 2^y$  in the same rectangular coordinate system.  
 60. Graph  $y = 3^x$  and  $x = 3^y$  in the same rectangular coordinate system.

In Exercises 61–64, give the equation of each exponential function whose graph is shown.

### Application Exercises

Use a calculator with a  $y^x$  key or a  $\wedge$  key to solve Exercises 65–70.

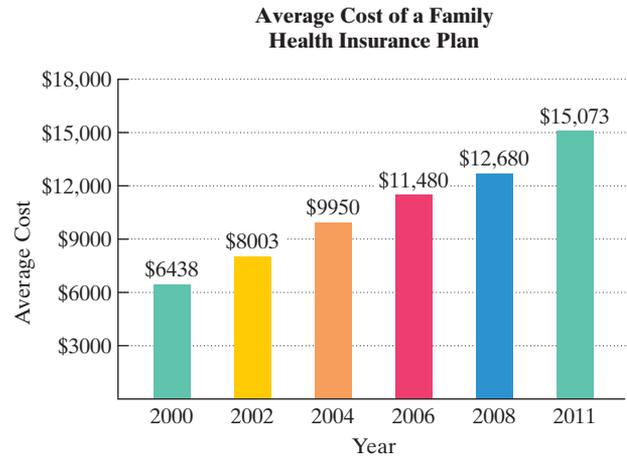

65. India is currently one of the world's fastest-growing countries. By 2040, the population of India will be larger than the population of China; by 2050, nearly one-third of the world's population will live in these two countries alone. The exponential function  $f(x) = 574(1.026)^x$  models the population of India,  $f(x)$ , in millions,  $x$  years after 1974.
- Substitute 0 for  $x$  and, without using a calculator, find India's population in 1974.
  - Substitute 27 for  $x$  and use your calculator to find India's population, to the nearest million, in the year 2001 as modeled by this function.
  - Find India's population, to the nearest million, in the year 2028 as predicted by this function.
  - Find India's population, to the nearest million, in the year 2055 as predicted by this function.
  - What appears to be happening to India's population every 27 years?
66. The 1986 explosion at the Chernobyl nuclear power plant in the former Soviet Union sent about 1000 kilograms of radioactive cesium-137 into the atmosphere. The function  $f(x) = 1000(0.5)^{\frac{x}{30}}$  describes the amount,  $f(x)$ , in kilograms, of cesium-137 remaining in Chernobyl  $x$  years after 1986. If even 100 kilograms of cesium-137 remain in Chernobyl's atmosphere, the area is considered unsafe for human habitation. Find  $f(80)$  and determine if Chernobyl will be safe for human habitation by 2066.

The formula  $S = C(1 + r)^t$  models inflation, where  $C$  = the value today,  $r$  = the annual inflation rate, and  $S$  = the inflated value  $t$  years from now. Use this formula to solve Exercises 67–68. Round answers to the nearest dollar.

- If the inflation rate is 6%, how much will a house now worth \$465,000 be worth in 10 years?
- If the inflation rate is 3%, how much will a house now worth \$510,000 be worth in 5 years?
- A decimal approximation for  $\sqrt{3}$  is 1.7320508. Use a calculator to find  $2^{1.7}$ ,  $2^{1.73}$ ,  $2^{1.732}$ ,  $2^{1.73205}$ , and  $2^{1.7320508}$ . Now find  $2^{\sqrt{3}}$ . What do you observe?
- A decimal approximation for  $\pi$  is 3.141593. Use a calculator to find  $2^3$ ,  $2^{3.1}$ ,  $2^{3.14}$ ,  $2^{3.141}$ ,  $2^{3.1415}$ , and  $2^{3.141593}$ . Now find  $2^\pi$ . What do you observe?

Use a calculator with an  $e^x$  key to solve Exercises 71–76.

Average annual premiums for employer-sponsored family health insurance policies more than doubled over 11 years. The bar graph shows the average cost of a family health insurance plan in the United States for six selected years from 2000 through 2011.

Source: Kaiser Family Foundation

The data can be modeled by

$$f(x) = 782x + 6564 \quad \text{and} \quad g(x) = 6875e^{0.077x},$$

in which  $f(x)$  and  $g(x)$  represent the average cost of a family health insurance plan  $x$  years after 2000. Use these functions to solve Exercises 71–72. Where necessary, round answers to the nearest whole dollar.

- According to the linear model, what was the average cost of a family health insurance plan in 2011?
  - According to the exponential model, what was the average cost of a family health insurance plan in 2011?
  - Which function is a better model for the data in 2011?
- According to the linear model, what was the average cost of a family health insurance plan in 2008?
  - According to the exponential model, what was the average cost of a family health insurance plan in 2008?
  - Which function is a better model for the data in 2008?
- In college, we study large volumes of information—information that, unfortunately, we do not often retain for very long. The function

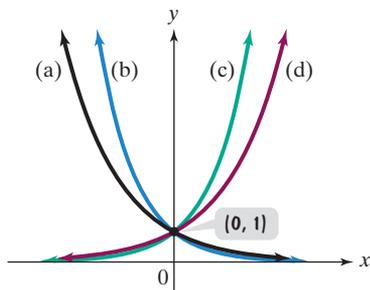

$$f(x) = 80e^{-0.5x} + 20$$

describes the percentage of information,  $f(x)$ , that a particular person remembers  $x$  weeks after learning the information.

- Substitute 0 for  $x$  and, without using a calculator, find the percentage of information remembered at the moment it is first learned.
- Substitute 1 for  $x$  and find the percentage of information that is remembered after 1 week.
- Find the percentage of information that is remembered after 4 weeks.
- Find the percentage of information that is remembered after one year (52 weeks).

91. The graphs labeled (a)–(d) in the figure represent  $y = 3^x$ ,  $y = 5^x$ ,  $y = (\frac{1}{3})^x$ , and  $y = (\frac{1}{5})^x$ , but not necessarily in that order. Which is which? Describe the process that enables you to make this decision.

92. Graph  $f(x) = 2^x$  and its inverse function in the same rectangular coordinate system.

93. The *hyperbolic cosine* and *hyperbolic sine* functions are defined by

$$\cosh x = \frac{e^x + e^{-x}}{2} \quad \text{and} \quad \sinh x = \frac{e^x - e^{-x}}{2}.$$

- Show that  $\cosh x$  is an even function.
- Show that  $\sinh x$  is an odd function.
- Prove that  $(\cosh x)^2 - (\sinh x)^2 = 1$ .

### Preview Exercises

Exercises 94–96 will help you prepare for the material covered in the next section.

- What problem do you encounter when using the switch-and-solve strategy to find the inverse of  $f(x) = 2^x$ ? (The switch-and-solve strategy is described in the box on page 248.)
- 25 to what power gives 5? ( $25^? = 5$ )
- Solve:  $(x - 3)^2 > 0$ .

## SECTION 3.2

## Logarithmic Functions

### Objectives

- Change from logarithmic to exponential form.
- Change from exponential to logarithmic form.
- Evaluate logarithms.
- Use basic logarithmic properties.
- Graph logarithmic functions.
- Find the domain of a logarithmic function.
- Use common logarithms.
- Use natural logarithms.

The earthquake that ripped through northern California on October 17, 1989, measured 7.1 on the Richter scale, killed more than 60 people, and injured more than 2400. Shown here is San Francisco's Marina district, where shock waves tossed houses off their foundations and into the street.

A higher measure on the Richter scale is more devastating than it seems because for each increase in one unit on the scale, there is a tenfold increase in the intensity of an earthquake. In this section, our focus is on the inverse of the exponential function, called the logarithmic function. The logarithmic function will help you to understand diverse phenomena, including earthquake intensity, human memory, and the pace of life in large cities.

### GREAT QUESTION!

**You mentioned that the inverse of the exponential function is called the logarithmic function. We haven't discussed inverses of functions since Section 1.8. What should I already know about functions and their inverses?**

Here's a brief summary:

- Only one-to-one functions have inverses that are functions. A function,  $f$ , has an inverse function,  $f^{-1}$ , if there is no horizontal line that intersects the graph of  $f$  at more than one point.
- If a function is one-to-one, its inverse function can be found by interchanging  $x$  and  $y$  in the function's equation and solving for  $y$ .
- If  $f(a) = b$ , then  $f^{-1}(b) = a$ . The domain of  $f$  is the range of  $f^{-1}$ . The range of  $f$  is the domain of  $f^{-1}$ .
- $f(f^{-1}(x)) = x$  and  $f^{-1}(f(x)) = x$ .
- The graph of  $f^{-1}$  is the reflection of the graph of  $f$  about the line  $y = x$ .

### The Definition of Logarithmic Functions

No horizontal line can be drawn that intersects the graph of an exponential function at more than one point. This means that the exponential function is one-to-one and has an inverse. Let's use our switch-and-solve strategy from Section 1.8 to find the inverse.

All exponential functions have inverse functions.

$$f(x) = b^x$$

**Step 1 Replace  $f(x)$  with  $y$ :**  $y = b^x$ .

**Step 2 Interchange  $x$  and  $y$ :**  $x = b^y$ .

**Step 3 Solve for  $y$ :** ?

The question mark indicates that we do not have a method for solving  $b^y = x$  for  $y$ . To isolate the exponent  $y$ , a new notation, called *logarithmic notation*, is needed. This notation gives us a way to name the inverse of  $f(x) = b^x$ . **The inverse function of the exponential function with base  $b$  is called the logarithmic function with base  $b$ .**

### Definition of the Logarithmic Function

For  $x > 0$  and  $b > 0, b \neq 1$ ,

$$y = \log_b x \text{ is equivalent to } b^y = x.$$

The function  $f(x) = \log_b x$  is the **logarithmic function with base  $b$** .

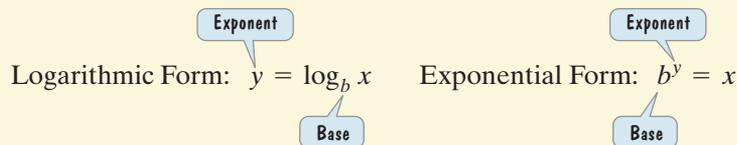

The equations

$$y = \log_b x \quad \text{and} \quad b^y = x$$

are different ways of expressing the same thing. The first equation is in **logarithmic form** and the second equivalent equation is in **exponential form**.

Notice that a **logarithm,  $y$ , is an exponent**. You should learn the location of the base and exponent in each form.

### Location of Base and Exponent in Exponential and Logarithmic Forms

- 1** Change from logarithmic to exponential form.

### EXAMPLE 1 Changing from Logarithmic to Exponential Form

Write each equation in its equivalent exponential form:

a.  $2 = \log_5 x$       b.  $3 = \log_b 64$       c.  $\log_3 7 = y$ .

### SOLUTION

We use the fact that  $y = \log_b x$  means  $b^y = x$ .

a.  $2 = \log_5 x$  means  $5^2 = x$ .      b.  $3 = \log_b 64$  means  $b^3 = 64$ .

Logarithms are exponents.

Logarithms are exponents.

c.  $\log_3 7 = y$  or  $y = \log_3 7$  means  $3^y = 7$ .      ...

### GREAT QUESTION!

Much of what you've discussed so far involves changing from logarithmic form to the more familiar exponential form. Is there a pattern I can use to help me remember how to do this?

Yes. To change from logarithmic form to exponential form, use this pattern:

$$y = \log_b x \text{ means } b^y = x.$$

- ✓ Check Point 1** Write each equation in its equivalent exponential form:
- a.  $3 = \log_7 x$       b.  $2 = \log_b 25$       c.  $\log_4 26 = y$ .

- 2 Change from exponential to logarithmic form.

### EXAMPLE 2 Changing from Exponential to Logarithmic Form

Write each equation in its equivalent logarithmic form:

a.  $12^2 = x$       b.  $b^3 = 8$       c.  $e^y = 9$ .

#### SOLUTION

We use the fact that  $b^y = x$  means  $y = \log_b x$ .

a.  $12^2 = x$  means  $2 = \log_{12} x$ .      b.  $b^3 = 8$  means  $3 = \log_b 8$ .

Exponents are logarithms.

Exponents are logarithms.

c.  $e^y = 9$  means  $y = \log_e 9$ .

 **Check Point 2** Write each equation in its equivalent logarithmic form:

a.  $2^5 = x$       b.  $b^3 = 27$       c.  $e^y = 33$ .

- 3 Evaluate logarithms.

Remembering that logarithms are exponents makes it possible to evaluate some logarithms by inspection. The logarithm of  $x$  with base  $b$ ,  $\log_b x$ , is the exponent to which  $b$  must be raised to get  $x$ . For example, suppose we want to evaluate  $\log_2 32$ . We ask, 2 to what power gives 32? Because  $2^5 = 32$ ,  $\log_2 32 = 5$ .

### EXAMPLE 3 Evaluating Logarithms

Evaluate:

a.  $\log_2 16$       b.  $\log_7 \frac{1}{49}$       c.  $\log_{25} 5$       d.  $\log_2 \sqrt[5]{2}$ .

#### SOLUTION

Logarithmic Expression	Question Needed for Evaluation	Logarithmic Expression Evaluated
a. $\log_2 16$	2 to what power gives 16? $2^? = 16$	$\log_2 16 = 4$ because $2^4 = 16$ .
b. $\log_7 \frac{1}{49}$	7 to what power gives $\frac{1}{49}$ ? $7^? = \frac{1}{49}$	$\log_7 \frac{1}{49} = -2$ because $7^{-2} = \frac{1}{7^2} = \frac{1}{49}$ .
c. $\log_{25} 5$	25 to what power gives 5? $25^? = 5$	$\log_{25} 5 = \frac{1}{2}$ because $25^{\frac{1}{2}} = \sqrt{25} = 5$ .
d. $\log_2 \sqrt[5]{2}$	2 to what power gives $\sqrt[5]{2}$ , or $2^{\frac{1}{5}}$ ? $2^? = \sqrt[5]{2}$	$\log_2 \sqrt[5]{2} = \frac{1}{5}$ because $2^{\frac{1}{5}} = \sqrt[5]{2}$ .

 **Check Point 3** Evaluate:

a.  $\log_{10} 100$       b.  $\log_5 \frac{1}{125}$       c.  $\log_{36} 6$       d.  $\log_3 \sqrt[3]{3}$ .

- 4 Use basic logarithmic properties.

### Basic Logarithmic Properties

Because logarithms are exponents, they have properties that can be verified using properties of exponents.

#### Basic Logarithmic Properties Involving One

- $\log_b b = 1$  because 1 is the exponent to which  $b$  must be raised to obtain  $b$ .  
( $b^1 = b$ )
- $\log_b 1 = 0$  because 0 is the exponent to which  $b$  must be raised to obtain 1.  
( $b^0 = 1$ )

**EXAMPLE 4** Using Properties of Logarithms

Evaluate:

- a.  $\log_7 7$       b.  $\log_5 1$ .

**SOLUTION**

a. Because  $\log_b b = 1$ , we conclude  $\log_7 7 = 1$ .

This means  
that  $7^1 = 7$ .

b. Because  $\log_b 1 = 0$ , we conclude  $\log_5 1 = 0$ .

This means  
that  $5^0 = 1$ .

...

 **Check Point 4** Evaluate:

- a.  $\log_9 9$       b.  $\log_8 1$ .

Now that we are familiar with logarithmic notation, let's resume and finish the switch-and-solve strategy for finding the inverse of  $f(x) = b^x$ .

**Step 1 Replace  $f(x)$  with  $y$ :**  $y = b^x$ .

**Step 2 Interchange  $x$  and  $y$ :**  $x = b^y$ .

**Step 3 Solve for  $y$ :**  $y = \log_b x$ .

**Step 4 Replace  $y$  with  $f^{-1}(x)$ :**  $f^{-1}(x) = \log_b x$ .

The completed switch-and-solve strategy illustrates that if  $f(x) = b^x$ , then  $f^{-1}(x) = \log_b x$ . The inverse of an exponential function is the logarithmic function with the same base.

In Section 1.8, we saw how inverse functions “undo” one another. In particular,

$$f(f^{-1}(x)) = x \quad \text{and} \quad f^{-1}(f(x)) = x.$$

Applying these relationships to exponential and logarithmic functions, we obtain the following **inverse properties of logarithms**:

**Inverse Properties of Logarithms**

For  $b > 0$  and  $b \neq 1$ ,

$\log_b b^x = x$       The logarithm with base  $b$  of  $b$  raised to a power equals that power.

$b^{\log_b x} = x$ .       $b$  raised to the logarithm with base  $b$  of a number equals that number.

**EXAMPLE 5** Using Inverse Properties of Logarithms

Evaluate:

- a.  $\log_4 4^5$       b.  $6^{\log_6 9}$ .

**SOLUTION**

a. Because  $\log_b b^x = x$ , we conclude  $\log_4 4^5 = 5$ .

b. Because  $b^{\log_b x} = x$ , we conclude  $6^{\log_6 9} = 9$ .

...

 **Check Point 5** Evaluate:

- a.  $\log_7 7^8$       b.  $3^{\log_3 17}$ .

**5** Graph logarithmic functions.**Graphs of Logarithmic Functions**

How do we graph logarithmic functions? We use the fact that a logarithmic function is the inverse of an exponential function. This means that the logarithmic function reverses the coordinates of the exponential function. It also means that the graph of the logarithmic function is a reflection of the graph of the exponential function about the line  $y = x$ .

**EXAMPLE 6** Graphs of Exponential and Logarithmic Functions

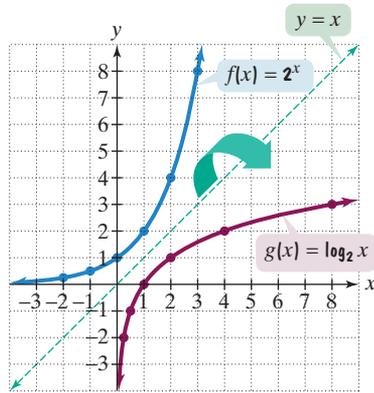

Graph  $f(x) = 2^x$  and  $g(x) = \log_2 x$  in the same rectangular coordinate system.

**SOLUTION**

We first set up a table of coordinates for  $f(x) = 2^x$ . Reversing these coordinates gives the coordinates for the inverse function  $g(x) = \log_2 x$ .

$x$	-2	-1	0	1	2	3		$x$	$\frac{1}{4}$	$\frac{1}{2}$	1	2	4	8
$f(x) = 2^x$	$\frac{1}{4}$	$\frac{1}{2}$	1	2	4	8	↔	$g(x) = \log_2 x$	-2	-1	0	1	2	3

Reverse coordinates.

**FIGURE 3.7** The graphs of  $f(x) = 2^x$  and its inverse function

We now plot the ordered pairs from each table, connecting them with smooth curves. **Figure 3.7** shows the graphs of  $f(x) = 2^x$  and its inverse function  $g(x) = \log_2 x$ . The graph of the inverse can also be drawn by reflecting the graph of  $f(x) = 2^x$  about the line  $y = x$ .

**GREAT QUESTION!**

**You found the coordinates of  $g(x) = \log_2 x$  by reversing the coordinates of  $f(x) = 2^x$ . Do I have to do it that way?**

Not necessarily. You can obtain a partial table of coordinates for  $g(x) = \log_2 x$  without having to obtain and reverse coordinates for  $f(x) = 2^x$ . Because  $g(x) = \log_2 x$  means  $2^{g(x)} = x$ , we begin with values for  $g(x)$  and compute corresponding values for  $x$ :

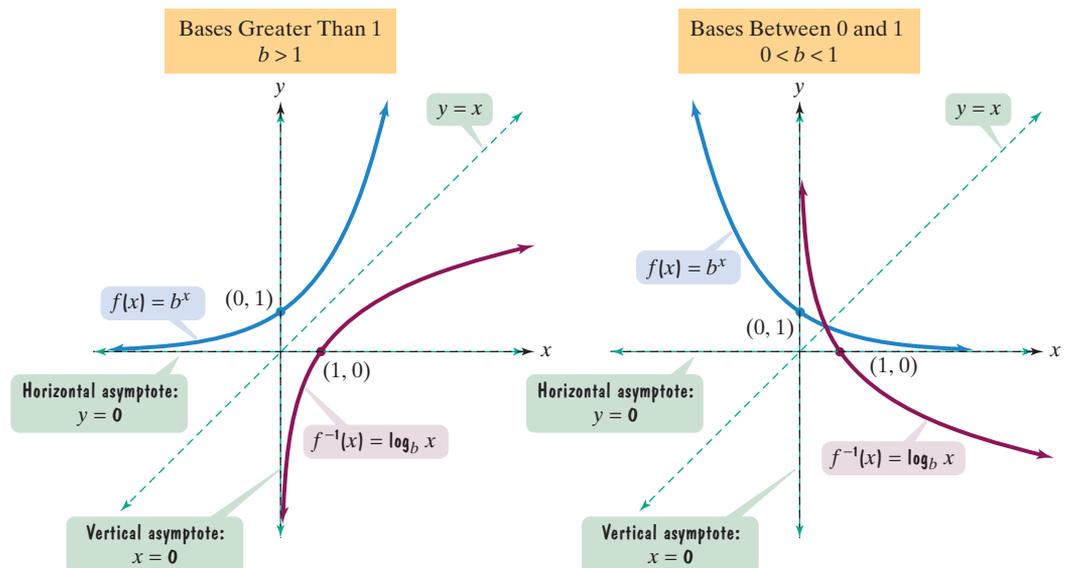

Use  $x = 2^{g(x)}$  to compute  $x$ . For example, if  $g(x) = -2$ ,  $x = 2^{-2} = \frac{1}{2^2} = \frac{1}{4}$ .

$x$	$\frac{1}{4}$	$\frac{1}{2}$	1	2	4	8
$g(x) = \log_2 x$	-2	-1	0	1	2	3

Start with values for  $g(x)$ .

**Check Point 6** Graph  $f(x) = 3^x$  and  $g(x) = \log_3 x$  in the same rectangular coordinate system.

**Figure 3.8** illustrates the relationship between the graph of an exponential function, shown in blue, and its inverse, a logarithmic function, shown in red, for bases greater than 1 and for bases between 0 and 1. Also shown and labeled are the exponential function's horizontal asymptote ( $y = 0$ ) and the logarithmic function's vertical asymptote ( $x = 0$ ).

**FIGURE 3.8** Graphs of exponential and logarithmic functions

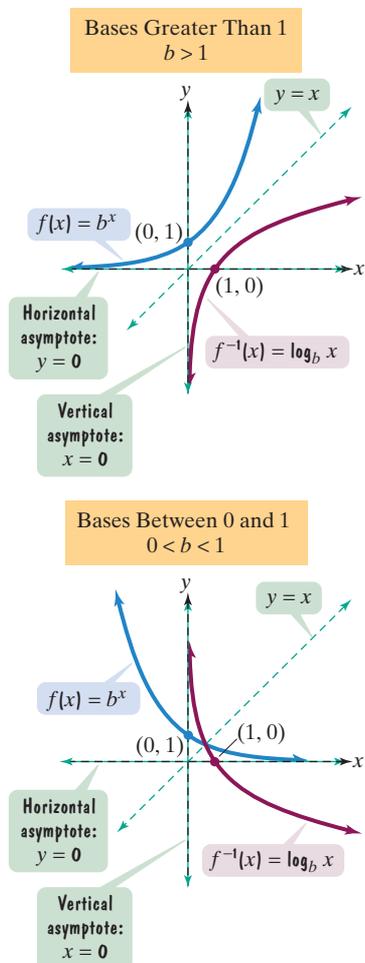

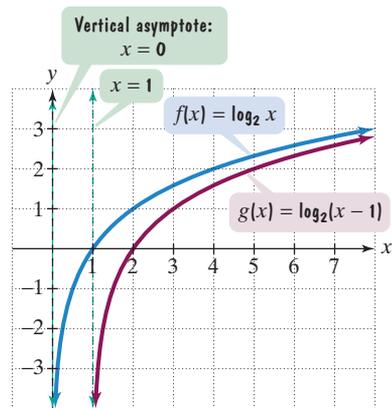

FIGURE 3.8 (repeated)

 FIGURE 3.9 Shifting  $f(x) = \log_2 x$  one unit to the right

The red graphs in **Figure 3.8** illustrate the following general characteristics of logarithmic functions:

### Characteristics of Logarithmic Functions of the Form $f(x) = \log_b x$

1. The domain of  $f(x) = \log_b x$  consists of all positive real numbers:  $(0, \infty)$ . The range of  $f(x) = \log_b x$  consists of all real numbers:  $(-\infty, \infty)$ .
2. The graphs of all logarithmic functions of the form  $f(x) = \log_b x$  pass through the point  $(1, 0)$  because  $f(1) = \log_b 1 = 0$ . The  $x$ -intercept is 1. There is no  $y$ -intercept.
3. If  $b > 1$ ,  $f(x) = \log_b x$  has a graph that goes up to the right and is an increasing function.
4. If  $0 < b < 1$ ,  $f(x) = \log_b x$  has a graph that goes down to the right and is a decreasing function.
5. The graph of  $f(x) = \log_b x$  approaches, but does not touch, the  $y$ -axis. The  $y$ -axis, or  $x = 0$ , is a vertical asymptote.

The graphs of logarithmic functions can be translated vertically or horizontally, reflected, stretched, or shrunk. These transformations are summarized in **Table 3.5**.

**Table 3.5** Transformations Involving Logarithmic Functions

In each case,  $c$  represents a positive real number.

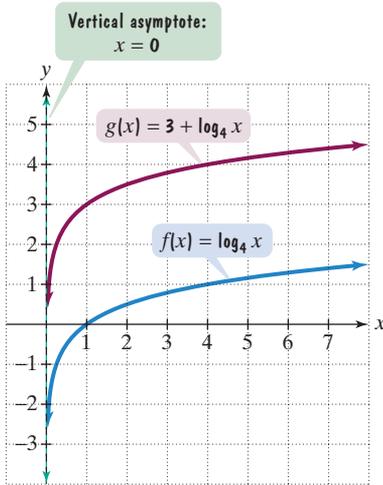

Transformation	Equation	Description
Vertical translation	$g(x) = \log_b x + c$ $g(x) = \log_b x - c$	<ul style="list-style-type: none"> <li>• Shifts the graph of <math>f(x) = \log_b x</math> upward <math>c</math> units.</li> <li>• Shifts the graph of <math>f(x) = \log_b x</math> downward <math>c</math> units.</li> </ul>
Horizontal translation	$g(x) = \log_b(x + c)$ $g(x) = \log_b(x - c)$	<ul style="list-style-type: none"> <li>• Shifts the graph of <math>f(x) = \log_b x</math> to the left <math>c</math> units. Vertical asymptote: <math>x = -c</math></li> <li>• Shifts the graph of <math>f(x) = \log_b x</math> to the right <math>c</math> units. Vertical asymptote: <math>x = c</math></li> </ul>
Reflection	$g(x) = -\log_b x$ $g(x) = \log_b(-x)$	<ul style="list-style-type: none"> <li>• Reflects the graph of <math>f(x) = \log_b x</math> about the <math>x</math>-axis.</li> <li>• Reflects the graph of <math>f(x) = \log_b x</math> about the <math>y</math>-axis.</li> </ul>
Vertical stretching or shrinking	$g(x) = c \log_b x$	<ul style="list-style-type: none"> <li>• Vertically stretches the graph of <math>f(x) = \log_b x</math> if <math>c &gt; 1</math>.</li> <li>• Vertically shrinks the graph of <math>f(x) = \log_b x</math> if <math>0 &lt; c &lt; 1</math>.</li> </ul>
Horizontal stretching or shrinking	$g(x) = \log_b(cx)$	<ul style="list-style-type: none"> <li>• Horizontally shrinks the graph of <math>f(x) = \log_b x</math> if <math>c &gt; 1</math>.</li> <li>• Horizontally stretches the graph of <math>f(x) = \log_b x</math> if <math>0 &lt; c &lt; 1</math>.</li> </ul>

For example, **Figure 3.9** illustrates that the graph of  $g(x) = \log_2(x - 1)$  is the graph of  $f(x) = \log_2 x$  shifted one unit to the right. If a logarithmic function is translated to the left or to the right, both the  $x$ -intercept and the vertical asymptote are shifted by the amount of the horizontal shift. In **Figure 3.9**, the  $x$ -intercept of  $f$  is 1. Because  $g$  is shifted one unit to the right, its  $x$ -intercept is 2. Also observe that the vertical asymptote for  $f$ , the  $y$ -axis, or  $x = 0$ , is shifted one unit to the right for the vertical asymptote for  $g$ . Thus,  $x = 1$  is the vertical asymptote for  $g$ .

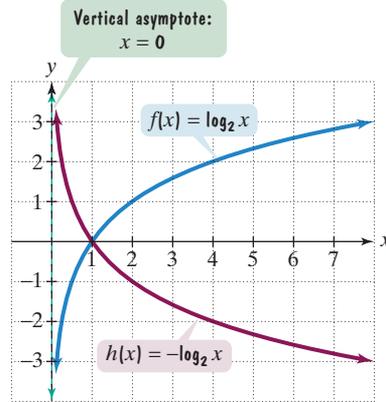

Here are some other examples of transformations of graphs of logarithmic functions:

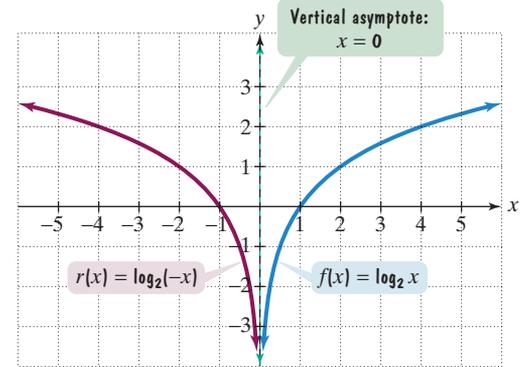

- The graph of  $g(x) = 3 + \log_4 x$  is the graph of  $f(x) = \log_4 x$  shifted up three units, shown in **Figure 3.10**.
- The graph of  $h(x) = -\log_2 x$  is the graph of  $f(x) = \log_2 x$  reflected about the  $x$ -axis, shown in **Figure 3.11**.
- The graph of  $r(x) = \log_2(-x)$  is the graph of  $f(x) = \log_2 x$  reflected about the  $y$ -axis, shown in **Figure 3.12**.

**FIGURE 3.10** Shifting vertically up three units

**FIGURE 3.11** Reflection about the  $x$ -axis

**FIGURE 3.12** Reflection about the  $y$ -axis

- 6** Find the domain of a logarithmic function.

### The Domain of a Logarithmic Function

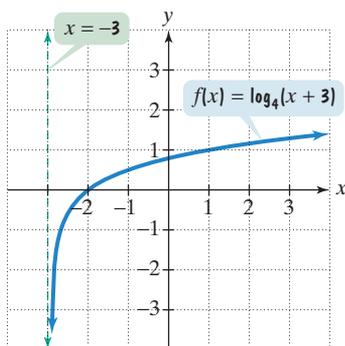

In Section 3.1, we learned that the domain of an exponential function of the form  $f(x) = b^x$  includes all real numbers and its range is the set of positive real numbers. Because the logarithmic function reverses the domain and the range of the exponential function, the **domain of a logarithmic function of the form  $f(x) = \log_b x$  is the set of all positive real numbers**. Thus,  $\log_2 8$  is defined because the value of  $x$  in the logarithmic expression, 8, is greater than zero and therefore is included in the domain of the logarithmic function  $f(x) = \log_2 x$ . However,  $\log_2 0$  and  $\log_2(-8)$  are not defined because 0 and  $-8$  are not positive real numbers and therefore are excluded from the domain of the logarithmic function  $f(x) = \log_2 x$ . In general, **the domain of  $f(x) = \log_b g(x)$  consists of all  $x$  for which  $g(x) > 0$** .

#### EXAMPLE 7 Finding the Domain of a Logarithmic Function

Find the domain of  $f(x) = \log_4(x + 3)$ .

#### SOLUTION

The domain of  $f$  consists of all  $x$  for which  $x + 3 > 0$ . Solving this inequality for  $x$ , we obtain  $x > -3$ . Thus, the domain of  $f$  is  $(-3, \infty)$ . This is illustrated in **Figure 3.13**. The vertical asymptote is  $x = -3$  and all points on the graph of  $f$  have  $x$ -coordinates that are greater than  $-3$ . ...

**FIGURE 3.13** The domain of  $f(x) = \log_4(x + 3)$  is  $(-3, \infty)$ .

**Check Point 7** Find the domain of  $f(x) = \log_4(x - 5)$ .

## 7 Use common logarithms.

## Common Logarithms

The logarithmic function with base 10 is called the **common logarithmic function**. The function  $f(x) = \log_{10} x$  is usually expressed as  $f(x) = \log x$ . A calculator with a **LOG** key can be used to evaluate common logarithms. Here are some examples:

Logarithm	Most Scientific Calculator Keystrokes	Most Graphing Calculator Keystrokes	Display (or Approximate Display)
$\log 1000$	1000 <b>LOG</b>	<b>LOG</b> 1000 <b>ENTER</b>	3
$\log \frac{5}{2}$	( <b>5</b> <b>÷</b> <b>2</b> ) <b>LOG</b>	<b>LOG</b> ( <b>5</b> <b>÷</b> <b>2</b> ) <b>ENTER</b>	0.39794
$\frac{\log 5}{\log 2}$	<b>5</b> <b>LOG</b> <b>÷</b> <b>2</b> <b>LOG</b> <b>=</b>	<b>LOG</b> <b>5</b> <b>÷</b> <b>LOG</b> <b>2</b> <b>ENTER</b>	2.32193
$\log(-3)$	<b>3</b> <b>+/-</b> <b>LOG</b>	<b>LOG</b> <b>(-)</b> <b>3</b> <b>ENTER</b>	<b>ERROR</b>

Some graphing calculators display an open parenthesis when the **LOG** key is pressed. In this case, remember to close the set of parentheses after entering the function's domain value: **LOG** **5** **)** **÷** **LOG** **2** **)** **ENTER**.

The error message or **NONREAL ANS** given by many calculators for  $\log(-3)$  is a reminder that the domain of the common logarithmic function,  $f(x) = \log x$ , is the set of positive real numbers. In general, the domain of  $f(x) = \log g(x)$  consists of all  $x$  for which  $g(x) > 0$ .

Many real-life phenomena start with rapid growth and then the growth begins to level off. This type of behavior can be modeled by logarithmic functions.

**EXAMPLE 8** Modeling Height of Children

The percentage of adult height attained by a boy who is  $x$  years old can be modeled by

$$f(x) = 29 + 48.8 \log(x + 1),$$

where  $x$  represents the boy's age (from 5 to 15) and  $f(x)$  represents the percentage of his adult height. Approximately what percentage of his adult height has a boy attained at age eight?

**SOLUTION**

We substitute the boy's age, 8, for  $x$  and evaluate the function.

$$\begin{aligned} f(x) &= 29 + 48.8 \log(x + 1) && \text{This is the given function.} \\ f(8) &= 29 + 48.8 \log(8 + 1) && \text{Substitute 8 for } x. \\ &= 29 + 48.8 \log 9 && \text{Graphing calculator keystrokes:} \\ &\approx 76 && 29 \text{ } + \text{ } 48.8 \text{ } \text{LOG} \text{ } 9 \text{ } \text{ENTER} \end{aligned}$$

Thus, an 8-year-old boy has attained approximately 76% of his adult height. ●●●

 **Check Point 8** Use the function in Example 8 to answer this question: Approximately what percentage of his adult height has a boy attained at age ten?

The basic properties of logarithms that were listed earlier in this section can be applied to common logarithms.

## Properties of Common Logarithms

## General Properties

- $\log_b 1 = 0$
- $\log_b b = 1$
- $\log_b b^x = x$
- $b^{\log_b x} = x$

Inverse  
properties

## Common Logarithms

- $\log 1 = 0$
- $\log 10 = 1$
- $\log 10^x = x$
- $10^{\log x} = x$

The property  $\log 10^x = x$  can be used to evaluate common logarithms involving powers of 10. For example,

$$\log 100 = \log 10^2 = 2, \quad \log 1000 = \log 10^3 = 3, \quad \text{and} \quad \log 10^{7.1} = 7.1.$$

### EXAMPLE 9 Earthquake Intensity

The magnitude,  $R$ , on the Richter scale of an earthquake of intensity  $I$  is given by

$$R = \log \frac{I}{I_0},$$

where  $I_0$  is the intensity of a barely felt zero-level earthquake. The earthquake that destroyed San Francisco in 1906 was  $10^{8.3}$  times as intense as a zero-level earthquake. What was its magnitude on the Richter scale?

### SOLUTION

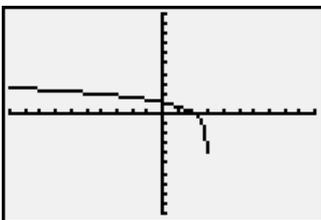

Because the earthquake was  $10^{8.3}$  times as intense as a zero-level earthquake, the intensity,  $I$ , is  $10^{8.3}I_0$ .

$$\begin{aligned} R &= \log \frac{I}{I_0} && \text{This is the formula for magnitude on the Richter scale.} \\ R &= \log \frac{10^{8.3}I_0}{I_0} && \text{Substitute } 10^{8.3}I_0 \text{ for } I. \\ &= \log 10^{8.3} && \text{Simplify.} \\ &= 8.3 && \text{Use the property } \log 10^x = x. \end{aligned}$$

San Francisco's 1906 earthquake registered 8.3 on the Richter scale. ●●●

 **Check Point 9** Use the formula in Example 9 to solve this problem. If an earthquake is 10,000 times as intense as a zero-level quake ( $I = 10,000I_0$ ), what is its magnitude on the Richter scale?

### 8 Use natural logarithms.

$[-10, 10, 1]$  by  $[-10, 10, 1]$

**FIGURE 3.14** The domain of  $f(x) = \ln(3 - x)$  is  $(-\infty, 3)$ .

$[-10, 10, 1]$  by  $[-10, 10, 1]$

**FIGURE 3.15** 3 is excluded from the domain of  $h(x) = \ln(x - 3)^2$ .

### Natural Logarithms

The logarithmic function with base  $e$  is called the **natural logarithmic function**. The function  $f(x) = \log_e x$  is usually expressed as  $f(x) = \ln x$ , read “el en of  $x$ .” A calculator with an  $\boxed{\text{LN}}$  key can be used to evaluate natural logarithms. Keystrokes are identical to those shown for common logarithmic evaluations on page 434.

Like the domain of all logarithmic functions, the domain of the natural logarithmic function  $f(x) = \ln x$  is the set of all positive real numbers. Thus, the domain of  $f(x) = \ln g(x)$  consists of all  $x$  for which  $g(x) > 0$ .

### EXAMPLE 10 Finding Domains of Natural Logarithmic Functions

Find the domain of each function:

**a.**  $f(x) = \ln(3 - x)$       **b.**  $h(x) = \ln(x - 3)^2$ .

### SOLUTION

- a.** The domain of  $f$  consists of all  $x$  for which  $3 - x > 0$ . Solving this inequality for  $x$ , we obtain  $x < 3$ . Thus, the domain of  $f$  is  $\{x \mid x < 3\}$  or  $(-\infty, 3)$ . This is verified by the graph in **Figure 3.14**.
- b.** The domain of  $h$  consists of all  $x$  for which  $(x - 3)^2 > 0$ . It follows that the domain of  $h$  is all real numbers except 3. Thus, the domain of  $h$  is  $\{x \mid x \neq 3\}$  or  $(-\infty, 3) \cup (3, \infty)$ . This is shown by the graph in **Figure 3.15**. To make it more obvious that 3 is excluded from the domain, we used a  $\boxed{\text{DOT}}$  format. ●●●

 **Check Point 10** Find the domain of each function:

**a.**  $f(x) = \ln(4 - x)$       **b.**  $h(x) = \ln x^2$ .

The basic properties of logarithms that were listed earlier in this section can be applied to natural logarithms.

### Properties of Natural Logarithms

General Properties	Natural Logarithms
1. $\log_b 1 = 0$	1. $\ln 1 = 0$
2. $\log_b b = 1$	2. $\ln e = 1$
3. $\log_b b^x = x$	3. $\ln e^x = x$
4. $b^{\log_b x} = x$	4. $e^{\ln x} = x$

Inverse  
properties

Examine the inverse properties,  $\ln e^x = x$  and  $e^{\ln x} = x$ . Can you see how  $\ln$  and  $e$  “undo” one another? For example,

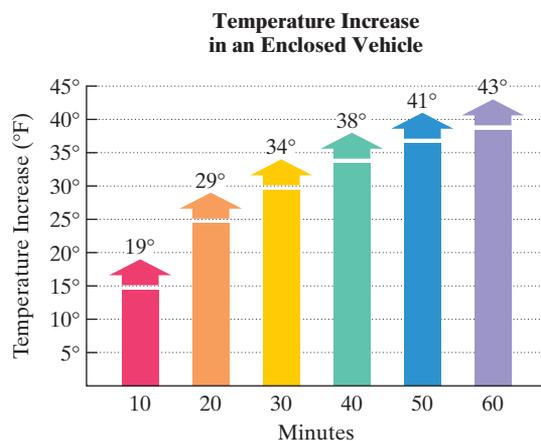

$$\ln e^2 = 2, \quad \ln e^{7x^2} = 7x^2, \quad e^{\ln 2} = 2, \quad \text{and} \quad e^{\ln 7x^2} = 7x^2.$$

### EXAMPLE 11 Dangerous Heat: Temperature in an Enclosed Vehicle

When the outside air temperature is anywhere from  $72^\circ$  to  $96^\circ$  Fahrenheit, the temperature in an enclosed vehicle climbs by  $43^\circ$  in the first hour. The bar graph in **Figure 3.16** shows the temperature increase throughout the hour. The function

$$f(x) = 13.4 \ln x - 11.6$$

models the temperature increase,  $f(x)$ , in degrees Fahrenheit, after  $x$  minutes. Use the function to find the temperature increase, to the nearest degree, after 50 minutes. How well does the function model the actual increase shown in **Figure 3.16**?

**FIGURE 3.16**  
Source: Professor Jan Null, San Francisco State University

### SOLUTION

We find the temperature increase after 50 minutes by substituting 50 for  $x$  and evaluating the function at 50.

$$\begin{aligned} f(x) &= 13.4 \ln x - 11.6 && \text{This is the given function.} \\ f(50) &= 13.4 \ln 50 - 11.6 && \text{Substitute 50 for } x. \\ &\approx 41 && \text{Graphing calculator keystrokes:} \\ &&& 13.4 \boxed{\ln} 50 \boxed{-} 11.6 \boxed{\text{ENTER}}. \text{ On some} \\ &&& \text{calculators, a parenthesis is needed after 50.} \end{aligned}$$

According to the function, the temperature will increase by approximately  $41^\circ$  after 50 minutes. Because the increase shown in **Figure 3.16** is  $41^\circ$ , the function models the actual increase extremely well. ●●●

 **Check Point 11** Use the function in Example 11 to find the temperature increase, to the nearest degree, after 30 minutes. How well does the function model the actual increase shown in **Figure 3.16**?

## Blitzer Bonus || The Curious Number $e$

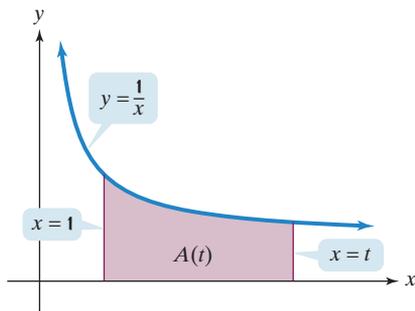

FIGURE 3.17

You will learn more about each curiosity mentioned below if you take calculus.

- The number  $e$  was named by the Swiss mathematician Leonhard Euler (1707–1783), who proved that it is the limit as  $n \rightarrow \infty$  of  $\left(1 + \frac{1}{n}\right)^n$ .
- $e$  features in Euler's remarkable relationship  $e^{i\pi} = -1$ , in which  $i = \sqrt{-1}$ .
- The first few decimal places of  $e$  are fairly easy to remember:  
 $e = 2.7\ 1828\ 1828\ 45\ 90\ 45\ \dots$
- The best approximation of  $e$  using numbers less than 1000 is also easy to remember:  
 $e \approx \frac{878}{323} \approx 2.71826\dots$
- Isaac Newton (1642–1727), one of the cofounders of calculus, showed that  $e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \dots$ , from which we obtain  $e = 1 + 1 + \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} + \dots$ , an infinite sum suitable for calculation because its terms decrease so rapidly. (Note:  $n!$  ( $n$  factorial) is the product of all the consecutive integers from  $n$  down to 1:  $n! = n(n-1)(n-2)(n-3)\cdots \cdot 3 \cdot 2 \cdot 1$ .)
- The area of the region bounded by  $y = \frac{1}{x}$ , the  $x$ -axis,  $x = 1$ , and  $x = t$  (shaded in **Figure 3.17**) is a function of  $t$ , designated by  $A(t)$ . Grégoire de Saint-Vincent, a Belgian Jesuit (1584–1667), spent his entire professional life attempting to find a formula for  $A(t)$ . With his student, he showed that  $A(t) = \ln t$ , becoming one of the first mathematicians to make use of the logarithmic function for something other than a computational device.

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- $y = \log_b x$  is equivalent to the exponential form \_\_\_\_\_,  $x > 0$ ,  $b > 0$ ,  $b \neq 1$ .
- The function  $f(x) = \log_b x$  is the \_\_\_\_\_ function with base \_\_\_\_\_.
- $\log_b b =$  \_\_\_\_\_
- $\log_b 1 =$  \_\_\_\_\_
- $\log_b b^x =$  \_\_\_\_\_
- $b^{\log_b x} =$  \_\_\_\_\_
- Using interval notation, the domain of  $f(x) = \log_b x$  is \_\_\_\_\_ and the range is \_\_\_\_\_.
- The graph of  $f(x) = \log_b x$  approaches, but does not touch, the \_\_\_\_\_-axis. This axis, whose equation is \_\_\_\_\_, is a/an \_\_\_\_\_ asymptote.
- The graph of  $g(x) = 5 + \log_2 x$  is the graph of  $f(x) = \log_2 x$  shifted \_\_\_\_\_.
- The graph of  $g(x) = \log_3(x + 5)$  is the graph of  $f(x) = \log_3 x$  shifted \_\_\_\_\_.
- The graph of  $g(x) = -\log_4 x$  is the graph of  $f(x) = \log_4 x$  reflected about the \_\_\_\_\_.
- The graph of  $g(x) = \log_5(-x)$  is the graph of  $f(x) = \log_5 x$  reflected about the \_\_\_\_\_.
- The domain of  $g(x) = \log_2(5 - x)$  can be found by solving the inequality \_\_\_\_\_.
- The logarithmic function with base 10 is called the \_\_\_\_\_ logarithmic function. The function  $f(x) = \log_{10} x$  is usually expressed as  $f(x) =$  \_\_\_\_\_.
- The logarithmic function with base  $e$  is called the \_\_\_\_\_ logarithmic function. The function  $f(x) = \log_e x$  is usually expressed as  $f(x) =$  \_\_\_\_\_.

## EXERCISE SET 3.2

### Practice Exercises

In Exercises 1–8, write each equation in its equivalent exponential form.

- $4 = \log_2 16$
- $6 = \log_2 64$
- $2 = \log_3 x$
- $2 = \log_9 x$
- $5 = \log_b 32$
- $3 = \log_b 27$
- $\log_6 216 = y$
- $\log_5 125 = y$

In Exercises 9–20, write each equation in its equivalent logarithmic form.

- $2^3 = 8$
- $5^4 = 625$
- $2^{-4} = \frac{1}{16}$
- $5^{-3} = \frac{1}{125}$
- $\sqrt[3]{8} = 2$
- $\sqrt[3]{64} = 4$
- $13^2 = x$
- $15^2 = x$
- $b^3 = 1000$
- $b^3 = 343$
- $7^y = 200$
- $8^y = 300$

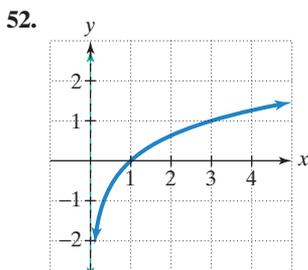

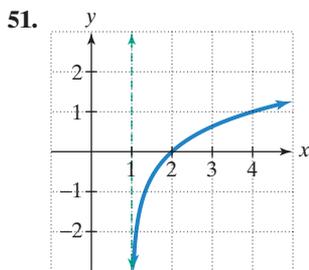

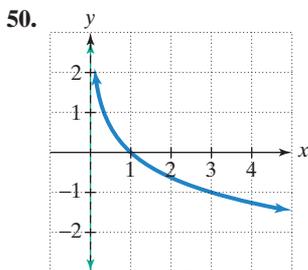

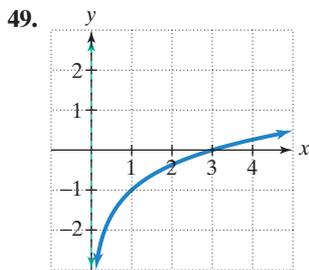

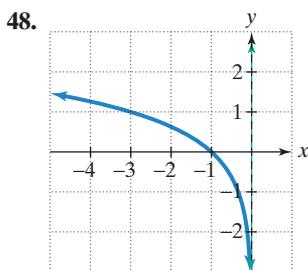

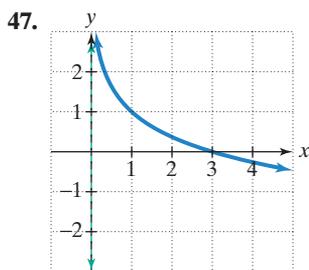

In Exercises 21–42, evaluate each expression without using a calculator.

21.  $\log_4 16$     22.  $\log_7 49$     23.  $\log_2 64$     24.  $\log_3 27$   
 25.  $\log_5 \frac{1}{5}$     26.  $\log_6 \frac{1}{6}$     27.  $\log_2 \frac{1}{8}$     28.  $\log_3 \frac{1}{9}$   
 29.  $\log_7 \sqrt{7}$     30.  $\log_6 \sqrt{6}$     31.  $\log_2 \frac{1}{\sqrt{2}}$     32.  $\log_3 \frac{1}{\sqrt{3}}$   
 33.  $\log_{64} 8$     34.  $\log_{81} 9$     35.  $\log_5 5$     36.  $\log_{11} 11$   
 37.  $\log_4 1$     38.  $\log_6 1$     39.  $\log_5 5^7$     40.  $\log_4 4^6$   
 41.  $8^{\log_8 19}$     42.  $7^{\log_7 23}$

43. Graph  $f(x) = 4^x$  and  $g(x) = \log_4 x$  in the same rectangular coordinate system.  
 44. Graph  $f(x) = 5^x$  and  $g(x) = \log_5 x$  in the same rectangular coordinate system.  
 45. Graph  $f(x) = (\frac{1}{2})^x$  and  $g(x) = \log_{\frac{1}{2}} x$  in the same rectangular coordinate system.  
 46. Graph  $f(x) = (\frac{1}{4})^x$  and  $g(x) = \log_{\frac{1}{4}} x$  in the same rectangular coordinate system.

In Exercises 47–52, the graph of a logarithmic function is given. Select the function for each graph from the following options:

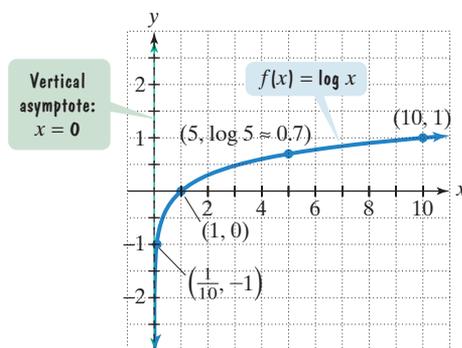

$f(x) = \log_3 x$ ,  $g(x) = \log_3(x - 1)$ ,  $h(x) = \log_3 x - 1$ ,  
 $F(x) = -\log_3 x$ ,  $G(x) = \log_3(-x)$ ,  $H(x) = 1 - \log_3 x$ .

In Exercises 53–58, begin by graphing  $f(x) = \log_2 x$ . Then use transformations of this graph to graph the given function. What is the vertical asymptote? Use the graphs to determine each function's domain and range.

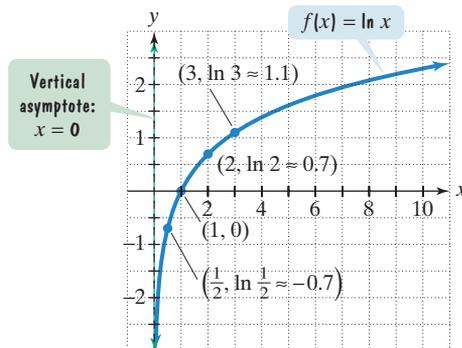

53.  $g(x) = \log_2(x + 1)$     54.  $g(x) = \log_2(x + 2)$   
 55.  $h(x) = 1 + \log_2 x$     56.  $h(x) = 2 + \log_2 x$   
 57.  $g(x) = \frac{1}{2} \log_2 x$     58.  $g(x) = -2 \log_2 x$

The figure shows the graph of  $f(x) = \log x$ . In Exercises 59–64, use transformations of this graph to graph each function. Graph and give equations of the asymptotes. Use the graphs to determine each function's domain and range.

59.  $g(x) = \log(x - 1)$     60.  $g(x) = \log(x - 2)$   
 61.  $h(x) = \log x - 1$     62.  $h(x) = \log x - 2$   
 63.  $g(x) = 1 - \log x$     64.  $g(x) = 2 - \log x$

The figure shows the graph of  $f(x) = \ln x$ . In Exercises 65–74, use transformations of this graph to graph each function. Graph and give equations of the asymptotes. Use the graphs to determine each function's domain and range.

65.  $g(x) = \ln(x + 2)$     66.  $g(x) = \ln(x + 1)$   
 67.  $h(x) = \ln(2x)$     68.  $h(x) = \ln(\frac{1}{2}x)$   
 69.  $g(x) = 2 \ln x$     70.  $g(x) = \frac{1}{2} \ln x$   
 71.  $h(x) = -\ln x$     72.  $h(x) = \ln(-x)$   
 73.  $g(x) = 2 - \ln x$     74.  $g(x) = 1 - \ln x$

In Exercises 75–80, find the domain of each logarithmic function.

75.  $f(x) = \log_5(x + 4)$     76.  $f(x) = \log_5(x + 6)$   
 77.  $f(x) = \log(2 - x)$     78.  $f(x) = \log(7 - x)$   
 79.  $f(x) = \ln(x - 2)^2$     80.  $f(x) = \ln(x - 7)^2$

In Exercises 81–100, evaluate or simplify each expression without using a calculator.

81.  $\log 100$     82.  $\log 1000$     83.  $\log 10^7$     84.  $\log 10^8$   
 85.  $10^{\log 33}$     86.  $10^{\log 53}$     87.  $\ln 1$     88.  $\ln e$   
 89.  $\ln e^6$     90.  $\ln e^7$     91.  $\ln \frac{1}{e^6}$     92.  $\ln \frac{1}{e^7}$   
 93.  $e^{\ln 125}$     94.  $e^{\ln 300}$     95.  $\ln e^{9x}$     96.  $\ln e^{13x}$   
 97.  $e^{\ln 5x^2}$     98.  $e^{\ln 7x^2}$     99.  $10^{\log \sqrt{x}}$     100.  $10^{\log \sqrt[3]{x}}$

## Practice Plus

In Exercises 101–104, write each equation in its equivalent exponential form. Then solve for  $x$ .

101.  $\log_3(x - 1) = 2$

102.  $\log_5(x + 4) = 2$

103.  $\log_4 x = -3$

104.  $\log_{64} x = \frac{2}{3}$

In Exercises 105–108, evaluate each expression without using a calculator.

105.  $\log_3(\log_7 7)$

106.  $\log_5(\log_2 32)$

107.  $\log_2(\log_3 81)$

108.  $\log(\ln e)$

In Exercises 109–112, find the domain of each logarithmic function.

109.  $f(x) = \ln(x^2 - x - 2)$

110.  $f(x) = \ln(x^2 - 4x - 12)$

111.  $f(x) = \log\left(\frac{x+1}{x-5}\right)$

112.  $f(x) = \log\left(\frac{x-2}{x+5}\right)$

## Application Exercises

The percentage of adult height attained by a girl who is  $x$  years old can be modeled by

$$f(x) = 62 + 35 \log(x - 4),$$

where  $x$  represents the girl's age (from 5 to 15) and  $f(x)$  represents the percentage of her adult height. Use the function to solve Exercises 113–114. Round answers to the nearest tenth of a percent.

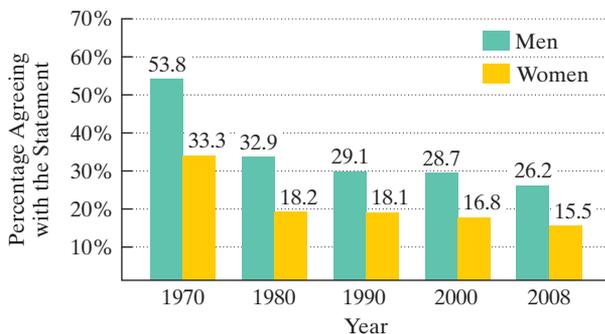

113. Approximately what percentage of her adult height has a girl attained at age 13?

114. Approximately what percentage of her adult height has a girl attained at age ten?

The bar graph indicates that the percentage of first-year college students expressing antifeminist views declined after 1970. Use this information to solve Exercises 115–116.

**Opposition to Feminism among First-Year United States College Students, 1970–2008**

Statement: "The activities of married women are best confined to the home and family."

Source: John Macionis, *Sociology, Thirteenth Edition*, Prentice Hall, 2010.

115. The function

$$f(x) = -7.52 \ln x + 53$$

models the percentage of first-year college men,  $f(x)$ , expressing antifeminist views (by agreeing with the statement)  $x$  years after 1969.

- Use the function to find the percentage of first-year college men expressing antifeminist views in 2008. Round to one decimal place. Does this function value overestimate or underestimate the percentage displayed by the graph? By how much?
- Use the function to project the percentage of first-year college men who will express antifeminist views in 2015. Round to one decimal place.

116. The function

$$f(x) = -4.82 \ln x + 32.5$$

models the percentage of first-year college women,  $f(x)$ , expressing antifeminist views (by agreeing with the statement)  $x$  years after 1969.

- Use the function to find the percentage of first-year college women expressing antifeminist views in 2008. Round to one decimal place. Does this function value overestimate or underestimate the percentage displayed by the graph? By how much?
- Use the function to project the percentage of first-year college women who will express antifeminist views in 2015. Round to one decimal place.

The loudness level of a sound,  $D$ , in decibels, is given by the formula

$$D = 10 \log(10^{12}I),$$

where  $I$  is the intensity of the sound, in watts per meter<sup>2</sup>. Decibel levels range from 0, a barely audible sound, to 160, a sound resulting in a ruptured eardrum. (Any exposure to sounds of 130 decibels or higher puts a person at immediate risk for hearing damage.) Use the formula to solve Exercises 117–118.

- The sound of a blue whale can be heard 500 miles away, reaching an intensity of  $6.3 \times 10^6$  watts per meter<sup>2</sup>. Determine the decibel level of this sound. At close range, can the sound of a blue whale rupture the human eardrum?
- What is the decibel level of a normal conversation,  $3.2 \times 10^{-6}$  watt per meter<sup>2</sup>?
- Students in a psychology class took a final examination. As part of an experiment to see how much of the course content they remembered over time, they took equivalent forms of the exam in monthly intervals thereafter. The average score for the group,  $f(t)$ , after  $t$  months was modeled by the function

$$f(t) = 88 - 15 \ln(t + 1), \quad 0 \leq t \leq 12.$$

- What was the average score on the original exam?
- What was the average score after 2 months? 4 months? 6 months? 8 months? 10 months? one year?
- Sketch the graph of  $f$  (either by hand or with a graphing utility). Describe what the graph indicates in terms of the material retained by the students.

## Writing in Mathematics

- Describe the relationship between an equation in logarithmic form and an equivalent equation in exponential form.
- What question can be asked to help evaluate  $\log_3 81$ ?
- Explain why the logarithm of 1 with base  $b$  is 0.
- Describe the following property using words:  $\log_b b^x = x$ .

124. Explain how to use the graph of  $f(x) = 2^x$  to obtain the graph of  $g(x) = \log_2 x$ .
125. Explain how to find the domain of a logarithmic function.
126. Logarithmic models are well suited to phenomena in which growth is initially rapid but then begins to level off. Describe something that is changing over time that can be modeled using a logarithmic function.
127. Suppose that a girl is 4 feet 6 inches at age 10. Explain how to use the function in Exercises 113–114 to determine how tall she can expect to be as an adult.

### Technology Exercises

In Exercises 128–131, graph  $f$  and  $g$  in the same viewing rectangle. Then describe the relationship of the graph of  $g$  to the graph of  $f$ .

128.  $f(x) = \ln x$ ,  $g(x) = \ln(x + 3)$
129.  $f(x) = \ln x$ ,  $g(x) = \ln x + 3$
130.  $f(x) = \log x$ ,  $g(x) = -\log x$
131.  $f(x) = \log x$ ,  $g(x) = \log(x - 2) + 1$
132. Students in a mathematics class took a final examination. They took equivalent forms of the exam in monthly intervals thereafter. The average score,  $f(t)$ , for the group after  $t$  months was modeled by the human memory function  $f(t) = 75 - 10 \log(t + 1)$ , where  $0 \leq t \leq 12$ . Use a graphing utility to graph the function. Then determine how many months elapsed before the average score fell below 65.
133. In parts (a)–(c), graph  $f$  and  $g$  in the same viewing rectangle.
- $f(x) = \ln(3x)$ ,  $g(x) = \ln 3 + \ln x$
  - $f(x) = \log(5x^2)$ ,  $g(x) = \log 5 + \log x^2$
  - $f(x) = \ln(2x^3)$ ,  $g(x) = \ln 2 + \ln x^3$
- d. Describe what you observe in parts (a)–(c). Generalize this observation by writing an equivalent expression for  $\log_b(MN)$ , where  $M > 0$  and  $N > 0$ .
- e. Complete this statement: The logarithm of a product is equal to \_\_\_\_\_.
134. Graph each of the following functions in the same viewing rectangle and then place the functions in order from the one that increases most slowly to the one that increases most rapidly.

$$y = x, y = \sqrt{x}, y = e^x, y = \ln x, y = x^x, y = x^2$$

### Critical Thinking Exercises

**Make Sense?** In Exercises 135–138, determine whether each statement makes sense or does not make sense, and explain your reasoning.

135. I've noticed that exponential functions and logarithmic functions exhibit inverse, or opposite, behavior in many ways. For example, a vertical translation shifts an exponential function's horizontal asymptote and a horizontal translation shifts a logarithmic function's vertical asymptote.
136. I estimate that  $\log_8 16$  lies between 1 and 2 because  $8^1 = 8$  and  $8^2 = 64$ .

137. I can evaluate some common logarithms without having to use a calculator.
138. An earthquake of magnitude 8 on the Richter scale is twice as intense as an earthquake of magnitude 4.

In Exercises 139–142, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

139.  $\frac{\log_2 8}{\log_2 4} = \frac{8}{4}$

140.  $\log(-100) = -2$

141. The domain of  $f(x) = \log_2 x$  is  $(-\infty, \infty)$ .

142.  $\log_b x$  is the exponent to which  $b$  must be raised to obtain  $x$ .

143. Without using a calculator, find the exact value of

$$\frac{\log_3 81 - \log_\pi 1}{\log_{2\sqrt{2}} 8 - \log 0.001}$$

144. Without using a calculator, find the exact value of  $\log_4[\log_3(\log_2 8)]$ .
145. Without using a calculator, determine which is the greater number:  $\log_4 60$  or  $\log_3 40$ .

### Group Exercise

146. This group exercise involves exploring the way we grow. Group members should create a graph for the function that models the percentage of adult height attained by a boy who is  $x$  years old,  $f(x) = 29 + 48.8 \log(x + 1)$ . Let  $x = 5, 6, 7, \dots, 15$ , find function values, and connect the resulting points with a smooth curve. Then create a graph for the function that models the percentage of adult height attained by a girl who is  $x$  years old,  $g(x) = 62 + 35 \log(x - 4)$ . Let  $x = 5, 6, 7, \dots, 15$ , find function values, and connect the resulting points with a smooth curve. Group members should then discuss similarities and differences in the growth patterns for boys and girls based on the graphs.

### Preview Exercises

Exercises 147–149 will help you prepare for the material covered in the next section. In each exercise, evaluate the indicated logarithmic expressions without using a calculator.

147. a. Evaluate:  $\log_2 32$ .  
 b. Evaluate:  $\log_2 8 + \log_2 4$ .  
 c. What can you conclude about  $\log_2 32$ , or  $\log_2(8 \cdot 4)$ ?
148. a. Evaluate:  $\log_2 16$ .  
 b. Evaluate:  $\log_2 32 - \log_2 2$ .  
 c. What can you conclude about

$$\log_2 16, \text{ or } \log_2 \left( \frac{32}{2} \right)?$$

149. a. Evaluate:  $\log_3 81$ .  
 b. Evaluate:  $2 \log_3 9$ .  
 c. What can you conclude about  $\log_3 81$ , or  $\log_3 9^2$ ?

## SECTION 3.3

## Properties of Logarithms

*Objectives*

- 1 Use the product rule.
- 2 Use the quotient rule.
- 3 Use the power rule.
- 4 Expand logarithmic expressions.
- 5 Condense logarithmic expressions.
- 6 Use the change-of-base property.

We all learn new things in different ways. In this section, we consider important properties of logarithms. What would be the most effective way for you to learn these properties? Would it be helpful to use your graphing utility and discover one of these properties for yourself? To do so, work Exercise 133 in Exercise Set 3.2 before continuing. Would it be helpful to evaluate certain logarithmic expressions that suggest three of the properties? If this is the case, work Preview Exercises 147–149 in Exercise Set 3.2 before continuing. Would the properties

become more meaningful if you could see exactly where they come from? If so, you will find details of the proofs of many of these properties in the appendix. The remainder of our work in this chapter will be based on the properties of logarithms that you learn in this section.

- 1 Use the product rule.

**DISCOVERY**

We know that  $\log 100,000 = 5$ . Show that you get the same result by writing 100,000 as  $1000 \cdot 100$  and then using the product rule. Then verify the product rule by using other numbers whose logarithms are easy to find.

You can find the proof of the product rule in the appendix.

**The Product Rule**

Properties of exponents correspond to properties of logarithms. For example, when we multiply with the same base, we add exponents:

$$b^m \cdot b^n = b^{m+n}.$$

This property of exponents, coupled with an awareness that a logarithm is an exponent, suggests the following property, called the **product rule**:

**The Product Rule**

Let  $b$ ,  $M$ , and  $N$  be positive real numbers with  $b \neq 1$ .

$$\log_b(MN) = \log_b M + \log_b N$$

The logarithm of a product is the sum of the logarithms.

When we use the product rule to write a single logarithm as the sum of two logarithms, we say that we are **expanding a logarithmic expression**. For example, we can use the product rule to expand  $\ln(7x)$ :

$$\ln(7x) = \ln 7 + \ln x.$$

The logarithm of a product

is

the sum of the logarithms.

**EXAMPLE 1** Using the Product Rule

Use the product rule to expand each logarithmic expression:

- a.  $\log_4(7 \cdot 5)$       b.  $\log(10x)$ .

**SOLUTION**

a.  $\log_4(7 \cdot 5) = \log_4 7 + \log_4 5$  *The logarithm of a product is the sum of the logarithms.*

b.  $\log(10x) = \log 10 + \log x$  *The logarithm of a product is the sum of the logarithms. These are common logarithms with base 10 understood.*

$$= 1 + \log x$$
 *Because  $\log_b b = 1$ , then  $\log 10 = 1$ .* ●●●

 **Check Point 1** Use the product rule to expand each logarithmic expression:

a.  $\log_6(7 \cdot 11)$

b.  $\log(100x)$

**2** Use the quotient rule.

**The Quotient Rule**

When we divide with the same base, we subtract exponents:

$$\frac{b^m}{b^n} = b^{m-n}.$$

This property suggests the following property of logarithms, called the **quotient rule**:

**DISCOVERY**

We know that  $\log_2 16 = 4$ . Show that you get the same result by writing 16 as  $\frac{32}{2}$  and then using the quotient rule. Then verify the quotient rule using other numbers whose logarithms are easy to find.

**The Quotient Rule**

Let  $b$ ,  $M$ , and  $N$  be positive real numbers with  $b \neq 1$ .

$$\log_b \left( \frac{M}{N} \right) = \log_b M - \log_b N$$

The logarithm of a quotient is the difference of the logarithms.

When we use the quotient rule to write a single logarithm as the difference of two logarithms, we say that we are **expanding a logarithmic expression**. For example, we can use the quotient rule to expand  $\log \frac{x}{2}$ :

$$\log \left( \frac{x}{2} \right) = \log x - \log 2.$$

The logarithm of a quotient

is

the difference of the logarithms.

**EXAMPLE 2** Using the Quotient Rule

Use the quotient rule to expand each logarithmic expression:

a.  $\log_7 \left( \frac{19}{x} \right)$       b.  $\ln \left( \frac{e^3}{7} \right)$

**SOLUTION**

a.  $\log_7 \left( \frac{19}{x} \right) = \log_7 19 - \log_7 x$  *The logarithm of a quotient is the difference of the logarithms.*

b.  $\ln \left( \frac{e^3}{7} \right) = \ln e^3 - \ln 7$  *The logarithm of a quotient is the difference of the logarithms. These are natural logarithms with base  $e$  understood.*

$$= 3 - \ln 7$$
 *Because  $\ln e^x = x$ , then  $\ln e^3 = 3$ .* ●●●

 **Check Point 2** Use the quotient rule to expand each logarithmic expression:

a.  $\log_8\left(\frac{23}{x}\right)$

b.  $\ln\left(\frac{e^5}{11}\right)$

**3** Use the power rule.

### The Power Rule

When an exponential expression is raised to a power, we multiply exponents:

$$(b^m)^n = b^{mn}.$$

This property suggests the following property of logarithms, called the **power rule**:

#### The Power Rule

Let  $b$  and  $M$  be positive real numbers with  $b \neq 1$ , and let  $p$  be any real number.

$$\log_b M^p = p \log_b M$$

The logarithm of a number with an exponent is the product of the exponent and the logarithm of that number.

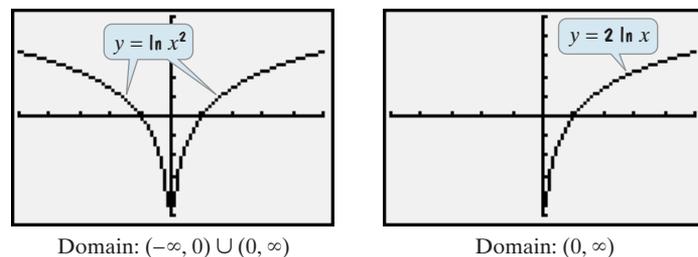

When we use the power rule to “pull the exponent to the front,” we say that we are **expanding a logarithmic expression**. For example, we can use the power rule to expand  $\ln x^2$ :

$$\ln x^2 = 2 \ln x.$$

The logarithm of a number with an exponent is the product of the exponent and the logarithm of that number.

**Figure 3.18** shows the graphs of  $y = \ln x^2$  and  $y = 2 \ln x$  in  $[-5, 5, 1]$  by  $[-5, 5, 1]$  viewing rectangles. Are  $\ln x^2$  and  $2 \ln x$  the same? The graphs illustrate that  $y = \ln x^2$  and  $y = 2 \ln x$  have different domains. The graphs are only the same if  $x > 0$ . Thus, we should write

$$\ln x^2 = 2 \ln x \text{ for } x > 0.$$

**FIGURE 3.18**  $\ln x^2$  and  $2 \ln x$  have different domains.

When expanding a logarithmic expression, you might want to determine whether the rewriting has changed the domain of the expression. For the rest of this section, assume that all variables and variable expressions represent positive numbers.

### EXAMPLE 3 Using the Power Rule

Use the power rule to expand each logarithmic expression:

a.  $\log_5 7^4$

b.  $\ln \sqrt{x}$

c.  $\log(4x)^5$

**SOLUTION**

a.  $\log_5 7^4 = 4 \log_5 7$

The logarithm of a number with an exponent is the exponent times the logarithm of the number.

b.  $\ln \sqrt{x} = \ln x^{\frac{1}{2}}$   
 $= \frac{1}{2} \ln x$

Rewrite the radical using a rational exponent.

Use the power rule to bring the exponent to the front.

c.  $\log(4x)^5 = 5 \log(4x)$

We immediately apply the power rule because the entire variable expression,  $4x$ , is raised to the 5th power. ●●●

 **Check Point 3** Use the power rule to expand each logarithmic expression:

a.  $\log_6 3^9$

b.  $\ln \sqrt[3]{x}$

c.  $\log(x + 4)^2$

**4** Expand logarithmic expressions.

**Expanding Logarithmic Expressions**

It is sometimes necessary to use more than one property of logarithms when you expand a logarithmic expression. Properties for expanding logarithmic expressions are as follows:

**Properties for Expanding Logarithmic Expressions**

For  $M > 0$  and  $N > 0$ :

1.  $\log_b(MN) = \log_b M + \log_b N$  *Product rule*

2.  $\log_b\left(\frac{M}{N}\right) = \log_b M - \log_b N$  *Quotient rule*

3.  $\log_b M^p = p \log_b M$  *Power rule*

**GREAT QUESTION!**

**Are there some common screw-ups that I can avoid when using properties of logarithms?**

The graphs show that

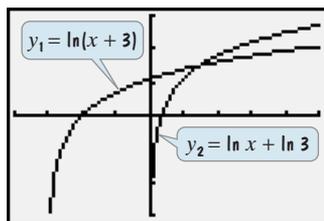

$$\ln(x + 3) \neq \ln x + \ln 3.$$

$y = \ln x$  shifted  
3 units left

$y = \ln x$  shifted  
ln 3 units up

In general,

$$\log_b(M + N) \neq \log_b M + \log_b N.$$

$[-4, 5, 1]$  by  $[-3, 3, 1]$

Try to avoid the following errors:

**Incorrect!**

~~$$\log_b(M + N) = \log_b M + \log_b N$$~~

~~$$\log_b(M - N) = \log_b M - \log_b N$$~~

~~$$\log_b(M \cdot N) = \log_b M \cdot \log_b N$$~~

~~$$\log_b\left(\frac{M}{N}\right) = \frac{\log_b M}{\log_b N}$$~~

~~$$\frac{\log_b M}{\log_b N} = \log_b M - \log_b N$$~~

~~$$\log_b(MN^p) = p \log_b(MN)$$~~

**EXAMPLE 4** Expanding Logarithmic Expressions

Use logarithmic properties to expand each expression as much as possible:

a.  $\log_b(x^2\sqrt{y})$

b.  $\log_6\left(\frac{\sqrt[3]{x}}{36y^4}\right)$

## SOLUTION

We will have to use two or more of the properties for expanding logarithms in each part of this example.

a.  $\log_b(x^2\sqrt{y}) = \log_b(x^2y^{\frac{1}{2}})$  Use exponential notation.

$$= \log_b x^2 + \log_b y^{\frac{1}{2}}$$

Use the product rule.

$$= 2 \log_b x + \frac{1}{2} \log_b y$$

Use the power rule.

b.  $\log_6\left(\frac{\sqrt[3]{x}}{36y^4}\right) = \log_6\left(\frac{x^{\frac{1}{3}}}{36y^4}\right)$  Use exponential notation.

$$= \log_6 x^{\frac{1}{3}} - \log_6(36y^4)$$

Use the quotient rule.

$$= \log_6 x^{\frac{1}{3}} - (\log_6 36 + \log_6 y^4)$$

Use the product rule on  $\log_6(36y^4)$ .

$$= \frac{1}{3} \log_6 x - (\log_6 36 + 4 \log_6 y)$$

Use the power rule.

$$= \frac{1}{3} \log_6 x - \log_6 36 - 4 \log_6 y$$

Apply the distributive property.

$$= \frac{1}{3} \log_6 x - 2 - 4 \log_6 y$$

Use  $\log_6 36 = 2$  because 2 is the power to which we must raise 6 to get 36. ( $6^2 = 36$ ) ●●●

 **Check Point 4** Use logarithmic properties to expand each expression as much as possible:

a.  $\log_b(x^4\sqrt[3]{y})$

b.  $\log_5\left(\frac{\sqrt{x}}{25y^3}\right)$

**5** Condense logarithmic expressions.

## GREAT QUESTION!

Are the properties listed on the right the same as those in the box on page 444?

Yes. The only difference is that we've reversed the sides in each property from the previous box.

## Condensing Logarithmic Expressions

To **condense a logarithmic expression**, we write the sum or difference of two or more logarithmic expressions as a single logarithmic expression. We use the properties of logarithms to do so.

## Properties for Condensing Logarithmic Expressions

For  $M > 0$  and  $N > 0$ :

1.  $\log_b M + \log_b N = \log_b(MN)$  Product rule

2.  $\log_b M - \log_b N = \log_b\left(\frac{M}{N}\right)$  Quotient rule

3.  $p \log_b M = \log_b M^p$  Power rule

## EXAMPLE 5 Condensing Logarithmic Expressions

Write as a single logarithm:

a.  $\log_4 2 + \log_4 32$

b.  $\log(4x - 3) - \log x$

## SOLUTION

a.  $\log_4 2 + \log_4 32 = \log_4(2 \cdot 32)$  Use the product rule.

$$= \log_4 64$$

We now have a single logarithm. However, we can simplify.

$$= 3$$

$\log_4 64 = 3$  because  $4^3 = 64$ .

b.  $\log(4x - 3) - \log x = \log\left(\frac{4x - 3}{x}\right)$  Use the quotient rule. ●●●

 **Check Point 5** Write as a single logarithm:

a.  $\log 25 + \log 4$

b.  $\log(7x + 6) - \log x$

**Coefficients of logarithms must be 1 before you can condense them using the product and quotient rules.** For example, to condense

$$2 \ln x + \ln(x + 1),$$

the coefficient of the first term must be 1. We use the power rule to rewrite the coefficient as an exponent:

1. Use the power rule to make the number in front an exponent.

$$2 \ln x + \ln(x + 1) = \ln x^2 + \ln(x + 1) = \ln[x^2(x + 1)].$$

2. Use the product rule. The sum of logarithms with coefficients of 1 is the logarithm of the product.

### EXAMPLE 6 Condensing Logarithmic Expressions

Write as a single logarithm:

a.  $\frac{1}{2} \log x + 4 \log(x - 1)$

b.  $3 \ln(x + 7) - \ln x$

c.  $4 \log_b x - 2 \log_b 6 - \frac{1}{2} \log_b y$

#### SOLUTION

a.  $\frac{1}{2} \log x + 4 \log(x - 1)$

$$= \log x^{\frac{1}{2}} + \log(x - 1)^4$$

$$= \log[x^{\frac{1}{2}}(x - 1)^4]$$

Use the power rule so that all coefficients are 1.

Use the product rule. The condensed form can be expressed as  $\log[\sqrt{x}(x - 1)^4]$ .

b.  $3 \ln(x + 7) - \ln x$

$$= \ln(x + 7)^3 - \ln x$$

$$= \ln\left[\frac{(x + 7)^3}{x}\right]$$

Use the power rule so that all coefficients are 1.

Use the quotient rule.

c.  $4 \log_b x - 2 \log_b 6 - \frac{1}{2} \log_b y$

$$= \log_b x^4 - \log_b 6^2 - \log_b y^{\frac{1}{2}}$$

$$= \log_b x^4 - (\log_b 36 + \log_b y^{\frac{1}{2}})$$

$$= \log_b x^4 - \log_b(36y^{\frac{1}{2}})$$

$$= \log_b\left(\frac{x^4}{36y^{\frac{1}{2}}}\right) \text{ or } \log_b\left(\frac{x^4}{36\sqrt{y}}\right)$$

Use the power rule so that all coefficients are 1.

Rewrite as a single subtraction.

Use the product rule.

Use the quotient rule. ...

 **Check Point 6** Write as a single logarithm:

a.  $2 \ln x + \frac{1}{3} \ln(x + 5)$

b.  $2 \log(x - 3) - \log x$

c.  $\frac{1}{4} \log_b x - 2 \log_b 5 - 10 \log_b y$

**6** Use the change-of-base property.

### The Change-of-Base Property

We have seen that calculators give the values of both common logarithms (base 10) and natural logarithms (base  $e$ ). To find a logarithm with any other base, we can use the following change-of-base property:

### The Change-of-Base Property

For any logarithmic bases  $a$  and  $b$ , and any positive number  $M$ ,

$$\log_b M = \frac{\log_a M}{\log_a b}.$$

The logarithm of  $M$  with base  $b$  is equal to the logarithm of  $M$  with any new base divided by the logarithm of  $b$  with that new base.

In the change-of-base property, base  $b$  is the base of the original logarithm. Base  $a$  is a new base that we introduce. Thus, the change-of-base property allows us to change from base  $b$  to *any* new base  $a$ , as long as the newly introduced base is a positive number not equal to 1.

The change-of-base property is used to write a logarithm in terms of quantities that can be evaluated with a calculator. Because calculators contain keys for common (base 10) and natural (base  $e$ ) logarithms, we will frequently introduce base 10 or base  $e$ .

Change-of-Base Property	Introducing Common Logarithms	Introducing Natural Logarithms
$\log_b M = \frac{\log_a M}{\log_a b}$ <p><i>a</i> is the new introduced base.</p>	$\log_b M = \frac{\log_{10} M}{\log_{10} b}$ <p>10 is the new introduced base.</p>	$\log_b M = \frac{\log_e M}{\log_e b}$ <p><i>e</i> is the new introduced base.</p>

Using the notations for common logarithms and natural logarithms, we have the following results:

### The Change-of-Base Property: Introducing Common and Natural Logarithms

#### Introducing Common Logarithms

$$\log_b M = \frac{\log M}{\log b}$$

#### Introducing Natural Logarithms

$$\log_b M = \frac{\ln M}{\ln b}$$

### EXAMPLE 7 Changing Base to Common Logarithms

Use common logarithms to evaluate  $\log_5 140$ .

#### SOLUTION

Because  $\log_b M = \frac{\log M}{\log b}$ ,

$$\begin{aligned} \log_5 140 &= \frac{\log 140}{\log 5} \\ &\approx 3.07. \end{aligned}$$

Use a calculator:  $140 \text{ LOG } \div 5 \text{ LOG } =$   
or  $\text{LOG } 140 \div \text{LOG } 5 \text{ ENTER}$ . On some calculators, parentheses are needed after 140 and 5.

This means that  $\log_5 140 \approx 3.07$ .

### DISCOVERY

Find a reasonable estimate of  $\log_5 140$  to the nearest whole number. To what power can you raise 5 in order to get 140? Compare your estimate to the value obtained in Example 7.

 **Check Point 7** Use common logarithms to evaluate  $\log_7 2506$ .

**EXAMPLE 8** Changing Base to Natural LogarithmsUse natural logarithms to evaluate  $\log_5 140$ .**SOLUTION**

$$\text{Because } \log_b M = \frac{\ln M}{\ln b},$$

$$\log_5 140 = \frac{\ln 140}{\ln 5}$$

$$\approx 3.07.$$

Use a calculator:  $140 \div 5 \ln =$ or  $\ln 140 \div \ln 5 \text{ ENTER}$ . On some calculators, parentheses are needed after 140 and 5.We have again shown that  $\log_5 140 \approx 3.07$ . **Check Point 8** Use natural logarithms to evaluate  $\log_7 2506$ .**TECHNOLOGY**

We can use the change-of-base property to graph logarithmic functions with bases other than 10 or  $e$  on a graphing utility. For example, **Figure 3.19** shows the graphs of

$$y = \log_2 x \quad \text{and} \quad y = \log_{20} x$$

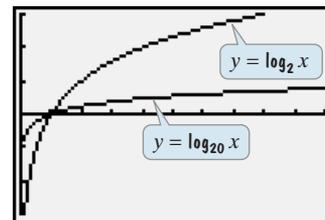

in a  $[0, 10, 1]$  by  $[-3, 3, 1]$  viewing rectangle. Because

$\log_2 x = \frac{\ln x}{\ln 2}$  and  $\log_{20} x = \frac{\ln x}{\ln 20}$ , the functions are entered as

$$y_1 = \frac{\ln x}{\ln 2}$$

$$\text{and } y_2 = \frac{\ln x}{\ln 20}.$$

On some calculators, parentheses are needed after  $x$ , 2, and 20.

**FIGURE 3.19** Using the change-of-base property to graph logarithmic functions

**CONCEPT AND VOCABULARY CHECK**

Fill in each blank so that the resulting statement is true.

- The product rule for logarithms states that  $\log_b(MN) = \underline{\hspace{2cm}}$ . The logarithm of a product is the            of the logarithms.
- The quotient rule for logarithms states that  $\log_b\left(\frac{M}{N}\right) = \underline{\hspace{2cm}}$ . The logarithm of a quotient is the            of the logarithms.
- The power rule for logarithms states that  $\log_b M^P = \underline{\hspace{2cm}}$ . The logarithm of a number with an exponent is the            of the exponent and the logarithm of that number.

- The change-of-base property for logarithms allows us to write logarithms with base  $b$  in terms of a new base  $a$ . Introducing base  $a$ , the property states that

$$\log_b M = \frac{\underline{\hspace{1cm}}}{\underline{\hspace{1cm}}}.$$

## EXERCISE SET 3.3

## Practice Exercises

In Exercises 1–40, use properties of logarithms to expand each logarithmic expression as much as possible. Where possible, evaluate logarithmic expressions without using a calculator.

1.  $\log_5(7 \cdot 3)$
2.  $\log_8(13 \cdot 7)$
3.  $\log_7(7x)$
4.  $\log_9(9x)$
5.  $\log(1000x)$
6.  $\log(10,000x)$
7.  $\log_7\left(\frac{7}{x}\right)$
8.  $\log_9\left(\frac{9}{x}\right)$
9.  $\log\left(\frac{x}{100}\right)$
10.  $\log\left(\frac{x}{1000}\right)$
11.  $\log_4\left(\frac{64}{y}\right)$
12.  $\log_5\left(\frac{125}{y}\right)$
13.  $\ln\left(\frac{e^2}{5}\right)$
14.  $\ln\left(\frac{e^4}{8}\right)$
15.  $\log_b x^3$
16.  $\log_b x^7$
17.  $\log N^{-6}$
18.  $\log M^{-8}$
19.  $\ln \sqrt[3]{x}$
20.  $\ln \sqrt{x}$
21.  $\log_b(x^2 y)$
22.  $\log_b(xy^3)$
23.  $\log_4\left(\frac{\sqrt{x}}{64}\right)$
24.  $\log_5\left(\frac{\sqrt{x}}{25}\right)$
25.  $\log_6\left(\frac{36}{\sqrt{x+1}}\right)$
26.  $\log_8\left(\frac{64}{\sqrt{x+1}}\right)$
27.  $\log_b\left(\frac{x^2 y}{z^2}\right)$
28.  $\log_b\left(\frac{x^3 y}{z^2}\right)$
29.  $\log \sqrt{100x}$
30.  $\ln \sqrt{ex}$
31.  $\log \sqrt[3]{\frac{x}{y}}$
32.  $\log \sqrt[5]{\frac{x}{y}}$
33.  $\log_b\left(\frac{\sqrt{xy^3}}{z^3}\right)$
34.  $\log_b\left(\frac{\sqrt[3]{xy^4}}{z^5}\right)$
35.  $\log_5 \sqrt[3]{\frac{x^2 y}{25}}$
36.  $\log_2 \sqrt[5]{\frac{xy^4}{16}}$
37.  $\ln \left[ \frac{x^3 \sqrt{x^2 + 1}}{(x + 1)^4} \right]$
38.  $\ln \left[ \frac{x^4 \sqrt{x^2 + 3}}{(x + 3)^5} \right]$
39.  $\log \left[ \frac{10x^2 \sqrt[3]{1 - x}}{7(x + 1)^2} \right]$
40.  $\log \left[ \frac{100x^3 \sqrt[3]{5 - x}}{3(x + 7)^2} \right]$

In Exercises 41–70, use properties of logarithms to condense each logarithmic expression. Write the expression as a single logarithm whose coefficient is 1. Where possible, evaluate logarithmic expressions without using a calculator.

41.  $\log 5 + \log 2$
42.  $\log 250 + \log 4$
43.  $\ln x + \ln 7$
44.  $\ln x + \ln 3$
45.  $\log_2 96 - \log_2 3$
46.  $\log_3 405 - \log_3 5$
47.  $\log(2x + 5) - \log x$
48.  $\log(3x + 7) - \log x$
49.  $\log x + 3 \log y$
50.  $\log x + 7 \log y$
51.  $\frac{1}{2} \ln x + \ln y$
52.  $\frac{1}{3} \ln x + \ln y$
53.  $2 \log_b x + 3 \log_b y$
54.  $5 \log_b x + 6 \log_b y$
55.  $5 \ln x - 2 \ln y$
56.  $7 \ln x - 3 \ln y$
57.  $3 \ln x - \frac{1}{3} \ln y$
58.  $2 \ln x - \frac{1}{2} \ln y$
59.  $4 \ln(x + 6) - 3 \ln x$
60.  $8 \ln(x + 9) - 4 \ln x$
61.  $3 \ln x + 5 \ln y - 6 \ln z$
62.  $4 \ln x + 7 \ln y - 3 \ln z$
63.  $\frac{1}{2}(\log x + \log y)$
64.  $\frac{1}{3}(\log_4 x - \log_4 y)$
65.  $\frac{1}{2}(\log_5 x + \log_5 y) - 2 \log_5(x + 1)$
66.  $\frac{1}{3}(\log_4 x - \log_4 y) + 2 \log_4(x + 1)$
67.  $\frac{1}{3}[2 \ln(x + 5) - \ln x - \ln(x^2 - 4)]$
68.  $\frac{1}{3}[5 \ln(x + 6) - \ln x - \ln(x^2 - 25)]$

69.  $\log x + \log(x^2 - 1) - \log 7 - \log(x + 1)$
70.  $\log x + \log(x^2 - 4) - \log 15 - \log(x + 2)$

In Exercises 71–78, use common logarithms or natural logarithms and a calculator to evaluate to four decimal places.

71.  $\log_5 13$
72.  $\log_6 17$
73.  $\log_{14} 87.5$
74.  $\log_{16} 57.2$
75.  $\log_{0.1} 17$
76.  $\log_{0.3} 19$
77.  $\log_\pi 63$
78.  $\log_\pi 400$

In Exercises 79–82, use a graphing utility and the change-of-base property to graph each function.

79.  $y = \log_3 x$
80.  $y = \log_{15} x$
81.  $y = \log_2(x + 2)$
82.  $y = \log_3(x - 2)$

## Practice Plus

In Exercises 83–88, let  $\log_b 2 = A$  and  $\log_b 3 = C$ . Write each expression in terms of  $A$  and  $C$ .

83.  $\log_b \frac{3}{2}$
84.  $\log_b 6$
85.  $\log_b 8$
86.  $\log_b 81$
87.  $\log_b \sqrt{\frac{2}{27}}$
88.  $\log_b \sqrt{\frac{3}{16}}$

In Exercises 89–102, determine whether each equation is true or false. Where possible, show work to support your conclusion. If the statement is false, make the necessary change(s) to produce a true statement.

89.  $\ln e = 0$
90.  $\ln 0 = e$
91.  $\log_4(2x^3) = 3 \log_4(2x)$
92.  $\ln(8x^3) = 3 \ln(2x)$
93.  $x \log 10^x = x^2$
94.  $\ln(x + 1) = \ln x + \ln 1$
95.  $\ln(5x) + \ln 1 = \ln(5x)$
96.  $\ln x + \ln(2x) = \ln(3x)$
97.  $\log(x + 3) - \log(2x) = \frac{\log(x + 3)}{\log(2x)}$
98.  $\frac{\log(x + 2)}{\log(x - 1)} = \log(x + 2) - \log(x - 1)$
99.  $\log_6\left(\frac{x - 1}{x^2 + 4}\right) = \log_6(x - 1) - \log_6(x^2 + 4)$
100.  $\log_6[4(x + 1)] = \log_6 4 + \log_6(x + 1)$
101.  $\log_3 7 = \frac{1}{\log_7 3}$
102.  $e^x = \frac{1}{\ln x}$

## Application Exercises

103. The loudness level of a sound can be expressed by comparing the sound's intensity to the intensity of a sound barely audible to the human ear. The formula

$$D = 10(\log I - \log I_0)$$

describes the loudness level of a sound,  $D$ , in decibels, where  $I$  is the intensity of the sound, in watts per meter<sup>2</sup>, and  $I_0$  is the intensity of a sound barely audible to the human ear.

- a. Express the formula so that the expression in parentheses is written as a single logarithm.
- b. Use the form of the formula from part (a) to answer this question: If a sound has an intensity 100 times the intensity of a softer sound, how much larger on the decibel scale is the loudness level of the more intense sound?

104. The formula

$$t = \frac{1}{c}[\ln A - \ln(A - N)]$$

describes the time,  $t$ , in weeks, that it takes to achieve mastery of a portion of a task, where  $A$  is the maximum learning possible,  $N$  is the portion of the learning that is to be achieved, and  $c$  is a constant used to measure an individual's learning style.

- Express the formula so that the expression in brackets is written as a single logarithm.
- The formula is also used to determine how long it will take chimpanzees and apes to master a task. For example, a typical chimpanzee learning sign language can master a maximum of 65 signs. Use the form of the formula from part (a) to answer this question: How many weeks will it take a chimpanzee to master 30 signs if  $c$  for that chimp is 0.03?

### Writing in Mathematics

- Describe the product rule for logarithms and give an example.
- Describe the quotient rule for logarithms and give an example.
- Describe the power rule for logarithms and give an example.
- Without showing the details, explain how to condense  $\ln x - 2 \ln(x + 1)$ .
- Describe the change-of-base property and give an example.
- Explain how to use your calculator to find  $\log_{14} 283$ .
- You overhear a student talking about a property of logarithms in which division becomes subtraction. Explain what the student means by this.
- Find  $\ln 2$  using a calculator. Then calculate each of the following:  $1 - \frac{1}{2}$ ;  $1 - \frac{1}{2} + \frac{1}{3}$ ;  $1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4}$ ;  $1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5}$ ; .... Describe what you observe.

### Technology Exercises

- Use a graphing utility (and the change-of-base property) to graph  $y = \log_3 x$ .
  - Graph  $y = 2 + \log_3 x$ ,  $y = \log_3(x + 2)$ , and  $y = -\log_3 x$  in the same viewing rectangle as  $y = \log_3 x$ . Then describe the change or changes that need to be made to the graph of  $y = \log_3 x$  to obtain each of these three graphs.
- Graph  $y = \log x$ ,  $y = \log(10x)$ , and  $y = \log(0.1x)$  in the same viewing rectangle. Describe the relationship among the three graphs. What logarithmic property accounts for this relationship?
- Use a graphing utility and the change-of-base property to graph  $y = \log_3 x$ ,  $y = \log_{25} x$ , and  $y = \log_{100} x$  in the same viewing rectangle.
  - Which graph is on the top in the interval  $(0, 1)$ ? Which is on the bottom?
  - Which graph is on the top in the interval  $(1, \infty)$ ? Which is on the bottom?
  - Generalize by writing a statement about which graph is on top, which is on the bottom, and in which intervals, using  $y = \log_b x$  where  $b > 1$ .

Disprove each statement in Exercises 116–120 by

- letting  $y$  equal a positive constant of your choice, and
- using a graphing utility to graph the function on each side of the equal sign. The two functions should have different graphs, showing that the equation is not true in general.

116.  $\log(x + y) = \log x + \log y$

117.  $\log\left(\frac{x}{y}\right) = \frac{\log x}{\log y}$

118.  $\ln(x - y) = \ln x - \ln y$

119.  $\ln(xy) = (\ln x)(\ln y)$

120.  $\frac{\ln x}{\ln y} = \ln x - \ln y$

### Critical Thinking Exercises

**Make Sense?** In Exercises 121–124, determine whether each statement makes sense or does not make sense, and explain your reasoning.

- Because I cannot simplify the expression  $b^m + b^n$  by adding exponents, there is no property for the logarithm of a sum.
- Because logarithms are exponents, the product, quotient, and power rules remind me of properties for operations with exponents.
- I can use any positive number other than 1 in the change-of-base property, but the only practical bases are 10 and  $e$  because my calculator gives logarithms for these two bases.
- I expanded  $\log_4 \sqrt{\frac{x}{y}}$  by writing the radical using a rational exponent and then applying the quotient rule, obtaining  $\frac{1}{2} \log_4 x - \log_4 y$ .

In Exercises 125–128, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

125.  $\ln \sqrt{2} = \frac{\ln 2}{2}$

126.  $\frac{\log_7 49}{\log_7 7} = \log_7 49 - \log_7 7$

127.  $\log_b(x^3 + y^3) = 3 \log_b x + 3 \log_b y$

128.  $\log_b(xy)^5 = (\log_b x + \log_b y)^5$

129. Use the change-of-base property to prove that

$$\log e = \frac{1}{\ln 10}.$$

130. If  $\log 3 = A$  and  $\log 7 = B$ , find  $\log_7 9$  in terms of  $A$  and  $B$ .

131. Write as a single term that does not contain a logarithm:

$$e^{\ln 8x^5 - \ln 2x^2}.$$

132. If  $f(x) = \log_b x$ , show that

$$\frac{f(x + h) - f(x)}{h} = \log_b \left(1 + \frac{h}{x}\right)^{\frac{1}{h}}, h \neq 0.$$

133. Use the proof of the product rule in the appendix to prove the quotient rule.

### Preview Exercises

Exercises 134–136 will help you prepare for the material covered in the next section.

134. Solve for  $x$ :  $a(x - 2) = b(2x + 3)$ .

135. Solve:  $x(x - 7) = 3$ .

136. Solve:  $\frac{x + 2}{4x + 3} = \frac{1}{x}$ .

## CHAPTER 3

## Mid-Chapter Check Point

**WHAT YOU KNOW:** We evaluated and graphed exponential functions  $[f(x) = b^x, b > 0$  and  $b \neq 1]$ , including the natural exponential function  $[f(x) = e^x, e \approx 2.718]$ . A function has an inverse that is a function if there is no horizontal line that intersects the function's graph more than once. The exponential function passes this horizontal line test and we called the inverse of the exponential function with base  $b$  the logarithmic function with base  $b$ . We learned that  $y = \log_b x$  is equivalent to  $b^y = x$ . We evaluated and graphed logarithmic functions, including the common logarithmic function  $[f(x) = \log_{10} x$  or  $f(x) = \log x]$  and the natural logarithmic function  $[f(x) = \log_e x$  or  $f(x) = \ln x]$ . We learned to use transformations to graph exponential and logarithmic functions. Finally, we used properties of logarithms to expand and condense logarithmic expressions.

In Exercises 1–5, graph  $f$  and  $g$  in the same rectangular coordinate system. Graph and give equations of all asymptotes. Give each function's domain and range.

- $f(x) = 2^x$  and  $g(x) = 2^x - 3$
- $f(x) = \left(\frac{1}{2}\right)^x$  and  $g(x) = \left(\frac{1}{2}\right)^{x-1}$
- $f(x) = e^x$  and  $g(x) = \ln x$
- $f(x) = \log_2 x$  and  $g(x) = \log_2(x - 1) + 1$
- $f(x) = \log_{\frac{1}{2}} x$  and  $g(x) = -2 \log_{\frac{1}{2}} x$

In Exercises 6–9, find the domain of each function.

- $f(x) = \log_3(x + 6)$
- $h(x) = \log_3(x + 6)^2$
- $g(x) = \log_3 x + 6$
- $f(x) = 3^{x+6}$

In Exercises 10–20, evaluate each expression without using a calculator. If evaluation is not possible, state the reason.

- $\log_2 8 + \log_5 25$
- $\log_3 \frac{1}{9}$
- $\log_{100} 10$
- $\log \sqrt[3]{10}$
- $\log_2(\log_3 81)$
- $\log_3(\log_2 \frac{1}{8})$
- $6^{\log_6 5}$
- $\ln e^{\sqrt{7}}$
- $10^{\log 13}$
- $\log_{100} 0.1$
- $\log_{\pi} \pi^{\sqrt{\pi}}$

In Exercises 21–22, expand and evaluate numerical terms.

- $\log\left(\frac{\sqrt{xy}}{1000}\right)$
- $\ln(e^{19} x^{20})$

In Exercises 23–25, write each expression as a single logarithm.

- $8 \log_7 x - \frac{1}{3} \log_7 y$
- $7 \log_5 x + 2 \log_5 x$
- $\frac{1}{2} \ln x - 3 \ln y - \ln(z - 2)$
- Use the formulas

$$A = P\left(1 + \frac{r}{n}\right)^{nt} \quad \text{and} \quad A = Pe^{rt}$$

to solve this exercise. You decide to invest \$8000 for 3 years at an annual rate of 8%. How much more is the return if the interest is compounded continuously than if it is compounded monthly? Round to the nearest dollar.

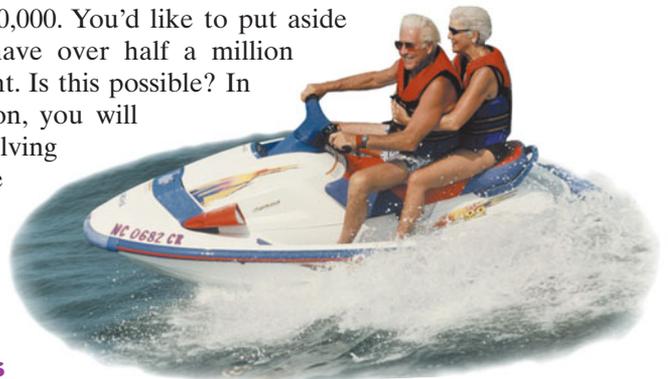

## SECTION 3.4

## Exponential and Logarithmic Equations

## Objectives

- Use like bases to solve exponential equations.
- Use logarithms to solve exponential equations.
- Use the definition of a logarithm to solve logarithmic equations.
- Use the one-to-one property of logarithms to solve logarithmic equations.
- Solve applied problems involving exponential and logarithmic equations.

At age 20, you inherit \$30,000. You'd like to put aside \$25,000 and eventually have over half a million dollars for early retirement. Is this possible? In Example 10 in this section, you will see how techniques for solving equations with variable exponents provide an answer to this question.

## Exponential Equations

An **exponential equation** is an equation containing a variable in an exponent. Examples of exponential equations include

$$2^{3x-8} = 16, \quad 4^x = 15, \quad \text{and} \quad 40e^{0.6x} = 240.$$

Some exponential equations can be solved by expressing each side of the equation as a power of the same base. All exponential functions are one-to-one—that is, no two different ordered pairs have the same second component. Thus, if  $b$  is a positive number other than 1 and  $b^M = b^N$ , then  $M = N$ .

- 1 Use like bases to solve exponential equations.

### Solving Exponential Equations by Expressing Each Side as a Power of the Same Base

If  $b^M = b^N$ , then  $M = N$ .

Express each side as a power of the same base.

Set the exponents equal to each other.

1. Rewrite the equation in the form  $b^M = b^N$ .
2. Set  $M = N$ .
3. Solve for the variable.

## TECHNOLOGY

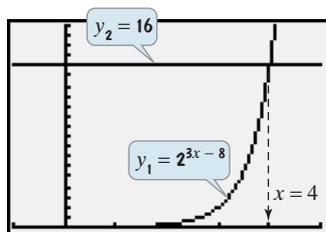

### Graphic Connections

The graphs of

$$y_1 = 2^{3x-8}$$

and  $y_2 = 16$

have an intersection point whose  $x$ -coordinate is 4. This verifies that  $\{4\}$  is the solution set of  $2^{3x-8} = 16$ .

$[-1, 5, 1]$  by  $[0, 20, 1]$

### EXAMPLE 1 Solving Exponential Equations

Solve:

a.  $2^{3x-8} = 16$       b.  $27^{x+3} = 9^{x-1}$ .

### SOLUTION

In each equation, express both sides as a power of the same base. Then set the exponents equal to each other and solve for the variable.

- a. Because 16 is  $2^4$ , we express each side of  $2^{3x-8} = 16$  in terms of base 2.

$$\begin{aligned} 2^{3x-8} &= 16 && \text{This is the given equation.} \\ 2^{3x-8} &= 2^4 && \text{Write each side as a power of the same base.} \\ 3x - 8 &= 4 && \text{If } b^M = b^N, b > 0 \text{ and } b \neq 1, \text{ then } M = N. \\ 3x &= 12 && \text{Add 8 to both sides.} \\ x &= 4 && \text{Divide both sides by 3.} \end{aligned}$$

Substituting 4 for  $x$  into the original equation produces the true statement  $16 = 16$ . The solution set is  $\{4\}$ .

- b. Because  $27 = 3^3$  and  $9 = 3^2$ , we can express both sides of  $27^{x+3} = 9^{x-1}$  in terms of base 3.

$$\begin{aligned} 27^{x+3} &= 9^{x-1} && \text{This is the given equation.} \\ (3^3)^{x+3} &= (3^2)^{x-1} && \text{Write each side as a power of the same base.} \\ 3^{3(x+3)} &= 3^{2(x-1)} && \text{When an exponential expression is raised to a power, multiply exponents.} \\ 3(x+3) &= 2(x-1) && \text{If two powers of the same base are equal, then the exponents are equal.} \\ 3x+9 &= 2x-2 && \text{Apply the distributive property.} \\ x+9 &= -2 && \text{Subtract } 2x \text{ from both sides.} \\ x &= -11 && \text{Subtract 9 from both sides.} \end{aligned}$$

Substituting  $-11$  for  $x$  into the original equation produces  $27^{-8} = 9^{-12}$ , which simplifies to the true statement  $3^{-24} = 3^{-24}$ . The solution set is  $\{-11\}$ . ●●●

### Check Point 1 Solve:

a.  $5^{3x-6} = 125$       b.  $8^{x+2} = 4^{x-3}$ .

- 2 Use logarithms to solve exponential equations.

Most exponential equations cannot be rewritten so that each side has the same base. Here are two examples:

$$4^x = 15$$

We cannot rewrite both sides in terms of base 2 or base 4.

$$10^x = 120,000.$$

We cannot rewrite both sides in terms of base 10.

Logarithms are extremely useful in solving these equations. The solution begins with isolating the exponential expression. Notice that the exponential expression is already isolated in both  $4^x = 15$  and  $10^x = 120,000$ . Then we take the logarithm on both sides. Why can we do this? All logarithmic relations are functions. Thus, if  $M$  and  $N$  are positive real numbers and  $M = N$ , then  $\log_b M = \log_b N$ .

The base that is used when taking the logarithm on both sides of an equation can be any base at all. If the exponential equation involves base 10, as in  $10^x = 120,000$ , we'll take the common logarithm on both sides. If the exponential equation involves any other base, as in  $4^x = 15$ , we'll take the natural logarithm on both sides.

### Using Logarithms to Solve Exponential Equations

1. Isolate the exponential expression.
2. Take the common logarithm on both sides of the equation for base 10. Take the natural logarithm on both sides of the equation for bases other than 10.
3. Simplify using one of the following properties:

$$\ln b^x = x \ln b \quad \text{or} \quad \ln e^x = x \quad \text{or} \quad \log 10^x = x.$$

4. Solve for the variable.

### EXAMPLE 2 Solving Exponential Equations

Solve:

a.  $4^x = 15$       b.  $10^x = 120,000$ .

#### SOLUTION

We will use the natural logarithmic function to solve  $4^x = 15$  and the common logarithmic function to solve  $10^x = 120,000$ .

- a. Because the exponential expression,  $4^x$ , is already isolated on the left side of  $4^x = 15$ , we begin by taking the natural logarithm on both sides of the equation.

$$4^x = 15 \quad \text{This is the given equation.}$$

$$\ln 4^x = \ln 15 \quad \text{Take the natural logarithm on both sides.}$$

$$x \ln 4 = \ln 15 \quad \text{Use the power rule and bring the variable exponent to the front: } \ln b^x = x \ln b.$$

$$x = \frac{\ln 15}{\ln 4} \quad \text{Solve for } x \text{ by dividing both sides by } \ln 4. \text{ Equivalently, } x = \log_4 15.$$

We now have an exact value for  $x$ . We use the exact value for  $x$  in the equation's solution set. Thus, the equation's solution is  $\frac{\ln 15}{\ln 4}$  and the solution set is

$\left\{ \frac{\ln 15}{\ln 4} \right\}$ . We can obtain a decimal approximation by using a calculator:  $x \approx 1.95$ . Because  $4^2 = 16$ , it seems reasonable that the solution to  $4^x = 15$  is approximately 1.95.

- b. Because the exponential expression,  $10^x$ , is already isolated on the left side of  $10^x = 120,000$ , we begin by taking the common logarithm on both sides of the equation.

$$10^x = 120,000 \quad \text{This is the given equation.}$$

$$\log 10^x = \log 120,000 \quad \text{Take the common logarithm on both sides.}$$

$$x = \log 120,000 \quad \text{Use the inverse property } \log 10^x = x \text{ on the left.}$$

The equation's solution is  $\log 120,000$  and the solution set is  $\{\log 120,000\}$ . We can obtain a decimal approximation by using a calculator:  $x \approx 5.08$ . Because  $10^5 = 100,000$ , it seems reasonable that the solution to  $10^x = 120,000$  is approximately 5.08.

### DISCOVERY

Keep in mind that the base used when taking the logarithm on both sides of an equation can be any base at all. Solve  $4^x = 15$  by taking the common logarithm on both sides. Solve again, this time taking the logarithm with base 4 on both sides. Use the change-of-base property to show that the solutions are the same as the one obtained in Example 2(a).

 **Check Point 2** Solve:

a.  $5^x = 134$

b.  $10^x = 8000$ .

Find each solution set and then use a calculator to obtain a decimal approximation to two decimal places for the solution.

**EXAMPLE 3** Solving an Exponential Equation

Solve:  $40e^{0.6x} - 3 = 237$ .

**SOLUTION**

We begin by adding 3 to both sides and dividing both sides by 40 to isolate the exponential expression,  $e^{0.6x}$ . Then we take the natural logarithm on both sides of the equation.

$$40e^{0.6x} - 3 = 237$$

*This is the given equation.*

$$40e^{0.6x} = 240$$

*Add 3 to both sides.*

$$e^{0.6x} = 6$$

*Isolate the exponential factor by dividing both sides by 40.*

$$\ln e^{0.6x} = \ln 6$$

*Take the natural logarithm on both sides.*

$$0.6x = \ln 6$$

*Use the inverse property  $\ln e^x = x$  on the left.*

$$x = \frac{\ln 6}{0.6} \approx 2.99$$

*Divide both sides by 0.6 and solve for x.*

Thus, the solution of the equation is  $\frac{\ln 6}{0.6} \approx 2.99$ . Try checking this approximate solution in the original equation to verify that  $\left\{ \frac{\ln 6}{0.6} \right\}$  is the solution set. ●●●

 **Check Point 3** Solve:  $7e^{2x} - 5 = 58$ . Find the solution set and then use a calculator to obtain a decimal approximation to two decimal places for the solution.

**EXAMPLE 4** Solving an Exponential Equation

Solve:  $5^{x-2} = 4^{2x+3}$ .

**SOLUTION**

Because each exponential expression is isolated on one side of the equation, we begin by taking the natural logarithm on both sides.

$$5^{x-2} = 4^{2x+3}$$

*This is the given equation.*

$$\ln 5^{x-2} = \ln 4^{2x+3}$$

*Take the natural logarithm on both sides.*

**Be sure to insert parentheses around the binomials.**

$$(x - 2) \ln 5 = (2x + 3) \ln 4$$

*Use the power rule and bring the variable exponents to the front:  $\ln b^x = x \ln b$ .*

**Remember that  $\ln 5$  and  $\ln 4$  are constants, not variables.**

$$x \ln 5 - 2 \ln 5 = 2x \ln 4 + 3 \ln 4$$

*Use the distributive property to distribute  $\ln 5$  and  $\ln 4$  to both terms in parentheses.*

$$x \ln 5 - 2x \ln 4 = 2 \ln 5 + 3 \ln 4$$

*Collect variable terms involving  $x$  on the left by subtracting  $2x \ln 4$  and adding  $2 \ln 5$  on both sides.*

## DISCOVERY

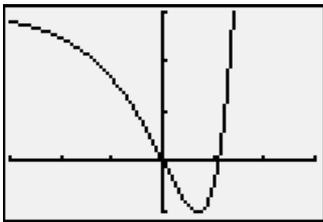

Use properties of logarithms to show that the solution in Example 4 can be expressed as

$$\frac{\ln 1600}{\ln\left(\frac{5}{16}\right)}.$$

## TECHNOLOGY

## Graphic Connections

Shown below is the graph of  $y = e^{2x} - 4e^x + 3$ . There are two  $x$ -intercepts, one at 0 and one at approximately 1.10. These intercepts verify our algebraic solution.

$[-3, 3, 1]$  by  $[-1, 3, 1]$

- 3 Use the definition of a logarithm to solve logarithmic equations.

$$\begin{aligned} x(\ln 5 - 2 \ln 4) &= 2 \ln 5 + 3 \ln 4 \\ x &= \frac{2 \ln 5 + 3 \ln 4}{\ln 5 - 2 \ln 4} \end{aligned}$$

Factor out  $x$  from the two terms on the left.

Isolate  $x$  by dividing both sides by  $\ln 5 - 2 \ln 4$ .

The solution set is  $\left\{\frac{2 \ln 5 + 3 \ln 4}{\ln 5 - 2 \ln 4}\right\}$ . The solution is approximately  $-6.34$ . ●●●

✓ **Check Point 4** Solve:  $3^{2x-1} = 7^{x+1}$ . Find the solution set and then use a calculator to obtain a decimal approximation to two decimal places for the solution.

## EXAMPLE 5 Solving an Exponential Equation

Solve:  $e^{2x} - 4e^x + 3 = 0$ .

## SOLUTION

The given equation is quadratic in form. If  $u = e^x$ , the equation can be expressed as  $u^2 - 4u + 3 = 0$ . Because this equation can be solved by factoring, we factor to isolate the exponential term.

$$\begin{aligned} e^{2x} - 4e^x + 3 &= 0 \\ (e^x - 3)(e^x - 1) &= 0 \end{aligned}$$

This is the given equation.

Factor on the left. Notice that if  $u = e^x$ ,  $u^2 - 4u + 3 = (u - 3)(u - 1)$ .

$$e^x - 3 = 0 \quad \text{or} \quad e^x - 1 = 0$$

Set each factor equal to 0.

$$e^x = 3 \qquad e^x = 1$$

Solve for  $e^x$ .

$$\ln e^x = \ln 3$$

$$x = 0$$

Take the natural logarithm on both sides of the first equation. The equation on the right can be solved by inspection.

$$x = \ln 3$$

$\ln e^x = x$

The solution set is  $\{0, \ln 3\}$ . The solutions are 0 and  $\ln 3$ , which is approximately 1.10. ●●●

✓ **Check Point 5** Solve:  $e^{2x} - 8e^x + 7 = 0$ . Find the solution set and then use a calculator to obtain a decimal approximation to two decimal places, if necessary, for the solutions.

## Logarithmic Equations

A **logarithmic equation** is an equation containing a variable in a logarithmic expression. Examples of logarithmic equations include

$$\log_4(x + 3) = 2 \quad \text{and} \quad \ln(x + 2) - \ln(4x + 3) = \ln\left(\frac{1}{x}\right).$$

Some logarithmic equations can be expressed in the form  $\log_b M = c$ . We can solve such equations by rewriting them in exponential form.

## Using the Definition of a Logarithm to Solve Logarithmic Equations

- Express the equation in the form  $\log_b M = c$ .
- Use the definition of a logarithm to rewrite the equation in exponential form:

$$\log_b M = c \quad \text{means} \quad b^c = M.$$

Logarithms are exponents.

- Solve for the variable.
- Check proposed solutions in the original equation. Include in the solution set only values for which  $M > 0$ .

**EXAMPLE 6** Solving Logarithmic Equations

Solve:

a.  $\log_4(x + 3) = 2$       b.  $3 \ln(2x) = 12$ .

**SOLUTION**

The form  $\log_b M = c$  involves a single logarithm whose coefficient is 1 on one side and a constant on the other side. Equation (a) is already in this form. We will need to divide both sides of equation (b) by 3 to obtain this form.

a.  $\log_4(x + 3) = 2$       *This is the given equation.*  
 $4^2 = x + 3$       *Rewrite in exponential form:  $\log_b M = c$  means  $b^c = M$ .*  
 $16 = x + 3$       *Square 4.*  
 $13 = x$       *Subtract 3 from both sides.*

**Check 13:**

$\log_4(x + 3) = 2$       *This is the given logarithmic equation.*  
 $\log_4(13 + 3) \stackrel{?}{=} 2$       *Substitute 13 for x.*  
 $\log_4 16 \stackrel{?}{=} 2$   
 $2 = 2$ , true       *$\log_4 16 = 2$  because  $4^2 = 16$ .*

This true statement indicates that the solution set is  $\{13\}$ .

b.  $3 \ln(2x) = 12$       *This is the given equation.*  
 $\ln(2x) = 4$       *Divide both sides by 3.*  
 $\log_e(2x) = 4$       *Rewrite the natural logarithm showing base e. This step is optional.*  
 $e^4 = 2x$       *Rewrite in exponential form:  $\log_b M = c$  means  $b^c = M$ .*  
 $\frac{e^4}{2} = x$       *Divide both sides by 2.*

**Check  $\frac{e^4}{2}$ :**

$3 \ln(2x) = 12$       *This is the given logarithmic equation.*  
 $3 \ln \left[ 2 \left( \frac{e^4}{2} \right) \right] \stackrel{?}{=} 12$       *Substitute  $\frac{e^4}{2}$  for x.*  
 $3 \ln e^4 \stackrel{?}{=} 12$       *Simplify:  $\frac{2}{1} \cdot \frac{e^4}{2} = e^4$ .*  
 $3 \cdot 4 \stackrel{?}{=} 12$       *Because  $\ln e^x = x$ , we conclude  $\ln e^4 = 4$ .*  
 $12 = 12$ , true

This true statement indicates that the solution set is  $\left\{ \frac{e^4}{2} \right\}$ . ...

**Check Point 6** Solve:

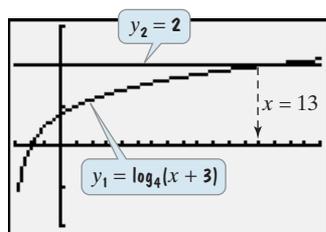

a.  $\log_2(x - 4) = 3$       b.  $4 \ln(3x) = 8$ .

**TECHNOLOGY****Graphic Connections**

The graphs of

$$y_1 = \log_4(x + 3) \text{ and } y_2 = 2$$

have an intersection point whose  $x$ -coordinate is 13. This verifies that  $\{13\}$  is the solution set for  $\log_4(x + 3) = 2$ .

$[-3, 17, 1]$  by  $[-2, 3, 1]$

Logarithmic expressions are defined only for logarithms of positive real numbers. **Always check proposed solutions of a logarithmic equation in the original equation. Exclude from the solution set any proposed solution that produces the logarithm of a negative number or the logarithm of 0.**

**GREAT QUESTION!**

Can a negative number belong to the solution set of a logarithmic equation?

Yes. Here's an example.

$$\begin{aligned} \log_2(x + 20) &= 3 && \text{Solve this equation.} \\ 2^3 &= x + 20 && \text{Rewrite in exponential form.} \\ 8 &= x + 20 && \text{Cube 2.} \\ -12 &= x && \text{Subtract 20 from both sides.} \end{aligned}$$

**Check -12:**

$$\begin{aligned} \log_2(-12 + 20) &\stackrel{?}{=} 3 && \text{Substitute } -12 \text{ for } x. \\ \log_2 8 &\stackrel{?}{=} 3 \\ 3 &= 3, \text{ true} && \log_2 8 = 3 \text{ because } 2^3 = 8. \end{aligned}$$

The solution set is  $\{-12\}$ . Although  $-12$  is negative, it does not produce the logarithm of a negative number in  $\log_2(x + 20) = 3$ , the given equation. Note that the domain of the expression  $\log_2(x + 20)$  is  $(-20, \infty)$ , which includes negative numbers such as  $-12$ .

To rewrite the logarithmic equation  $\log_b M = c$  in the equivalent exponential form  $b^c = M$ , we need a single logarithm whose coefficient is one. It is sometimes necessary to use properties of logarithms to condense logarithms into a single logarithm. In the next example, we use the product rule for logarithms to obtain a single logarithmic expression on the left side.

**EXAMPLE 7** Solving a Logarithmic Equation

Solve:  $\log_2 x + \log_2(x - 7) = 3$ .

**SOLUTION**

$$\begin{aligned} \log_2 x + \log_2(x - 7) &= 3 && \text{This is the given equation.} \\ \log_2[x(x - 7)] &= 3 && \text{Use the product rule to obtain a single} \\ &&& \text{logarithm: } \log_b M + \log_b N = \log_b(MN). \\ 2^3 &= x(x - 7) && \text{Rewrite in exponential form: } \log_b M = c \\ &&& \text{means } b^c = M. \\ 8 &= x^2 - 7x && \text{Evaluate } 2^3 \text{ on the left and apply the} \\ &&& \text{distributive property on the right.} \\ 0 &= x^2 - 7x - 8 && \text{Set the equation equal to 0.} \\ 0 &= (x - 8)(x + 1) && \text{Factor.} \\ x - 8 = 0 \quad \text{or} \quad x + 1 = 0 &&& \text{Set each factor equal to 0.} \\ x = 8 &&& \text{Solve for } x. \\ &&& x = -1 \end{aligned}$$

**Check 8:**

$$\begin{aligned} \log_2 8 + \log_2(8 - 7) &= 3 \\ \log_2 8 + \log_2(8 - 7) &\stackrel{?}{=} 3 \\ \log_2 8 + \log_2 1 &\stackrel{?}{=} 3 \\ 3 + 0 &\stackrel{?}{=} 3 \\ 3 &= 3, \text{ true} \end{aligned}$$

**Check -1:**

$$\begin{aligned} \log_2 x + \log_2(x - 7) &= 3 \\ \log_2(-1) + \log_2(-1 - 7) &\stackrel{?}{=} 3 \\ \text{The number } -1 &\text{ does not check.} \\ \text{The domain of a logarithmic function} &\text{ consists of positive numbers.} \end{aligned}$$

The solution set is  $\{8\}$ .

 **Check Point 7** Solve:  $\log x + \log(x - 3) = 1$ .

- 4 Use the one-to-one property of logarithms to solve logarithmic equations.

Some logarithmic equations can be expressed in the form  $\log_b M = \log_b N$ , where the bases on both sides of the equation are the same. Because all logarithmic functions are one-to-one, we can conclude that  $M = N$ .

**Using the One-to-One Property of Logarithms to Solve Logarithmic Equations**

- Express the equation in the form  $\log_b M = \log_b N$ . This form involves a single logarithm whose coefficient is 1 on each side of the equation.
- Use the one-to-one property to rewrite the equation without logarithms: If  $\log_b M = \log_b N$ , then  $M = N$ .
- Solve for the variable.
- Check proposed solutions in the original equation. Include in the solution set only values for which  $M > 0$  and  $N > 0$ .

**EXAMPLE 8 Solving a Logarithmic Equation**

Solve:  $\ln(x + 2) - \ln(4x + 3) = \ln\left(\frac{1}{x}\right)$ .

**SOLUTION**

In order to apply the one-to-one property of logarithms, we need a single logarithm whose coefficient is 1 on each side of the equation. The right side is already in this form. We can obtain a single logarithm on the left side by applying the quotient rule.

$$\ln(x + 2) - \ln(4x + 3) = \ln\left(\frac{1}{x}\right)$$

$$\ln\left(\frac{x + 2}{4x + 3}\right) = \ln\left(\frac{1}{x}\right)$$

This is the given equation.

Use the quotient rule to obtain a single logarithm on the left side:

$$\log_b M - \log_b N = \log_b\left(\frac{M}{N}\right)$$

Use the one-to-one property: If  $\log_b M = \log_b N$ , then  $M = N$ .

Multiply both sides by  $x(4x + 3)$ , the LCD.

Simplify.

Apply the distributive property.

Subtract  $4x + 3$  from both sides and set the equation equal to 0.

Factor.

Set each factor equal to 0.

Solve for  $x$ .

$$x(4x + 3)\left(\frac{x + 2}{4x + 3}\right) = x(4x + 3)\left(\frac{1}{x}\right)$$

$$x(x + 2) = 4x + 3$$

$$x^2 + 2x = 4x + 3$$

$$x^2 - 2x - 3 = 0$$

$$(x - 3)(x + 1) = 0$$

$$x - 3 = 0 \quad \text{or} \quad x + 1 = 0$$

$$x = 3 \qquad \qquad \qquad x = -1$$

Substituting 3 for  $x$  into  $\ln(x + 2) - \ln(4x + 3) = \ln\left(\frac{1}{x}\right)$  produces the true statement  $\ln\left(\frac{1}{3}\right) = \ln\left(\frac{1}{3}\right)$ . However, substituting  $-1$  produces logarithms of negative numbers. Thus,  $-1$  is not a solution. The solution set is  $\{3\}$ .

 **Check Point 8** Solve:  $\ln(x - 3) = \ln(7x - 23) - \ln(x + 1)$ .

**TECHNOLOGY**

**Numeric Connections**

A graphing utility's TABLE feature can be used to verify that  $\{3\}$  is the solution set of

$$\ln(x + 2) - \ln(4x + 3) = \ln\left(\frac{1}{x}\right)$$

$y_1 = \ln(x + 2) - \ln(4x + 3)$        $y_2 = \ln\left(\frac{1}{x}\right)$

X	Y1	Y2
-1	ERROR	ERROR
0	-.4055	ERROR
1	-.8473	0
2	-1.012	-.6931
3	-1.099	-1.099
4	-1.153	-1.386

X = -2

$y_1$  and  $y_2$  are equal when  $x = 3$ .

- 5 Solve applied problems involving exponential and logarithmic equations.

**Applications**

Our first applied example provides a mathematical perspective on the old slogan “Alcohol and driving don’t mix.” In California, where 38% of fatal traffic crashes involve drinking drivers, it is illegal to drive with a blood alcohol concentration of 0.08 or higher. At these levels, drivers may be arrested and charged with driving under the influence.

**EXAMPLE 9** Alcohol and Risk of a Car Accident

Medical research indicates that the risk of having a car accident increases exponentially as the concentration of alcohol in the blood increases. The risk is modeled by

$$R = 6e^{12.77x},$$

where  $x$  is the blood alcohol concentration and  $R$ , given as a percent, is the risk of having a car accident. What blood alcohol concentration corresponds to a 17% risk of a car accident? How is this shown on the graph of  $R$  in **Figure 3.20**?

**SOLUTION**

For a risk of 17%, we let  $R = 17$  in the equation and solve for  $x$ , the blood alcohol concentration.

$$R = 6e^{12.77x}$$

$$6e^{12.77x} = 17$$

This is the given equation.

Substitute 17 for  $R$  and (optional) reverse the two sides of the equation.

$$e^{12.77x} = \frac{17}{6}$$

Isolate the exponential factor by dividing both sides by 6.

$$\ln e^{12.77x} = \ln\left(\frac{17}{6}\right)$$

Take the natural logarithm on both sides.

$$12.77x = \ln\left(\frac{17}{6}\right)$$

Use the inverse property  $\ln e^x = x$  on the left side.

$$x = \frac{\ln\left(\frac{17}{6}\right)}{12.77} \approx 0.08$$

Divide both sides by 12.77.

For a blood alcohol concentration of 0.08, the risk of a car accident is 17%. This is shown on the graph of  $R$  in **Figure 3.20** by the point (0.08, 17) that lies on the blue curve. Take a moment to locate this point on the curve. In many states, it is illegal to drive with a blood alcohol concentration of 0.08. ●●●

 **Check Point 9** Use the formula in Example 9 to answer this question: What blood alcohol concentration corresponds to a 7% risk of a car accident? (In many states, drivers under the age of 21 can lose their licenses for driving at this level.)

Suppose that you inherit \$30,000 at age 20. Is it possible to invest \$25,000 and have over half a million dollars for early retirement? Our next example illustrates the power of compound interest.

**EXAMPLE 10** Revisiting the Formula for Compound Interest

The formula

$$A = P\left(1 + \frac{r}{n}\right)^{nt}$$

describes the accumulated value,  $A$ , of a sum of money,  $P$ , the principal, after  $t$  years at annual percentage rate  $r$  (in decimal form) compounded  $n$  times a year. How long will it take \$25,000 to grow to \$500,000 at 9% annual interest compounded monthly?

A blood alcohol concentration of 0.22 corresponds to near certainty, or a 100% probability, of a car accident.

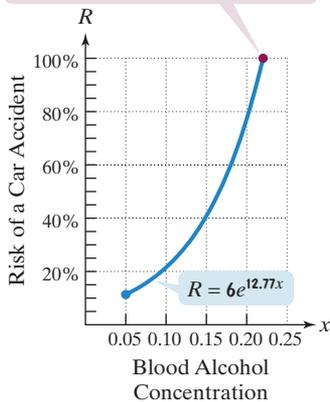

FIGURE 3.20

## SOLUTION

$$A = P\left(1 + \frac{r}{n}\right)^{nt}$$

$$500,000 = 25,000\left(1 + \frac{0.09}{12}\right)^{12t}$$

Because of the exponent,  $12t$ , do not distribute 25,000 over the terms in parentheses.

This is the given formula.

$A$  (the desired accumulated value) = \$500,000,  
 $P$  (the principal) = \$25,000,  
 $r$  (the interest rate) = 9% = 0.09, and  $n = 12$   
 (monthly compounding).

### Blitzer Bonus

#### Playing Doubles: Interest Rates and Doubling Time

One way to calculate what your savings will be worth at some point in the future is to consider doubling time. The following table shows how long it takes for your money to double at different annual interest rates subject to continuous compounding.

Annual Interest Rate	Years to Double
5%	13.9 years
7%	9.9 years
9%	7.7 years
11%	6.3 years

Of course, the first problem is collecting some money to invest. The second problem is finding a reasonably safe investment with a return of 9% or more.

Our goal is to solve the equation for  $t$ . Let's reverse the two sides of the equation and then simplify within parentheses.

$$25,000\left(1 + \frac{0.09}{12}\right)^{12t} = 500,000$$

Reverse the two sides of the previous equation.

$$25,000(1 + 0.0075)^{12t} = 500,000$$

Divide within parentheses:  $\frac{0.09}{12} = 0.0075$ .

$$25,000(1.0075)^{12t} = 500,000$$

Add within parentheses.

$$(1.0075)^{12t} = 20$$

Divide both sides by 25,000.

$$\ln(1.0075)^{12t} = \ln 20$$

Take the natural logarithm on both sides.

$$12t \ln(1.0075) = \ln 20$$

Use the power rule to bring the exponent to the front:  $\ln b^x = x \ln b$ .

$$t = \frac{\ln 20}{12 \ln 1.0075}$$

Solve for  $t$ , dividing both sides by  $12 \ln 1.0075$ .

$$\approx 33.4$$

Use a calculator.

After approximately 33.4 years, the \$25,000 will grow to an accumulated value of \$500,000. If you set aside the money at age 20, you can begin enjoying a life as a half-millionaire at about age 53. ●●●

 **Check Point 10** How long, to the nearest tenth of a year, will it take \$1000 to grow to \$3600 at 8% annual interest compounded quarterly?

### EXAMPLE 11 Revisiting the Model for Height of Children

We have seen that the percentage of adult height attained by a boy who is  $x$  years old can be modeled by

$$f(x) = 29 + 48.8 \log(x + 1),$$

where  $x$  represents the boy's age (from 5 to 15) and  $f(x)$  represents the percentage of his adult height. At what age, rounded to the nearest year, has a boy attained 85% of his adult height?

## SOLUTION

To find at what age a boy has attained 85% of his adult height, we substitute 85 for  $f(x)$  and solve for  $x$ , the boy's age.

$$f(x) = 29 + 48.8 \log(x + 1)$$

This is the given function.

$$85 = 29 + 48.8 \log(x + 1)$$

Substitute 85 for  $f(x)$ .

Our goal is to isolate  $\log(x + 1)$  and then rewrite the equation in exponential form.

$$56 = 48.8 \log(x + 1)$$

Subtract 29 from both sides.

$$\frac{56}{48.8} = \log(x + 1)$$

Divide both sides by 48.8.

$$\begin{aligned}\frac{56}{48.8} &= \log_{10}(x + 1) \\ 10^{\frac{56}{48.8}} &= x + 1 \\ 10^{\frac{56}{48.8}} - 1 &= x \\ 13 &\approx x\end{aligned}$$

Rewrite the common logarithm showing base 10. This step is optional.

Rewrite in exponential form.

Subtract 1 from both sides.

Use a calculator:

$$10 \left[ \wedge \right] \left[ ( 56 \div 48.8 ) \right] - 1 \left[ \text{ENTER} \right].$$

At approximately age 13, a boy has attained 85% of his adult height. This is shown on the graph of the model in **Figure 3.21** by the point (13, 85).

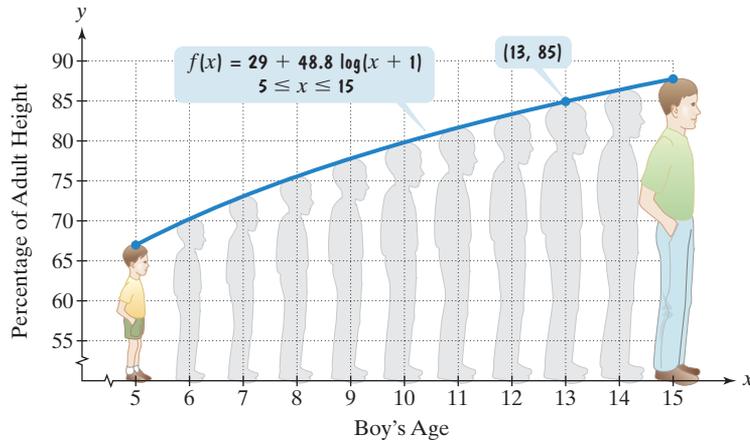

FIGURE 3.21 Graph of a model for the percentage of adult height attained by a boy

**Check Point 11** The percentage of adult height attained by a girl who is  $x$  years old can be modeled by

$$f(x) = 62 + 35 \log(x - 4),$$

where  $x$  represents the girl's age (from 5 to 15) and  $f(x)$  represents the percentage of her adult height. At what age has a girl attained 97% of her adult height?

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- If  $b^M = b^N$ , then \_\_\_\_\_.
- If  $2^{4x-1} = 2^7$ , then \_\_\_\_\_ = 7.
- If  $x \ln 9 = \ln 20$ , then  $x =$  \_\_\_\_\_.
- If  $e^{0.6x} = 6$ , then  $0.6x =$  \_\_\_\_\_.
- If  $\log_5(x + 1) = 3$ , then \_\_\_\_\_ =  $x + 1$ .
- If  $\log_3 x + \log_3(x + 1) = 2$ , then  $\log_3$  \_\_\_\_\_ = 2.
- If  $\ln\left(\frac{7x - 23}{x + 1}\right) = \ln(x - 3)$ , then \_\_\_\_\_ =  $x - 3$ .
- True or false:  $x^4 = 15$  is an exponential equation. \_\_\_\_\_
- True or false:  $4^x = 15$  is an exponential equation. \_\_\_\_\_
- True or false:  $-3$  is a solution of  $\log_5 9 = 2 \log_5 x$ . \_\_\_\_\_
- True or false:  $-10$  is a solution of  $\log_5(x + 35) = 2$ . \_\_\_\_\_

## EXERCISE SET 3.4

### Practice Exercises

Solve each exponential equation in Exercises 1–22 by expressing each side as a power of the same base and then equating exponents.

- |                |                |                              |                               |
|----------------|----------------|------------------------------|-------------------------------|
| 1. $2^x = 64$  | 2. $3^x = 81$  | 5. $2^{2x-1} = 32$           | 6. $3^{2x+1} = 27$            |
| 3. $5^x = 125$ | 4. $5^x = 625$ | 7. $4^{2x-1} = 64$           | 8. $5^{3x-1} = 125$           |
|                |                | 9. $32^x = 8$                | 10. $4^x = 32$                |
|                |                | 11. $9^x = 27$               | 12. $125^x = 625$             |
|                |                | 13. $3^{1-x} = \frac{1}{27}$ | 14. $5^{2-x} = \frac{1}{125}$ |

15.  $6^{\frac{x-3}{4}} = \sqrt{6}$

17.  $4^x = \frac{1}{\sqrt{2}}$

19.  $8^{x+3} = 16^{x-1}$

21.  $e^{x+1} = \frac{1}{e}$

16.  $7^{\frac{x-2}{6}} = \sqrt{7}$

18.  $9^x = \frac{1}{\sqrt[3]{3}}$

20.  $8^{1-x} = 4^{x+2}$

22.  $e^{x+4} = \frac{1}{e^{2x}}$

Solve each exponential equation in Exercises 23–48. Express the solution set in terms of natural logarithms or common logarithms. Then use a calculator to obtain a decimal approximation, correct to two decimal places, for the solution.

23.  $10^x = 3.91$

24.  $10^x = 8.07$

25.  $e^x = 5.7$

26.  $e^x = 0.83$

27.  $5^x = 17$

28.  $19^x = 143$

29.  $5e^x = 23$

30.  $9e^x = 107$

31.  $3e^{5x} = 1977$

32.  $4e^{7x} = 10,273$

33.  $e^{1-5x} = 793$

34.  $e^{1-8x} = 7957$

35.  $e^{5x-3} - 2 = 10,476$

36.  $e^{4x-5} - 7 = 11,243$

37.  $7^{x+2} = 410$

38.  $5^{\frac{x}{3}} = 137$

39.  $7^{0.3x} = 813$

40.  $3^{\frac{7}{x}} = 0.2$

41.  $5^{2x+3} = 3^{x-1}$

42.  $7^{2x+1} = 3^{x+2}$

43.  $e^{2x} - 3e^x + 2 = 0$

44.  $e^{2x} - 2e^x - 3 = 0$

45.  $e^{4x} + 5e^{2x} - 24 = 0$

46.  $e^{4x} - 3e^{2x} - 18 = 0$

47.  $3^{2x} + 3^x - 2 = 0$

48.  $2^{2x} + 2^x - 12 = 0$

Solve each logarithmic equation in Exercises 49–92. Be sure to reject any value of  $x$  that is not in the domain of the original logarithmic expressions. Give the exact answer. Then, where necessary, use a calculator to obtain a decimal approximation, correct to two decimal places, for the solution.

49.  $\log_3 x = 4$

50.  $\log_5 x = 3$

51.  $\ln x = 2$

52.  $\ln x = 3$

53.  $\log_4(x + 5) = 3$

54.  $\log_5(x - 7) = 2$

55.  $\log_2(x + 25) = 4$

56.  $\log_2(x + 50) = 5$

57.  $\log_3(x + 4) = -3$

58.  $\log_7(x + 2) = -2$

59.  $\log_4(3x + 2) = 3$

60.  $\log_2(4x + 1) = 5$

61.  $5 \ln(2x) = 20$

62.  $6 \ln(2x) = 30$

63.  $6 + 2 \ln x = 5$

64.  $7 + 3 \ln x = 6$

65.  $\ln \sqrt{x + 3} = 1$

66.  $\ln \sqrt{x + 4} = 1$

67.  $\log_5 x + \log_5(4x - 1) = 1$

68.  $\log_6(x + 5) + \log_6 x = 2$

69.  $\log_3(x + 6) + \log_3(x + 4) = 1$

70.  $\log_6(x + 3) + \log_6(x + 4) = 1$

71.  $\log_2(x + 2) - \log_2(x - 5) = 3$

72.  $\log_4(x + 2) - \log_4(x - 1) = 1$

73.  $2 \log_3(x + 4) = \log_3 9 + 2$

74.  $3 \log_2(x - 1) = 5 - \log_2 4$

75.  $\log_2(x - 6) + \log_2(x - 4) - \log_2 x = 2$

76.  $\log_2(x - 3) + \log_2 x - \log_2(x + 2) = 2$

77.  $\log(x + 4) = \log x + \log 4$

78.  $\log(5x + 1) = \log(2x + 3) + \log 2$

79.  $\log(3x - 3) = \log(x + 1) + \log 4$

80.  $\log(2x - 1) = \log(x + 3) + \log 3$

81.  $2 \log x = \log 25$

82.  $3 \log x = \log 125$

83.  $\log(x + 4) - \log 2 = \log(5x + 1)$

84.  $\log(x + 7) - \log 3 = \log(7x + 1)$

85.  $2 \log x - \log 7 = \log 112$

86.  $\log(x - 2) + \log 5 = \log 100$

87.  $\log x + \log(x + 3) = \log 10$

88.  $\log(x + 3) + \log(x - 2) = \log 14$

89.  $\ln(x - 4) + \ln(x + 1) = \ln(x - 8)$

90.  $\log_2(x - 1) - \log_2(x + 3) = \log_2\left(\frac{1}{x}\right)$

91.  $\ln(x - 2) - \ln(x + 3) = \ln(x - 1) - \ln(x + 7)$

92.  $\ln(x - 5) - \ln(x + 4) = \ln(x - 1) - \ln(x + 2)$

### Practice Plus

In Exercises 93–102, solve each equation.

93.  $5^{2x} \cdot 5^{4x} = 125$

94.  $3^{x+2} \cdot 3^x = 81$

95.  $2|\ln x| - 6 = 0$

96.  $3|\log x| - 6 = 0$

97.  $3^{x^2} = 45$

98.  $5^{x^2} = 50$

99.  $\ln(2x + 1) + \ln(x - 3) - 2 \ln x = 0$

100.  $\ln 3 - \ln(x + 5) - \ln x = 0$

101.  $5^{x^2-12} = 25^{2x}$

102.  $3^{x^2-12} = 9^{2x}$

### Application Exercises

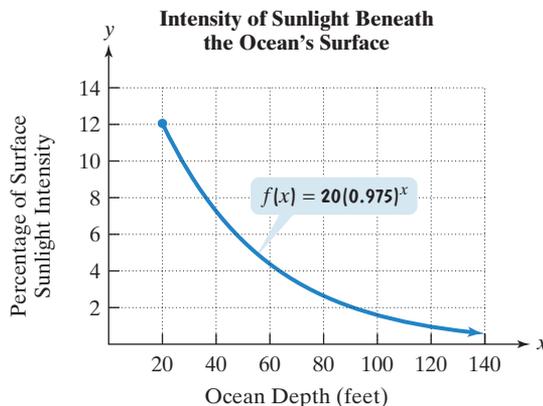

103. The formula  $A = 37.3e^{0.0095t}$  models the population of California,  $A$ , in millions,  $t$  years after 2010.

- What was the population of California in 2010?
- When will the population of California reach 40 million?

104. The formula  $A = 25.1e^{0.0187t}$  models the population of Texas,  $A$ , in millions,  $t$  years after 2010.

- What was the population of Texas in 2010?
- When will the population of Texas reach 28 million?

The function  $f(x) = 20(0.975)^x$  models the percentage of surface sunlight,  $f(x)$ , that reaches a depth of  $x$  feet beneath the surface of the ocean. The figure shows the graph of this function. Use this information to solve Exercises 105–106.

- Use the function to determine at what depth, to the nearest foot, there is 1% of surface sunlight. How is this shown on the graph of  $f$ ?
- Use the function to determine at what depth, to the nearest foot, there is 3% of surface sunlight. How is this shown on the graph of  $f$ ?

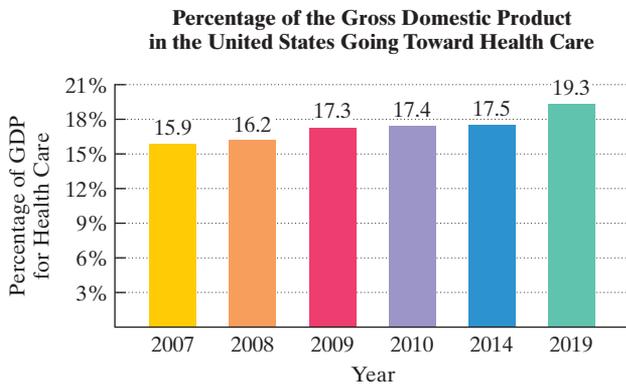

In Exercises 107–110, complete the table for a savings account subject to  $n$  compoundings yearly  $\left[ A = P \left( 1 + \frac{r}{n} \right)^{nt} \right]$ . Round answers to one decimal place.

	Amount Invested	Number of Compounding Periods	Annual Interest Rate	Accumulated Amount	Time $t$ in Years
107.	\$12,500	4	5.75%	\$20,000	
108.	\$7250	12	6.5%	\$15,000	
109.	\$1000	360	16.8%	\$1400	
110.	\$5000	360	14.7%	\$9000	

In Exercises 111–114, complete the table for a savings account subject to continuous compounding ( $A = Pe^{rt}$ ). Round answers to one decimal place.

	Amount Invested	Annual Interest Rate	Accumulated Amount	Time $t$ in Years
111.	\$8000	8%	Double the amount invested	
112.	\$8000	20.3%	\$12,000	
113.	\$2350	15.7%	Triple the amount invested	
114.	\$17,425	4.25%	\$25,000	

By 2019, nearly \$1 out of every \$5 spent in the U.S. economy is projected to go for health care. The bar graph shows the percentage of the U.S. gross domestic product (GDP) going toward health care from 2007 through 2010, with projections for 2014 and 2019.

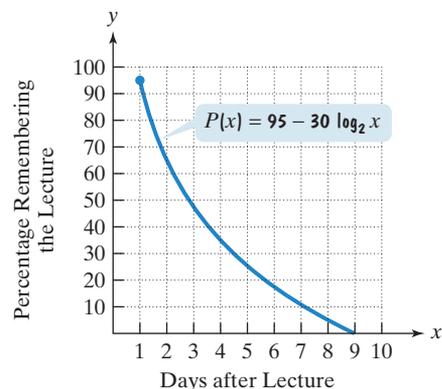

Source: Health Affairs (healthaffairs.org)

The data can be modeled by the function  $f(x) = 1.2 \ln x + 15.7$ , where  $f(x)$  is the percentage of the U.S. gross domestic product going toward health care  $x$  years after 2006. Use this information to solve Exercises 115–116.

115. a. Use the function to determine the percentage of the U.S. gross domestic product that went toward health care in 2009. Round to the nearest tenth of a percent. Does this underestimate or overestimate the percent displayed by the graph? By how much?
- b. According to the model, when will 18.5% of the U.S. gross domestic product go toward health care? Round to the nearest year.

116. a. Use the function to determine the percentage of the U.S. gross domestic product that went toward health care in 2008. Round to the nearest tenth of a percent. Does this underestimate or overestimate the percent displayed by the graph? By how much?
- b. According to the model, when will 18.6% of the U.S. gross domestic product go toward health care? Round to the nearest year.

The function  $P(x) = 95 - 30 \log_2 x$  models the percentage,  $P(x)$ , of students who could recall the important features of a classroom lecture as a function of time, where  $x$  represents the number of days that have elapsed since the lecture was given. The figure shows the graph of the function. Use this information to solve Exercises 117–118. Round answers to one decimal place.

117. After how many days do only half the students recall the important features of the classroom lecture? (Let  $P(x) = 50$  and solve for  $x$ .) Locate the point on the graph that conveys this information.
118. After how many days have all students forgotten the important features of the classroom lecture? (Let  $P(x) = 0$  and solve for  $x$ .) Locate the point on the graph that conveys this information.

In Exercises 141–144, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

141. If  $\log(x + 3) = 2$ , then  $e^2 = x + 3$ .  
 142. If  $\log(7x + 3) - \log(2x + 5) = 4$ , then the equation in exponential form is  $10^4 = (7x + 3) - (2x + 5)$ .  
 143. If  $x = \frac{1}{k} \ln y$ , then  $y = e^{kx}$ .  
 144. Examples of exponential equations include  $10^x = 5.71$ ,  $e^x = 0.72$ , and  $x^{10} = 5.71$ .  
 145. If \$4000 is deposited into an account paying 3% interest compounded annually and at the same time \$2000 is deposited into an account paying 5% interest compounded annually, after how long will the two accounts have the same balance? Round to the nearest year.

Solve each equation in Exercises 146–148. Check each proposed solution by direct substitution or with a graphing utility.

146.  $(\ln x)^2 = \ln x^2$   
 147.  $(\log x)(2 \log x + 1) = 6$   
 148.  $\ln(\ln x) = 0$

### Group Exercise

149. Research applications of logarithmic functions as mathematical models and plan a seminar based on your group's research. Each group member should research one of the following areas or any other area of interest: pH (acidity of solutions), intensity of sound (decibels), brightness of stars, human memory, progress over time in a sport, profit over time. For the area that you select, explain how logarithmic functions are used and provide examples.

### Preview Exercises

Exercises 150–152 will help you prepare for the material covered in the next section.

150. The formula  $A = 10e^{-0.003t}$  models the population of Hungary,  $A$ , in millions,  $t$  years after 2006.  
 a. Find Hungary's population, in millions, for 2006, 2007, 2008, and 2009. Round to two decimal places.  
 b. Is Hungary's population increasing or decreasing?

151. a. Simplify:  $e^{\ln 3}$ .  
 b. Use your simplification from part (a) to rewrite  $3^x$  in terms of base  $e$ .  
 152. U.S. soldiers fight Russian troops who have invaded New York City. Incoming missiles from Russian submarines and warships ravage the Manhattan skyline. It's just another scenario for the multi-billion-dollar video games *Call of Duty*, which have sold more than 100 million games since the franchise's birth in 2003.

The table shows the annual retail sales for *Call of Duty* video games from 2004 through 2010. Create a scatter plot for the data. Based on the shape of the scatter plot, would a logarithmic function, an exponential function, or a linear function be the best choice for modeling the data?

Annual Retail Sales for *Call of Duty* Games

Year	Retail Sales (millions of dollars)
2004	56
2005	101
2006	196
2007	352
2008	436
2009	778
2010	980

## SECTION 3.5

## Exponential Growth and Decay; Modeling Data

*Objectives*

- 1 Model exponential growth and decay.
- 2 Use logistic growth models.
- 3 Use Newton's Law of Cooling.
- 4 Choose an appropriate model for data.
- 5 Express an exponential model in base  $e$ .

On October 31, 2011, the world marked a major milestone: According to the United Nations, the number of people on Earth reached 7 billion—and counting. Since the dawn of humankind some 50,000 years ago, an estimated total of 108 billion people have lived on our planet, which means that about 6.5% of all humans ever born are alive today. That's a lot of bodies to feed, clothe, and shelter. Scientists, politicians, economists, and demographers have long disagreed when it comes to making predictions about the effects of the world's growing population. Debates about entities that are growing exponentially can be approached mathematically: We can create functions that model data and use these functions to make

predictions. In this section, we will show you how this is done.

- 1 Model exponential growth and decay.

**Exponential Growth and Decay**

One of algebra's many applications is to predict the behavior of variables. This can be done with *exponential growth* and *decay models*. With exponential growth or decay, quantities grow or decay at a rate directly proportional to their size. Populations that are growing exponentially grow extremely rapidly as they get larger because there are more adults to have offspring. For example, world population is increasing at approximately 1.2% per year. This means that each year world population is 1.2% more than what it was in the previous year. In 2010, world population was 6.9 billion. Thus, we compute the world population in 2011 as follows:

$$6.9 \text{ billion} + 1.2\% \text{ of } 6.9 \text{ billion} = 6.9 + (0.012)(6.9) = 6.9828.$$

This computation indicates that 6.9828 billion people populated the world in 2011. The 0.0828 billion represents an increase of 82.8 million people from 2010 to 2011, the equivalent of the population of Germany. Using 1.2% as the annual rate of increase, world population for 2012 is found in a similar manner:

$$6.9828 + 1.2\% \text{ of } 6.9828 = 6.9828 + (0.012)(6.9828) \approx 7.067.$$

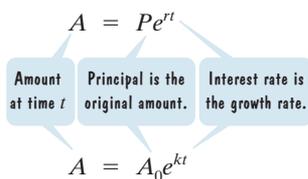

This computation indicates that approximately 7.1 billion people populated the world in 2012.

The explosive growth of world population may remind you of the growth of money in an account subject to compound interest. Just as the growth rate for world population is multiplied by the population plus any increase in the population, a compound interest rate is multiplied by the original investment plus any accumulated interest. The balance in an account subject to continuous compounding and world population are special cases of *exponential growth models*.

**GREAT QUESTION!**

**Why does the formula for exponential growth look familiar?**

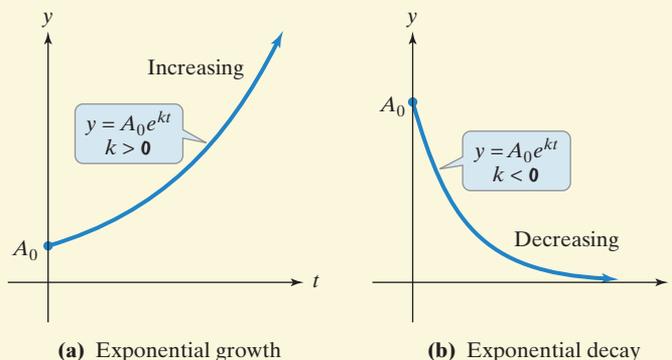

You have seen the formula for exponential growth before, but with different letters. It is the formula for compound interest with continuous compounding.

**Exponential Growth and Decay Models**

The mathematical model for **exponential growth** or **decay** is given by

$$f(t) = A_0e^{kt} \quad \text{or} \quad A = A_0e^{kt}.$$

- If  $k > 0$ , the function models the amount, or size, of a **growing** entity.  $A_0$  is the original amount, or size, of the growing entity at time  $t = 0$ ,  $A$  is the amount at time  $t$ , and  $k$  is a constant representing the growth rate.
- If  $k < 0$ , the function models the amount, or size, of a **decaying** entity.  $A_0$  is the original amount, or size, of the decaying entity at time  $t = 0$ ,  $A$  is the amount at time  $t$ , and  $k$  is a constant representing the decay rate.

Sometimes we need to use given data to determine  $k$ , the rate of growth or decay. After we compute the value of  $k$ , we can use the formula  $A = A_0e^{kt}$  to make predictions. This idea is illustrated in our first two examples.

**EXAMPLE 1** Modeling the Growth of the U.S. Population

The graph in **Figure 3.22** shows the U.S. population, in millions, for five selected years from 1970 through 2010. In 1970, the U.S. population was 203.3 million. By 2010, it had grown to 308.7 million.

- Find an exponential growth function that models the data for 1970 through 2010.
- By which year will the U.S. population reach 335 million?

**SOLUTION**

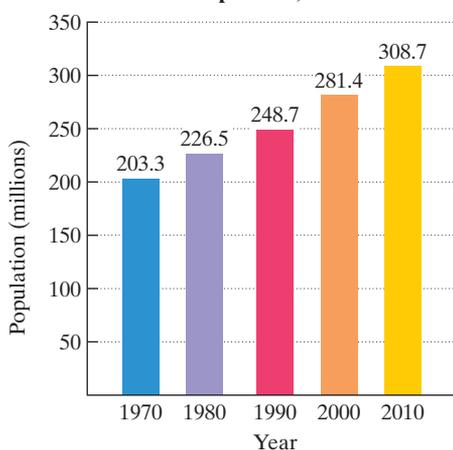

- We use the exponential growth model

$$A = A_0e^{kt}$$

in which  $t$  is the number of years after 1970. This means that 1970 corresponds to  $t = 0$ . At that time the U.S. population was 203.3 million, so we substitute 203.3 for  $A_0$  in the growth model:

$$A = 203.3e^{kt}.$$

We are given that 308.7 million was the population in 2010. Because 2010 is 40 years after 1970, when  $t = 40$  the value of  $A$  is 308.7. Substituting these numbers into the growth model will enable us to find  $k$ , the growth rate. We know that  $k > 0$  because the problem involves growth.

**U.S. Population, 1970–2010****FIGURE 3.22**

Source: U.S. Census Bureau

U.S. Population, 1970–2010

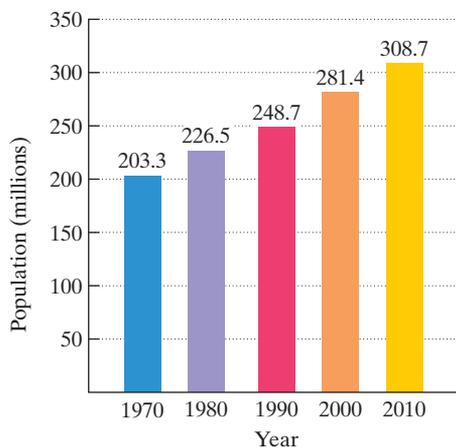

FIGURE 3.22 (repeated)

$$A = 203.3e^{kt}$$

$$308.7 = 203.3e^{k \cdot 40}$$

$$e^{40k} = \frac{308.7}{203.3}$$

$$\ln e^{40k} = \ln\left(\frac{308.7}{203.3}\right)$$

$$40k = \ln\left(\frac{308.7}{203.3}\right)$$

$$k = \frac{\ln\left(\frac{308.7}{203.3}\right)}{40} \approx 0.01$$

Use the growth model with  $A_0 = 203.3$ .  
When  $t = 40$ ,  $A = 308.7$ . Substitute these numbers into the model.

Isolate the exponential factor by dividing both sides by 203.3. We also reversed the sides.

Take the natural logarithm on both sides.

Simplify the left side using  $\ln e^x = x$ .

Divide both sides by 40 and solve for  $k$ . Then use a calculator.

The value of  $k$ , approximately 0.01, indicates a growth rate of about 1%. We substitute 0.01 for  $k$  in the growth model,  $A = 203.3e^{kt}$ , to obtain an exponential growth function for the U.S. population. It is

$$A = 203.3e^{0.01t},$$

where  $t$  is measured in years after 1970.

- b. To find the year in which the U.S. population will reach 335 million, substitute 335 for  $A$  in the model from part (a) and solve for  $t$ .

$$A = 203.3e^{0.01t}$$

$$335 = 203.3e^{0.01t}$$

$$e^{0.01t} = \frac{335}{203.3}$$

$$\ln e^{0.01t} = \ln\left(\frac{335}{203.3}\right)$$

$$0.01t = \ln\left(\frac{335}{203.3}\right)$$

$$t = \frac{\ln\left(\frac{335}{203.3}\right)}{0.01} \approx 50$$

This is the model from part (a).  
Substitute 335 for  $A$ .

Divide both sides by 203.3. We also reversed the sides.

Take the natural logarithm on both sides.

Simplify on the left using  $\ln e^x = x$ .

Divide both sides by 0.01 and solve for  $t$ . Then use a calculator.

Because  $t$  represents the number of years after 1970, the model indicates that the U.S. population will reach 335 million by  $1970 + 50$ , or in the year 2020. ●●●

In Example 1, we used only two data values, the population for 1970 and the population for 2010, to develop a model for U.S. population growth from 1970 through 2010. By not using data for any other years, have we created a model that inaccurately describes both the existing data and future population projections given by the U.S. Census Bureau? Something else to think about: Is an exponential model the best choice for describing U.S. population growth, or might a linear model provide a better description? We return to these issues in Exercises 70–74 in the Exercise Set.

**Check Point 1** In 2000, the population of Africa was 807 million and by 2011 it had grown to 1052 million.

- Use the exponential growth model  $A = A_0e^{kt}$ , in which  $t$  is the number of years after 2000, to find the exponential growth function that models the data.
- By which year will Africa's population reach 2000 million, or two billion?

Our next example involves exponential decay and its use in determining the age of fossils and artifacts. The method is based on considering the percentage of carbon-14 remaining in the fossil or artifact. Carbon-14 decays exponentially with a *half-life* of approximately 5715 years. The **half-life** of a substance is the time required for half of a given sample to disintegrate. Thus, after 5715 years a given amount of carbon-14 will have decayed to half the original amount. Carbon dating is useful for artifacts or fossils up to 80,000 years old. Older objects do not have enough carbon-14 left to determine age accurately.

### EXAMPLE 2 Carbon-14 Dating: The Dead Sea Scrolls

- Use the fact that after 5715 years a given amount of carbon-14 will have decayed to half the original amount to find the exponential decay model for carbon-14.
- In 1947, earthenware jars containing what are known as the Dead Sea Scrolls were found by an Arab Bedouin herdsman. Analysis indicated that the scroll wrappings contained 76% of their original carbon-14. Estimate the age of the Dead Sea Scrolls.

### SOLUTION

- We begin with the exponential decay model  $A = A_0e^{kt}$ . We know that  $k < 0$  because the problem involves the decay of carbon-14. After 5715 years ( $t = 5715$ ), the amount of carbon-14 present,  $A$ , is half the original amount,  $A_0$ . Thus, we can substitute  $\frac{A_0}{2}$  for  $A$  in the exponential decay model. This will enable us to find  $k$ , the decay rate.

$$A = A_0e^{kt} \quad \text{Begin with the exponential decay model.}$$

$$\frac{A_0}{2} = A_0e^{k5715} \quad \text{After 5715 years } (t = 5715), A = \frac{A_0}{2} \text{ (because the amount present, } A, \text{ is half the original amount, } A_0\text{).}$$

$$\frac{1}{2} = e^{5715k} \quad \text{Divide both sides of the equation by } A_0.$$

$$\ln\left(\frac{1}{2}\right) = \ln e^{5715k} \quad \text{Take the natural logarithm on both sides.}$$

$$\ln\left(\frac{1}{2}\right) = 5715k \quad \text{Simplify the right side using } \ln e^x = x.$$

$$k = \frac{\ln\left(\frac{1}{2}\right)}{5715} \approx -0.000121 \quad \text{Divide both sides by 5715 and solve for } k.$$

Substituting  $-0.000121$  for  $k$  in the decay model,  $A = A_0e^{kt}$ , the model for carbon-14 is

$$A = A_0e^{-0.000121t}.$$

- In 1947, the Dead Sea Scrolls contained 76% of their original carbon-14. To find their age in 1947, substitute  $0.76A_0$  for  $A$  in the model from part (a) and solve for  $t$ .

$$A = A_0e^{-0.000121t} \quad \text{This is the decay model for carbon-14.}$$

$$0.76A_0 = A_0e^{-0.000121t} \quad \text{A, the amount present, is 76% of the original amount, so } A = 0.76A_0.$$

$$0.76 = e^{-0.000121t} \quad \text{Divide both sides of the equation by } A_0.$$

$$\ln 0.76 = \ln e^{-0.000121t} \quad \text{Take the natural logarithm on both sides.}$$

$$\ln 0.76 = -0.000121t \quad \text{Simplify the right side using } \ln e^x = x.$$

$$t = \frac{\ln 0.76}{-0.000121} \approx 2268 \quad \text{Divide both sides by } -0.000121 \text{ and solve for } t.$$

The Dead Sea Scrolls are approximately 2268 years old plus the number of years between 1947 and the current year. ●●●

### Blitzer Bonus

#### Carbon Dating and Artistic Development

The artistic community was electrified by the discovery in 1995 of spectacular cave paintings in a limestone cavern in France. Carbon dating of the charcoal from the site showed that the images, created by artists of remarkable talent, were 30,000 years old, making them the oldest cave paintings ever found. The artists seemed to have used the cavern's natural contours to heighten a sense of perspective. The quality of the painting suggests that the art of early humans did not mature steadily from primitive to sophisticated in any simple linear fashion.

 **Check Point 2** Strontium-90 is a waste product from nuclear reactors. As a consequence of fallout from atmospheric nuclear tests, we all have a measurable amount of strontium-90 in our bones.

- The half-life of strontium-90 is 28 years, meaning that after 28 years a given amount of the substance will have decayed to half the original amount. Find the exponential decay model for strontium-90.
- Suppose that a nuclear accident occurs and releases 60 grams of strontium-90 into the atmosphere. How long will it take for strontium-90 to decay to a level of 10 grams?

## 2 Use logistic growth models.

### Logistic Growth Models

From population growth to the spread of an epidemic, nothing on Earth can grow exponentially indefinitely. Growth is always limited. This is shown in **Figure 3.23** by the horizontal asymptote. The *logistic growth model* is a function used to model situations of this type.

**FIGURE 3.23** The logistic growth curve has a horizontal asymptote that identifies the limit of the growth of  $A$  over time.

#### Logistic Growth Model

The mathematical model for limited logistic growth is given by

$$f(t) = \frac{c}{1 + ae^{-bt}} \quad \text{or} \quad A = \frac{c}{1 + ae^{-bt}},$$

where  $a$ ,  $b$ , and  $c$  are constants, with  $c > 0$  and  $b > 0$ .

As time increases ( $t \rightarrow \infty$ ), the expression  $ae^{-bt}$  in the model approaches 0, and  $A$  gets closer and closer to  $c$ . This means that  $y = c$  is a horizontal asymptote for the graph of the function. Thus, the value of  $A$  can never exceed  $c$  and  $c$  represents the limiting size that  $A$  can attain.

#### EXAMPLE 3 Modeling the Spread of the Flu

The function

$$f(t) = \frac{30,000}{1 + 20e^{-1.5t}}$$

describes the number of people,  $f(t)$ , who have become ill with influenza  $t$  weeks after its initial outbreak in a town with 30,000 inhabitants.

- How many people became ill with the flu when the epidemic began?
- How many people were ill by the end of the fourth week?
- What is the limiting size of  $f(t)$ , the population that becomes ill?

#### SOLUTION

- The time at the beginning of the flu epidemic is  $t = 0$ . Thus, we can find the number of people who were ill at the beginning of the epidemic by substituting 0 for  $t$ .

$$\begin{aligned} f(t) &= \frac{30,000}{1 + 20e^{-1.5t}} && \text{This is the given logistic growth function.} \\ f(0) &= \frac{30,000}{1 + 20e^{-1.5(0)}} && \text{When the epidemic began, } t = 0. \\ &= \frac{30,000}{1 + 20} && e^{-1.5(0)} = e^0 = 1 \\ &\approx 1429 \end{aligned}$$

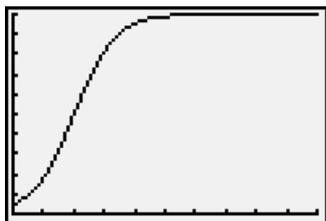

Approximately 1429 people were ill when the epidemic began.

**TECHNOLOGY**

The graph of the logistic growth function for the flu epidemic

$$y = \frac{30,000}{1 + 20e^{-1.5x}}$$

can be obtained using a graphing utility. We started  $x$  at 0 and ended at 10. This takes us to week 10. (In Example 3, we found that by week 4 approximately 28,583 people were ill.) We also know that 30,000 is the limiting size, so we took values of  $y$  up to 30,000. Using a  $[0, 10, 1]$  by  $[0, 30,000, 3000]$  viewing rectangle, the graph of the logistic growth function is shown below.

- b. We find the number of people who were ill at the end of the fourth week by substituting 4 for  $t$  in the logistic growth function.

$$f(t) = \frac{30,000}{1 + 20e^{-1.5t}} \quad \text{Use the given logistic growth function.}$$

$$f(4) = \frac{30,000}{1 + 20e^{-1.5(4)}} \quad \text{To find the number of people ill by the end of week four, let } t = 4.$$

$$\approx 28,583 \quad \text{Use a calculator.}$$

Approximately 28,583 people were ill by the end of the fourth week. Compared with the number of people who were ill initially, 1429, this illustrates the virulence of the epidemic.

- c. Recall that in the logistic growth model,  $f(t) = \frac{c}{1 + ae^{-bt}}$ , the constant  $c$  represents the limiting size that  $f(t)$  can attain. Thus, the number in the numerator, 30,000, is the limiting size of the population that becomes ill. ●●●

 **Check Point 3** In a learning theory project, psychologists discovered that

$$f(t) = \frac{0.8}{1 + e^{-0.2t}}$$

is a model for describing the proportion of correct responses,  $f(t)$ , after  $t$  learning trials.

- Find the proportion of correct responses prior to learning trials taking place.
- Find the proportion of correct responses after 10 learning trials.
- What is the limiting size of  $f(t)$ , the proportion of correct responses, as continued learning trials take place?

**3** Use Newton's Law of Cooling.

**GREAT QUESTION!**

**Does Newton's Law of Cooling apply only to cooling objects?**

No. Newton's Law of Cooling applies to any situation in which an object's temperature is different from that of the surrounding medium. Thus, it can be used to model the temperature of a heated object cooling to room temperature as well as the temperature of a frozen object thawing to room temperature.

**Modeling Cooling**

Over a period of time, a cup of hot coffee cools to the temperature of the surrounding air. **Newton's Law of Cooling**, named after Sir Isaac Newton, states that the temperature of a heated object decreases exponentially over time toward the temperature of the surrounding medium.

**Newton's Law of Cooling**

The temperature,  $T$ , of a heated object at time  $t$  is given by

$$T = C + (T_0 - C)e^{kt},$$

where  $C$  is the constant temperature of the surrounding medium,  $T_0$  is the initial temperature of the heated object, and  $k$  is a negative constant that is associated with the cooling object.

**EXAMPLE 4** Using Newton's Law of Cooling

A cake removed from the oven has a temperature of 210°F. It is left to cool in a room that has a temperature of 70°F. After 30 minutes, the temperature of the cake is 140°F.

- Use Newton's Law of Cooling to find a model for the temperature of the cake,  $T$ , after  $t$  minutes.
- What is the temperature of the cake after 40 minutes?
- When will the temperature of the cake be 90°F?

**SOLUTION**

- We use Newton's Law of Cooling

$$T = C + (T_0 - C)e^{kt}.$$

When the cake is removed from the oven, its temperature is 210°F. This is its initial temperature:  $T_0 = 210$ . The constant temperature of the room is 70°F:  $C = 70$ . Substitute these values into Newton's Law of Cooling. Thus, the temperature of the cake,  $T$ , in degrees Fahrenheit, at time  $t$ , in minutes, is

$$T = 70 + (210 - 70)e^{kt} = 70 + 140e^{kt}.$$

After 30 minutes, the temperature of the cake is 140°F. This means that when  $t = 30$ ,  $T = 140$ . Substituting these numbers into Newton's Law of Cooling will enable us to find  $k$ , a negative constant.

$$T = 70 + 140e^{kt} \quad \text{Use Newton's Law of Cooling from above.}$$

$$140 = 70 + 140e^{k \cdot 30} \quad \text{When } t = 30, T = 140. \text{ Substitute these numbers into the cooling model.}$$

$$70 = 140e^{30k} \quad \text{Subtract 70 from both sides.}$$

$$e^{30k} = \frac{1}{2} \quad \text{Isolate the exponential factor by dividing both sides by 140. We also reversed the sides.}$$

$$\ln e^{30k} = \ln \left( \frac{1}{2} \right) \quad \text{Take the natural logarithm on both sides.}$$

$$30k = \ln \left( \frac{1}{2} \right) \quad \text{Simplify the left side using } \ln e^x = x.$$

$$k = \frac{\ln \left( \frac{1}{2} \right)}{30} \approx -0.0231 \quad \text{Divide both sides by 30 and solve for } k.$$

We substitute  $-0.0231$  for  $k$  into Newton's Law of Cooling,  $T = 70 + 140e^{kt}$ . The temperature of the cake,  $T$ , in degrees Fahrenheit, after  $t$  minutes is modeled by

$$T = 70 + 140e^{-0.0231t}.$$

- To find the temperature of the cake after 40 minutes, we substitute 40 for  $t$  into the cooling model from part (a) and evaluate to find  $T$ .

$$T = 70 + 140e^{-0.0231(40)} \approx 126$$

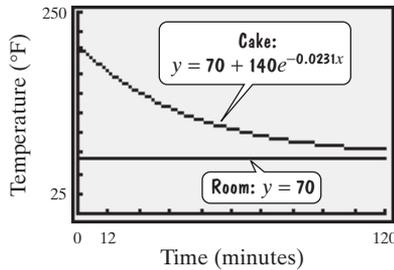

After 40 minutes, the temperature of the cake will be approximately 126°F.

## TECHNOLOGY

### Graphic Connections

The graphs illustrate how the temperature of the cake decreases exponentially over time toward the 70°F room temperature.

- c. To find when the temperature of the cake will be 90°F, we substitute 90 for  $T$  into the cooling model from part (a) and solve for  $t$ .

$$T = 70 + 140e^{-0.0231t} \quad \text{This is the cooling model from part (a).}$$

$$90 = 70 + 140e^{-0.0231t} \quad \text{Substitute 90 for } T.$$

$$20 = 140e^{-0.0231t} \quad \text{Subtract 70 from both sides.}$$

$$e^{-0.0231t} = \frac{1}{7} \quad \text{Divide both sides by 140. We also reversed the sides.}$$

$$\ln e^{-0.0231t} = \ln\left(\frac{1}{7}\right) \quad \text{Take the natural logarithm on both sides.}$$

$$-0.0231t = \ln\left(\frac{1}{7}\right) \quad \text{Simplify the left side using } \ln e^x = x.$$

$$t = \frac{\ln\left(\frac{1}{7}\right)}{-0.0231} \approx 84 \quad \text{Solve for } t \text{ by dividing both sides by } -0.0231.$$

The temperature of the cake will be 90°F after approximately 84 minutes. ●●●

**Check Point 4** An object is heated to 100°C. It is left to cool in a room that has a temperature of 30°C. After 5 minutes, the temperature of the object is 80°C.

- Use Newton's Law of Cooling to find a model for the temperature of the object,  $T$ , after  $t$  minutes.
- What is the temperature of the object after 20 minutes?
- When will the temperature of the object be 35°C?

- 4 Choose an appropriate model for data.

### Modeling Data

Throughout this chapter, we have been working with models that were given. However, we can create functions that model data by observing patterns in scatter plots. **Figure 3.24** shows scatter plots for data that are exponential, logarithmic, and linear.

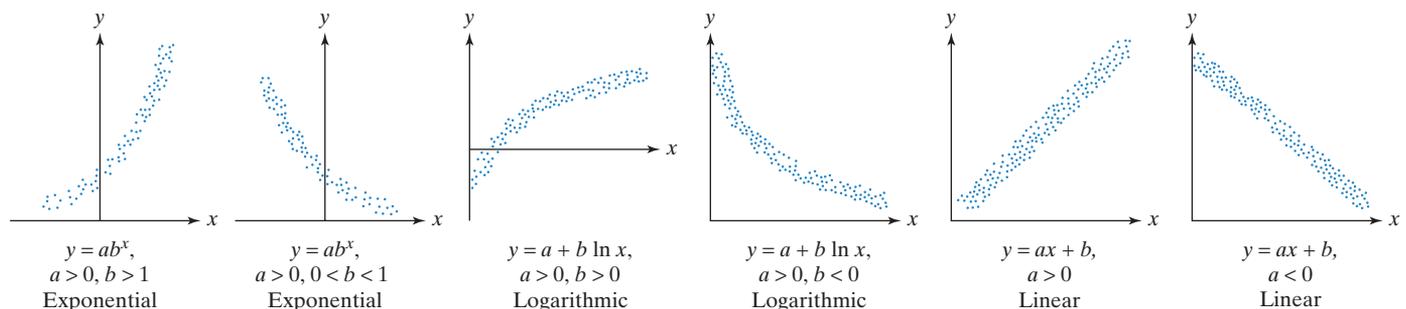

FIGURE 3.24 Scatter plots for exponential, logarithmic, and linear models

**EXAMPLE 5** Choosing a Model for Data

The data in **Table 3.6** indicate that between the ages of 1 and 11, the human brain does not grow linearly, or steadily. A scatter plot for the data is shown in **Figure 3.25**. What type of function would be a good choice for modeling the data?

**FIGURE 3.25**

**SOLUTION**

Because the data in the scatter plot increase rapidly at first and then begin to level off a bit, the shape suggests that a logarithmic function is a good choice for modeling the data.

**Check Point 5** **Table 3.7** shows the populations of various cities, in thousands, and the average walking speed, in feet per second, of a person living in the city. Create a scatter plot for the data. Based on the scatter plot, what type of function would be a good choice for modeling the data?

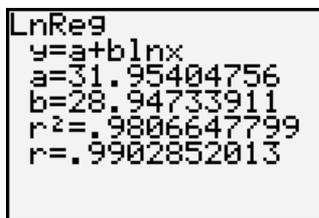

**Table 3.7** Population and Walking Speed

11	99

**FIGURE 3.26** A logarithmic model for the data in **Table 3.8**

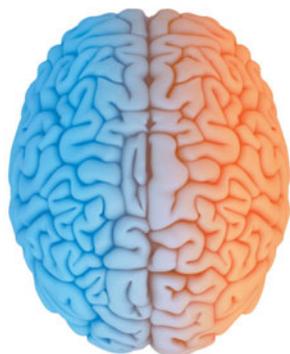

How can we obtain a logarithmic function that models the data for the growth of the human brain? A graphing utility can be used to obtain a logarithmic model of the form  $y = a + b \ln x$ . **Because the domain of the logarithmic function is the set of positive numbers, zero must not be a value for  $x$ .** This is not a problem for the data giving the percentage of an adult size brain because the data begin at age 1. We will assign  $x$  to represent age and  $y$  to represent the percentage of an adult size brain. This gives us

the data shown in **Table 3.8**. Using the logarithmic regression option, we obtain the equation in **Figure 3.26**.

From **Figure 3.26**, we see that the logarithmic model of the data, with numbers rounded to three decimal places, is

$$y = 31.954 + 28.947 \ln x.$$

The number  $r$  that appears in **Figure 3.26** is called the **correlation coefficient** and is a measure of how well the model fits the data. The value of  $r$  is such that  $-1 \leq r \leq 1$ . A positive  $r$  means that as the  $x$ -values increase, so do the  $y$ -values. A negative  $r$  means that as the  $x$ -values increase, the  $y$ -values decrease. **The closer that  $r$  is to  $-1$  or  $1$ , the better the model fits the data.** Because  $r$  is approximately 0.99, the model fits the data very well.

**EXAMPLE 6** Choosing a Model for Data

**Figure 3.27(a)** shows world population, in billions, for seven selected years from 1950 through 2010. A scatter plot is shown in **Figure 3.27(b)**. Suggest two types of functions that would be good choices for modeling the data.

World Population, 1950–2010

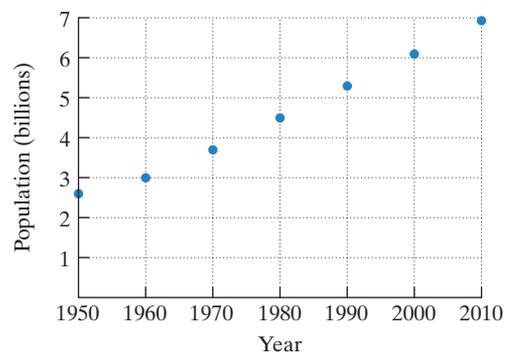

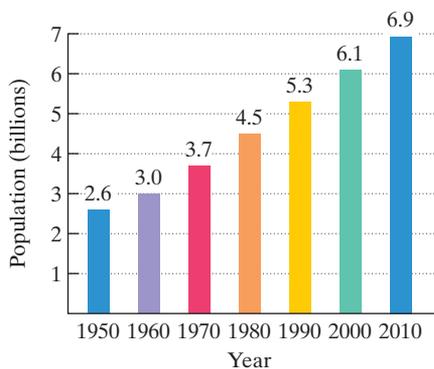

FIGURE 3.27(a)

FIGURE 3.27(b)

Source: U.S. Census Bureau, International Database

**SOLUTION**

Because the data in the scatter plot appear to increase more and more rapidly, the shape suggests that an exponential model might be a good choice. Furthermore, we can probably draw a line that passes through or near the seven points. Thus, a linear function would also be a good choice for modeling the data. ●●●

**Check Point 6** Table 3.9 shows the percentage of U.S. men who are married or who have been married, by age. Create a scatter plot for the data. Based on the scatter plot, what type of function would be a good choice for modeling the data?

**Table 3.9** Percentage of U.S. Men Who Are Married or Who Have Been Married, by Age

Age	Percent
18	2
20	7
25	36
30	61
35	75

Source: National Center for Health Statistics

**EXAMPLE 7** Comparing Linear and Exponential Models

The data for world population are shown in **Table 3.10**. Using a graphing utility's linear regression feature and exponential regression feature, we enter the data and obtain the models shown in **Figure 3.28**.

Table 3.10

x, Number of Years after 1949	y, World Population (billions)
1 (1950)	2.6
11 (1960)	3.0
21 (1970)	3.7
31 (1980)	4.5
41 (1990)	5.3
51 (2000)	6.1
61 (2010)	6.9

Although the domain of  $y = ab^x$  is the set of all real numbers, some graphing utilities only accept positive values for  $x$ . That's why we assigned  $x$  to represent the number of years after 1949.

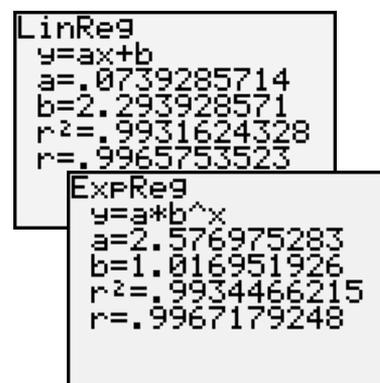

FIGURE 3.28 A linear model and an exponential model for the data in Table 3.10

Because  $r$ , the correlation coefficient, is close to 1 in each screen in **Figure 3.28**, the models fit the data very well.

- Use **Figure 3.28** to express each model in function notation, with numbers rounded to three decimal places.
- How well do the functions model world population in 2000?
- By one projection, world population is expected to reach 8 billion in the year 2026. Which function serves as a better model for this prediction?

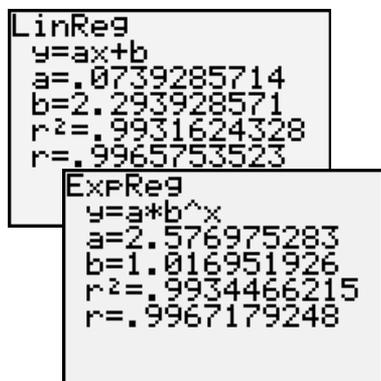

FIGURE 3.28 (repeated) A linear model and an exponential model for world population

## GREAT QUESTION!

**How can I use a graphing utility to see how well my models describe the data?**

Once you have obtained one or more models for the data, you can use a graphing utility's **TABLE** feature to numerically see how well each model describes the data. Enter the models as  $y_1, y_2$ , and so on. Create a table, scroll through the table, and compare the table values given by the models to the actual data.

## SOLUTION

- a. Using **Figure 3.28** and rounding to three decimal places, the functions

$$f(x) = 0.074x + 2.294 \quad \text{and} \quad g(x) = 2.577(1.017)^x$$

model world population, in billions,  $x$  years after 1949. We named the linear function  $f$  and the exponential function  $g$ , although any letters can be used.

- b. **Table 3.10** on the previous page shows that world population in 2000 was 6.1 billion. The year 2000 is 51 years after 1949. Thus, we substitute 51 for  $x$  in each function's equation and then evaluate the resulting expressions with a calculator to see how well the functions describe world population in 2000.

$$f(x) = 0.074x + 2.294$$

This is the linear model.

$$f(51) = 0.074(51) + 2.294$$

Substitute 51 for  $x$ .

$$\approx 6.1$$

Use a calculator.

$$g(x) = 2.577(1.017)^x$$

This is the exponential model.

$$g(51) = 2.577(1.017)^{51}$$

Substitute 51 for  $x$ .

$$\approx 6.1$$

Use a calculator:

$2.577 \times 1.017^{51}$  (or  $\wedge$ ) 51 =.

Because 6.1 billion was the actual world population in 2000, both functions model world population in 2000 extremely well.

- c. Let's see which model comes closer to projecting a world population of 8 billion in the year 2026. Because 2026 is 77 years after 1949 ( $2026 - 1949 = 77$ ), we substitute 77 for  $x$  in each function's equation.

$$f(x) = 0.074x + 2.294$$

This is the linear model.

$$f(77) = 0.074(77) + 2.294$$

Substitute 77 for  $x$ .

$$\approx 8.0$$

Use a calculator.

$$g(x) = 2.577(1.017)^x$$

This is the exponential model.

$$g(77) = 2.577(1.017)^{77}$$

Substitute 77 for  $x$ .

$$\approx 9.4$$

Use a calculator:

$2.577 \times 1.017^{77}$  (or  $\wedge$ ) 77 =.

The linear function  $f(x) = 0.074x + 2.294$  serves as a better model for a projected world population of 8 billion by 2026. ●●●

 **Check Point 7** Use the models  $f(x) = 0.074x + 2.294$  and  $g(x) = 2.577(1.017)^x$  to solve this problem.

- World population in 1970 was 3.7 billion. Which function serves as a better model for this year?
- By one projection, world population is expected to reach 9.3 billion by 2050. Which function serves as a better model for this projection?

When using a graphing utility to model data, begin with a scatter plot, drawn either by hand or with the graphing utility, to obtain a general picture for the shape of the data. It might be difficult to determine which model best fits the data—linear, logarithmic, exponential, quadratic, or something else. If necessary, use your graphing utility to fit several models to the data. The best model is the one that yields the value  $r$ , the correlation coefficient, closest to 1 or  $-1$ . Finding a proper fit for data can be almost as much art as it is mathematics. In this era of technology, the process of creating models that best fit data is one that involves more decision making than computation.

- 5 Express an exponential model in base  $e$ .

### Expressing $y = ab^x$ in Base $e$

Graphing utilities display exponential models in the form  $y = ab^x$ . However, our discussion of exponential growth involved base  $e$ . Because of the inverse property  $b = e^{\ln b}$ , we can rewrite any model in the form  $y = ab^x$  in terms of base  $e$ .

#### Expressing an Exponential Model in Base $e$

$$y = ab^x \text{ is equivalent to } y = ae^{(\ln b) \cdot x}.$$

### EXAMPLE 8 Rewriting the Model for World Population in Base $e$

We have seen that the function

$$g(x) = 2.577(1.017)^x$$

models world population,  $g(x)$ , in billions,  $x$  years after 1949. Rewrite the model in terms of base  $e$ .

#### SOLUTION

We use the two equivalent equations shown in the voice balloons to rewrite the model in terms of base  $e$ .

$$y = ab^x$$

$$y = ae^{(\ln b) \cdot x}$$

$$g(x) = 2.577(1.017)^x \text{ is equivalent to } g(x) = 2.577e^{(\ln 1.017)x}.$$

Using  $\ln 1.017 \approx 0.017$ , the exponential growth model for world population,  $g(x)$ , in billions,  $x$  years after 1949 is

$$g(x) = 2.577e^{0.017x}. \quad \dots$$

In Example 8, we can replace  $g(x)$  with  $A$  and  $x$  with  $t$  so that the model has the same letters as those in the exponential growth model  $A = A_0e^{kt}$ .

$$A = A_0 e^{kt} \quad \text{This is the exponential growth model.}$$

$$A = 2.577e^{0.017t} \quad \text{This is the model for world population.}$$

The value of  $k$ , 0.017, indicates a growth rate of 1.7%. Although this is an excellent model for the data, we must be careful about making projections about world population using this growth function. Why? World population growth rate is now 1.2%, not 1.7%, so our model will overestimate future populations.

 **Check Point 8** Rewrite  $y = 4(7.8)^x$  in terms of base  $e$ . Express the answer in terms of a natural logarithm and then round to three decimal places.

### Blitzer Bonus Global Population Increase

By the time you finish reading Example 8 and working Check Point 8, more than 1000 people will have been added to our planet. By this time tomorrow, world population will have increased by more than 220,000.

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

1. Consider the model for exponential growth or decay given by

$$A = A_0e^{kt}.$$

If  $k$  \_\_\_\_\_, the function models the amount, or size, of a growing entity. If  $k$  \_\_\_\_\_, the function models the amount, or size, of a decaying entity.

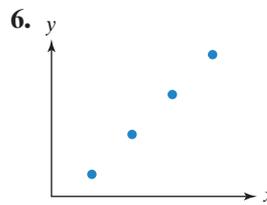

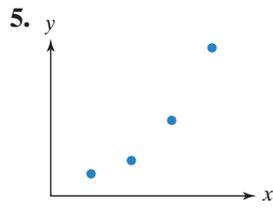

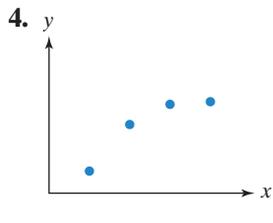

2. In the model for exponential growth or decay, the amount, or size, at  $t = 0$  is represented by \_\_\_\_\_. The amount, or size, at time  $t$  is represented by \_\_\_\_\_.

3. Consider the model for limited logistic growth given by

$$A = \frac{c}{1 + ae^{-bt}}.$$

The amount, or size, at time  $t$  is represented by \_\_\_\_\_. This value can never exceed \_\_\_\_\_.

For each of the scatter plots in Exercises 4–6, determine whether an exponential function, a logarithmic function, or a linear function is the best choice for modeling the data.

7.  $y = 3(5)^x$  can be written in terms of base  $e$  as  $y = 3e^{(\quad)x}$ .

### EXERCISE SET 3.5

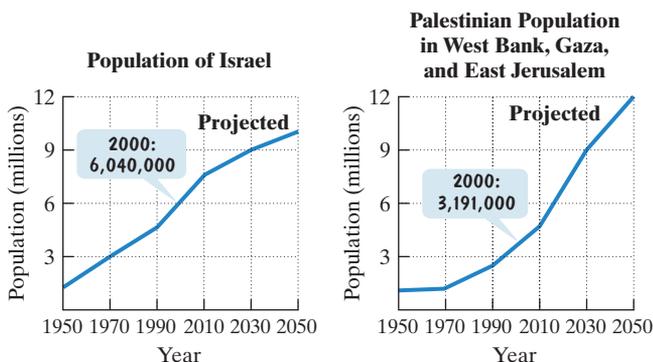

#### Practice Exercises and Application Exercises

The exponential models describe the population of the indicated country,  $A$ , in millions,  $t$  years after 2010. Use these models to solve Exercises 1–6.

India  $A = 1173.1e^{0.008t}$   
 Iraq  $A = 31.5e^{0.019t}$   
 Japan  $A = 127.3e^{-0.006t}$   
 Russia  $A = 141.9e^{-0.005t}$

- What was the population of Japan in 2010?
- What was the population of Iraq in 2010?
- Which country has the greatest growth rate? By what percentage is the population of that country increasing each year?
- Which countries have a decreasing population? By what percentage is the population of these countries decreasing each year?
- When will India's population be 1377 million?
- When will India's population be 1491 million?

About the size of New Jersey, Israel has seen its population soar to more than 6 million since it was established. The graphs show that by 2050, Palestinians in the West Bank, Gaza Strip, and East Jerusalem will outnumber Israelis. Exercises 7–8 involve the projected growth of these two populations.

Source: Newsweek

- In 2000, the population of Israel was approximately 6.04 million and by 2050 it is projected to grow to 10 million. Use the exponential growth model  $A = A_0e^{kt}$ , in which  $t$  is the number of years after 2000, to find an exponential growth function that models the data.
  - In which year will Israel's population be 9 million?
- In 2000, the population of the Palestinians in the West Bank, Gaza Strip, and East Jerusalem was approximately 3.2 million and by 2050 it is projected to grow to 12 million. Use the exponential growth model  $A = A_0e^{kt}$ , in which  $t$  is the number of years after 2000, to find the exponential growth function that models the data.
  - In which year will the Palestinian population be 9 million?

In Exercises 9–14, complete the table. Round projected populations to one decimal place and values of  $k$  to four decimal places.

	Country	2010 Population (millions)	Projected 2050 Population (millions)	Projected Growth Rate, $k$
9.	Philippines	99.9		0.0095
10.	Pakistan	184.4		0.0149
11.	Colombia	44.2	62.9	
12.	Madagascar	21.3	42.7	
13.	Germany	82.3	70.5	
14.	Bulgaria	7.1	5.4	

Source: International Programs Center, U.S. Census Bureau

An artifact originally had 16 grams of carbon-14 present. The decay model  $A = 16e^{-0.000121t}$  describes the amount of carbon-14 present after  $t$  years. Use this model to solve Exercises 15–16.

- How many grams of carbon-14 will be present in 5715 years?
- How many grams of carbon-14 will be present in 11,430 years?
- The half-life of the radioactive element krypton-91 is 10 seconds. If 16 grams of krypton-91 are initially present, how many grams are present after 10 seconds? 20 seconds? 30 seconds? 40 seconds? 50 seconds?
- The half-life of the radioactive element plutonium-239 is 25,000 years. If 16 grams of plutonium-239 are initially present, how many grams are present after 25,000 years? 50,000 years? 75,000 years? 100,000 years? 125,000 years?

Use the exponential decay model for carbon-14,  $A = A_0e^{-0.000121t}$ , to solve Exercises 19–20.

19. Prehistoric cave paintings were discovered in a cave in France. The paint contained 15% of the original carbon-14. Estimate the age of the paintings.
20. Skeletons were found at a construction site in San Francisco in 1989. The skeletons contained 88% of the expected amount of carbon-14 found in a living person. In 1989, how old were the skeletons?

In Exercises 21–26, complete the table. Round half-lives to one decimal place and values of  $k$  to six decimal places.

	Radioactive Substance	Half-Life	Decay Rate, $k$
21.	Tritium		5.5% per year = $-0.055$
22.	Krypton-85		6.3% per year = $-0.063$
23.	Radium-226	1620 years	
24.	Uranium-238	4560 years	
25.	Arsenic-74	17.5 days	
26.	Calcium-47	113 hours	

27. The August 1978 issue of *National Geographic* described the 1964 find of bones of a newly discovered dinosaur weighing 170 pounds, measuring 9 feet, with a 6-inch claw on one toe of each hind foot. The age of the dinosaur was estimated using potassium-40 dating of rocks surrounding the bones.
  - a. Potassium-40 decays exponentially with a half-life of approximately 1.31 billion years. Use the fact that after 1.31 billion years a given amount of potassium-40 will have decayed to half the original amount to show that the decay model for potassium-40 is given by  $A = A_0e^{-0.52912t}$ , where  $t$  is in billions of years.
  - b. Analysis of the rocks surrounding the dinosaur bones indicated that 94.5% of the original amount of potassium-40 was still present. Let  $A = 0.945A_0$  in the model in part (a) and estimate the age of the bones of the dinosaur.

Use the exponential decay model,  $A = A_0e^{kt}$ , to solve Exercises 28–31. Round answers to one decimal place.

28. The half-life of thorium-229 is 7340 years. How long will it take for a sample of this substance to decay to 20% of its original amount?
29. The half-life of lead is 22 years. How long will it take for a sample of this substance to decay to 80% of its original amount?
30. The half-life of aspirin in your bloodstream is 12 hours. How long will it take for the aspirin to decay to 70% of the original dosage?
31. Xanax is a tranquilizer used in the short-term relief of symptoms of anxiety. Its half-life in the bloodstream is 36 hours. How long will it take for Xanax to decay to 90% of the original dosage?
32. A bird species in danger of extinction has a population that is decreasing exponentially ( $A = A_0e^{kt}$ ). Five years ago the population was at 1400 and today only 1000 of the birds are alive. Once the population drops below 100, the situation will be irreversible. When will this happen?

33. Use the exponential growth model,  $A = A_0e^{kt}$ , to show that the time it takes a population to double (to grow from  $A_0$  to  $2A_0$ ) is given by  $t = \frac{\ln 2}{k}$ .

34. Use the exponential growth model,  $A = A_0e^{kt}$ , to show that the time it takes a population to triple (to grow from  $A_0$  to  $3A_0$ ) is given by  $t = \frac{\ln 3}{k}$ .

Use the formula  $t = \frac{\ln 2}{k}$  that gives the time for a population with a growth rate  $k$  to double to solve Exercises 35–36. Express each answer to the nearest whole year.

35. The growth model  $A = 4.3e^{0.01t}$  describes New Zealand's population,  $A$ , in millions,  $t$  years after 2010.
  - a. What is New Zealand's growth rate?
  - b. How long will it take New Zealand to double its population?
36. The growth model  $A = 112.5e^{0.012t}$  describes Mexico's population,  $A$ , in millions,  $t$  years after 2010.
  - a. What is Mexico's growth rate?
  - b. How long will it take Mexico to double its population?
37. The logistic growth function

$$f(t) = \frac{100,000}{1 + 5000e^{-t}}$$

describes the number of people,  $f(t)$ , who have become ill with influenza  $t$  weeks after its initial outbreak in a particular community.

- a. How many people became ill with the flu when the epidemic began?
- b. How many people were ill by the end of the fourth week?
- c. What is the limiting size of the population that becomes ill?

Shown, again, in the following table is world population, in billions, for seven selected years from 1950 through 2010. Using a graphing utility's logistic regression option, we obtain the equation shown on the screen.

x, Number of Years after 1949	y, World Population (billions)
1 (1950)	2.6
11 (1960)	3.0
21 (1970)	3.7
31 (1980)	4.5
41 (1990)	5.3
51 (2000)	6.1
61 (2010)	6.9

```

Logistic
y=c/(1+ae^(-bx))
a=4.110936638
b=.0264832525
c=12.57374318
    
```

We see from the calculator screen at the bottom of the previous page that a logistic growth model for world population,  $f(x)$ , in billions,  $x$  years after 1949 is

$$f(x) = \frac{12.57}{1 + 4.11e^{-0.026x}}$$

Use this function to solve Exercises 38–42.

38. How well does the function model the data showing a world population of 6.1 billion for 2000?
39. How well does the function model the data showing a world population of 6.9 billion for 2010?
40. When will world population reach 7 billion?
41. When will world population reach 8 billion?
42. According to the model, what is the limiting size of the population that Earth will eventually sustain?

The logistic growth function

$$P(x) = \frac{90}{1 + 271e^{-0.122x}}$$

models the percentage,  $P(x)$ , of Americans who are  $x$  years old with some coronary heart disease. Use the function to solve Exercises 43–46.

43. What percentage of 20-year-olds have some coronary heart disease?
44. What percentage of 80-year-olds have some coronary heart disease?
45. At what age is the percentage of some coronary heart disease 50%?
46. At what age is the percentage of some coronary heart disease 70%?

Use Newton's Law of Cooling,  $T = C + (T_0 - C)e^{kt}$ , to solve Exercises 47–50.

47. A bottle of juice initially has a temperature of 70°F. It is left to cool in a refrigerator that has a temperature of 45°F. After 10 minutes, the temperature of the juice is 55°F.
  - a. Use Newton's Law of Cooling to find a model for the temperature of the juice,  $T$ , after  $t$  minutes.
  - b. What is the temperature of the juice after 15 minutes?
  - c. When will the temperature of the juice be 50°F?
48. A pizza removed from the oven has a temperature of 450°F. It is left sitting in a room that has a temperature of 70°F. After 5 minutes, the temperature of the pizza is 300°F.
  - a. Use Newton's Law of Cooling to find a model for the temperature of the pizza,  $T$ , after  $t$  minutes.
  - b. What is the temperature of the pizza after 20 minutes?
  - c. When will the temperature of the pizza be 140°F?
49. A frozen steak initially has a temperature of 28°F. It is left to thaw in a room that has a temperature of 75°F. After 10 minutes, the temperature of the steak has risen to 38°F. After how many minutes will the temperature of the steak be 50°F?
50. A frozen steak initially has a temperature of 24°F. It is left to thaw in a room that has a temperature of 65°F. After 10 minutes, the temperature of the steak has risen to 30°F. After how many minutes will the temperature of the steak be 45°F?

Exercises 51–56 present data in the form of tables. For each data set shown by the table,

- a. Create a scatter plot for the data.
- b. Use the scatter plot to determine whether an exponential function, a logarithmic function, or a linear function is the best choice for modeling the data. (If applicable, in Exercise 76, you will use your graphing utility to obtain these functions.)

### 51. Percent of Miscarriages, by Age

Woman's Age	Percent of Miscarriages
22	9%
27	10%
32	13%
37	20%
42	38%
47	52%

Source: *Time*

### 52. Savings Needed for Health-Care Expenses during Retirement

Age at Death	Savings Needed
80	\$219,000
85	\$307,000
90	\$409,000
95	\$524,000
100	\$656,000

Source: Employee Benefit Research Institute

### 53. Intensity and Loudness Level of Various Sounds

Intensity (watts per meter <sup>2</sup> )	Loudness Level (decibels)
0.1 (loud thunder)	110
1 (rock concert, 2 yd from speakers)	120
10 (jackhammer)	130
100 (jet takeoff, 40 yd away)	140

### 54. Temperature Increase in an Enclosed Vehicle

Minutes	Temperature Increase (°F)
10	19°
20	29°
30	34°
40	38°
50	41°
60	43°

### 55. Dads Raising Kids Alone

Year	Number of Single U.S. Fathers Heading Households with Children Younger Than 18 (millions)
1980	0.6
1990	1.2
2000	1.8
2010	2.5

Source: U.S. Census Bureau

### 56. Percentage of Births to Unmarried Women in the United States

Year	Percentage of Births
1960	5%
1970	11%
1980	18%
1990	28%
2000	33%
2009	41%

Source: National Center for Health Statistics

In Exercises 57–60, rewrite the equation in terms of base  $e$ . Express the answer in terms of a natural logarithm and then round to three decimal places.

57.  $y = 100(4.6)^x$       58.  $y = 1000(7.3)^x$   
 59.  $y = 2.5(0.7)^x$       60.  $y = 4.5(0.6)^x$

### Writing in Mathematics

- Nigeria has a growth rate of 0.025 or 2.5%. Describe what this means.
- How can you tell whether an exponential model describes exponential growth or exponential decay?
- Suppose that a population that is growing exponentially increases from 800,000 people in 2007 to 1,000,000 people in 2010. Without showing the details, describe how to obtain the exponential growth function that models the data.
- What is the half-life of a substance?
- Describe a difference between exponential growth and logistic growth.
- Describe the shape of a scatter plot that suggests modeling the data with an exponential function.
- You take up weightlifting and record the maximum number of pounds you can lift at the end of each week. You start off with rapid growth in terms of the weight you can lift from week to week, but then the growth begins to level off. Describe how to obtain a function that models the number of pounds you can lift at the end of each week. How can you use this function to predict what might happen if you continue the sport?
- Would you prefer that your salary be modeled exponentially or logarithmically? Explain your answer.
- One problem with all exponential growth models is that nothing can grow exponentially forever. Describe factors that might limit the size of a population.

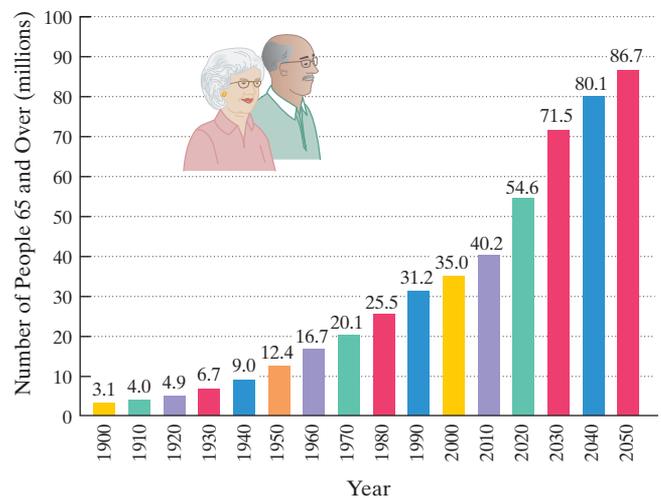

### Technology Exercises

In Example 1 on page 467, we used two data points and an exponential function to model the population of the United States from 1970 through 2010. The data are shown again in the table. Use all five data points to solve Exercises 70–74.

$x$ , Number of Years after 1969	$y$ , U.S. Population (millions)
1 (1970)	203.3
11 (1980)	226.5
21 (1990)	248.7
31 (2000)	281.4
41 (2010)	308.7

- Use your graphing utility's exponential regression option to obtain a model of the form  $y = ab^x$  that fits the data. How well does the correlation coefficient,  $r$ , indicate that the model fits the data?
  - Rewrite the model in terms of base  $e$ . By what percentage is the population of the United States increasing each year?
- Use your graphing utility's logarithmic regression option to obtain a model of the form  $y = a + b \ln x$  that fits the data. How well does the correlation coefficient,  $r$ , indicate that the model fits the data?
- Use your graphing utility's linear regression option to obtain a model of the form  $y = ax + b$  that fits the data. How well does the correlation coefficient,  $r$ , indicate that the model fits the data?
- Use your graphing utility's power regression option to obtain a model of the form  $y = ax^b$  that fits the data. How well does the correlation coefficient,  $r$ , indicate that the model fits the data?
- Use the values of  $r$  in Exercises 70–73 to select the two models of best fit. Use each of these models to predict by which year the U.S. population will reach 335 million. How do these answers compare to the year we found in Example 1, namely 2020? If you obtained different years, how do you account for this difference?
- The figure shows the number of people in the United States age 65 and over, with projected figures for the year 2020 and beyond.

United States Population Age 65 and Over

Source: U.S. Census Bureau

- Let  $x$  represent the number of years after 1899 and let  $y$  represent the U.S. population age 65 and over, in millions. Use your graphing utility to find the model that best fits the data in the bar graph.
  - Rewrite the model in terms of base  $e$ . By what percentage is the 65 and over population increasing each year?
76. In Exercises 51–56, you determined the best choice for the kind of function that modeled the data in the table. For each of the exercises that you worked, use a graphing utility to find the actual function that best fits the data. Then use the model to make a reasonable prediction for a value that exceeds those shown in the table's first column.

## Critical Thinking Exercises

**Make Sense?** In Exercises 77–80, determine whether each statement makes sense or does not make sense, and explain your reasoning.

77. I used an exponential model with a positive growth rate to describe the depreciation in my car's value over four years.
78. After 100 years, a population whose growth rate is 3% will have three times as many people as a population whose growth rate is 1%.
79. When I used an exponential function to model Russia's declining population, the growth rate  $k$  was negative.
80. Because carbon-14 decays exponentially, carbon dating can determine the ages of ancient fossils.

The exponential growth models describe the population of the indicated country,  $A$ , in millions,  $t$  years after 2006.

Canada  $A = 33.1e^{0.009t}$

Uganda  $A = 28.2e^{0.034t}$

In Exercises 81–84, use this information to determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

81. In 2006, Canada's population exceeded Uganda's by 4.9 million.
82. By 2009, the models indicate that Canada's population will exceed Uganda's by approximately 2.8 million.
83. The models indicate that in 2013, Uganda's population will exceed Canada's.
84. Uganda's growth rate is approximately 3.8 times that of Canada's.
85. Use Newton's Law of Cooling,  $T = C + (T_0 - C)e^{kt}$ , to solve this exercise. At 9:00 A.M., a coroner arrived at the home of a person who had died. The temperature of the room was 70°F, and at the time of death the person had a body temperature of 98.6°F. The coroner took the body's temperature at 9:30 A.M., at which time it was 85.6°F, and again at 10:00 A.M., when it was 82.7°F. At what time did the person die?

## Group Exercise

86. Each group member should consult an almanac, newspaper, magazine, or the Internet to find data that can be modeled by exponential or logarithmic functions. Group members should select the two sets of data that are most interesting and relevant. For each set selected, find a model that best fits the data. Each group member should make one prediction based on the model and then discuss a consequence of this prediction. What factors might change the accuracy of the prediction?

## Preview Exercises

Exercises 87–89 will help you prepare for the material covered in the first section of the next chapter.

87. Solve:  $\frac{5\pi}{4} = 2\pi x$ .
88. Simplify:  $\frac{17\pi}{6} - 2\pi$ .
89. Simplify:  $-\frac{\pi}{12} + 2\pi$ .

## CHAPTER 3

## Summary, Review, and Test

## SUMMARY

## DEFINITIONS AND CONCEPTS

## 3.1 Exponential Functions

- a. The exponential function with base  $b$  is defined by  $f(x) = b^x$ , where  $b > 0$  and  $b \neq 1$ .
- b. Characteristics of exponential functions and graphs for  $0 < b < 1$  and  $b > 1$  are shown in the box on page 417.
- c. Transformations involving exponential functions are summarized in Table 3.1 on page 418.
- d. The natural exponential function is  $f(x) = e^x$ . The irrational number  $e$  is called the natural base, where  $e \approx 2.7183$ .  $e$  is the value that  $\left(1 + \frac{1}{n}\right)^n$  approaches as  $n \rightarrow \infty$ .
- e. Formulas for compound interest: After  $t$  years, the balance,  $A$ , in an account with principal  $P$  and annual interest rate  $r$  (in decimal form) is given by one of the following formulas:
- For  $n$  compoundings per year:  $A = P\left(1 + \frac{r}{n}\right)^{nt}$
  - For continuous compounding:  $A = Pe^{rt}$ .

### 3.2 Logarithmic Functions

- a. Definition of the logarithmic function: For  $x > 0$  and  $b > 0, b \neq 1, y = \log_b x$  is equivalent to  $b^y = x$ . The function  $f(x) = \log_b x$  is the logarithmic function with base  $b$ . This function is the inverse function of the exponential function with base  $b$ . Ex. 1, p. 428;  
Ex. 2, p. 429;  
Ex. 3, p. 429
- b. Graphs of logarithmic functions for  $b > 1$  and  $0 < b < 1$  are shown in Figure 3.8 on page 431. Characteristics of the graphs are summarized in the box on page 432. Ex. 6, p. 431
- c. Transformations involving logarithmic functions are summarized in Table 3.5 on page 432. Figures 3.9–3.12,  
pp. 432–433
- d. The domain of a logarithmic function of the form  $f(x) = \log_b x$  is the set of all positive real numbers. The domain of  $f(x) = \log_b g(x)$  consists of all  $x$  for which  $g(x) > 0$ . Ex. 7, p. 433;  
Ex. 10, p. 435
- e. Common and natural logarithms:  $f(x) = \log x$  means  $f(x) = \log_{10} x$  and is the common logarithmic function.  $f(x) = \ln x$  means  $f(x) = \log_e x$  and is the natural logarithmic function. Ex. 8, p. 434;  
Ex. 9, p. 435;  
Ex. 11, p. 436
- f. Basic Logarithmic Properties

Base $b$ ( $b > 0, b \neq 1$ )	Base 10 (Common Logarithms)	Base $e$ (Natural Logarithms)
$\log_b 1 = 0$	$\log 1 = 0$	$\ln 1 = 0$
$\log_b b = 1$	$\log 10 = 1$	$\ln e = 1$
$\log_b b^x = x$	$\log 10^x = x$	$\ln e^x = x$
$b^{\log_b x} = x$	$10^{\log x} = x$	$e^{\ln x} = x$

Ex. 4, p. 430

Ex. 5, p. 430

### 3.3 Properties of Logarithms

- a. *The Product Rule:*  $\log_b(MN) = \log_b M + \log_b N$  Ex. 1, p. 441
- b. *The Quotient Rule:*  $\log_b\left(\frac{M}{N}\right) = \log_b M - \log_b N$  Ex. 2, p. 442
- c. *The Power Rule:*  $\log_b M^p = p \log_b M$  Ex. 3, p. 443
- d. *The Change-of-Base Property:*

The General Property	Introducing Common Logarithms	Introducing Natural Logarithms
$\log_b M = \frac{\log_a M}{\log_a b}$	$\log_b M = \frac{\log M}{\log b}$	$\log_b M = \frac{\ln M}{\ln b}$

Ex. 7, p. 447;  
Ex. 8, p. 448

- e. Properties for expanding logarithmic expressions are given in the box on page 444. Ex. 4, p. 444
- f. Properties for condensing logarithmic expressions are given in the box on page 445. Ex. 5, p. 445;  
Ex. 6, p. 446

### 3.4 Exponential and Logarithmic Equations

- a. An exponential equation is an equation containing a variable in an exponent. Some exponential equations can be solved by expressing each side as a power of the same base: If  $b^M = b^N$ , then  $M = N$ . Details are in the box on page 452. Ex. 1, p. 452
- b. The procedure for using logarithms to solve exponential equations is given in the box on page 453. The solution procedure involves isolating the exponential expression. Take the common logarithm on both sides for base 10. Take the natural logarithm on both sides for bases other than 10. Simplify using  $\ln b^x = x \ln b$  or  $\ln e^x = x$  or  $\log 10^x = x$ . Ex. 2, p. 453;  
Ex. 3, p. 454;  
Ex. 4, p. 454;  
Ex. 5, p. 455
- c. A logarithmic equation is an equation containing a variable in a logarithmic expression. Some logarithmic equations can be expressed in the form  $\log_b M = c$ . The definition of a logarithm is used to rewrite the equation in exponential form:  $b^c = M$ . See the box on page 455. When checking logarithmic equations, reject proposed solutions that produce the logarithm of a negative number or the logarithm of 0 in the original equation. Ex. 6, p. 456;  
Ex. 7, p. 457
- d. Some logarithmic equations can be expressed in the form  $\log_b M = \log_b N$ . Use the one-to-one property to rewrite the equation without logarithms:  $M = N$ . See the box on page 458. Ex. 8, p. 458

## DEFINITIONS AND CONCEPTS

## EXAMPLES

## 3.5 Exponential Growth and Decay; Modeling Data

- a. Exponential growth and decay models are given by  $A = A_0e^{kt}$  in which  $t$  represents time,  $A_0$  is the amount present at  $t = 0$ , and  $A$  is the amount present at time  $t$ . If  $k > 0$ , the model describes growth and  $k$  is the growth rate. If  $k < 0$ , the model describes decay and  $k$  is the decay rate. Ex. 1, p. 467;  
Ex. 2, p. 469
- b. The logistic growth model, given by  $A = \frac{c}{1 + ae^{-bt}}$ , describes situations in which growth is limited.  $y = c$  is a horizontal asymptote for the graph, and growth,  $A$ , can never exceed  $c$ . Ex. 3, p. 470
- c. Newton's Law of Cooling: The temperature,  $T$ , of a heated object at time  $t$  is given by Ex. 4, p. 472
- $$T = C + (T_0 - C)e^{kt},$$
- where  $C$  is the constant temperature of the surrounding medium,  $T_0$  is the initial temperature of the heated object, and  $k$  is a negative constant.
- d. Scatter plots for exponential, logarithmic, and linear models are shown in Figure 3.24 on page 473. When using a graphing utility to model data, the closer that the correlation coefficient,  $r$ , is to  $-1$  or  $1$ , the better the model fits the data. Ex. 5, p. 474;  
Ex. 6, p. 475;  
Ex. 7, p. 475
- e. Expressing an Exponential Model in Base  $e$ :  $y = ab^x$  is equivalent to  $y = ae^{(\ln b)x}$ . Ex. 8, p. 477

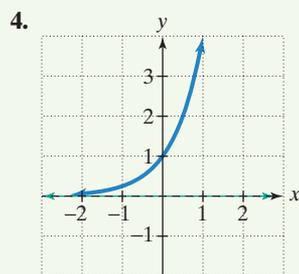

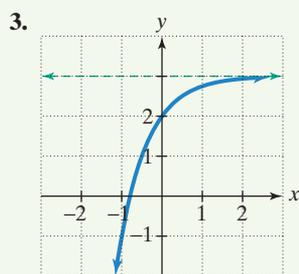

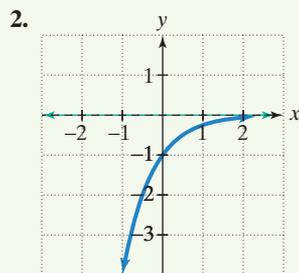

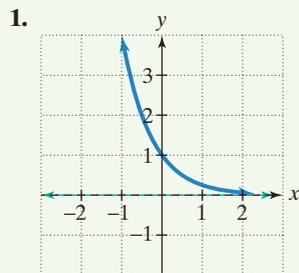

## REVIEW EXERCISES

## 3.1

In Exercises 1–4, the graph of an exponential function is given. Select the function for each graph from the following options:

$$f(x) = 4^x, g(x) = 4^{-x},$$

$$h(x) = -4^{-x}, r(x) = -4^{-x} + 3.$$

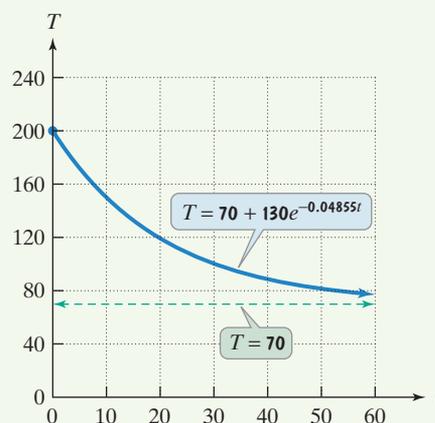

In Exercises 5–9, graph  $f$  and  $g$  in the same rectangular coordinate system. Use transformations of the graph of  $f$  to obtain the graph of  $g$ . Graph and give equations of all asymptotes. Use the graphs to determine each function's domain and range.

5.  $f(x) = 2^x$  and  $g(x) = 2^{x-1}$
6.  $f(x) = 3^x$  and  $g(x) = 3^x - 1$
7.  $f(x) = 3^x$  and  $g(x) = -3^x$
8.  $f(x) = \left(\frac{1}{2}\right)^x$  and  $g(x) = \left(\frac{1}{2}\right)^{-x}$
9.  $f(x) = e^x$  and  $g(x) = 2e^{\frac{x}{2}}$

Use the compound interest formulas to solve Exercises 10–11.

10. Suppose that you have \$5000 to invest. Which investment yields the greater return over 5 years: 5.5% compounded semiannually or 5.25% compounded monthly?
11. Suppose that you have \$14,000 to invest. Which investment yields the greater return over 10 years: 7% compounded monthly or 6.85% compounded continuously?
12. A cup of coffee is taken out of a microwave oven and placed in a room. The temperature,  $T$ , in degrees Fahrenheit, of the coffee after  $t$  minutes is modeled by the function  $T = 70 + 130e^{-0.04855t}$ . The graph of the function is shown in the figure.

Use the graph to answer each of the following questions.

- a. What was the temperature of the coffee when it was first taken out of the microwave?
- b. What is a reasonable estimate of the temperature of the coffee after 20 minutes? Use your calculator to verify this estimate.
- c. What is the limit of the temperature to which the coffee will cool? What does this tell you about the temperature of the room?

**3.2**

In Exercises 13–15, write each equation in its equivalent exponential form.

13.  $\frac{1}{2} = \log_{49} 7$       14.  $3 = \log_4 x$       15.  $\log_3 81 = y$

In Exercises 16–18, write each equation in its equivalent logarithmic form.

16.  $6^3 = 216$       17.  $b^4 = 625$       18.  $13^y = 874$

In Exercises 19–29, evaluate each expression without using a calculator. If evaluation is not possible, state the reason.

19.  $\log_4 64$       20.  $\log_5 \frac{1}{25}$       21.  $\log_3(-9)$

22.  $\log_{16} 4$       23.  $\log_{17} 17$       24.  $\log_3 3^8$

25.  $\ln e^5$       26.  $\log_3 \frac{1}{\sqrt{3}}$       27.  $\ln \frac{1}{e^2}$

28.  $\log \frac{1}{1000}$       29.  $\log_3(\log_8 8)$

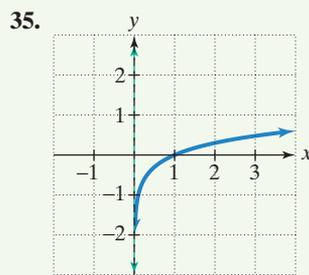

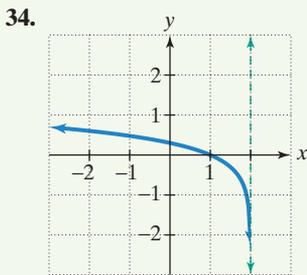

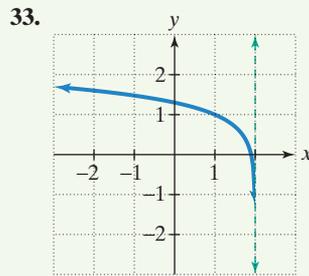

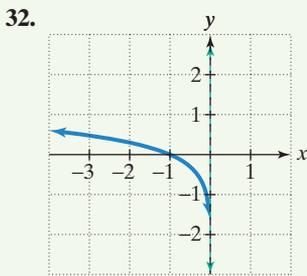

30. Graph  $f(x) = 2^x$  and  $g(x) = \log_2 x$  in the same rectangular coordinate system. Use the graphs to determine each function's domain and range.

31. Graph  $f(x) = \left(\frac{1}{3}\right)^x$  and  $g(x) = \log_3 x$  in the same rectangular coordinate system. Use the graphs to determine each function's domain and range.

In Exercises 32–35, the graph of a logarithmic function is given. Select the function for each graph from the following options:

$$f(x) = \log x, \quad g(x) = \log(-x),$$

$$h(x) = \log(2 - x), \quad r(x) = 1 + \log(2 - x).$$

In Exercises 36–38, begin by graphing  $f(x) = \log_2 x$ . Then use transformations of this graph to graph the given function. What is the graph's  $x$ -intercept? What is the vertical asymptote? Use the graphs to determine each function's domain and range.

36.  $g(x) = \log_2(x - 2)$       37.  $h(x) = -1 + \log_2 x$

38.  $r(x) = \log_2(-x)$

In Exercises 39–40, graph  $f$  and  $g$  in the same rectangular coordinate system. Use transformations of the graph of  $f$  to obtain the graph of  $g$ . Graph and give equations of all asymptotes. Use the graphs to determine each function's domain and range.

39.  $f(x) = \log x$  and  $g(x) = -\log(x + 3)$

40.  $f(x) = \ln x$  and  $g(x) = -\ln(2x)$

In Exercises 41–43, find the domain of each logarithmic function.

41.  $f(x) = \log_8(x + 5)$       42.  $f(x) = \log(3 - x)$

43.  $f(x) = \ln(x - 1)^2$

In Exercises 44–46, use inverse properties of logarithms to simplify each expression.

44.  $\ln e^{6x}$       45.  $e^{\ln \sqrt{x}}$       46.  $10^{\log 4x^2}$

47. On the Richter scale, the magnitude,  $R$ , of an earthquake of intensity  $I$  is given by  $R = \log \frac{I}{I_0}$ , where  $I_0$  is the intensity of a barely felt zero-level earthquake. If the intensity of an earthquake is  $1000I_0$ , what is its magnitude on the Richter scale?

48. Students in a psychology class took a final examination. As part of an experiment to see how much of the course content they remembered over time, they took equivalent forms of the exam in monthly intervals thereafter. The average score,  $f(t)$ , for the group after  $t$  months is modeled by the function  $f(t) = 76 - 18 \log(t + 1)$ , where  $0 \leq t \leq 12$ .

- What was the average score when the exam was first given?
- What was the average score after 2 months? 4 months? 6 months? 8 months? one year?
- Use the results from parts (a) and (b) to graph  $f$ . Describe what the shape of the graph indicates in terms of the material retained by the students.

49. The formula

$$t = \frac{1}{c} \ln \left( \frac{A}{A - N} \right)$$

describes the time,  $t$ , in weeks, that it takes to achieve mastery of a portion of a task. In the formula,  $A$  represents maximum learning possible,  $N$  is the portion of the learning that is to be achieved, and  $c$  is a constant used to measure an individual's learning style. A 50-year-old man decides to start running as a way to maintain good health. He feels that the maximum rate he could ever hope to achieve is 12 miles per hour. How many weeks will it take before the man can run 5 miles per hour if  $c = 0.06$  for this person?

**3.3**

In Exercises 50–53, use properties of logarithms to expand each logarithmic expression as much as possible. Where possible, evaluate logarithmic expressions without using a calculator.

50.  $\log_6(36x^3)$       51.  $\log_4 \left( \frac{\sqrt{x}}{64} \right)$

52.  $\log_2 \left( \frac{xy^2}{64} \right)$       53.  $\ln \sqrt[3]{\frac{x}{e}}$

In Exercises 54–57, use properties of logarithms to condense each logarithmic expression. Write the expression as a single logarithm whose coefficient is 1.

54.  $\log_b 7 + \log_b 3$       55.  $\log 3 - 3 \log x$

56.  $3 \ln x + 4 \ln y$       57.  $\frac{1}{2} \ln x - \ln y$

3.5

86. According to the U.S. Bureau of the Census, in 2000 there were 35.3 million residents of Hispanic origin living in the United States. By 2010, the number had increased to 50.5 million. The exponential growth function  $A = 35.3e^{kt}$  describes the U.S. Hispanic population,  $A$ , in millions,  $t$  years after 2000.
- Find  $k$ , correct to three decimal places.
  - Use the resulting model to project the Hispanic resident population in 2015.
  - In which year will the Hispanic resident population reach 70 million?
87. Use the exponential decay model,  $A = A_0e^{kt}$ , to solve this exercise. The half-life of polonium-210 is 140 days. How long will it take for a sample of this substance to decay to 20% of its original amount?
88. The function

$$f(t) = \frac{500,000}{1 + 2499e^{-0.92t}}$$

models the number of people,  $f(t)$ , in a city who have become ill with influenza  $t$  weeks after its initial outbreak.

- How many people became ill with the flu when the epidemic began?
  - How many people were ill by the end of the sixth week?
  - What is the limiting size of  $f(t)$ , the population that becomes ill?
89. Use Newton's Law of Cooling,  $T = C + (T_0 - C)e^{kt}$ , to solve this exercise. You are served a cup of coffee that has a temperature of 185°F. The room temperature is 65°F. After 2 minutes, the temperature of the coffee is 155°F.
- Write a model for the temperature of the coffee,  $T$ , after  $t$  minutes.
  - When will the temperature of the coffee be 105°F?

Exercises 90–92 present data in the form of tables. For each data set shown by the table,

- Create a scatter plot for the data.
- Use the scatter plot to determine whether an exponential function, a logarithmic function, or a linear function is the best choice for modeling the data.

90. U.S. Ice Cream Consumption

Year	Average Annual Consumption (pounds)
1968	18.5
1978	17.6
1988	17.3
1998	16.3

In Exercises 93–94, rewrite the equation in terms of base  $e$ . Express the answer in terms of a natural logarithm and then round to three decimal places.

93.  $y = 73(2.6)^x$

94.  $y = 6.5(0.43)^x$

95. The figure shows world population projections through the year 2150. The data are from the United Nations Family Planning Program and are based on optimistic or pessimistic expectations for successful control of human population growth. Suppose that you are interested in modeling these data using exponential, logarithmic, linear, and quadratic functions. Which function would you use to model each of the projections? Explain your choices. For the choice corresponding to a quadratic model, would your formula involve one with a positive or negative leading coefficient? Explain.

## CHAPTER 3 TEST

- Graph  $f(x) = 2^x$  and  $g(x) = 2^{x+1}$  in the same rectangular coordinate system.
- Graph  $f(x) = \log_2 x$  and  $g(x) = \log_2(x - 1)$  in the same rectangular coordinate system.
- Write in exponential form:  $\log_5 125 = 3$ .
- Write in logarithmic form:  $\sqrt{36} = 6$ .
- Find the domain:  $f(x) = \ln(3 - x)$ .

In Exercises 6–7, use properties of logarithms to expand each logarithmic expression as much as possible. Where possible, evaluate logarithmic expressions without using a calculator.

6.  $\log_4(64x^5)$

7.  $\log_3\left(\frac{\sqrt[3]{x}}{81}\right)$

In Exercises 8–9, write each expression as a single logarithm.

8.  $6 \log x + 2 \log y$

9.  $\ln 7 - 3 \ln x$

- Use a calculator to evaluate  $\log_{15} 71$  to four decimal places.

In Exercises 11–18, solve each equation.

11.  $3^{x-2} = 9^{x+4}$

12.  $5^x = 1.4$

13.  $400e^{0.005x} = 1600$

14.  $e^{2x} - 6e^x + 5 = 0$

15.  $\log_6(4x - 1) = 3$

16.  $2 \ln(3x) = 8$

17.  $\log x + \log(x + 15) = 2$

18.  $\ln(x - 4) - \ln(x + 1) = \ln 6$

- On the decibel scale, the loudness of a sound,  $D$ , in decibels, is given by  $D = 10 \log \frac{I}{I_0}$ , where  $I$  is the intensity of the sound, in watts per meter<sup>2</sup>, and  $I_0$  is the intensity of a sound barely audible to the human ear. If the intensity of a sound is  $10^{12}I_0$ , what is its loudness in decibels? (Such a sound is potentially damaging to the ear.)

In Exercises 20–22, simplify each expression.

20.  $\ln e^{5x}$

21.  $\log_b b$

22.  $\log_6 1$

Use the compound interest formulas to solve Exercises 23–25.

- Suppose you have \$3000 to invest. Which investment yields the greater return over 10 years: 6.5% compounded semiannually or 6% compounded continuously? How much more (to the nearest dollar) is yielded by the better investment?
- How long, to the nearest tenth of a year, will it take \$4000 to grow to \$8000 at 5% annual interest compounded quarterly?
- What interest rate, to the nearest tenth of a percent, is required for an investment subject to continuous compounding to double in 10 years?

- The function

$$A = 82.3e^{-0.004t}$$

models the population of Germany,  $A$ , in millions,  $t$  years after 2010.

- What was the population of Germany in 2010?
  - Is the population of Germany increasing or decreasing? Explain.
  - In which year will the population of Germany be 79.1 million?
- The 2010 population of Asia was 4121 million; in 2050, it is projected to be 5231 million. Write the exponential growth function that describes the population of Asia, in millions,  $t$  years after 2010.
  - Use the exponential decay model,  $A = A_0e^{kt}$ , to solve this exercise. The half-life of iodine-131 is 7.2 days. How long will it take for a sample of this substance to decay to 30% of its original amount? Round to one decimal place.
  - The logistic growth function

$$f(t) = \frac{140}{1 + 9e^{-0.165t}}$$

describes the population,  $f(t)$ , of an endangered species of elk  $t$  years after they were introduced to a nonthreatening habitat.

- How many elk were initially introduced to the habitat?
- How many elk are expected in the habitat after 10 years?
- What is the limiting size of the elk population that the habitat will sustain?

In Exercises 30–33, determine whether the values in each table belong to an exponential function, a logarithmic function, a linear function, or a quadratic function.

$x$	$y$
0	3
1	1
2	-1
3	-3
4	-5

$x$	$y$
$\frac{1}{3}$	-1
1	0
3	1
9	2
27	3

$x$	$y$

2	25
3	125
4	625

$x$	$y$
0	12
1	3
2	0
3	3
4	12

- Rewrite  $y = 96(0.38)^x$  in terms of base  $e$ . Express the answer in terms of a natural logarithm and then round to three decimal places.

## CUMULATIVE REVIEW EXERCISES (CHAPTERS P-3)

In Exercises 1–8, solve each equation or inequality.

1.  $|3x - 4| = 2$
2.  $x^2 + 2x + 5 = 0$
3.  $x^4 + x^3 - 3x^2 - x + 2 = 0$
4.  $e^{5x} - 32 = 96$
5.  $\log_2(x + 5) + \log_2(x - 1) = 4$
6.  $\ln(x + 4) + \ln(x + 1) = 2 \ln(x + 3)$
7.  $14 - 5x \geq -6$
8.  $|2x - 4| \leq 2$

In Exercises 9–14, graph each equation in a rectangular coordinate system. If two functions are indicated, graph both in the same system.

9.  $(x - 3)^2 + (y + 2)^2 = 4$
10.  $f(x) = (x - 2)^2 - 1$
11.  $f(x) = \frac{x^2 - 1}{x^2 - 4}$
12.  $f(x) = (x - 2)^2(x + 1)$
13.  $f(x) = 2x - 4$  and  $f^{-1}(x)$
14.  $f(x) = \ln x$  and  $g(x) = \ln(x - 2) + 1$

15. Write the point-slope form and the slope-intercept form of the line passing through  $(1, 3)$  and  $(3, -3)$ .
16. If  $f(x) = x^2$  and  $g(x) = x + 2$ , find  $(f \circ g)(x)$  and  $(g \circ f)(x)$ .
17. You discover that the number of hours you sleep each night varies inversely as the square of the number of cups of coffee consumed during the early evening. If 2 cups of coffee are consumed, you get 8 hours of sleep. If the number of cups of coffee is doubled, how many hours should you expect to sleep?

A baseball player hits a pop fly into the air. The function

$$s(t) = -16t^2 + 64t + 5$$

models the ball's height above the ground,  $s(t)$ , in feet,  $t$  seconds after it is hit. Use the function to solve Exercises 18–19.

18. When does the baseball reach its maximum height? What is that height?
19. After how many seconds does the baseball hit the ground? Round to the nearest tenth of a second.
20. You are paid time-and-a-half for each hour worked over 40 hours a week. Last week you worked 50 hours and earned \$660. What is your normal hourly salary?

# TRIGONOMETRIC FUNCTIONS

## CHAPTER

# 4

*Have you had days* when your physical, intellectual, and emotional potentials were all at their peak? Then there are those other days when we feel we should not even bother getting out of bed. Do our potentials run in oscillating cycles like the tides? Can they be described mathematically? In this chapter, you will encounter functions that enable us to model phenomena that occur in cycles.

### HERE'S WHERE YOU'LL FIND THESE APPLICATIONS:

Graphs of functions showing a person's biorhythms, the physical, intellectual, and emotional cycles we experience in life, are presented in Exercises 75–82 of Exercise Set 4.5.

## SECTION 4.1

## Angles and Radian Measure

## Objectives

- 1 Recognize and use the vocabulary of angles.
- 2 Use degree measure.
- 3 Use radian measure.
- 4 Convert between degrees and radians.
- 5 Draw angles in standard position.
- 6 Find coterminal angles.
- 7 Find the length of a circular arc.
- 8 Use linear and angular speed to describe motion on a circular path.

- 1 Recognize and use the vocabulary of angles.

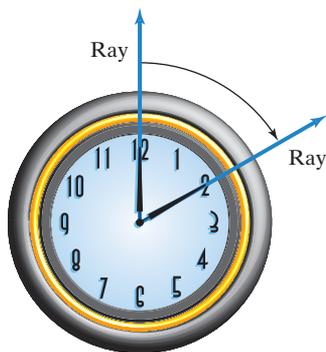

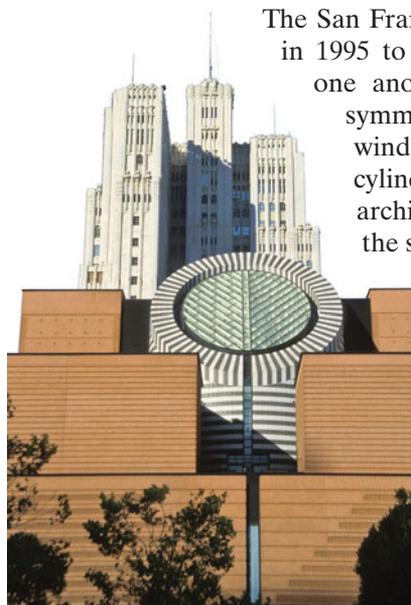

FIGURE 4.1 Clock with hands forming an angle

The San Francisco Museum of Modern Art was constructed in 1995 to illustrate how art and architecture can enrich one another. The exterior involves geometric shapes, symmetry, and unusual facades. Although there are no windows, natural light streams in through a truncated cylindrical skylight that crowns the building. The architect worked with a scale model of the museum at the site and observed how light hit it during different times of the day. These observations were used to cut the cylindrical skylight at an angle that maximizes sunlight entering the interior.

Angles play a critical role in creating modern architecture. They are also fundamental in trigonometry. In this section, we begin our study of trigonometry by looking at angles and methods for measuring them.

## Angles

The hour hand of a clock suggests a **ray**, a part of a line that has only one endpoint and extends forever in the opposite direction. An **angle** is formed by two rays that have a common endpoint. One ray is called the **initial side** and the other the **terminal side**.

A rotating ray is often a useful way to think about angles. The ray in **Figure 4.1** rotates from 12 to 2. The ray pointing to 12 is the **initial side** and the ray pointing to 2 is the **terminal side**. The common endpoint of an angle's initial side and terminal side is the **vertex** of the angle.

**Figure 4.2** shows an angle. The arrow near the vertex shows the direction and the amount of rotation from the initial side to the terminal side. Several methods can be used to name an angle. Lowercase Greek letters, such as  $\alpha$  (alpha),  $\beta$  (beta),  $\gamma$  (gamma), and  $\theta$  (theta), are often used.

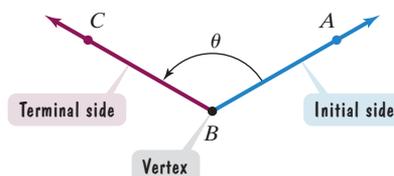

FIGURE 4.2 An angle; two rays with a common endpoint

An angle is in **standard position** if

- its vertex is at the origin of a rectangular coordinate system and
- its initial side lies along the positive  $x$ -axis.

The angles in **Figure 4.3** at the top of the next page are both in standard position.

When we see an initial side and a terminal side in place, there are two kinds of rotations that could have generated the angle. The arrow in **Figure 4.3(a)** indicates that the rotation from the initial side to the terminal side is in the counterclockwise direction. **Positive angles** are generated by counterclockwise rotation. Thus, angle  $\alpha$  is positive. By contrast, the arrow in **Figure 4.3(b)** shows that the rotation from

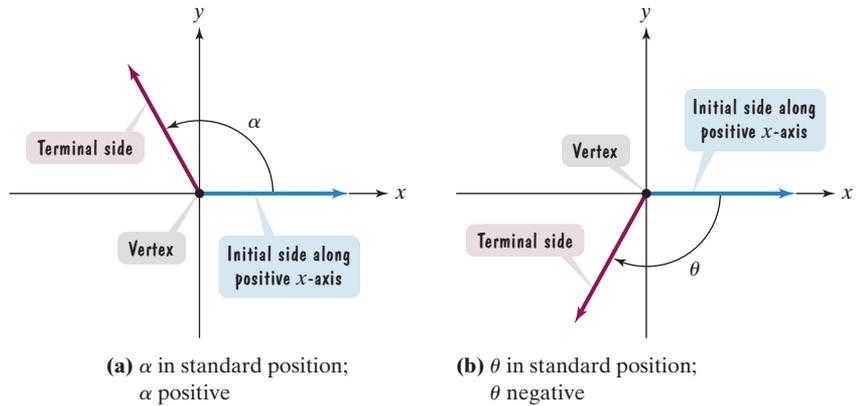

FIGURE 4.3 Two angles in standard position

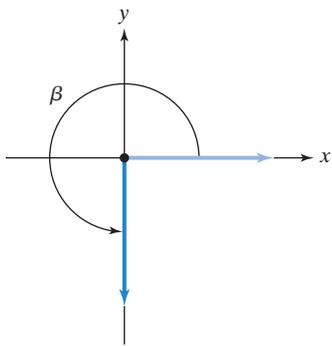

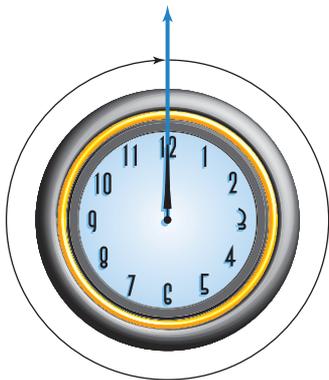

FIGURE 4.4  $\beta$  is a quadrantal angle.

the initial side to the terminal side is in the clockwise direction. **Negative angles** are generated by clockwise rotation. Thus, angle  $\theta$  is negative.

When an angle is in standard position, its terminal side can lie in a quadrant. We say that the angle **lies in that quadrant**. For example, in **Figure 4.3(a)**, the terminal side of angle  $\alpha$  lies in quadrant II. Thus, angle  $\alpha$  lies in quadrant II. By contrast, in **Figure 4.3(b)**, the terminal side of angle  $\theta$  lies in quadrant III. Thus, angle  $\theta$  lies in quadrant III.

Must all angles in standard position lie in a quadrant? The answer is no. The terminal side can lie on the  $x$ -axis or the  $y$ -axis. For example, angle  $\beta$  in **Figure 4.4** has a terminal side that lies on the negative  $y$ -axis. An angle is called a **quadrantal angle** if its terminal side lies on the  $x$ -axis or on the  $y$ -axis. Angle  $\beta$  in **Figure 4.4** is an example of a quadrantal angle.

2 Use degree measure.

A complete  $360^\circ$  rotation

Measuring Angles Using Degrees

Angles are measured by determining the amount of rotation from the initial side to the terminal side. One way to measure angles is in **degrees**, symbolized by a small, raised circle  $^\circ$ . Think of the hour hand of a clock. From 12 noon to 12 midnight, the hour hand moves around in a complete circle. By definition, the ray has rotated through 360 degrees, or  $360^\circ$ . Using  $360^\circ$  as the amount of rotation of a ray back onto itself, a degree,  $1^\circ$ , is  $\frac{1}{360}$  of a complete rotation.

**Figure 4.5** shows that certain angles have special names. An **acute angle** measures less than  $90^\circ$  [see **Figure 4.5(a)**]. A **right angle**, one quarter of a complete rotation, measures  $90^\circ$  [**Figure 4.5(b)**]. Examine the right angle—do you see a small square at the vertex? This symbol is used to indicate a right angle. An **obtuse angle** measures more than  $90^\circ$  but less than  $180^\circ$  [**Figure 4.5(c)**]. Finally, a **straight angle**, one-half a complete rotation, measures  $180^\circ$  [**Figure 4.5(d)**].

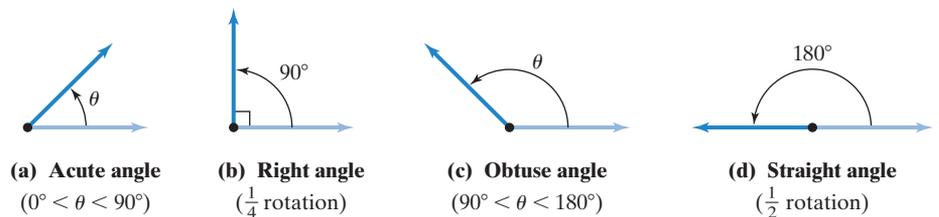

FIGURE 4.5 Classifying angles by their degree measurement

We will be using notation such as  $\theta = 60^\circ$  to refer to an angle  $\theta$  whose measure is  $60^\circ$ . We also refer to *an angle of  $60^\circ$*  or a  *$60^\circ$  angle*, rather than using the more precise (but cumbersome) phrase *an angle whose measure is  $60^\circ$* .

## TECHNOLOGY

Fractional parts of degrees are measured in minutes and seconds.

One minute, written  $1'$ , is  $\frac{1}{60}$  degree:  $1' = \frac{1}{60}^\circ$ .

One second, written  $1''$ , is  $\frac{1}{3600}$  degree:  $1'' = \frac{1}{3600}^\circ$ .

For example,

$$31^\circ 47' 12'' = \left( 31 + \frac{47}{60} + \frac{12}{3600} \right)^\circ \\ \approx 31.787^\circ.$$

Many calculators have keys for changing an angle from degree-minute-second notation ( $D^\circ M' S''$ ) to a decimal form and vice versa.

### 3 Use radian measure.

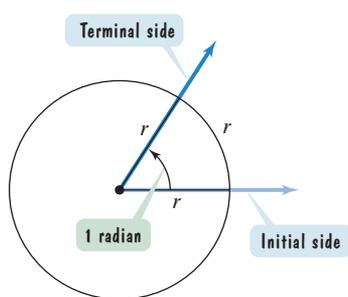

FIGURE 4.6 For a 1-radian angle, the intercepted arc and the radius are equal.

## Measuring Angles Using Radians

Another way to measure angles is in *radians*. Let's first define an angle measuring **1 radian**. We use a circle of radius  $r$ . In **Figure 4.6**, we've constructed an angle whose vertex is at the center of the circle. Such an angle is called a **central angle**. Notice that this central angle intercepts an arc along the circle measuring  $r$  units. The radius of the circle is also  $r$  units. The measure of such an angle is 1 radian.

### Definition of a Radian

**One radian** is the measure of the central angle of a circle that intercepts an arc equal in length to the radius of the circle.

The **radian measure** of any central angle is the length of the intercepted arc divided by the circle's radius. In **Figure 4.7(a)**, the length of the arc intercepted by angle  $\beta$  is double the radius,  $r$ . We find the measure of angle  $\beta$  in radians by dividing the length of the intercepted arc by the radius.

$$\beta = \frac{\text{length of the intercepted arc}}{\text{radius}} = \frac{2r}{r} = 2$$

Thus, angle  $\beta$  measures 2 radians.

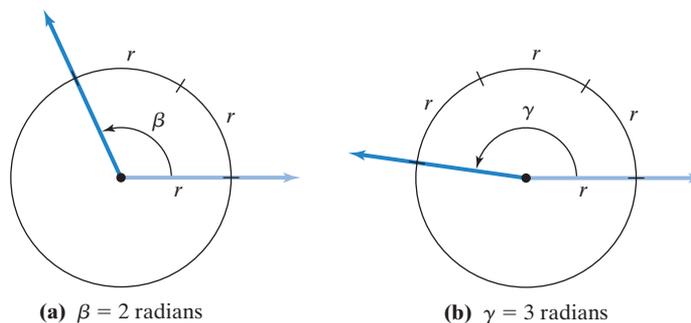

FIGURE 4.7 Two central angles measured in radians

In **Figure 4.7(b)**, the length of the intercepted arc is triple the radius,  $r$ . Let us find the measure of angle  $\gamma$ :

$$\gamma = \frac{\text{length of the intercepted arc}}{\text{radius}} = \frac{3r}{r} = 3.$$

Thus, angle  $\gamma$  measures 3 radians.

## Radian Measure

Consider an arc of length  $s$  on a circle of radius  $r$ . The measure of the central angle,  $\theta$ , that intercepts the arc is

$$\theta = \frac{s}{r} \text{ radians.}$$

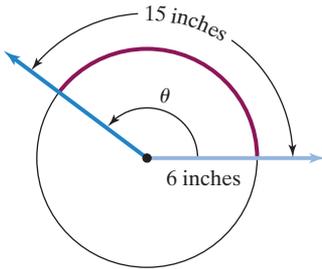

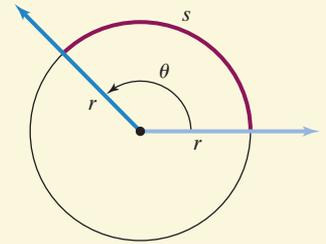

FIGURE 4.8

## GREAT QUESTION!

**When determining radian measure, do the units for the length of the intercepted arc and the radius have to be the same?**

Yes. Before applying the formula for radian measure, be sure that the same unit of length is used for the intercepted arc,  $s$ , and the radius,  $r$ .

- 4 Convert between degrees and radians.

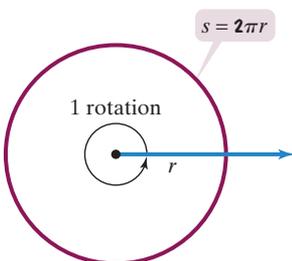

FIGURE 4.9 A complete rotation

## EXAMPLE 1 Computing Radian Measure

A central angle,  $\theta$ , in a circle of radius 6 inches intercepts an arc of length 15 inches. What is the radian measure of  $\theta$ ?

## SOLUTION

Angle  $\theta$  is shown in **Figure 4.8**. The radian measure of a central angle is the length of the intercepted arc,  $s$ , divided by the circle's radius,  $r$ . The length of the intercepted arc is 15 inches:  $s = 15$  inches. The circle's radius is 6 inches:  $r = 6$  inches. Now we use the formula for radian measure to find the radian measure of  $\theta$ .

$$\theta = \frac{s}{r} = \frac{15 \text{ inches}}{6 \text{ inches}} = 2.5$$

Thus, the radian measure of  $\theta$  is 2.5. ...

In Example 1, notice that the units (inches) cancel when we use the formula for radian measure. We are left with a number with no units. Thus, if an angle  $\theta$  has a measure of 2.5 radians, we can write  $\theta = 2.5$  radians or  $\theta = 2.5$ . We will often include the word *radians* simply for emphasis. There should be no confusion as to whether radian or degree measure is being used. Why is this so? If  $\theta$  has a degree measure of, say,  $2.5^\circ$ , we must include the degree symbol and write  $\theta = 2.5^\circ$ , and *not*  $\theta = 2.5$ .

**Check Point 1** A central angle,  $\theta$ , in a circle of radius 12 feet intercepts an arc of length 42 feet. What is the radian measure of  $\theta$ ?

## Relationship between Degrees and Radians

How can we obtain a relationship between degrees and radians? We compare the number of degrees and the number of radians in one complete rotation, shown in **Figure 4.9**. We know that  $360^\circ$  is the amount of rotation of a ray back onto itself. The length of the intercepted arc is equal to the circumference of the circle. Thus, the radian measure of this central angle is the circumference of the circle divided by the circle's radius,  $r$ . The circumference of a circle of radius  $r$  is  $2\pi r$ . We use the formula for radian measure to find the radian measure of the  $360^\circ$  angle.

$$\theta = \frac{s}{r} = \frac{\text{the circle's circumference}}{r} = \frac{2\pi r}{r} = 2\pi$$

Because one complete rotation measures  $360^\circ$  and  $2\pi$  radians,

$$360^\circ = 2\pi \text{ radians.}$$

Dividing both sides by 2, we have

$$180^\circ = \pi \text{ radians.}$$

Dividing this last equation by  $180^\circ$  or  $\pi$  gives the conversion rules in the box on the next page.

**GREAT QUESTION!**

When converting between degrees and radians, which unit goes in the numerator of the conversion factor?

The unit you are converting to appears in the numerator of the conversion factor.

**Conversion between Degrees and Radians**

Using the basic relationship  $\pi$  radians =  $180^\circ$ ,

- To convert degrees to radians, multiply degrees by  $\frac{\pi \text{ radians}}{180^\circ}$ .
- To convert radians to degrees, multiply radians by  $\frac{180^\circ}{\pi \text{ radians}}$ .

Angles that are fractions of a complete rotation are usually expressed in radian measure as fractional multiples of  $\pi$ , rather than as decimal approximations. For example, we write  $\theta = \frac{\pi}{2}$  rather than using the decimal approximation  $\theta \approx 1.57$ .

**EXAMPLE 2** Converting from Degrees to Radians

Convert each angle in degrees to radians:

- a.  $30^\circ$       b.  $90^\circ$       c.  $-135^\circ$ .

**SOLUTION**

To convert degrees to radians, multiply by  $\frac{\pi \text{ radians}}{180^\circ}$ . Observe how the degree units cancel.

$$\begin{aligned} \text{a. } 30^\circ &= 30^\circ \cdot \frac{\pi \text{ radians}}{180^\circ} = \frac{30\pi}{180} \text{ radians} = \frac{\pi}{6} \text{ radians} \\ \text{b. } 90^\circ &= 90^\circ \cdot \frac{\pi \text{ radians}}{180^\circ} = \frac{90\pi}{180} \text{ radians} = \frac{\pi}{2} \text{ radians} \\ \text{c. } -135^\circ &= -135^\circ \cdot \frac{\pi \text{ radians}}{180^\circ} = -\frac{135\pi}{180} \text{ radians} = -\frac{3\pi}{4} \text{ radians} \end{aligned}$$

Divide the numerator and denominator by 45.

 **Check Point 2** Convert each angle in degrees to radians:

- a.  $60^\circ$       b.  $270^\circ$       c.  $-300^\circ$ .

**EXAMPLE 3** Converting from Radians to Degrees

Convert each angle in radians to degrees:

- a.  $\frac{\pi}{3}$  radians      b.  $-\frac{5\pi}{3}$  radians      c. 1 radian.

**SOLUTION**

To convert radians to degrees, multiply by  $\frac{180^\circ}{\pi \text{ radians}}$ . Observe how the radian units cancel.

$$\begin{aligned} \text{a. } \frac{\pi}{3} \text{ radians} &= \frac{\cancel{\pi} \text{ radians}}{3} \cdot \frac{180^\circ}{\cancel{\pi} \text{ radians}} = \frac{180^\circ}{3} = 60^\circ \\ \text{b. } -\frac{5\pi}{3} \text{ radians} &= -\frac{5\cancel{\pi} \text{ radians}}{3} \cdot \frac{180^\circ}{\cancel{\pi} \text{ radians}} = -\frac{5 \cdot 180^\circ}{3} = -300^\circ \\ \text{c. } 1 \text{ radian} &= 1 \cancel{\text{radian}} \cdot \frac{180^\circ}{\cancel{\pi} \text{ radians}} = \frac{180^\circ}{\pi} \approx 57.3^\circ \end{aligned}$$

**GREAT QUESTION!**

Based on Example 3(c), can I conclude that 1 radian is approximately  $57^\circ$ ?

Yes. Keep in mind that a radian is much larger than a degree.

 **Check Point 3** Convert each angle in radians to degrees:

- a.  $\frac{\pi}{4}$  radians      b.  $-\frac{4\pi}{3}$  radians      c. 6 radians.

- 5 Draw angles in standard position.

### Drawing Angles in Standard Position

Although we can convert angles in radians to degrees, it is helpful to “think in radians” without having to make this conversion. To become comfortable with radian measure, consider angles in standard position: Each vertex is at the origin and each initial side lies along the positive  $x$ -axis. Think of the terminal side of the angle revolving around the origin. Thinking in radians means determining what part of a complete revolution or how many full revolutions will produce an angle whose radian measure is known. And here’s the thing: We want to do this without having to convert from radians to degrees.

**Figure 4.10** is a starting point for learning to think in radians. The figure illustrates that when the terminal side makes one full revolution, it forms an angle whose radian measure is  $2\pi$ . The figure shows the quadrantal angles formed by  $\frac{3}{4}$  of a revolution,  $\frac{1}{2}$  of a revolution, and  $\frac{1}{4}$  of a revolution.

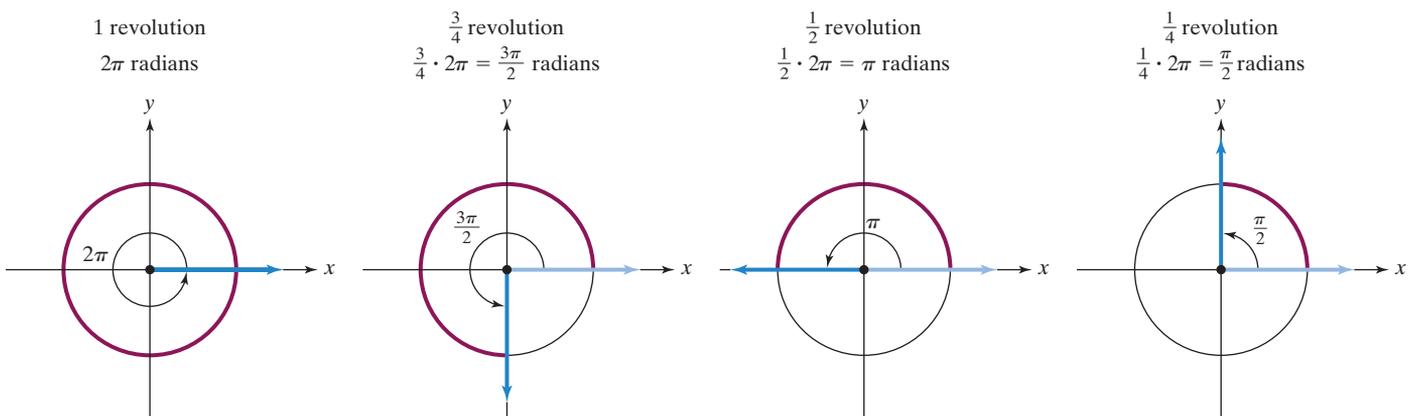

FIGURE 4.10 Angles formed by revolutions of terminal sides

### EXAMPLE 4 Drawing Angles in Standard Position

Draw and label each angle in standard position:

a.  $\theta = \frac{\pi}{4}$   
theta

b.  $\alpha = \frac{5\pi}{4}$   
alpha

c.  $\beta = -\frac{3\pi}{4}$   
beta

d.  $\gamma = \frac{9\pi}{4}$   
gamma

### SOLUTION

Because we are drawing angles in standard position, each vertex is at the origin and each initial side lies along the positive  $x$ -axis.

- a. An angle of  $\frac{\pi}{4}$  radians is a positive angle. It is obtained by rotating the terminal side counterclockwise. Because  $2\pi$  is a full-circle revolution, we can express  $\frac{\pi}{4}$  as a fractional part of  $2\pi$  to determine the necessary rotation:

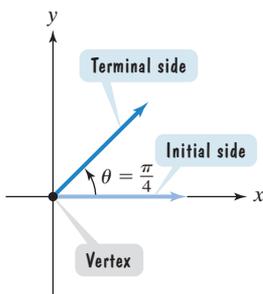

FIGURE 4.11

$$\frac{\pi}{4} = \frac{1}{8} \cdot 2\pi.$$

$\frac{\pi}{4}$  is  $\frac{1}{8}$  of a complete revolution of  $2\pi$  radians.

We see that  $\theta = \frac{\pi}{4}$  is obtained by rotating the terminal side counterclockwise for  $\frac{1}{8}$  of a revolution. The angle lies in quadrant I and is shown in **Figure 4.11**.

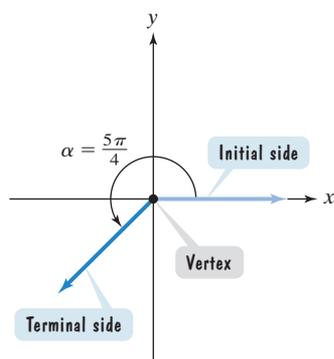

FIGURE 4.12

- b. An angle of  $\frac{5\pi}{4}$  radians is a positive angle. It is obtained by rotating the terminal side counterclockwise. Here are two ways to determine the necessary rotation:

**Method 1**

$$\frac{5\pi}{4} = \frac{5}{8} \cdot 2\pi$$

$\frac{5\pi}{4}$  is  $\frac{5}{8}$  of a complete revolution of  $2\pi$  radians.

**Method 2**

$$\frac{5\pi}{4} = \pi + \frac{\pi}{4}$$

$\pi$  is a half-circle revolution.

$\frac{\pi}{4}$  is  $\frac{1}{8}$  of a complete revolution.

Method 1 shows that  $\alpha = \frac{5\pi}{4}$  is obtained by rotating the terminal side counterclockwise for  $\frac{5}{8}$  of a revolution. Method 2 shows that  $\alpha = \frac{5\pi}{4}$  is obtained by rotating the terminal side counterclockwise for half of a revolution followed by a counterclockwise rotation of  $\frac{1}{8}$  of a revolution. The angle lies in quadrant III and is shown in **Figure 4.12**.

- c. An angle of  $-\frac{3\pi}{4}$  is a negative angle. It is obtained by rotating the terminal side clockwise. We use  $-\frac{3\pi}{4}$ , or  $\frac{3\pi}{4}$ , to determine the necessary rotation.

**Method 1**

$$\frac{3\pi}{4} = \frac{3}{8} \cdot 2\pi$$

$\frac{3\pi}{4}$  is  $\frac{3}{8}$  of a complete revolution of  $2\pi$  radians.

**Method 2**

$$\frac{3\pi}{4} = \frac{2\pi}{4} + \frac{\pi}{4} = \frac{\pi}{2} + \frac{\pi}{4}$$

$\frac{\pi}{2}$  is a quarter-circle revolution.

$\frac{\pi}{4}$  is  $\frac{1}{8}$  of a complete revolution.

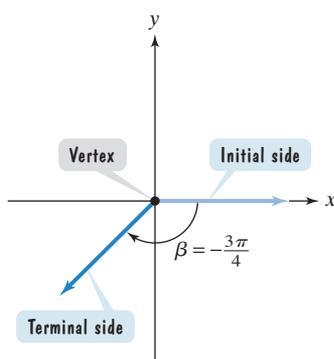

FIGURE 4.13

Method 1 shows that  $\beta = -\frac{3\pi}{4}$  is obtained by rotating the terminal side clockwise for  $\frac{3}{8}$  of a revolution. Method 2 shows that  $\beta = -\frac{3\pi}{4}$  is obtained by rotating the terminal side clockwise for  $\frac{1}{4}$  of a revolution followed by a clockwise rotation of  $\frac{1}{8}$  of a revolution. The angle lies in quadrant III and is shown in **Figure 4.13**.

- d. An angle of  $\frac{9\pi}{4}$  radians is a positive angle. It is obtained by rotating the terminal side counterclockwise. Here are two methods to determine the necessary rotation:

**Method 1**

$$\frac{9\pi}{4} = \frac{9}{8} \cdot 2\pi$$

$\frac{9\pi}{4}$  is  $\frac{9}{8}$ , or  $1\frac{1}{8}$ , complete revolutions of  $2\pi$  radians.

**Method 2**

$$\frac{9\pi}{4} = 2\pi + \frac{\pi}{4}$$

$2\pi$  is a full-circle revolution.

$\frac{\pi}{4}$  is  $\frac{1}{8}$  of a complete revolution.

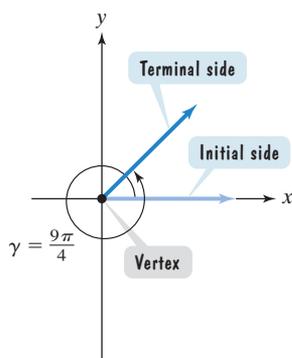

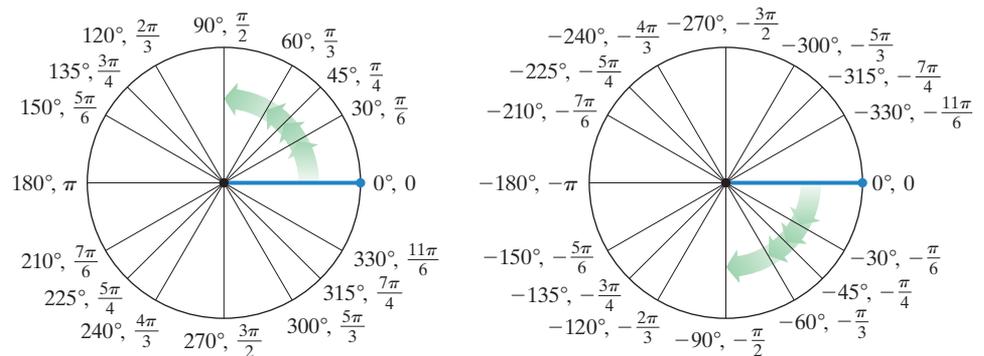

FIGURE 4.14

Method 1 shows that  $\gamma = \frac{9\pi}{4}$  is obtained by rotating the terminal side counterclockwise for  $1\frac{1}{8}$  revolutions. Method 2 shows that  $\gamma = \frac{9\pi}{4}$  is obtained by rotating the terminal side counterclockwise for a full-circle revolution followed by a counterclockwise rotation of  $\frac{1}{8}$  of a revolution. The angle lies in quadrant I and is shown in **Figure 4.14**. ●●●

**Check Point 4** Draw and label each angle in standard position:

- a.  $\theta = -\frac{\pi}{4}$       b.  $\alpha = \frac{3\pi}{4}$       c.  $\beta = -\frac{7\pi}{4}$       d.  $\gamma = \frac{13\pi}{4}$ .

**Figure 4.15** illustrates the degree and radian measures of angles that you will commonly see in trigonometry. Each angle is in standard position, so that the initial side lies along the positive  $x$ -axis. We will be using both degree and radian measures for these angles.

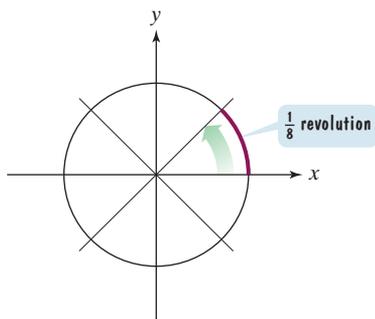

**FIGURE 4.15** Degree and radian measures of selected positive and negative angles

**Table 4.1** describes some of the positive angles in **Figure 4.15** in terms of revolutions of the angle's terminal side around the origin.

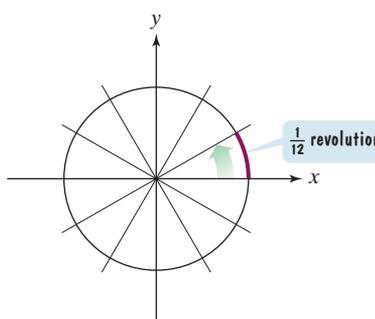

**GREAT QUESTION!**

Any hints for drawing the angles in **Table 4.1** and **Figure 4.15**?

Yes. It is helpful to first divide the rectangular coordinate system into eight equal sectors:

or 12 equal sectors:

**Table 4.1**

Terminal Side	Radian Measure of Angle	Degree Measure of Angle
$\frac{1}{12}$ revolution	$\frac{1}{12} \cdot 2\pi = \frac{\pi}{6}$	$\frac{1}{12} \cdot 360^\circ = 30^\circ$
$\frac{1}{8}$ revolution	$\frac{1}{8} \cdot 2\pi = \frac{\pi}{4}$	$\frac{1}{8} \cdot 360^\circ = 45^\circ$
$\frac{1}{6}$ revolution	$\frac{1}{6} \cdot 2\pi = \frac{\pi}{3}$	$\frac{1}{6} \cdot 360^\circ = 60^\circ$
$\frac{1}{4}$ revolution	$\frac{1}{4} \cdot 2\pi = \frac{\pi}{2}$	$\frac{1}{4} \cdot 360^\circ = 90^\circ$
$\frac{1}{3}$ revolution	$\frac{1}{3} \cdot 2\pi = \frac{2\pi}{3}$	$\frac{1}{3} \cdot 360^\circ = 120^\circ$
$\frac{1}{2}$ revolution	$\frac{1}{2} \cdot 2\pi = \pi$	$\frac{1}{2} \cdot 360^\circ = 180^\circ$
$\frac{2}{3}$ revolution	$\frac{2}{3} \cdot 2\pi = \frac{4\pi}{3}$	$\frac{2}{3} \cdot 360^\circ = 240^\circ$
$\frac{3}{4}$ revolution	$\frac{3}{4} \cdot 2\pi = \frac{3\pi}{2}$	$\frac{3}{4} \cdot 360^\circ = 270^\circ$
$\frac{7}{8}$ revolution	$\frac{7}{8} \cdot 2\pi = \frac{7\pi}{4}$	$\frac{7}{8} \cdot 360^\circ = 315^\circ$
1 revolution	$1 \cdot 2\pi = 2\pi$	$1 \cdot 360^\circ = 360^\circ$

## 6 Find coterminal angles.

## Coterminal Angles

Two angles with the same initial and terminal sides but possibly different rotations are called **coterminal angles**.

Every angle has infinitely many coterminal angles. Why? Think of an angle in standard position. If the rotation of the angle is extended by one or more complete rotations of  $360^\circ$  or  $2\pi$ , clockwise or counterclockwise, the result is an angle with the same initial and terminal sides as the original angle.

## Coterminal Angles

Increasing or decreasing the degree measure of an angle in standard position by an integer multiple of  $360^\circ$  results in a coterminal angle. Thus, an angle of  $\theta^\circ$  is coterminal with angles of  $\theta^\circ \pm 360^\circ k$ , where  $k$  is an integer.

Increasing or decreasing the radian measure of an angle by an integer multiple of  $2\pi$  results in a coterminal angle. Thus, an angle of  $\theta$  radians is coterminal with angles of  $\theta \pm 2\pi k$ , where  $k$  is an integer.

Two coterminal angles for an angle of  $\theta^\circ$  can be found by adding  $360^\circ$  to  $\theta^\circ$  and subtracting  $360^\circ$  from  $\theta^\circ$ .

## EXAMPLE 5 Finding Coterminal Angles

Assume the following angles are in standard position. Find a positive angle less than  $360^\circ$  that is coterminal with each of the following:

- a. a  $420^\circ$  angle      b. a  $-120^\circ$  angle.

## SOLUTION

We obtain the coterminal angle by adding or subtracting  $360^\circ$ . The requirement to obtain a positive angle less than  $360^\circ$  determines whether we should add or subtract.

- a. For a  $420^\circ$  angle, subtract  $360^\circ$  to find a positive coterminal angle.

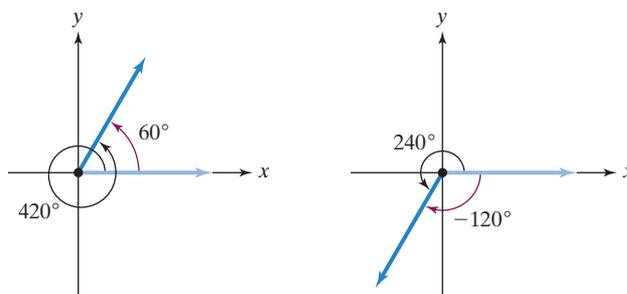

$$420^\circ - 360^\circ = 60^\circ$$

A  $60^\circ$  angle is coterminal with a  $420^\circ$  angle. **Figure 4.16(a)** illustrates that these angles have the same initial and terminal sides.

- b. For a  $-120^\circ$  angle, add  $360^\circ$  to find a positive coterminal angle.

$$-120^\circ + 360^\circ = 240^\circ$$

A  $240^\circ$  angle is coterminal with a  $-120^\circ$  angle. **Figure 4.16(b)** illustrates that these angles have the same initial and terminal sides.

(a) Angles of  $420^\circ$  and  $60^\circ$  are coterminal.

(b) Angles of  $-120^\circ$  and  $240^\circ$  are coterminal.

FIGURE 4.16 Pairs of coterminal angles

 **Check Point 5** Find a positive angle less than  $360^\circ$  that is coterminal with each of the following:

- a. a  $400^\circ$  angle      b. a  $-135^\circ$  angle.

Two coterminal angles for an angle of  $\theta$  radians can be found by adding  $2\pi$  to  $\theta$  and subtracting  $2\pi$  from  $\theta$ .

### EXAMPLE 6 Finding Coterminal Angles

Assume the following angles are in standard position. Find a positive angle less than  $2\pi$  that is coterminal with each of the following:

- a. a  $\frac{17\pi}{6}$  angle      b. a  $-\frac{\pi}{12}$  angle.

### SOLUTION

We obtain the coterminal angle by adding or subtracting  $2\pi$ . The requirement to obtain a positive angle less than  $2\pi$  determines whether we should add or subtract.

- a. For a  $\frac{17\pi}{6}$ , or  $2\frac{5}{6}\pi$ , angle, subtract  $2\pi$  to find a positive coterminal angle.

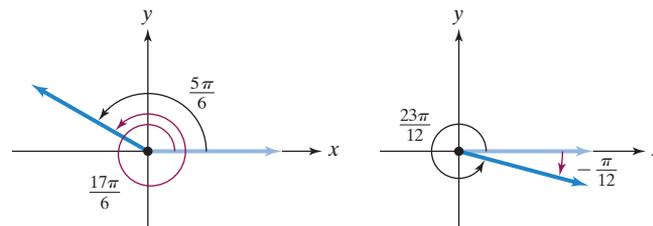

$$\frac{17\pi}{6} - 2\pi = \frac{17\pi}{6} - \frac{12\pi}{6} = \frac{5\pi}{6}$$

A  $\frac{5\pi}{6}$  angle is coterminal with a  $\frac{17\pi}{6}$  angle. **Figure 4.17(a)** illustrates that these angles have the same initial and terminal sides.

- b. For a  $-\frac{\pi}{12}$  angle, add  $2\pi$  to find a positive coterminal angle.

$$-\frac{\pi}{12} + 2\pi = -\frac{\pi}{12} + \frac{24\pi}{12} = \frac{23\pi}{12}$$

A  $\frac{23\pi}{12}$  angle is coterminal with a  $-\frac{\pi}{12}$  angle. **Figure 4.17(b)** illustrates that these angles have the same initial and terminal sides.

(a) Angles of  $\frac{17\pi}{6}$  and  $\frac{5\pi}{6}$  are coterminal.

(b) Angles of  $-\frac{\pi}{12}$  and  $\frac{23\pi}{12}$  are coterminal.

FIGURE 4.17 Pairs of coterminal angles

 **Check Point 6** Find a positive angle less than  $2\pi$  that is coterminal with each of the following:

- a. a  $\frac{13\pi}{5}$  angle      b. a  $-\frac{\pi}{15}$  angle.

To find a positive coterminal angle less than  $360^\circ$  or  $2\pi$ , it is sometimes necessary to add or subtract more than one multiple of  $360^\circ$  or  $2\pi$ .

### EXAMPLE 7 Finding Coterminal Angles

Find a positive angle less than  $360^\circ$  or  $2\pi$  that is coterminal with each of the following:

- a. a  $750^\circ$  angle      b. a  $\frac{22\pi}{3}$  angle      c. a  $-\frac{17\pi}{6}$  angle.

## SOLUTION

- a. For a  $750^\circ$  angle, subtract two multiples of  $360^\circ$ , or  $720^\circ$ , to find a positive coterminal angle less than  $360^\circ$ .

$$750^\circ - 360^\circ \cdot 2 = 750^\circ - 720^\circ = 30^\circ$$

A  $30^\circ$  angle is coterminal with a  $750^\circ$  angle.

- b. For a  $\frac{22\pi}{3}$ , or  $7\frac{1}{3}\pi$ , angle, subtract three multiples of  $2\pi$ , or  $6\pi$ , to find a positive coterminal angle less than  $2\pi$ .

$$\frac{22\pi}{3} - 2\pi \cdot 3 = \frac{22\pi}{3} - 6\pi = \frac{22\pi}{3} - \frac{18\pi}{3} = \frac{4\pi}{3}$$

A  $\frac{4\pi}{3}$  angle is coterminal with a  $\frac{22\pi}{3}$  angle.

- c. For a  $-\frac{17\pi}{6}$ , or  $-2\frac{5}{6}\pi$  angle, add two multiples of  $2\pi$ , or  $4\pi$ , to find a positive coterminal angle less than  $2\pi$ .

$$-\frac{17\pi}{6} + 2\pi \cdot 2 = -\frac{17\pi}{6} + 4\pi = -\frac{17\pi}{6} + \frac{24\pi}{6} = \frac{7\pi}{6}$$

A  $\frac{7\pi}{6}$  angle is coterminal with a  $-\frac{17\pi}{6}$  angle. ...

 **Check Point 7** Find a positive angle less than  $360^\circ$  or  $2\pi$  that is coterminal with each of the following:

- a. an  $855^\circ$  angle      b. a  $\frac{17\pi}{3}$  angle      c. a  $-\frac{25\pi}{6}$  angle.

**7** Find the length of a circular arc.

## The Length of a Circular Arc

We can use the radian measure formula,  $\theta = \frac{s}{r}$ , to find the length of the arc of a circle. How do we do this? Remember that  $s$  represents the length of the arc intercepted by the central angle  $\theta$ . Thus, by solving the formula for  $s$ , we have an equation for arc length.

## GREAT QUESTION!

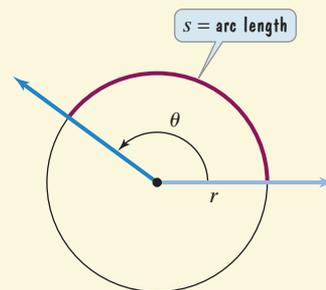

**Can I apply the formula  $s = r\theta$  if  $\theta$  is expressed in degrees?**

No. The formula can only be used when  $\theta$  is expressed in radians. If  $\theta$  is given in degrees, you'll need to convert from degrees to radians before using  $s = r\theta$  to determine  $s$ , the length of the circular arc.

## The Length of a Circular Arc

Let  $r$  be the radius of a circle and  $\theta$  the nonnegative radian measure of a central angle of the circle. The length of the arc intercepted by the central angle is

$$s = r\theta.$$

## EXAMPLE 8 Finding the Length of a Circular Arc

A circle has a radius of 10 inches. Find the length of the arc intercepted by a central angle of  $120^\circ$ .

## SOLUTION

The formula  $s = r\theta$  can be used only when  $\theta$  is expressed in radians. Thus, we begin by converting  $120^\circ$  to radians. Multiply by  $\frac{\pi \text{ radians}}{180^\circ}$ .

$$120^\circ = 120^\circ \cdot \frac{\pi \text{ radians}}{180^\circ} = \frac{120\pi}{180} \text{ radians} = \frac{2\pi}{3} \text{ radians}$$

Now we can use the formula  $s = r\theta$  to find the length of the arc. The circle's radius is 10 inches:  $r = 10$  inches. The measure of the central angle, in radians, is  $\frac{2\pi}{3}$ :  $\theta = \frac{2\pi}{3}$ . The length of the arc intercepted by this central angle is

$$s = r\theta = (10 \text{ inches})\left(\frac{2\pi}{3}\right) = \frac{20\pi}{3} \text{ inches} \approx 20.94 \text{ inches.} \quad \dots$$

 **Check Point 8** A circle has a radius of 6 inches. Find the length of the arc intercepted by a central angle of  $45^\circ$ . Express arc length in terms of  $\pi$ . Then round your answer to two decimal places.

## GREAT QUESTION!

**What unit do I use when expressing the length of a circular arc?**

The unit used to describe the length of a circular arc is the same unit that is given in the circle's radius.

- 8** Use linear and angular speed to describe motion on a circular path.

## Linear and Angular Speed

A carousel contains four circular rows of animals. As the carousel revolves, the animals in the outer row travel a greater distance per unit of time than those in the inner rows. These animals have a greater *linear speed* than those in the inner rows. By contrast, all animals, regardless of the row, complete the same number of revolutions per unit of time. All animals in the four circular rows travel at the same *angular speed*.

Using  $v$  for linear speed and  $\omega$  (omega) for angular speed, we define these two kinds of speed along a circular path as follows:

## Definitions of Linear and Angular Speed

If a point is in motion on a circle of radius  $r$  through an angle of  $\theta$  radians in time  $t$ , then its **linear speed** is

$$v = \frac{s}{t},$$

where  $s$  is the arc length given by  $s = r\theta$ , and its **angular speed** is

$$\omega = \frac{\theta}{t}.$$

The hard drive in a computer rotates at 3600 revolutions per minute. This angular speed, expressed in revolutions per minute, can also be expressed in revolutions per second, radians per minute, and radians per second. Using  $2\pi$  radians = 1 revolution, we express the angular speed of a hard drive in radians per minute as follows:

$$\begin{aligned} & 3600 \text{ revolutions per minute} \\ &= \frac{3600 \cancel{\text{revolutions}}}{1 \text{ minute}} \cdot \frac{2\pi \text{ radians}}{1 \cancel{\text{revolution}}} = \frac{7200\pi \text{ radians}}{1 \text{ minute}} \\ &= 7200\pi \text{ radians per minute.} \end{aligned}$$

We can establish a relationship between the two kinds of speed by dividing both sides of the arc length formula,  $s = r\theta$ , by  $t$ :

$$\frac{s}{t} = \frac{r\theta}{t} = r \frac{\theta}{t}.$$

This expression defines linear speed.

This expression defines angular speed.

Thus, linear speed is the product of the radius and the angular speed.

### Linear Speed in Terms of Angular Speed

The linear speed,  $v$ , of a point a distance  $r$  from the center of rotation is given by

$$v = r\omega,$$

where  $\omega$  is the angular speed in radians per unit of time.

### EXAMPLE 9 Finding Linear Speed

A wind machine used to generate electricity has blades that are 10 feet in length (see **Figure 4.18**). The propeller is rotating at four revolutions per second. Find the linear speed, in feet per second, of the tips of the blades.

#### SOLUTION

We are given  $\omega$ , the angular speed.

$$\omega = 4 \text{ revolutions per second}$$

We use the formula  $v = r\omega$  to find  $v$ , the linear speed. Before applying the formula, we must express  $\omega$  in radians per second.

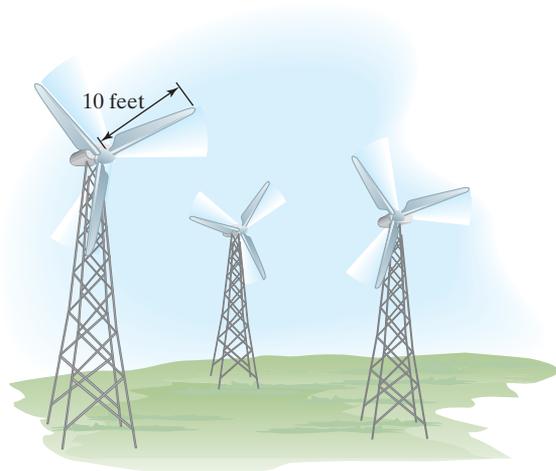

FIGURE 4.18

$$\omega = \frac{4 \text{ revolutions}}{1 \text{ second}} \cdot \frac{2\pi \text{ radians}}{1 \text{ revolution}} = \frac{8\pi \text{ radians}}{1 \text{ second}} \quad \text{or} \quad \frac{8\pi}{1 \text{ second}}$$

The angular speed of the propeller is  $8\pi$  radians per second. The linear speed is

$$v = r\omega = 10 \text{ feet} \cdot \frac{8\pi}{1 \text{ second}} = \frac{80\pi \text{ feet}}{\text{second}}.$$

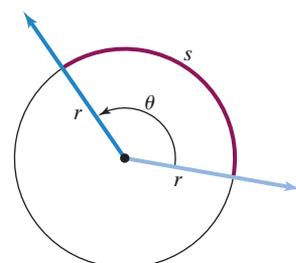

The linear speed of the tips of the blades is  $80\pi$  feet per second, which is approximately 251 feet per second. ●●●

 **Check Point 9** Long before iPods that hold thousands of songs and play them with superb audio quality, individual songs were delivered on 75-rpm and 45-rpm circular records. A 45-rpm record has an angular speed of 45 revolutions per minute. Find the linear speed, in inches per minute, at the point where the needle is 1.5 inches from the record's center.

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- An angle in a rectangular coordinate system is in standard position if its vertex is at the \_\_\_\_\_ and its initial side lies along the positive \_\_\_\_\_.
- Positive angles are generated by \_\_\_\_\_ rotation. Negative angles are generated by \_\_\_\_\_ rotation.
- If  $0^\circ < \theta < 90^\circ$ ,  $\theta$  is a/an \_\_\_\_\_ angle.  
If  $\theta = 90^\circ$ ,  $\theta$  is a/an \_\_\_\_\_ angle.  
If  $90^\circ < \theta < 180^\circ$ ,  $\theta$  is a/an \_\_\_\_\_ angle.  
If  $\theta = 180^\circ$ ,  $\theta$  is a/an \_\_\_\_\_ angle.
- The radian measure of  $\theta$  shown in the figure is  $\theta =$  \_\_\_\_\_.

- To convert degrees to radians, multiply degrees by \_\_\_\_\_.
- To convert radians to degrees, multiply radians by \_\_\_\_\_.
- Two angles with the same initial and terminal sides but possibly different rotations are called \_\_\_\_\_ angles. Increasing or decreasing the degree measure of an angle in standard position by an integer multiple of \_\_\_\_\_ results in such an angle. Increasing or decreasing the radian measure of an angle in standard position by an integer multiple of \_\_\_\_\_ results in such an angle.
- Using the figure shown in Exercise 4 on the previous page, the length of the arc intercepted by the central angle  $\theta$  is  $s =$  \_\_\_\_\_.
- True or false: If  $r = 10$  centimeters and  $\theta = 20^\circ$ , then  $s = 10 \cdot 20 = 200$  centimeters. \_\_\_\_\_
- The linear speed,  $v$ , of a point a distance  $r$  from the center of rotation is given by  $v =$  \_\_\_\_\_, where  $\omega$  is the \_\_\_\_\_ speed in radians per unit of time.

## EXERCISE SET 4.1

### Practice Exercises

In Exercises 1–6, the measure of an angle is given. Classify the angle as acute, right, obtuse, or straight.

- $135^\circ$
- $177^\circ$
- $83.135^\circ$
- $87.177^\circ$
- $\pi$
- $\frac{\pi}{2}$

In Exercises 7–12, find the radian measure of the central angle of a circle of radius  $r$  that intercepts an arc of length  $s$ .

Radius, $r$	Arc Length, $s$
7. 10 inches	40 inches
8. 5 feet	30 feet
9. 6 yards	8 yards
10. 8 yards	18 yards
11. 1 meter	400 centimeters
12. 1 meter	600 centimeters

In Exercises 13–20, convert each angle in degrees to radians. Express your answer as a multiple of  $\pi$ .

- $45^\circ$
- $150^\circ$
- $-225^\circ$
- $18^\circ$
- $300^\circ$
- $-270^\circ$
- $135^\circ$
- $330^\circ$

In Exercises 21–28, convert each angle in radians to degrees.

- $\frac{\pi}{2}$
- $\frac{3\pi}{4}$
- $-3\pi$
- $\frac{\pi}{9}$
- $\frac{7\pi}{6}$
- $-4\pi$
- $\frac{2\pi}{3}$
- $\frac{11\pi}{6}$

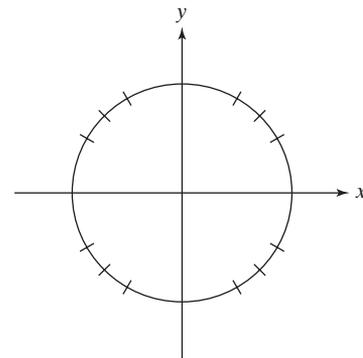

In Exercises 29–34, convert each angle in degrees to radians. Round to two decimal places.

- $18^\circ$
- $-50^\circ$
- $76^\circ$
- $200^\circ$
- $-40^\circ$
- $250^\circ$

In Exercises 35–40, convert each angle in radians to degrees. Round to two decimal places.

- 2 radians
- $\frac{\pi}{13}$  radians
- $-4.8$  radians
- 3 radians
- $\frac{\pi}{17}$  radians
- $-5.2$  radians

In Exercises 41–56, use the circle shown in the rectangular coordinate system to draw each angle in standard position. State the quadrant in which the angle lies. When an angle's measure is given in radians, work the exercise without converting to degrees.

- $\frac{7\pi}{6}$
- $\frac{7\pi}{4}$
- $-\frac{5\pi}{4}$
- $\frac{14\pi}{3}$
- $-210^\circ$
- $405^\circ$
- $\frac{4\pi}{3}$
- $-\frac{2\pi}{3}$
- $-\frac{7\pi}{4}$
- $120^\circ$
- $-240^\circ$
- $\frac{3\pi}{4}$
- $-\frac{5\pi}{6}$
- $\frac{16\pi}{3}$
- $150^\circ$
- $420^\circ$

In Exercises 57–70, find a positive angle less than  $360^\circ$  or  $2\pi$  that is coterminal with the given angle.

- $395^\circ$
- $-160^\circ$
- $415^\circ$
- $-765^\circ$
- $-150^\circ$
- $-760^\circ$

63.  $\frac{19\pi}{6}$       64.  $\frac{17\pi}{5}$       65.  $\frac{23\pi}{5}$   
 66.  $\frac{25\pi}{6}$       67.  $-\frac{\pi}{50}$       68.  $-\frac{\pi}{40}$   
 69.  $-\frac{31\pi}{7}$       70.  $-\frac{38\pi}{9}$

In Exercises 71–74, find the length of the arc on a circle of radius  $r$  intercepted by a central angle  $\theta$ . Express arc length in terms of  $\pi$ . Then round your answer to two decimal places.

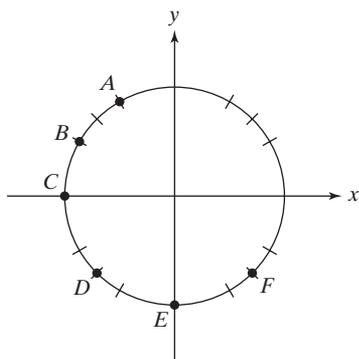

Radius, $r$	Central Angle, $\theta$
71. 12 inches	$\theta = 45^\circ$
72. 16 inches	$\theta = 60^\circ$
73. 8 feet	$\theta = 225^\circ$
74. 9 yards	$\theta = 315^\circ$

In Exercises 75–76, express each angular speed in radians per second.

75. 6 revolutions per second  
 76. 20 revolutions per second

### Practice Plus

Use the circle shown in the rectangular coordinate system to solve Exercises 77–82. Find two angles, in radians, between  $-2\pi$  and  $2\pi$  such that each angle's terminal side passes through the origin and the given point.

77. A                      78. B  
 79. D                      80. F  
 81. E                      82. C

In Exercises 83–86, find the positive radian measure of the angle that the second hand of a clock moves through in the given time.

83. 55 seconds              84. 35 seconds  
 85. 3 minutes and 40 seconds  
 86. 4 minutes and 25 seconds

### Application Exercises

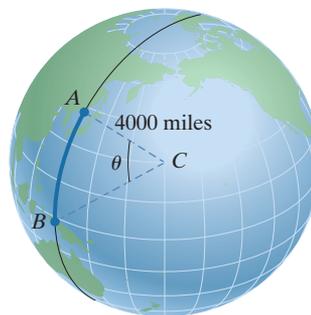

87. The minute hand of a clock moves from 12 to 2 o'clock, or  $\frac{1}{6}$  of a complete revolution. Through how many degrees does it move? Through how many radians does it move?  
 88. The minute hand of a clock moves from 12 to 4 o'clock, or  $\frac{1}{3}$  of a complete revolution. Through how many degrees does it move? Through how many radians does it move?

89. The minute hand of a clock is 8 inches long and moves from 12 to 2 o'clock. How far does the tip of the minute hand move? Express your answer in terms of  $\pi$  and then round to two decimal places.  
 90. The minute hand of a clock is 6 inches long and moves from 12 to 4 o'clock. How far does the tip of the minute hand move? Express your answer in terms of  $\pi$  and then round to two decimal places.  
 91. The figure shows a highway sign that warns of a railway crossing. The lines that form the cross pass through the circle's center and intersect at right angles. If the radius of the circle is 24 inches, find the length of each of the four arcs formed by the cross. Express your answer in terms of  $\pi$  and then round to two decimal places.

92. The radius of a wheel rolling on the ground is 80 centimeters. If the wheel rotates through an angle of  $60^\circ$ , how many centimeters does it move? Express your answer in terms of  $\pi$  and then round to two decimal places.

How do we measure the distance between two points,  $A$  and  $B$ , on Earth? We measure along a circle with a center,  $C$ , at the center of Earth. The radius of the circle is equal to the distance from  $C$  to the surface. Use the fact that Earth is a sphere of radius equal to approximately 4000 miles to solve Exercises 93–96.

93. If two points,  $A$  and  $B$ , are 8000 miles apart, express angle  $\theta$  in radians and in degrees.  
 94. If two points,  $A$  and  $B$ , are 10,000 miles apart, express angle  $\theta$  in radians and in degrees.  
 95. If  $\theta = 30^\circ$ , find the distance between  $A$  and  $B$  to the nearest mile.  
 96. If  $\theta = 10^\circ$ , find the distance between  $A$  and  $B$  to the nearest mile.  
 97. The angular speed of a point on Earth is  $\frac{\pi}{12}$  radian per hour. The Equator lies on a circle of radius approximately 4000 miles. Find the linear velocity, in miles per hour, of a point on the Equator.

98. A Ferris wheel has a radius of 25 feet. The wheel is rotating at two revolutions per minute. Find the linear speed, in feet per minute, of a seat on this Ferris wheel.
99. A water wheel has a radius of 12 feet. The wheel is rotating at 20 revolutions per minute. Find the linear speed, in feet per minute, of the water.
100. On a carousel, the outer row of animals is 20 feet from the center. The inner row of animals is 10 feet from the center. The carousel is rotating at 2.5 revolutions per minute. What is the difference, in feet per minute, in the linear speeds of the animals in the outer and inner rows? Round to the nearest foot per minute.

### Writing in Mathematics

101. What is an angle?
102. What determines the size of an angle?
103. Describe an angle in standard position.
104. Explain the difference between positive and negative angles. What are coterminal angles?
105. Explain what is meant by one radian.
106. Explain how to find the radian measure of a central angle.
107. Describe how to convert an angle in degrees to radians.
108. Explain how to convert an angle in radians to degrees.
109. Explain how to find the length of a circular arc.
110. If a carousel is rotating at 2.5 revolutions per minute, explain how to find the linear speed of a child seated on one of the animals.
111. The angular velocity of a point on Earth is  $\frac{\pi}{12}$  radian per hour. Describe what happens every 24 hours.
112. Have you ever noticed that we use the vocabulary of angles in everyday speech? Here is an example:  
My opinion about art museums took a  $180^\circ$  turn after visiting the San Francisco Museum of Modern Art.  
Explain what this means. Then give another example of the vocabulary of angles in everyday use.

### Technology Exercises

In Exercises 113–116, use the keys on your calculator or graphing utility for converting an angle in degrees, minutes, and seconds ( $D^\circ M' S''$ ) into decimal form, and vice versa.

In Exercises 113–114, convert each angle to a decimal in degrees. Round your answer to two decimal places.

113.  $30^\circ 15' 10''$       114.  $65^\circ 45' 20''$

In Exercises 115–116, convert each angle to  $D^\circ M' S''$  form. Round your answer to the nearest second.

115.  $30.42^\circ$       116.  $50.42^\circ$

### Critical Thinking Exercises

**Make Sense?** In Exercises 117–120, determine whether each statement makes sense or does not make sense, and explain your reasoning.

117. I made an error because the angle I drew in standard position exceeded a straight angle.
118. When an angle's measure is given in terms of  $\pi$ , I know that it's measured using radians.
119. When I convert degrees to radians, I multiply by 1, choosing  $\frac{\pi}{180^\circ}$  for 1.
120. Using radian measure, I can always find a positive angle less than  $2\pi$  coterminal with a given angle by adding or subtracting  $2\pi$ .
121. If  $\theta = \frac{3}{2}$ , is this angle larger or smaller than a right angle?
122. A railroad curve is laid out on a circle. What radius should be used if the track is to change direction by  $20^\circ$  in a distance of 100 miles? Round your answer to the nearest mile.
123. Assuming Earth to be a sphere of radius 4000 miles, how many miles north of the Equator is Miami, Florida, if it is  $26^\circ$  north from the Equator? Round your answer to the nearest mile.

### Preview Exercises

Exercises 124–126 will help you prepare for the material covered in the next section.

124. Graph:  $x^2 + y^2 = 1$ . Then locate the point  $(-\frac{1}{2}, \frac{\sqrt{3}}{2})$  on the graph.
125. Use your graph of  $x^2 + y^2 = 1$  from Exercise 124 to determine the relation's domain and range.
126. Find  $\frac{x}{y}$  for  $x = -\frac{1}{2}$  and  $y = \frac{\sqrt{3}}{2}$ , and then rationalize the denominator.

## SECTION 4.2

## Trigonometric Functions: The Unit Circle

## Objectives

- 1 Use a unit circle to define trigonometric functions of real numbers.
- 2 Recognize the domain and range of sine and cosine functions.
- 3 Find exact values of the trigonometric functions at  $\frac{\pi}{4}$ .
- 4 Use even and odd trigonometric functions.
- 5 Recognize and use fundamental identities.
- 6 Use periodic properties.
- 7 Evaluate trigonometric functions with a calculator.

There is something comforting in the repetition of some of nature's patterns. The ocean level at a beach varies between high and low tide approximately every 12 hours. The number of hours of daylight oscillates from a maximum on the summer solstice, June 21, to a minimum on the winter solstice, December 21. Then it increases to the same maximum the following June 21. Some believe that cycles, called biorhythms, represent physical, emotional, and intellectual aspects of our lives. In this chapter, we study six functions, the six *trigonometric functions*, that are used to model phenomena that occur again and again.

## Calculus and the Unit Circle

The word *trigonometry* means measurement of triangles. Trigonometric functions, with domains consisting of sets of angles, were first defined using right triangles. By contrast, problems in calculus are solved using functions whose domains are sets of real numbers. Therefore, we introduce the trigonometric functions using unit circles and radians, rather than right triangles and degrees.

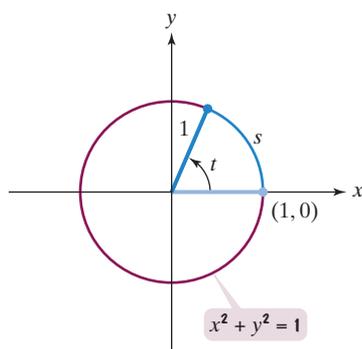

A **unit circle** is a circle of radius 1, with its center at the origin of a rectangular coordinate system. The equation of this unit circle is  $x^2 + y^2 = 1$ . **Figure 4.19** shows a unit circle with a central angle measuring  $t$  radians.

We can use the formula for the length of a circular arc,  $s = r\theta$ , to find the length of the intercepted arc.

$$s = r\theta = 1 \cdot t = t$$

The radius of a unit circle is 1.

The radian measure of the central angle is  $t$ .

**FIGURE 4.19** Unit circle with a central angle measuring  $t$  radians

Thus, the length of the intercepted arc is  $t$ . This is also the radian measure of the central angle. Thus, **in a unit circle, the radian measure of the central angle is equal to the length of the intercepted arc.** Both are given by the same *real number*  $t$ .

In **Figure 4.20**, the radian measure of the angle and the length of the intercepted arc are both shown by  $t$ . Let  $P = (x, y)$  denote the point on the unit circle that has arc length  $t$  from  $(1, 0)$ . **Figure 4.20(a)** shows that if  $t$  is positive, point  $P$  is reached by moving counterclockwise along the unit circle from  $(1, 0)$ . **Figure 4.20(b)** shows that if  $t$  is negative, point  $P$  is reached by moving clockwise along the unit circle from  $(1, 0)$ . For each real number  $t$ , there corresponds a point  $P = (x, y)$  on the unit circle.

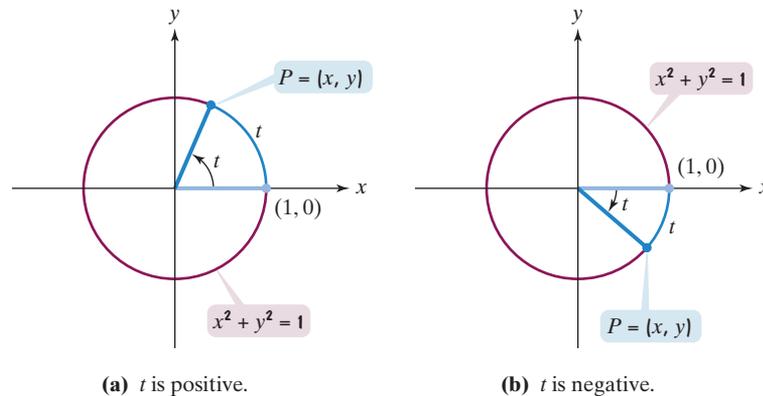

FIGURE 4.20

- 1 Use a unit circle to define trigonometric functions of real numbers.

### The Six Trigonometric Functions

We begin the study of trigonometry by defining the six trigonometric functions. The inputs of these functions are real numbers, represented by  $t$  in **Figure 4.20**. The outputs involve the point  $P = (x, y)$  on the unit circle that corresponds to  $t$  and the coordinates of this point.

The trigonometric functions have names that are words, rather than single letters such as  $f$ ,  $g$ , and  $h$ . For example, the **sine of  $t$**  is the  $y$ -coordinate of point  $P$  on the unit circle:

$$\sin t = y.$$

Input is the real number  $t$ .      Output is the  $y$ -coordinate of a point on the unit circle.

The value of  $y$  depends on the real number  $t$  and thus is a function of  $t$ . The expression  $\sin t$  really means  $\sin(t)$ , where sine is the name of the function and  $t$ , a real number, is an input.

For example, a point  $P = (x, y)$  on the unit circle corresponding to a real number  $t$  is shown in **Figure 4.21** for  $\pi < t < \frac{3\pi}{2}$ . We see that the coordinates of  $P = (x, y)$  are  $x = -\frac{3}{5}$  and  $y = -\frac{4}{5}$ . Because the sine function is the  $y$ -coordinate of  $P$ , the value of this trigonometric function at the real number  $t$  is

$$\sin t = -\frac{4}{5}.$$

Here are the names of the six trigonometric functions, along with their abbreviations.

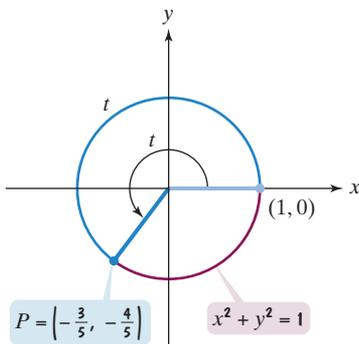

FIGURE 4.21

Name	Abbreviation	Name	Abbreviation
sine	sin	cosecant	csc
cosine	cos	secant	sec
tangent	tan	cotangent	cot

### Definitions of the Trigonometric Functions in Terms of a Unit Circle

If  $t$  is a real number and  $P = (x, y)$  is a point on the unit circle that corresponds to  $t$ , then

$$\begin{array}{ll} \sin t = y & \csc t = \frac{1}{y}, y \neq 0 \\ \cos t = x & \sec t = \frac{1}{x}, x \neq 0 \\ \tan t = \frac{y}{x}, x \neq 0 & \cot t = \frac{x}{y}, y \neq 0. \end{array}$$

Because this definition expresses function values in terms of coordinates of a point on a unit circle, the trigonometric functions are sometimes called the **circular functions**. Observe that the function values in the second column in the box are the reciprocals of the corresponding function values in the first column.

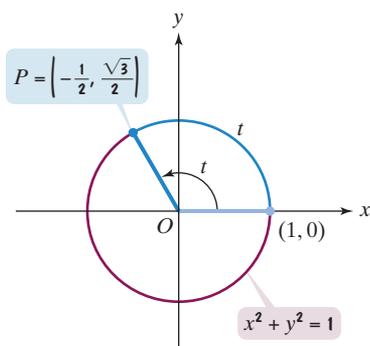

FIGURE 4.22

### EXAMPLE 1 Finding Values of the Trigonometric Functions

In **Figure 4.22**,  $t$  is a real number equal to the length of the intercepted arc of an angle that measures  $t$  radians and  $P = \left(-\frac{1}{2}, \frac{\sqrt{3}}{2}\right)$  is the point on the unit circle that corresponds to  $t$ . Use the figure to find the values of the trigonometric functions at  $t$ .

#### SOLUTION

The point  $P$  on the unit circle that corresponds to  $t$  has coordinates  $\left(-\frac{1}{2}, \frac{\sqrt{3}}{2}\right)$ . We use  $x = -\frac{1}{2}$  and  $y = \frac{\sqrt{3}}{2}$  to find the values of the trigonometric functions. Because radical expressions are usually written without radicals in the denominators, we simplify by rationalizing denominators where appropriate.

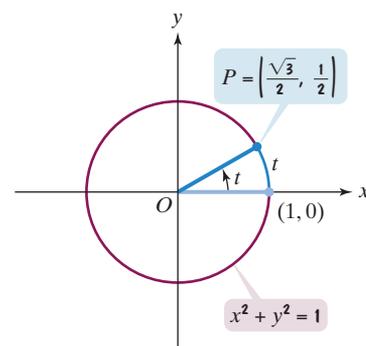

$$\sin t = y = \frac{\sqrt{3}}{2} \qquad \csc t = \frac{1}{y} = \frac{1}{\frac{\sqrt{3}}{2}} = \frac{2}{\sqrt{3}} = \frac{2}{\sqrt{3}} \cdot \frac{\sqrt{3}}{\sqrt{3}} = \frac{2\sqrt{3}}{3}$$

$$\cos t = x = -\frac{1}{2} \qquad \sec t = \frac{1}{x} = \frac{1}{-\frac{1}{2}} = -2$$

Rationalize denominators.  
We are multiplying by 1 and not changing function values.

$$\tan t = \frac{y}{x} = \frac{\frac{\sqrt{3}}{2}}{-\frac{1}{2}} = -\sqrt{3} \qquad \cot t = \frac{x}{y} = \frac{-\frac{1}{2}}{\frac{\sqrt{3}}{2}} = -\frac{1}{\sqrt{3}} = -\frac{1}{\sqrt{3}} \cdot \frac{\sqrt{3}}{\sqrt{3}} = -\frac{\sqrt{3}}{3}$$

 **Check Point 1** Use the figure on the right to find the values of the trigonometric functions at  $t$ .

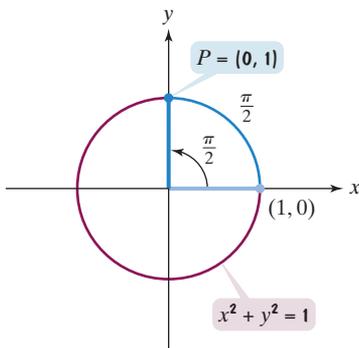

FIGURE 4.23

**EXAMPLE 2** Finding Values of the Trigonometric Functions

Use **Figure 4.23** to find the values of the trigonometric functions at  $t = \frac{\pi}{2}$ .

**SOLUTION**

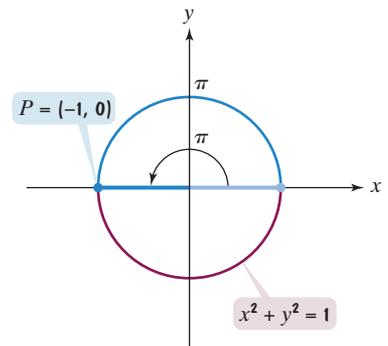

The point  $P$  on the unit circle that corresponds to  $t = \frac{\pi}{2}$  has coordinates  $(0, 1)$ . We use  $x = 0$  and  $y = 1$  to find the values of the trigonometric functions at  $\frac{\pi}{2}$ .

$$\begin{aligned} \sin \frac{\pi}{2} &= y = 1 & \csc \frac{\pi}{2} &= \frac{1}{y} = \frac{1}{1} = 1 \\ \cos \frac{\pi}{2} &= x = 0 & \sec \frac{\pi}{2} &= \frac{1}{x} = \frac{1}{0} \\ \tan \frac{\pi}{2} &= \frac{y}{x} = \frac{1}{0} & \cot \frac{\pi}{2} &= \frac{x}{y} = \frac{0}{1} = 0 \end{aligned}$$

$\sec \frac{\pi}{2}$  and  $\tan \frac{\pi}{2}$  are undefined.

**Check Point 2** Use the figure on the right to find the values of the trigonometric functions at  $t = \pi$ .

2 Recognize the domain and range of sine and cosine functions.

**Domain and Range of Sine and Cosine Functions**

The domain and range of each trigonometric function can be found from the unit circle definition. At this point, let's look only at the sine and cosine functions,

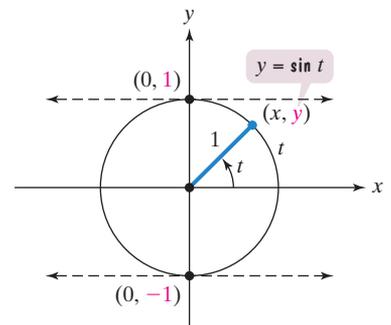

$$\sin t = y \quad \text{and} \quad \cos t = x.$$

**Figure 4.24** shows the sine function at  $t$  as the  $y$ -coordinate of a point along the unit circle:

$y = \sin t$ .

The domain is associated with  $t$ , the angle's radian measure and the intercepted arc's length.

The range is associated with  $y$ , the point's second coordinate.

Because  $t$  can be any real number, the domain of the sine function is  $(-\infty, \infty)$ , the set of all real numbers. The radius of the unit circle is 1 and the dashed horizontal lines in **Figure 4.24** show that  $y$  cannot be less than  $-1$  or greater than  $1$ . Thus, the range of the sine function is  $[-1, 1]$ , the set of all real numbers from  $-1$  to  $1$ , inclusive.

FIGURE 4.24

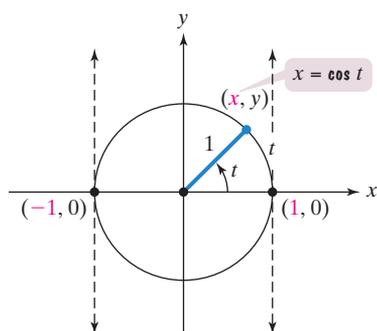

FIGURE 4.25

**Figure 4.25** shows the cosine function at  $t$  as the  $x$ -coordinate of a point along the unit circle:

$x = \cos t$ .

The domain is associated with  $t$ , the angle's radian measure and the intercepted arc's length.

The range is associated with  $x$ , the point's first coordinate.

Because  $t$  can be any real number, the domain of the cosine function is  $(-\infty, \infty)$ . The radius of the unit circle is 1 and the dashed vertical lines in **Figure 4.25** show that  $x$  cannot be less than  $-1$  or greater than  $1$ . Thus, the range of the cosine function is  $[-1, 1]$ .

### The Domain and Range of the Sine and Cosine Functions

The domain of the sine function and the cosine function is  $(-\infty, \infty)$ , the set of all real numbers. The range of these functions is  $[-1, 1]$ , the set of all real numbers from  $-1$  to  $1$ , inclusive.

- 3 Find exact values of the trigonometric functions at  $\frac{\pi}{4}$ .

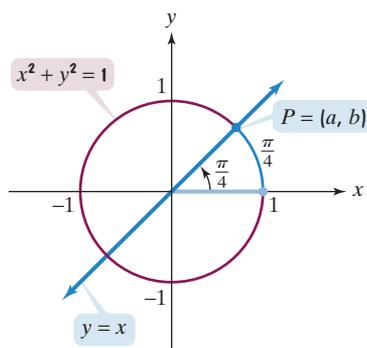

FIGURE 4.26

### Exact Values of the Trigonometric Functions at $t = \frac{\pi}{4}$

Trigonometric functions at  $t = \frac{\pi}{4}$  occur frequently. How do we use the unit circle to find values of the trigonometric functions at  $t = \frac{\pi}{4}$ ? Look at **Figure 4.26**. We must find the coordinates of point  $P = (a, b)$  on the unit circle that correspond to  $t = \frac{\pi}{4}$ . Can you see that  $P$  lies on the line  $y = x$ ? Thus, point  $P$  has equal  $x$ - and  $y$ -coordinates:  $a = b$ . We find these coordinates as follows:

$$x^2 + y^2 = 1 \quad \text{This is the equation of the unit circle.}$$

$$a^2 + b^2 = 1 \quad \text{Point } P = (a, b) \text{ lies on the unit circle. Thus, its coordinates satisfy the circle's equation.}$$

$$a^2 + a^2 = 1 \quad \text{Because } a = b, \text{ substitute } a \text{ for } b \text{ in the previous equation.}$$

$$2a^2 = 1 \quad \text{Combine like terms.}$$

$$a^2 = \frac{1}{2} \quad \text{Divide both sides of the equation by 2.}$$

$$a = \sqrt{\frac{1}{2}} \quad \text{Because } a > 0, \text{ take the positive square root of both sides.}$$

We see that  $a = \sqrt{\frac{1}{2}} = \frac{1}{\sqrt{2}}$ . Because  $a = b$ , we also have  $b = \frac{1}{\sqrt{2}}$ . Thus, if  $t = \frac{\pi}{4}$ , point  $P = \left(\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right)$  is the point on the unit circle that corresponds to  $t$ . Let's rationalize the denominator on each coordinate:

$$\frac{1}{\sqrt{2}} = \frac{1}{\sqrt{2}} \cdot \frac{\sqrt{2}}{\sqrt{2}} = \frac{\sqrt{2}}{2}.$$

We are multiplying by 1 and not changing the value of  $\frac{1}{\sqrt{2}}$ .

We use  $\left(\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}\right)$  to find the values of the trigonometric functions at  $t = \frac{\pi}{4}$ .

**EXAMPLE 3** Finding Values of the Trigonometric Functionsat  $t = \frac{\pi}{4}$ Find  $\sin \frac{\pi}{4}$ ,  $\cos \frac{\pi}{4}$ , and  $\tan \frac{\pi}{4}$ .**SOLUTION**

The point  $P$  on the unit circle that corresponds to  $t = \frac{\pi}{4}$  has coordinates  $\left(\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}\right)$ . We use  $x = \frac{\sqrt{2}}{2}$  and  $y = \frac{\sqrt{2}}{2}$  to find the values of the three trigonometric functions at  $\frac{\pi}{4}$ .

$$\sin \frac{\pi}{4} = y = \frac{\sqrt{2}}{2} \quad \cos \frac{\pi}{4} = x = \frac{\sqrt{2}}{2} \quad \tan \frac{\pi}{4} = \frac{y}{x} = \frac{\frac{\sqrt{2}}{2}}{\frac{\sqrt{2}}{2}} = 1 \quad \dots$$

 **Check Point 3** Find  $\csc \frac{\pi}{4}$ ,  $\sec \frac{\pi}{4}$ , and  $\cot \frac{\pi}{4}$ .

Because you will often see the trigonometric functions at  $\frac{\pi}{4}$ , it is a good idea to memorize the values shown in the following box. In the next section, you will learn to use a right triangle to obtain these values.

**Trigonometric Functions at  $\frac{\pi}{4}$** 

$$\sin \frac{\pi}{4} = \frac{\sqrt{2}}{2}$$

$$\csc \frac{\pi}{4} = \sqrt{2}$$

$$\cos \frac{\pi}{4} = \frac{\sqrt{2}}{2}$$

$$\sec \frac{\pi}{4} = \sqrt{2}$$

$$\tan \frac{\pi}{4} = 1$$

$$\cot \frac{\pi}{4} = 1$$

- 4** Use even and odd trigonometric functions.

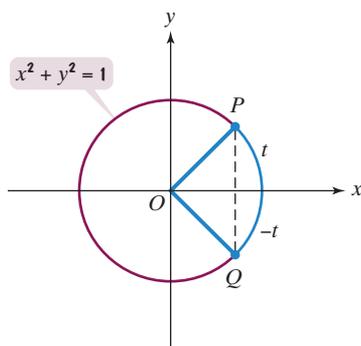

FIGURE 4.27

**Even and Odd Trigonometric Functions**

We have seen that a function is even if  $f(-t) = f(t)$  and odd if  $f(-t) = -f(t)$ . We can use **Figure 4.27** to show that the cosine function is an even function and the sine function is an odd function. By definition, the coordinates of the points  $P$  and  $Q$  in **Figure 4.27** are as follows:

$$P: (\cos t, \sin t)$$

$$Q: (\cos(-t), \sin(-t)).$$

In **Figure 4.27**, the  $x$ -coordinates of  $P$  and  $Q$  are the same. Thus,

$$\cos(-t) = \cos t.$$

This shows that the cosine function is an even function. By contrast, the  $y$ -coordinates of  $P$  and  $Q$  are negatives of each other. Thus,

$$\sin(-t) = -\sin t.$$

This shows that the sine function is an odd function.

This argument is valid regardless of the length of  $t$ . Thus, the arc may terminate in any of the four quadrants or on any axis. Using the unit circle definition of the trigonometric functions, we obtain the following results:

### Even and Odd Trigonometric Functions

The cosine and secant functions are *even*.

$$\cos(-t) = \cos t \qquad \sec(-t) = \sec t$$

The sine, cosecant, tangent, and cotangent functions are *odd*.

$$\begin{aligned} \sin(-t) &= -\sin t & \csc(-t) &= -\csc t \\ \tan(-t) &= -\tan t & \cot(-t) &= -\cot t \end{aligned}$$

### EXAMPLE 4 Using Even and Odd Functions to Find Values of Trigonometric Functions

Find the value of each trigonometric function:

a.  $\cos\left(-\frac{\pi}{4}\right)$       b.  $\tan\left(-\frac{\pi}{4}\right)$ .

#### SOLUTION

a.  $\cos\left(-\frac{\pi}{4}\right) = \cos\frac{\pi}{4} = \frac{\sqrt{2}}{2}$       b.  $\tan\left(-\frac{\pi}{4}\right) = -\tan\frac{\pi}{4} = -1$       ...

 **Check Point 4** Find the value of each trigonometric function:

a.  $\sec\left(-\frac{\pi}{4}\right)$       b.  $\sin\left(-\frac{\pi}{4}\right)$ .

- 5 Recognize and use fundamental identities.

### Fundamental Identities

Many relationships exist among the six trigonometric functions. These relationships are described using **trigonometric identities**. Trigonometric identities are equations that are true for all real numbers for which the trigonometric expressions in the equations are defined. For example, the definitions of the cosine and secant functions are given by

$$\cos t = x \quad \text{and} \quad \sec t = \frac{1}{x}, x \neq 0.$$

Substituting  $\cos t$  for  $x$  in the equation on the right, we see that

$$\sec t = \frac{1}{\cos t}, \cos t \neq 0.$$

This identity is one of six **reciprocal identities**.

### Reciprocal Identities

$$\begin{aligned} \sin t &= \frac{1}{\csc t} & \csc t &= \frac{1}{\sin t} \\ \cos t &= \frac{1}{\sec t} & \sec t &= \frac{1}{\cos t} \\ \tan t &= \frac{1}{\cot t} & \cot t &= \frac{1}{\tan t} \end{aligned}$$

Two other relationships that follow from the definitions of the trigonometric functions are called the **quotient identities**.

### Quotient Identities

$$\tan t = \frac{\sin t}{\cos t}$$

$$\cot t = \frac{\cos t}{\sin t}$$

If  $\sin t$  and  $\cos t$  are known, a quotient identity and three reciprocal identities make it possible to find the value of each of the four remaining trigonometric functions.

### EXAMPLE 5 Using Quotient and Reciprocal Identities

Given  $\sin t = \frac{2}{5}$  and  $\cos t = \frac{\sqrt{21}}{5}$ , find the value of each of the four remaining trigonometric functions.

### SOLUTION

We can find  $\tan t$  by using the quotient identity that describes  $\tan t$  as the quotient of  $\sin t$  and  $\cos t$ .

$$\tan \theta = \frac{\sin \theta}{\cos \theta} = \frac{\frac{2}{5}}{\frac{\sqrt{21}}{5}} = \frac{2}{5} \cdot \frac{5}{\sqrt{21}} = \frac{2}{\sqrt{21}} = \frac{2}{\sqrt{21}} \cdot \frac{\sqrt{21}}{\sqrt{21}} = \frac{2\sqrt{21}}{21}$$

Rationalize the denominator.

We use the reciprocal identities to find the value of each of the remaining three functions.

$$\csc t = \frac{1}{\sin t} = \frac{1}{\frac{2}{5}} = \frac{5}{2}$$

$$\sec \theta = \frac{1}{\cos \theta} = \frac{1}{\frac{\sqrt{21}}{5}} = \frac{5}{\sqrt{21}} = \frac{5}{\sqrt{21}} \cdot \frac{\sqrt{21}}{\sqrt{21}} = \frac{5\sqrt{21}}{21}$$

Rationalize the denominator.

$$\cot t = \frac{1}{\tan t} = \frac{1}{\frac{2\sqrt{21}}{21}} = \frac{1}{\frac{2}{\sqrt{21}}} = \frac{\sqrt{21}}{2}$$

We found  $\tan t = \frac{2}{\sqrt{21}}$ . We could use  $\tan t = \frac{2\sqrt{21}}{21}$ , but then we would have to rationalize the denominator. ●●●

 **Check Point 5** Given  $\sin t = \frac{2}{3}$  and  $\cos t = \frac{\sqrt{5}}{3}$ , find the value of each of the four remaining trigonometric functions.

Other relationships among trigonometric functions follow from the equation of the unit circle

$$x^2 + y^2 = 1.$$

Because  $\cos t = x$  and  $\sin t = y$ , we see that

$$(\cos t)^2 + (\sin t)^2 = 1.$$

We will eliminate the parentheses in  $(\cos t)^2 + (\sin t)^2 = 1$  by writing  $\cos^2 t$  instead of  $(\cos t)^2$  and  $\sin^2 t$  instead of  $(\sin t)^2$ . With this notation, we can write the identity as

$$\cos^2 t + \sin^2 t = 1$$

or

$$\sin^2 t + \cos^2 t = 1. \text{ The identity usually appears in this form.}$$

Two additional identities can be obtained from  $x^2 + y^2 = 1$  by dividing both sides by  $x^2$  and  $y^2$ , respectively. The three identities are called the **Pythagorean identities**.

### Pythagorean Identities

$$\sin^2 t + \cos^2 t = 1 \qquad 1 + \tan^2 t = \sec^2 t \qquad 1 + \cot^2 t = \csc^2 t$$

### EXAMPLE 6 Using a Pythagorean Identity

Given that  $\sin t = \frac{3}{5}$  and  $0 \leq t < \frac{\pi}{2}$ , find the value of  $\cos t$  using a trigonometric identity.

#### SOLUTION

We can find the value of  $\cos t$  by using the Pythagorean identity

$$\sin^2 t + \cos^2 t = 1.$$

$$\left(\frac{3}{5}\right)^2 + \cos^2 t = 1$$

$$\frac{9}{25} + \cos^2 t = 1$$

$$\cos^2 t = 1 - \frac{9}{25}$$

$$\cos^2 t = \frac{16}{25}$$

$$\cos t = \sqrt{\frac{16}{25}} = \frac{4}{5}$$

$$\text{Thus, } \cos t = \frac{4}{5}.$$

We are given that  $\sin t = \frac{3}{5}$ .

$$\text{Square } \frac{3}{5}: \left(\frac{3}{5}\right)^2 = \frac{3^2}{5^2} = \frac{9}{25}.$$

Subtract  $\frac{9}{25}$  from both sides.

$$\text{Simplify: } 1 - \frac{9}{25} = \frac{25}{25} - \frac{9}{25} = \frac{16}{25}.$$

Because  $0 \leq t < \frac{\pi}{2}$ ,  $\cos t$ , the  $x$ -coordinate of a point on the unit circle, is positive.

 **Check Point 6** Given that  $\sin t = \frac{1}{2}$  and  $0 \leq t < \frac{\pi}{2}$ , find the value of  $\cos t$  using a trigonometric identity.

**6** Use periodic properties.

### Periodic Functions

Certain patterns in nature repeat again and again. For example, the ocean level at a beach varies from low tide to high tide and then back to low tide approximately every 12 hours. If low tide occurs at noon, then high tide will be around 6 P.M. and low tide will occur again around midnight, and so on infinitely. If  $f(t)$  represents the ocean level at the beach at any time  $t$ , then the level is the same 12 hours later. Thus,

$$f(t + 12) = f(t).$$

The word *periodic* means that this tidal behavior repeats infinitely. The *period*, 12 hours, is the time it takes to complete one full cycle.

#### Definition of a Periodic Function

A function  $f$  is **periodic** if there exists a positive number  $p$  such that

$$f(t + p) = f(t)$$

for all  $t$  in the domain of  $f$ . The smallest positive number  $p$  for which  $f$  is periodic is called the **period** of  $f$ .

The trigonometric functions are used to model periodic phenomena. Why? If we begin at any point  $P$  on the unit circle and travel a distance of  $2\pi$  units along the perimeter, we will return to the same point  $P$ . Because the trigonometric functions are defined in terms of the coordinates of that point  $P$ , we obtain the following results:

### Periodic Properties of the Sine and Cosine Functions

$$\sin(t + 2\pi) = \sin t \quad \text{and} \quad \cos(t + 2\pi) = \cos t$$

The sine and cosine functions are periodic functions and have period  $2\pi$ .

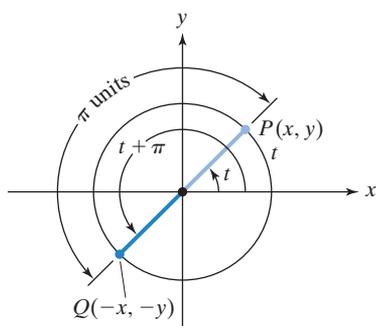

FIGURE 4.28  
tangent at  $P$  = tangent at  $Q$

Like the sine and cosine functions, the secant and cosecant functions have period  $2\pi$ . However, the tangent and cotangent functions have a smaller period. **Figure 4.28** shows that if we begin at any point  $P(x, y)$  on the unit circle and travel a distance of  $\pi$  units along the perimeter, we arrive at the point  $Q(-x, -y)$ . The tangent function, defined in terms of the coordinates of a point, is the same at  $(x, y)$  and  $(-x, -y)$ .

$$\begin{array}{ccc} \text{Tangent function} & \frac{y}{x} = \frac{-y}{-x} & \text{Tangent function} \\ \text{at } (x, y) & & \text{at } \pi \text{ radians later} \end{array}$$

We see that  $\tan(t + \pi) = \tan t$ . The same observations apply to the cotangent function.

### Periodic Properties of the Tangent and Cotangent Functions

$$\tan(t + \pi) = \tan t \quad \text{and} \quad \cot(t + \pi) = \cot t$$

The tangent and cotangent functions are periodic functions and have period  $\pi$ .

### EXAMPLE 7 Using Periodic Properties

Find the value of each trigonometric function:

a.  $\sin \frac{9\pi}{4}$       b.  $\tan\left(-\frac{5\pi}{4}\right)$ .

#### SOLUTION

a.  $\sin \frac{9\pi}{4} = \sin\left(\frac{\pi}{4} + 2\pi\right) = \sin \frac{\pi}{4} = \frac{\sqrt{2}}{2}$

$$\sin(t + 2\pi) = \sin t$$

b.  $\tan\left(-\frac{5\pi}{4}\right) = -\tan \frac{5\pi}{4} = -\tan\left(\frac{\pi}{4} + \pi\right) = -\tan \frac{\pi}{4} = -1$

The tangent function is odd:  $\tan(-t) = -\tan t$ .

$$\tan(t + \pi) = \tan t$$

 **Check Point 7** Find the value of each trigonometric function:

a.  $\cot \frac{5\pi}{4}$       b.  $\cos\left(-\frac{9\pi}{4}\right)$ .

Why do the trigonometric functions model phenomena that repeat *indefinitely*? By starting at point  $P$  on the unit circle and traveling a distance of  $2\pi$  units,  $4\pi$  units,  $6\pi$  units, and so on, we return to the starting point  $P$ . Because the trigonometric functions are defined in terms of the coordinates of that point  $P$ , if we add (or subtract) multiples of  $2\pi$  to  $t$ , the values of the trigonometric functions of  $t$  do not change. Furthermore, the values for the tangent and cotangent functions of  $t$  do not change if we add (or subtract) multiples of  $\pi$  to  $t$ .

### Repetitive Behavior of the Sine, Cosine, and Tangent Functions

For any integer  $n$  and real number  $t$ ,

$$\sin(t + 2\pi n) = \sin t, \quad \cos(t + 2\pi n) = \cos t, \quad \text{and} \quad \tan(t + \pi n) = \tan t.$$

**7** Evaluate trigonometric functions with a calculator.

### Using a Calculator to Evaluate Trigonometric Functions

We used a unit circle to find values of the trigonometric functions at  $\frac{\pi}{4}$ . These are exact values. We can find approximate values of the trigonometric functions using a calculator.

The first step in using a calculator to evaluate trigonometric functions is to set the calculator to the correct *mode*, degrees or radians. The domains of the trigonometric functions in the unit circle are sets of real numbers. Therefore, we use the radian mode.

Most calculators have keys marked  $\boxed{\text{SIN}}$ ,  $\boxed{\text{COS}}$ , and  $\boxed{\text{TAN}}$ . For example, to find the value of  $\sin 1.2$ , set the calculator to the radian mode and enter 1.2  $\boxed{\text{SIN}}$  on most scientific calculators and  $\boxed{\text{SIN}}$  1.2  $\boxed{\text{ENTER}}$  on most graphing calculators. Consult the manual for your calculator.

To evaluate the cosecant, secant, and cotangent functions, use the key for the respective reciprocal function,  $\boxed{\text{SIN}}$ ,  $\boxed{\text{COS}}$ , or  $\boxed{\text{TAN}}$ , and then use the reciprocal key. The reciprocal key is  $\boxed{1/x}$  on many scientific calculators and  $\boxed{x^{-1}}$  on many graphing calculators. For example, we can evaluate  $\sec \frac{\pi}{12}$  using the following reciprocal relationship:

$$\sec \frac{\pi}{12} = \frac{1}{\cos \frac{\pi}{12}}.$$

Using the radian mode, enter one of the following keystroke sequences:

#### Many Scientific Calculators

$$\boxed{\pi} \boxed{\div} 12 \boxed{=} \boxed{\text{COS}} \boxed{1/x}$$

#### Many Graphing Calculators

$$\boxed{(} \boxed{\text{COS}} \boxed{(} \boxed{\pi} \boxed{\div} 12 \boxed{)} \boxed{)} \boxed{x^{-1}} \boxed{\text{ENTER}}.$$

(The open parenthesis following the  $\boxed{\text{COS}}$  key is provided on some calculators.)

Rounding the display to four decimal places, we obtain  $\sec \frac{\pi}{12} \approx 1.0353$ .

### EXAMPLE 8 Evaluating Trigonometric Functions with a Calculator

Use a calculator to find the value to four decimal places:

**a.**  $\cos \frac{\pi}{4}$       **b.**  $\cot 1.2$ .

## SOLUTION

## Scientific Calculator Solution

Function	Mode	Keystrokes	Display, rounded to four decimal places
a. $\cos \frac{\pi}{4}$	Radian	$\pi$ $\div$ 4 $=$ $\text{COS}$	0.7071
b. $\cot 1.2$	Radian	1.2 $\text{TAN}$ $1/x$	0.3888

## Graphing Calculator Solution

Function	Mode	Keystrokes	Display, rounded to four decimal places
a. $\cos \frac{\pi}{4}$	Radian	$\text{COS}$ $($ $\pi$ $\div$ 4 $)$ $\text{ENTER}$	0.7071
b. $\cot 1.2$	Radian	$($ $\text{TAN}$ 1.2 $)$ $x^{-1}$ $\text{ENTER}$	0.3888

 **Check Point 8** Use a calculator to find the value to four decimal places:

a.  $\sin \frac{\pi}{4}$

b.  $\csc 1.5$ .

## CONCEPT AND VOCABULARY CHECK

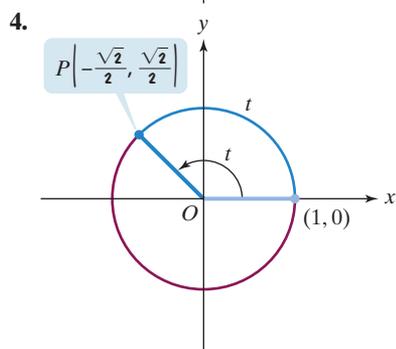

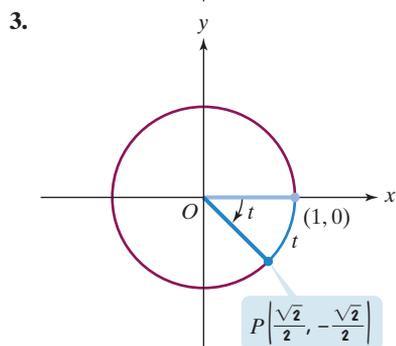

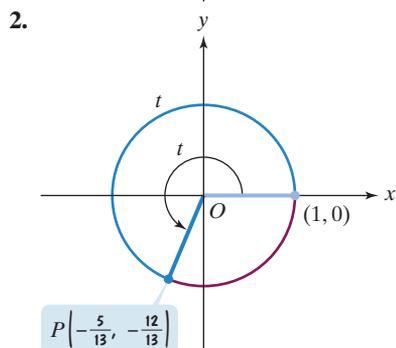

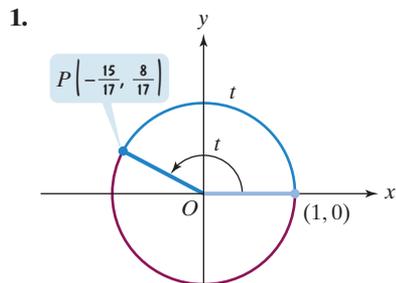

Fill in each blank so that the resulting statement is true.

- In a unit circle, the radian measure of the central angle is equal to the length of the \_\_\_\_\_.
- If  $t$  is a real number and  $P = (x, y)$  is a point on the unit circle that corresponds to  $t$ , then  $x$  is the \_\_\_\_\_ of  $t$  and  $y$  is the \_\_\_\_\_ of  $t$ .
- The two trigonometric functions defined for all real numbers are the \_\_\_\_\_ function and the \_\_\_\_\_ function. The domain of each of these functions is \_\_\_\_\_.
- The largest possible value for the sine function and the cosine function is \_\_\_\_\_ and the smallest possible value is \_\_\_\_\_. The range for each of these functions is \_\_\_\_\_.
- The point  $P$  on the unit circle that corresponds to  $t = \frac{\pi}{4}$  has coordinates  $\left(\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}\right)$ . Thus,  $\sin \frac{\pi}{4} =$  \_\_\_\_\_,  $\cos \frac{\pi}{4} =$  \_\_\_\_\_, and  $\tan \frac{\pi}{4} =$  \_\_\_\_\_.
- $\cos(-t) =$  \_\_\_\_\_ and  $\sec(-t) =$  \_\_\_\_\_, so the cosine and secant are \_\_\_\_\_ functions.
- $\sin(-t) =$  \_\_\_\_\_,  $\csc(-t) =$  \_\_\_\_\_,  $\tan(-t) =$  \_\_\_\_\_, and  $\cot(-t) =$  \_\_\_\_\_, so the sine, cosecant, tangent, and cotangent are \_\_\_\_\_ functions.
- According to the reciprocal identities,  $\frac{1}{\csc t} =$  \_\_\_\_\_,  $\frac{1}{\sec t} =$  \_\_\_\_\_, and  $\frac{1}{\cot t} =$  \_\_\_\_\_.
- According to the quotient identities,  $\frac{\sin t}{\cos t} =$  \_\_\_\_\_ and  $\frac{\cos t}{\sin t} =$  \_\_\_\_\_.
- According to the Pythagorean identities,  $\sin^2 t + \cos^2 t =$  \_\_\_\_\_,  $1 + \tan^2 t =$  \_\_\_\_\_, and  $1 + \cot^2 t =$  \_\_\_\_\_.
- If there exists a positive number  $p$  such that  $f(t + p) = f(t)$ , the function  $f$  is \_\_\_\_\_. The smallest positive number  $p$  for which  $f(t + p) = f(t)$  is called the \_\_\_\_\_ of  $t$ .
- $\sin(t + 2\pi) =$  \_\_\_\_\_ and  $\cos(t + 2\pi) =$  \_\_\_\_\_, so the sine and cosine functions are \_\_\_\_\_ functions. The period of each of these functions is \_\_\_\_\_.
- $\tan(t + \pi) =$  \_\_\_\_\_ and  $\cot(t + \pi) =$  \_\_\_\_\_, so the tangent and cotangent functions are \_\_\_\_\_ functions. The period of each of these functions is \_\_\_\_\_.

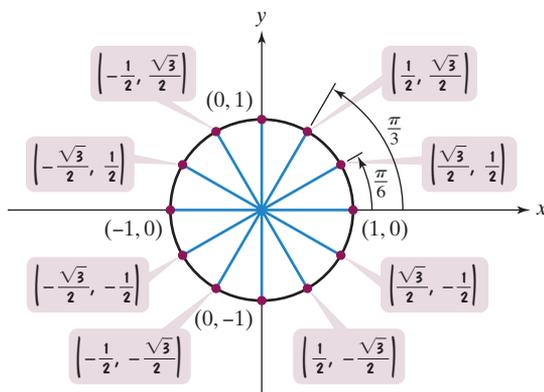

EXERCISE SET 4.2

Practice Exercises

In Exercises 1–4, a point  $P(x, y)$  is shown on the unit circle corresponding to a real number  $t$ . Find the values of the trigonometric functions at  $t$ .

In Exercises 5–18, the unit circle at the top of the next column has been divided into twelve equal arcs, corresponding to  $t$ -values of  $0, \frac{\pi}{6}, \frac{\pi}{3}, \frac{\pi}{2}, \frac{2\pi}{3}, \frac{5\pi}{6}, \pi, \frac{7\pi}{6}, \frac{4\pi}{3}, \frac{3\pi}{2}, \frac{5\pi}{3}, \frac{11\pi}{6}$ , and  $2\pi$ . Use the  $(x, y)$  coordinates in the figure to find the value of each trigonometric function at the indicated real number,  $t$ , or state that the expression is undefined.

- |                           |                           |                            |
|---------------------------|---------------------------|----------------------------|
| 5. $\sin \frac{\pi}{6}$   | 6. $\sin \frac{\pi}{3}$   | 7. $\cos \frac{5\pi}{6}$   |
| 8. $\cos \frac{2\pi}{3}$  | 9. $\tan \pi$             | 10. $\tan 0$               |
| 11. $\csc \frac{7\pi}{6}$ | 12. $\csc \frac{4\pi}{3}$ | 13. $\sec \frac{11\pi}{6}$ |
| 14. $\sec \frac{5\pi}{3}$ | 15. $\sin \frac{3\pi}{2}$ | 16. $\cos \frac{3\pi}{2}$  |
| 17. $\sec \frac{3\pi}{2}$ | 18. $\tan \frac{3\pi}{2}$ |                            |

In Exercises 19–24,

- a. Use the unit circle shown for Exercises 5–18 to find the value of the trigonometric function.  
 b. Use even and odd properties of trigonometric functions and your answer from part (a) to find the value of the same trigonometric function at the indicated real number.

- |                                       |  |
|---------------------------------------|--|
| 19. a. $\cos \frac{\pi}{6}$           | 20. a. $\cos \frac{\pi}{3}$            |
| b. $\cos\left(-\frac{\pi}{6}\right)$  | b. $\cos\left(-\frac{\pi}{3}\right)$   |
| 21. a. $\sin \frac{5\pi}{6}$          | 22. a. $\sin \frac{2\pi}{3}$           |
| b. $\sin\left(-\frac{5\pi}{6}\right)$ | b. $\sin\left(-\frac{2\pi}{3}\right)$  |
| 23. a. $\tan \frac{5\pi}{3}$          | 24. a. $\tan \frac{11\pi}{6}$          |
| b. $\tan\left(-\frac{5\pi}{3}\right)$ | b. $\tan\left(-\frac{11\pi}{6}\right)$ |

In Exercises 25–28,  $\sin t$  and  $\cos t$  are given. Use identities to find  $\tan t$ ,  $\csc t$ ,  $\sec t$ , and  $\cot t$ . Where necessary, rationalize denominators.

- |  |   |
|--|---|
| 25. $\sin t = \frac{8}{17}, \cos t = \frac{15}{17}$      | 26. $\sin t = \frac{3}{5}, \cos t = \frac{4}{5}$        |
| 27. $\sin t = \frac{1}{3}, \cos t = \frac{2\sqrt{2}}{3}$ | 28. $\sin t = \frac{2}{3}, \cos t = \frac{\sqrt{5}}{3}$ |

In Exercises 29–32,  $0 \leq t < \frac{\pi}{2}$  and  $\sin t$  is given. Use the Pythagorean identity  $\sin^2 t + \cos^2 t = 1$  to find  $\cos t$ .

- |                                    |                                    |
|------------------------------------|------------------------------------|
| 29. $\sin t = \frac{6}{7}$         | 30. $\sin t = \frac{7}{8}$         |
| 31. $\sin t = \frac{\sqrt{39}}{8}$ | 32. $\sin t = \frac{\sqrt{21}}{5}$ |

In Exercises 33–38, use an identity to find the value of each expression. Do not use a calculator.

33.  $\sin 1.7 \csc 1.7$

34.  $\cos 2.3 \sec 2.3$

35.  $\sin^2 \frac{\pi}{6} + \cos^2 \frac{\pi}{6}$

36.  $\sin^2 \frac{\pi}{3} + \cos^2 \frac{\pi}{3}$

37.  $\sec^2 \frac{\pi}{3} - \tan^2 \frac{\pi}{3}$

38.  $\csc^2 \frac{\pi}{6} - \cot^2 \frac{\pi}{6}$

In Exercises 39–52, find the exact value of each trigonometric function. Do not use a calculator.

39.  $\cos \frac{9\pi}{4}$

40.  $\csc \frac{9\pi}{4}$

41.  $\sin\left(-\frac{9\pi}{4}\right)$

42.  $\sec\left(-\frac{9\pi}{4}\right)$

43.  $\tan \frac{5\pi}{4}$

44.  $\cot \frac{5\pi}{4}$

45.  $\cot\left(-\frac{5\pi}{4}\right)$

46.  $\tan\left(-\frac{9\pi}{4}\right)$

47.  $-\tan\left(\frac{\pi}{4} + 15\pi\right)$

48.  $-\cot\left(\frac{\pi}{4} + 17\pi\right)$

49.  $\sin\left(-\frac{\pi}{4} - 1000\pi\right)$

50.  $\sin\left(-\frac{\pi}{4} - 2000\pi\right)$

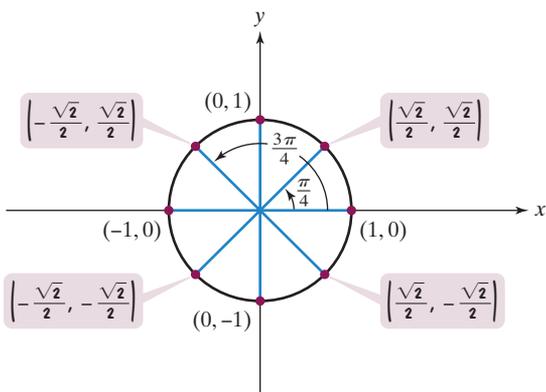

51.  $\cos\left(-\frac{\pi}{4} - 1000\pi\right)$

52.  $\cos\left(-\frac{\pi}{4} - 2000\pi\right)$

In Exercises 53–60, the unit circle has been divided into eight equal arcs, corresponding to  $t$ -values of

$$0, \frac{\pi}{4}, \frac{\pi}{2}, \frac{3\pi}{4}, \pi, \frac{5\pi}{4}, \frac{3\pi}{2}, \frac{7\pi}{4}, \text{ and } 2\pi.$$

- Use the  $(x, y)$  coordinates in the figure to find the value of the trigonometric function.
- Use periodic properties and your answer from part (a) to find the value of the same trigonometric function at the indicated real number.

53. a.  $\sin \frac{3\pi}{4}$

54. a.  $\cos \frac{3\pi}{4}$

b.  $\sin \frac{11\pi}{4}$

b.  $\cos \frac{11\pi}{4}$

55. a.  $\cos \frac{\pi}{2}$

56. a.  $\sin \frac{\pi}{2}$

b.  $\cos \frac{9\pi}{2}$

b.  $\sin \frac{9\pi}{2}$

57. a.  $\tan \pi$

58. a.  $\cot \frac{\pi}{2}$

b.  $\tan 17\pi$

b.  $\cot \frac{15\pi}{2}$

59. a.  $\sin \frac{7\pi}{4}$

60. a.  $\cos \frac{7\pi}{4}$

b.  $\sin \frac{47\pi}{4}$

b.  $\cos \frac{47\pi}{4}$

In Exercises 61–70, use a calculator to find the value of the trigonometric function to four decimal places.

61.  $\sin 0.8$

62.  $\cos 0.6$

63.  $\tan 3.4$

64.  $\tan 3.7$

65.  $\csc 1$

66.  $\sec 1$

67.  $\cos \frac{\pi}{10}$

68.  $\sin \frac{3\pi}{10}$

69.  $\cot \frac{\pi}{12}$

70.  $\cot \frac{\pi}{18}$

### Practice Plus

In Exercises 71–80, let

$$\sin t = a, \cos t = b, \text{ and } \tan t = c.$$

Write each expression in terms of  $a, b,$  and  $c.$

71.  $\sin(-t) - \sin t$

72.  $\tan(-t) - \tan t$

73.  $4 \cos(-t) - \cos t$

74.  $3 \cos(-t) - \cos t$

75.  $\sin(t + 2\pi) - \cos(t + 4\pi) + \tan(t + \pi)$

76.  $\sin(t + 2\pi) + \cos(t + 4\pi) - \tan(t + \pi)$

77.  $\sin(-t - 2\pi) - \cos(-t - 4\pi) - \tan(-t - \pi)$

78.  $\sin(-t - 2\pi) + \cos(-t - 4\pi) - \tan(-t - \pi)$

79.  $\cos t + \cos(t + 1000\pi) - \tan t - \tan(t + 999\pi) - \sin t + 4 \sin(t - 1000\pi)$

80.  $-\cos t + 7 \cos(t + 1000\pi) + \tan t + \tan(t + 999\pi) + \sin t + \sin(t - 1000\pi)$

### Application Exercises

81. The number of hours of daylight,  $H$ , on day  $t$  of any given year (on January 1,  $t = 1$ ) in Fairbanks, Alaska, can be modeled by the function

$$H(t) = 12 + 8.3 \sin\left[\frac{2\pi}{365}(t - 80)\right].$$

- March 21, the 80th day of the year, is the spring equinox. Find the number of hours of daylight in Fairbanks on this day.
- June 21, the 172nd day of the year, is the summer solstice, the day with the maximum number of hours of daylight. To the nearest tenth of an hour, find the number of hours of daylight in Fairbanks on this day.
- December 21, the 355th day of the year, is the winter solstice, the day with the minimum number of hours of daylight. Find, to the nearest tenth of an hour, the number of hours of daylight in Fairbanks on this day.

82. The number of hours of daylight,  $H$ , on day  $t$  of any given year (on January 1,  $t = 1$ ) in San Diego, California, can be modeled by the function

$$H(t) = 12 + 2.4 \sin\left[\frac{2\pi}{365}(t - 80)\right].$$

- March 21, the 80th day of the year, is the spring equinox. Find the number of hours of daylight in San Diego on this day.

- b. June 21, the 172nd day of the year, is the summer solstice, the day with the maximum number of hours of daylight. Find, to the nearest tenth of an hour, the number of hours of daylight in San Diego on this day.
- c. December 21, the 355th day of the year, is the winter solstice, the day with the minimum number of hours of daylight. To the nearest tenth of an hour, find the number of hours of daylight in San Diego on this day.
83. People who believe in biorhythms claim that there are three cycles that rule our behavior—the physical, emotional, and mental. Each is a sine function of a certain period. The function for our emotional fluctuations is

$$E = \sin \frac{\pi}{14}t,$$

where  $t$  is measured in days starting at birth. Emotional fluctuations,  $E$ , are measured from  $-1$  to  $1$ , inclusive, with  $1$  representing peak emotional well-being,  $-1$  representing the low for emotional well-being, and  $0$  representing feeling neither emotionally high nor low.

- a. Find  $E$  corresponding to  $t = 7, 14, 21, 28$ , and  $35$ . Describe what you observe.
- b. What is the period of the emotional cycle?
84. The height of the water,  $H$ , in feet, at a boat dock  $t$  hours after 6 A.M. is given by

$$H = 10 + 4 \sin \frac{\pi}{6}t.$$

- a. Find the height of the water at the dock at 6 A.M., 9 A.M., noon, 6 P.M., midnight, and 3 A.M.
- b. When is low tide and when is high tide?
- c. What is the period of this function and what does this mean about the tides?

### Writing in Mathematics

85. Why are the trigonometric functions sometimes called circular functions?
86. Define the sine of  $t$ .
87. Given a point on the unit circle that corresponds to  $t$ , explain how to find  $\tan t$ .
88. What is the range of the sine function? Use the unit circle to explain where this range comes from.
89. Explain how to use the unit circle to find values of the trigonometric functions at  $\frac{\pi}{4}$ .
90. What do we mean by even trigonometric functions? Which of the six functions fall into this category?
91. Use words (not an equation) to describe one of the reciprocal identities.
92. Use words (not an equation) to describe one of the quotient identities.
93. Use words (not an equation) to describe one of the Pythagorean identities.
94. What is a periodic function? Why are the sine and cosine functions periodic?
95. Explain how you can use the function for emotional fluctuations in Exercise 83 to determine good days for having dinner with your moody boss.
96. Describe a phenomenon that repeats infinitely. What is its period?

### Critical Thinking Exercises

**Make Sense?** In Exercises 97–100, determine whether each statement makes sense or does not make sense, and explain your reasoning.

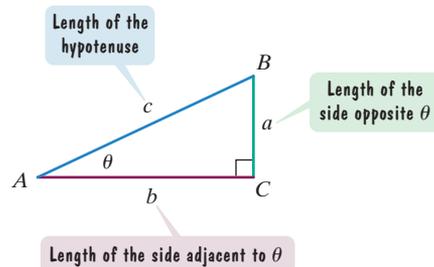

97. Assuming that the innermost circle on this Navajo sand painting is a unit circle, as  $A$  moves around the circle, its coordinates define the cosine and sine functions, respectively.
98. I'm using a value for  $t$  and a point on the unit circle corresponding to  $t$  for which  $\sin t = -\frac{\sqrt{10}}{2}$ .

99. Because  $\cos \frac{\pi}{6} = \frac{\sqrt{3}}{2}$ , I can conclude that  $\cos \left( -\frac{\pi}{6} \right) = -\frac{\sqrt{3}}{2}$ .
100. I can rewrite  $\tan t$  as  $\frac{1}{\cot t}$ , as well as  $\frac{\sin t}{\cos t}$ .
101. If  $\pi < t < \frac{3\pi}{2}$ , which of the following is true?  
 a.  $\sin t > 0$  and  $\tan t > 0$ .    b.  $\sin t < 0$  and  $\tan t < 0$ .  
 c.  $\tan t > 0$  and  $\cot t > 0$ .    d.  $\tan t < 0$  and  $\cot t < 0$ .
102. If  $f(x) = \sin x$  and  $f(a) = \frac{1}{4}$ , find the value of  $f(a) + f(a + 2\pi) + f(a + 4\pi) + f(a + 6\pi)$ .
103. If  $f(x) = \sin x$  and  $f(a) = \frac{1}{4}$ , find the value of  $f(a) + 2f(-a)$ .
104. The seats of a Ferris wheel are 40 feet from the wheel's center. When you get on the ride, your seat is 5 feet above the ground. How far above the ground are you after rotating through an angle of  $\frac{17\pi}{4}$  radians? Round to the nearest foot.

### Preview Exercises

Exercises 105–107 will help you prepare for the material covered in the next section. In each exercise, let  $\theta$  be an acute angle in a right triangle, as shown in the figure. These exercises require the use of the Pythagorean Theorem.

105. If  $a = 5$  and  $b = 12$ , find the ratio of the length of the side opposite  $\theta$  to the length of the hypotenuse.
106. If  $a = 1$  and  $b = 1$ , find the ratio of the length of the side opposite  $\theta$  to the length of the hypotenuse. Simplify the ratio by rationalizing the denominator.
107. Simplify:  $\left(\frac{a}{c}\right)^2 + \left(\frac{b}{c}\right)^2$ .

## SECTION 4.3

## Right Triangle Trigonometry

## Objectives

- 1 Use right triangles to evaluate trigonometric functions.
- 2 Find function values for  $30^\circ\left(\frac{\pi}{6}\right)$ ,  $45^\circ\left(\frac{\pi}{4}\right)$ , and  $60^\circ\left(\frac{\pi}{3}\right)$ .
- 3 Use equal cofunctions of complements.
- 4 Use right triangle trigonometry to solve applied problems.

- 1 Use right triangles to evaluate trigonometric functions.

In the last century, Ang Rita Sherpa climbed Mount Everest ten times, all without the use of bottled oxygen.

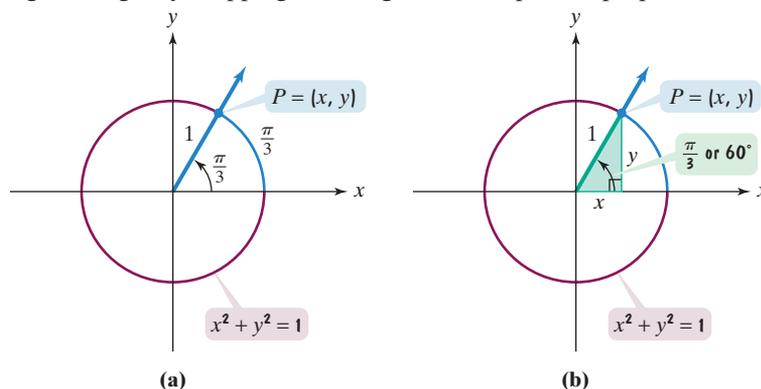

Mountain climbers have forever been fascinated by reaching the top of Mount Everest, sometimes with tragic results. The mountain, on Asia's Tibet-Nepal border, is Earth's highest, peaking at an incredible 29,035 feet. The heights of mountains can be

found using trigonometric functions. Remember that the word “trigonometry” means “measurement of triangles.” Trigonometry is used in navigation, building, and engineering. For centuries, Muslims used trigonometry and the stars to navigate across the Arabian desert to Mecca, the birthplace of the prophet Muhammad, the founder of Islam. The ancient Greeks used trigonometry to record the locations of thousands of stars and worked out the motion of the Moon relative to Earth. Today, trigonometry is used to study the structure of DNA, the master molecule that determines how we grow from a single cell to a complex, fully developed adult.

## Right Triangle Definitions of Trigonometric Functions

We have seen that in a unit circle, the radian measure of a central angle is equal to the measure of the intercepted arc. Thus, the value of a trigonometric function at the real number  $t$  is its value at an angle of  $t$  radians.

**Figure 4.29(a)** shows a central angle that measures  $\frac{\pi}{3}$  radians and an intercepted arc of length  $\frac{\pi}{3}$ . Interpret  $\frac{\pi}{3}$  as the measure of the central angle. In **Figure 4.29(b)**, we construct a right triangle by dropping a line segment from point  $P$  perpendicular to the  $x$ -axis.

**FIGURE 4.29** Interpreting trigonometric functions using a unit circle and a right triangle

Now we can think of  $\frac{\pi}{3}$ , or  $60^\circ$ , as the measure of an acute angle in the right triangle in **Figure 4.29(b)**. Because  $\sin t$  is the second coordinate of point  $P$  and  $\cos t$  is the first coordinate of point  $P$ , we see that

$$\sin \frac{\pi}{3} = \sin 60^\circ = y = \frac{y}{1}$$

This is the length of the side opposite the  $60^\circ$  angle in the right triangle.

This is the length of the hypotenuse in the right triangle.

$$\cos \frac{\pi}{3} = \cos 60^\circ = x = \frac{x}{1}$$

This is the length of the side adjacent to the  $60^\circ$  angle in the right triangle.

This is the length of the hypotenuse in the right triangle.

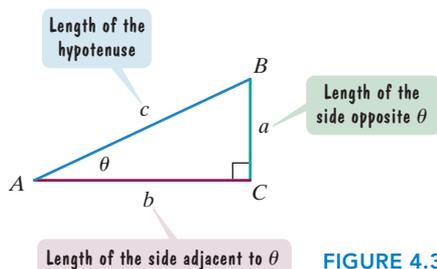

FIGURE 4.30

In solving certain kinds of problems, it is helpful to interpret trigonometric functions in right triangles, where angles are limited to acute angles. **Figure 4.30** shows a right triangle with one of its acute angles labeled  $\theta$ . The side opposite the right angle, the hypotenuse, has length  $c$ . The other sides of the triangle are described by their position relative to the acute angle  $\theta$ . One side is opposite  $\theta$ . The length of this side is  $a$ . One side is adjacent to  $\theta$ . The length of this side is  $b$ .

### Right Triangle Definitions of Trigonometric Functions

See **Figure 4.30**. The six trigonometric functions of the acute angle  $\theta$  are defined as follows:

$$\sin \theta = \frac{\text{length of side opposite angle } \theta}{\text{length of hypotenuse}} = \frac{a}{c}$$

$$\csc \theta = \frac{\text{length of hypotenuse}}{\text{length of side opposite angle } \theta} = \frac{c}{a}$$

$$\cos \theta = \frac{\text{length of side adjacent to angle } \theta}{\text{length of hypotenuse}} = \frac{b}{c}$$

$$\sec \theta = \frac{\text{length of hypotenuse}}{\text{length of side adjacent to angle } \theta} = \frac{c}{b}$$

$$\tan \theta = \frac{\text{length of side opposite angle } \theta}{\text{length of side adjacent to angle } \theta} = \frac{a}{b}$$

$$\cot \theta = \frac{\text{length of side adjacent to angle } \theta}{\text{length of side opposite angle } \theta} = \frac{b}{a}$$

Each of the trigonometric functions of the acute angle  $\theta$  is positive. Observe that the ratios in the second column in the box are the reciprocals of the corresponding ratios in the first column.

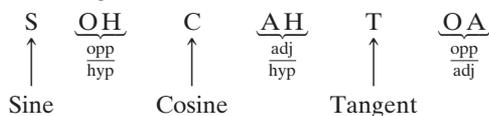

### GREAT QUESTION!

Is there a way to help me remember the right triangle definitions of any of the trigonometric functions?

The word

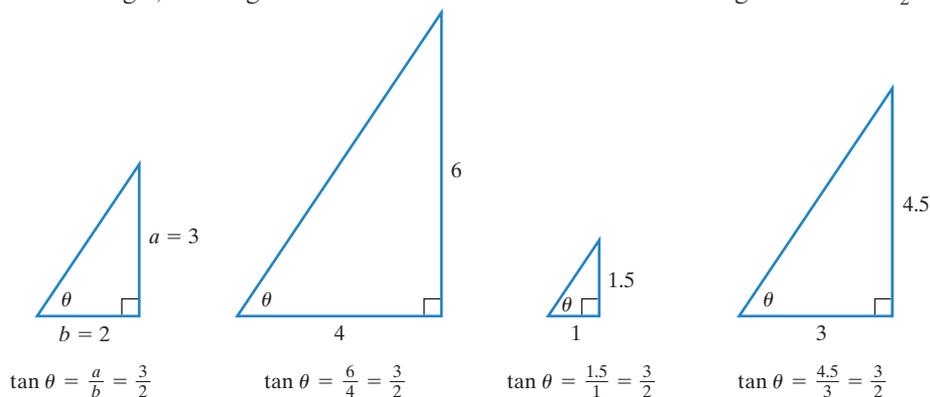

SOHCAHTOA (pronounced: so-cah-tow-ah)

may be helpful in remembering the definitions for sine, cosine, and tangent.

“Some Old Hog Came Around Here and Took Our Apples.”

**Figure 4.31** shows four right triangles of varying sizes. In each of the triangles,  $\theta$  is the same acute angle, measuring approximately  $56.3^\circ$ . All four of these similar triangles have the same shape and the lengths of corresponding sides are in the same ratio. In each triangle, the tangent function has the same value for the angle  $\theta$ :  $\tan \theta = \frac{3}{2}$ .

**FIGURE 4.31** A particular acute angle always gives the same ratio of opposite to adjacent sides.

In general, **the trigonometric function values of  $\theta$  depend only on the size of angle  $\theta$  and not on the size of the triangle.**

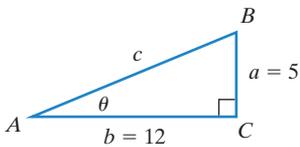

FIGURE 4.32

**EXAMPLE 1** Evaluating Trigonometric FunctionsFind the value of each of the six trigonometric functions of  $\theta$  in **Figure 4.32**.**SOLUTION**

We need to find the values of the six trigonometric functions of  $\theta$ . However, we must know the lengths of all three sides of the triangle ( $a$ ,  $b$ , and  $c$ ) to evaluate all six functions. The values of  $a$  and  $b$  are given. We can use the Pythagorean Theorem,  $c^2 = a^2 + b^2$ , to find  $c$ .

$$\begin{aligned} c^2 &= a^2 + b^2 = 5^2 + 12^2 = 25 + 144 = 169 \\ c &= \sqrt{169} = 13 \end{aligned}$$

Now that we know the lengths of the three sides of the triangle, we apply the definitions of the six trigonometric functions of  $\theta$ . Referring to these lengths as opposite, adjacent, and hypotenuse, we have

$$\sin \theta = \frac{\text{opposite}}{\text{hypotenuse}} = \frac{5}{13} \qquad \csc \theta = \frac{\text{hypotenuse}}{\text{opposite}} = \frac{13}{5}$$

$$\cos \theta = \frac{\text{adjacent}}{\text{hypotenuse}} = \frac{12}{13} \qquad \sec \theta = \frac{\text{hypotenuse}}{\text{adjacent}} = \frac{13}{12}$$

$$\tan \theta = \frac{\text{opposite}}{\text{adjacent}} = \frac{5}{12} \qquad \cot \theta = \frac{\text{adjacent}}{\text{opposite}} = \frac{12}{5} \quad \dots$$

**GREAT QUESTION!**

**Do I have to use the definitions of the trigonometric functions to get the function values shown in the second column?**

No. The function values in the second column are reciprocals of those in the first column. You can obtain each of these values by interchanging the numerator and denominator of the corresponding ratio in the first column.

 **Check Point 1** Find the value of each of the six trigonometric functions of  $\theta$  in the figure.

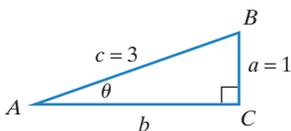

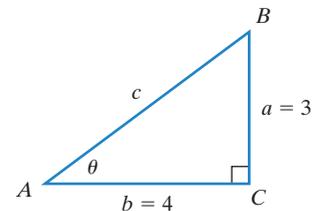

FIGURE 4.33

**EXAMPLE 2** Evaluating Trigonometric FunctionsFind the value of each of the six trigonometric functions of  $\theta$  in **Figure 4.33**.**SOLUTION**We begin by finding  $b$ .

$$a^2 + b^2 = c^2$$

Use the Pythagorean Theorem.

$$1^2 + b^2 = 3^2$$

Figure 4.33 shows that  $a = 1$  and  $c = 3$ .

$$1 + b^2 = 9$$

 $1^2 = 1$  and  $3^2 = 9$ .

$$b^2 = 8$$

Subtract 1 from both sides.

$$b = \sqrt{8} = 2\sqrt{2}$$

Take the principal square root and simplify:

$$\sqrt{8} = \sqrt{4 \cdot 2} = \sqrt{4}\sqrt{2} = 2\sqrt{2}.$$

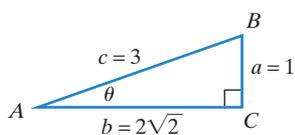

FIGURE 4.33 (repeated, showing  $b = 2\sqrt{2}$ )

Now that we know the lengths of the three sides of the triangle, we apply the definitions of the six trigonometric functions of  $\theta$ .

$$\sin \theta = \frac{\text{opposite}}{\text{hypotenuse}} = \frac{1}{3}$$

$$\csc \theta = \frac{\text{hypotenuse}}{\text{opposite}} = \frac{3}{1} = 3$$

$$\cos \theta = \frac{\text{adjacent}}{\text{hypotenuse}} = \frac{2\sqrt{2}}{3}$$

$$\sec \theta = \frac{\text{hypotenuse}}{\text{adjacent}} = \frac{3}{2\sqrt{2}}$$

$$\tan \theta = \frac{\text{opposite}}{\text{adjacent}} = \frac{1}{2\sqrt{2}}$$

$$\cot \theta = \frac{\text{adjacent}}{\text{opposite}} = \frac{2\sqrt{2}}{1} = 2\sqrt{2}$$

Because fractional expressions are usually written without radicals in the denominators, we simplify the values of  $\tan \theta$  and  $\sec \theta$  by rationalizing the denominators:

$$\tan \theta = \frac{1}{2\sqrt{2}} = \frac{1}{2\sqrt{2}} \cdot \frac{\sqrt{2}}{\sqrt{2}} = \frac{\sqrt{2}}{2 \cdot 2} = \frac{\sqrt{2}}{4}$$

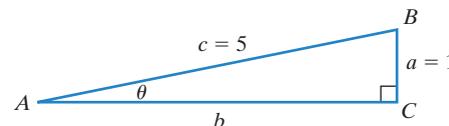

$$\sec \theta = \frac{3}{2\sqrt{2}} = \frac{3}{2\sqrt{2}} \cdot \frac{\sqrt{2}}{\sqrt{2}} = \frac{3\sqrt{2}}{2 \cdot 2} = \frac{3\sqrt{2}}{4}$$

We are multiplying by 1 and not changing the value of  $\frac{1}{2\sqrt{2}}$ .

We are multiplying by 1 and not changing the value of  $\frac{3}{2\sqrt{2}}$ .

...

 **Check Point 2** Find the value of each of the six trigonometric functions of  $\theta$  in the figure. Express each value in simplified form.

- 2 Find function values for  $30^\circ\left(\frac{\pi}{6}\right)$ ,  $45^\circ\left(\frac{\pi}{4}\right)$ , and  $60^\circ\left(\frac{\pi}{3}\right)$ .

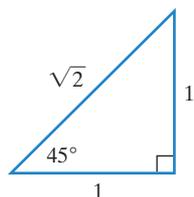

FIGURE 4.34 An isosceles right triangle

### Function Values for Some Special Angles

In Section 4.2, we used the unit circle to find values of the trigonometric functions at  $\frac{\pi}{4}$ . How can we find the values of the trigonometric functions at  $\frac{\pi}{4}$ , or  $45^\circ$ , using a right triangle? We construct a right triangle with a  $45^\circ$  angle, as shown in **Figure 4.34**. The triangle actually has two  $45^\circ$  angles. Thus, the triangle is isosceles—that is, it has two sides of the same length. Assume that each leg of the triangle has a length equal to 1. We can find the length of the hypotenuse using the Pythagorean Theorem.

$$(\text{length of hypotenuse})^2 = 1^2 + 1^2 = 2$$

$$\text{length of hypotenuse} = \sqrt{2}$$

With **Figure 4.34**, we can determine the trigonometric function values for  $45^\circ$ .

### EXAMPLE 3 Evaluating Trigonometric Functions of $45^\circ$

Use **Figure 4.34** to find  $\sin 45^\circ$ ,  $\cos 45^\circ$ , and  $\tan 45^\circ$ .

#### SOLUTION

We apply the definitions of these three trigonometric functions. Where appropriate, we simplify by rationalizing denominators.

$$\sin 45^\circ = \frac{\text{length of side opposite } 45^\circ}{\text{length of hypotenuse}} = \frac{1}{\sqrt{2}} = \frac{1}{\sqrt{2}} \cdot \frac{\sqrt{2}}{\sqrt{2}} = \frac{\sqrt{2}}{2}$$

Rationalize denominators.

$$\cos 45^\circ = \frac{\text{length of side adjacent to } 45^\circ}{\text{length of hypotenuse}} = \frac{1}{\sqrt{2}} = \frac{1}{\sqrt{2}} \cdot \frac{\sqrt{2}}{\sqrt{2}} = \frac{\sqrt{2}}{2}$$

$$\tan 45^\circ = \frac{\text{length of side opposite } 45^\circ}{\text{length of side adjacent to } 45^\circ} = \frac{1}{1} = 1$$

...

 **Check Point 3** Use **Figure 4.34** to find  $\csc 45^\circ$ ,  $\sec 45^\circ$ , and  $\cot 45^\circ$ .

When you worked Check Point 3, did you actually use **Figure 4.34** or did you use reciprocals to find the values?

### GREAT QUESTION!

**Can I use my calculator to evaluate trigonometric functions and skip this part of the section?**

No. In the last section, you learned that calculators provide *approximate* values of the trigonometric functions for most angles. The function values obtained in this part of the section are exact. When these exact values are irrational numbers, they cannot be obtained with a calculator.

$$\csc 45^\circ = \sqrt{2}$$

Take the reciprocal  
of  $\sin 45^\circ = \frac{1}{\sqrt{2}}$ .

$$\sec 45^\circ = \sqrt{2}$$

Take the reciprocal  
of  $\cos 45^\circ = \frac{1}{\sqrt{2}}$ .

$$\cot 45^\circ = 1$$

Take the reciprocal  
of  $\tan 45^\circ = \frac{1}{1}$ .

Notice that if you use reciprocals, you should take the reciprocal of a function value before the denominator is rationalized. In this way, the reciprocal value will not contain a radical in the denominator.

Two other angles that occur frequently in trigonometry are  $30^\circ$ , or  $\frac{\pi}{6}$  radian, and  $60^\circ$ , or  $\frac{\pi}{3}$  radian, angles. We can find the values of the trigonometric functions of  $30^\circ$  and  $60^\circ$  by using a right triangle. To form this right triangle, draw an equilateral triangle—that is, a triangle with all sides the same length. Assume that each side has a length equal to 2. Now take half of the equilateral triangle. We obtain the right triangle in **Figure 4.35**. This right triangle has a hypotenuse of length 2 and a leg of length 1. The other leg has length  $a$ , which can be found using the Pythagorean Theorem.

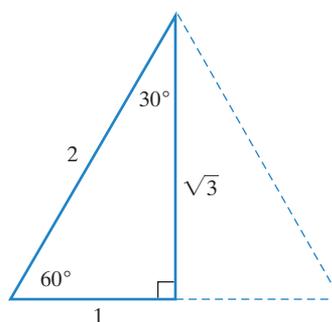

$$a^2 + 1^2 = 2^2$$

$$a^2 + 1 = 4$$

$$a^2 = 3$$

$$a = \sqrt{3}$$

With the right triangle in **Figure 4.35**, we can determine the trigonometric functions for  $30^\circ$  and  $60^\circ$ .

**FIGURE 4.35**  $30^\circ$ – $60^\circ$ – $90^\circ$  triangle

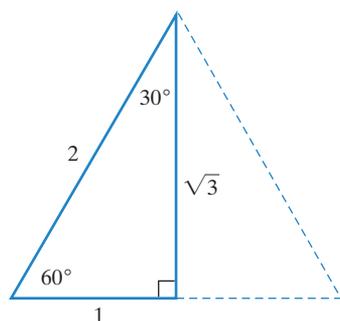

FIGURE 4.35 30°–60°–90° triangle (repeated)

#### EXAMPLE 4 Evaluating Trigonometric Functions of 30° and 60°

Use **Figure 4.35** to find  $\sin 60^\circ$ ,  $\cos 60^\circ$ ,  $\sin 30^\circ$ , and  $\cos 30^\circ$ .

#### SOLUTION

We begin with  $60^\circ$ . Use the angle on the lower left in **Figure 4.35**.

$$\sin 60^\circ = \frac{\text{length of side opposite } 60^\circ}{\text{length of hypotenuse}} = \frac{\sqrt{3}}{2}$$

$$\cos 60^\circ = \frac{\text{length of side adjacent to } 60^\circ}{\text{length of hypotenuse}} = \frac{1}{2}$$

To find  $\sin 30^\circ$  and  $\cos 30^\circ$ , use the angle on the upper right in **Figure 4.35**.

$$\sin 30^\circ = \frac{\text{length of side opposite } 30^\circ}{\text{length of hypotenuse}} = \frac{1}{2}$$

$$\cos 30^\circ = \frac{\text{length of side adjacent to } 30^\circ}{\text{length of hypotenuse}} = \frac{\sqrt{3}}{2}$$

 **Check Point 4** Use **Figure 4.35** to find  $\tan 60^\circ$  and  $\tan 30^\circ$ . If a radical appears in a denominator, rationalize the denominator.

Because we will often use the function values of  $30^\circ$ ,  $45^\circ$ , and  $60^\circ$ , you should learn to construct the right triangles in **Figure 4.34**, shown on page 526, and **Figure 4.35**, shown above. With sufficient practice, you will memorize the values in **Table 4.2**.

Table 4.2 Trigonometric Functions of Special Angles

$\theta$	$30^\circ = \frac{\pi}{6}$	$45^\circ = \frac{\pi}{4}$	$60^\circ = \frac{\pi}{3}$
$\sin \theta$	$\frac{1}{2}$	$\frac{\sqrt{2}}{2}$	$\frac{\sqrt{3}}{2}$
$\cos \theta$	$\frac{\sqrt{3}}{2}$	$\frac{\sqrt{2}}{2}$	$\frac{1}{2}$
$\tan \theta$	$\frac{\sqrt{3}}{3}$	1	$\sqrt{3}$

**3** Use equal cofunctions of complements.

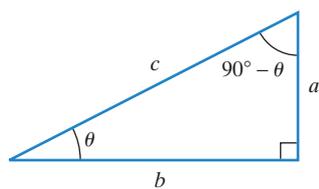

FIGURE 4.36

#### Trigonometric Functions and Complements

Two positive angles are **complements** if their sum is  $90^\circ$  or  $\frac{\pi}{2}$ . For example, angles of  $70^\circ$  and  $20^\circ$  are complements because  $70^\circ + 20^\circ = 90^\circ$ .

In Section 4.2, we used the unit circle to establish fundamental trigonometric identities. Another relationship among trigonometric functions is based on angles that are complements. Refer to **Figure 4.36**. Because the sum of the angles of any triangle is  $180^\circ$ , in a right triangle the sum of the acute angles is  $90^\circ$ . Thus, the acute angles are complements. If the degree measure of one acute angle is  $\theta$ , then the degree measure of the other acute angle is  $(90^\circ - \theta)$ . This angle is shown on the upper right in **Figure 4.36**.

Let's use **Figure 4.36** to compare  $\sin \theta$  and  $\cos(90^\circ - \theta)$ .

$$\sin \theta = \frac{\text{length of side opposite } \theta}{\text{length of hypotenuse}} = \frac{a}{c}$$

$$\cos(90^\circ - \theta) = \frac{\text{length of side adjacent to } (90^\circ - \theta)}{\text{length of hypotenuse}} = \frac{a}{c}$$

Thus,  $\sin \theta = \cos(90^\circ - \theta)$ .

Because  $\sin \theta = \cos(90^\circ - \theta)$ , if two angles are complements, the sine of one equals the cosine of the other. Because of this relationship, the sine and cosine are called *cofunctions* of each other. The name *cosine* is a shortened form of the phrase *complement's sine*.

Any pair of trigonometric functions  $f$  and  $g$  for which

$$f(\theta) = g(90^\circ - \theta) \quad \text{and} \quad g(\theta) = f(90^\circ - \theta)$$

are called **cofunctions**. Using **Figure 4.36**, we can show that the tangent and cotangent are also cofunctions of each other. So are the secant and cosecant.

### Cofunction Identities

The value of a trigonometric function of  $\theta$  is equal to the cofunction of the complement of  $\theta$ . Cofunctions of complementary angles are equal.

$$\begin{array}{ll} \sin \theta = \cos(90^\circ - \theta) & \cos \theta = \sin(90^\circ - \theta) \\ \tan \theta = \cot(90^\circ - \theta) & \cot \theta = \tan(90^\circ - \theta) \\ \sec \theta = \csc(90^\circ - \theta) & \csc \theta = \sec(90^\circ - \theta) \end{array}$$

If  $\theta$  is in radians, replace  $90^\circ$  with  $\frac{\pi}{2}$ .

### EXAMPLE 5 Using Cofunction Identities

Find a cofunction with the same value as the given expression:

a.  $\sin 72^\circ$       b.  $\csc \frac{\pi}{3}$ .

### SOLUTION

Because the value of a trigonometric function of  $\theta$  is equal to the cofunction of the complement of  $\theta$ , we need to find the complement of each angle. We do this by subtracting the angle's measure from  $90^\circ$  or its radian equivalent,  $\frac{\pi}{2}$ .

a.  $\sin 72^\circ = \cos(90^\circ - 72^\circ) = \cos 18^\circ$

We have a function and its cofunction.

b.  $\csc \frac{\pi}{3} = \sec\left(\frac{\pi}{2} - \frac{\pi}{3}\right) = \sec\left(\frac{3\pi}{6} - \frac{2\pi}{6}\right) = \sec \frac{\pi}{6}$

We have a cofunction and its function.

Perform the subtraction using the least common denominator, 6.

...

 **Check Point 5** Find a cofunction with the same value as the given expression:

a.  $\sin 46^\circ$       b.  $\cot \frac{\pi}{12}$ .

- 4 Use right triangle trigonometry to solve applied problems.

### Applications

Many applications of right triangle trigonometry involve the angle made with an imaginary horizontal line. As shown in **Figure 4.37**, an angle formed by a horizontal line and the line of sight to an object that is above the horizontal line is called the **angle of elevation**. The angle formed by a horizontal line and the line of sight to an object that is below the horizontal line is called the **angle of depression**. Transits and sextants are instruments used to measure such angles.

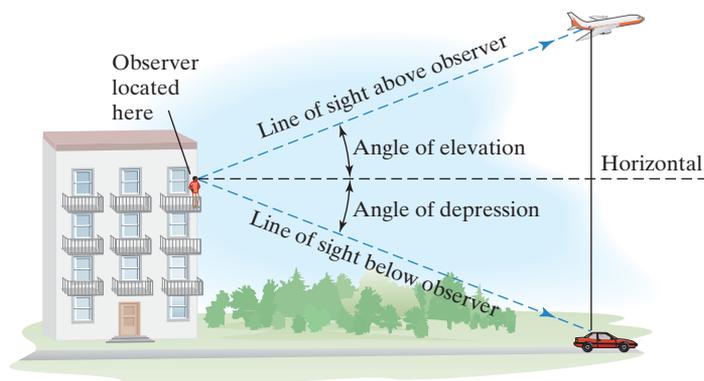

FIGURE 4.37

#### EXAMPLE 6 Problem Solving Using an Angle of Elevation

Sighting the top of a building, a surveyor measured the angle of elevation to be  $22^\circ$ . The transit is 5 feet above the ground and 300 feet from the building. Find the building's height.

#### SOLUTION

The situation is illustrated in **Figure 4.38**. Let  $a$  be the height of the portion of the building that lies above the transit. The height of the building is the transit's height, 5 feet, plus  $a$ . Thus, we need to identify a trigonometric function that will make it possible to find  $a$ . In terms of the  $22^\circ$  angle, we are looking for the side opposite the angle. The transit is 300 feet from the building, so the side adjacent to the  $22^\circ$  angle is 300 feet. Because we have a known angle, an unknown opposite side, and a known adjacent side, we select the tangent function.

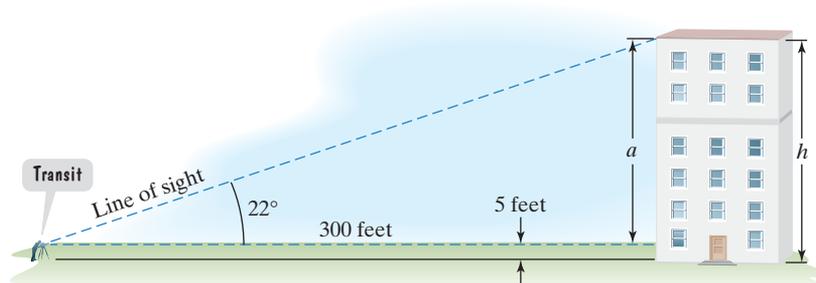

FIGURE 4.38

$$\tan 22^\circ = \frac{a}{300}$$

Length of side opposite the  $22^\circ$  angle
Length of side adjacent to the  $22^\circ$  angle

$$a = 300 \tan 22^\circ$$

Multiply both sides of the equation by 300.

$$a \approx 121$$

Use a calculator in the degree mode.

The height of the part of the building above the transit is approximately 121 feet. Thus, the height of the building is determined by adding the transit's height, 5 feet, to 121 feet.

$$h \approx 5 + 121 = 126$$

The building's height is approximately 126 feet. ...

 **Check Point 6** The irregular blue shape in **Figure 4.39** represents a lake. The distance across the lake,  $a$ , is unknown. To find this distance, a surveyor took the measurements shown in the figure. What is the distance across the lake?

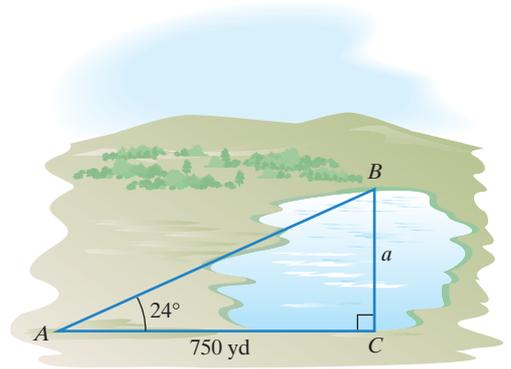

FIGURE 4.39

If two sides of a right triangle are known, an appropriate trigonometric function can be used to find an acute angle  $\theta$  in the triangle. You will also need to use an inverse trigonometric key on a calculator. These keys use a function value to display the acute angle  $\theta$ . For example, suppose that  $\sin \theta = 0.866$ . We can find  $\theta$  in the degree mode by using the secondary *inverse sine* key, usually labelled  $\boxed{\text{SIN}^{-1}}$ . The key  $\boxed{\text{SIN}^{-1}}$  is not a button you will actually press. It is the secondary function for the button labeled  $\boxed{\text{SIN}}$ .

**Many Scientific Calculators:**.866  $\boxed{2\text{nd}}$   $\boxed{\text{SIN}}$ 

Pressing  $\boxed{2\text{nd}}$   $\boxed{\text{SIN}}$  accesses the inverse sine key,  $\boxed{\text{SIN}^{-1}}$ .

**Many Graphing Calculators:** $\boxed{2\text{nd}}$   $\boxed{\text{SIN}}$  .866  $\boxed{\text{ENTER}}$ 

The display should show approximately 59.997, which can be rounded to 60. Thus, if  $\sin \theta = 0.866$ , then  $\theta \approx 60^\circ$ .

**EXAMPLE 7** Determining the Angle of Elevation

A building that is 21 meters tall casts a shadow 25 meters long. Find the angle of elevation of the sun to the nearest degree.

**SOLUTION**

The situation is illustrated in **Figure 4.40**. We are asked to find  $\theta$ .

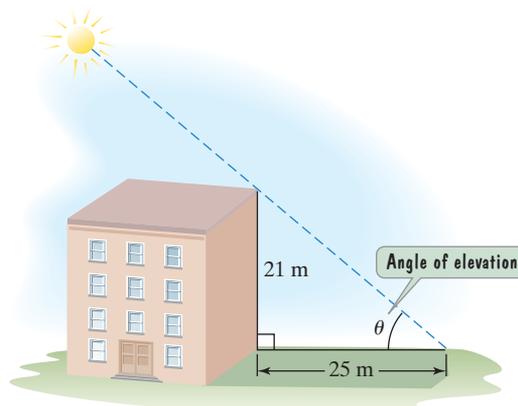

FIGURE 4.40

We begin with the tangent function.

$$\tan \theta = \frac{\text{side opposite } \theta}{\text{side adjacent to } \theta} = \frac{21}{25}$$

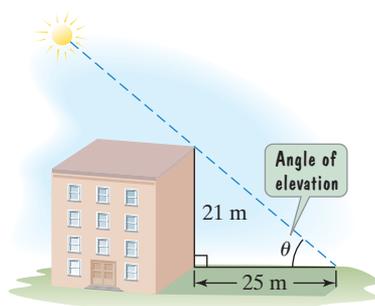

FIGURE 4.40 (repeated)

We use  $\tan \theta = \frac{21}{25}$  and a calculator in the degree mode to find  $\theta$ .

#### Many Scientific Calculators:

$$\left( \left[ 21 \div 25 \right] \left[ 2\text{nd} \right] \left[ \text{TAN} \right] \right)$$

Pressing  $\left[ 2\text{nd} \right] \left[ \text{TAN} \right]$  accesses the inverse tangent key,  $\left[ \text{TAN}^{-1} \right]$ .

#### Many Graphing Calculators:

$$\left[ 2\text{nd} \right] \left[ \text{TAN} \right] \left( \left[ 21 \div 25 \right] \right) \left[ \text{ENTER} \right]$$

The display should show approximately 40. Thus, the angle of elevation of the sun is approximately  $40^\circ$ . ...

**Check Point 7** A flagpole that is 14 meters tall casts a shadow 10 meters long. Find the angle of elevation of the sun to the nearest degree.

### Blitzer Bonus || The Mountain Man

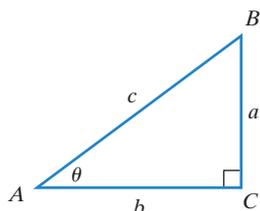

In the 1930s, a *National Geographic* team headed by Brad Washburn used trigonometry to create a map of the 5000-square-mile region of the Yukon, near the Canadian border. The team started with aerial photography. By drawing a network of angles on the photographs, the approximate locations of the major mountains and their rough heights were determined. The expedition then spent three months on foot to find the exact heights. Team members established two base points a known distance apart, one directly under the mountain's peak. By measuring the angle of elevation from one of the base points to the peak, the tangent function was used to determine the peak's height. The Yukon expedition was a major advance in the way maps are made.

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

1. Using lengths  $a$ ,  $b$ , and  $c$  in the right triangle shown, the trigonometric functions of  $\theta$  are defined as follows:

$$\sin \theta = \frac{\quad}{\quad} \quad \csc \theta = \frac{\quad}{\quad}$$

$$\cos \theta = \frac{\quad}{\quad} \quad \sec \theta = \frac{\quad}{\quad}$$

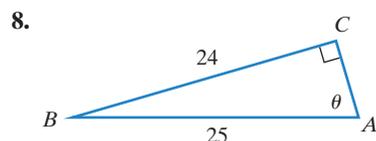

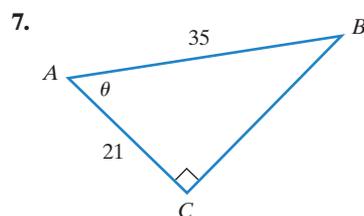

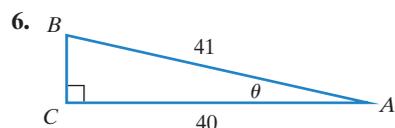

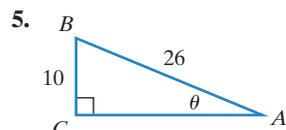

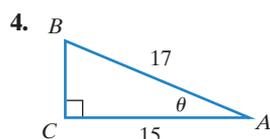

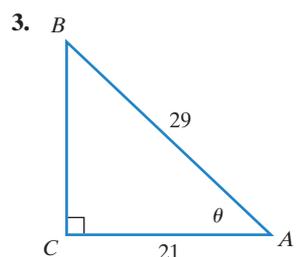

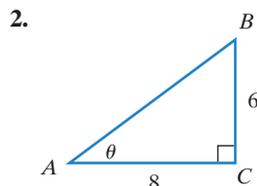

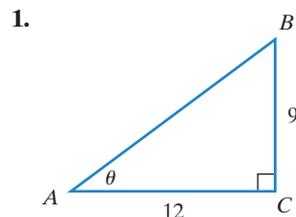

$$\tan \theta = \frac{\quad}{\quad} \quad \cot \theta = \frac{\quad}{\quad}$$

2. Using the definitions in Exercise 1, we refer to  $a$  as the length of the side \_\_\_\_\_ angle  $\theta$ ,  $b$  as the length of the side \_\_\_\_\_ angle  $\theta$ , and  $c$  as the length of the \_\_\_\_\_.
3. True or false: The trigonometric functions of  $\theta$  in Exercise 1 depend only on the size of  $\theta$  and not on the size of the triangle. \_\_\_\_\_
4. According to the cofunction identities,  
 $\cos(90^\circ - \theta) = \underline{\hspace{2cm}}$ ,  $\cot(90^\circ - \theta) = \underline{\hspace{2cm}}$ ,  
 and  $\csc(90^\circ - \theta) = \underline{\hspace{2cm}}$ .

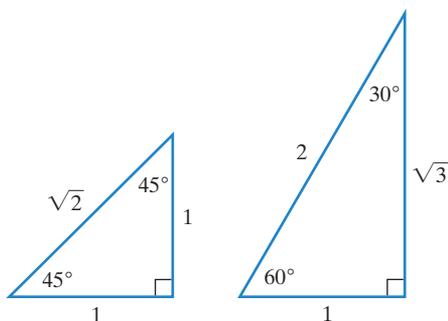

## EXERCISE SET 4.3

## Practice Exercises

In Exercises 1–8, use the Pythagorean Theorem to find the length of the missing side of each right triangle. Then find the value of each of the six trigonometric functions of  $\theta$ .

In Exercises 9–20, use the given triangles to evaluate each expression. If necessary, express the value without a square root in the denominator by rationalizing the denominator.

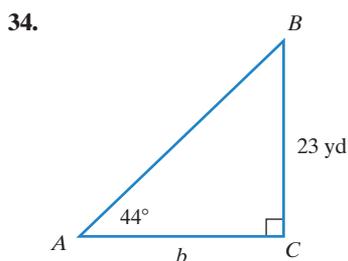

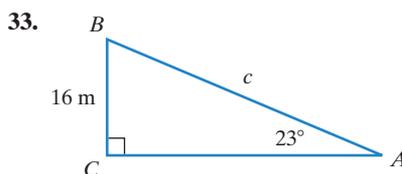

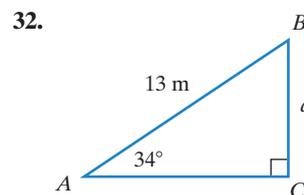

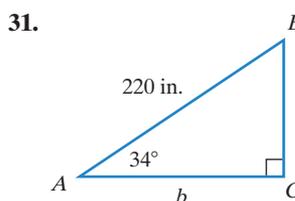

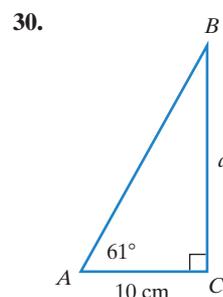

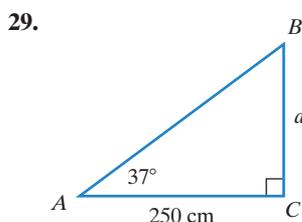

9.  $\cos 30^\circ$
10.  $\tan 30^\circ$
11.  $\sec 45^\circ$
12.  $\csc 45^\circ$
13.  $\tan \frac{\pi}{3}$
14.  $\cot \frac{\pi}{3}$
15.  $\sin \frac{\pi}{4} - \cos \frac{\pi}{4}$
16.  $\tan \frac{\pi}{4} + \csc \frac{\pi}{6}$
17.  $\sin \frac{\pi}{3} \cos \frac{\pi}{4} - \tan \frac{\pi}{4}$
18.  $\cos \frac{\pi}{3} \sec \frac{\pi}{3} - \cot \frac{\pi}{3}$
19.  $2 \tan \frac{\pi}{3} + \cos \frac{\pi}{4} \tan \frac{\pi}{6}$
20.  $6 \tan \frac{\pi}{4} + \sin \frac{\pi}{3} \sec \frac{\pi}{6}$

In Exercises 21–28, find a cofunction with the same value as the given expression.

21.  $\sin 7^\circ$
22.  $\sin 19^\circ$
23.  $\csc 25^\circ$
24.  $\csc 35^\circ$
25.  $\tan \frac{\pi}{9}$
26.  $\tan \frac{\pi}{7}$
27.  $\cos \frac{2\pi}{5}$
28.  $\cos \frac{3\pi}{8}$

In Exercises 29–34, find the measure of the side of the right triangle whose length is designated by a lowercase letter. Round answers to the nearest whole number.

**534 Chapter 4** Trigonometric Functions

In Exercises 35–38, use a calculator to find the value of the acute angle  $\theta$  to the nearest degree.

35.  $\sin \theta = 0.2974$       36.  $\cos \theta = 0.8771$   
 37.  $\tan \theta = 4.6252$       38.  $\tan \theta = 26.0307$

In Exercises 39–42, use a calculator to find the value of the acute angle  $\theta$  in radians, rounded to three decimal places.

39.  $\cos \theta = 0.4112$       40.  $\sin \theta = 0.9499$   
 41.  $\tan \theta = 0.4169$       42.  $\tan \theta = 0.5117$

**Practice Plus**

In Exercises 43–48, find the exact value of each expression. Do not use a calculator.

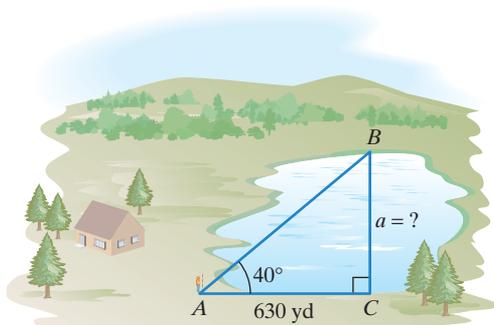

43.  $\frac{\tan \frac{\pi}{3}}{2} - \frac{1}{\sec \frac{\pi}{6}}$   
 44.  $\frac{1}{\cot \frac{\pi}{4}} - \frac{2}{\csc \frac{\pi}{6}}$   
 45.  $1 + \sin^2 40^\circ + \sin^2 50^\circ$   
 46.  $1 - \tan^2 10^\circ + \csc^2 80^\circ$   
 47.  $\csc 37^\circ \sec 53^\circ - \tan 53^\circ \cot 37^\circ$   
 48.  $\cos 12^\circ \sin 78^\circ + \cos 78^\circ \sin 12^\circ$

In Exercises 49–50, express the exact value of each function as a single fraction. Do not use a calculator.

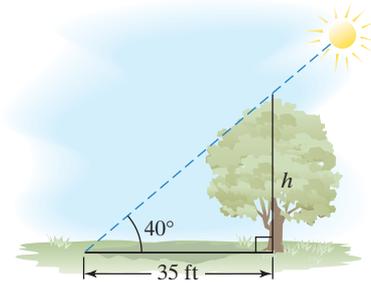

49. If  $f(\theta) = 2 \cos \theta - \cos 2\theta$ , find  $f\left(\frac{\pi}{6}\right)$ .  
 50. If  $f(\theta) = 2 \sin \theta - \sin \frac{\theta}{2}$ , find  $f\left(\frac{\pi}{3}\right)$ .  
 51. If  $\theta$  is an acute angle and  $\cot \theta = \frac{1}{4}$ , find  $\tan\left(\frac{\pi}{2} - \theta\right)$ .  
 52. If  $\theta$  is an acute angle and  $\cos \theta = \frac{1}{3}$ , find  $\csc\left(\frac{\pi}{2} - \theta\right)$ .

**Application Exercises**

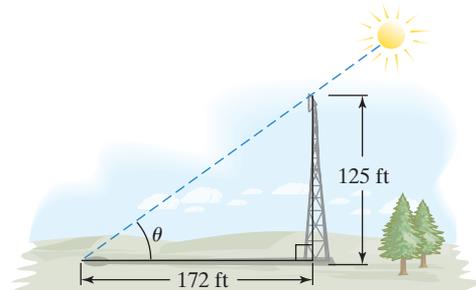

53. To find the distance across a lake, a surveyor took the measurements shown in the figure. Use these measurements to determine how far it is across the lake. Round to the nearest yard.

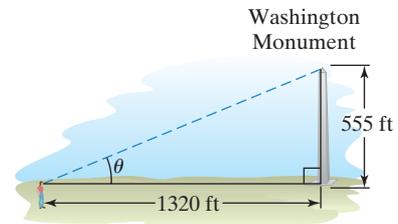

54. At a certain time of day, the angle of elevation of the sun is  $40^\circ$ . To the nearest foot, find the height of a tree whose shadow is 35 feet long.

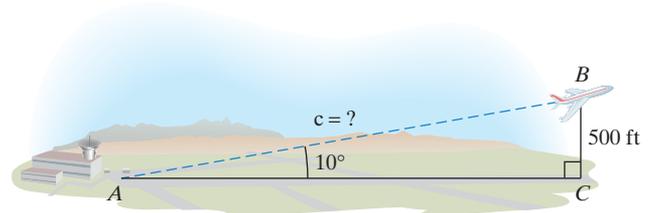

55. A tower that is 125 feet tall casts a shadow 172 feet long. Find the angle of elevation of the sun to the nearest degree.

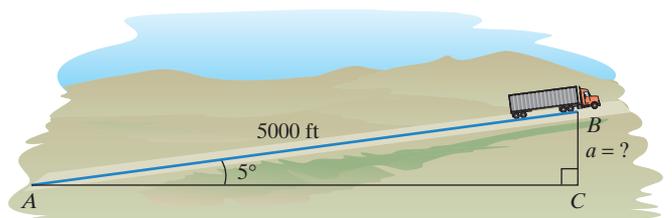

56. The Washington Monument is 555 feet high. If you are standing one quarter of a mile, or 1320 feet, from the base of the monument and looking to the top, find the angle of elevation to the nearest degree.

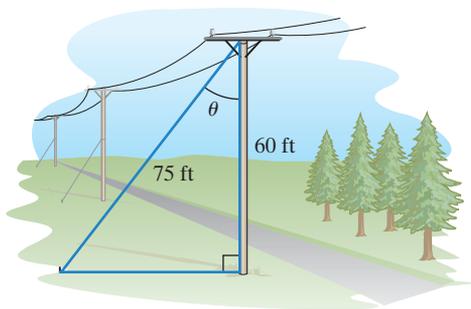

57. A plane rises from take-off and flies at an angle of  $10^\circ$  with the horizontal runway. When it has gained 500 feet, find the distance, to the nearest foot, the plane has flown.

58. A road is inclined at an angle of  $5^\circ$ . After driving 5000 feet along this road, find the driver's increase in altitude. Round to the nearest foot.

59. A telephone pole is 60 feet tall. A guy wire 75 feet long is attached from the ground to the top of the pole. Find the angle between the wire and the pole to the nearest degree.

60. A telephone pole is 55 feet tall. A guy wire 80 feet long is attached from the ground to the top of the pole. Find the angle between the wire and the pole to the nearest degree.

### Writing in Mathematics

- If you are given the lengths of the sides of a right triangle, describe how to find the sine of either acute angle.
- Describe one similarity and one difference between the definitions of  $\sin \theta$  and  $\cos \theta$ , where  $\theta$  is an acute angle of a right triangle.
- Describe the triangle used to find the trigonometric functions of  $45^\circ$ .
- Describe the triangle used to find the trigonometric functions of  $30^\circ$  and  $60^\circ$ .
- Describe a relationship among trigonometric functions that is based on angles that are complements.
- Describe what is meant by an angle of elevation and an angle of depression.
- Stonehenge, the famous “stone circle” in England, was built between 2750 B.C. and 1300 B.C. using solid stone blocks weighing over 99,000 pounds each. It required 550 people to pull a single stone up a ramp inclined at a  $9^\circ$  angle. Describe how right triangle trigonometry can be used to determine the distance the 550 workers had to drag a stone in order to raise it to a height of 30 feet.

### Technology Exercises

68. Use a calculator in the radian mode to fill in the values in the following table. Then draw a conclusion about  $\frac{\sin \theta}{\theta}$  as  $\theta$  approaches 0.

$\theta$	0.4	0.3	0.2	0.1	0.01	0.001	0.0001	0.00001
$\sin \theta$								
$\frac{\sin \theta}{\theta}$								

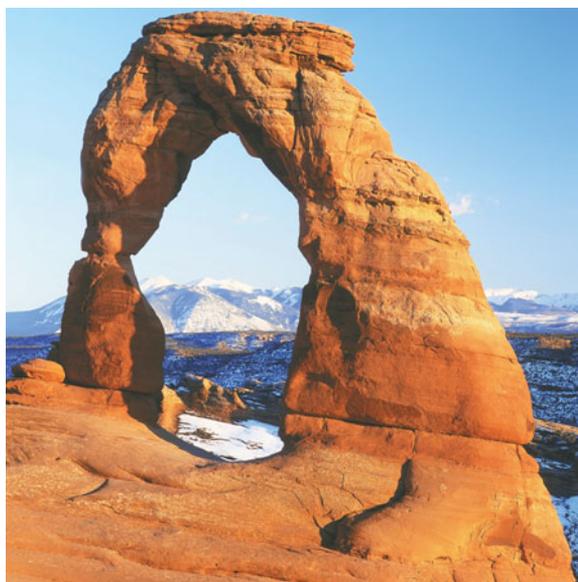

69. Use a calculator in the radian mode to fill in the values in the following table. Then draw a conclusion about  $\frac{\cos \theta - 1}{\theta}$  as  $\theta$  approaches 0.

$\theta$	0.4	0.3	0.2	0.1	0.01	0.001	0.0001	0.00001
$\cos \theta$								
$\frac{\cos \theta - 1}{\theta}$								

### Critical Thinking Exercises

**Make Sense?** In Exercises 70–73, determine whether each statement makes sense or does not make sense, and explain your reasoning.

- For a given angle  $\theta$ , I found a slight increase in  $\sin \theta$  as the size of the triangle increased.
- Although I can use an isosceles right triangle to determine the exact value of  $\sin \frac{\pi}{4}$ , I can also use my calculator to obtain this value.
- The sine and cosine are cofunctions and reciprocals of each other.
- Standing under this arch, I can determine its height by measuring the angle of elevation to the top of the arch and my distance to a point directly under the arch.

Delicate Arch in Arches National Park, Utah

In Exercises 74–77, determine whether each statement is true or false. If the statement is false, make the necessary change(s) to produce a true statement.

74.  $\frac{\tan 45^\circ}{\tan 15^\circ} = \tan 3^\circ$

75.  $\tan^2 15^\circ - \sec^2 15^\circ = -1$

76.  $\sin 45^\circ + \cos 45^\circ = 1$

77.  $\tan^2 5^\circ = \tan 25^\circ$

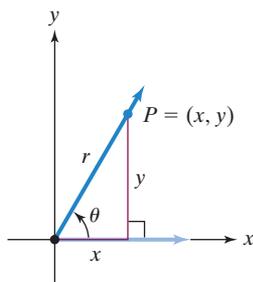

78. Explain why the sine or cosine of an acute angle cannot be greater than or equal to 1.

79. Describe what happens to the tangent of an acute angle as the angle gets close to  $90^\circ$ . What happens at  $90^\circ$ ?

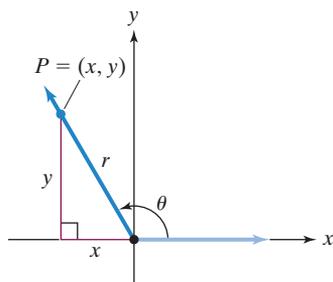

80. From the top of a 250-foot lighthouse, a plane is sighted overhead and a ship is observed directly below the plane. The angle of elevation of the plane is  $22^\circ$  and the angle of depression of the ship is  $35^\circ$ . Find **a.** the distance of the ship from the lighthouse; **b.** the plane's height above the water. Round to the nearest foot.

### Preview Exercises

Exercises 81–83 will help you prepare for the material covered in the next section. Use these figures to solve Exercises 81–82.

(a)  $\theta$  lies in quadrant I.

(b)  $\theta$  lies in quadrant II.

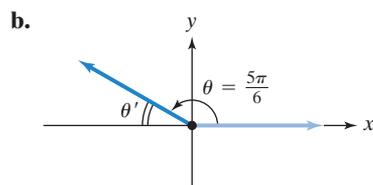

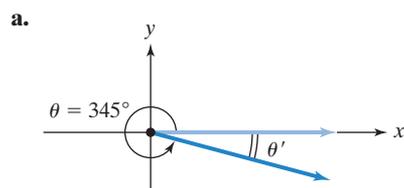

81. **a.** Write a ratio that expresses  $\sin \theta$  for the right triangle in **Figure (a)**.

**b.** Determine the ratio that you wrote in part (a) for **Figure (b)** with  $x = -3$  and  $y = 4$ . Is this ratio positive or negative?

82. **a.** Write a ratio that expresses  $\cos \theta$  for the right triangle in **Figure (a)**.

**b.** Determine the ratio that you wrote in part (a) for **Figure (b)** with  $x = -3$  and  $y = 5$ . Is this ratio positive or negative?

83. Find the positive angle  $\theta'$  formed by the terminal side of  $\theta$  and the  $x$ -axis.

## SECTION 4.4

## Trigonometric Functions of Any Angle

## Objectives

- 1 Use the definitions of trigonometric functions of any angle.
- 2 Use the signs of the trigonometric functions.
- 3 Find reference angles.
- 4 Use reference angles to evaluate trigonometric functions.

Cycles govern many aspects of life—heartbeats, sleep patterns, seasons, and tides all follow regular, predictable cycles. Because of their periodic nature, trigonometric functions are used to model phenomena that occur in cycles. It is helpful to apply these models regardless of whether we think of the domains of trigonometric functions as sets of real numbers or sets of angles. In order to understand and use models for cyclic phenomena from an angle perspective, we need to move beyond right triangles.

## Trigonometric Functions of Any Angle

In the last section, we evaluated trigonometric functions of acute angles, such as that shown in **Figure 4.41(a)**.

Note that this angle is in standard position. The point  $P = (x, y)$  is a point  $r$  units from the origin on the terminal side of  $\theta$ . A right triangle is formed by drawing a line segment from  $P = (x, y)$  perpendicular to the  $x$ -axis. Note that  $y$  is the length of the side opposite  $\theta$  and  $x$  is the length of the side adjacent to  $\theta$ .

- 1 Use the definitions of trigonometric functions of any angle.

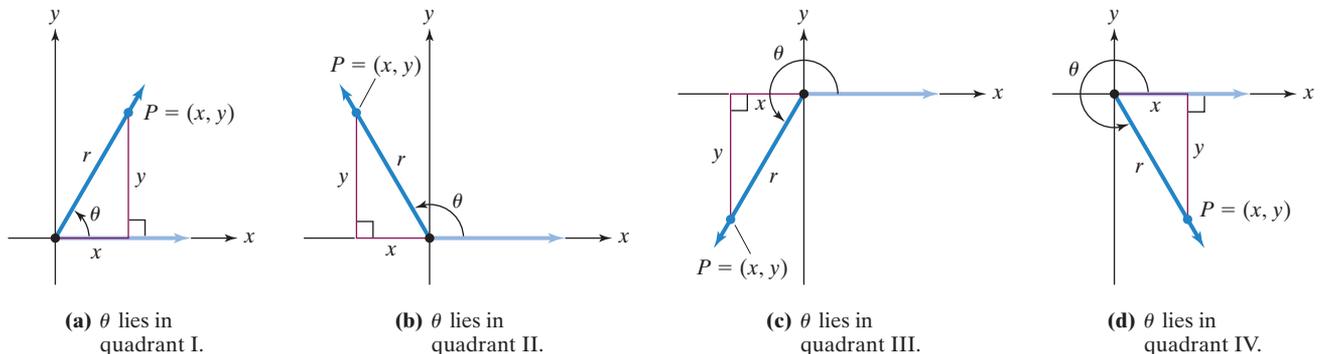

FIGURE 4.41

**Figures 4.41(b), (c), and (d)** show angles in standard position, but they are not acute. We can extend our definitions of the six trigonometric functions to include such angles, as well as quadrantal angles. (Recall that a quadrantal angle has its terminal side on the  $x$ -axis or  $y$ -axis; such angles are *not* shown in **Figure 4.41**.) The point  $P = (x, y)$  may be any point on the terminal side of the angle  $\theta$  other than the origin,  $(0, 0)$ .

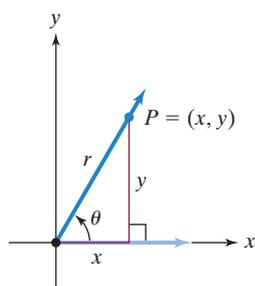

FIGURE 4.41(a)  $\theta$  lies in quadrant I. (repeated)

## GREAT QUESTION!

Is there a way to make it easier for me to remember the definitions of trigonometric functions of any angle?

Yes. If  $\theta$  is acute, we have the right triangle shown in **Figure 4.41(a)**. In this situation, the definitions in the box are the right triangle definitions of the trigonometric functions. This should make it easier for you to remember the six definitions.

## Definitions of Trigonometric Functions of Any Angle

Let  $\theta$  be any angle in standard position and let  $P = (x, y)$  be a point on the terminal side of  $\theta$ . If  $r = \sqrt{x^2 + y^2}$  is the distance from  $(0, 0)$  to  $(x, y)$ , as shown in **Figure 4.41** on the previous page, the **six trigonometric functions of  $\theta$**  are defined by the following ratios:

$$\begin{aligned} \sin \theta &= \frac{y}{r} & \csc \theta &= \frac{r}{y}, y \neq 0 \\ \cos \theta &= \frac{x}{r} & \sec \theta &= \frac{r}{x}, x \neq 0 \\ \tan \theta &= \frac{y}{x}, x \neq 0 & \cot \theta &= \frac{x}{y}, y \neq 0. \end{aligned}$$

The ratios in the second column are the reciprocals of the corresponding ratios in the first column.

Because the point  $P = (x, y)$  is any point on the terminal side of  $\theta$  other than the origin,  $(0, 0)$ ,  $r = \sqrt{x^2 + y^2}$  cannot be zero. Examine the six trigonometric functions defined above. Note that the denominator of the sine and cosine functions is  $r$ . Because  $r \neq 0$ , the sine and cosine functions are defined for any angle  $\theta$ . This is not true for the other four trigonometric functions. Note that the denominator of the tangent and secant functions is  $x$ :  $\tan \theta = \frac{y}{x}$  and  $\sec \theta = \frac{r}{x}$ . These functions are not defined if  $x = 0$ . If the point  $P = (x, y)$  is on the  $y$ -axis, then  $x = 0$ . Thus, the tangent and secant functions are undefined for all quadrantal angles with terminal sides on the positive or negative  $y$ -axis. Likewise, if  $P = (x, y)$  is on the  $x$ -axis, then  $y = 0$ , and the cotangent and cosecant functions are undefined:  $\cot \theta = \frac{x}{y}$  and  $\csc \theta = \frac{r}{y}$ . The cotangent and cosecant functions are undefined for all quadrantal angles with terminal sides on the positive or negative  $x$ -axis.

## EXAMPLE 1 Evaluating Trigonometric Functions

Let  $P = (-3, -5)$  be a point on the terminal side of  $\theta$ . Find each of the six trigonometric functions of  $\theta$ .

### SOLUTION

The situation is shown in **Figure 4.42**. We need values for  $x$ ,  $y$ , and  $r$  to evaluate all six trigonometric functions. We are given the values of  $x$  and  $y$ . Because  $P = (-3, -5)$  is a point on the terminal side of  $\theta$ ,  $x = -3$  and  $y = -5$ . Furthermore,

$$r = \sqrt{x^2 + y^2} = \sqrt{(-3)^2 + (-5)^2} = \sqrt{9 + 25} = \sqrt{34}.$$

Now that we know  $x$ ,  $y$ , and  $r$ , we can find the six trigonometric functions of  $\theta$ . Where appropriate, we will rationalize denominators.

$$\begin{aligned} \sin \theta &= \frac{y}{r} = \frac{-5}{\sqrt{34}} = -\frac{5}{\sqrt{34}} \cdot \frac{\sqrt{34}}{\sqrt{34}} = -\frac{5\sqrt{34}}{34} & \csc \theta &= \frac{r}{y} = \frac{\sqrt{34}}{-5} = -\frac{\sqrt{34}}{5} \\ \cos \theta &= \frac{x}{r} = \frac{-3}{\sqrt{34}} = -\frac{3}{\sqrt{34}} \cdot \frac{\sqrt{34}}{\sqrt{34}} = -\frac{3\sqrt{34}}{34} & \sec \theta &= \frac{r}{x} = \frac{\sqrt{34}}{-3} = -\frac{\sqrt{34}}{3} \\ \tan \theta &= \frac{y}{x} = \frac{-5}{-3} = \frac{5}{3} & \cot \theta &= \frac{x}{y} = \frac{-3}{-5} = \frac{3}{5} \end{aligned}$$

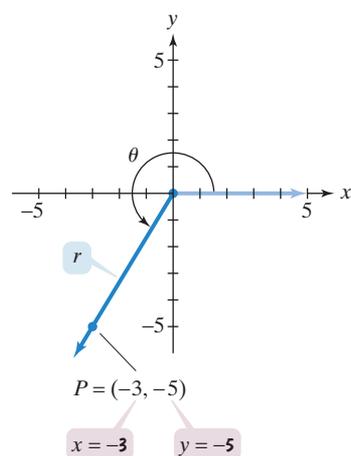

FIGURE 4.42

 **Check Point 1** Let  $P = (1, -3)$  be a point on the terminal side of  $\theta$ . Find each of the six trigonometric functions of  $\theta$ .

How do we find the values of the trigonometric functions for a quadrantal angle? First, draw the angle in standard position. Second, choose a point  $P$  on the angle's terminal side. The trigonometric function values of  $\theta$  depend only on the size of  $\theta$  and not on the distance of point  $P$  from the origin. Thus, we will choose a point that is 1 unit from the origin. Finally, apply the definitions of the appropriate trigonometric functions.

### EXAMPLE 2 Trigonometric Functions of Quadrantal Angles

Evaluate, if possible, the sine function and the tangent function at the following four quadrantal angles:

a.  $\theta = 0^\circ = 0$     b.  $\theta = 90^\circ = \frac{\pi}{2}$     c.  $\theta = 180^\circ = \pi$     d.  $\theta = 270^\circ = \frac{3\pi}{2}$ .

### SOLUTION

- a. If  $\theta = 0^\circ = 0$  radians, then the terminal side of the angle is on the positive  $x$ -axis. Let us select the point  $P = (1, 0)$  with  $x = 1$  and  $y = 0$ . This point is 1 unit from the origin, so  $r = 1$ . **Figure 4.43** shows values of  $x$ ,  $y$ , and  $r$  corresponding to  $\theta = 0^\circ$  or 0 radians. Now that we know  $x$ ,  $y$ , and  $r$ , we can apply the definitions of the sine and tangent functions.

$$\sin 0^\circ = \sin 0 = \frac{y}{r} = \frac{0}{1} = 0$$

$$\tan 0^\circ = \tan 0 = \frac{y}{x} = \frac{0}{1} = 0$$

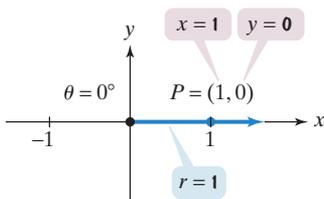

FIGURE 4.43

- b. If  $\theta = 90^\circ = \frac{\pi}{2}$  radians, then the terminal side of the angle is on the positive  $y$ -axis. Let us select the point  $P = (0, 1)$  with  $x = 0$  and  $y = 1$ . This point is 1 unit from the origin, so  $r = 1$ . **Figure 4.44** shows values of  $x$ ,  $y$ , and  $r$  corresponding to  $\theta = 90^\circ$  or  $\frac{\pi}{2}$ . Now that we know  $x$ ,  $y$ , and  $r$ , we can apply the definitions of the sine and tangent functions.

$$\sin 90^\circ = \sin \frac{\pi}{2} = \frac{y}{r} = \frac{1}{1} = 1$$

$$\tan 90^\circ = \tan \frac{\pi}{2} = \frac{y}{x} = \frac{1}{0}$$

Because division by 0 is undefined,  $\tan 90^\circ$  is undefined.

- c. If  $\theta = 180^\circ = \pi$  radians, then the terminal side of the angle is on the negative  $x$ -axis. Let us select the point  $P = (-1, 0)$  with  $x = -1$  and  $y = 0$ . This point is 1 unit from the origin, so  $r = 1$ . **Figure 4.45** shows values of  $x$ ,  $y$ , and  $r$  corresponding to  $\theta = 180^\circ$  or  $\pi$ . Now that we know  $x$ ,  $y$ , and  $r$ , we can apply the definitions of the sine and tangent functions.

$$\sin 180^\circ = \sin \pi = \frac{y}{r} = \frac{0}{1} = 0$$

$$\tan 180^\circ = \tan \pi = \frac{y}{x} = \frac{0}{-1} = 0$$

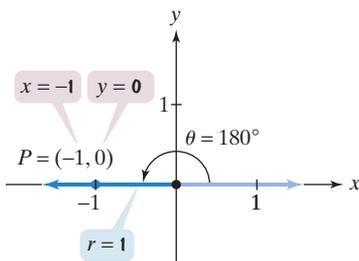

FIGURE 4.45

- d. If  $\theta = 270^\circ = \frac{3\pi}{2}$  radians, then the terminal side of the angle is on the negative  $y$ -axis. Let us select the point  $P = (0, -1)$  with  $x = 0$  and  $y = -1$ . This point is 1 unit from the origin, so  $r = 1$ . **Figure 4.46** shows values of  $x$ ,  $y$ , and  $r$  corresponding to  $\theta = 270^\circ$  or  $\frac{3\pi}{2}$ . Now that we know  $x$ ,  $y$ , and  $r$ , we can apply the definitions of the sine and tangent functions.

$$\sin 270^\circ = \sin \frac{3\pi}{2} = \frac{y}{r} = \frac{-1}{1} = -1$$

$$\tan 270^\circ = \tan \frac{3\pi}{2} = \frac{y}{x} = \frac{-1}{0}$$

### DISCOVERY

Try finding  $\tan 90^\circ$  and  $\tan 270^\circ$  with your calculator. Describe what occurs.

Because division by 0 is undefined,  $\tan 270^\circ$  is undefined.

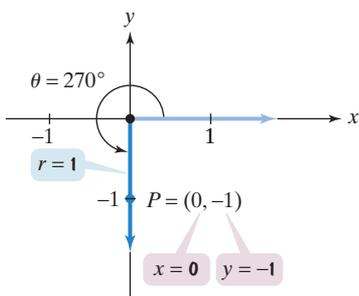

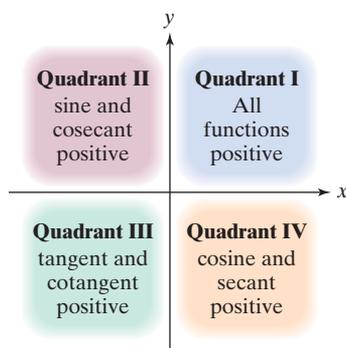

FIGURE 4.46

 **Check Point 2** Evaluate, if possible, the cosine function and the cosecant function at the following four quadrantal angles:

a.  $\theta = 0^\circ = 0$     b.  $\theta = 90^\circ = \frac{\pi}{2}$     c.  $\theta = 180^\circ = \pi$     d.  $\theta = 270^\circ = \frac{3\pi}{2}$ .

**2** Use the signs of the trigonometric functions.

**FIGURE 4.47** The signs of the trigonometric functions

### The Signs of the Trigonometric Functions

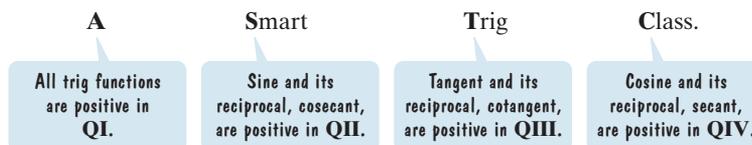

In Example 2, we evaluated trigonometric functions of quadrantal angles. However, we will now return to the trigonometric functions of nonquadrantal angles. **If  $\theta$  is not a quadrantal angle, the sign of a trigonometric function depends on the quadrant in which  $\theta$  lies.** In all four quadrants,  $r$  is positive. However,  $x$  and  $y$  can be positive or negative. For example, if  $\theta$  lies in quadrant II,  $x$  is negative and  $y$  is positive. Thus, the only positive ratios in this quadrant are  $\frac{y}{r}$  and its reciprocal,  $\frac{r}{y}$ . These ratios are the function values for the sine and cosecant, respectively. In short, if  $\theta$  lies in quadrant II,  $\sin \theta$  and  $\csc \theta$  are positive. The other four trigonometric functions are negative.

**Figure 4.47** summarizes the signs of the trigonometric functions. If  $\theta$  lies in quadrant I, all six functions are positive. If  $\theta$  lies in quadrant II, only  $\sin \theta$  and  $\csc \theta$  are positive. If  $\theta$  lies in quadrant III, only  $\tan \theta$  and  $\cot \theta$  are positive. Finally, if  $\theta$  lies in quadrant IV, only  $\cos \theta$  and  $\sec \theta$  are positive. Observe that the positive functions in each quadrant occur in reciprocal pairs.

### GREAT QUESTION!

**Is there a way to remember the signs of the trigonometric functions?**

Here's a phrase that may be helpful:

### EXAMPLE 3 Finding the Quadrant in Which an Angle Lies

If  $\tan \theta < 0$  and  $\cos \theta > 0$ , name the quadrant in which angle  $\theta$  lies.

#### SOLUTION

When  $\tan \theta < 0$ ,  $\theta$  lies in quadrant II or IV. When  $\cos \theta > 0$ ,  $\theta$  lies in quadrant I or IV. When both conditions are met ( $\tan \theta < 0$  and  $\cos \theta > 0$ ),  $\theta$  must lie in quadrant IV. ...

 **Check Point 3** If  $\sin \theta < 0$  and  $\cos \theta < 0$ , name the quadrant in which angle  $\theta$  lies.

### EXAMPLE 4 Evaluating Trigonometric Functions

Given  $\tan \theta = -\frac{2}{3}$  and  $\cos \theta > 0$ , find  $\cos \theta$  and  $\csc \theta$ .

#### SOLUTION

Because the tangent is negative and the cosine is positive,  $\theta$  lies in quadrant IV. This will help us to determine whether the negative sign in  $\tan \theta = -\frac{2}{3}$  should be associated with the numerator or the denominator. Keep in mind that in quadrant IV,  $x$  is positive and  $y$  is negative. Thus,

In quadrant IV,  $y$  is negative.

$$\tan \theta = -\frac{2}{3} = \frac{y}{x} = \frac{-2}{3}.$$

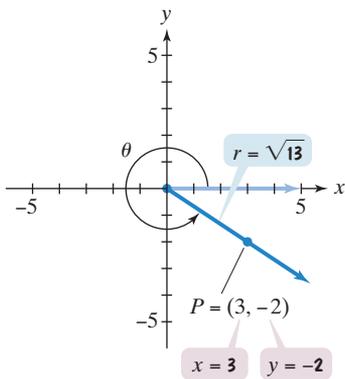

FIGURE 4.48  $\tan \theta = -\frac{2}{3}$  and  $\cos \theta > 0$

(See **Figure 4.48**.) Thus,  $x = 3$  and  $y = -2$ . Furthermore,

$$r = \sqrt{x^2 + y^2} = \sqrt{3^2 + (-2)^2} = \sqrt{9 + 4} = \sqrt{13}.$$

Now that we know  $x$ ,  $y$ , and  $r$ , we can find  $\cos \theta$  and  $\csc \theta$ .

$$\cos \theta = \frac{x}{r} = \frac{3}{\sqrt{13}} = \frac{3}{\sqrt{13}} \cdot \frac{\sqrt{13}}{\sqrt{13}} = \frac{3\sqrt{13}}{13} \quad \csc \theta = \frac{r}{y} = \frac{\sqrt{13}}{-2} = -\frac{\sqrt{13}}{2} \dots$$

**Check Point 4** Given  $\tan \theta = -\frac{1}{3}$  and  $\cos \theta < 0$ , find  $\sin \theta$  and  $\sec \theta$ .

In Example 4, we used the quadrant in which  $\theta$  lies to determine whether a negative sign should be associated with the numerator or the denominator. Here's a situation, similar to Example 4, where negative signs should be associated with *both* the numerator and the denominator:

$$\tan \theta = \frac{3}{5} \quad \text{and} \quad \cos \theta < 0.$$

Because the tangent is positive and the cosine is negative,  $\theta$  lies in quadrant III. In quadrant III,  $x$  is negative and  $y$  is negative. Thus,

$$\tan \theta = \frac{3}{5} = \frac{y}{x} = \frac{-3}{-5}.$$

We see that  $x = -5$   
and  $y = -3$ .

### 3 Find reference angles.

### Reference Angles

We will often evaluate trigonometric functions of positive angles greater than  $90^\circ$  and all negative angles by making use of a positive acute angle. This positive acute angle is called a *reference angle*.

#### Definition of a Reference Angle

Let  $\theta$  be a nonacute angle in standard position that lies in a quadrant. Its **reference angle** is the positive acute angle  $\theta'$  formed by the terminal side of  $\theta$  and the  $x$ -axis.

**Figure 4.49** shows the reference angle for  $\theta$  lying in quadrants II, III, and IV. Notice that the formula used to find  $\theta'$ , the reference angle, varies according to the quadrant in which  $\theta$  lies. You may find it easier to find the reference angle for a given angle by making a figure that shows the angle in standard position. The acute angle formed by the terminal side of this angle and the  $x$ -axis is the reference angle.

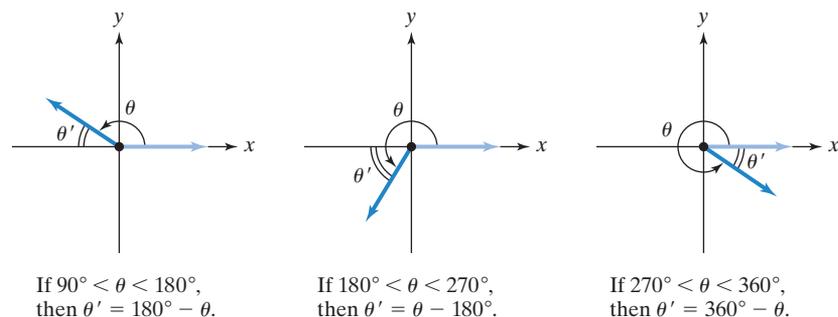

FIGURE 4.49 Reference angles,  $\theta'$ , for positive angles,  $\theta$ , in quadrants II, III, and IV

**EXAMPLE 5** Finding Reference AnglesFind the reference angle,  $\theta'$ , for each of the following angles:

a.  $\theta = 345^\circ$     b.  $\theta = \frac{5\pi}{6}$     c.  $\theta = -135^\circ$     d.  $\theta = 2.5$ .

**SOLUTION**

a. A  $345^\circ$  angle in standard position is shown in **Figure 4.50**. Because  $345^\circ$  lies in quadrant IV, the reference angle is

$$\theta' = 360^\circ - 345^\circ = 15^\circ.$$

b. Because  $\frac{5\pi}{6}$  lies between  $\frac{\pi}{2} = \frac{3\pi}{6}$  and  $\pi = \frac{6\pi}{6}$ ,  $\theta = \frac{5\pi}{6}$  lies in quadrant II. The angle is shown in **Figure 4.51**. The reference angle is

$$\theta' = \pi - \frac{5\pi}{6} = \frac{6\pi}{6} - \frac{5\pi}{6} = \frac{\pi}{6}.$$

c. A  $-135^\circ$  angle in standard position is shown in **Figure 4.52**. The figure indicates that the positive acute angle formed by the terminal side of  $\theta$  and the  $x$ -axis is  $45^\circ$ . The reference angle is

$$\theta' = 45^\circ.$$

d. The angle  $\theta = 2.5$  lies between  $\frac{\pi}{2} \approx 1.57$  and  $\pi \approx 3.14$ . This means that  $\theta = 2.5$  is in quadrant II, shown in **Figure 4.53**. The reference angle is

$$\theta' = \pi - 2.5 \approx 0.64.$$

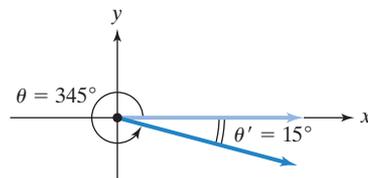

FIGURE 4.50

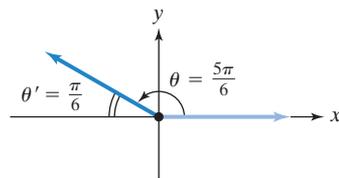

FIGURE 4.51

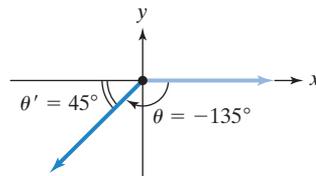

FIGURE 4.52

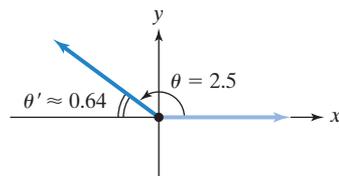

FIGURE 4.53

**DISCOVERY**

Solve part (c) by first finding a positive coterminal angle for  $-135^\circ$  less than  $360^\circ$ . Use the positive coterminal angle to find the reference angle.

 **Check Point 5** Find the reference angle,  $\theta'$ , for each of the following angles:

a.  $\theta = 210^\circ$     b.  $\theta = \frac{7\pi}{4}$     c.  $\theta = -240^\circ$     d.  $\theta = 3.6$ .

Finding reference angles for angles that are greater than  $360^\circ$  ( $2\pi$ ) or less than  $-360^\circ$  ( $-2\pi$ ) involves using coterminal angles. We have seen that coterminal angles have the same initial and terminal sides. Recall that coterminal angles can be obtained by increasing or decreasing an angle's measure by an integer multiple of  $360^\circ$  or  $2\pi$ .

**Finding Reference Angles for Angles Greater Than  $360^\circ$  ( $2\pi$ ) or Less Than  $-360^\circ$  ( $-2\pi$ )**

1. Find a positive angle  $\alpha$  less than  $360^\circ$  or  $2\pi$  that is coterminal with the given angle.
2. Draw  $\alpha$  in standard position.
3. Use the drawing to find the reference angle for the given angle. The positive acute angle formed by the terminal side of  $\alpha$  and the  $x$ -axis is the reference angle.

**EXAMPLE 6** Finding Reference Angles

Find the reference angle for each of the following angles:

a.  $\theta = 580^\circ$       b.  $\theta = \frac{8\pi}{3}$       c.  $\theta = -\frac{13\pi}{6}$ .

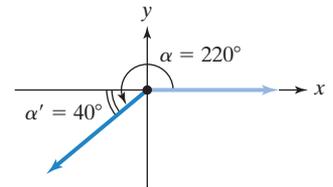

**SOLUTION**

- a. For a  $580^\circ$  angle, subtract  $360^\circ$  to find a positive coterminal angle less than  $360^\circ$ .

$$580^\circ - 360^\circ = 220^\circ$$

**Figure 4.54** shows  $\alpha = 220^\circ$  in standard position. Because  $220^\circ$  lies in quadrant III, the reference angle is

$$\alpha' = 220^\circ - 180^\circ = 40^\circ.$$

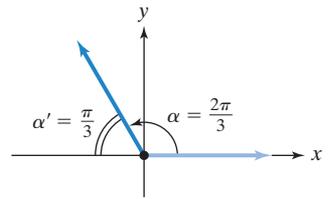

**FIGURE 4.54**

- b. For an  $\frac{8\pi}{3}$ , or  $2\frac{2}{3}\pi$ , angle, subtract  $2\pi$  to find a positive coterminal angle less than  $2\pi$ .

$$\frac{8\pi}{3} - 2\pi = \frac{8\pi}{3} - \frac{6\pi}{3} = \frac{2\pi}{3}$$

**Figure 4.55** shows  $\alpha = \frac{2\pi}{3}$  in standard position. Because  $\frac{2\pi}{3}$  lies in quadrant II, the reference angle is

$$\alpha' = \pi - \frac{2\pi}{3} = \frac{3\pi}{3} - \frac{2\pi}{3} = \frac{\pi}{3}.$$

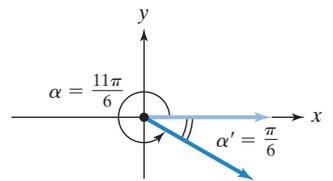

**FIGURE 4.55**

- c. For a  $-\frac{13\pi}{6}$ , or  $-2\frac{1}{6}\pi$ , angle, add  $4\pi$  to find a positive coterminal angle less than  $2\pi$ .

$$-\frac{13\pi}{6} + 4\pi = -\frac{13\pi}{6} + \frac{24\pi}{6} = \frac{11\pi}{6}$$

**Figure 4.56** shows  $\alpha = \frac{11\pi}{6}$  in standard position. Because  $\frac{11\pi}{6}$  lies in quadrant IV, the reference angle is

$$\alpha' = 2\pi - \frac{11\pi}{6} = \frac{12\pi}{6} - \frac{11\pi}{6} = \frac{\pi}{6}.$$

**FIGURE 4.56****DISCOVERY**

Solve part (c) using the coterminal angle formed by adding  $2\pi$ , rather than  $4\pi$ , to the given angle.

- 4 Use reference angles to evaluate trigonometric functions.

**Check Point 6** Find the reference angle for each of the following angles:

a.  $\theta = 665^\circ$       b.  $\theta = \frac{15\pi}{4}$       c.  $\theta = -\frac{11\pi}{3}$ .

**Evaluating Trigonometric Functions Using Reference Angles**

The way that reference angles are defined makes them useful in evaluating trigonometric functions.

**Using Reference Angles to Evaluate Trigonometric Functions**

The values of the trigonometric functions of a given angle,  $\theta$ , are the same as the values of the trigonometric functions of the reference angle,  $\theta'$ , except possibly for the sign. A function value of the acute reference angle,  $\theta'$ , is always positive. However, the same function value for  $\theta$  may be positive or negative.

For example, we can use a reference angle,  $\theta'$ , to obtain an exact value for  $\tan 120^\circ$ . The reference angle for  $\theta = 120^\circ$  is  $\theta' = 180^\circ - 120^\circ = 60^\circ$ . We know the exact value of the tangent function of the reference angle:  $\tan 60^\circ = \sqrt{3}$ . We also know that the value of a trigonometric function of a given angle,  $\theta$ , is the same as that of its reference angle,  $\theta'$ , except possibly for the sign. Thus, we can conclude that  $\tan 120^\circ$  equals  $-\sqrt{3}$  or  $\sqrt{3}$ .

What sign should we attach to  $\sqrt{3}$ ? A  $120^\circ$  angle lies in quadrant II, where only the sine and cosecant are positive. Thus, the tangent function is negative for a  $120^\circ$  angle. Therefore,

Prefix by a negative sign to show tangent is negative in quadrant II.

$$\tan 120^\circ = -\tan 60^\circ = -\sqrt{3}.$$

The reference angle for  $120^\circ$  is  $60^\circ$ .

In the previous section, we used two right triangles to find exact trigonometric values of  $30^\circ$ ,  $45^\circ$ , and  $60^\circ$ . Using a procedure similar to finding  $\tan 120^\circ$ , we can now find the exact function values of all angles for which  $30^\circ$ ,  $45^\circ$ , or  $60^\circ$  are reference angles.

### A Procedure for Using Reference Angles to Evaluate Trigonometric Functions

The value of a trigonometric function of any angle  $\theta$  is found as follows:

1. Find the associated reference angle,  $\theta'$ , and the function value for  $\theta'$ .
2. Use the quadrant in which  $\theta$  lies to prefix the appropriate sign to the function value in step 1.

## DISCOVERY

Draw the two right triangles involving  $30^\circ$ ,  $45^\circ$ , and  $60^\circ$ . Indicate the length of each side. Use these lengths to verify the function values for the reference angles in the solution to Example 7.

### EXAMPLE 7 Using Reference Angles to Evaluate Trigonometric Functions

Use reference angles to find the exact value of each of the following trigonometric functions:

a.  $\sin 135^\circ$       b.  $\cos \frac{4\pi}{3}$       c.  $\cot\left(-\frac{\pi}{3}\right)$ .

### SOLUTION

- a. We use our two-step procedure to find  $\sin 135^\circ$ .

**Step 1 Find the reference angle,  $\theta'$ , and  $\sin \theta'$ .** Figure 4.57 shows  $135^\circ$  lies in quadrant II. The reference angle is

$$\theta' = 180^\circ - 135^\circ = 45^\circ.$$

The function value for the reference angle is  $\sin 45^\circ = \frac{\sqrt{2}}{2}$ .

**Step 2 Use the quadrant in which  $\theta$  lies to prefix the appropriate sign to the function value in step 1.** The angle  $\theta = 135^\circ$  lies in quadrant II. Because the sine is positive in quadrant II, we put a + sign before the function value of the reference angle. Thus,

The sine is positive in quadrant II.

$$\sin 135^\circ = +\sin 45^\circ = \frac{\sqrt{2}}{2}.$$

The reference angle for  $135^\circ$  is  $45^\circ$ .

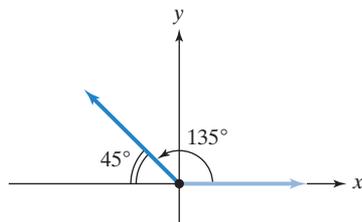

FIGURE 4.57 Reference angle for  $135^\circ$

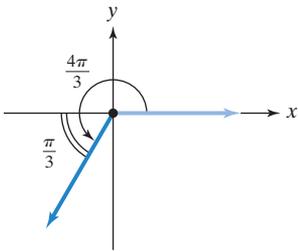

FIGURE 4.58 Reference angle for  $\frac{4\pi}{3}$

- b. We use our two-step procedure to find  $\cos \frac{4\pi}{3}$ .

**Step 1 Find the reference angle,  $\theta'$ , and  $\cos \theta'$ .** Figure 4.58 shows that  $\theta = \frac{4\pi}{3}$  lies in quadrant III. The reference angle is

$$\theta' = \frac{4\pi}{3} - \pi = \frac{4\pi}{3} - \frac{3\pi}{3} = \frac{\pi}{3}.$$

The function value for the reference angle is

$$\cos \frac{\pi}{3} = \frac{1}{2}.$$

**Step 2 Use the quadrant in which  $\theta$  lies to prefix the appropriate sign to the function value in step 1.** The angle  $\theta = \frac{4\pi}{3}$  lies in quadrant III. Because only the tangent and cotangent are positive in quadrant III, the cosine is negative in this quadrant. We put a  $-$  sign before the function value of the reference angle. Thus,

The cosine is negative in quadrant III.

$$\cos \frac{4\pi}{3} = -\cos \frac{\pi}{3} = -\frac{1}{2}.$$

The reference angle for  $\frac{4\pi}{3}$  is  $\frac{\pi}{3}$ .

- c. We use our two-step procedure to find  $\cot\left(-\frac{\pi}{3}\right)$ .

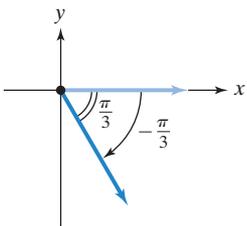

FIGURE 4.59 Reference angle for  $-\frac{\pi}{3}$

**Step 1 Find the reference angle,  $\theta'$ , and  $\cot \theta'$ .** Figure 4.59 shows that  $\theta = -\frac{\pi}{3}$  lies in quadrant IV. The reference angle is  $\theta' = \frac{\pi}{3}$ . The function value for the reference angle is  $\cot \frac{\pi}{3} = \frac{\sqrt{3}}{3}$ .

**Step 2 Use the quadrant in which  $\theta$  lies to prefix the appropriate sign to the function value in step 1.** The angle  $\theta = -\frac{\pi}{3}$  lies in quadrant IV. Because only the cosine and secant are positive in quadrant IV, the cotangent is negative in this quadrant. We put a  $-$  sign before the function value of the reference angle. Thus,

The cotangent is negative in quadrant IV.

$$\cot\left(-\frac{\pi}{3}\right) = -\cot \frac{\pi}{3} = -\frac{\sqrt{3}}{3}.$$

The reference angle for  $-\frac{\pi}{3}$  is  $\frac{\pi}{3}$ .

**Check Point 7** Use reference angles to find the exact value of the following trigonometric functions:

a.  $\sin 300^\circ$

b.  $\tan \frac{5\pi}{4}$

c.  $\sec\left(-\frac{\pi}{6}\right)$

In our final example, we use positive coterminal angles less than  $2\pi$  to find the reference angles.

### EXAMPLE 8 Using Reference Angles to Evaluate Trigonometric Functions

Use reference angles to find the exact value of each of the following trigonometric functions:

a.  $\tan \frac{14\pi}{3}$       b.  $\sec\left(-\frac{17\pi}{4}\right)$ .

#### SOLUTION

a. We use our two-step procedure to find  $\tan \frac{14\pi}{3}$ .

**Step 1 Find the reference angle,  $\theta'$ , and  $\tan \theta'$ .** Because the given angle,  $\frac{14\pi}{3}$  or  $4\frac{2}{3}\pi$ , exceeds  $2\pi$ , subtract  $4\pi$  to find a positive coterminal angle less than  $2\pi$ .

$$\theta = \frac{14\pi}{3} - 4\pi = \frac{14\pi}{3} - \frac{12\pi}{3} = \frac{2\pi}{3}$$

**Figure 4.60** shows  $\theta = \frac{2\pi}{3}$  in standard position. The angle lies in quadrant II. The reference angle is

$$\theta' = \pi - \frac{2\pi}{3} = \frac{3\pi}{3} - \frac{2\pi}{3} = \frac{\pi}{3}.$$

The function value for the reference angle is  $\tan \frac{\pi}{3} = \sqrt{3}$ .

**Step 2 Use the quadrant in which  $\theta$  lies to prefix the appropriate sign to the function value in step 1.** The coterminal angle  $\theta = \frac{2\pi}{3}$  lies in quadrant II.

Because the tangent is negative in quadrant II, we put a  $-$  sign before the function value of the reference angle. Thus,

$$\tan \frac{14\pi}{3} = \tan \frac{2\pi}{3} = -\tan \frac{\pi}{3} = -\sqrt{3}.$$

The tangent is negative in quadrant II.

The reference angle for  $\frac{2\pi}{3}$  is  $\frac{\pi}{3}$ .

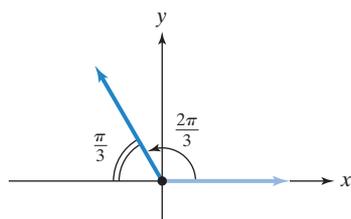

FIGURE 4.60 Reference angle for  $\frac{2\pi}{3}$

b. We use our two-step procedure to find  $\sec\left(-\frac{17\pi}{4}\right)$ .

**Step 1 Find the reference angle,  $\theta'$ , and  $\sec \theta'$ .** Because the given angle,  $-\frac{17\pi}{4}$  or  $-4\frac{1}{4}\pi$ , is less than  $-2\pi$ , add  $6\pi$  (three multiples of  $2\pi$ ) to find a positive coterminal angle less than  $2\pi$ .

$$\theta = -\frac{17\pi}{4} + 6\pi = -\frac{17\pi}{4} + \frac{24\pi}{4} = \frac{7\pi}{4}$$

**Figure 4.61** shows  $\theta = \frac{7\pi}{4}$  in standard position. The angle lies in quadrant IV. The reference angle is

$$\theta' = 2\pi - \frac{7\pi}{4} = \frac{8\pi}{4} - \frac{7\pi}{4} = \frac{\pi}{4}.$$

The function value for the reference angle is  $\sec \frac{\pi}{4} = \sqrt{2}$ .

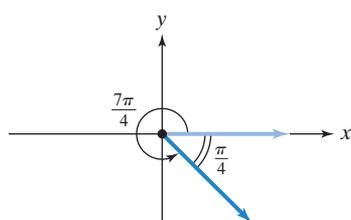

FIGURE 4.61 Reference angle for  $\frac{7\pi}{4}$

**Step 2 Use the quadrant in which  $\theta$  lies to prefix the appropriate sign to the function value in step 1.** The coterminal angle  $\theta = \frac{7\pi}{4}$  lies in quadrant IV. Because the secant is positive in quadrant IV, we put a + sign before the function value of the reference angle. Thus,

$$\sec\left(-\frac{17\pi}{4}\right) = \sec \frac{7\pi}{4} = + \sec \frac{\pi}{4} = \sqrt{2}.$$

The secant is positive in quadrant IV.

The reference angle for  $\frac{7\pi}{4}$  is  $\frac{\pi}{4}$ .

 **Check Point 8** Use reference angles to find the exact value of each of the following trigonometric functions:

a.  $\cos \frac{17\pi}{6}$

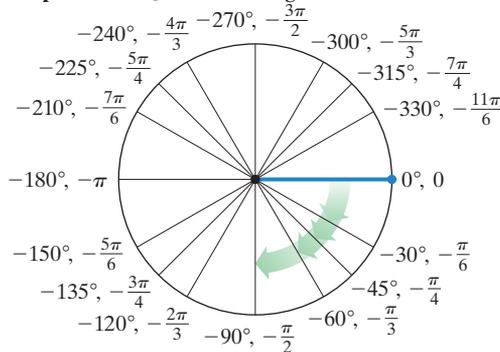

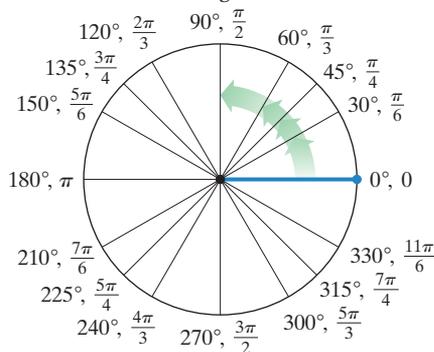

b.  $\sin\left(-\frac{22\pi}{3}\right)$ .

## GREAT QUESTION!

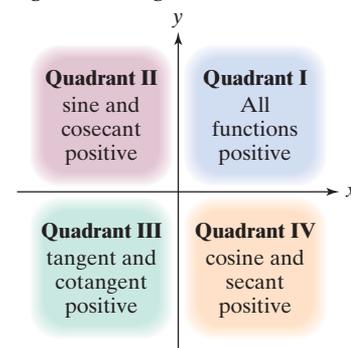

I feel overwhelmed by the amount of information required to evaluate trigonometric functions. Can you help me out?

You're right. Evaluating trigonometric functions like those in Example 8 and Check Point 8 involves using a number of concepts, including finding coterminal angles and reference angles, locating special angles, determining the signs of trigonometric functions in specific quadrants, and finding the trigonometric functions of special angles ( $30^\circ = \frac{\pi}{6}$ ,  $45^\circ = \frac{\pi}{4}$ , and  $60^\circ = \frac{\pi}{3}$ ). To be successful in trigonometry, it is often necessary to connect concepts. Here's an early reference sheet showing some of the concepts you should have at your fingertips (or memorized).

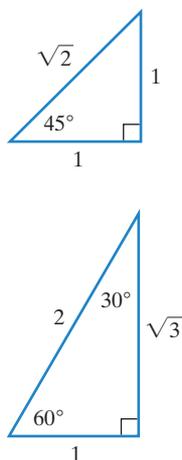

**Degree and Radian Measures of Special and Quadrantal Angles**

**Signs of the Trigonometric Functions**

**Special Right Triangles and Trigonometric Functions of Special Angles**

$\theta$	$30^\circ = \frac{\pi}{6}$	$45^\circ = \frac{\pi}{4}$	$60^\circ = \frac{\pi}{3}$
$\sin \theta$	$\frac{1}{2}$	$\frac{\sqrt{2}}{2}$	$\frac{\sqrt{3}}{2}$
$\cos \theta$	$\frac{\sqrt{3}}{2}$	$\frac{\sqrt{2}}{2}$	$\frac{1}{2}$
$\tan \theta$	$\frac{\sqrt{3}}{3}$	1	$\sqrt{3}$

**Trigonometric Functions of Quadrantal Angles**

$\theta$	$0^\circ = 0$	$90^\circ = \frac{\pi}{2}$	$180^\circ = \pi$	$270^\circ = \frac{3\pi}{2}$
$\sin \theta$	0	1	0	-1
$\cos \theta$	1	0	-1	0
$\tan \theta$	0	undefined	0	undefined

**Using Reference Angles to Evaluate Trigonometric Functions**

$$\begin{aligned} \sin \theta &= \square \sin \theta' \\ \cos \theta &= \square \cos \theta' \\ \tan \theta &= \square \tan \theta' \end{aligned}$$

+ or - in  $\square$  determined by the quadrant in which  $\theta$  lies and the sign of the function in that quadrant.

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- Let  $\theta$  be any angle in standard position and let  $P = (x, y)$  be any point besides the origin on the terminal side of  $\theta$ . If  $r = \sqrt{x^2 + y^2}$  is the distance from  $(0, 0)$  to  $(x, y)$ , the trigonometric functions of  $\theta$  are defined as follows:
 

$\sin \theta =$ _____	$\csc \theta =$ _____
$\cos \theta =$ _____	$\sec \theta =$ _____
$\tan \theta =$ _____	$\cot \theta =$ _____
- Using the definitions in Exercise 1, the trigonometric functions that are undefined when  $x = 0$  are \_\_\_\_\_ and \_\_\_\_\_. The trigonometric functions that are undefined when  $y = 0$  are \_\_\_\_\_ and \_\_\_\_\_. The trigonometric functions that do not depend on the value of  $r$  are \_\_\_\_\_ and \_\_\_\_\_.
- If  $\theta$  lies in quadrant II, \_\_\_\_\_ and \_\_\_\_\_ are positive.
- If  $\theta$  lies in quadrant III, \_\_\_\_\_ and \_\_\_\_\_ are positive.
- If  $\theta$  lies in quadrant IV, \_\_\_\_\_ and \_\_\_\_\_ are positive.
- Let  $\theta$  be a nonacute angle in standard position that lies in a quadrant. Its reference angle is the positive acute angle formed by the \_\_\_\_\_ side of  $\theta$  and the \_\_\_\_\_-axis.
- Complete each statement for a positive angle  $\theta$  and its reference angle  $\theta'$ .
  - If  $90^\circ < \theta < 180^\circ$ , then  $\theta' =$  \_\_\_\_\_.
  - If  $180^\circ < \theta < 270^\circ$ , then  $\theta' =$  \_\_\_\_\_.
  - If  $270^\circ < \theta < 360^\circ$ , then  $\theta' =$  \_\_\_\_\_.

## EXERCISE SET 4.4

### Practice Exercises

In Exercises 1–8, a point on the terminal side of angle  $\theta$  is given. Find the exact value of each of the six trigonometric functions of  $\theta$ .

- |               |               |              |
|---------------|---------------|--------------|
| 1. $(-4, 3)$  | 2. $(-12, 5)$ | 3. $(2, 3)$  |
| 4. $(3, 7)$   | 5. $(3, -3)$  | 6. $(5, -5)$ |
| 7. $(-2, -5)$ | 8. $(-1, -3)$ |              |

In Exercises 9–16, evaluate the trigonometric function at the quadrantal angle, or state that the expression is undefined.

- |                          |                           |                           |
|--------------------------|---------------------------|---------------------------|
| 9. $\cos \pi$            | 10. $\tan \pi$            | 11. $\sec \pi$            |
| 12. $\csc \pi$           | 13. $\tan \frac{3\pi}{2}$ | 14. $\cos \frac{3\pi}{2}$ |
| 15. $\cot \frac{\pi}{2}$ | 16. $\tan \frac{\pi}{2}$  |                           |

In Exercises 17–22, let  $\theta$  be an angle in standard position. Name the quadrant in which  $\theta$  lies.

- |  |  |
|--|--|
| 17. $\sin \theta > 0, \cos \theta > 0$ | 18. $\sin \theta < 0, \cos \theta > 0$ |
| 19. $\sin \theta < 0, \cos \theta < 0$ | 20. $\tan \theta < 0, \sin \theta < 0$ |
| 21. $\tan \theta < 0, \cos \theta < 0$ | 22. $\cot \theta > 0, \sec \theta < 0$ |

In Exercises 23–34, find the exact value of each of the remaining trigonometric functions of  $\theta$ .

- |  |   |
|--|---|
| 23. $\cos \theta = -\frac{3}{5}, \theta$ in quadrant III         |   |
| 24. $\sin \theta = -\frac{12}{13}, \theta$ in quadrant III       |   |
| 25. $\sin \theta = \frac{5}{13}, \theta$ in quadrant II          |   |
| 26. $\cos \theta = \frac{4}{5}, \theta$ in quadrant IV           |   |
| 27. $\cos \theta = \frac{8}{17}, 270^\circ < \theta < 360^\circ$ |   |
| 28. $\cos \theta = \frac{1}{3}, 270^\circ < \theta < 360^\circ$  |   |
| 29. $\tan \theta = -\frac{2}{3}, \sin \theta > 0$                | 30. $\tan \theta = -\frac{1}{3}, \sin \theta > 0$ |
| 31. $\tan \theta = \frac{4}{3}, \cos \theta < 0$                 | 32. $\tan \theta = \frac{5}{12}, \cos \theta < 0$ |
| 33. $\sec \theta = -3, \tan \theta > 0$                          | 34. $\csc \theta = -4, \tan \theta > 0$           |

In Exercises 35–60, find the reference angle for each angle.

- |                        |                        |                        |
|------------------------|------------------------|------------------------|
| 35. $160^\circ$        | 36. $170^\circ$        | 37. $205^\circ$        |
| 38. $210^\circ$        | 39. $355^\circ$        | 40. $351^\circ$        |
| 41. $\frac{7\pi}{4}$   | 42. $\frac{5\pi}{4}$   | 43. $\frac{5\pi}{6}$   |
| 44. $\frac{5\pi}{7}$   | 45. $-150^\circ$       | 46. $-250^\circ$       |
| 47. $-335^\circ$       | 48. $-359^\circ$       | 49. $4.7$              |
| 50. $5.5$              | 51. $565^\circ$        | 52. $553^\circ$        |
| 53. $\frac{17\pi}{6}$  | 54. $\frac{11\pi}{4}$  | 55. $\frac{23\pi}{4}$  |
| 56. $\frac{17\pi}{3}$  | 57. $-\frac{11\pi}{4}$ | 58. $-\frac{17\pi}{6}$ |
| 59. $-\frac{25\pi}{6}$ | 60. $-\frac{13\pi}{3}$ |                        |

In Exercises 61–86, use reference angles to find the exact value of each expression. Do not use a calculator.

- |   |   |   |
|---|---|---|
| 61. $\cos 225^\circ$                    | 62. $\sin 300^\circ$                    | 63. $\tan 210^\circ$                    |
| 64. $\sec 240^\circ$                    | 65. $\tan 420^\circ$                    | 66. $\tan 405^\circ$                    |
| 67. $\sin \frac{2\pi}{3}$               | 68. $\cos \frac{3\pi}{4}$               | 69. $\csc \frac{7\pi}{6}$               |
| 70. $\cot \frac{7\pi}{4}$               | 71. $\tan \frac{9\pi}{4}$               | 72. $\tan \frac{9\pi}{2}$               |
| 73. $\sin(-240^\circ)$                  | 74. $\sin(-225^\circ)$                  | 75. $\tan\left(-\frac{\pi}{4}\right)$   |
| 76. $\tan\left(-\frac{\pi}{6}\right)$   | 77. $\sec 495^\circ$                    | 78. $\sec 510^\circ$                    |
| 79. $\cot \frac{19\pi}{6}$              | 80. $\cot \frac{13\pi}{3}$              | 81. $\cos \frac{23\pi}{4}$              |
| 82. $\cos \frac{35\pi}{6}$              | 83. $\tan\left(-\frac{17\pi}{6}\right)$ | 84. $\tan\left(-\frac{11\pi}{4}\right)$ |
| 85. $\sin\left(-\frac{17\pi}{3}\right)$ | 86. $\sin\left(-\frac{35\pi}{6}\right)$ |   |

## Practice Plus

In Exercises 87–92, find the exact value of each expression. Write the answer as a single fraction. Do not use a calculator.

87.  $\sin \frac{\pi}{3} \cos \pi - \cos \frac{\pi}{3} \sin \frac{3\pi}{2}$

88.  $\sin \frac{\pi}{4} \cos 0 - \sin \frac{\pi}{6} \cos \pi$

89.  $\sin \frac{11\pi}{4} \cos \frac{5\pi}{6} + \cos \frac{11\pi}{4} \sin \frac{5\pi}{6}$

90.  $\sin \frac{17\pi}{3} \cos \frac{5\pi}{4} + \cos \frac{17\pi}{3} \sin \frac{5\pi}{4}$

91.  $\sin \frac{3\pi}{2} \tan \left( -\frac{15\pi}{4} \right) - \cos \left( -\frac{5\pi}{3} \right)$

92.  $\sin \frac{3\pi}{2} \tan \left( -\frac{8\pi}{3} \right) + \cos \left( -\frac{5\pi}{6} \right)$

In Exercises 93–98, let

$$f(x) = \sin x, g(x) = \cos x, \text{ and } h(x) = 2x.$$

Find the exact value of each expression. Do not use a calculator.

93.  $f\left(\frac{4\pi}{3} + \frac{\pi}{6}\right) + f\left(\frac{4\pi}{3}\right) + f\left(\frac{\pi}{6}\right)$

94.  $g\left(\frac{5\pi}{6} + \frac{\pi}{6}\right) + g\left(\frac{5\pi}{6}\right) + g\left(\frac{\pi}{6}\right)$

95.  $(h \circ g)\left(\frac{17\pi}{3}\right)$

96.  $(h \circ f)\left(\frac{11\pi}{4}\right)$

97. the average rate of change of  $f$  from  $x_1 = \frac{5\pi}{4}$  to  $x_2 = \frac{3\pi}{2}$

98. the average rate of change of  $g$  from  $x_1 = \frac{3\pi}{4}$  to  $x_2 = \pi$

In Exercises 99–104, find two values of  $\theta$ ,  $0 \leq \theta < 2\pi$ , that satisfy each equation.

99.  $\sin \theta = \frac{\sqrt{2}}{2}$

100.  $\cos \theta = \frac{1}{2}$

101.  $\sin \theta = -\frac{\sqrt{2}}{2}$

102.  $\cos \theta = -\frac{1}{2}$

103.  $\tan \theta = -\sqrt{3}$

104.  $\tan \theta = -\frac{\sqrt{3}}{3}$

## Writing in Mathematics

105. If you are given a point on the terminal side of angle  $\theta$ , explain how to find  $\sin \theta$ .
106. Explain why  $\tan 90^\circ$  is undefined.

107. If  $\cos \theta > 0$  and  $\tan \theta < 0$ , explain how to find the quadrant in which  $\theta$  lies.
108. What is a reference angle? Give an example with your description.
109. Explain how reference angles are used to evaluate trigonometric functions. Give an example with your description.

## Critical Thinking Exercises

**Make Sense?** In Exercises 110–113, determine whether each statement makes sense or does not make sense, and explain your reasoning.

110. I'm working with a quadrantal angle  $\theta$  for which  $\sin \theta$  is undefined.
111. This angle  $\theta$  is in a quadrant in which  $\sin \theta < 0$  and  $\csc \theta > 0$ .
112. I am given that  $\tan \theta = \frac{3}{5}$ , so I can conclude that  $y = 3$  and  $x = 5$ .
113. When I found the exact value of  $\cos \frac{14\pi}{3}$ , I used a number of concepts, including coterminal angles, reference angles, finding the cosine of a special angle, and knowing the cosine's sign in various quadrants.

## Preview Exercises

Exercises 114–116 will help you prepare for the material covered in the next section. In each exercise, complete the table of coordinates. Do not use a calculator.

114.  $y = \frac{1}{2} \cos(4x + \pi)$

x	$-\frac{\pi}{4}$	$-\frac{\pi}{8}$	0	$\frac{\pi}{8}$	$\frac{\pi}{4}$
y					

115.  $y = 4 \sin\left(2x - \frac{2\pi}{3}\right)$

x	$\frac{\pi}{3}$	$\frac{7\pi}{12}$	$\frac{5\pi}{6}$	$\frac{13\pi}{12}$	$\frac{4\pi}{3}$
y					

116.  $y = 3 \sin \frac{\pi}{2}x$

x	0	$\frac{1}{3}$	1	$\frac{5}{3}$	2	$\frac{7}{3}$	3	$\frac{11}{3}$	4
y									

After completing this table of coordinates, plot the nine ordered pairs as points in a rectangular coordinate system. Then connect the points with a smooth curve.

## CHAPTER 4

## Mid-Chapter Check Point

**WHAT YOU KNOW:** We learned to use radians to measure angles: One radian (approximately  $57^\circ$ ) is the measure of the central angle that intercepts an arc equal in length to the radius of the circle. Using  $180^\circ = \pi$  radians,

we converted degrees to radians (multiply by  $\frac{\pi}{180^\circ}$ ) and radians to degrees (multiply by  $\frac{180^\circ}{\pi}$ ). We defined the

six trigonometric functions using coordinates of points along the unit circle, right triangles, and angles in standard position. Evaluating trigonometric functions using reference angles involved connecting a number of concepts, including finding coterminal and reference angles, locating special angles, determining the signs of the trigonometric functions in specific quadrants, and finding the function values at special angles. Use the important Great Question! box on page 547 as a reference sheet to help connect these concepts.

In Exercises 1–2, convert each angle in degrees to radians. Express your answer as a multiple of  $\pi$ .

1.  $10^\circ$                       2.  $-105^\circ$

In Exercises 3–4, convert each angle in radians to degrees.

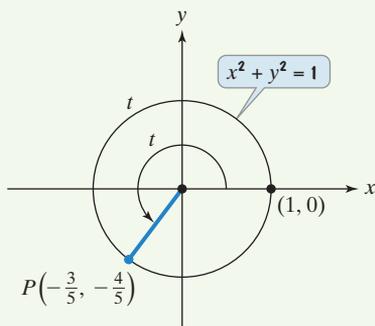

3.  $\frac{5\pi}{12}$                       4.  $-\frac{13\pi}{20}$

In Exercises 5–7,

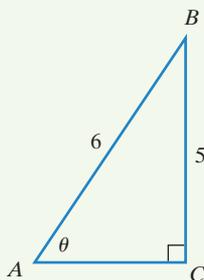

- Find a positive angle less than  $360^\circ$  or  $2\pi$  that is coterminal with the given angle.
- Draw the given angle in standard position.
- Find the reference angle for the given angle.

5.  $\frac{11\pi}{3}$                       6.  $-\frac{19\pi}{4}$                       7.  $510^\circ$

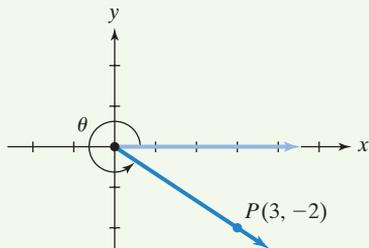

8. Use the point shown on the unit circle to find each of the six trigonometric functions at  $t$ .

9. Use the triangle to find each of the six trigonometric functions of  $\theta$ .

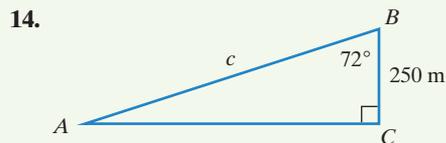

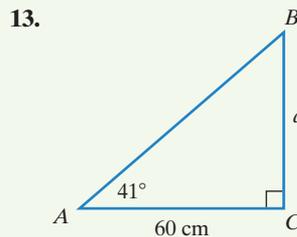

10. Use the point on the terminal side of  $\theta$  to find each of the six trigonometric functions of  $\theta$ .

In Exercises 11–12, find the exact value of the remaining trigonometric functions of  $\theta$ .

11.  $\tan \theta = -\frac{3}{4}$ ,  $\cos \theta < 0$     12.  $\cos \theta = \frac{3}{7}$ ,  $\sin \theta < 0$

In Exercises 13–14, find the measure of the side of the right triangle whose length is designated by a lowercase letter. Round the answer to the nearest whole number.

15. If  $\cos \theta = \frac{1}{6}$  and  $\theta$  is acute, find  $\cot\left(\frac{\pi}{2} - \theta\right)$ .

In Exercises 16–26, find the exact value of each expression. Do not use a calculator.

16.  $\tan 30^\circ$                       17.  $\cot 120^\circ$   
 18.  $\cos 240^\circ$                       19.  $\sec \frac{11\pi}{6}$   
 20.  $\sin^2 \frac{\pi}{7} + \cos^2 \frac{\pi}{7}$                       21.  $\sin\left(-\frac{2\pi}{3}\right)$   
 22.  $\csc\left(\frac{22\pi}{3}\right)$                       23.  $\cos 495^\circ$   
 24.  $\tan\left(-\frac{17\pi}{6}\right)$                       25.  $\sin^2 \frac{\pi}{2} - \cos \pi$   
 26.  $\cos\left(\frac{5\pi}{6} + 2\pi n\right) + \tan\left(\frac{5\pi}{6} + n\pi\right)$ ,  $n$  is an integer.

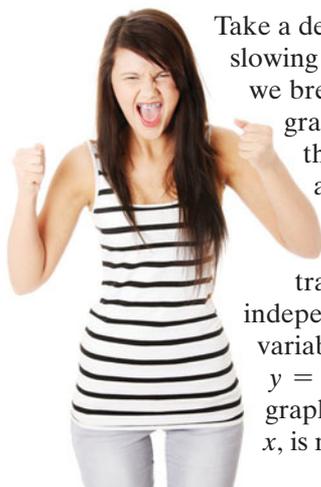

27. A circle has a radius of 40 centimeters. Find the length of the arc intercepted by a central angle of  $36^\circ$ . Express the answer in terms of  $\pi$ . Then round to two decimal places.
28. A merry-go-round makes 8 revolutions per minute. Find the linear speed, in feet per minute, of a horse 10 feet from the center. Express the answer in terms of  $\pi$ . Then round to one decimal place.
29. A plane takes off at an angle of  $6^\circ$ . After traveling for one mile, or 5280 feet, along this flight path, find the plane's height, to the nearest tenth of a foot, above the ground.
30. A tree that is 50 feet tall casts a shadow that is 60 feet long. Find the angle of elevation, to the nearest degree, of the sun.

## SECTION 4.5

## Graphs of Sine and Cosine Functions

*Objectives*

- 1 Understand the graph of  $y = \sin x$ .
- 2 Graph variations of  $y = \sin x$ .
- 3 Understand the graph of  $y = \cos x$ .
- 4 Graph variations of  $y = \cos x$ .
- 5 Use vertical shifts of sine and cosine curves.
- 6 Model periodic behavior.

Take a deep breath and relax. Many relaxation exercises involve slowing down our breathing. Some people suggest that the way we breathe affects every part of our lives. Did you know that graphs of trigonometric functions can be used to analyze the breathing cycle, which is our closest link to both life and death?

In this section, we use graphs of sine and cosine functions to visualize their properties. We use the traditional symbol  $x$ , rather than  $\theta$  or  $t$ , to represent the independent variable. We use the symbol  $y$  for the dependent variable, or the function's value at  $x$ . Thus, we will be graphing  $y = \sin x$  and  $y = \cos x$  in rectangular coordinates. In all graphs of trigonometric functions, the independent variable,  $x$ , is measured in radians.

- 1 Understand the graph of  $y = \sin x$ .

**The Graph of  $y = \sin x$** 

The trigonometric functions can be graphed in a rectangular coordinate system by plotting points whose coordinates satisfy the function. Thus, we graph  $y = \sin x$  by listing some points on the graph. Because the period of the sine function is  $2\pi$ , we will graph the function on the interval  $[0, 2\pi]$ . The rest of the graph is made up of repetitions of this portion.

**Table 4.3** lists some values of  $(x, y)$  on the graph of  $y = \sin x$ ,  $0 \leq x \leq 2\pi$ .

**Table 4.3** Values of  $(x, y)$  on the graph of  $y = \sin x$

$x$	0	$\frac{\pi}{6}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{5\pi}{6}$	$\pi$	$\frac{7\pi}{6}$	$\frac{4\pi}{3}$	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{11\pi}{6}$	$2\pi$
$y = \sin x$	0	$\frac{1}{2}$	$\frac{\sqrt{3}}{2}$	1	$\frac{\sqrt{3}}{2}$	$\frac{1}{2}$	0	$-\frac{1}{2}$	$-\frac{\sqrt{3}}{2}$	-1	$-\frac{\sqrt{3}}{2}$	$-\frac{1}{2}$	0

As  $x$  increases from 0 to  $\frac{\pi}{2}$ ,  $y$  increases from 0 to 1.

As  $x$  increases from  $\frac{\pi}{2}$  to  $\pi$ ,  $y$  decreases from 1 to 0.

As  $x$  increases from  $\pi$  to  $\frac{3\pi}{2}$ ,  $y$  decreases from 0 to -1.

As  $x$  increases from  $\frac{3\pi}{2}$  to  $2\pi$ ,  $y$  increases from -1 to 0.

In plotting the points obtained in **Table 4.3**, we will use the approximation  $\frac{\sqrt{3}}{2} \approx 0.87$ . Rather than approximating  $\pi$ , we will mark off units on the  $x$ -axis in terms of  $\pi$ . If we connect these points with a smooth curve, we obtain the graph shown in **Figure 4.62**. The figure shows one period of the graph of  $y = \sin x$ .

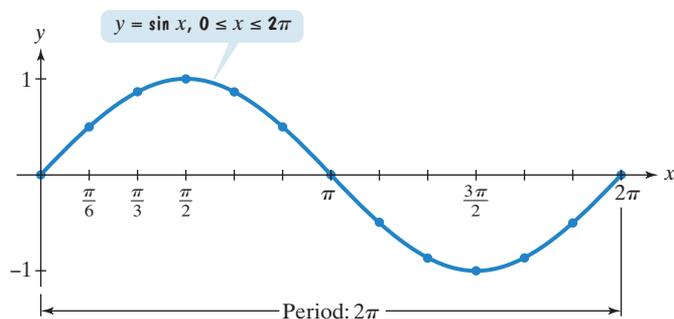

FIGURE 4.62 One period of the graph of  $y = \sin x$

We can obtain a more complete graph of  $y = \sin x$  by continuing the portion shown in **Figure 4.62** to the left and to the right. The graph of the sine function, called a **sine curve**, is shown in **Figure 4.63**. Any part of the graph that corresponds to one period ( $2\pi$ ) is one cycle of the graph of  $y = \sin x$ .

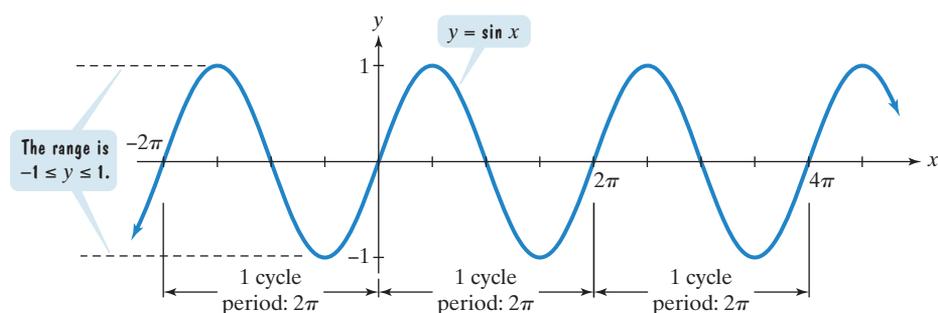

FIGURE 4.63 The graph of  $y = \sin x$

The graph of  $y = \sin x$  allows us to visualize some of the properties of the sine function.

- The domain is  $(-\infty, \infty)$ , the set of all real numbers. The graph extends indefinitely to the left and to the right with no gaps or holes.
- The range is  $[-1, 1]$ , the set of all real numbers between  $-1$  and  $1$ , inclusive. The graph never rises above  $1$  or falls below  $-1$ .
- The period is  $2\pi$ . The graph's pattern repeats in every interval of length  $2\pi$ .
- The function is an odd function:  $\sin(-x) = -\sin x$ . This can be seen by observing that the graph is symmetric with respect to the origin.

## 2 Graph variations of $y = \sin x$ .

### Graphing Variations of $y = \sin x$

To graph variations of  $y = \sin x$  by hand, it is helpful to find  $x$ -intercepts, maximum points, and minimum points. One complete cycle of the sine curve includes three  $x$ -intercepts, one maximum point, and one minimum point. The graph of  $y = \sin x$  has  $x$ -intercepts at the beginning, middle, and end of its full period, shown in **Figure 4.64**. The curve reaches its maximum point  $\frac{1}{4}$  of the way through the period. It reaches its minimum point  $\frac{3}{4}$  of the way through the period. Thus, key points in graphing sine

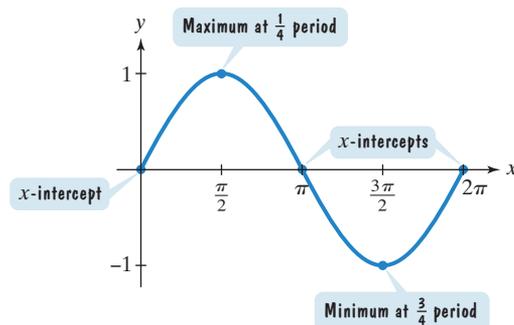

FIGURE 4.64 Key points in graphing the sine function

functions are obtained by dividing the period into four equal parts. The  $x$ -coordinates of the five key points are as follows:

$$x_1 = \text{value of } x \text{ where the cycle begins}$$

$$x_2 = x_1 + \frac{\text{period}}{4}$$

$$x_3 = x_2 + \frac{\text{period}}{4}$$

$$x_4 = x_3 + \frac{\text{period}}{4}$$

$$x_5 = x_4 + \frac{\text{period}}{4}$$

Add  
"quarter-periods"  
to find  
successive  
values of  $x$ .

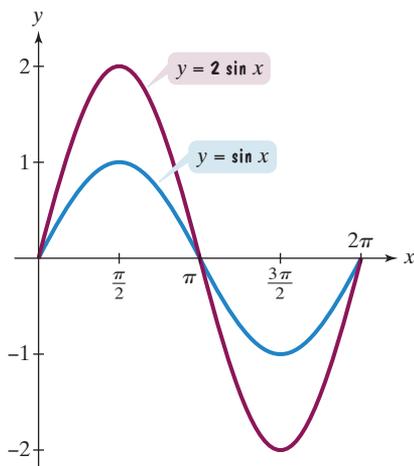

FIGURE 4.65 Comparing the graphs of  $y = \sin x$  and  $y = 2 \sin x$

The  $y$ -coordinates of the five key points are obtained by evaluating the given function at each of these values of  $x$ .

The graph of  $y = \sin x$  forms the basis for graphing functions of the form

$$y = A \sin x.$$

For example, consider  $y = 2 \sin x$ , in which  $A = 2$ . We can obtain the graph of  $y = 2 \sin x$  from that of  $y = \sin x$  if we multiply each  $y$ -coordinate on the graph of  $y = \sin x$  by 2. **Figure 4.65** shows the graphs. The basic sine curve is *stretched* and ranges between  $-2$  and  $2$ , rather than between  $-1$  and  $1$ . However, both  $y = \sin x$  and  $y = 2 \sin x$  have a period of  $2\pi$ .

In general, the graph of  $y = A \sin x$  ranges between  $-|A|$  and  $|A|$ . Thus, the range of the function is  $-|A| \leq y \leq |A|$ . If  $|A| > 1$ , the basic sine curve is *stretched*, as in **Figure 4.65**. If  $|A| < 1$ , the basic sine curve is *shrunk*. We call  $|A|$  the **amplitude** of  $y = A \sin x$ . The maximum value of  $y$  on the graph of  $y = A \sin x$  is  $|A|$ , the amplitude.

### Graphing Variations of $y = \sin x$

1. Identify the amplitude and the period.
2. Find the values of  $x$  for the five key points—the three  $x$ -intercepts, the maximum point, and the minimum point. Start with the value of  $x$  where the cycle begins and add quarter-periods—that is,  $\frac{\text{period}}{4}$ —to find successive values of  $x$ .
3. Find the values of  $y$  for the five key points by evaluating the function at each value of  $x$  from step 2.
4. Connect the five key points with a smooth curve and graph one complete cycle of the given function.
5. Extend the graph in step 4 to the left or right as desired.

### EXAMPLE 1 Graphing a Variation of $y = \sin x$

Determine the amplitude of  $y = \frac{1}{2} \sin x$ . Then graph  $y = \sin x$  and  $y = \frac{1}{2} \sin x$  for  $0 \leq x \leq 2\pi$ .

#### SOLUTION

**Step 1 Identify the amplitude and the period.** The equation  $y = \frac{1}{2} \sin x$  is of the form  $y = A \sin x$  with  $A = \frac{1}{2}$ . Thus, the amplitude is  $|A| = \frac{1}{2}$ . This means that the maximum value of  $y$  is  $\frac{1}{2}$  and the minimum value of  $y$  is  $-\frac{1}{2}$ . The period for both  $y = \frac{1}{2} \sin x$  and  $y = \sin x$  is  $2\pi$ .

**Step 2 Find the values of  $x$  for the five key points.** We need to find the three  $x$ -intercepts, the maximum point, and the minimum point on the interval  $[0, 2\pi]$ . To do so, we begin by dividing the period,  $2\pi$ , by 4.

$$\frac{\text{period}}{4} = \frac{2\pi}{4} = \frac{\pi}{2}$$

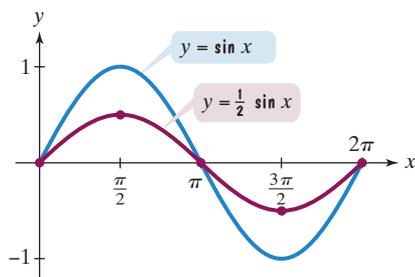

We start with the value of  $x$  where the cycle begins:  $x_1 = 0$ . Now we add quarter-periods,  $\frac{\pi}{2}$ , to generate  $x$ -values for each of the key points. The five  $x$ -values are

$$x_1 = 0, \quad x_2 = 0 + \frac{\pi}{2} = \frac{\pi}{2}, \quad x_3 = \frac{\pi}{2} + \frac{\pi}{2} = \pi,$$

$$x_4 = \pi + \frac{\pi}{2} = \frac{3\pi}{2}, \quad x_5 = \frac{3\pi}{2} + \frac{\pi}{2} = 2\pi.$$

**Step 3 Find the values of  $y$  for the five key points.** We evaluate the function at each value of  $x$  from step 2.

Value of $x$	Value of $y$ : $y = \frac{1}{2} \sin x$	Coordinates of key point
0	$y = \frac{1}{2} \sin 0 = \frac{1}{2} \cdot 0 = 0$	(0, 0)
$\frac{\pi}{2}$	$y = \frac{1}{2} \sin \frac{\pi}{2} = \frac{1}{2} \cdot 1 = \frac{1}{2}$	$(\frac{\pi}{2}, \frac{1}{2})$ <span style="float: right;">maximum point</span>
$\pi$	$y = \frac{1}{2} \sin \pi = \frac{1}{2} \cdot 0 = 0$	( $\pi$ , 0)
$\frac{3\pi}{2}$	$y = \frac{1}{2} \sin \frac{3\pi}{2} = \frac{1}{2}(-1) = -\frac{1}{2}$	$(\frac{3\pi}{2}, -\frac{1}{2})$ <span style="float: right;">minimum point</span>
$2\pi$	$y = \frac{1}{2} \sin 2\pi = \frac{1}{2} \cdot 0 = 0$	( $2\pi$ , 0)

**FIGURE 4.66** The graphs of  $y = \sin x$  and  $y = \frac{1}{2} \sin x$ ,  $0 \leq x \leq 2\pi$

There are  $x$ -intercepts at  $0$ ,  $\pi$ , and  $2\pi$ . The maximum and minimum points are indicated by the voice balloons.

**Step 4 Connect the five key points with a smooth curve and graph one complete cycle of the given function.** The five key points for  $y = \frac{1}{2} \sin x$  are shown in red in **Figure 4.66**. By connecting the points with a smooth curve, the figure shows one complete cycle of  $y = \frac{1}{2} \sin x$ . Also shown is the graph of  $y = \sin x$ . The graph of  $y = \frac{1}{2} \sin x$  is the graph of  $y = \sin x$  vertically shrunk by a factor of  $\frac{1}{2}$ . ●●●

**Check Point 1** Determine the amplitude of  $y = 3 \sin x$ . Then graph  $y = \sin x$  and  $y = 3 \sin x$  for  $0 \leq x \leq 2\pi$ .

### EXAMPLE 2 Graphing a Variation of $y = \sin x$

Determine the amplitude of  $y = -2 \sin x$ . Then graph  $y = \sin x$  and  $y = -2 \sin x$  for  $-\pi \leq x \leq 3\pi$ .

#### SOLUTION

**Step 1 Identify the amplitude and the period.** The equation  $y = -2 \sin x$  is of the form  $y = A \sin x$  with  $A = -2$ . Thus, the amplitude is  $|A| = |-2| = 2$ . This means that the maximum value of  $y$  is 2 and the minimum value of  $y$  is  $-2$ . Both  $y = \sin x$  and  $y = -2 \sin x$  have a period of  $2\pi$ .

**Step 2 Find the values of  $x$  for the five key points.** Begin by dividing the period,  $2\pi$ , by 4.

$$\frac{\text{period}}{4} = \frac{2\pi}{4} = \frac{\pi}{2}$$

Start with the value of  $x$  where the cycle begins:  $x_1 = 0$ . Adding quarter-periods,  $\frac{\pi}{2}$ , the five  $x$ -values for the key points are

$$x_1 = 0, \quad x_2 = 0 + \frac{\pi}{2} = \frac{\pi}{2}, \quad x_3 = \frac{\pi}{2} + \frac{\pi}{2} = \pi,$$

$$x_4 = \pi + \frac{\pi}{2} = \frac{3\pi}{2}, \quad x_5 = \frac{3\pi}{2} + \frac{\pi}{2} = 2\pi.$$

Although we will be graphing on  $[-\pi, 3\pi]$ , we select  $x_1 = 0$  rather than  $x_1 = -\pi$ . Knowing the graph's shape on  $[0, 2\pi]$  will enable us to continue the pattern and extend it to the left to  $-\pi$  and to the right to  $3\pi$ .

**Step 3 Find the values of  $y$  for the five key points.** We evaluate the function at each value of  $x$  from step 2.

Value of $x$	Value of $y$ : $y = -2 \sin x$	Coordinates of key point	
0	$y = -2 \sin 0 = -2 \cdot 0 = 0$	$(0, 0)$	
$\frac{\pi}{2}$	$y = -2 \sin \frac{\pi}{2} = -2 \cdot 1 = -2$	$(\frac{\pi}{2}, -2)$	minimum point
$\pi$	$y = -2 \sin \pi = -2 \cdot 0 = 0$	$(\pi, 0)$	
$\frac{3\pi}{2}$	$y = -2 \sin \frac{3\pi}{2} = -2(-1) = 2$	$(\frac{3\pi}{2}, 2)$	maximum point
$2\pi$	$y = -2 \sin 2\pi = -2 \cdot 0 = 0$	$(2\pi, 0)$	

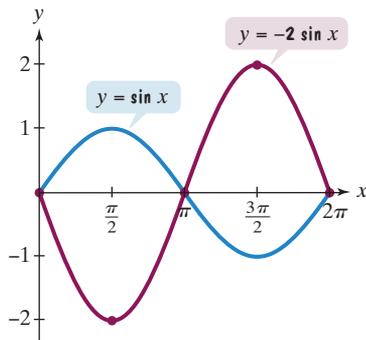

FIGURE 4.67 The graphs of  $y = \sin x$  and  $y = -2 \sin x$ ,  $0 \leq x \leq 2\pi$

There are  $x$ -intercepts at  $0, \pi$ , and  $2\pi$ . The minimum and maximum points are indicated by the voice balloons.

**Step 4 Connect the five key points with a smooth curve and graph one complete cycle of the given function.** The five key points for  $y = -2 \sin x$  are shown in red in **Figure 4.67**. By connecting the points with a smooth curve, the dark red portion shows one complete cycle of  $y = -2 \sin x$ . Also shown in dark blue is one complete cycle of the graph of  $y = \sin x$ . The graph of  $y = -2 \sin x$  is the graph of  $y = \sin x$  reflected about the  $x$ -axis and vertically stretched by a factor of 2.

**Step 5 Extend the graph in step 4 to the left or right as desired.** The dark red and dark blue portions of the graphs in **Figure 4.67** are from  $0$  to  $2\pi$ . In order to graph for  $-\pi \leq x \leq 3\pi$ , continue the pattern of each graph to the left and to the right. These extensions are shown by the lighter colors in **Figure 4.68**.

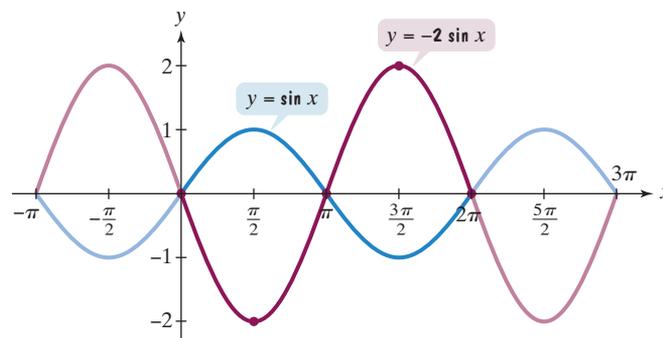

FIGURE 4.68 The graphs of  $y = \sin x$  and  $y = -2 \sin x$ ,  $-\pi \leq x \leq 3\pi$

 **Check Point 2** Determine the amplitude of  $y = -\frac{1}{2} \sin x$ . Then graph  $y = \sin x$  and  $y = -\frac{1}{2} \sin x$  for  $-\pi \leq x \leq 3\pi$ .

**GREAT QUESTION!**

What should I do to graph functions of the form  $y = A \sin Bx$  if  $B$  is negative?

If  $B < 0$  in  $y = A \sin Bx$ , use  $\sin(-\theta) = -\sin \theta$  to rewrite the equation before obtaining its graph.

Now let us examine the graphs of functions of the form  $y = A \sin Bx$ , where  $B$  is the coefficient of  $x$  and  $B > 0$ . How do such graphs compare to those of functions of the form  $y = A \sin x$ ? We know that  $y = A \sin x$  completes one cycle from  $x = 0$  to  $x = 2\pi$ . Thus,  $y = A \sin Bx$  completes one cycle as  $Bx$  increases from 0 to  $2\pi$ . Set up an inequality to represent this and solve for  $x$  to determine the values of  $x$  for which  $y = \sin Bx$  completes one cycle.

$$0 \leq Bx \leq 2\pi \quad y = \sin Bx \text{ completes one cycle as } Bx \text{ increases from } 0 \text{ to } 2\pi.$$

$$0 \leq x \leq \frac{2\pi}{B} \quad \text{Divide by } B, \text{ where } B > 0, \text{ and solve for } x.$$

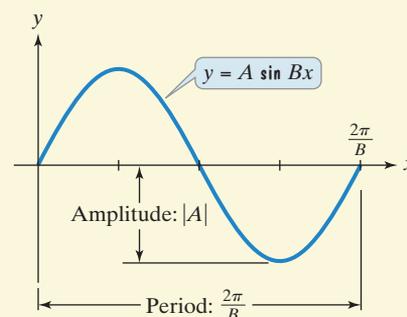

The inequality  $0 \leq x \leq \frac{2\pi}{B}$  means that  $y = A \sin Bx$  completes one cycle from 0 to  $\frac{2\pi}{B}$ . The period is  $\frac{2\pi}{B}$ . The graph of  $y = A \sin Bx$  is the graph of  $y = A \sin x$  horizontally shrunk by a factor of  $\frac{1}{B}$  if  $B > 1$  and horizontally stretched by a factor of  $\frac{1}{B}$  if  $0 < B < 1$ .

**Amplitudes and Periods**

The graph of  $y = A \sin Bx$ ,  $B > 0$ , has

$$\text{amplitude} = |A|$$

$$\text{period} = \frac{2\pi}{B}.$$

**EXAMPLE 3** Graphing a Function of the Form  $y = A \sin Bx$ 

Determine the amplitude and period of  $y = 3 \sin 2x$ . Then graph the function for  $0 \leq x \leq 2\pi$ .

**SOLUTION**

**Step 1 Identify the amplitude and the period.** The equation  $y = 3 \sin 2x$  is of the form  $y = A \sin Bx$  with  $A = 3$  and  $B = 2$ .

$$\text{amplitude: } |A| = |3| = 3$$

$$\text{period: } \frac{2\pi}{B} = \frac{2\pi}{2} = \pi$$

The amplitude, 3, tells us that the maximum value of  $y$  is 3 and the minimum value of  $y$  is  $-3$ . The period,  $\pi$ , tells us that the graph completes one cycle from 0 to  $\pi$ .

**Step 2 Find the values of  $x$  for the five key points.** Begin by dividing the period of  $y = 3 \sin 2x$ ,  $\pi$ , by 4.

$$\frac{\text{period}}{4} = \frac{\pi}{4}$$

Start with the value of  $x$  where the cycle begins:  $x_1 = 0$ . Adding quarter-periods,  $\frac{\pi}{4}$ , the five  $x$ -values for the key points are

$$x_1 = 0, \quad x_2 = 0 + \frac{\pi}{4} = \frac{\pi}{4}, \quad x_3 = \frac{\pi}{4} + \frac{\pi}{4} = \frac{\pi}{2},$$

$$x_4 = \frac{\pi}{2} + \frac{\pi}{4} = \frac{3\pi}{4}, \quad x_5 = \frac{3\pi}{4} + \frac{\pi}{4} = \pi.$$

**Step 3 Find the values of  $y$  for the five key points.** We evaluate the function at each value of  $x$  from step 2.

Value of $x$	Value of $y$ : $y = 3 \sin 2x$	Coordinates of key point
0	$y = 3 \sin(2 \cdot 0)$ $= 3 \sin 0 = 3 \cdot 0 = 0$	(0, 0)
$\frac{\pi}{4}$	$y = 3 \sin\left(2 \cdot \frac{\pi}{4}\right)$ $= 3 \sin \frac{\pi}{2} = 3 \cdot 1 = 3$	$\left(\frac{\pi}{4}, 3\right)$
$\frac{\pi}{2}$	$y = 3 \sin\left(2 \cdot \frac{\pi}{2}\right)$ $= 3 \sin \pi = 3 \cdot 0 = 0$	$\left(\frac{\pi}{2}, 0\right)$
$\frac{3\pi}{4}$	$y = 3 \sin\left(2 \cdot \frac{3\pi}{4}\right)$ $= 3 \sin \frac{3\pi}{2} = 3(-1) = -3$	$\left(\frac{3\pi}{4}, -3\right)$
$\pi$	$y = 3 \sin(2 \cdot \pi)$ $= 3 \sin 2\pi = 3 \cdot 0 = 0$	( $\pi$ , 0)

maximum point

minimum point

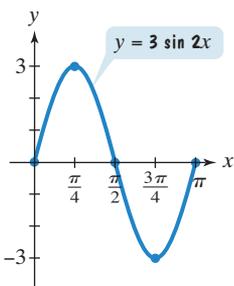

FIGURE 4.69 The graph of  $y = 3 \sin 2x$ ,  $0 \leq x \leq \pi$

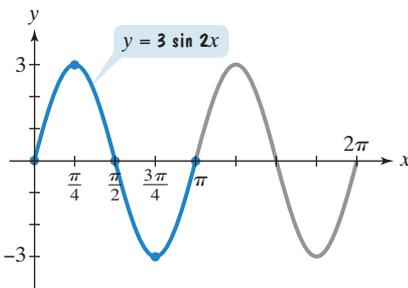

FIGURE 4.70

In the interval  $[0, \pi]$ , there are  $x$ -intercepts at  $0$ ,  $\frac{\pi}{2}$ , and  $\pi$ . The maximum and minimum points are indicated by the voice balloons.

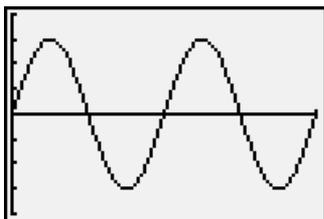

**Step 4 Connect the five key points with a smooth curve and graph one complete cycle of the given function.** The five key points for  $y = 3 \sin 2x$  are shown in Figure 4.69. By connecting the points with a smooth curve, the blue portion shows one complete cycle of  $y = 3 \sin 2x$  from  $0$  to  $\pi$ . The graph of  $y = 3 \sin 2x$  is the graph of  $y = \sin x$  vertically stretched by a factor of 3 and horizontally shrunk by a factor of  $\frac{1}{2}$ .

**Step 5 Extend the graph in step 4 to the left or right as desired.** The blue portion of the graph in Figure 4.69 is from  $0$  to  $\pi$ . In order to graph for  $0 \leq x \leq 2\pi$ , we continue this portion and extend the graph another full period to the right. This extension is shown in graph in Figure 4.70.

**Check Point 3** Determine the amplitude and period of  $y = 2 \sin \frac{1}{2}x$ . Then graph the function for  $0 \leq x \leq 8\pi$ .

### TECHNOLOGY

The graph of  $y = 3 \sin 2x$  in a  $\left[0, 2\pi, \frac{\pi}{2}\right]$  by  $[-4, 4, 1]$  viewing rectangle verifies our hand-drawn graph in Figure 4.70.

Now let us examine the graphs of functions of the form  $y = A \sin(Bx - C)$ , where  $B > 0$ . How do such graphs compare to those of functions of the form  $y = A \sin Bx$ ? In both cases, the amplitude is  $|A|$  and the period is  $\frac{2\pi}{B}$ . One complete cycle occurs as  $Bx - C$  increases from  $0$  to  $2\pi$ . This means that we can find an interval containing one cycle by solving the following inequality:

$$0 \leq Bx - C \leq 2\pi.$$

$$C \leq Bx \leq C + 2\pi$$

$$\frac{C}{B} \leq x \leq \frac{C}{B} + \frac{2\pi}{B}$$

$y = A \sin(Bx - C)$  completes one cycle as  $Bx - C$  increases from  $0$  to  $2\pi$ .

Add  $C$  to all three parts.

Divide by  $B$ , where  $B > 0$ , and solve for  $x$ .

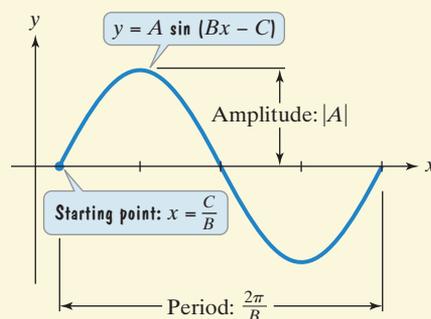

This is the  $x$ -coordinate on the left where the cycle begins.

This is the  $x$ -coordinate on the right where the cycle ends.  $\frac{2\pi}{B}$  is the period.

The voice balloon on the left at the bottom of the previous page indicates that the graph of  $y = A \sin(Bx - C)$  is the graph of  $y = A \sin Bx$  shifted horizontally by  $\frac{C}{B}$ . Thus, the number  $\frac{C}{B}$  is the **phase shift** associated with the graph.

### The Graph of $y = A \sin(Bx - C)$

The graph of  $y = A \sin(Bx - C)$ ,  $B > 0$ , is obtained by horizontally shifting the graph of  $y = A \sin Bx$  so that the starting point of the cycle is shifted from  $x = 0$  to  $x = \frac{C}{B}$ . If  $\frac{C}{B} > 0$ , the shift is to the right. If  $\frac{C}{B} < 0$ , the shift is to the left. The number  $\frac{C}{B}$  is called the **phase shift**.

$$\text{amplitude} = |A|$$

$$\text{period} = \frac{2\pi}{B}$$

### EXAMPLE 4 Graphing a Function of the Form $y = A \sin(Bx - C)$

Determine the amplitude, period, and phase shift of  $y = 4 \sin\left(2x - \frac{2\pi}{3}\right)$ . Then graph one period of the function.

#### SOLUTION

**Step 1 Identify the amplitude, the period, and the phase shift.** We must first identify values for  $A$ ,  $B$ , and  $C$ .

The equation is of the form  
 $y = A \sin(Bx - C)$ .

$$y = 4 \sin\left(2x - \frac{2\pi}{3}\right)$$

Using the voice balloon, we see that  $A = 4$ ,  $B = 2$ , and  $C = \frac{2\pi}{3}$ .

amplitude:  $|A| = |4| = 4$

The maximum value of  $y$  is 4  
and the minimum is  $-4$ .

period:  $\frac{2\pi}{B} = \frac{2\pi}{2} = \pi$

Each cycle is  
of length  $\pi$ .

phase shift:  $\frac{C}{B} = \frac{\frac{2\pi}{3}}{2} = \frac{2\pi}{3} \cdot \frac{1}{2} = \frac{\pi}{3}$

A cycle starts at  $x = \frac{\pi}{3}$ .

**Step 2 Find the values of  $x$  for the five key points.** Begin by dividing the period,  $\pi$ , by 4.

$$\frac{\text{period}}{4} = \frac{\pi}{4}$$

**GREAT QUESTION!**

Is there a way I can speed up the additions shown on the right?

Yes. First write the starting point,  $\frac{\pi}{3}$ , and the quarter-period,  $\frac{\pi}{4}$ , with a common denominator, 12.

$$\text{starting point} = \frac{\pi}{3} = \frac{4\pi}{12}$$

$$\text{quarter-period} = \frac{\pi}{4} = \frac{3\pi}{12}$$

Start with the value of  $x$  where the cycle begins:  $x_1 = \frac{\pi}{3}$ . Adding quarter-periods,  $\frac{\pi}{4}$ , the five  $x$ -values for the key points are

$$x_1 = \frac{\pi}{3}, \quad x_2 = \frac{\pi}{3} + \frac{\pi}{4} = \frac{4\pi}{12} + \frac{3\pi}{12} = \frac{7\pi}{12},$$

$$x_3 = \frac{7\pi}{12} + \frac{\pi}{4} = \frac{7\pi}{12} + \frac{3\pi}{12} = \frac{10\pi}{12} = \frac{5\pi}{6},$$

$$x_4 = \frac{5\pi}{6} + \frac{\pi}{4} = \frac{10\pi}{12} + \frac{3\pi}{12} = \frac{13\pi}{12},$$

$$x_5 = \frac{13\pi}{12} + \frac{\pi}{4} = \frac{13\pi}{12} + \frac{3\pi}{12} = \frac{16\pi}{12} = \frac{4\pi}{3}.$$

**GREAT QUESTION!**

Is there a way to check my computations for the  $x$ -values for the five key points?

Yes. The difference between  $x_5$  and  $x_1$ , or  $x_5 - x_1$ , should equal the period.

$$x_5 - x_1 = \frac{4\pi}{3} - \frac{\pi}{3} = \frac{3\pi}{3} = \pi$$

Because the period is  $\pi$ , this verifies that our five  $x$ -values are correct.

**Step 3 Find the values of  $y$  for the five key points.** We evaluate the function at each value of  $x$  from step 2.

Value of $x$	Value of $y$ : $y = 4 \sin\left(2x - \frac{2\pi}{3}\right)$	Coordinates of key point
$\frac{\pi}{3}$	$y = 4 \sin\left(2 \cdot \frac{\pi}{3} - \frac{2\pi}{3}\right)$ $= 4 \sin 0 = 4 \cdot 0 = 0$	$\left(\frac{\pi}{3}, 0\right)$
$\frac{7\pi}{12}$	$y = 4 \sin\left(2 \cdot \frac{7\pi}{12} - \frac{2\pi}{3}\right)$ $= 4 \sin\left(\frac{7\pi}{6} - \frac{4\pi}{6}\right)$ $= 4 \sin \frac{3\pi}{6} = 4 \sin \frac{\pi}{2} = 4 \cdot 1 = 4$	$\left(\frac{7\pi}{12}, 4\right)$ <span style="border: 1px solid black; border-radius: 50%; padding: 2px;">maximum point</span>
$\frac{5\pi}{6}$	$y = 4 \sin\left(2 \cdot \frac{5\pi}{6} - \frac{2\pi}{3}\right)$ $= 4 \sin\left(\frac{5\pi}{3} - \frac{2\pi}{3}\right)$ $= 4 \sin \frac{3\pi}{3} = 4 \sin \pi = 4 \cdot 0 = 0$	$\left(\frac{5\pi}{6}, 0\right)$
$\frac{13\pi}{12}$	$y = 4 \sin\left(2 \cdot \frac{13\pi}{12} - \frac{2\pi}{3}\right)$ $= 4 \sin\left(\frac{13\pi}{6} - \frac{4\pi}{6}\right)$ $= 4 \sin \frac{9\pi}{6} = 4 \sin \frac{3\pi}{2} = 4(-1) = -4$	$\left(\frac{13\pi}{12}, -4\right)$ <span style="border: 1px solid black; border-radius: 50%; padding: 2px;">minimum point</span>
$\frac{4\pi}{3}$	$y = 4 \sin\left(2 \cdot \frac{4\pi}{3} - \frac{2\pi}{3}\right)$ $= 4 \sin \frac{6\pi}{3} = 4 \sin 2\pi = 4 \cdot 0 = 0$	$\left(\frac{4\pi}{3}, 0\right)$

In the interval  $\left[\frac{\pi}{3}, \frac{4\pi}{3}\right]$ , there are  $x$ -intercepts at  $\frac{\pi}{3}$ ,  $\frac{5\pi}{6}$ , and  $\frac{4\pi}{3}$ . The maximum and minimum points are indicated by the voice balloons.

**Step 4** Connect the five key points with a smooth curve and graph one complete cycle of the given function. The five key points,  $(\frac{\pi}{3}, 0)$ ,  $(\frac{7\pi}{12}, 4)$ ,  $(\frac{5\pi}{6}, 0)$ ,  $(\frac{13\pi}{12}, -4)$ , and  $(\frac{4\pi}{3}, 0)$ , are shown on the graph of  $y = 4 \sin(2x - \frac{2\pi}{3})$  in

Figure 4.71.

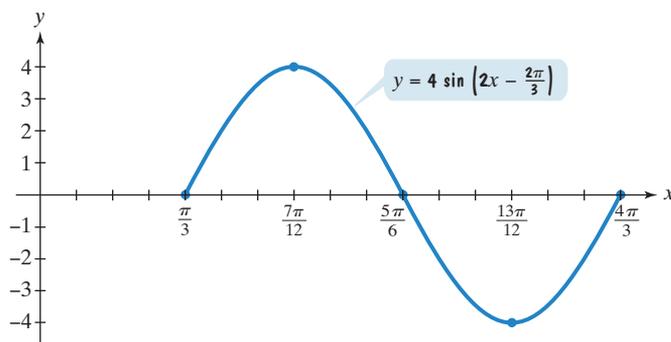

FIGURE 4.71

**Check Point 4** Determine the amplitude, period, and phase shift of  $y = 3 \sin(2x - \frac{\pi}{3})$ . Then graph one period of the function.

**3** Understand the graph of  $y = \cos x$ .

### The Graph of $y = \cos x$

We graph  $y = \cos x$  by listing some points on the graph. Because the period of the cosine function is  $2\pi$ , we will concentrate on the graph of the basic cosine curve on the interval  $[0, 2\pi]$ . The rest of the graph is made up of repetitions of this portion. **Table 4.4** lists some values of  $(x, y)$  on the graph of  $y = \cos x$ .

Table 4.4 Values of  $(x, y)$  on the Graph of  $y = \cos x$

$x$	0	$\frac{\pi}{6}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{5\pi}{6}$	$\pi$	$\frac{7\pi}{6}$	$\frac{4\pi}{3}$	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{11\pi}{6}$	$2\pi$
$y = \cos x$	1	$\frac{\sqrt{3}}{2}$	$\frac{1}{2}$	0	$-\frac{1}{2}$	$-\frac{\sqrt{3}}{2}$	-1	$-\frac{\sqrt{3}}{2}$	$-\frac{1}{2}$	0	$\frac{1}{2}$	$\frac{\sqrt{3}}{2}$	1

As  $x$  increases from 0 to  $\frac{\pi}{2}$ ,  $y$  decreases from 1 to 0.

As  $x$  increases from  $\frac{\pi}{2}$  to  $\pi$ ,  $y$  decreases from 0 to -1.

As  $x$  increases from  $\pi$  to  $\frac{3\pi}{2}$ ,  $y$  increases from -1 to 0.

As  $x$  increases from  $\frac{3\pi}{2}$  to  $2\pi$ ,  $y$  increases from 0 to 1.

Plotting the points in **Table 4.4** and connecting them with a smooth curve, we obtain the graph shown in **Figure 4.72**. The portion of the graph in dark blue shows one complete period. We can obtain a more complete graph of  $y = \cos x$  by extending this dark blue portion to the left and to the right.

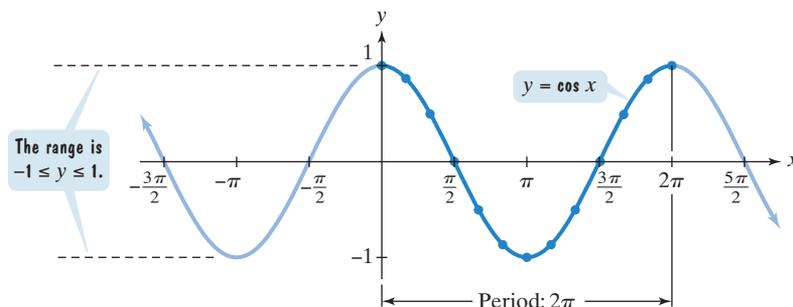

FIGURE 4.72 The graph of  $y = \cos x$

The graph of  $y = \cos x$  allows us to visualize some of the properties of the cosine function.

- The domain is  $(-\infty, \infty)$ , the set of all real numbers. The graph extends indefinitely to the left and to the right with no gaps or holes.
- The range is  $[-1, 1]$ , the set of all real numbers between  $-1$  and  $1$ , inclusive. The graph never rises above  $1$  or falls below  $-1$ .
- The period is  $2\pi$ . The graph's pattern repeats in every interval of length  $2\pi$ .
- The function is an even function:  $\cos(-x) = \cos x$ . This can be seen by observing that the graph is symmetric with respect to the  $y$ -axis.

Take a second look at **Figure 4.72**. Can you see that the graph of  $y = \cos x$  is the graph of  $y = \sin x$  with a phase shift of  $-\frac{\pi}{2}$ ? If you trace along the curve from  $x = -\frac{\pi}{2}$  to  $x = \frac{3\pi}{2}$ , you are tracing one complete cycle of the sine curve. This can be expressed as an identity:

$$\cos x = \sin\left(x + \frac{\pi}{2}\right).$$

Because of this similarity, the graphs of sine functions and cosine functions are called **sinusoidal graphs**.

#### 4 Graph variations of $y = \cos x$ .

#### Graphing Variations of $y = \cos x$

We use the same steps to graph variations of  $y = \cos x$  as we did for graphing variations of  $y = \sin x$ . We will continue finding key points by dividing the period into four equal parts. Amplitudes, periods, and phase shifts play an important role when graphing by hand.

### GREAT QUESTION!

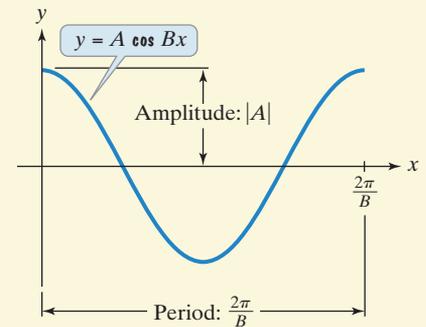

**What should I do to graph functions of the form  $y = A \cos Bx$  if  $B$  is negative?**  
If  $B < 0$  in  $y = A \cos Bx$ , use  $\cos(-\theta) = \cos \theta$  to rewrite the equation before obtaining its graph.

#### The Graph of $y = A \cos Bx$

The graph of  $y = A \cos Bx$ ,  $B > 0$ , has

$$\text{amplitude} = |A|$$

$$\text{period} = \frac{2\pi}{B}.$$

#### EXAMPLE 5 Graphing a Function of the Form $y = A \cos Bx$

Determine the amplitude and period of  $y = -3 \cos \frac{\pi}{2}x$ . Then graph the function for  $-4 \leq x \leq 4$ .

#### SOLUTION

**Step 1 Identify the amplitude and the period.** The equation  $y = -3 \cos \frac{\pi}{2}x$  is of the form  $y = A \cos Bx$  with  $A = -3$  and  $B = \frac{\pi}{2}$ .

amplitude:  $|A| = |-3| = 3$  The maximum value of  $y$  is 3 and the minimum is  $-3$ .

period:  $\frac{2\pi}{B} = \frac{2\pi}{\frac{\pi}{2}} = 2\cancel{\pi} \cdot \frac{2}{\cancel{\pi}} = 4$  Each cycle is of length 4.

**Step 2 Find the values of  $x$  for the five key points.** Begin by dividing the period, 4, by 4.

$$\frac{\text{period}}{4} = \frac{4}{4} = 1$$

Start with the value of  $x$  where the cycle begins:  $x_1 = 0$ . Adding quarter-periods, 1, the five  $x$ -values for the key points are

$$x_1 = 0, \quad x_2 = 0 + 1 = 1, \quad x_3 = 1 + 1 = 2, \quad x_4 = 2 + 1 = 3, \quad x_5 = 3 + 1 = 4.$$

**Step 3 Find the values of  $y$  for the five key points.** We evaluate the function at each value of  $x$  from step 2.

Value of $x$	Value of $y$ : $y = -3 \cos \frac{\pi}{2}x$	Coordinates of key point
0	$y = -3 \cos \left( \frac{\pi}{2} \cdot 0 \right)$ $= -3 \cos 0 = -3 \cdot 1 = -3$	(0, -3) <span style="float: right;">minimum point</span>
1	$y = -3 \cos \left( \frac{\pi}{2} \cdot 1 \right)$ $= -3 \cos \frac{\pi}{2} = -3 \cdot 0 = 0$	(1, 0)
2	$y = -3 \cos \left( \frac{\pi}{2} \cdot 2 \right)$ $= -3 \cos \pi = -3(-1) = 3$	(2, 3) <span style="float: right;">maximum point</span>
3	$y = -3 \cos \left( \frac{\pi}{2} \cdot 3 \right)$ $= -3 \cos \frac{3\pi}{2} = -3 \cdot 0 = 0$	(3, 0)
4	$y = -3 \cos \left( \frac{\pi}{2} \cdot 4 \right)$ $= -3 \cos 2\pi = -3 \cdot 1 = -3$	(4, -3) <span style="float: right;">minimum point</span>

In the interval  $[0, 4]$ , there are  $x$ -intercepts at 1 and 3. The minimum and maximum points are indicated by the voice balloons.

**Step 4 Connect the five key points with a smooth curve and graph one complete cycle of the given function.** The five key points for  $y = -3 \cos \frac{\pi}{2}x$  are shown in

**Figure 4.73.** By connecting the points with a smooth curve, the blue portion shows one complete cycle of  $y = -3 \cos \frac{\pi}{2}x$  from 0 to 4.

**Step 5 Extend the graph in step 4 to the left or right as desired.** The blue portion of the graph in **Figure 4.73** is for  $x$  from 0 to 4. In order to graph for  $-4 \leq x \leq 4$ , we continue this portion and extend the graph another full period to the left. This extension is shown in **Figure 4.73**.

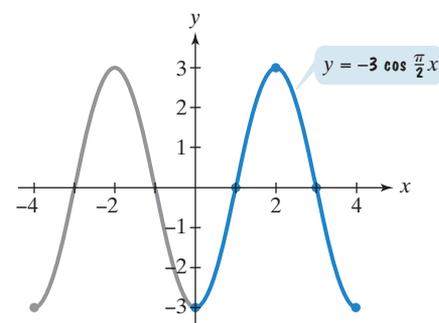

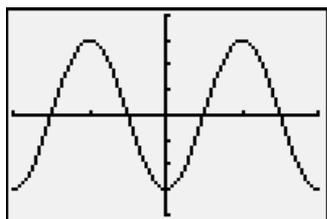

FIGURE 4.73

## TECHNOLOGY

The graph of  $y = -3 \cos \frac{\pi}{2}x$  in a  $[-4, 4, 1]$  by  $[-4, 4, 1]$  viewing rectangle verifies our hand-drawn graph in **Figure 4.73**.

**Check Point 5** Determine the amplitude and period of  $y = -4 \cos \pi x$ . Then graph the function for  $-2 \leq x \leq 2$ .

Finally, let us examine the graphs of functions of the form  $y = A \cos(Bx - C)$ . Graphs of these functions shift the graph of  $y = A \cos Bx$  horizontally by  $\frac{C}{B}$ .

### The Graph of $y = A \cos(Bx - C)$

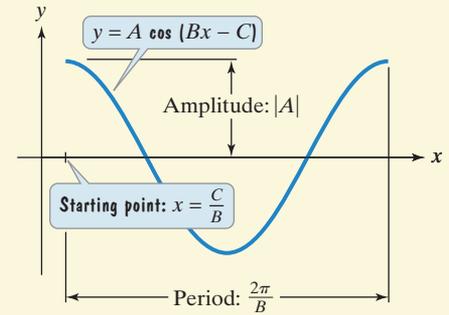

The graph of  $y = A \cos(Bx - C)$ ,  $B > 0$ , is obtained by horizontally shifting the graph of  $y = A \cos Bx$  so that the starting point of the cycle is shifted from

$x = 0$  to  $x = \frac{C}{B}$ . If  $\frac{C}{B} > 0$ , the shift is to the right. If  $\frac{C}{B} < 0$ , the shift is to the left.

The number  $\frac{C}{B}$  is called the **phase shift**.

$$\text{amplitude} = |A|$$

$$\text{period} = \frac{2\pi}{B}$$

### EXAMPLE 6 Graphing a Function of the Form $y = A \cos(Bx - C)$

Determine the amplitude, period, and phase shift of  $y = \frac{1}{2} \cos(4x + \pi)$ . Then graph one period of the function.

#### SOLUTION

**Step 1 Identify the amplitude, the period, and the phase shift.** We must first identify values for  $A$ ,  $B$ , and  $C$ . To do this, we need to express the equation in the form  $y = A \cos(Bx - C)$ . Thus, we write  $y = \frac{1}{2} \cos(4x + \pi)$  as  $y = \frac{1}{2} \cos[4x - (-\pi)]$ . Now we can identify values for  $A$ ,  $B$ , and  $C$ .

The equation is of the form  
 $y = A \cos(Bx - C)$ .

$$y = \frac{1}{2} \cos[4x - (-\pi)]$$

Using the voice balloon, we see that  $A = \frac{1}{2}$ ,  $B = 4$ , and  $C = -\pi$ .

$$\text{amplitude: } |A| = \left| \frac{1}{2} \right| = \frac{1}{2}$$

The maximum value of  $y$  is  $\frac{1}{2}$   
and the minimum is  $-\frac{1}{2}$ .

$$\text{period: } \frac{2\pi}{B} = \frac{2\pi}{4} = \frac{\pi}{2}$$

Each cycle is of length  $\frac{\pi}{2}$ .

$$\text{phase shift: } \frac{C}{B} = -\frac{\pi}{4}$$

A cycle starts at  $x = -\frac{\pi}{4}$ .

**Step 2 Find the values of  $x$  for the five key points.** Begin by dividing the period,  $\frac{\pi}{2}$ , by 4.

$$\frac{\text{period}}{4} = \frac{\frac{\pi}{2}}{4} = \frac{\pi}{8}$$

Start with the value of  $x$  where the cycle begins:  $x_1 = -\frac{\pi}{4}$ . Adding quarter-periods,  $\frac{\pi}{8}$ , the five  $x$ -values for the key points are

$$x_1 = -\frac{\pi}{4}, \quad x_2 = -\frac{\pi}{4} + \frac{\pi}{8} = -\frac{2\pi}{8} + \frac{\pi}{8} = -\frac{\pi}{8}, \quad x_3 = -\frac{\pi}{8} + \frac{\pi}{8} = 0,$$

$$x_4 = 0 + \frac{\pi}{8} = \frac{\pi}{8}, \quad x_5 = \frac{\pi}{8} + \frac{\pi}{8} = \frac{2\pi}{8} = \frac{\pi}{4}.$$

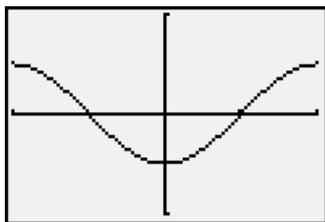

## TECHNOLOGY

The graph of

$$y = \frac{1}{2} \cos(4x + \pi)$$

in a  $\left[-\frac{\pi}{4}, \frac{\pi}{4}, \frac{\pi}{8}\right]$  by  $[-1, 1, 1]$

viewing rectangle verifies our hand-drawn graph in **Figure 4.74**.

**Step 3 Find the values of  $y$  for the five key points.** Take a few minutes and use your calculator to evaluate the function at each value of  $x$  from step 2. Show that the key points are

$$\left(-\frac{\pi}{4}, \frac{1}{2}\right), \quad \left(-\frac{\pi}{8}, 0\right), \quad \left(0, -\frac{1}{2}\right), \quad \left(\frac{\pi}{8}, 0\right), \quad \text{and} \quad \left(\frac{\pi}{4}, \frac{1}{2}\right).$$

maximum  
point

$x$ -intercept  
at  $-\frac{\pi}{8}$

minimum  
point

$x$ -intercept  
at  $\frac{\pi}{8}$

maximum  
point

**Step 4 Connect the five key points with a smooth curve and graph one complete cycle of the given function.** The key points and the graph of  $y = \frac{1}{2} \cos(4x + \pi)$  are shown in **Figure 4.74**.

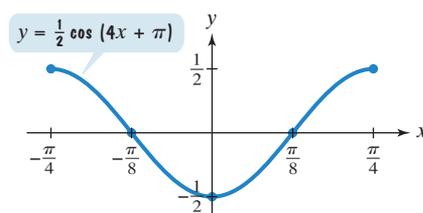

FIGURE 4.74

 **Check Point 6** Determine the amplitude, period, and phase shift of  $y = \frac{3}{2} \cos(2x + \pi)$ . Then graph one period of the function.

- 5** Use vertical shifts of sine and cosine curves.

## Vertical Shifts of Sinusoidal Graphs

We now look at sinusoidal graphs of functions of the form

$$y = A \sin(Bx - C) + D \quad \text{and} \quad y = A \cos(Bx - C) + D.$$

The constant  $D$  causes a vertical shift in each of the graphs of  $y = A \sin(Bx - C)$  and  $y = A \cos(Bx - C)$ . If  $D$  is positive, the shift is  $D$  units upward. If  $D$  is negative, the shift is  $|D|$  units downward. These vertical shifts result in sinusoidal graphs oscillating about the horizontal line  $y = D$  rather than about the  $x$ -axis. Thus, the maximum value of  $y$  is  $D + |A|$  and the minimum value of  $y$  is  $D - |A|$ .

### EXAMPLE 7 A Vertical Shift

Graph one period of the function  $y = \frac{1}{2} \cos x - 1$ .

#### SOLUTION

The graph of  $y = \frac{1}{2} \cos x - 1$  is the graph of  $y = \frac{1}{2} \cos x$  shifted one unit downward. The period of  $y = \frac{1}{2} \cos x$  is  $2\pi$ , which is also the period for the vertically shifted graph. The key points on the interval  $[0, 2\pi]$  for  $y = \frac{1}{2} \cos x - 1$  are found by first determining their  $x$ -coordinates. The quarter-period is  $\frac{2\pi}{4}$ , or  $\frac{\pi}{2}$ . The cycle begins at  $x = 0$ . As always, we add quarter-periods to generate  $x$ -values for each of the key points. The five  $x$ -values are

$$x_1 = 0, \quad x_2 = 0 + \frac{\pi}{2} = \frac{\pi}{2}, \quad x_3 = \frac{\pi}{2} + \frac{\pi}{2} = \pi,$$

$$x_4 = \pi + \frac{\pi}{2} = \frac{3\pi}{2}, \quad x_5 = \frac{3\pi}{2} + \frac{\pi}{2} = 2\pi.$$

The values of  $y$  for the five key points and their coordinates are determined as follows.

Value of $x$	Value of $y$ : $y = \frac{1}{2} \cos x - 1$	Coordinates of Key Point
0	$y = \frac{1}{2} \cos 0 - 1$ $= \frac{1}{2} \cdot 1 - 1 = -\frac{1}{2}$	$(0, -\frac{1}{2})$
$\frac{\pi}{2}$	$y = \frac{1}{2} \cos \frac{\pi}{2} - 1$ $= \frac{1}{2} \cdot 0 - 1 = -1$	$(\frac{\pi}{2}, -1)$
$\pi$	$y = \frac{1}{2} \cos \pi - 1$ $= \frac{1}{2}(-1) - 1 = -\frac{3}{2}$	$(\pi, -\frac{3}{2})$
$\frac{3\pi}{2}$	$y = \frac{1}{2} \cos \frac{3\pi}{2} - 1$ $= \frac{1}{2} \cdot 0 - 1 = -1$	$(\frac{3\pi}{2}, -1)$
$2\pi$	$y = \frac{1}{2} \cos 2\pi - 1$ $= \frac{1}{2} \cdot 1 - 1 = -\frac{1}{2}$	$(2\pi, -\frac{1}{2})$

The five key points for  $y = \frac{1}{2} \cos x - 1$  are shown in **Figure 4.75**. By connecting the points with a smooth curve, we obtain one period of the graph.

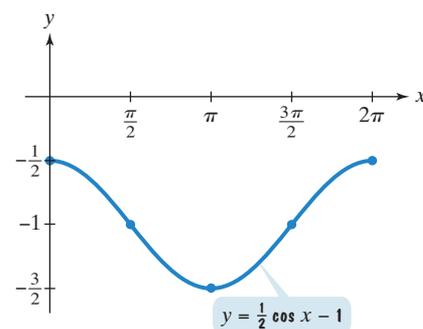

FIGURE 4.75

 **Check Point 7** Graph one period of the function  $y = 2 \cos x + 1$ .

**6** Model periodic behavior.

**Modeling Periodic Behavior**

Our breathing consists of alternating periods of inhaling and exhaling. Each complete pumping cycle of the human heart can be described using a sine function. Our brain waves during deep sleep are sinusoidal. Viewed in this way, trigonometry becomes an intimate experience.

Some graphing utilities have a SINE REGRESSION feature. This feature gives the sine function in the form  $y = A \sin(Bx + C) + D$  of best fit for wavelike data. At least four data points must be used. However, it is not always necessary to use technology. In our next example, we use our understanding of sinusoidal graphs to model the process of breathing.

**EXAMPLE 8** A Trigonometric Breath of Life

The graph in **Figure 4.76** shows one complete normal breathing cycle. The cycle consists of inhaling and exhaling. It takes place every 5 seconds. Velocity of air flow is positive when we inhale and negative when we exhale. It is measured in liters per second. If  $y$  represents velocity of air flow after  $x$  seconds, find a function of the form  $y = A \sin Bx$  that models air flow in a normal breathing cycle.

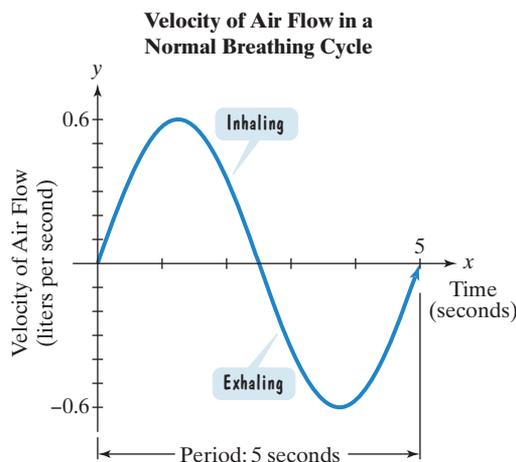

FIGURE 4.76

**SOLUTION**

We need to determine values for  $A$  and  $B$  in the equation  $y = A \sin Bx$ . The amplitude,  $A$ , is the maximum value of  $y$ . **Figure 4.76** shows that this maximum value is 0.6. Thus,  $A = 0.6$ .

The value of  $B$  in  $y = A \sin Bx$  can be found using the formula for the period:  $\text{period} = \frac{2\pi}{B}$ . The period of our breathing cycle is 5 seconds. Thus,

$$5 = \frac{2\pi}{B} \quad \text{Our goal is to solve this equation for } B.$$

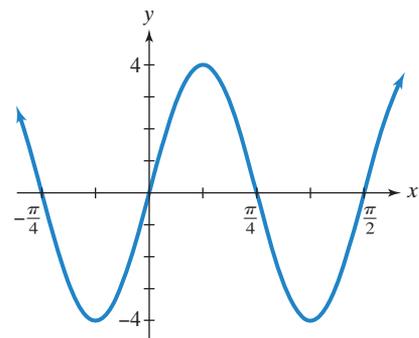

$$5B = 2\pi \quad \text{Multiply both sides of the equation by } B.$$

$$B = \frac{2\pi}{5}. \quad \text{Divide both sides of the equation by } 5.$$

We see that  $A = 0.6$  and  $B = \frac{2\pi}{5}$ . Substitute these values into  $y = A \sin Bx$ . The breathing cycle is modeled by

$$y = 0.6 \sin \frac{2\pi}{5}x. \quad \dots$$

 **Check Point 8** Find an equation of the form  $y = A \sin Bx$  that produces the graph shown in the figure on the right.

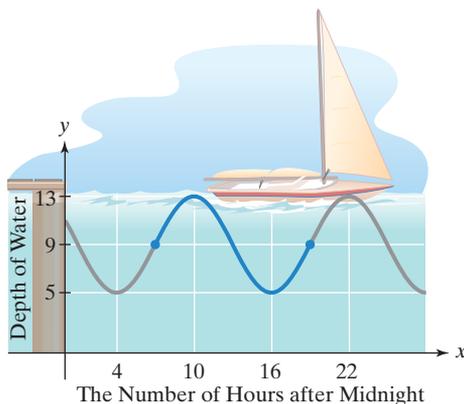

**EXAMPLE 9** Modeling a Tidal Cycle

FIGURE 4.77

**Figure 4.77** shows that the depth of water at a boat dock varies with the tides. The depth is 5 feet at low tide and 13 feet at high tide. On a certain day, low tide occurs at 4 A.M. and high tide at 10 A.M. If  $y$  represents the depth of the water, in feet,  $x$  hours after midnight, use a sine function of the form  $y = A \sin(Bx - C) + D$  to model the water's depth.

**SOLUTION**

We need to determine values for  $A$ ,  $B$ ,  $C$ , and  $D$  in the equation  $y = A \sin(Bx - C) + D$ . We can find these values using **Figure 4.77**. We begin with  $D$ .

To find  $D$ , we use the vertical shift. Because the water's depth ranges from a minimum of 5 feet to a maximum of 13 feet, the curve oscillates about the middle value, 9 feet. Thus,  $D = 9$ , which is the vertical shift.

At maximum depth, the water is 4 feet above 9 feet. Thus,  $A$ , the amplitude, is 4:  $A = 4$ .

To find  $B$ , we use the period. The blue portion of the graph shows that one complete tidal cycle occurs in  $19 - 7$ , or 12 hours. The period is 12. Thus,

$$12 = \frac{2\pi}{B} \quad \text{Our goal is to solve this equation for } B.$$

$$12B = 2\pi \quad \text{Multiply both sides by } B.$$

$$B = \frac{2\pi}{12} = \frac{\pi}{6}. \quad \text{Divide both sides by 12.}$$

To find  $C$ , we use the phase shift. The blue portion of the graph shows that the starting point of the cycle is shifted from 0 to 7. The phase shift,  $\frac{C}{B}$ , is 7.

$$7 = \frac{C}{B} \quad \text{The phase shift of } y = A \sin(Bx - C) \text{ is } \frac{C}{B}.$$

$$7 = \frac{C}{\frac{\pi}{6}} \quad \text{From above, we have } B = \frac{\pi}{6}.$$

$$\frac{7\pi}{6} = C \quad \text{Multiply both sides of the equation by } \frac{\pi}{6}.$$

We see that  $A = 4$ ,  $B = \frac{\pi}{6}$ ,  $C = \frac{7\pi}{6}$ , and  $D = 9$ . Substitute these values into  $y = A \sin(Bx - C) + D$ . The water's depth, in feet,  $x$  hours after midnight is modeled by

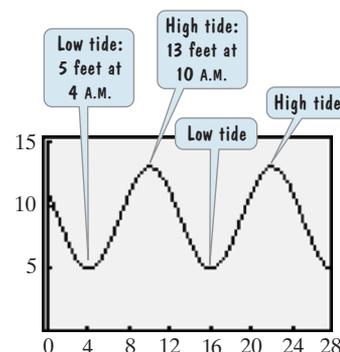

$$y = 4 \sin\left(\frac{\pi}{6}x - \frac{7\pi}{6}\right) + 9. \quad \dots$$

**TECHNOLOGY****Graphic Connections**

We can use a graphing utility to verify that the model in Example 9,

$$y = 4 \sin\left(\frac{\pi}{6}x - \frac{7\pi}{6}\right) + 9,$$

is correct. The graph of the function is shown in a  $[0, 28, 4]$  by  $[0, 15, 5]$  viewing rectangle.

 **Check Point 9** A region that is  $30^\circ$  north of the Equator averages a minimum of 10 hours of daylight in December. Hours of daylight are at a maximum of 14 hours in June. Let  $x$  represent the month of the year, with 1 for January, 2 for February, 3 for March, and 12 for December. If  $y$  represents the number of hours of daylight in month  $x$ , use a sine function of the form  $y = A \sin(Bx - C) + D$  to model the hours of daylight.

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- The graph of  $y = A \sin Bx$  has amplitude = \_\_\_\_\_ and period = \_\_\_\_\_.
- The amplitude of  $y = 3 \sin \frac{1}{2}x$  is \_\_\_\_\_ and the period is \_\_\_\_\_.
- The period of  $y = 4 \sin 2x$  is \_\_\_\_\_, so the  $x$ -values for the five key points are  $x_1 =$  \_\_\_\_\_,  $x_2 =$  \_\_\_\_\_,  $x_3 =$  \_\_\_\_\_,  $x_4 =$  \_\_\_\_\_, and  $x_5 =$  \_\_\_\_\_.
- The graph of  $y = A \sin(Bx - C)$  has phase shift \_\_\_\_\_. If this phase shift is positive, the graph of  $y = A \sin Bx$  is shifted to the \_\_\_\_\_. If this phase shift is negative, the graph of  $y = A \sin Bx$  is shifted to the \_\_\_\_\_.
- The graph of  $y = A \cos Bx$  has amplitude = \_\_\_\_\_ and period = \_\_\_\_\_.
- The amplitude of  $y = \frac{1}{2} \cos 3x$  is \_\_\_\_\_ and the period is \_\_\_\_\_.
- True or false: The graph of  $y = \cos\left(x + \frac{\pi}{4}\right)$  lies  $\frac{\pi}{4}$  units to the right of the graph of  $y = \cos x$ . \_\_\_\_\_
- True or false: The graph of  $y = \cos\left(2x - \frac{\pi}{2}\right)$  has phase shift  $\frac{\pi}{4}$ . \_\_\_\_\_
- True or false: The maximum value of the function  $y = -2 \cos x + 5$  is 7. \_\_\_\_\_
- True or false: The minimum value of the function  $y = 2 \sin x + 1$  is  $-1$ . \_\_\_\_\_

## EXERCISE SET 4.5

### Practice Exercises

In Exercises 1–6, determine the amplitude of each function. Then graph the function and  $y = \sin x$  in the same rectangular coordinate system for  $0 \leq x \leq 2\pi$ .

- $y = 4 \sin x$
- $y = 5 \sin x$
- $y = \frac{1}{3} \sin x$
- $y = \frac{1}{4} \sin x$
- $y = -3 \sin x$
- $y = -4 \sin x$

In Exercises 7–16, determine the amplitude and period of each function. Then graph one period of the function.

- $y = \sin 2x$
- $y = \sin 4x$
- $y = 3 \sin \frac{1}{2}x$
- $y = 2 \sin \frac{1}{4}x$
- $y = 4 \sin \pi x$
- $y = 3 \sin 2\pi x$
- $y = -3 \sin 2\pi x$
- $y = -2 \sin \pi x$
- $y = -\sin \frac{2}{3}x$
- $y = -\sin \frac{4}{3}x$

In Exercises 17–30, determine the amplitude, period, and phase shift of each function. Then graph one period of the function.

- $y = \sin(x - \pi)$
- $y = \sin\left(x - \frac{\pi}{2}\right)$
- $y = \sin(2x - \pi)$
- $y = \sin\left(2x - \frac{\pi}{2}\right)$
- $y = 3 \sin(2x - \pi)$
- $y = 3 \sin\left(2x - \frac{\pi}{2}\right)$
- $y = \frac{1}{2} \sin\left(x + \frac{\pi}{2}\right)$
- $y = \frac{1}{2} \sin(x + \pi)$

- $y = -2 \sin\left(2x + \frac{\pi}{2}\right)$
- $y = -3 \sin\left(2x + \frac{\pi}{2}\right)$
- $y = 3 \sin(\pi x + 2)$
- $y = 3 \sin(2\pi x + 4)$
- $y = -2 \sin(2\pi x + 4\pi)$
- $y = -3 \sin(2\pi x + 4\pi)$

In Exercises 31–34, determine the amplitude of each function. Then graph the function and  $y = \cos x$  in the same rectangular coordinate system for  $0 \leq x \leq 2\pi$ .

- $y = 2 \cos x$
- $y = 3 \cos x$
- $y = -2 \cos x$
- $y = -3 \cos x$

In Exercises 35–42, determine the amplitude and period of each function. Then graph one period of the function.

- $y = \cos 2x$
- $y = \cos 4x$
- $y = 4 \cos 2\pi x$
- $y = 5 \cos 2\pi x$
- $y = -4 \cos \frac{1}{2}x$
- $y = -3 \cos \frac{1}{3}x$
- $y = -\frac{1}{2} \cos \frac{\pi}{3}x$
- $y = -\frac{1}{2} \cos \frac{\pi}{4}x$

In Exercises 43–52, determine the amplitude, period, and phase shift of each function. Then graph one period of the function.

- $y = \cos\left(x - \frac{\pi}{2}\right)$
- $y = \cos\left(x + \frac{\pi}{2}\right)$
- $y = 3 \cos(2x - \pi)$
- $y = 4 \cos(2x - \pi)$
- $y = \frac{1}{2} \cos\left(3x + \frac{\pi}{2}\right)$
- $y = \frac{1}{2} \cos(2x + \pi)$

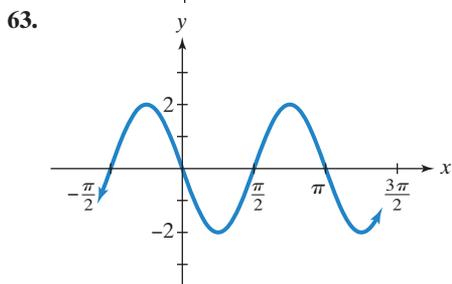

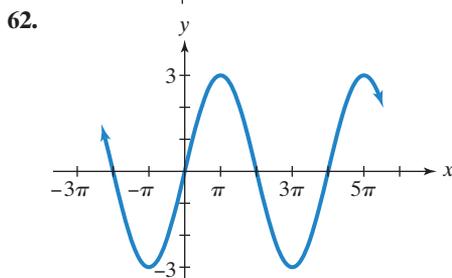

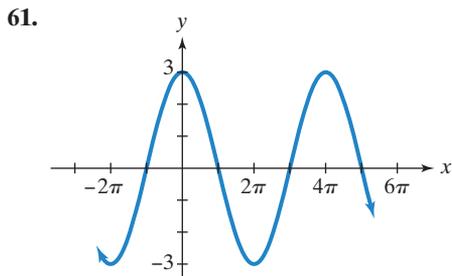

49.  $y = -3 \cos\left(2x - \frac{\pi}{2}\right)$     50.  $y = -4 \cos\left(2x - \frac{\pi}{2}\right)$   
 51.  $y = 2 \cos(2\pi x + 8\pi)$     52.  $y = 3 \cos(2\pi x + 4\pi)$

In Exercises 53–60, use a vertical shift to graph one period of the function.

53.  $y = \sin x + 2$     54.  $y = \sin x - 2$   
 55.  $y = \cos x - 3$     56.  $y = \cos x + 3$   
 57.  $y = 2 \sin \frac{1}{2}x + 1$     58.  $y = 2 \cos \frac{1}{2}x + 1$   
 59.  $y = -3 \cos 2\pi x + 2$     60.  $y = -3 \sin 2\pi x + 2$

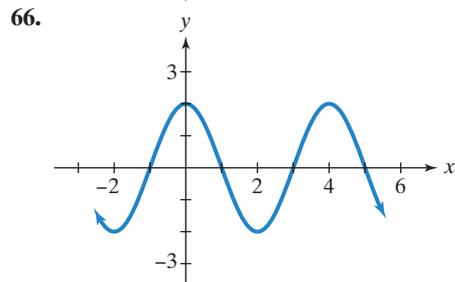

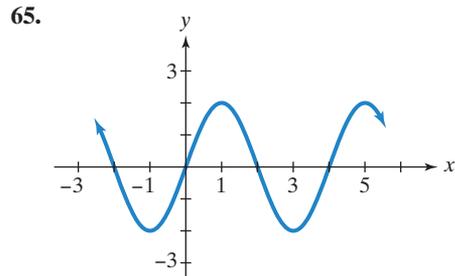

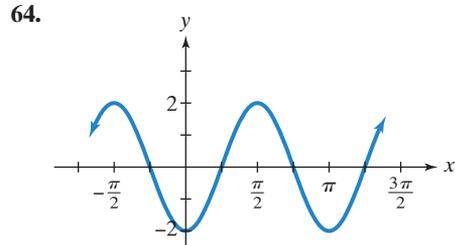

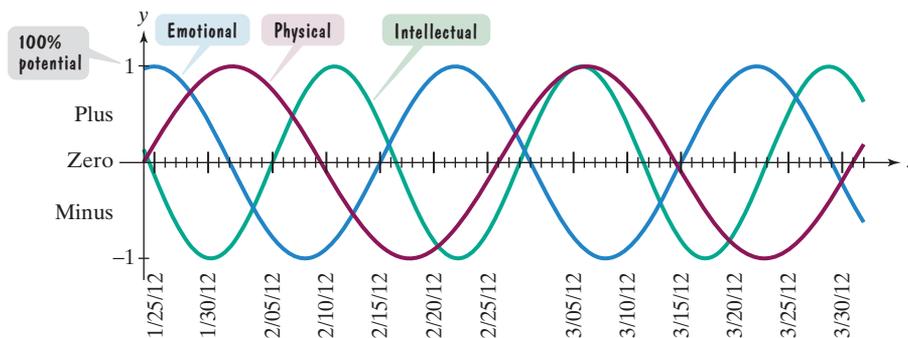

**Practice Plus**

In Exercises 61–66, find an equation for each graph.

**Application Exercises**

In the theory of biorhythms, sine functions are used to measure a person's potential. You can obtain your biorhythm chart online by simply entering your date of birth, the date you want your biorhythm chart to begin, and the number of months you wish to have included in the plot. Shown below is your author's chart, beginning January 25, 2012, when he was 24,378 days old. We all have cycles with the same amplitudes and periods as those shown here. Each of our three basic cycles begins at birth. Use the biorhythm chart shown to solve Exercises 75–82. The longer tick marks correspond to the dates shown.

In Exercises 67–70, graph one period of each function.

67.  $y = \left|2 \cos \frac{x}{2}\right|$     68.  $y = \left|3 \cos \frac{2x}{3}\right|$   
 69.  $y = -|3 \sin \pi x|$     70.  $y = -\left|2 \sin \frac{\pi x}{2}\right|$

In Exercises 71–74, graph  $f$ ,  $g$ , and  $h$  in the same rectangular coordinate system for  $0 \leq x \leq 2\pi$ . Obtain the graph of  $h$  by adding or subtracting the corresponding  $y$ -coordinates on the graphs of  $f$  and  $g$ .

71.  $f(x) = -2 \sin x$ ,  $g(x) = \sin 2x$ ,  $h(x) = (f + g)(x)$   
 72.  $f(x) = 2 \cos x$ ,  $g(x) = \cos 2x$ ,  $h(x) = (f + g)(x)$   
 73.  $f(x) = \sin x$ ,  $g(x) = \cos 2x$ ,  $h(x) = (f - g)(x)$   
 74.  $f(x) = \cos x$ ,  $g(x) = \sin 2x$ ,  $h(x) = (f - g)(x)$

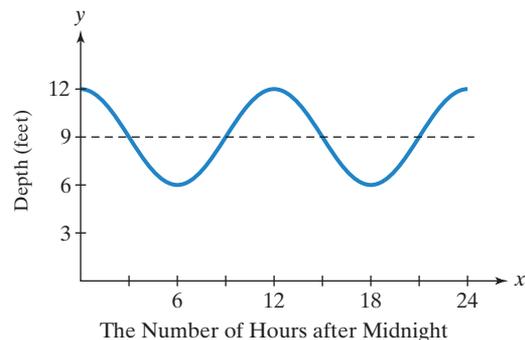

(In exercises 75–82, be sure to refer to the biorhythm chart shown at the bottom of the previous page.)

75. What is the period of the physical cycle?
76. What is the period of the emotional cycle?
77. What is the period of the intellectual cycle?
78. For the period shown, what is the worst day in February for your author to run in a marathon?
79. For the period shown, what is the best day in March for your author to meet an online friend for the first time?
80. For the period shown, what is the best day in February for your author to begin writing this trigonometry chapter?
81. If you extend these sinusoidal graphs to the end of the year, is there a day when your author should not even bother getting out of bed?
82. If you extend these sinusoidal graphs to the end of the year, are there any days where your author is at near-peak physical, emotional, and intellectual potential?
83. Rounded to the nearest hour, Los Angeles averages 14 hours of daylight in June, 10 hours in December, and 12 hours in March and September. Let  $x$  represent the number of months after June and let  $y$  represent the number of hours of daylight in month  $x$ . Make a graph that displays the information from June of one year to June of the following year.
84. A clock with an hour hand that is 15 inches long is hanging on a wall. At noon, the distance between the tip of the hour hand and the ceiling is 23 inches. At 3 P.M., the distance is 38 inches; at 6 P.M., 53 inches; at 9 P.M., 38 inches; and at midnight the distance is again 23 inches. If  $y$  represents the distance between the tip of the hour hand and the ceiling  $x$  hours after noon, make a graph that displays the information for  $0 \leq x \leq 24$ .
85. The number of hours of daylight in Boston is given by

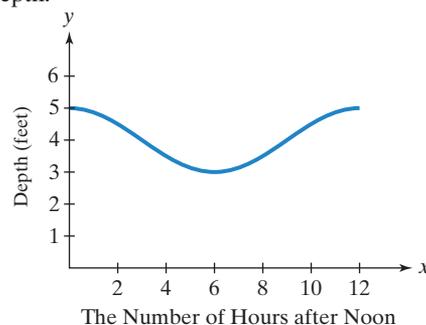

$$y = 3 \sin \frac{2\pi}{365}(x - 79) + 12,$$

where  $x$  is the number of days after January 1.

- a. What is the amplitude of this function?
  - b. What is the period of this function?
  - c. How many hours of daylight are there on the longest day of the year?
  - d. How many hours of daylight are there on the shortest day of the year?
  - e. Graph the function for one period, starting on January 1.
86. The average monthly temperature,  $y$ , in degrees Fahrenheit, for Juneau, Alaska, can be modeled by  $y = 16 \sin\left(\frac{\pi}{6}x - \frac{2\pi}{3}\right) + 40$ , where  $x$  is the month of the year (January = 1, February = 2, . . . December = 12). Graph the function for  $1 \leq x \leq 12$ . What is the highest average monthly temperature? In which month does this occur?
  87. The figure at the top of the next column shows the depth of water at the end of a boat dock. The depth is 6 feet at low tide and 12 feet at high tide. On a certain day, low tide occurs at 6 a.m. and high tide at noon. If  $y$  represents the depth of the water  $x$  hours after midnight, use a cosine function of the form  $y = A \cos Bx + D$  to model the water's depth.

88. The figure shows the depth of water at the end of a boat dock. The depth is 5 feet at high tide and 3 feet at low tide. On a certain day, high tide occurs at noon and low tide at 6 P.M. If  $y$  represents the depth of the water  $x$  hours after noon, use a cosine function of the form  $y = A \cos Bx + D$  to model the water's depth.

### Writing in Mathematics

89. Without drawing a graph, describe the behavior of the basic sine curve.
90. What is the amplitude of the sine function? What does this tell you about the graph?
91. If you are given the equation of a sine function, how do you determine the period?
92. What does a phase shift indicate about the graph of a sine function? How do you determine the phase shift from the function's equation?
93. Describe a general procedure for obtaining the graph of  $y = A \sin(Bx - C)$ .
94. Without drawing a graph, describe the behavior of the basic cosine curve.
95. Describe a relationship between the graphs of  $y = \sin x$  and  $y = \cos x$ .
96. Describe the relationship between the graphs of  $y = A \cos(Bx - C)$  and  $y = A \cos(Bx - C) + D$ .
97. Biorhythm cycles provide interesting applications of sinusoidal graphs. But do you believe in the validity of biorhythms? Write a few sentences explaining why or why not.

### Technology Exercises

98. Use a graphing utility to verify any five of the sine curves that you drew by hand in Exercises 7–30. The amplitude, period, and phase shift should help you to determine appropriate viewing rectangle settings.
99. Use a graphing utility to verify any five of the cosine curves that you drew by hand in Exercises 35–52.
100. Use a graphing utility to verify any two of the sinusoidal curves with vertical shifts that you drew in Exercises 53–60.

In Exercises 101–104, use a graphing utility to graph two periods of the function.

101.  $y = 3 \sin(2x + \pi)$       102.  $y = -2 \cos\left(2\pi x - \frac{\pi}{2}\right)$

103.  $y = 0.2 \sin\left(\frac{\pi}{10}x + \pi\right)$       104.  $y = 3 \sin(2x - \pi) + 5$

105. Use a graphing utility to graph  $y = \sin x$  and  $y = x - \frac{x^3}{6} + \frac{x^5}{120}$  in a  $\left[-\pi, \pi, \frac{\pi}{2}\right]$  by  $[-2, 2, 1]$  viewing rectangle. How do the graphs compare?

106. Use a graphing utility to graph  $y = \cos x$  and  $y = 1 - \frac{x^2}{2} + \frac{x^4}{24}$  in a  $\left[-\pi, \pi, \frac{\pi}{2}\right]$  by  $[-2, 2, 1]$  viewing rectangle. How do the graphs compare?

107. Use a graphing utility to graph  

$$y = \sin x + \frac{\sin 2x}{2} + \frac{\sin 3x}{3} + \frac{\sin 4x}{4}$$
in a  $\left[-2\pi, 2\pi, \frac{\pi}{2}\right]$  by  $[-2, 2, 1]$  viewing rectangle. How do these waves compare to the smooth rolling waves of the basic sine curve?

108. Use a graphing utility to graph  

$$y = \sin x - \frac{\sin 3x}{9} + \frac{\sin 5x}{25}$$
in a  $\left[-2\pi, 2\pi, \frac{\pi}{2}\right]$  by  $[-2, 2, 1]$  viewing rectangle. How do these waves compare to the smooth rolling waves of the basic sine curve?

109. The data show the average monthly temperatures for Washington, D.C.

$x$ (Month)	Average Monthly Temperature, °F
1 (January)	34.6
2 (February)	37.5
3 (March)	47.2
4 (April)	56.5
5 (May)	66.4
6 (June)	75.6
7 (July)	80.0
8 (August)	78.5
9 (September)	71.3
10 (October)	59.7
11 (November)	49.8
12 (December)	39.4

Source: U.S. National Oceanic and Atmospheric Administration

- a. Use your graphing utility to draw a scatter plot of the data from  $x = 1$  through  $x = 12$ .
- b. Use the SINE REGression feature to find the sinusoidal function of the form  $y = A \sin(Bx + C) + D$  that best fits the data.
- c. Use your graphing utility to draw the sinusoidal function of best fit on the scatter plot.
110. Repeat Exercise 109 for data of your choice. The data can involve the average monthly temperatures for the region where you live or any data whose scatter plot takes the form of a sinusoidal function.

### Critical Thinking Exercises

**Make Sense?** In Exercises 111–114, determine whether each statement makes sense or does not make sense, and explain your reasoning.

111. When graphing one complete cycle of  $y = A \sin(Bx - C)$ , I find it easiest to begin my graph on the  $x$ -axis.
112. When graphing one complete cycle of  $y = A \cos(Bx - C)$ , I find it easiest to begin my graph on the  $x$ -axis.
113. Using the equation  $y = A \sin Bx$ , if I replace either  $A$  or  $B$  with its opposite, the graph of the resulting equation is a reflection of the graph of the original equation about the  $x$ -axis.
114. A ride on a circular Ferris wheel is like riding sinusoidal graphs.
115. Determine the range of each of the following functions. Then give a viewing rectangle, or window, that shows two periods of the function's graph.
- a.  $f(x) = 3 \sin\left(x + \frac{\pi}{6}\right) - 2$
- b.  $g(x) = \sin 3\left(x + \frac{\pi}{6}\right) - 2$
116. Write the equation for a cosine function with amplitude  $\pi$ , period 1, and phase shift  $-2$ .

In Chapter 5, we will prove the following identities:

$$\sin^2 x = \frac{1}{2} - \frac{1}{2} \cos 2x$$

$$\cos^2 x = \frac{1}{2} + \frac{1}{2} \cos 2x.$$

Use these identities to solve Exercises 117–118.

117. Use the identity for  $\sin^2 x$  to graph one period of  $y = \sin^2 x$ .
118. Use the identity for  $\cos^2 x$  to graph one period of  $y = \cos^2 x$ .

### Group Exercise

119. This exercise is intended to provide some fun with biorhythms, regardless of whether you believe they have any validity. We will use each member's chart to determine biorhythmic compatibility. Before meeting, each group member should go online and obtain his or her biorhythm chart. The date of the group meeting is the date on which your chart should begin. Include 12 months in the plot. At the meeting, compare differences and similarities among the intellectual sinusoidal curves. Using these comparisons, each person should find the one other person with whom he or she would be most intellectually compatible.

### Preview Exercises

Exercises 120–122 will help you prepare for the material covered in the next section.

120. Solve:  $-\frac{\pi}{2} < x + \frac{\pi}{4} < \frac{\pi}{2}$ .

121. Simplify:  $\frac{-\frac{3\pi}{4} + \frac{\pi}{4}}{2}$ .

122. a. Graph  $y = -3 \cos \frac{x}{2}$  for  $-\pi \leq x \leq 5\pi$ .

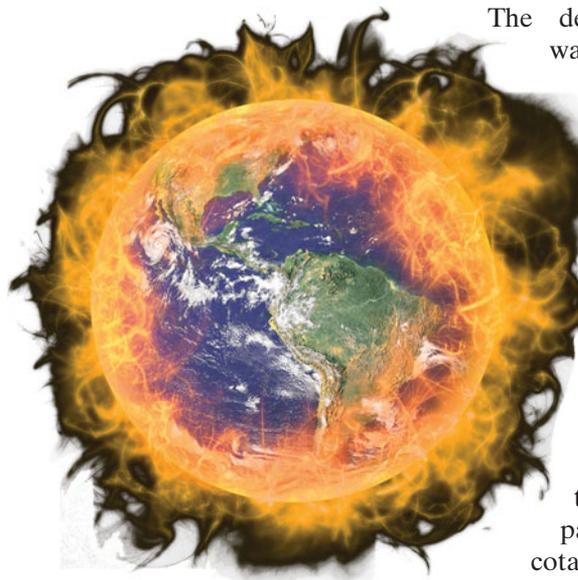

- b. Consider the reciprocal function of  $y = -3 \cos \frac{x}{2}$ , namely,  $y = -3 \sec \frac{x}{2}$ . What does your graph from part (a) indicate about this reciprocal function for  $x = -\pi, \pi, 3\pi$ , and  $5\pi$ ?

## SECTION 4.6

## Graphs of Other Trigonometric Functions

## Objectives

- 1 Understand the graph of  $y = \tan x$ .
- 2 Graph variations of  $y = \tan x$ .
- 3 Understand the graph of  $y = \cot x$ .
- 4 Graph variations of  $y = \cot x$ .
- 5 Understand the graphs of  $y = \csc x$  and  $y = \sec x$ .
- 6 Graph variations of  $y = \csc x$  and  $y = \sec x$ .

The debate over whether Earth is warming up is over: Humankind's reliance on fossil fuels—coal, fuel oil, and natural gas—is to blame for global warming. In an earlier chapter, we developed a linear function that modeled average global temperature in terms of atmospheric carbon dioxide. In this section's Exercise Set, you will see how trigonometric graphs reveal interesting patterns in carbon dioxide concentration from 1990 through 2008. In this section, trigonometric graphs will reveal patterns involving the tangent, cotangent, secant, and cosecant functions.

- 1 Understand the graph of  $y = \tan x$ .

The Graph of  $y = \tan x$ 

The properties of the tangent function discussed in Section 4.2 will help us determine its graph. Because the tangent function has properties that are different from sinusoidal functions, its graph differs significantly from those of sine and cosine. Properties of the tangent function include the following:

- The period is  $\pi$ . It is only necessary to graph  $y = \tan x$  over an interval of length  $\pi$ . The remainder of the graph consists of repetitions of that graph at intervals of  $\pi$ .
- The tangent function is an odd function:  $\tan(-x) = -\tan x$ . The graph is symmetric with respect to the origin.
- The tangent function is undefined at  $\frac{\pi}{2}$ . The graph of  $y = \tan x$  has a vertical asymptote at  $x = \frac{\pi}{2}$ .

We obtain the graph of  $y = \tan x$  using some points on the graph and origin symmetry. **Table 4.5** lists some values of  $(x, y)$  on the graph of  $y = \tan x$  on the interval  $\left[0, \frac{\pi}{2}\right)$ .

**Table 4.5** Values of  $(x, y)$  on the graph of  $y = \tan x$

$x$	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{5\pi}{12}$ (75°)	$\frac{17\pi}{36}$ (85°)	$\frac{89\pi}{180}$ (89°)	1.57	$\frac{\pi}{2}$
$y = \tan x$	0	$\frac{\sqrt{3}}{3} \approx 0.6$	1	$\sqrt{3} \approx 1.7$	3.7	11.4	57.3	1255.8	undefined

As  $x$  increases from 0 toward  $\frac{\pi}{2}$ ,  $y$  increases slowly at first, then more and more rapidly.

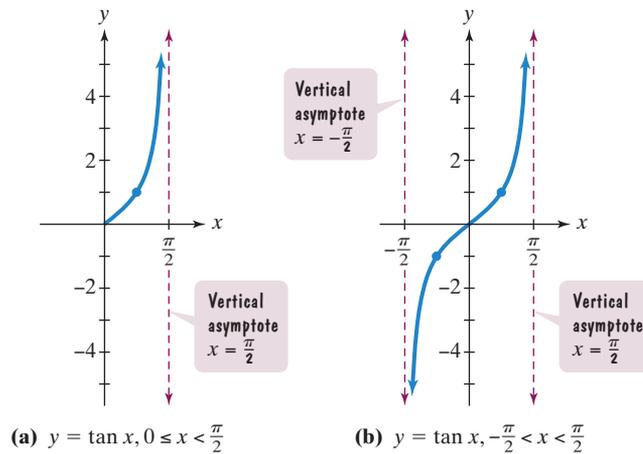

FIGURE 4.78 Graphing the tangent function

The graph in **Figure 4.78(a)** is based on our observation that as  $x$  increases from 0 toward  $\frac{\pi}{2}$ ,  $y$  increases slowly at first, then more and more rapidly. Notice that  $y$  increases without bound as  $x$  approaches  $\frac{\pi}{2}$ . As the figure shows, the graph of  $y = \tan x$  has a vertical asymptote at  $x = \frac{\pi}{2}$ .

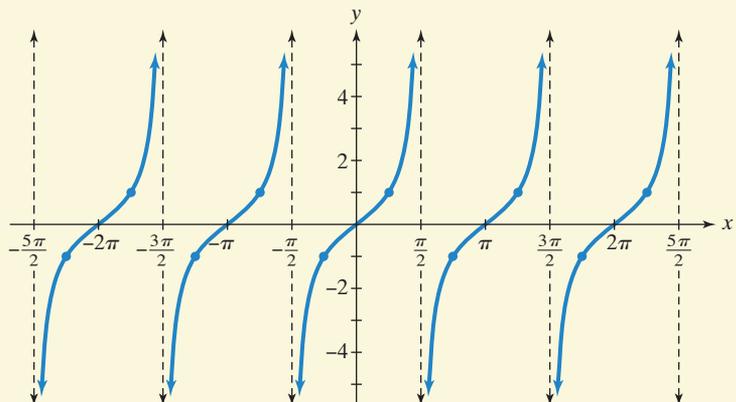

The graph of  $y = \tan x$  can be completed on the interval  $(-\frac{\pi}{2}, \frac{\pi}{2})$  by using origin symmetry. **Figure 4.78(b)** shows the result of reflecting the graph in **Figure 4.78(a)** about the origin. The graph of  $y = \tan x$  has another vertical asymptote at  $x = -\frac{\pi}{2}$ . Notice that  $y$  decreases without bound as  $x$  approaches  $-\frac{\pi}{2}$ .

Because the period of the tangent function is  $\pi$ , the graph in **Figure 4.78(b)** shows one complete period of  $y = \tan x$ . We obtain the complete graph of  $y = \tan x$  by repeating the graph in **Figure 4.78(b)** to the left and right over intervals of  $\pi$ . The resulting graph and its main characteristics are shown in the following box:

### The Tangent Curve: The Graph of $y = \tan x$ and Its Characteristics

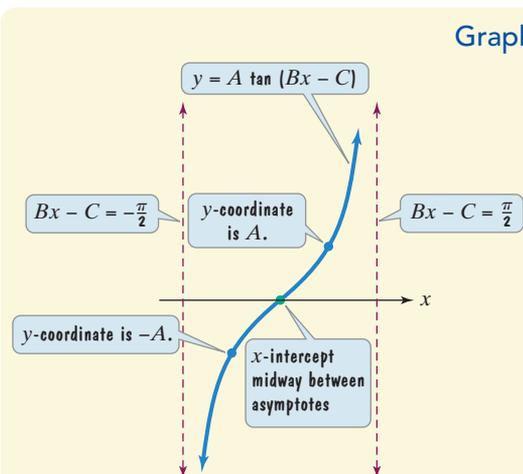

#### Characteristics

- **Period:**  $\pi$
- **Domain:** All real numbers except odd multiples of  $\frac{\pi}{2}$
- **Range:** All real numbers
- **Vertical asymptotes** at odd multiples of  $\frac{\pi}{2}$
- **An  $x$ -intercept** occurs midway between each pair of consecutive asymptotes.
- **Odd function** with origin symmetry
- Points on the graph  $\frac{1}{4}$  and  $\frac{3}{4}$  of the way between consecutive asymptotes have  $y$ -coordinates of  $-1$  and  $1$ , respectively.

2 Graph variations of  $y = \tan x$ .Graphing Variations of  $y = \tan x$ 

We use the characteristics of the tangent curve to graph tangent functions of the form  $y = A \tan(Bx - C)$ .

Graphing  $y = A \tan(Bx - C)$ ,  $B > 0$ 

1. Find two consecutive asymptotes by finding an interval containing one period:

$$-\frac{\pi}{2} < Bx - C < \frac{\pi}{2}.$$

A pair of consecutive asymptotes occurs at

$$Bx - C = -\frac{\pi}{2} \text{ and } Bx - C = \frac{\pi}{2}.$$

2. Identify an  $x$ -intercept, midway between the consecutive asymptotes.
3. Find the points on the graph  $\frac{1}{4}$  and  $\frac{3}{4}$  of the way between the consecutive asymptotes. These points have  $y$ -coordinates of  $-A$  and  $A$ , respectively.
4. Use steps 1–3 to graph one full period of the function. Add additional cycles to the left or right as needed.

## EXAMPLE 1 Graphing a Tangent Function

Graph  $y = 2 \tan \frac{x}{2}$  for  $-\pi < x < 3\pi$ .

## SOLUTION

Refer to **Figure 4.79** as you read each step.

**Step 1 Find two consecutive asymptotes.** We do this by finding an interval containing one period.

$$-\frac{\pi}{2} < \frac{x}{2} < \frac{\pi}{2} \quad \text{Set up the inequality } -\frac{\pi}{2} < \text{variable expression in tangent} < \frac{\pi}{2}.$$

$$-\pi < x < \pi \quad \text{Multiply all parts by 2 and solve for } x.$$

An interval containing one period is  $(-\pi, \pi)$ . Thus, two consecutive asymptotes occur at  $x = -\pi$  and  $x = \pi$ .

**Step 2 Identify an  $x$ -intercept, midway between the consecutive asymptotes.** Midway between  $x = -\pi$  and  $x = \pi$  is  $x = 0$ . An  $x$ -intercept is 0 and the graph passes through  $(0, 0)$ .

**Step 3 Find points on the graph  $\frac{1}{4}$  and  $\frac{3}{4}$  of the way between the consecutive asymptotes.** These points have  $y$ -coordinates of  $-A$  and  $A$ . Because  $A$ , the coefficient of the tangent in  $y = 2 \tan \frac{x}{2}$ , is 2, these points have  $y$ -coordinates of  $-2$  and 2. The graph passes through  $(-\frac{\pi}{2}, -2)$  and  $(\frac{\pi}{2}, 2)$ .

**Step 4 Use steps 1–3 to graph one full period of the function.** We use the two consecutive asymptotes,  $x = -\pi$  and  $x = \pi$ , an  $x$ -intercept of 0, and points midway between the  $x$ -intercept and asymptotes with  $y$ -coordinates of  $-2$  and 2. We graph one period of  $y = 2 \tan \frac{x}{2}$  from  $-\pi$  to  $\pi$ . In order to graph for  $-\pi < x < 3\pi$ , we continue the pattern and extend the graph another full period to the right. The graph is shown in **Figure 4.79**.

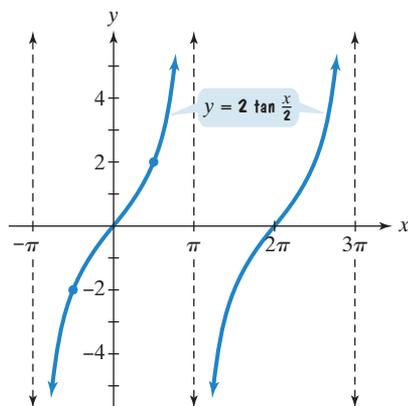

FIGURE 4.79 The graph is shown for two full periods.

 **Check Point 1** Graph  $y = 3 \tan 2x$  for  $-\frac{\pi}{4} < x < \frac{3\pi}{4}$ .

### EXAMPLE 2 Graphing a Tangent Function

Graph two full periods of  $y = \tan\left(x + \frac{\pi}{4}\right)$ .

#### SOLUTION

The graph of  $y = \tan\left(x + \frac{\pi}{4}\right)$  is the graph of  $y = \tan x$  shifted horizontally to the left  $\frac{\pi}{4}$  units. Refer to **Figure 4.80** as you read each step.

**Step 1 Find two consecutive asymptotes.** We do this by finding an interval containing one period.

$$-\frac{\pi}{2} < x + \frac{\pi}{4} < \frac{\pi}{2}$$

Set up the inequality  $-\frac{\pi}{2} < \text{variable expression in tangent} < \frac{\pi}{2}$ .

$$-\frac{\pi}{2} - \frac{\pi}{4} < x < \frac{\pi}{2} - \frac{\pi}{4}$$

Subtract  $\frac{\pi}{4}$  from all parts and solve for  $x$ .

$$-\frac{3\pi}{4} < x < \frac{\pi}{4}$$

$$\text{Simplify: } -\frac{\pi}{2} - \frac{\pi}{4} = -\frac{2\pi}{4} - \frac{\pi}{4} = -\frac{3\pi}{4}$$

$$\text{and } \frac{\pi}{2} - \frac{\pi}{4} = \frac{2\pi}{4} - \frac{\pi}{4} = \frac{\pi}{4}$$

An interval containing one period is  $\left(-\frac{3\pi}{4}, \frac{\pi}{4}\right)$ . Thus, two consecutive asymptotes occur at  $x = -\frac{3\pi}{4}$  and  $x = \frac{\pi}{4}$ .

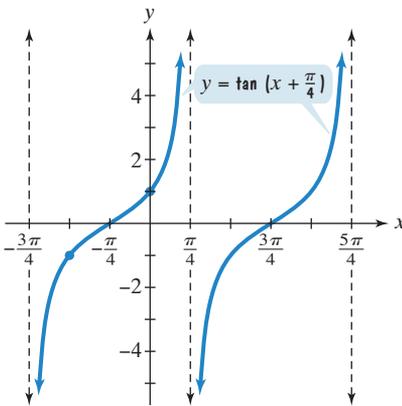

**Step 2 Identify an  $x$ -intercept, midway between the consecutive asymptotes.**

$$x\text{-intercept} = \frac{-\frac{3\pi}{4} + \frac{\pi}{4}}{2} = \frac{-\frac{2\pi}{4}}{2} = -\frac{2\pi}{8} = -\frac{\pi}{4}$$

An  $x$ -intercept is  $-\frac{\pi}{4}$  and the graph passes through  $\left(-\frac{\pi}{4}, 0\right)$ .

**Step 3 Find points on the graph  $\frac{1}{4}$  and  $\frac{3}{4}$  of the way between the consecutive asymptotes. These points have  $y$ -coordinates of  $-A$  and  $A$ .** Because  $A$ , the coefficient of the tangent in  $y = \tan\left(x + \frac{\pi}{4}\right)$ , is 1, these points have  $y$ -coordinates of  $-1$  and  $1$ . They are shown as blue dots in **Figure 4.80**.

**Step 4 Use steps 1–3 to graph one full period of the function.** We use the two consecutive asymptotes,  $x = -\frac{3\pi}{4}$  and  $x = \frac{\pi}{4}$ , to graph one full period of  $y = \tan\left(x + \frac{\pi}{4}\right)$  from  $-\frac{3\pi}{4}$  to  $\frac{\pi}{4}$ . We graph two full periods by continuing the pattern and extending the graph another full period to the right. The graph is shown in **Figure 4.80**. •••

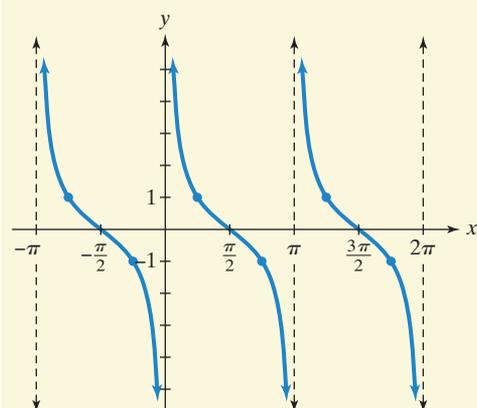

**FIGURE 4.80** The graph is shown for two full periods.

 **Check Point 2** Graph two full periods of  $y = \tan\left(x - \frac{\pi}{2}\right)$ .

- 3 Understand the graph of  $y = \cot x$ .

### The Graph of $y = \cot x$

Like the tangent function, the cotangent function,  $y = \cot x$ , has a period of  $\pi$ . The graph and its main characteristics are shown in the following box.

#### The Cotangent Curve: The Graph of $y = \cot x$ and Its Characteristics

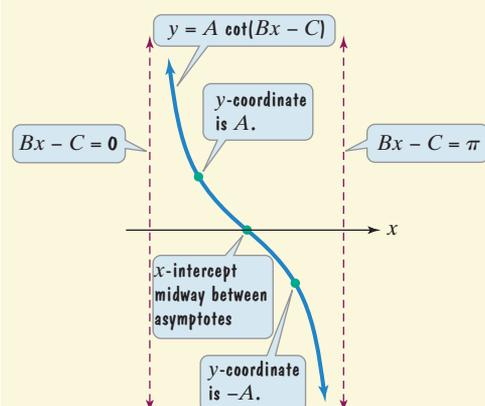

##### Characteristics

- **Period:**  $\pi$
- **Domain:** All real numbers except integral multiples of  $\pi$
- **Range:** All real numbers
- **Vertical asymptotes** at integral multiples of  $\pi$
- **An  $x$ -intercept** occurs midway between each pair of consecutive asymptotes.
- **Odd function** with origin symmetry
- Points on the graph  $\frac{1}{4}$  and  $\frac{3}{4}$  of the way between consecutive asymptotes have  $y$ -coordinates of 1 and  $-1$ , respectively.

- 4 Graph variations of  $y = \cot x$ .

### Graphing Variations of $y = \cot x$

We use the characteristics of the cotangent curve to graph cotangent functions of the form  $y = A \cot(Bx - C)$ .

#### Graphing $y = A \cot(Bx - C)$ , $B > 0$

1. Find two consecutive asymptotes by finding an interval containing one full period:

$$0 < Bx - C < \pi.$$

A pair of consecutive asymptotes occurs at

$$Bx - C = 0 \text{ and } Bx - C = \pi.$$

2. Identify an  $x$ -intercept, midway between the consecutive asymptotes.
3. Find the points on the graph  $\frac{1}{4}$  and  $\frac{3}{4}$  of the way between the consecutive asymptotes. These points have  $y$ -coordinates of  $A$  and  $-A$ , respectively.
4. Use steps 1–3 to graph one full period of the function. Add additional cycles to the left or right as needed.

### EXAMPLE 3 Graphing a Cotangent Function

Graph  $y = 3 \cot 2x$ .

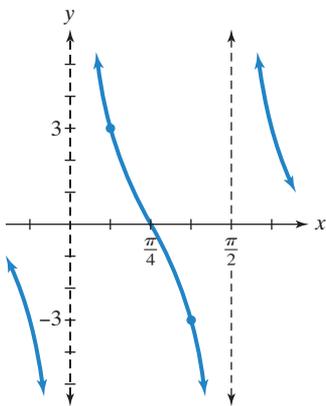

#### SOLUTION

**Step 1 Find two consecutive asymptotes.** We do this by finding an interval containing one period.

$$0 < 2x < \pi \quad \text{Set up the inequality } 0 < \text{variable expression in cotangent} < \pi.$$

$$0 < x < \frac{\pi}{2} \quad \text{Divide all parts by 2 and solve for } x.$$

 FIGURE 4.81 The graph of  $y = 3 \cot 2x$ 

An interval containing one period is  $\left(0, \frac{\pi}{2}\right)$ . Thus, two consecutive asymptotes occur at  $x = 0$  and  $x = \frac{\pi}{2}$ , shown in **Figure 4.81**.

**Step 2 Identify an  $x$ -intercept, midway between the consecutive asymptotes.** Midway between  $x = 0$  and  $x = \frac{\pi}{2}$  is  $x = \frac{\pi}{4}$ . An  $x$ -intercept is  $\frac{\pi}{4}$  and the graph passes through  $\left(\frac{\pi}{4}, 0\right)$ .

**Step 3 Find points on the graph  $\frac{1}{4}$  and  $\frac{3}{4}$  of the way between consecutive asymptotes. These points have  $y$ -coordinates of  $A$  and  $-A$ .** Because  $A$ , the coefficient of the cotangent in  $y = 3 \cot 2x$ , is 3, these points have  $y$ -coordinates of 3 and  $-3$ . They are shown as blue dots in **Figure 4.81**.

**Step 4 Use steps 1–3 to graph one full period of the function.** We use the two consecutive asymptotes,  $x = 0$  and  $x = \frac{\pi}{2}$ , to graph one full period of  $y = 3 \cot 2x$ . This curve is repeated to the left and right, as shown in **Figure 4.81**. ●●●

**Check Point 3** Graph  $y = \frac{1}{2} \cot \frac{\pi}{2}x$ .

- 5 Understand the graphs of  $y = \csc x$  and  $y = \sec x$ .

### The Graphs of $y = \csc x$ and $y = \sec x$

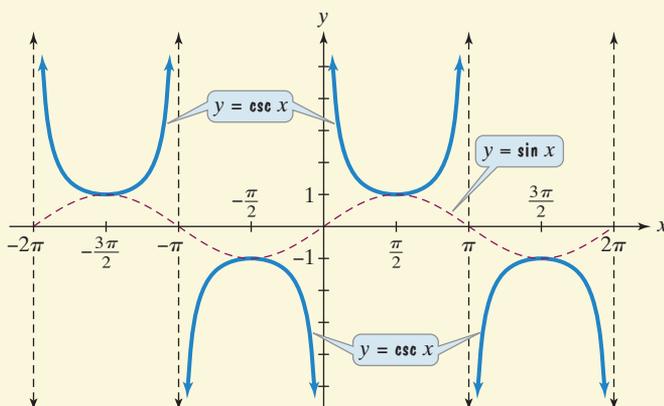

We obtain the graphs of the cosecant and secant curves by using the reciprocal identities

$$\csc x = \frac{1}{\sin x} \quad \text{and} \quad \sec x = \frac{1}{\cos x}.$$

The identity  $\csc x = \frac{1}{\sin x}$  tells us that the value of the cosecant function  $y = \csc x$  at a given value of  $x$  equals the reciprocal of the corresponding value of the sine function, provided that the value of the sine function is not 0. If the value of  $\sin x$  is 0, then at each of these values of  $x$ , the cosecant function is not defined. A vertical asymptote is associated with each of these values on the graph of  $y = \csc x$ .

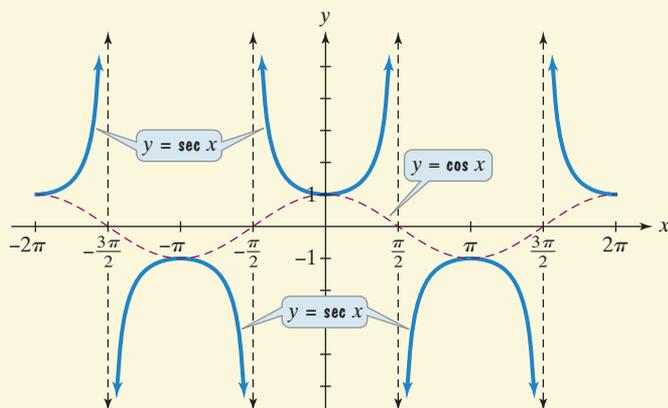

We obtain the graph of  $y = \csc x$  by taking reciprocals of the  $y$ -values in the graph of  $y = \sin x$ . Vertical asymptotes of  $y = \csc x$  occur at the  $x$ -intercepts of  $y = \sin x$ . Likewise, we obtain the graph of  $y = \sec x$  by taking the reciprocal of  $y = \cos x$ . Vertical asymptotes of  $y = \sec x$  occur at the  $x$ -intercepts of  $y = \cos x$ . The graphs of  $y = \csc x$  and  $y = \sec x$  and their key characteristics are shown in the following boxes. We have used dashed red curves to graph  $y = \sin x$  and  $y = \cos x$  first, drawing vertical asymptotes through the  $x$ -intercepts.

#### The Cosecant Curve: The Graph of $y = \csc x$ and Its Characteristics

#### Characteristics

- **Period:**  $2\pi$
- **Domain:** All real numbers except integral multiples of  $\pi$
- **Range:** All real numbers  $y$  such that  $y \leq -1$  or  $y \geq 1$ :  $(-\infty, -1] \cup [1, \infty)$
- **Vertical asymptotes** at integral multiples of  $\pi$
- **Odd function**,  $\csc(-x) = -\csc x$ , with origin symmetry

The Secant Curve: The Graph of  $y = \sec x$  and Its Characteristics

**Characteristics**

- **Period:**  $2\pi$
- **Domain:** All real numbers except odd multiples of  $\frac{\pi}{2}$
- **Range:** All real numbers  $y$  such that  $y \leq -1$  or  $y \geq 1$ :  $(-\infty, -1] \cup [1, \infty)$
- **Vertical asymptotes** at odd multiples of  $\frac{\pi}{2}$
- **Even function**,  $\sec(-x) = \sec x$ , with  $y$ -axis symmetry

- 6 Graph variations of  $y = \csc x$  and  $y = \sec x$ .

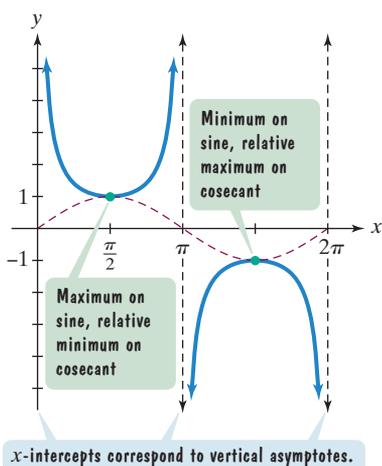

**Graphing Variations of  $y = \csc x$  and  $y = \sec x$** 

We use graphs of functions involving the corresponding reciprocal functions to obtain graphs of cosecant and secant functions. To graph a cosecant or secant curve, begin by graphing the function where cosecant or secant is replaced by its reciprocal function. For example, to graph  $y = 2 \csc 2x$ , we use the graph of  $y = 2 \sin 2x$ .

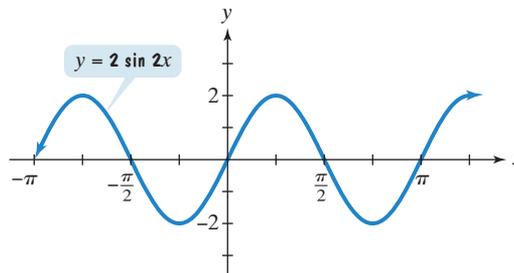

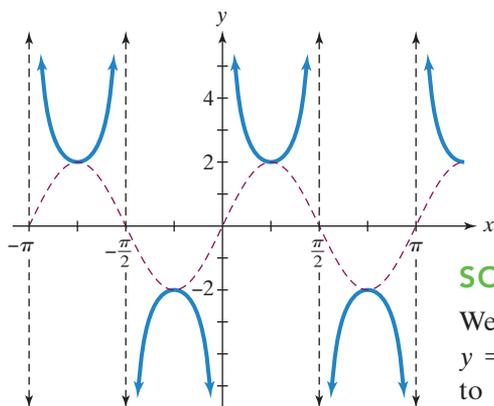

Likewise, to graph  $y = -3 \sec \frac{x}{2}$ , we use the graph of  $y = -3 \cos \frac{x}{2}$ .

**Figure 4.82** illustrates how we use a sine curve to obtain a cosecant curve. Notice that

- $x$ -intercepts on the red sine curve correspond to vertical asymptotes of the blue cosecant curve.
- A maximum point on the red sine curve corresponds to a minimum point on a continuous portion of the blue cosecant curve.
- A minimum point on the red sine curve corresponds to a maximum point on a continuous portion of the blue cosecant curve.

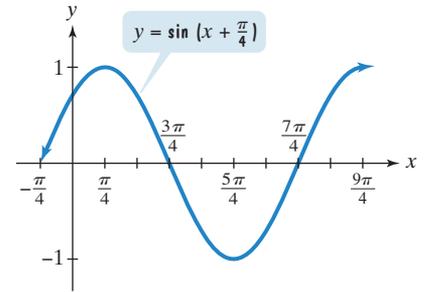

**FIGURE 4.82**
**EXAMPLE 4** Using a Sine Curve to Obtain a Cosecant Curve

Use the graph of  $y = 2 \sin 2x$  in **Figure 4.83** to obtain the graph of  $y = 2 \csc 2x$ .

**FIGURE 4.83**

**FIGURE 4.84** Using a sine curve to graph  $y = 2 \csc 2x$ 
**SOLUTION**

We begin our work in **Figure 4.84** by showing the given graph, the graph of  $y = 2 \sin 2x$ , using dashed red lines. The  $x$ -intercepts of  $y = 2 \sin 2x$  correspond to the vertical asymptotes of  $y = 2 \csc 2x$ . Thus, we draw vertical asymptotes through the  $x$ -intercepts, shown in **Figure 4.84**. Using the asymptotes as guides, we sketch the graph of  $y = 2 \csc 2x$  in **Figure 4.84**. ●●●

 **Check Point 4** Use the graph of  $y = \sin\left(x + \frac{\pi}{4}\right)$ , shown on the right, to obtain the graph of  $y = \csc\left(x + \frac{\pi}{4}\right)$ .

We use a cosine curve to obtain a secant curve in exactly the same way we used a sine curve to obtain a cosecant curve. Thus,

- $x$ -intercepts on the cosine curve correspond to vertical asymptotes on the secant curve.
- A maximum point on the cosine curve corresponds to a minimum point on a continuous portion of the secant curve.
- A minimum point on the cosine curve corresponds to a maximum point on a continuous portion of the secant curve.

### EXAMPLE 5 Graphing a Secant Function

Graph  $y = -3 \sec \frac{x}{2}$  for  $-\pi < x < 5\pi$ .

#### SOLUTION

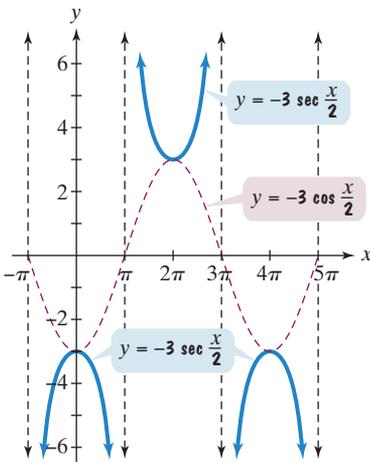

We begin by graphing the function  $y = -3 \cos \frac{x}{2}$ , where secant has been replaced by cosine, its reciprocal function. This equation is of the form  $y = A \cos Bx$  with  $A = -3$  and  $B = \frac{1}{2}$ .

amplitude:  $|A| = |-3| = 3$  The maximum value of  $y$  is 3 and the minimum is  $-3$ .

period:  $\frac{2\pi}{B} = \frac{2\pi}{\frac{1}{2}} = 4\pi$  Each cycle is of length  $4\pi$ .

We use quarter-periods,  $\frac{4\pi}{4}$ , or  $\pi$ , to find the  $x$ -values for the five key points. Starting with  $x = 0$ , the  $x$ -values are  $0, \pi, 2\pi, 3\pi$ , and  $4\pi$ . Evaluating the function  $y = -3 \cos \frac{x}{2}$  at each of these values of  $x$ , the key points are  $(0, -3), (\pi, 0), (2\pi, 3), (3\pi, 0)$ , and  $(4\pi, -3)$ .

We use these key points to graph  $y = -3 \cos \frac{x}{2}$  from  $0$  to  $4\pi$ , shown using a dashed red line in **Figure 4.85**. In order to graph  $y = -3 \sec \frac{x}{2}$  for  $-\pi < x < 5\pi$ , extend the dashed red graph of the cosine function  $\pi$  units to the left and  $\pi$  units to the right. Now use this dashed red graph to obtain the graph of the corresponding secant function, its reciprocal function. Draw vertical asymptotes through the  $x$ -intercepts. Using these asymptotes as guides, the graph of  $y = -3 \sec \frac{x}{2}$  is shown in blue in **Figure 4.85**. ...

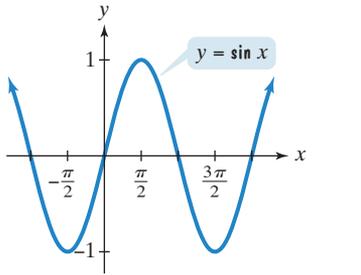

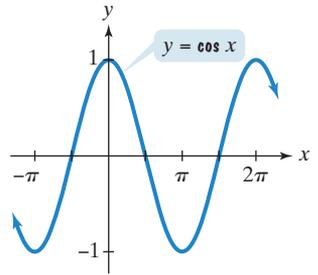

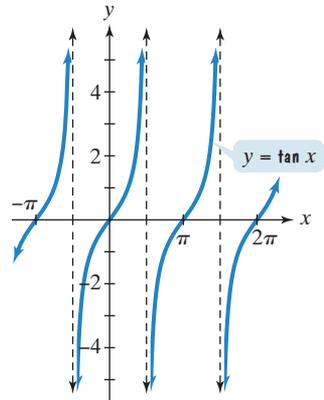

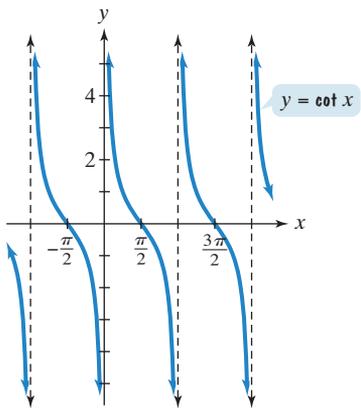

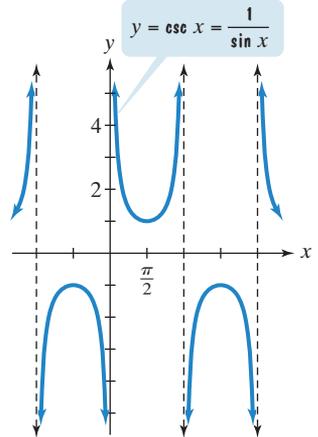

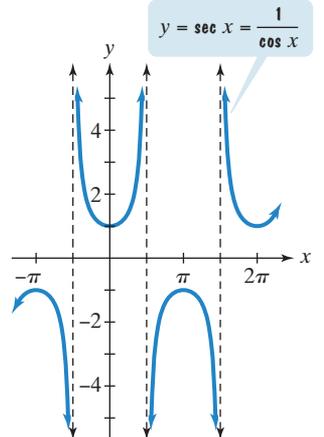

**FIGURE 4.85** Using a cosine curve to graph  $y = -3 \sec \frac{x}{2}$

 **Check Point 5** Graph  $y = 2 \sec 2x$  for  $-\frac{3\pi}{4} < x < \frac{3\pi}{4}$ .

### The Six Curves of Trigonometry

Table 4.6 summarizes the graphs of the six trigonometric functions. Below each of the graphs is a description of the domain, range, and period of the function.

### CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- In order to graph  $y = \frac{1}{2} \tan 2x$ , an interval containing one period is found by solving  $-\frac{\pi}{2} < 2x < \frac{\pi}{2}$ .
- An interval containing one period of  $y = \tan\left(x - \frac{\pi}{2}\right)$  is \_\_\_\_\_. Thus, two consecutive asymptotes occur at  $x = \underline{\hspace{2cm}}$  and  $x = \underline{\hspace{2cm}}$ .

An interval containing one period is \_\_\_\_\_. Thus, two consecutive asymptotes occur at  $x = \underline{\hspace{2cm}}$  and  $x = \underline{\hspace{2cm}}$ .

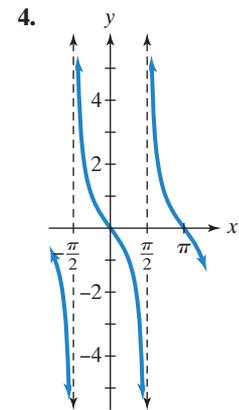

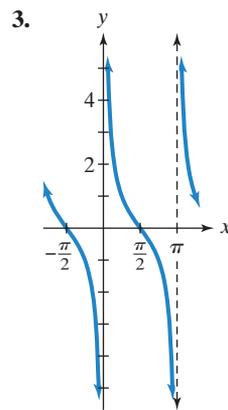

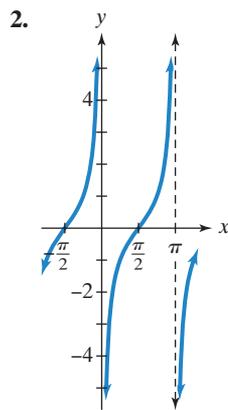

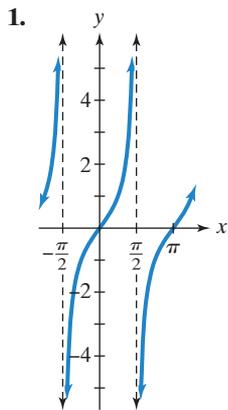

3. In order to graph  $y = 3 \cot \frac{\pi}{2} x$ , an interval containing one period is found by solving  $0 < \frac{\pi}{2} x < \pi$ .  
An interval containing one period is \_\_\_\_\_. Thus, two consecutive asymptotes occur at  $x =$  \_\_\_\_\_ and  $x =$  \_\_\_\_\_.
4. An interval containing one period of  $y = 4 \cot\left(x + \frac{\pi}{4}\right)$  is \_\_\_\_\_. Thus, two consecutive asymptotes occur at  $x =$  \_\_\_\_\_ and  $x =$  \_\_\_\_\_.
5. It is easiest to graph  $y = 3 \csc 2x$  by first graphing  $y =$  \_\_\_\_\_.
6. It is easiest to graph  $y = 2 \sec \pi x$  by first graphing \_\_\_\_\_.
7. True or false: The graphs of  $y = \sec \frac{x}{2}$  and  $y = \cos \frac{x}{2}$  are identical. \_\_\_\_\_
8. True or false: The graph of  $y = 2 \sin 2x$  has an  $x$ -intercept at  $\frac{\pi}{2}$ , so  $x = \frac{\pi}{2}$  is a vertical asymptote of  $y = 2 \csc 2x$ . \_\_\_\_\_

## EXERCISE SET 4.6

### Practice Exercises

In Exercises 1–4, the graph of a tangent function is given. Select the equation for each graph from the following options:

$$y = \tan\left(x + \frac{\pi}{2}\right), \quad y = \tan(x + \pi), \quad y = -\tan x, \quad y = -\tan\left(x - \frac{\pi}{2}\right).$$

In Exercises 5–12, graph two periods of the given tangent function.

5.  $y = 3 \tan \frac{x}{4}$

6.  $y = 2 \tan \frac{x}{4}$

7.  $y = \frac{1}{2} \tan 2x$

8.  $y = 2 \tan 2x$

9.  $y = -2 \tan \frac{1}{2}x$

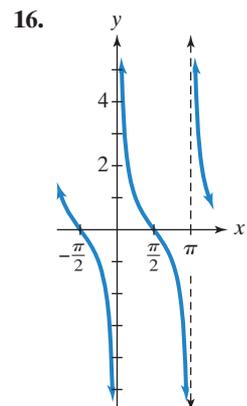

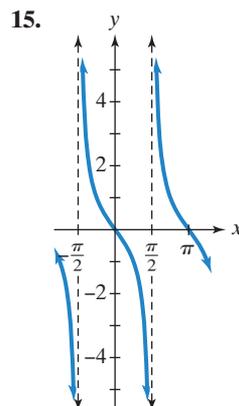

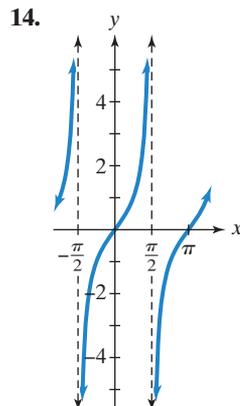

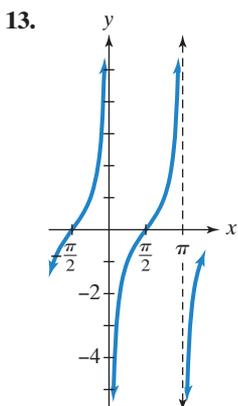

10.  $y = -3 \tan \frac{1}{2}x$

11.  $y = \tan(x - \pi)$

12.  $y = \tan\left(x - \frac{\pi}{4}\right)$

In Exercises 13–16, the graph of a cotangent function is given. Select the equation for each graph from the following options:

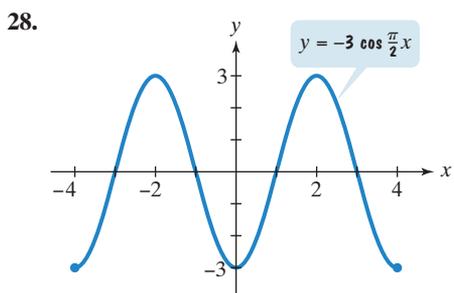

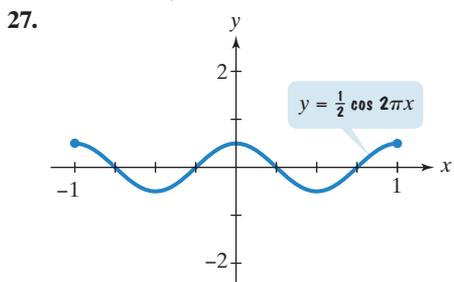

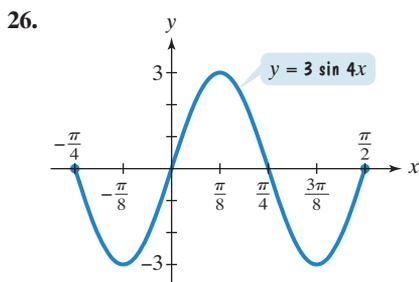

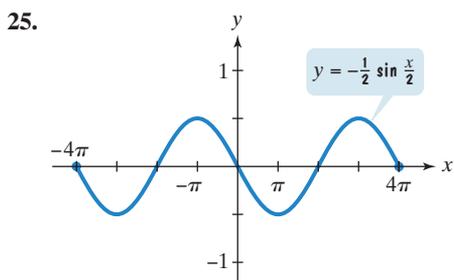

$$y = \cot\left(x + \frac{\pi}{2}\right), \quad y = \cot(x + \pi), \quad y = -\cot x, \quad y = -\cot\left(x - \frac{\pi}{2}\right).$$

In Exercises 17–24, graph two periods of the given cotangent function.

17.  $y = 2 \cot x$                       18.  $y = \frac{1}{2} \cot x$   
 19.  $y = \frac{1}{2} \cot 2x$                 20.  $y = 2 \cot 2x$   
 21.  $y = -3 \cot \frac{\pi}{2}x$                 22.  $y = -2 \cot \frac{\pi}{4}x$   
 23.  $y = 3 \cot\left(x + \frac{\pi}{2}\right)$         24.  $y = 3 \cot\left(x + \frac{\pi}{4}\right)$

In Exercises 25–28, use each graph to obtain the graph of the corresponding reciprocal function, cosecant or secant. Give the equation of the function for the graph that you obtain.

In Exercises 29–44, graph two periods of the given cosecant or secant function.

29.  $y = 3 \csc x$                       30.  $y = 2 \csc x$   
 31.  $y = \frac{1}{2} \csc \frac{x}{2}$                       32.  $y = \frac{3}{2} \csc \frac{x}{4}$   
 33.  $y = 2 \sec x$                       34.  $y = 3 \sec x$   
 35.  $y = \sec \frac{x}{3}$                       36.  $y = \sec \frac{x}{2}$

37.  $y = -2 \csc \pi x$                       38.  $y = -\frac{1}{2} \csc \pi x$   
 39.  $y = -\frac{1}{2} \sec \pi x$                       40.  $y = -\frac{3}{2} \sec \pi x$   
 41.  $y = \csc(x - \pi)$                       42.  $y = \csc\left(x - \frac{\pi}{2}\right)$   
 43.  $y = 2 \sec(x + \pi)$                       44.  $y = 2 \sec\left(x + \frac{\pi}{2}\right)$

### Practice Plus

In Exercises 45–52, graph two periods of each function.

45.  $y = 2 \tan\left(x - \frac{\pi}{6}\right) + 1$         46.  $y = 2 \cot\left(x + \frac{\pi}{6}\right) - 1$   
 47.  $y = \sec\left(2x + \frac{\pi}{2}\right) - 1$         48.  $y = \csc\left(2x - \frac{\pi}{2}\right) + 1$   
 49.  $y = \csc|x|$                       50.  $y = \sec|x|$   
 51.  $y = |\cot \frac{1}{2}x|$                       52.  $y = |\tan \frac{1}{2}x|$

In Exercises 53–54, let  $f(x) = 2 \sec x$ ,  $g(x) = -2 \tan x$ , and  $h(x) = 2x - \frac{\pi}{2}$ .

53. Graph two periods of  
 $y = (f \circ h)(x)$ .  
 54. Graph two periods of  
 $y = (g \circ h)(x)$ .

In Exercises 55–58, use a graph to solve each equation for  $-2\pi \leq x \leq 2\pi$ .

55.  $\tan x = -1$                       56.  $\cot x = -1$   
 57.  $\csc x = 1$                       58.  $\sec x = 1$

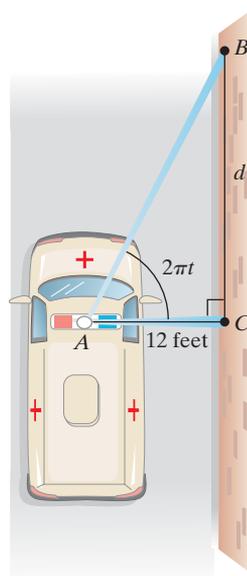

### Application Exercises

59. An ambulance with a rotating beam of light is parked 12 feet from a building. The function

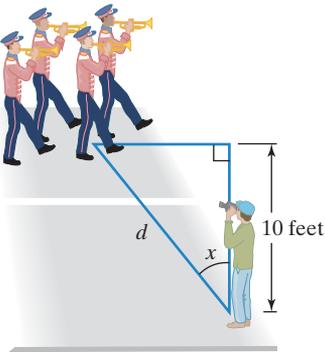

$$d = 12 \tan 2\pi t$$

describes the distance,  $d$ , in feet, of the rotating beam of light from point  $C$  after  $t$  seconds.

- a. Graph the function on the interval  $[0, 2]$ .  
 b. For what values of  $t$  in  $[0, 2]$  is the function undefined? What does this mean in terms of the rotating beam of light in the figure shown?

60. The angle of elevation from the top of a house to a jet flying 2 miles above the house is  $x$  radians. If  $d$  represents the horizontal distance, in miles, of the jet from the house, express  $d$  in terms of a trigonometric function of  $x$ . Then graph the function for  $0 < x < \pi$ .
61. Your best friend is marching with a band and has asked you to film him. The figure below shows that you have set yourself up 10 feet from the street where your friend will be passing from left to right. If  $d$  represents your distance, in feet, from your friend and  $x$  is the radian measure of the angle shown, express  $d$  in terms of a trigonometric function of  $x$ . Then graph the function for  $-\frac{\pi}{2} < x < \frac{\pi}{2}$ . Negative angles indicate that your marching buddy is on your left.

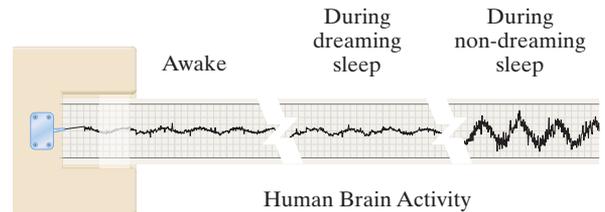

In Exercises 62–64, sketch a reasonable graph that models the given situation.

62. The number of hours of daylight per day in your hometown over a two-year period
63. The motion of a diving board vibrating 10 inches in each direction per second just after someone has dived off
64. The distance of a rotating beam of light from a point on a wall (See the figure for Exercise 59.)

### Writing in Mathematics

65. Without drawing a graph, describe the behavior of the basic tangent curve.
66. If you are given the equation of a tangent function, how do you find a pair of consecutive asymptotes?
67. If you are given the equation of a tangent function, how do you identify an  $x$ -intercept?
68. Without drawing a graph, describe the behavior of the basic cotangent curve.
69. If you are given the equation of a cotangent function, how do you find a pair of consecutive asymptotes?
70. Explain how to determine the range of  $y = \csc x$  from the graph. What is the range?
71. Explain how to use a sine curve to obtain a cosecant curve. Why can the same procedure be used to obtain a secant curve from a cosine curve?

72. Scientists record brain activity by attaching electrodes to the scalp and then connecting these electrodes to a machine. The brain activity recorded with this machine is shown in the three graphs. Which trigonometric functions would be most appropriate for describing the oscillations in brain activity? Describe similarities and differences among these functions when modeling brain activity when awake, during dreaming sleep, and during non-dreaming sleep.

### Technology Exercises

In working Exercises 73–76, describe what happens at the asymptotes on the graphing utility. Compare the graphs in the connected and dot modes.

73. Use a graphing utility to verify any two of the tangent curves that you drew by hand in Exercises 5–12.
74. Use a graphing utility to verify any two of the cotangent curves that you drew by hand in Exercises 17–24.
75. Use a graphing utility to verify any two of the cosecant curves that you drew by hand in Exercises 29–44.
76. Use a graphing utility to verify any two of the secant curves that you drew by hand in Exercises 29–44.

In Exercises 77–82, use a graphing utility to graph each function. Use a viewing rectangle that shows the graph for at least two periods.

77.  $y = \tan \frac{x}{4}$

78.  $y = \tan 4x$

79.  $y = \cot 2x$

80.  $y = \cot \frac{x}{2}$

81.  $y = \frac{1}{2} \tan \pi x$

82.  $y = \frac{1}{2} \tan(\pi x + 1)$

In Exercises 83–86, use a graphing utility to graph each pair of functions in the same viewing rectangle. Use a viewing rectangle that shows the graphs for at least two periods.

83.  $y = 0.8 \sin \frac{x}{2}$  and  $y = 0.8 \csc \frac{x}{2}$

84.  $y = -2.5 \sin \frac{\pi}{3}x$  and  $y = -2.5 \csc \frac{\pi}{3}x$

85.  $y = 4 \cos\left(2x - \frac{\pi}{6}\right)$  and  $y = 4 \sec\left(2x - \frac{\pi}{6}\right)$

86.  $y = -3.5 \cos\left(\pi x - \frac{\pi}{6}\right)$  and  $y = -3.5 \sec\left(\pi x - \frac{\pi}{6}\right)$

87. Carbon dioxide particles in our atmosphere trap heat and raise the planet's temperature. Even if all greenhouse-gas emissions miraculously ended today, the planet would continue to warm through the rest of the century because of the amount of carbon we have already added to the atmosphere. Carbon dioxide accounts for about half of global warming. The function

$$y = 2.5 \sin 2\pi x + 0.0216x^2 + 0.654x + 316$$

models carbon dioxide concentration,  $y$ , in parts per million, where  $x = 0$  represents January 1960;  $x = \frac{1}{12}$ , February 1960;  $x = \frac{2}{12}$ , March 1960;  $\dots$ ,  $x = 1$ , January 1961;  $x = \frac{13}{12}$ , February 1961; and so on. Use a graphing utility to graph the function in a  $[30, 48, 5]$  by  $[310, 420, 5]$  viewing rectangle. Describe what the graph reveals about carbon dioxide concentration from 1990 through 2008.

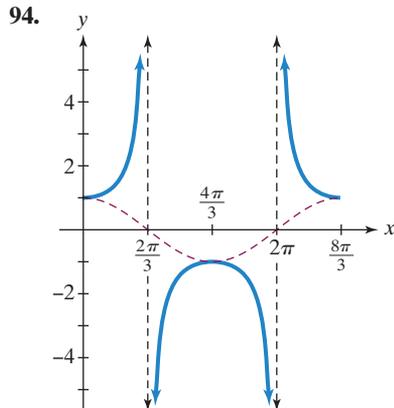

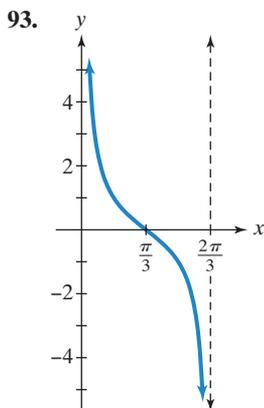

88. Graph  $y = \sin \frac{1}{x}$  in a  $[-0.2, 0.2, 0.01]$  by  $[-1.2, 1.2, 0.01]$  viewing rectangle. What is happening as  $x$  approaches 0 from the left or the right? Explain this behavior.

### Critical Thinking Exercises

**Make Sense?** In Exercises 89–92, determine whether each statement makes sense or does not make sense, and explain your reasoning.

89. I use the pattern  
asymptote,  $-A$ ,  $x$ -intercept,  $A$ , asymptote  
to graph one full period of  $y = A \tan(Bx - C)$ .
90. After using the four-step procedure to graph  $y = -\cot\left(x + \frac{\pi}{4}\right)$ , I checked my graph by verifying it was the graph of  $y = \cot x$  shifted left  $\frac{\pi}{4}$  unit and reflected about the  $x$ -axis.
91. I used the graph of  $y = 3 \cos 2x$  to obtain the graph of  $y = 3 \csc 2x$ .
92. I used a tangent function to model the average monthly temperature of New York City, where  $x = 1$  represents January,  $x = 2$  represents February, and so on.

In Exercises 93–94, write an equation for each blue graph.

In Exercises 95–96, write the equation for a cosecant function satisfying the given conditions.

95. period:  $3\pi$ ; range:  $(-\infty, -2] \cup [2, \infty)$
96. period: 2; range:  $(-\infty, -\pi] \cup [\pi, \infty)$
97. Determine the range of the following functions. Then give a viewing rectangle, or window, that shows two periods of the function's graph.
- $f(x) = \sec\left(3x + \frac{\pi}{2}\right)$
  - $g(x) = 3 \sec \pi\left(x + \frac{1}{2}\right)$
98. For  $x > 0$ , what effect does  $2^{-x}$  in  $y = 2^{-x} \sin x$  have on the graph of  $y = \sin x$ ? What kind of behavior can be modeled by a function such as  $y = 2^{-x} \sin x$ ?

### Preview Exercises

Exercises 99–101 will help you prepare for the material covered in the next section.

99. a. Graph  $y = \sin x$  for  $-\frac{\pi}{2} \leq x \leq \frac{\pi}{2}$ .
- b. Based on your graph in part (a), does  $y = \sin x$  have an inverse function if the domain is restricted to  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ ? Explain your answer.
- c. Determine the angle in the interval  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$  whose sine is  $-\frac{1}{2}$ . Identify this information as a point on your graph in part (a).
100. a. Graph  $y = \cos x$  for  $0 \leq x \leq \pi$ .
- b. Based on your graph in part (a), does  $y = \cos x$  have an inverse function if the domain is restricted to  $[0, \pi]$ ? Explain your answer.
- c. Determine the angle in the interval  $[0, \pi]$  whose cosine is  $-\frac{\sqrt{3}}{2}$ . Identify this information as a point on your graph in part (a).
101. a. Graph  $y = \tan x$  for  $-\frac{\pi}{2} < x < \frac{\pi}{2}$ .
- b. Based on your graph in part (a), does  $y = \tan x$  have an inverse function if the domain is restricted to  $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$ ? Explain your answer.
- c. Determine the angle in the interval  $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$  whose tangent is  $-\sqrt{3}$ . Identify this information as a point on your graph in part (a).

## SECTION 4.7

## Inverse Trigonometric Functions

## Objectives

- 1 Understand and use the inverse sine function.
- 2 Understand and use the inverse cosine function.
- 3 Understand and use the inverse tangent function.
- 4 Use a calculator to evaluate inverse trigonometric functions.
- 5 Find exact values of composite functions with inverse trigonometric functions.

Movies are very much a visual medium. Though music and sound effects are important to the experience, the power of film is captured by the phrase “watching the movie.” Where in the theater should you sit to maximize the visual impact of the astonishing worlds created by film? In this section’s Exercise Set, you will see how an inverse trigonometric function can enhance your movie-going experience.

## GREAT QUESTION!

**What are the most important things I should already know about inverse functions?**

Here are some helpful things to remember from our earlier discussion of inverse functions.

- If no horizontal line intersects the graph of a function more than once, the function is one-to-one and has an inverse function.
- If the point  $(a, b)$  is on the graph of  $f$ , then the point  $(b, a)$  is on the graph of the inverse function, denoted  $f^{-1}$ . The graph of  $f^{-1}$  is a reflection of the graph of  $f$  about the line  $y = x$ .

- 1 Understand and use the inverse sine function.

## The Inverse Sine Function

Figure 4.86 shows the graph of  $y = \sin x$ . Can you see that every horizontal line that can be drawn between  $-1$  and  $1$  intersects the graph infinitely many times? Thus, the sine function is not one-to-one and has no inverse function.

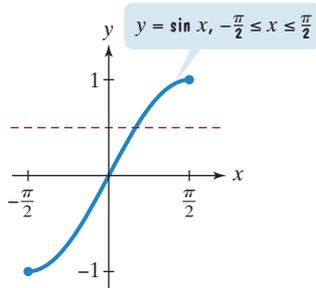

FIGURE 4.87 The restricted sine function passes the horizontal line test. It is one-to-one and has an inverse function.

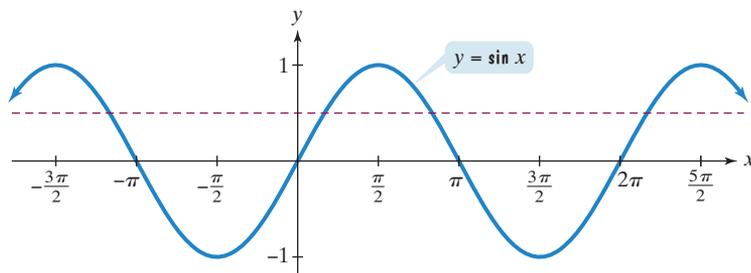

FIGURE 4.86 The horizontal line test shows that the sine function is not one-to-one and has no inverse function.

In Figure 4.87, we have taken a portion of the sine curve, restricting the domain of the sine function to  $-\frac{\pi}{2} \leq x \leq \frac{\pi}{2}$ . With this restricted domain, every horizontal line that can be drawn between  $-1$  and  $1$  intersects the graph exactly once. Thus, the restricted function passes the horizontal line test and is one-to-one.

On the restricted domain  $-\frac{\pi}{2} \leq x \leq \frac{\pi}{2}$ ,  $y = \sin x$  has an inverse function. The inverse of the restricted sine function is called the **inverse sine function**. Two notations are commonly used to denote the inverse sine function:

$$y = \sin^{-1} x \quad \text{or} \quad y = \arcsin x.$$

In this text, we will use  $y = \sin^{-1} x$ . This notation has the same symbol as the inverse function notation  $f^{-1}(x)$ .

### The Inverse Sine Function

The **inverse sine function**, denoted by  $\sin^{-1}$ , is the inverse of the restricted sine function  $y = \sin x$ ,  $-\frac{\pi}{2} \leq x \leq \frac{\pi}{2}$ . Thus,

$$y = \sin^{-1} x \quad \text{means} \quad \sin y = x,$$

where  $-\frac{\pi}{2} \leq y \leq \frac{\pi}{2}$  and  $-1 \leq x \leq 1$ . We read  $y = \sin^{-1} x$  as “y equals the inverse sine at x.”

## GREAT QUESTION!

Is  $\sin^{-1} x$  the same thing as  $\frac{1}{\sin x}$ ?

No. The notation  $y = \sin^{-1} x$  does not mean  $y = \frac{1}{\sin x}$ . The notation  $y = \frac{1}{\sin x}$ , or the reciprocal of the sine function, is written  $y = (\sin x)^{-1}$  and means  $y = \csc x$ .

Inverse sine function

Reciprocal of sine function

$$y = \sin^{-1} x \quad y = (\sin x)^{-1} = \frac{1}{\sin x} = \csc x$$

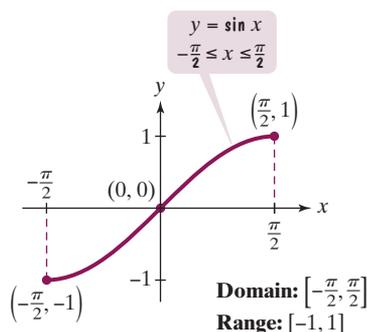

FIGURE 4.88 The restricted sine function

One way to graph  $y = \sin^{-1} x$  is to take points on the graph of the restricted sine function and reverse the order of the coordinates. For example, **Figure 4.88** shows that  $(-\frac{\pi}{2}, -1)$ ,  $(0, 0)$ , and  $(\frac{\pi}{2}, 1)$  are on the graph of the restricted sine function. Reversing the order of the coordinates gives  $(-1, -\frac{\pi}{2})$ ,  $(0, 0)$ , and  $(1, \frac{\pi}{2})$ . We now use these three points to sketch the inverse sine function. The graph of  $y = \sin^{-1} x$  is shown in **Figure 4.89**.

Another way to obtain the graph of  $y = \sin^{-1} x$  is to reflect the graph of the restricted sine function about the line  $y = x$ , shown in **Figure 4.90**. The red graph is the restricted sine function and the blue graph is the graph of  $y = \sin^{-1} x$ .

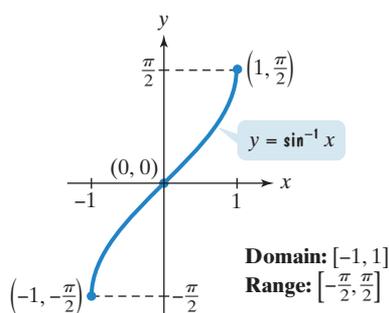

FIGURE 4.89 The graph of the inverse sine function

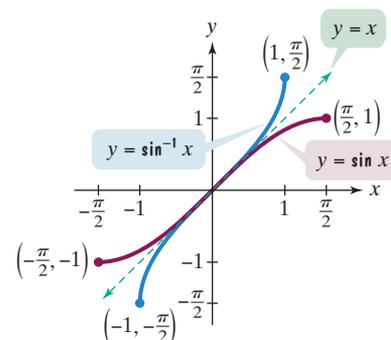

FIGURE 4.90 Using a reflection to obtain the graph of the inverse sine function

Exact values of  $\sin^{-1} x$  can be found by thinking of  $\sin^{-1} x$  as the angle in the interval  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$  whose sine is  $x$ . For example, we can use the two endpoints on the blue graph of the inverse sine function in **Figure 4.89** to write

$$\sin^{-1}(-1) = -\frac{\pi}{2} \quad \text{and} \quad \sin^{-1} 1 = \frac{\pi}{2}.$$

The angle whose sine is  $-1$  is  $-\frac{\pi}{2}$ .

The angle whose sine is  $1$  is  $\frac{\pi}{2}$ .

Because we are thinking of  $\sin^{-1} x$  in terms of an angle, we will represent such an angle by  $\theta$ .

### Finding Exact Values of $\sin^{-1} x$

1. Let  $\theta = \sin^{-1} x$ .
2. Rewrite  $\theta = \sin^{-1} x$  as  $\sin \theta = x$ , where  $-\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}$ .
3. Use the exact values in **Table 4.7** to find the value of  $\theta$  in  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$  that satisfies  $\sin \theta = x$ .

**Table 4.7** Exact Values for  $\sin \theta$ ,  $-\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}$

$\theta$	$-\frac{\pi}{2}$	$-\frac{\pi}{3}$	$-\frac{\pi}{4}$	$-\frac{\pi}{6}$	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$
$\sin \theta$	-1	$-\frac{\sqrt{3}}{2}$	$-\frac{\sqrt{2}}{2}$	$-\frac{1}{2}$	0	$\frac{1}{2}$	$\frac{\sqrt{2}}{2}$	$\frac{\sqrt{3}}{2}$	1

### EXAMPLE 1 Finding the Exact Value of an Inverse Sine Function

Find the exact value of  $\sin^{-1} \frac{\sqrt{2}}{2}$ .

#### SOLUTION

**Step 1** Let  $\theta = \sin^{-1} x$ . Thus,

$$\theta = \sin^{-1} \frac{\sqrt{2}}{2}.$$

We must find the angle  $\theta$ ,  $-\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}$ , whose sine equals  $\frac{\sqrt{2}}{2}$ .

**Step 2** Rewrite  $\theta = \sin^{-1} x$  as  $\sin \theta = x$ , where  $-\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}$ . Using the definition of the inverse sine function, we rewrite  $\theta = \sin^{-1} \frac{\sqrt{2}}{2}$  as

$$\sin \theta = \frac{\sqrt{2}}{2}, \text{ where } -\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}.$$

**Step 3** Use the exact values in **Table 4.7** to find the value of  $\theta$  in  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$  that satisfies  $\sin \theta = x$ . **Table 4.7** shows that the only angle in the interval  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$  that satisfies  $\sin \theta = \frac{\sqrt{2}}{2}$  is  $\frac{\pi}{4}$ . Thus,  $\theta = \frac{\pi}{4}$ . Because  $\theta$ , in step 1, represents  $\sin^{-1} \frac{\sqrt{2}}{2}$ , we conclude that

$$\sin^{-1} \frac{\sqrt{2}}{2} = \frac{\pi}{4}. \quad \text{The angle in } \left[-\frac{\pi}{2}, \frac{\pi}{2}\right] \text{ whose sine is } \frac{\sqrt{2}}{2} \text{ is } \frac{\pi}{4}. \quad \dots$$

 **Check Point 1** Find the exact value of  $\sin^{-1} \frac{\sqrt{3}}{2}$ .

### EXAMPLE 2 Finding the Exact Value of an Inverse Sine Function

Find the exact value of  $\sin^{-1}\left(-\frac{1}{2}\right)$ .

#### SOLUTION

**Step 1** Let  $\theta = \sin^{-1} x$ . Thus,

$$\theta = \sin^{-1}\left(-\frac{1}{2}\right).$$

We must find the angle  $\theta$ ,  $-\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}$ , whose sine equals  $-\frac{1}{2}$ .

**Step 2** Rewrite  $\theta = \sin^{-1} x$  as  $\sin \theta = x$ , where  $-\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}$ . We rewrite  $\theta = \sin^{-1}\left(-\frac{1}{2}\right)$  and obtain

$$\sin \theta = -\frac{1}{2}, \text{ where } -\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}.$$

**Step 3** Use the exact values in Table 4.7 to find the value of  $\theta$  in  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$  that satisfies  $\sin \theta = x$ . Table 4.7 shows that the only angle in the interval  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$  that satisfies  $\sin \theta = -\frac{1}{2}$  is  $-\frac{\pi}{6}$ . Thus,

$$\sin^{-1}\left(-\frac{1}{2}\right) = -\frac{\pi}{6}. \quad \dots$$

 **Check Point 2** Find the exact value of  $\sin^{-1}\left(-\frac{\sqrt{2}}{2}\right)$ .

Some inverse sine expressions cannot be evaluated. Because the domain of the inverse sine function is  $[-1, 1]$ , it is only possible to evaluate  $\sin^{-1} x$  for values of  $x$  in this domain. Thus,  $\sin^{-1} 3$  cannot be evaluated. There is no angle whose sine is 3.

- 2 Understand and use the inverse cosine function.

### The Inverse Cosine Function

Figure 4.91 shows how we restrict the domain of the cosine function so that it becomes one-to-one and has an inverse function. Restrict the domain to the interval  $[0, \pi]$ , shown by the dark blue graph. Over this interval, the restricted cosine function passes the horizontal line test and has an inverse function.

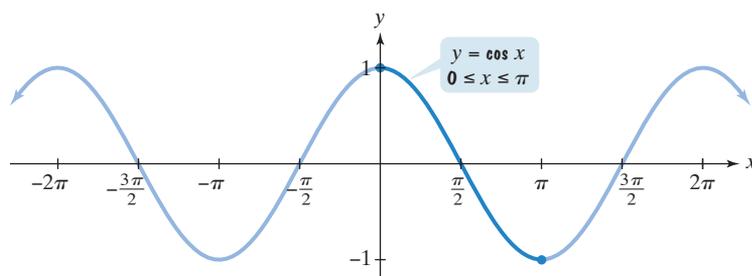

FIGURE 4.91  $y = \cos x$  is one-to-one on the interval  $[0, \pi]$ .

### The Inverse Cosine Function

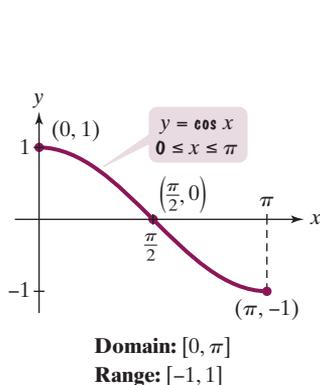

The **inverse cosine function**, denoted by  $\cos^{-1}$ , is the inverse of the restricted cosine function  $y = \cos x$ ,  $0 \leq x \leq \pi$ . Thus,

$$y = \cos^{-1} x \text{ means } \cos y = x,$$

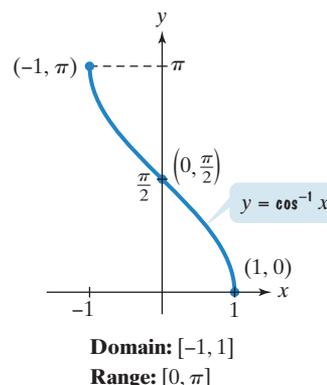

where  $0 \leq y \leq \pi$  and  $-1 \leq x \leq 1$ .

One way to graph  $y = \cos^{-1} x$  is to take points on the graph of the restricted cosine function and reverse the order of the coordinates. For example, **Figure 4.92** shows that  $(0, 1)$ ,  $(\frac{\pi}{2}, 0)$ , and  $(\pi, -1)$  are on the graph of the restricted cosine function. Reversing the order of the coordinates gives  $(1, 0)$ ,  $(0, \frac{\pi}{2})$ , and  $(-1, \pi)$ .

We now use these three points to sketch the inverse cosine function. The graph of  $y = \cos^{-1} x$  is shown in **Figure 4.93**. You can also obtain this graph by reflecting the graph of the restricted cosine function about the line  $y = x$ .

**FIGURE 4.92** The restricted cosine function

**FIGURE 4.93** The graph of the inverse cosine function

Exact values of  $\cos^{-1} x$  can be found by thinking of  $\cos^{-1} x$  as **the angle in the interval  $[0, \pi]$  whose cosine is  $x$** .

### Finding Exact Values of $\cos^{-1} x$

1. Let  $\theta = \cos^{-1} x$ .
2. Rewrite  $\theta = \cos^{-1} x$  as  $\cos \theta = x$ , where  $0 \leq \theta \leq \pi$ .
3. Use the exact values in **Table 4.8** to find the value of  $\theta$  in  $[0, \pi]$  that satisfies  $\cos \theta = x$ .

**Table 4.8** Exact Values for  $\cos \theta$ ,  $0 \leq \theta \leq \pi$

$\theta$	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	$\pi$
$\cos \theta$	1	$\frac{\sqrt{3}}{2}$	$\frac{\sqrt{2}}{2}$	$\frac{1}{2}$	0	$-\frac{1}{2}$	$-\frac{\sqrt{2}}{2}$	$-\frac{\sqrt{3}}{2}$	-1

### EXAMPLE 3 Finding the Exact Value of an Inverse Cosine Function

Find the exact value of  $\cos^{-1}\left(-\frac{\sqrt{3}}{2}\right)$ .

## SOLUTION

**Step 1** Let  $\theta = \cos^{-1}x$ . Thus,

$$\theta = \cos^{-1}\left(-\frac{\sqrt{3}}{2}\right).$$

We must find the angle  $\theta$ ,  $0 \leq \theta \leq \pi$ , whose cosine equals  $-\frac{\sqrt{3}}{2}$ .

**Step 2** Rewrite  $\theta = \cos^{-1}x$  as  $\cos \theta = x$ , where  $0 \leq \theta \leq \pi$ . We obtain

$$\cos \theta = -\frac{\sqrt{3}}{2}, \text{ where } 0 \leq \theta \leq \pi.$$

**Step 3** Use the exact values in Table 4.8 to find the value of  $\theta$  in  $[0, \pi]$  that satisfies  $\cos \theta = x$ . Table 4.8 shows that the only angle in the interval  $[0, \pi]$  that satisfies  $\cos \theta = -\frac{\sqrt{3}}{2}$  is  $\frac{5\pi}{6}$ . Thus,  $\theta = \frac{5\pi}{6}$  and

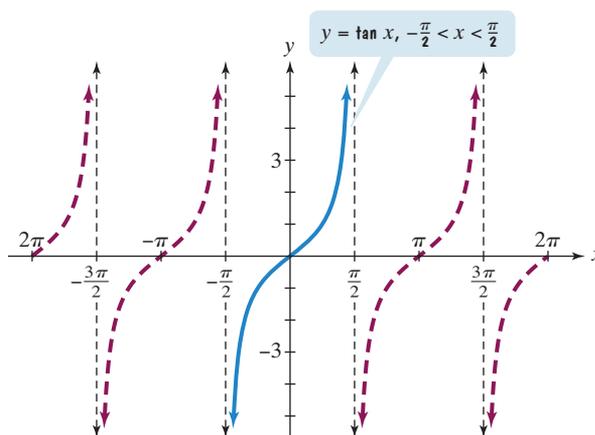

$$\cos^{-1}\left(-\frac{\sqrt{3}}{2}\right) = \frac{5\pi}{6}. \quad \text{The angle in } [0, \pi] \text{ whose cosine is } -\frac{\sqrt{3}}{2} \text{ is } \frac{5\pi}{6}. \quad \dots$$

 **Check Point 3** Find the exact value of  $\cos^{-1}\left(-\frac{1}{2}\right)$ .

- 3** Understand and use the inverse tangent function.

## The Inverse Tangent Function

Figure 4.94 shows how we restrict the domain of the tangent function so that it becomes one-to-one and has an inverse function. Restrict the domain to the interval  $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$ , shown by the solid blue graph. Over this interval, the restricted tangent function passes the horizontal line test and has an inverse function.

**FIGURE 4.94**  $y = \tan x$  is one-to-one on the interval  $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$ .

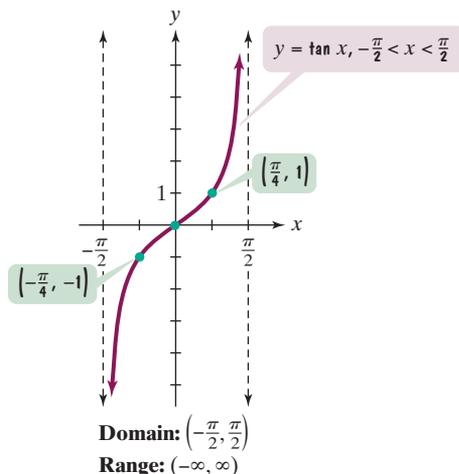

## The Inverse Tangent Function

The **inverse tangent function**, denoted by  $\tan^{-1}$ , is the inverse of the restricted tangent function  $y = \tan x$ ,  $-\frac{\pi}{2} < x < \frac{\pi}{2}$ . Thus,

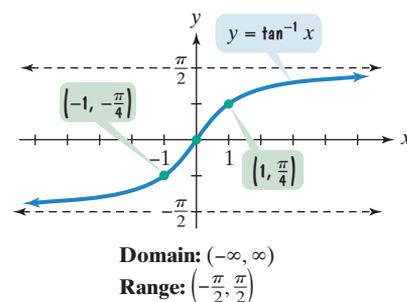

$$y = \tan^{-1}x \text{ means } \tan y = x,$$

where  $-\frac{\pi}{2} < y < \frac{\pi}{2}$  and  $-\infty < x < \infty$ .

We graph  $y = \tan^{-1} x$  by taking points on the graph of the restricted function and reversing the order of the coordinates. **Figure 4.95** shows that  $(-\frac{\pi}{4}, -1)$ ,  $(0, 0)$ , and  $(\frac{\pi}{4}, 1)$  are on the graph of the restricted tangent function. Reversing the order gives  $(-1, -\frac{\pi}{4})$ ,  $(0, 0)$ , and  $(1, \frac{\pi}{4})$ . We now use these three points to graph the inverse tangent function. The graph of  $y = \tan^{-1} x$  is shown in **Figure 4.96**. Notice that the vertical asymptotes become horizontal asymptotes for the graph of the inverse function.

**FIGURE 4.95** The restricted tangent function

**FIGURE 4.96** The graph of the inverse tangent function

Exact values of  $\tan^{-1} x$  can be found by thinking of  $\tan^{-1} x$  as the angle in the interval  $(-\frac{\pi}{2}, \frac{\pi}{2})$  whose tangent is  $x$ .

### Finding Exact Values of $\tan^{-1} x$

- Let  $\theta = \tan^{-1} x$ .
- Rewrite  $\theta = \tan^{-1} x$  as  $\tan \theta = x$ , where  $-\frac{\pi}{2} < \theta < \frac{\pi}{2}$ .
- Use the exact values in **Table 4.9** to find the value of  $\theta$  in  $(-\frac{\pi}{2}, \frac{\pi}{2})$  that satisfies  $\tan \theta = x$ .

**Table 4.9** Exact Values for  $\tan \theta, -\frac{\pi}{2} < \theta < \frac{\pi}{2}$

$\theta$	$-\frac{\pi}{3}$	$-\frac{\pi}{4}$	$-\frac{\pi}{6}$	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$
$\tan \theta$	$-\sqrt{3}$	-1	$-\frac{\sqrt{3}}{3}$	0	$\frac{\sqrt{3}}{3}$	1	$\sqrt{3}$

### EXAMPLE 4 Finding the Exact Value of an Inverse Tangent Function

Find the exact value of  $\tan^{-1} \sqrt{3}$ .

## SOLUTION

**Step 1** Let  $\theta = \tan^{-1}x$ . Thus,

$$\theta = \tan^{-1}\sqrt{3}.$$

We must find the angle  $\theta$ ,  $-\frac{\pi}{2} < \theta < \frac{\pi}{2}$ , whose tangent equals  $\sqrt{3}$ .

**Step 2** Rewrite  $\theta = \tan^{-1}x$  as  $\tan \theta = x$ , where  $-\frac{\pi}{2} < \theta < \frac{\pi}{2}$ . We obtain

$$\tan \theta = \sqrt{3}, \text{ where } -\frac{\pi}{2} < \theta < \frac{\pi}{2}.$$

**Step 3** Use the exact values in Table 4.9 to find the value of  $\theta$  in  $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$  that satisfies  $\tan \theta = x$ . Table 4.9 shows that the only angle in the interval  $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$  that satisfies  $\tan \theta = \sqrt{3}$  is  $\frac{\pi}{3}$ . Thus,  $\theta = \frac{\pi}{3}$  and

$$\tan^{-1}\sqrt{3} = \frac{\pi}{3}. \quad \text{The angle in } \left(-\frac{\pi}{2}, \frac{\pi}{2}\right) \text{ whose tangent is } \sqrt{3} \text{ is } \frac{\pi}{3}.$$

## GREAT QUESTION!

Are the domains of the restricted trigonometric functions the same as the intervals on which the nonrestricted functions complete one cycle?

Do not confuse the domains of the restricted trigonometric functions with the intervals on which the nonrestricted functions complete one cycle. They are only the same for the tangent function.

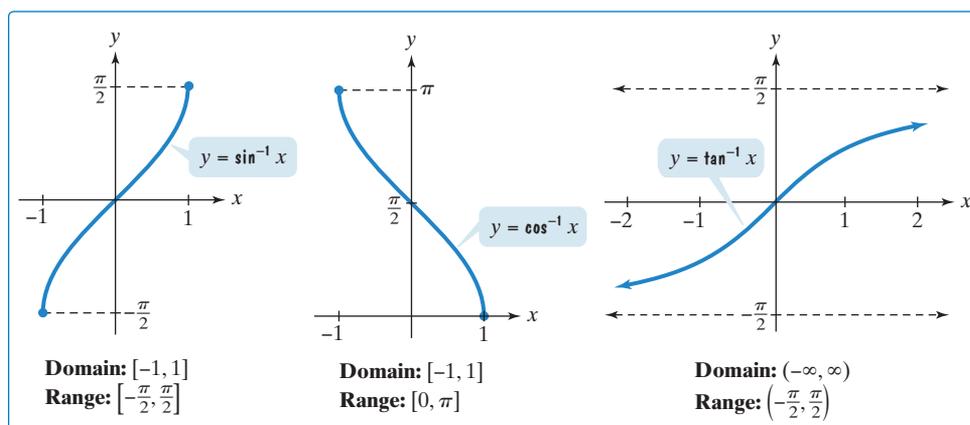

Trigonometric Function	Domain of Restricted Function	Interval on Which Nonrestricted Function's Graph Completes One Period
$y = \sin x$	$\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$	$[0, 2\pi]$ <span style="float: right;">Period: <math>2\pi</math></span>
$y = \cos x$	$[0, \pi]$	$[0, 2\pi]$ <span style="float: right;">Period: <math>2\pi</math></span>
$y = \tan x$	$\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$	$\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$ <span style="float: right;">Period: <math>\pi</math></span>

These domain restrictions are the range for  $y = \sin^{-1}x$ ,  $y = \cos^{-1}x$ , and  $y = \tan^{-1}x$ , respectively.

 **Check Point 4** Find the exact value of  $\tan^{-1}(-1)$ .

**Table 4.10** summarizes the graphs of the three basic inverse trigonometric functions. Below each of the graphs is a description of the function's domain and range.

**Table 4.10** Graphs of the Three Basic Inverse Trigonometric Functions

- 4 Use a calculator to evaluate inverse trigonometric functions.

### Using a Calculator to Evaluate Inverse Trigonometric Functions

Calculators give approximate values of inverse trigonometric functions. Use the secondary keys marked  $\boxed{\text{SIN}^{-1}}$ ,  $\boxed{\text{COS}^{-1}}$ , and  $\boxed{\text{TAN}^{-1}}$ . These keys are not buttons that you actually press. They are the secondary functions for the buttons labeled  $\boxed{\text{SIN}}$ ,  $\boxed{\text{COS}}$ , and  $\boxed{\text{TAN}}$ , respectively. Consult your manual for the location of this feature.

#### EXAMPLE 5 Calculators and Inverse Trigonometric Functions

Use a calculator to find the value to four decimal places of each function:

a.  $\sin^{-1} \frac{1}{4}$       b.  $\tan^{-1}(-9.65)$ .

#### SOLUTION

##### Scientific Calculator Solution

Function	Mode	Keystrokes	Display, Rounded to Four Places
a. $\sin^{-1} \frac{1}{4}$	Radian	1 $\boxed{\div}$ 4 $\boxed{=}$ $\boxed{2\text{nd}}$ $\boxed{\text{SIN}}$	0.2527
b. $\tan^{-1}(-9.65)$	Radian	9.65 $\boxed{+/-}$ $\boxed{2\text{nd}}$ $\boxed{\text{TAN}}$	-1.4675

##### Graphing Calculator Solution

Function	Mode	Keystrokes	Display, Rounded to Four Places
a. $\sin^{-1} \frac{1}{4}$	Radian	$\boxed{2\text{nd}}$ $\boxed{\text{SIN}}$ $\boxed{(}$ 1 $\boxed{\div}$ 4 $\boxed{)}$ $\boxed{\text{ENTER}}$	0.2527
b. $\tan^{-1}(-9.65)$	Radian	$\boxed{2\text{nd}}$ $\boxed{\text{TAN}}$ $\boxed{(}$ - $\boxed{)}$ 9.65 $\boxed{\text{ENTER}}$	-1.4675

-  **Check Point 5** Use a calculator to find the value to four decimal places of each function:

a.  $\cos^{-1} \frac{1}{3}$       b.  $\tan^{-1}(-35.85)$ .

### GREAT QUESTION!

**What happens if I attempt to evaluate an inverse trigonometric function at a value that is not in its domain?**

In real number mode, most calculators will display an error message. For example, an error message can result if you attempt to approximate  $\cos^{-1} 3$ . There is no angle whose cosine is 3. The domain of the inverse cosine function is  $[-1, 1]$  and 3 does not belong to this domain.

- 5 Find exact values of composite functions with inverse trigonometric functions.

### Composition of Functions Involving Inverse Trigonometric Functions

In our earlier discussion of functions and their inverses, we saw that

$$f(f^{-1}(x)) = x \quad \text{and} \quad f^{-1}(f(x)) = x.$$

$x$  must be in the domain of  $f^{-1}$ .

$x$  must be in the domain of  $f$ .

We apply these properties to the sine, cosine, tangent, and their inverse functions to obtain the following properties:

### Inverse Properties

#### The Sine Function and Its Inverse

$$\sin(\sin^{-1} x) = x \quad \text{for every } x \text{ in the interval } [-1, 1]$$

$$\sin^{-1}(\sin x) = x \quad \text{for every } x \text{ in the interval } \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$$

#### The Cosine Function and Its Inverse

$$\cos(\cos^{-1} x) = x \quad \text{for every } x \text{ in the interval } [-1, 1]$$

$$\cos^{-1}(\cos x) = x \quad \text{for every } x \text{ in the interval } [0, \pi]$$

#### The Tangent Function and Its Inverse

$$\tan(\tan^{-1} x) = x \quad \text{for every real number } x$$

$$\tan^{-1}(\tan x) = x \quad \text{for every } x \text{ in the interval } \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$$

The restrictions on  $x$  in the inverse properties are a bit tricky. For example,

$$\sin^{-1}\left(\sin \frac{\pi}{4}\right) = \frac{\pi}{4}.$$

$$\sin^{-1}(\sin x) = x \text{ for } x \text{ in } \left[-\frac{\pi}{2}, \frac{\pi}{2}\right].$$

Observe that  $\frac{\pi}{4}$  is in this interval.

Can we use  $\sin^{-1}(\sin x) = x$  to find the exact value of  $\sin^{-1}\left(\sin \frac{5\pi}{4}\right)$ ? Is  $\frac{5\pi}{4}$  in the interval  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ ? No. Thus, to evaluate  $\sin^{-1}\left(\sin \frac{5\pi}{4}\right)$ , we must first find  $\sin \frac{5\pi}{4}$ .

$\frac{5\pi}{4}$  is in quadrant III,  
where the sine is negative.

$$\sin \frac{5\pi}{4} = -\sin \frac{\pi}{4} = -\frac{\sqrt{2}}{2}$$

The reference angle  
for  $\frac{5\pi}{4}$  is  $\frac{\pi}{4}$ .

We evaluate  $\sin^{-1}\left(\sin \frac{5\pi}{4}\right)$  as follows:

$$\sin^{-1}\left(\sin \frac{5\pi}{4}\right) = \sin^{-1}\left(-\frac{\sqrt{2}}{2}\right) = -\frac{\pi}{4}.$$

If necessary, see Table 4.7 on page 587.

To determine how to evaluate the composition of functions involving inverse trigonometric functions, first examine the value of  $x$ . You can use the inverse properties in the box only if  $x$  is in the specified interval.

**EXAMPLE 6** Evaluating Compositions of Functions and Their Inverses

Find the exact value, if possible:

a.  $\cos(\cos^{-1} 0.6)$       b.  $\sin^{-1}\left(\sin \frac{3\pi}{2}\right)$       c.  $\cos(\cos^{-1} 1.5)$ .

**SOLUTION**

- a. The inverse property  $\cos(\cos^{-1} x) = x$  applies for every  $x$  in  $[-1, 1]$ . To evaluate  $\cos(\cos^{-1} 0.6)$ , observe that  $x = 0.6$ . This value of  $x$  lies in  $[-1, 1]$ , which is the domain of the inverse cosine function. This means that we can use the inverse property  $\cos(\cos^{-1} x) = x$ . Thus,

$$\cos(\cos^{-1} 0.6) = 0.6.$$

- b. The inverse property  $\sin^{-1}(\sin x) = x$  applies for every  $x$  in  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ . To evaluate  $\sin^{-1}\left(\sin \frac{3\pi}{2}\right)$ , observe that  $x = \frac{3\pi}{2}$ . This value of  $x$  does not lie in  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ . To evaluate this expression, we first find  $\sin \frac{3\pi}{2}$ .

$$\sin^{-1}\left(\sin \frac{3\pi}{2}\right) = \sin^{-1}(-1) = -\frac{\pi}{2}$$

The angle in  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$  whose sine is  $-1$  is  $-\frac{\pi}{2}$ .

- c. The inverse property  $\cos(\cos^{-1} x) = x$  applies for every  $x$  in  $[-1, 1]$ . To attempt to evaluate  $\cos(\cos^{-1} 1.5)$ , observe that  $x = 1.5$ . This value of  $x$  does not lie in  $[-1, 1]$ , which is the domain of the inverse cosine function. Thus, the expression  $\cos(\cos^{-1} 1.5)$  is not defined because  $\cos^{-1} 1.5$  is not defined. ●●●

**Check Point 6** Find the exact value, if possible:

a.  $\cos(\cos^{-1} 0.7)$       b.  $\sin^{-1}(\sin \pi)$       c.  $\cos[\cos^{-1}(-1.2)]$ .

We can use points on terminal sides of angles in standard position to find exact values of expressions involving the composition of a function and a different inverse function. Here are two examples:

$$\cos\left(\tan^{-1} \frac{5}{12}\right) \quad \cot\left[\sin^{-1}\left(-\frac{1}{3}\right)\right].$$

Inner part involves the angle in  $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$  whose tangent is  $\frac{5}{12}$ .

Inner part involves the angle in  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$  whose sine is  $-\frac{1}{3}$ .

The inner part of each expression involves an angle. To evaluate such expressions, we represent such angles by  $\theta$ . Then we use a sketch that illustrates our representation. Examples 7 and 8 show how to carry out such evaluations.

**EXAMPLE 7** Evaluating a Composite Trigonometric Expression

Find the exact value of  $\cos\left(\tan^{-1} \frac{5}{12}\right)$ .

**SOLUTION**

We let  $\theta$  represent the angle in  $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$  whose tangent is  $\frac{5}{12}$ . Thus,

$$\theta = \tan^{-1} \frac{5}{12}.$$

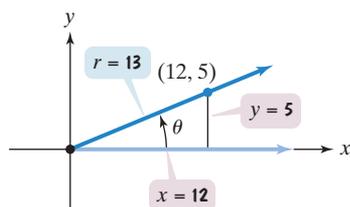

FIGURE 4.97 Representing  $\tan \theta = \frac{5}{12}$

We are looking for the exact value of  $\cos\left(\tan^{-1}\frac{5}{12}\right)$ , with  $\theta = \tan^{-1}\frac{5}{12}$ . Using the definition of the inverse tangent function, we can rewrite  $\theta = \tan^{-1}\frac{5}{12}$  as

$$\tan \theta = \frac{5}{12}, \quad \text{where } -\frac{\pi}{2} < \theta < \frac{\pi}{2}.$$

Because  $\tan \theta$  is positive,  $\theta$  must be an angle in  $\left(0, \frac{\pi}{2}\right)$ . Thus,  $\theta$  is a first-quadrant angle. **Figure 4.97** shows a right triangle in quadrant I with

$$\tan \theta = \frac{5}{12}.$$

Side opposite  $\theta$ , or  $y$   
Side adjacent to  $\theta$ , or  $x$

The hypotenuse of the triangle,  $r$ , or the distance from the origin to  $(12, 5)$ , is found using  $r = \sqrt{x^2 + y^2}$ .

$$r = \sqrt{x^2 + y^2} = \sqrt{12^2 + 5^2} = \sqrt{144 + 25} = \sqrt{169} = 13$$

We use the values for  $x$  and  $r$  to find the exact value of  $\cos\left(\tan^{-1}\frac{5}{12}\right)$ .

$$\cos\left(\tan^{-1}\frac{5}{12}\right) = \cos \theta = \frac{\text{side adjacent to } \theta, \text{ or } x}{\text{hypotenuse, or } r} = \frac{12}{13}$$

**Check Point 7** Find the exact value of  $\sin\left(\tan^{-1}\frac{3}{4}\right)$ .

### EXAMPLE 8 Evaluating a Composite Trigonometric Expression

Find the exact value of  $\cot\left[\sin^{-1}\left(-\frac{1}{3}\right)\right]$ .

#### SOLUTION

We let  $\theta$  represent the angle in  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$  whose sine is  $-\frac{1}{3}$ . Thus,

$$\theta = \sin^{-1}\left(-\frac{1}{3}\right) \quad \text{and} \quad \sin \theta = -\frac{1}{3}, \quad \text{where } -\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}.$$

Because  $\sin \theta$  is negative in  $\sin \theta = -\frac{1}{3}$ ,  $\theta$  must be an angle in  $\left[-\frac{\pi}{2}, 0\right)$ . Thus,  $\theta$  is a negative angle that lies in quadrant IV. **Figure 4.98** shows angle  $\theta$  in quadrant IV with

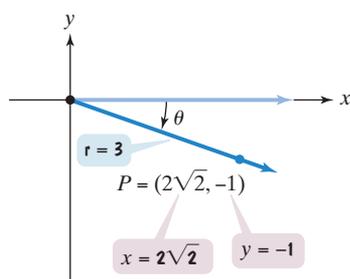

FIGURE 4.98 Representing  $\sin \theta = -\frac{1}{3}$

In quadrant IV,  $y$  is negative.

$$\sin \theta = -\frac{1}{3} = \frac{y}{r} = \frac{-1}{3}.$$

Thus,  $y = -1$  and  $r = 3$ . The value of  $x$  can be found using  $r = \sqrt{x^2 + y^2}$  or  $x^2 + y^2 = r^2$ .

$$\begin{aligned} x^2 + (-1)^2 &= 3^2 \\ x^2 + 1 &= 9 \\ x^2 &= 8 \\ x &= \sqrt{8} = \sqrt{4 \cdot 2} = 2\sqrt{2} \end{aligned}$$

Use  $x^2 + y^2 = r^2$  with  $y = -1$  and  $r = 3$ .

Square  $-1$  and square  $3$ .

Subtract 1 from both sides.

Use the square root property. Remember that  $x$  is positive in quadrant IV.

We use values for  $x$  and  $y$  to find the exact value of  $\cot\left[\sin^{-1}\left(-\frac{1}{3}\right)\right]$ .

$$\cot\left[\sin^{-1}\left(-\frac{1}{3}\right)\right] = \cot \theta = \frac{x}{y} = \frac{2\sqrt{2}}{-1} = -2\sqrt{2} \quad \dots$$

 **Check Point 8** Find the exact value of  $\cos\left[\sin^{-1}\left(-\frac{1}{2}\right)\right]$ .

Some composite functions with inverse trigonometric functions can be simplified to algebraic expressions. To simplify such an expression, we represent the inverse trigonometric function in the expression by  $\theta$ . Then we use a right triangle.

### EXAMPLE 9 Simplifying an Expression Involving $\sin^{-1}x$

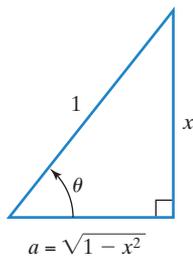

If  $0 < x \leq 1$ , write  $\cos(\sin^{-1}x)$  as an algebraic expression in  $x$ .

#### SOLUTION

We let  $\theta$  represent the angle in  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$  whose sine is  $x$ . Thus,

$$\theta = \sin^{-1}x \quad \text{and} \quad \sin \theta = x, \quad \text{where} \quad -\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}.$$

Because  $0 < x \leq 1$ ,  $\sin \theta$  is positive. Thus,  $\theta$  is a first-quadrant angle and can be represented as an acute angle of a right triangle. **Figure 4.99** shows a right triangle with

**FIGURE 4.99** Representing  $\sin \theta = x$

$$\sin \theta = x = \frac{x}{1}.$$

Side opposite  $\theta$   
Hypotenuse

The third side,  $a$  in **Figure 4.99**, can be found using the Pythagorean Theorem.

$$a^2 + x^2 = 1^2$$

Apply the Pythagorean Theorem to the right triangle in Figure 4.99.

$$a^2 = 1 - x^2$$

Subtract  $x^2$  from both sides.

$$a = \sqrt{1 - x^2}$$

Use the square root property and solve for  $a$ . Remember that side  $a$  is positive.

We use the right triangle in **Figure 4.99** to write  $\cos(\sin^{-1}x)$  as an algebraic expression.

$$\cos(\sin^{-1}x) = \cos \theta = \frac{\text{side adjacent to } \theta}{\text{hypotenuse}} = \frac{\sqrt{1 - x^2}}{1} = \sqrt{1 - x^2} \quad \dots$$

 **Check Point 9** If  $x > 0$ , write  $\sec(\tan^{-1}x)$  as an algebraic expression in  $x$ .

The inverse secant function,  $y = \sec^{-1}x$ , is used in calculus. However, inverse cotangent and inverse cosecant functions are rarely used. Two of these remaining inverse trigonometric functions are briefly developed in the Exercise Set that follows.

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

1. By restricting the domain of  $y = \sin x$  to \_\_\_\_\_, the restricted sine function has an inverse function. The inverse sine function is denoted by  $y =$  \_\_\_\_\_.
2. By restricting the domain of  $y = \cos x$  to \_\_\_\_\_, the restricted cosine function has an inverse function. The inverse cosine function is denoted by  $y =$  \_\_\_\_\_.
3. By restricting the domain of  $y = \tan x$  to \_\_\_\_\_, the restricted tangent function has an inverse function. The inverse of the tangent function is denoted by  $y =$  \_\_\_\_\_.
4. The domain of  $y = \sin^{-1} x$  is \_\_\_\_\_ and the range is \_\_\_\_\_.
5. The domain of  $y = \cos^{-1} x$  is \_\_\_\_\_ and the range is \_\_\_\_\_.
6. The domain of  $y = \tan^{-1} x$  is \_\_\_\_\_ and the range is \_\_\_\_\_.
7.  $\sin^{-1}(\sin x) = x$  for every  $x$  in the interval \_\_\_\_\_.
8.  $\cos^{-1}(\cos x) = x$  for every  $x$  in the interval \_\_\_\_\_.
9.  $\tan^{-1}(\tan x) = x$  for every  $x$  in the interval \_\_\_\_\_.
10. True or false:  $\cos^{-1} x = \frac{1}{\cos x}$  \_\_\_\_\_

## EXERCISE SET 4.7

### Practice Exercises

In Exercises 1–18, find the exact value of each expression.

- |   |  |
|---|--|
| 1. $\sin^{-1} \frac{1}{2}$                      | 2. $\sin^{-1} 0$                                 |
| 3. $\sin^{-1} \frac{\sqrt{2}}{2}$               | 4. $\sin^{-1} \frac{\sqrt{3}}{2}$                |
| 5. $\sin^{-1} \left(-\frac{1}{2}\right)$        | 6. $\sin^{-1} \left(-\frac{\sqrt{3}}{2}\right)$  |
| 7. $\cos^{-1} \frac{\sqrt{3}}{2}$               | 8. $\cos^{-1} \frac{\sqrt{2}}{2}$                |
| 9. $\cos^{-1} \left(-\frac{\sqrt{2}}{2}\right)$ | 10. $\cos^{-1} \left(-\frac{\sqrt{3}}{2}\right)$ |

In Exercises 63–72, use a right triangle to write each expression as an algebraic expression. Assume that  $x$  is positive and that the given inverse trigonometric function is defined for the expression in  $x$ .

63.  $\tan(\cos^{-1} x)$                       64.  $\sin(\tan^{-1} x)$   
 65.  $\cos(\sin^{-1} 2x)$                     66.  $\sin(\cos^{-1} 2x)$   
 67.  $\cos\left(\sin^{-1}\frac{1}{x}\right)$                     68.  $\sec\left(\cos^{-1}\frac{1}{x}\right)$   
 69.  $\cot\left(\tan^{-1}\frac{x}{\sqrt{3}}\right)$                     70.  $\cot\left(\tan^{-1}\frac{x}{\sqrt{2}}\right)$   
 71.  $\sec\left(\sin^{-1}\frac{x}{\sqrt{x^2+4}}\right)$                 72.  $\cot\left(\sin^{-1}\frac{\sqrt{x^2-9}}{x}\right)$
73. a. Graph the restricted secant function,  $y = \sec x$ , by restricting  $x$  to the intervals  $\left[0, \frac{\pi}{2}\right)$  and  $\left(\frac{\pi}{2}, \pi\right]$ .  
 b. Use the horizontal line test to explain why the restricted secant function has an inverse function.  
 c. Use the graph of the restricted secant function to graph  $y = \sec^{-1} x$ .
74. a. Graph the restricted cotangent function,  $y = \cot x$ , by restricting  $x$  to the interval  $(0, \pi)$ .  
 b. Use the horizontal line test to explain why the restricted cotangent function has an inverse function.  
 c. Use the graph of the restricted cotangent function to graph  $y = \cot^{-1} x$ .

### Practice Plus

The graphs of  $y = \sin^{-1} x$ ,  $y = \cos^{-1} x$ , and  $y = \tan^{-1} x$  are shown in **Table 4.10** on page 592. In Exercises 75–84, use transformations (vertical shifts, horizontal shifts, reflections, stretching, or shrinking) of these graphs to graph each function. Then use interval notation to give the function's domain and range.

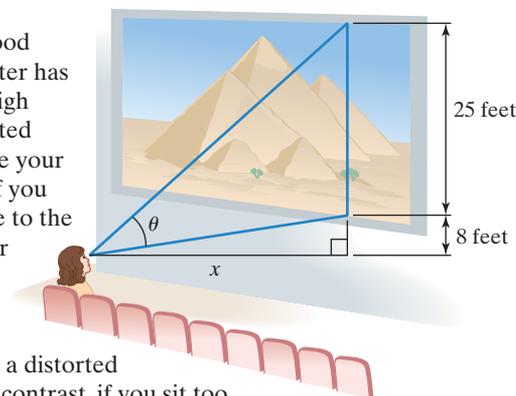

75.  $f(x) = \sin^{-1} x + \frac{\pi}{2}$                     76.  $f(x) = \cos^{-1} x + \frac{\pi}{2}$   
 77.  $g(x) = \cos^{-1}(x + 1)$                 78.  $g(x) = \sin^{-1}(x + 1)$   
 79.  $h(x) = -2 \tan^{-1} x$                     80.  $h(x) = -3 \tan^{-1} x$   
 81.  $f(x) = \sin^{-1}(x - 2) - \frac{\pi}{2}$             82.  $f(x) = \cos^{-1}(x - 2) - \frac{\pi}{2}$   
 83.  $g(x) = \cos^{-1}\frac{x}{2}$                       84.  $g(x) = \sin^{-1}\frac{x}{2}$

In Exercises 85–92, determine the domain and the range of each function.

85.  $f(x) = \sin(\sin^{-1} x)$   
 86.  $f(x) = \cos(\cos^{-1} x)$   
 87.  $f(x) = \cos^{-1}(\cos x)$   
 88.  $f(x) = \sin^{-1}(\sin x)$   
 89.  $f(x) = \sin^{-1}(\cos x)$   
 90.  $f(x) = \cos^{-1}(\sin x)$   
 91.  $f(x) = \sin^{-1} x + \cos^{-1} x$   
 92.  $f(x) = \cos^{-1} x - \sin^{-1} x$

### Application Exercises

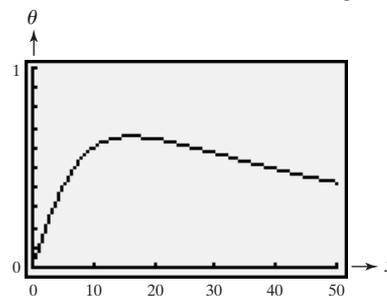

93. Your neighborhood movie theater has a 25-foot-high screen located 8 feet above your eye level. If you sit too close to the screen, your viewing angle is too small, resulting in a distorted picture. By contrast, if you sit too far back, the image is quite small, diminishing the movie's visual impact. If you sit  $x$  feet back from the screen, your viewing angle,  $\theta$ , is given by

$$\theta = \tan^{-1} \frac{33}{x} - \tan^{-1} \frac{8}{x}$$

Find the viewing angle, in radians, at distances of 5 feet, 10 feet, 15 feet, 20 feet, and 25 feet.

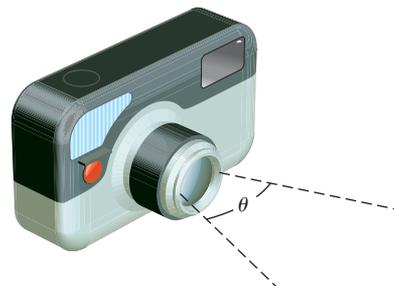

94. The function  $\theta = \tan^{-1} \frac{33}{x} - \tan^{-1} \frac{8}{x}$ , described in Exercise 93, is graphed below in a  $[0, 50, 10]$  by  $[0, 1, 0.1]$  viewing rectangle. Use the graph to describe what happens to your viewing angle as you move farther back from the screen. How far back from the screen, to the nearest foot, should you sit to maximize your viewing angle? Verify this observation by finding the viewing angle one foot closer to the screen and one foot farther from the screen for this ideal viewing distance.

The formula

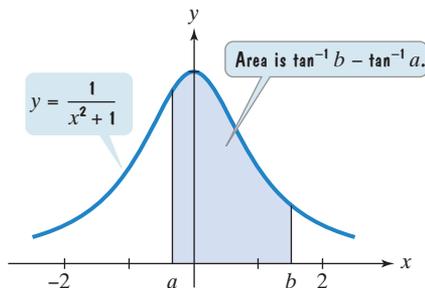

$$\theta = 2 \tan^{-1} \frac{21.634}{x}$$

gives the viewing angle,  $\theta$ , in radians, for a camera whose lens is  $x$  millimeters wide. Use this formula to solve Exercises 95–96.

95. Find the viewing angle, in radians and in degrees (to the nearest tenth of a degree), of a 28-millimeter lens.  
 96. Find the viewing angle, in radians and in degrees (to the nearest tenth of a degree), of a 300-millimeter telephoto lens.

For years, mathematicians were challenged by the following problem: What is the area of a region under a curve between two values of  $x$ ? The problem was solved in the seventeenth century with the development of integral calculus. Using calculus, the area of the region under  $y = \frac{1}{x^2 + 1}$ , above the  $x$ -axis, and between  $x = a$  and  $x = b$  is  $\tan^{-1} b - \tan^{-1} a$ . Use this result, shown in the figure, to find the area of the region under  $y = \frac{1}{x^2 + 1}$ , above the  $x$ -axis, and between the values of  $a$  and  $b$  given in Exercises 97–98.

97.  $a = 0$  and  $b = 2$       98.  $a = -2$  and  $b = 1$

### Writing in Mathematics

99. Explain why, without restrictions, no trigonometric function has an inverse function.
100. Describe the restriction on the sine function so that it has an inverse function.
101. How can the graph of  $y = \sin^{-1} x$  be obtained from the graph of the restricted sine function?
102. Without drawing a graph, describe the behavior of the graph of  $y = \sin^{-1} x$ . Mention the function's domain and range in your description.
103. Describe the restriction on the cosine function so that it has an inverse function.
104. Without drawing a graph, describe the behavior of the graph of  $y = \cos^{-1} x$ . Mention the function's domain and range in your description.
105. Describe the restriction on the tangent function so that it has an inverse function.
106. Without drawing a graph, describe the behavior of the graph of  $y = \tan^{-1} x$ . Mention the function's domain and range in your description.
107. If  $\sin^{-1}\left(\sin \frac{\pi}{3}\right) = \frac{\pi}{3}$ , is  $\sin^{-1}\left(\sin \frac{5\pi}{6}\right) = \frac{5\pi}{6}$ ? Explain your answer.
108. Explain how a right triangle can be used to find the exact value of  $\sec\left(\sin^{-1}\frac{4}{5}\right)$ .
109. Find the height of the screen and the number of feet that it is located above eye level in your favorite movie theater. Modify the formula given in Exercise 93 so that it applies to your theater. Then describe where in the theater you should sit so that a movie creates the greatest visual impact.

### Technology Exercises

In Exercises 110–113, graph each pair of functions in the same viewing rectangle. Use your knowledge of the domain and range for the inverse trigonometric function to select an appropriate viewing rectangle. How is the graph of the second equation in each exercise related to the graph of the first equation?

110.  $y = \sin^{-1} x$  and  $y = \sin^{-1} x + 2$
111.  $y = \cos^{-1} x$  and  $y = \cos^{-1}(x - 1)$
112.  $y = \tan^{-1} x$  and  $y = -2 \tan^{-1} x$
113.  $y = \sin^{-1} x$  and  $y = \sin^{-1}(x + 2) + 1$
114. Graph  $y = \tan^{-1} x$  and its two horizontal asymptotes in a

$[-3, 3, 1]$  by  $\left[-\pi, \pi, \frac{\pi}{2}\right]$  viewing rectangle. Then change the viewing rectangle to  $[-50, 50, 5]$  by  $\left[-\pi, \pi, \frac{\pi}{2}\right]$ . What do you observe?

115. Graph  $y = \sin^{-1} x + \cos^{-1} x$  in a  $[-2, 2, 1]$  by  $[0, 3, 1]$  viewing rectangle. What appears to be true about the sum of the inverse sine and inverse cosine for values between  $-1$  and  $1$ , inclusive?

### Critical Thinking Exercises

**Make Sense?** In Exercises 116–119, determine whether each statement makes sense or does not make sense, and explain your reasoning.

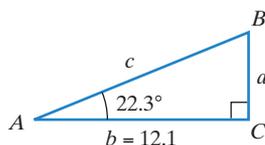

116. Because  $y = \sin x$  has an inverse function if  $x$  is restricted to  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ , they should make restrictions easier to remember by also using  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$  as the restriction for  $y = \cos x$ .
117. Because  $y = \sin x$  has an inverse function if  $x$  is restricted to  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ , they should make restrictions easier to remember by also using  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$  as the restriction for  $y = \tan x$ .
118. Although  $\sin^{-1}\left(-\frac{1}{2}\right)$  is negative,  $\cos^{-1}\left(-\frac{1}{2}\right)$  is positive.
119. I used  $f^{-1}(f(x)) = x$  and concluded that  $\sin^{-1}\left(\sin \frac{5\pi}{4}\right) = \frac{5\pi}{4}$ .
120. Solve  $y = 2 \sin^{-1}(x - 5)$  for  $x$  in terms of  $y$ .
121. Solve for  $x$ :  $2 \sin^{-1} x = \frac{\pi}{4}$ .
122. Prove that if  $x > 0$ ,  $\tan^{-1} x + \tan^{-1} \frac{1}{x} = \frac{\pi}{2}$ .
123. Derive the formula for  $\theta$ , your viewing angle at the movie theater, in Exercise 93. *Hint:* Use the figure shown and represent the acute angle on the left in the smaller right triangle by  $\alpha$ . Find expressions for  $\tan \alpha$  and  $\tan(\alpha + \theta)$ .

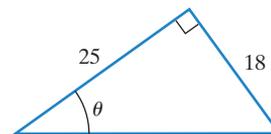

## Preview Exercises

Exercises 124–126 will help you prepare for the material covered in the next section.

124. Use trigonometric functions to find  $a$  and  $c$  to two decimal places.

125. Find  $\theta$  to the nearest tenth of a degree.

126. Determine the amplitude and period of  $y = 10 \cos \frac{\pi}{6}x$ .

## SECTION 4.8

## Applications of Trigonometric Functions

## Objectives

- 1 Solve a right triangle.
- 2 Solve problems involving bearings.
- 3 Model simple harmonic motion.

In the late 1960s, popular musicians were searching for new sounds. Film composers were looking for ways to create unique sounds as well. From these efforts, synthesizers that electronically reproduce musical sounds were born. From providing the backbone of today's most popular music to providing the strange sounds for the most experimental music, synthesizing programs now available on computers are at the forefront of music technology.

If we did not understand the periodic nature of sinusoidal functions, the synthesizing programs used in almost all forms of music would not exist. In this section, we look at applications of trigonometric functions in solving right triangles and in modeling periodic phenomena such as sound.

- 1 Solve a right triangle.

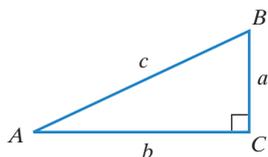

FIGURE 4.100 Labeling right triangles

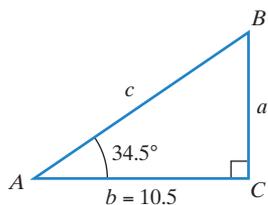

FIGURE 4.101 Find  $B$ ,  $a$ , and  $c$ .

## Solving Right Triangles

**Solving a right triangle** means finding the missing lengths of its sides and the measurements of its angles. We will label right triangles so that side  $a$  is opposite angle  $A$ , side  $b$  is opposite angle  $B$ , and side  $c$ , the hypotenuse, is opposite right angle  $C$ . **Figure 4.100** illustrates this labeling.

When solving a right triangle, we will use the sine, cosine, and tangent functions, rather than their reciprocals. Example 1 shows how to solve a right triangle when we know the length of a side and the measure of an acute angle.

## EXAMPLE 1 Solving a Right Triangle

Solve the right triangle shown in **Figure 4.101**, rounding lengths to two decimal places.

## SOLUTION

We begin by finding the measure of angle  $B$ . We do not need a trigonometric function to do so. Because  $C = 90^\circ$  and the sum of a triangle's angles is  $180^\circ$ , we see that  $A + B = 90^\circ$ . Thus,

$$B = 90^\circ - A = 90^\circ - 34.5^\circ = 55.5^\circ.$$

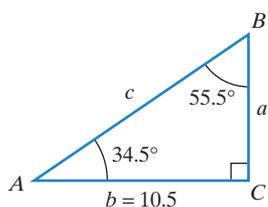

FIGURE 4.101 (repeated)

## DISCOVERY

There is often more than one correct way to solve a right triangle. In Example 1, find  $a$  using angle  $B = 55.5^\circ$ . Find  $c$  using the Pythagorean Theorem.

Now we need to find  $a$ . Because we have a known angle, an unknown opposite side, and a known adjacent side, we use the tangent function.

$$\tan 34.5^\circ = \frac{a}{10.5}$$

Side opposite the  $34.5^\circ$  angle  
Side adjacent to the  $34.5^\circ$  angle

Now we multiply both sides of this equation by 10.5 and solve for  $a$ .

$$a = 10.5 \tan 34.5^\circ \approx 7.22$$

Finally, we need to find  $c$ . Because we have a known angle, a known adjacent side, and an unknown hypotenuse, we use the cosine function.

$$\cos 34.5^\circ = \frac{10.5}{c}$$

Side adjacent to the  $34.5^\circ$  angle  
Hypotenuse

Now we multiply both sides of  $\cos 34.5^\circ = \frac{10.5}{c}$  by  $c$  and then solve for  $c$ .

$$c \cos 34.5^\circ = 10.5$$

Multiply both sides by  $c$ .

$$c = \frac{10.5}{\cos 34.5^\circ} \approx 12.74$$

Divide both sides by  $\cos 34.5^\circ$  and solve for  $c$ .

In summary,  $B = 55.5^\circ$ ,  $a \approx 7.22$ , and  $c \approx 12.74$ . ...

**Check Point 1** In **Figure 4.100** on the previous page, let  $A = 62.7^\circ$  and  $a = 8.4$ . Solve the right triangle, rounding lengths to two decimal places.

Trigonometry was first developed to measure heights and distances that were inconvenient or impossible to measure directly. In solving application problems, begin by making a sketch involving a right triangle that illustrates the problem's conditions. Then put your knowledge of solving right triangles to work and find the required distance or height.

### EXAMPLE 2 Finding a Side of a Right Triangle

From a point on level ground 125 feet from the base of a tower, the angle of elevation is  $57.2^\circ$ . Approximate the height of the tower to the nearest foot.

#### SOLUTION

A sketch is shown in **Figure 4.102**, where  $a$  represents the height of the tower. In the right triangle, we have a known angle, an unknown opposite side, and a known adjacent side. Therefore, we use the tangent function.

$$\tan 57.2^\circ = \frac{a}{125}$$

Side opposite the  $57.2^\circ$  angle  
Side adjacent to the  $57.2^\circ$  angle

Now we multiply both sides of this equation by 125 and solve for  $a$ .

$$a = 125 \tan 57.2^\circ \approx 194$$

The tower is approximately 194 feet high. ...

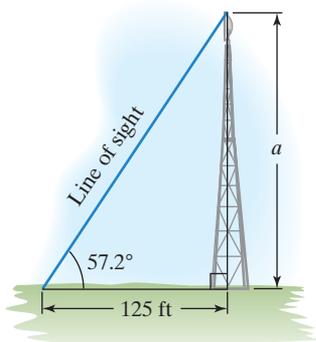

FIGURE 4.102 Determining height without using direct measurement

**Check Point 2** From a point on level ground 80 feet from the base of the Eiffel Tower, the angle of elevation is  $85.4^\circ$ . Approximate the height of the Eiffel Tower to the nearest foot.

Example 3 illustrates how to find the measure of an acute angle of a right triangle if the lengths of two sides are known.

### EXAMPLE 3 Finding an Angle of a Right Triangle

A kite flies at a height of 30 feet when 65 feet of string is out. If the string is in a straight line, find the angle that it makes with the ground. Round to the nearest tenth of a degree.

#### SOLUTION

A sketch is shown in **Figure 4.103**, where  $A$  represents the angle the string makes with the ground. In the right triangle, we have an unknown angle, a known opposite side, and a known hypotenuse. Therefore, we use the sine function.

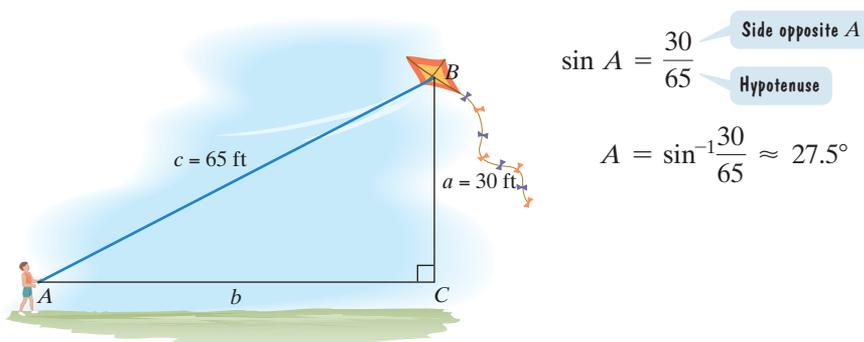

FIGURE 4.103 Flying a kite

The string makes an angle of approximately  $27.5^\circ$  with the ground. ...

**Check Point 3** A guy wire is 13.8 yards long and is attached from the ground to a pole 6.7 yards above the ground. Find the angle, to the nearest tenth of a degree, that the wire makes with the ground.

### EXAMPLE 4 Using Two Right Triangles to Solve a Problem

You are taking your first hot-air balloon ride. Your friend is standing on level ground, 100 feet away from your point of launch, making a video of the terrified look on your rapidly ascending face. How rapidly? At one instant, the angle of elevation from the video camera to your face is  $31.7^\circ$ . One minute later, the angle of elevation is  $76.2^\circ$ . How far did you travel, to the nearest tenth of a foot, during that minute?

#### SOLUTION

A sketch that illustrates the problem is shown in **Figure 4.104**. We need to determine  $b - a$ , the distance traveled during the one-minute period. We find  $a$  using the small right triangle. Because we have a known angle, an unknown opposite side, and a known adjacent side, we use the tangent function.

$$\tan 31.7^\circ = \frac{a}{100}$$

Side opposite the  $31.7^\circ$  angle  
Side adjacent to the  $31.7^\circ$  angle

$$a = 100 \tan 31.7^\circ \approx 61.8$$

We find  $b$  using the tangent function in the large right triangle.

$$\tan 76.2^\circ = \frac{b}{100}$$

Side opposite the  $76.2^\circ$  angle  
Side adjacent to the  $76.2^\circ$  angle

$$b = 100 \tan 76.2^\circ \approx 407.1$$

The balloon traveled  $407.1 - 61.8$ , or approximately 345.3 feet, during the minute. ...

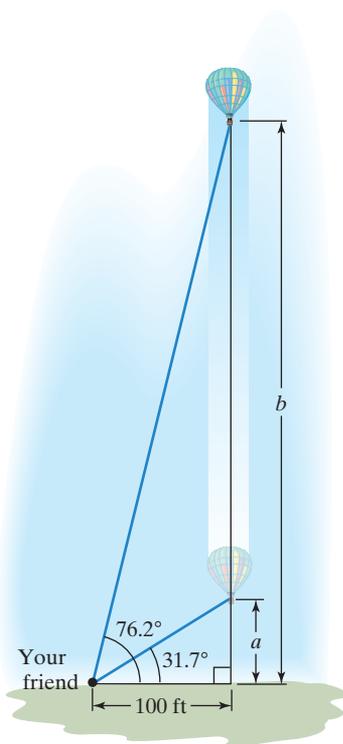

FIGURE 4.104 Ascending in a hot-air balloon

 **Check Point 4** You are standing on level ground 800 feet from Mt. Rushmore, looking at the sculpture of Abraham Lincoln's face. The angle of elevation to the bottom of the sculpture is  $32^\circ$  and the angle of elevation to the top is  $35^\circ$ . Find the height of the sculpture of Lincoln's face to the nearest tenth of a foot.

- 2** Solve problems involving bearings.

### Trigonometry and Bearings

In navigation and surveying problems, the term *bearing* is used to specify the location of one point relative to another. The **bearing** from point  $O$  to point  $P$  is the acute angle, measured in degrees, between ray  $OP$  and a north-south line.

The bearing from  $O$  to  $P$  can also be described using the phrase “the bearing of  $P$  from  $O$ .” **Figure 4.105** illustrates some examples of bearings. The north-south line and the east-west line intersect at right angles.

**FIGURE 4.105** An illustration of three bearings

Each bearing has three parts: a letter (N or S), the measure of an acute angle, and a letter (E or W). Here's how we write a bearing:

- If the acute angle is measured from the *north side* of the north-south line, then we write N first. [See **Figure 4.105(a)**.] If the acute angle is measured from the *south side* of the north-south line, then we write S first. [See **Figure 4.105(c)**.]
- Second, we write the measure of the acute angle.
- If the acute angle is measured on the *east side* of the north-south line, then we write E last. [See **Figure 4.105(a)**.] If the acute angle is measured on the *west side* of the north-south line, then we write W last. [See **Figure 4.105(b)**.]

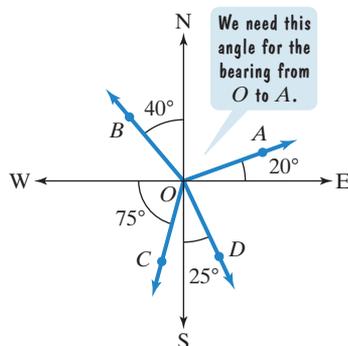

### EXAMPLE 5 Understanding Bearings

Use **Figure 4.106** to find each of the following:

- the bearing from  $O$  to  $B$
- the bearing from  $O$  to  $A$ .

#### SOLUTION

- To find the bearing from  $O$  to  $B$ , we need the acute angle between the ray  $OB$  and the north-south line through  $O$ . The measurement of this angle is given to be  $40^\circ$ . **Figure 4.106** shows that the angle is measured from the north side of the north-south line and lies west of the north-south line. Thus, the bearing from  $O$  to  $B$  is  $N 40^\circ W$ .
- To find the bearing from  $O$  to  $A$ , we need the acute angle between the ray  $OA$  and the north-south line through  $O$ . This angle is specified by the voice balloon in **Figure 4.106**. Because of the given  $20^\circ$  angle, this angle measures  $90^\circ - 20^\circ$ , or  $70^\circ$ . This angle is measured from the north side of the north-south line. This angle is also east of the north-south line. Thus, the bearing from  $O$  to  $A$  is  $N 70^\circ E$ . ...

**FIGURE 4.106** Finding bearings

 **Check Point 5** Use **Figure 4.106** to find each of the following:

- the bearing from  $O$  to  $D$
- the bearing from  $O$  to  $C$ .

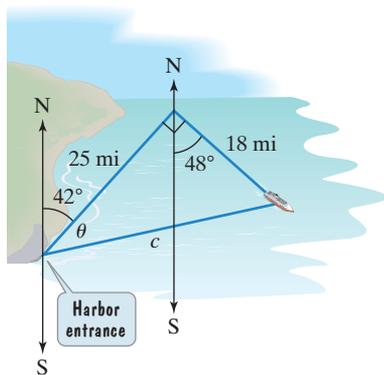

FIGURE 4.107 Finding a boat's bearing from the harbor entrance

## GREAT QUESTION!

I can follow Example 6 because Figure 4.107 is given. What should I do if I have to draw the figure?

When making a diagram showing bearings, draw a north-south line through each point at which a change in course occurs. The north side of the line lies above each point. The south side of the line lies below each point.

### EXAMPLE 6 Finding the Bearing of a Boat

A boat leaves the entrance to a harbor and travels 25 miles on a bearing of N  $42^\circ$  E. **Figure 4.107** shows that the captain then turns the boat  $90^\circ$  clockwise and travels 18 miles on a bearing of S  $48^\circ$  E. At that time:

- How far is the boat, to the nearest tenth of a mile, from the harbor entrance?
- What is the bearing, to the nearest tenth of a degree, of the boat from the harbor entrance?

### SOLUTION

- The boat's distance from the harbor entrance is represented by  $c$  in **Figure 4.107**. Because we know the length of two sides of the right triangle, we find  $c$  using the Pythagorean Theorem. We have

$$c^2 = a^2 + b^2 = 25^2 + 18^2 = 949$$

$$c = \sqrt{949} \approx 30.8.$$

The boat is approximately 30.8 miles from the harbor entrance.

- The bearing of the boat from the harbor entrance means the bearing from the harbor entrance to the boat. Look at the north-south line passing through the harbor entrance on the left in **Figure 4.107**. The acute angle from this line to the ray on which the boat lies is  $42^\circ + \theta$ . Because we are measuring the angle from the north side of the line and the boat is east of the harbor, its bearing from the harbor entrance is N  $(42^\circ + \theta)$  E. To find  $\theta$ , we use the right triangle shown in **Figure 4.107** and the tangent function.

$$\tan \theta = \frac{\text{side opposite } \theta}{\text{side adjacent to } \theta} = \frac{18}{25}$$

$$\theta = \tan^{-1} \frac{18}{25}$$

We can use a calculator in degree mode to find the value of  $\theta$ :  $\theta \approx 35.8^\circ$ . Thus,  $42^\circ + \theta \approx 42^\circ + 35.8^\circ = 77.8^\circ$ . The bearing of the boat from the harbor entrance is N  $77.8^\circ$  E. ...

**Check Point 6** You leave the entrance to a system of hiking trails and hike 2.3 miles on a bearing of S  $31^\circ$  W. Then the trail turns  $90^\circ$  clockwise and you hike 3.5 miles on a bearing of N  $59^\circ$  W. At that time:

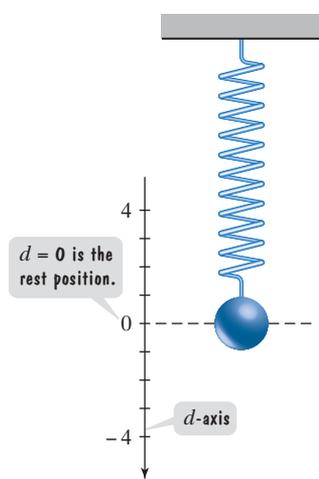

- How far are you, to the nearest tenth of a mile, from the entrance to the trail system?
- What is your bearing, to the nearest tenth of a degree, from the entrance to the trail system?

### 3 Model simple harmonic motion.

### Simple Harmonic Motion

Because of their periodic nature, trigonometric functions are used to model phenomena that occur again and again. This includes vibratory or oscillatory motion, such as the motion of a vibrating guitar string, the swinging of a pendulum, or the bobbing of an object attached to a spring. Trigonometric functions are also used to describe radio waves from your favorite FM station, television waves from your not-to-be-missed weekly sitcom, and sound waves from your most-prized CDs.

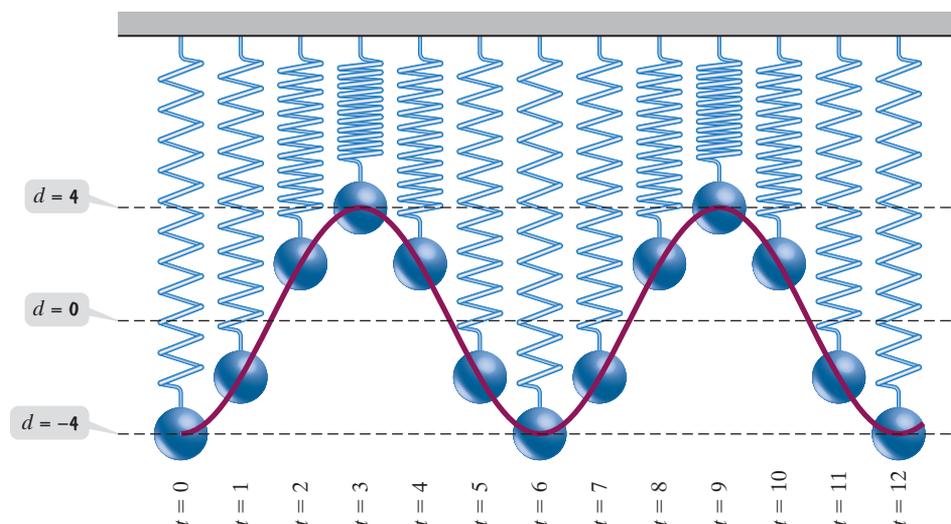

To see how trigonometric functions are used to model vibratory motion, consider this: A ball is attached to a spring hung from the ceiling. You pull the ball down 4 inches and then release it. If we neglect the effects of friction and air resistance, the ball will continue bobbing up and down on the end of the spring. These up-and-down oscillations are called **simple harmonic motion**.

**FIGURE 4.108** Using a  $d$ -axis to describe a ball's distance from its rest position

**FIGURE 4.109** A sequence of “photographs” showing the bobbing ball's distance from the rest position, taken at one-second intervals

To better understand this motion, we use a  $d$ -axis, where  $d$  represents distance. This axis is shown in **Figure 4.108**. On this axis, the position of the ball before you pull it down is  $d = 0$ . This rest position is called the **equilibrium position**. Now you pull the ball down 4 inches to  $d = -4$  and release it. **Figure 4.109** shows a sequence of “photographs” taken at one-second time intervals illustrating the distance of the ball from its rest position,  $d$ .

The curve in **Figure 4.109** shows how the ball's distance from its rest position changes over time. The curve is sinusoidal and the motion can be described using a cosine or a sine function.

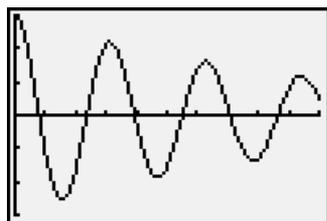

### Blitzer Bonus

#### Diminishing Motion with Increasing Time

Due to friction and other resistive forces, the motion of an oscillating object decreases over time. The function

$$d = 3e^{-0.1t} \cos 2t$$

models this type of motion. The graph of the function is shown in a  $t = [0, 10, 1]$  by  $d = [-3, 3, 1]$  viewing rectangle. Notice how the amplitude is decreasing with time as the moving object loses energy.

#### Simple Harmonic Motion

An object that moves on a coordinate axis is in **simple harmonic motion** if its distance from the origin,  $d$ , at time  $t$  is given by either

$$d = a \cos \omega t \quad \text{or} \quad d = a \sin \omega t.$$

The motion has **amplitude**  $|a|$ , the maximum displacement of the object from its rest position. The **period** of the motion is  $\frac{2\pi}{\omega}$ , where  $\omega > 0$ . The period gives the time it takes for the motion to go through one complete cycle.

In describing simple harmonic motion, the equation with the cosine function,  $d = a \cos \omega t$ , is used if the object is at its greatest distance from rest position, the origin, at  $t = 0$ . By contrast, the equation with the sine function,  $d = a \sin \omega t$ , is used if the object is at its rest position, the origin, at  $t = 0$ .

#### EXAMPLE 7 Finding an Equation for an Object in Simple Harmonic Motion

A ball on a spring is pulled 4 inches below its rest position and then released. The period of the motion is 6 seconds. Write the equation for the ball's simple harmonic motion.

#### SOLUTION

We need to write an equation that describes  $d$ , the distance of the ball from its rest position, after  $t$  seconds. (The motion is illustrated by the “photo” sequence in **Figure 4.109**.) When the object is released ( $t = 0$ ), the ball's distance from its rest position is 4 inches down. Because it is *down* 4 inches,  $d$  is negative:

When  $t = 0$ ,  $d = -4$ . Notice that the greatest distance from rest position occurs at  $t = 0$ . Thus, we will use the equation with the cosine function,

$$d = a \cos \omega t,$$

to model the ball's simple harmonic motion.

Now we determine values for  $a$  and  $\omega$ . Recall that  $|a|$  is the maximum displacement. Because the ball is initially below rest position,  $a = -4$ .

The value of  $\omega$  in  $d = a \cos \omega t$  can be found using the formula for the period.

$$\begin{aligned} \text{period} &= \frac{2\pi}{\omega} = 6 && \text{We are given that the period of the motion is 6 seconds.} \\ 2\pi &= 6\omega && \text{Multiply both sides by } \omega. \\ \omega &= \frac{2\pi}{6} = \frac{\pi}{3} && \text{Divide both sides by 6 and solve for } \omega. \end{aligned}$$

We see that  $a = -4$  and  $\omega = \frac{\pi}{3}$ . Substitute these values into  $d = a \cos \omega t$ . The equation for the ball's simple harmonic motion is

$$d = -4 \cos \frac{\pi}{3} t. \quad \dots$$

### Blitzer Bonus Modeling Music

Sounds are caused by vibrating objects that result in variations in pressure in the surrounding air. Areas of high and low pressure moving through the air are modeled by the harmonic motion formulas. When these vibrations reach our eardrums, the eardrums' vibrations send signals to our brains, which create the sensation of hearing.

French mathematician John Fourier (1768–1830) proved that all musical sounds—instrumental and vocal—could be modeled by sums involving sine functions. Modeling musical sounds with sinusoidal functions is used by synthesizing programs available on computers to electronically produce sounds unobtainable from ordinary musical instruments.

 **Check Point 7** A ball on a spring is pulled 6 inches below its rest position and then released. The period for the motion is 4 seconds. Write the equation for the ball's simple harmonic motion.

The period of the harmonic motion in Example 7 was 6 seconds. It takes 6 seconds for the moving object to complete one cycle. Thus,  $\frac{1}{6}$  of a cycle is completed every second. We call  $\frac{1}{6}$  the *frequency* of the moving object. **Frequency** describes the number of complete cycles per unit time and is the reciprocal of the period.

#### Frequency of an Object in Simple Harmonic Motion

An object in simple harmonic motion given by

$$d = a \cos \omega t \quad \text{or} \quad d = a \sin \omega t$$

has **frequency**  $f$  given by

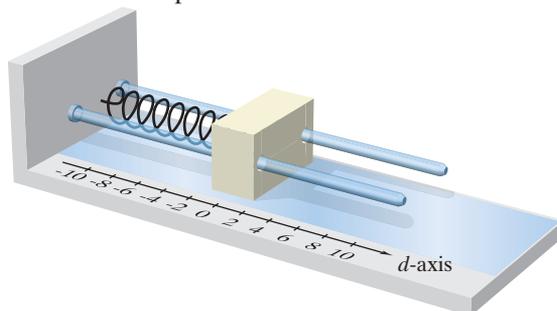

$$f = \frac{\omega}{2\pi}, \quad \omega > 0.$$

Equivalently,

$$f = \frac{1}{\text{period}}.$$

#### EXAMPLE 8 Analyzing Simple Harmonic Motion

**Figure 4.110** shows a mass on a smooth surface attached to a spring. The mass moves in simple harmonic motion described by

$$d = 10 \cos \frac{\pi}{6} t,$$

with  $t$  measured in seconds and  $d$  in centimeters. Find:

- the maximum displacement
- the frequency
- the time required for one cycle.

**FIGURE 4.110** A mass attached to a spring, moving in simple harmonic motion

## SOLUTION

We begin by identifying values for  $a$  and  $\omega$ .

$$d = 10 \cos \frac{\pi}{6} t$$

The form of this equation is  
 $d = a \cos \omega t$   
 with  $a = 10$  and  $\omega = \frac{\pi}{6}$ .

- a. The maximum displacement from the rest position is the amplitude. Because  $a = 10$ , the maximum displacement is 10 centimeters.
- b. The frequency,  $f$ , is

$$f = \frac{\omega}{2\pi} = \frac{\frac{\pi}{6}}{2\pi} = \frac{\cancel{\pi}}{6} \cdot \frac{1}{2\cancel{\pi}} = \frac{1}{12}$$

The frequency is  $\frac{1}{12}$  cycle (or oscillation) per second.

- c. The time required for one cycle is the period.

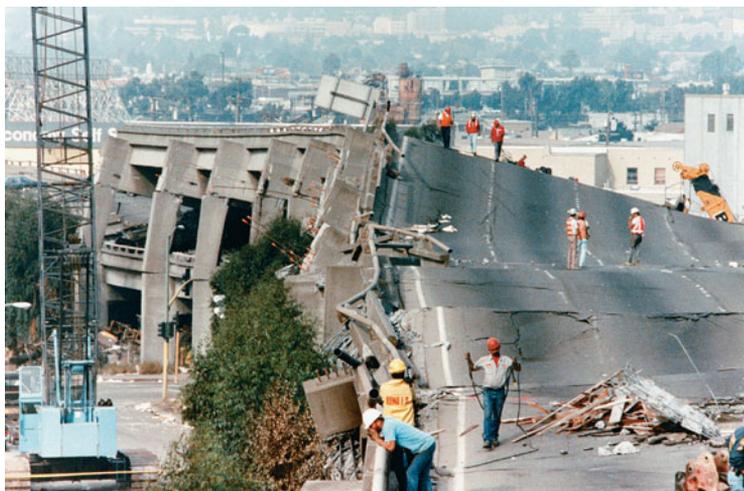

$$\text{period} = \frac{2\pi}{\omega} = \frac{2\pi}{\frac{\pi}{6}} = 2\cancel{\pi} \cdot \frac{6}{\cancel{\pi}} = 12$$

The time required for one cycle is 12 seconds. This value can also be obtained by taking the reciprocal of the frequency in part (b). ●●●

 **Check Point 8** An object moves in simple harmonic motion described by  $d = 12 \cos \frac{\pi}{4} t$ , where  $t$  is measured in seconds and  $d$  in centimeters. Find

- a. the maximum displacement, b. the frequency, and c. the time required for one cycle.

### Blitzer Bonus || Resisting Damage of Simple Harmonic Motion

Simple harmonic motion from an earthquake caused this highway in Oakland, California, to collapse. By studying the harmonic motion of the soil under the highway, engineers learn to build structures that can resist damage.

## CONCEPT AND VOCABULARY CHECK

Fill in each blank so that the resulting statement is true.

- Solving a right triangle means finding the missing lengths of its \_\_\_\_\_ and the measurements of its \_\_\_\_\_.
- The bearing from point  $O$  to point  $P$  is the acute angle, measured in degrees, between ray  $OP$  and a \_\_\_\_\_-\_\_\_\_\_ line.

- An object that moves on a coordinate axis is in \_\_\_\_\_ motion if its distance from the origin,  $d$ , at time  $t$  is given by either

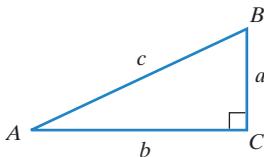

$$d = a \cos \omega t \quad \text{or} \quad d = a \sin \omega t.$$

The motion has amplitude \_\_\_\_\_, the maximum displacement of the object from its rest position. The period of the motion is \_\_\_\_\_ and the frequency  $f$  is given by  $f = \frac{1}{T}$ , where  $\omega > 0$ .

## EXERCISE SET 4.8

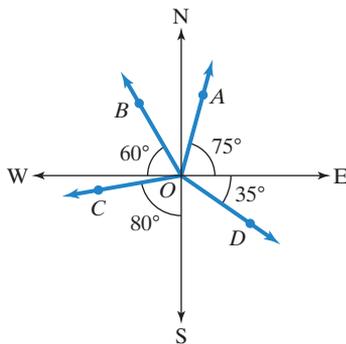

### Practice Exercises

In Exercises 1–12, solve the right triangle shown in the figure. Round lengths to two decimal places and express angles to the nearest tenth of a degree.

- |                               |                               |
|-------------------------------|-------------------------------|
| 1. $A = 23.5^\circ, b = 10$   | 2. $A = 41.5^\circ, b = 20$   |
| 3. $A = 52.6^\circ, c = 54$   | 4. $A = 54.8^\circ, c = 80$   |
| 5. $B = 16.8^\circ, b = 30.5$ | 6. $B = 23.8^\circ, b = 40.5$ |
| 7. $a = 30.4, c = 50.2$       | 8. $a = 11.2, c = 65.8$       |
| 9. $a = 10.8, b = 24.7$       | 10. $a = 15.3, b = 17.6$      |
| 11. $b = 2, c = 7$            | 12. $b = 4, c = 9$            |

Use the figure shown to solve Exercises 13–16.

- Find the bearing from  $O$  to  $A$ .
- Find the bearing from  $O$  to  $B$ .
- Find the bearing from  $O$  to  $C$ .
- Find the bearing from  $O$  to  $D$ .

In Exercises 17–20, an object is attached to a coiled spring. In Exercises 17–18, the object is pulled down (negative direction from the rest position) and then released. In Exercises 19–20, the object is propelled downward from its rest position at time  $t = 0$ . Write an equation for the distance of the object from its rest position after  $t$  seconds.

Distance from Rest Position at $t = 0$	Amplitude	Period
17. 6 centimeters	6 centimeters	4 seconds
18. 8 inches	8 inches	2 seconds
19. 0 inches	3 inches	1.5 seconds
20. 0 centimeters	5 centimeters	2.5 seconds

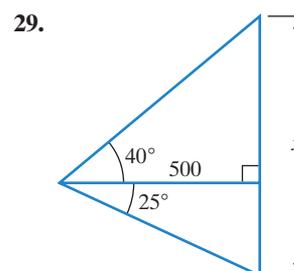

In Exercises 21–28, an object moves in simple harmonic motion described by the given equation, where  $t$  is measured in seconds and  $d$  in inches. In each exercise, find the following:

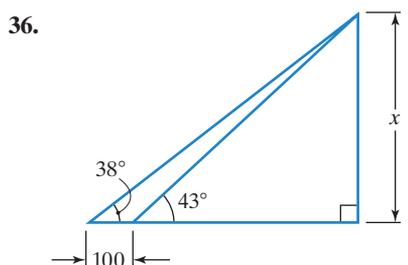

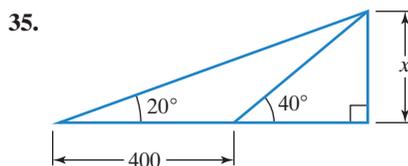

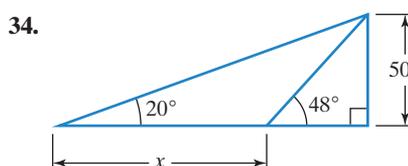

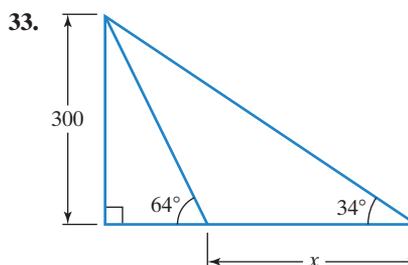

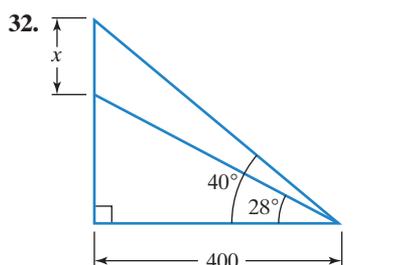

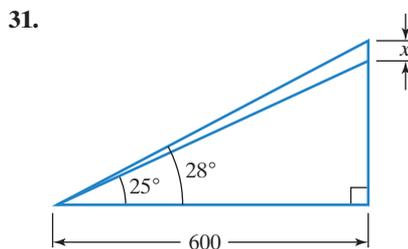

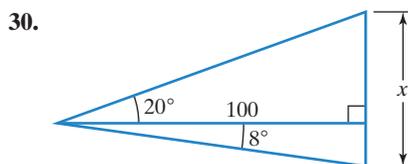

- the maximum displacement
- the frequency
- the time required for one cycle.

- |                                   |                                   |
|-----------------------------------|-----------------------------------|
| 21. $d = 5 \cos \frac{\pi}{2}t$   | 22. $d = 10 \cos 2\pi t$          |
| 23. $d = -6 \cos 2\pi t$          | 24. $d = -8 \cos \frac{\pi}{2}t$  |
| 25. $d = \frac{1}{2} \sin 2t$     | 26. $d = \frac{1}{3} \sin 2t$     |
| 27. $d = -5 \sin \frac{2\pi}{3}t$ | 28. $d = -4 \sin \frac{3\pi}{2}t$ |

### Practice Plus

In Exercises 29–36, find the length  $x$  to the nearest whole unit.

In Exercises 37–40, an object moves in simple harmonic motion described by the given equation, where  $t$  is measured in seconds and  $d$  in inches. In each exercise, graph one period of the equation. Then find the following:

- the maximum displacement
- the frequency
- the time required for one cycle
- the phase shift of the motion.

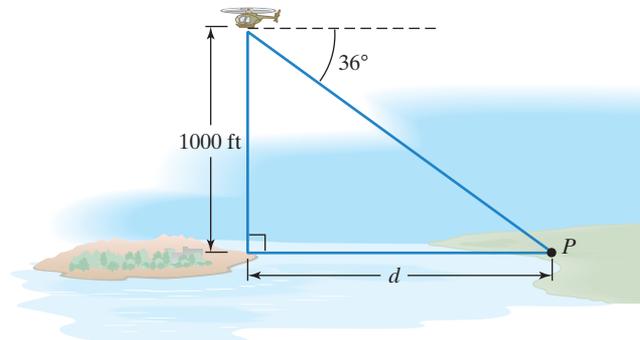

Describe how (a) through (d) are illustrated by your graph.

37.  $d = 4 \cos\left(\pi t - \frac{\pi}{2}\right)$       38.  $d = 3 \cos\left(\pi t + \frac{\pi}{2}\right)$

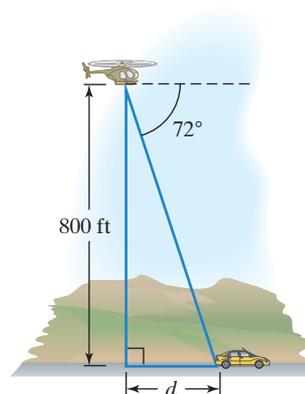

39.  $d = -2 \sin\left(\frac{\pi t}{4} + \frac{\pi}{2}\right)$       40.  $d = -\frac{1}{2} \sin\left(\frac{\pi t}{4} - \frac{\pi}{2}\right)$

### Application Exercises

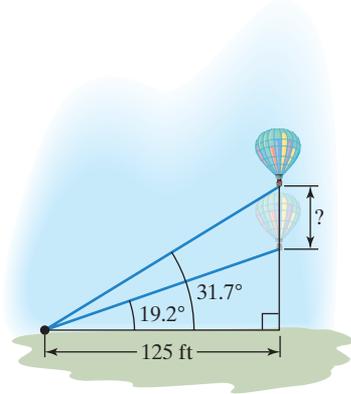

- The tallest television transmitting tower in the world is in North Dakota. From a point on level ground 5280 feet (1 mile) from the base of the tower, the angle of elevation is  $21.3^\circ$ . Approximate the height of the tower to the nearest foot.
- From a point on level ground 30 yards from the base of a building, the angle of elevation is  $38.7^\circ$ . Approximate the height of the building to the nearest foot.
- The Statue of Liberty is approximately 305 feet tall. If the angle of elevation from a ship to the top of the statue is  $23.7^\circ$ , how far, to the nearest foot, is the ship from the statue's base?
- A 200-foot cliff drops vertically into the ocean. If the angle of elevation from a ship to the top of the cliff is  $22.3^\circ$ , how far off shore, to the nearest foot, is the ship?
- A helicopter hovers 1000 feet above a small island. The figure shows that the angle of depression from the helicopter to point  $P$  on the coast is  $36^\circ$ . How far off the coast, to the nearest foot, is the island?

- A police helicopter is flying at 800 feet. A stolen car is sighted at an angle of depression of  $72^\circ$ . Find the distance of the stolen car, to the nearest foot, from a point directly below the helicopter.

47. A wheelchair ramp is to be built beside the steps to the campus library. Find the angle of elevation of the 23-foot ramp, to the nearest tenth of a degree, if its final height is 6 feet.
48. A building that is 250 feet high casts a shadow 40 feet long. Find the angle of elevation, to the nearest tenth of a degree, of the sun at this time.
49. A hot-air balloon is rising vertically. From a point on level ground 125 feet from the point directly under the passenger compartment, the angle of elevation to the balloon changes from  $19.2^\circ$  to  $31.7^\circ$ . How far, to the nearest tenth of a foot, does the balloon rise during this period?

50. A flagpole is situated on top of a building. The angle of elevation from a point on level ground 330 feet from the building to the top of the flagpole is  $63^\circ$ . The angle of elevation from the same point to the bottom of the flagpole is  $53^\circ$ . Find the height of the flagpole to the nearest tenth of a foot.
51. A boat leaves the entrance to a harbor and travels 150 miles on a bearing of N  $53^\circ$  E. How many miles north and how many miles east from the harbor has the boat traveled?
52. A boat leaves the entrance to a harbor and travels 40 miles on a bearing of S  $64^\circ$  E. How many miles south and how many miles east from the harbor has the boat traveled?
53. A forest ranger sights a fire directly to the south. A second ranger, 7 miles east of the first ranger, also sights the fire. The bearing from the second ranger to the fire is S  $28^\circ$  W. How far, to the nearest tenth of a mile, is the first ranger from the fire?
54. A ship sights a lighthouse directly to the south. A second ship, 9 miles east of the first ship, also sights the lighthouse. The bearing from the second ship to the lighthouse is S  $34^\circ$  W. How far, to the nearest tenth of a mile, is the first ship from the lighthouse?
55. You leave your house and run 2 miles due west followed by 1.5 miles due north. At that time, what is your bearing from your house?
56. A ship is 9 miles east and 6 miles south of a harbor. What bearing should be taken to sail directly to the harbor?
57. A jet leaves a runway whose bearing is N  $35^\circ$  E from the control tower. After flying 5 miles, the jet turns  $90^\circ$  and flies on a bearing of S  $55^\circ$  E for 7 miles. At that time, what is the bearing of the jet from the control tower?
58. A ship leaves port with a bearing of S  $40^\circ$  W. After traveling 7 miles, the ship turns  $90^\circ$  and travels on a bearing of N  $50^\circ$  W for 11 miles. At that time, what is the bearing of the ship from port?
59. An object in simple harmonic motion has a frequency of  $\frac{1}{2}$  oscillation per minute and an amplitude of 6 feet. Write an equation in the form  $d = a \sin \omega t$  for the object's simple harmonic motion.
60. An object in simple harmonic motion has a frequency of  $\frac{1}{4}$  oscillation per minute and an amplitude of 8 feet. Write an equation in the form  $d = a \sin \omega t$  for the object's simple harmonic motion.
61. A piano tuner uses a tuning fork. If middle C has a frequency of 264 vibrations per second, write an equation in the form  $d = \sin \omega t$  for the simple harmonic motion.
62. A radio station, 98.1 on the FM dial, has radio waves with a frequency of 98.1 million cycles per second. Write an equation in the form  $d = \sin \omega t$  for the simple harmonic motion of the radio waves.

### Writing in Mathematics

63. What does it mean to solve a right triangle?
64. Explain how to find one of the acute angles of a right triangle if two sides are known.
65. Describe a situation in which a right triangle and a trigonometric function are used to measure a height or distance that would otherwise be inconvenient or impossible to measure.
66. What is meant by the bearing from point  $O$  to point  $P$ ? Give an example with your description.
67. What is simple harmonic motion? Give an example with your description.
68. Explain the period and the frequency of simple harmonic motion. How are they related?
69. Explain how the photograph of the damaged highway on page 608 illustrates simple harmonic motion.

### Technology Exercises

The functions in Exercises 70–71 model motion in which the amplitude decreases with time due to friction or other resistive forces. Graph each function in the given viewing rectangle. How many complete oscillations occur on the time interval  $0 \leq x \leq 10$ ?

70.  $y = 4e^{-0.1x} \cos 2x$ ;  $[0, 10, 1]$  by  $[-4, 4, 1]$

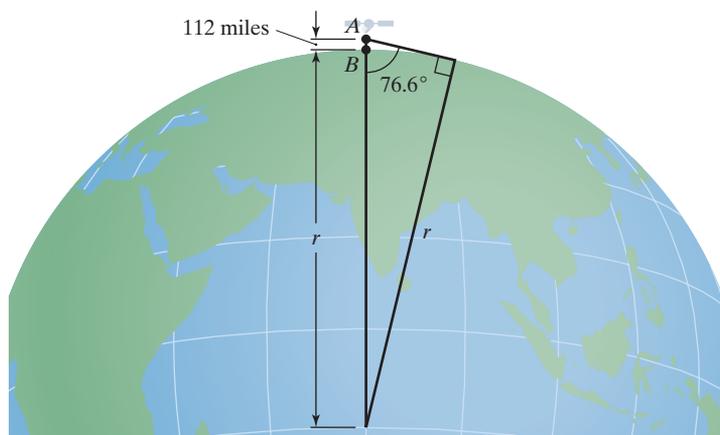

71.  $y = -6e^{-0.09x} \cos 2\pi x$ ;  $[0, 10, 1]$  by  $[-6, 6, 1]$

### Critical Thinking Exercises

**Make Sense?** In Exercises 72–75, determine whether each statement makes sense or does not make sense, and explain your reasoning.

72. A wheelchair ramp must be constructed so that the slope is not more than 1 inch of rise for every 1 foot of run, so I used the tangent function to determine the maximum angle that the ramp can make with the ground.
73. The bearing from  $O$  to  $A$  is N  $103^\circ$  W.
74. The bearing from  $O$  to  $B$  is E  $70^\circ$  S.
75. I analyzed simple harmonic motion in which the period was 10 seconds and the frequency was 0.2 oscillation per second.

76. The figure shows a satellite circling 112 miles above Earth. When the satellite is directly above point  $B$ , angle  $A$  measures  $76.6^\circ$ . Find Earth's radius to the nearest mile.

77. The angle of elevation to the top of a building changes from  $20^\circ$  to  $40^\circ$  as an observer advances 75 feet toward the building. Find the height of the building to the nearest foot.

### Group Exercise

78. Music and mathematics have been linked over the centuries. Group members should research and present a seminar to the class on music and mathematics. Be sure to include the role of trigonometric functions in the music-mathematics link.

### Preview Exercises

Exercises 79–81 will help you prepare for the material covered in the first section of the next chapter. The exercises use identities, introduced in Section 4.2, that enable you to rewrite trigonometric expressions so that they contain only sines and cosines:

$$\begin{aligned} \csc x &= \frac{1}{\sin x} & \sec x &= \frac{1}{\cos x} \\ \tan x &= \frac{\sin x}{\cos x} & \cot x &= \frac{\cos x}{\sin x} \end{aligned}$$

In Exercises 79–81, rewrite each expression by changing to sines and cosines. Then simplify the resulting expression.

79.  $\sec x \cot x$   
 80.  $\tan x \csc x \cos x$   
 81.  $\sec x + \tan x$

## CHAPTER 4

### Summary, Review, and Test

## SUMMARY

### DEFINITIONS AND CONCEPTS

#### 4.1 Angles and Radian Measure

- An angle consists of two rays with a common endpoint, the vertex.
- An angle is in standard position if its vertex is at the origin and its initial side lies along the positive  $x$ -axis. Figure 4.3 on page 493 shows positive and negative angles in standard position.
- A quadrantal angle is an angle with its terminal side on the  $x$ -axis or the  $y$ -axis.
- Angles can be measured in degrees.  $1^\circ$  is  $\frac{1}{360}$  of a complete rotation.
- Acute angles measure more than  $0^\circ$  but less than  $90^\circ$ , right angles  $90^\circ$ , obtuse angles more than  $90^\circ$  but less than  $180^\circ$ , and straight angles  $180^\circ$ . Figure 4.5, p. 493
- Angles can be measured in radians. One radian is the measure of the central angle when the intercepted arc and radius have the same length. In general, the radian measure of a central angle is the length of the intercepted arc divided by the circle's radius:  $\theta = \frac{s}{r}$ . Ex. 1, p. 495
- To convert from degrees to radians, multiply degrees by  $\frac{\pi \text{ radians}}{180^\circ}$ . To convert from radians to degrees, multiply radians by  $\frac{180^\circ}{\pi \text{ radians}}$ . Ex. 2, p. 496;  
Ex. 3, p. 496
- To draw angles measured in radians in standard position, it is helpful to “think in radians” without having to convert to degrees. See Figure 4.15 on page 499. Ex. 4, p. 497
- Two angles with the same initial and terminal sides are called coterminal angles. Increasing or decreasing an angle's measure by integer multiples of  $360^\circ$  or  $2\pi$  produces coterminal angles. Ex. 5, p. 500;  
Ex. 6, p. 501;  
Ex. 7, p. 501
- The arc length formula is  $s = r\theta$ , as described in the box on page 502. Ex. 8, p. 502
- The definition of linear speed is  $v = \frac{s}{t}$ ; angular speed is  $\omega = \frac{\theta}{t}$ , as given in the box on page 503.
- Linear speed is expressed in terms of angular speed by  $v = r\omega$ , where  $v$  is the linear speed of a point a distance  $r$  from the center of rotation and  $\omega$  is the angular speed in radians per unit of time. Ex. 9, p. 504

### EXAMPLES

## DEFINITIONS AND CONCEPTS

## EXAMPLES

### 4.2 Trigonometric Functions: The Unit Circle

- a. Definitions of the trigonometric functions in terms of a unit circle are given in the box on page 510.

Ex. 1, p. 510;  
Ex. 2, p. 511

- b. The cosine and secant functions are even:

$$\cos(-t) = \cos t, \quad \sec(-t) = \sec t.$$

Ex. 4, p. 514

The other trigonometric functions are odd:

$$\begin{aligned} \sin(-t) &= -\sin t, & \csc(-t) &= -\csc t, \\ \tan(-t) &= -\tan t, & \cot(-t) &= -\cot t. \end{aligned}$$

- c. Fundamental Identities

Ex. 5, p. 515;

1. Reciprocal Identities

Ex. 6, p. 516

$$\sin t = \frac{1}{\csc t} \text{ and } \csc t = \frac{1}{\sin t}; \quad \cos t = \frac{1}{\sec t} \text{ and } \sec t = \frac{1}{\cos t}; \quad \tan t = \frac{1}{\cot t} \text{ and } \cot t = \frac{1}{\tan t}$$

2. Quotient Identities

$$\tan t = \frac{\sin t}{\cos t}; \quad \cot t = \frac{\cos t}{\sin t}$$

3. Pythagorean Identities

$$\sin^2 t + \cos^2 t = 1; \quad 1 + \tan^2 t = \sec^2 t; \quad 1 + \cot^2 t = \csc^2 t$$

- d. If  $f(t + p) = f(t)$ , the function  $f$  is periodic. The smallest positive value of  $p$  for which  $f(t + p) = f(t)$  is the period of  $f$ . The tangent and cotangent functions have period  $\pi$ . The other four trigonometric functions have period  $2\pi$ .

Ex. 7, p. 517

### 4.3 Right Triangle Trigonometry

- a. The right triangle definitions of the six trigonometric functions are given in the box on page 524.

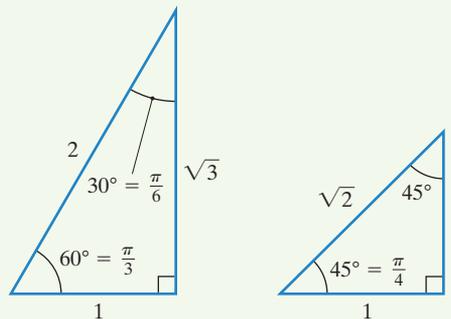

Ex. 1, p. 525;  
Ex. 2, p. 525

$$\sin \theta = \frac{\text{opp}}{\text{hyp}}; \quad \csc \theta = \frac{\text{hyp}}{\text{opp}}; \quad \cos \theta = \frac{\text{adj}}{\text{hyp}}; \quad \sec \theta = \frac{\text{hyp}}{\text{adj}}; \quad \tan \theta = \frac{\text{opp}}{\text{adj}}; \quad \cot \theta = \frac{\text{adj}}{\text{opp}}$$

- b. Function values for  $30^\circ$ ,  $45^\circ$ , and  $60^\circ$  can be obtained using these special triangles.

Ex. 3, p. 526;  
Ex. 4, p. 528

- c. Two angles are complements if their sum is  $90^\circ$  or  $\frac{\pi}{2}$ . The value of a trigonometric function of  $\theta$  is equal to the cofunction of the complement of  $\theta$ . Cofunction identities are listed in the box on page 529.

Ex. 5, p. 529

### 4.4 Trigonometric Functions of Any Angle

- a. Definitions of the trigonometric functions of any angle are given in the box on page 538.

Ex. 1, p. 538;  
Ex. 2, p. 539

$$\sin \theta = \frac{y}{r}; \quad \csc \theta = \frac{r}{y}; \quad \cos \theta = \frac{x}{r}; \quad \sec \theta = \frac{r}{x}; \quad \tan \theta = \frac{y}{x}; \quad \cot \theta = \frac{x}{y}; \quad r = \sqrt{x^2 + y^2}$$

- b. Signs of the trigonometric functions: All functions are positive in quadrant I. If  $\theta$  lies in quadrant II,  $\sin \theta$  and  $\csc \theta$  are positive. If  $\theta$  lies in quadrant III,  $\tan \theta$  and  $\cot \theta$  are positive. If  $\theta$  lies in quadrant IV,  $\cos \theta$  and  $\sec \theta$  are positive.

Ex. 3, p. 540;  
Ex. 4, p. 540

- c. If  $\theta$  is a nonacute angle in standard position that lies in a quadrant, its reference angle is the positive acute angle  $\theta'$  formed by the terminal side of  $\theta$  and the  $x$ -axis. The reference angle for a given angle can be found by making a sketch that shows the angle in standard position. Figure 4.49 on page 541 shows reference angles for  $\theta$  in quadrants II, III, and IV.

Ex. 5, p. 542;  
Ex. 6, p. 543

- d. The values of the trigonometric functions of a given angle are the same as the values of the functions of the reference angle, except possibly for the sign. A procedure for using reference angles to evaluate trigonometric functions is given in the box on page 544.

Ex. 7, p. 544;  
Ex. 8, p. 546

## DEFINITIONS AND CONCEPTS

## EXAMPLES

## 4.5 and 4.6 Graphs of the Trigonometric Functions

- a. Graphs of the six trigonometric functions, with a description of the domain, range, and period of each function, are given in Table 4.6 on page 580.
- b. The graph of  $y = A \sin(Bx - C)$ ,  $B > 0$ , can be obtained using amplitude =  $|A|$ , period =  $\frac{2\pi}{B}$ , and phase shift =  $\frac{C}{B}$ . See the illustration in the box on page 558. Ex. 1, p. 553;  
Ex. 2, p. 554;  
Ex. 3, p. 556;  
Ex. 4, p. 558
- c. The graph of  $y = A \cos(Bx - C)$ ,  $B > 0$ , can be obtained using amplitude =  $|A|$ , period =  $\frac{2\pi}{B}$ , and phase shift =  $\frac{C}{B}$ . See the illustration in the box on page 563. Ex. 5, p. 561;  
Ex. 6, p. 563
- d. The constant  $D$  in  $y = A \sin(Bx - C) + D$  and  $y = A \cos(Bx - C) + D$  causes vertical shifts in the graphs in the preceding items (b) and (c). If  $D > 0$ , the shift is  $D$  units upward and if  $D < 0$ , the shift is  $|D|$  units downward. Oscillation is about the horizontal line  $y = D$ . Ex. 7, p. 564
- e. The graph of  $y = A \tan(Bx - C)$ ,  $B > 0$ , is obtained using the procedure in the box on page 574. Consecutive asymptotes  
(solve  $-\frac{\pi}{2} < Bx - C < \frac{\pi}{2}$ ; consecutive asymptotes occur at  $Bx - C = -\frac{\pi}{2}$  and  $Bx - C = \frac{\pi}{2}$ )  
and an  $x$ -intercept midway between them play a key role in the graphing process. Ex. 1, p. 574;  
Ex. 2, p. 575
- f. The graph of  $y = A \cot(Bx - C)$ ,  $B > 0$ , is obtained using the procedure in the lower box on page 576. Consecutive asymptotes (solve  $0 < Bx - C < \pi$ ; consecutive asymptotes occur at  $Bx - C = 0$  and  $Bx - C = \pi$ ) and an  $x$ -intercept midway between them play a key role in the graphing process. Ex. 3, p. 576
- g. To graph a cosecant curve, begin by graphing the corresponding sine curve. Draw vertical asymptotes through  $x$ -intercepts, using asymptotes as guides to sketch the graph. To graph a secant curve, first graph the corresponding cosine curve and use the same procedure. Ex. 4, p. 578;  
Ex. 5, p. 579

## 4.7 Inverse Trigonometric Functions

- a. On the restricted domain  $-\frac{\pi}{2} \leq x \leq \frac{\pi}{2}$ ,  $y = \sin x$  has an inverse function, defined in the box on page 586. Ex. 1, p. 587;  
Ex. 2, p. 588  
Think of  $\sin^{-1} x$  as the angle in  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$  whose sine is  $x$ . A procedure for finding exact values of  $\sin^{-1} x$  is given in the box on page 587.
- b. On the restricted domain  $0 \leq x \leq \pi$ ,  $y = \cos x$  has an inverse function, defined in the upper box on page 589. Think of  $\cos^{-1} x$  as the angle in  $[0, \pi]$  whose cosine is  $x$ . A procedure for finding exact values of  $\cos^{-1} x$  is given in the lower box on page 589. Ex. 3, p. 589
- c. On the restricted domain  $-\frac{\pi}{2} < x < \frac{\pi}{2}$ ,  $y = \tan x$  has an inverse function, defined in the box on page 590. Ex. 4, p. 591  
Think of  $\tan^{-1} x$  as the angle in  $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$  whose tangent is  $x$ . A procedure for finding exact values of  $\tan^{-1} x$  is given in the box on page 591.
- d. Graphs of the three basic inverse trigonometric functions, with a description of the domain and range of each function, are given in Table 4.10 on page 592.
- e. Inverse properties are given in the box on page 594. Points on terminal sides of angles in standard position and right triangles are used to find exact values of the composition of a function and a different inverse function. Ex. 6, p. 595;  
Ex. 7, p. 595;  
Ex. 8, p. 596;  
Ex. 9, p. 597

## 4.8 Applications of Trigonometric Functions

- a. Solving a right triangle means finding the missing lengths of its sides and the measurements of its angles. The Pythagorean Theorem, two acute angles whose sum is  $90^\circ$ , and appropriate trigonometric functions are used in this process. Ex. 1, p. 601;  
Ex. 2, p. 602;  
Ex. 3, p. 603;  
Ex. 4, p. 603
- b. The bearing from point  $O$  to point  $P$  is the acute angle between ray  $OP$  and a north-south line, shown in Figure 4.105 on page 604. Ex. 5, p. 604;  
Ex. 6, p. 605
- c. Simple harmonic motion, described in the box on page 606, is modeled by  $d = a \cos \omega t$  or  $d = a \sin \omega t$ , with amplitude =  $|a|$ , period =  $\frac{2\pi}{\omega}$ , and frequency =  $\frac{\omega}{2\pi} = \frac{1}{\text{period}}$ . Ex. 7, p. 606;  
Ex. 8, p. 607

## GREAT QUESTION!

**This was a long chapter! Where can I find the essential information I should know to achieve success as I continue studying trigonometry?**

Much of the essential information in this chapter can be found in three places:

- The Great Question! feature on page 547, showing special angles and how to obtain exact values of trigonometric functions at these angles
- **Table 4.6** on page 580, showing the graphs of the six trigonometric functions, with their domains, ranges, and periods
- **Table 4.10** on page 592, showing graphs of the three basic inverse trigonometric functions, with their domains and ranges.

Make copies of these pages and mount them on cardstock. Use this reference sheet as you work the review exercises until you have all the information on the reference sheet memorized for the chapter test.

## REVIEW EXERCISES

### 4.1

1. Find the radian measure of the central angle of a circle of radius 6 centimeters that intercepts an arc of length 27 centimeters.

In Exercises 2–4, convert each angle in degrees to radians. Express your answer as a multiple of  $\pi$ .

2.  $15^\circ$                       3.  $120^\circ$                       4.  $315^\circ$

In Exercises 5–7, convert each angle in radians to degrees.

5.  $\frac{5\pi}{3}$                       6.  $\frac{7\pi}{5}$                       7.  $-\frac{5\pi}{6}$

In Exercises 8–12, draw each angle in standard position.

8.  $\frac{5\pi}{6}$                       9.  $-\frac{2\pi}{3}$                       10.  $\frac{8\pi}{3}$

11.  $190^\circ$                       12.  $-135^\circ$

In Exercises 13–17, find a positive angle less than  $360^\circ$  or  $2\pi$  that is coterminal with the given angle.

13.  $400^\circ$                       14.  $-445^\circ$                       15.  $\frac{13\pi}{4}$

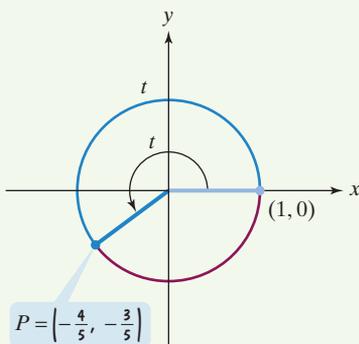

16.  $\frac{31\pi}{6}$                       17.  $-\frac{8\pi}{3}$

18. Find the length of the arc on a circle of radius 10 feet intercepted by a  $135^\circ$  central angle. Express arc length in terms of  $\pi$ . Then round your answer to two decimal places.
19. The angular speed of a propeller on a wind generator is 10.3 revolutions per minute. Express this angular speed in radians per minute.
20. The propeller of an airplane has a radius of 3 feet. The propeller is rotating at 2250 revolutions per minute. Find the linear speed, in feet per minute, of the tip of the propeller.

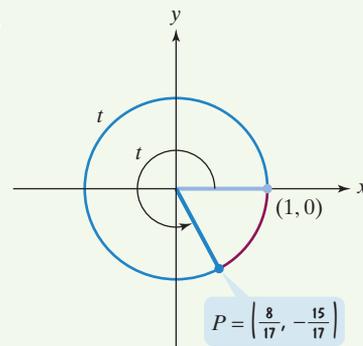

### 4.2

In Exercises 21–22, a point  $P(x, y)$  is shown on the unit circle corresponding to a real number  $t$ . Find the values of the trigonometric functions at  $t$ .

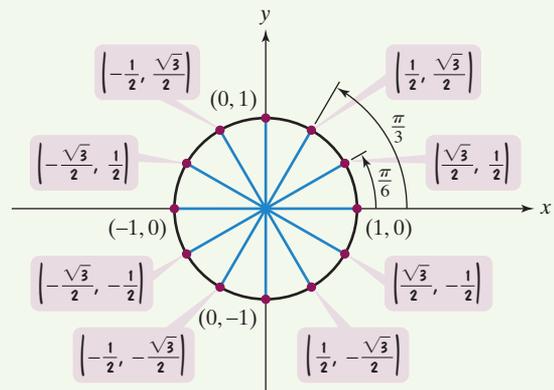

21.

22.

In Exercises 23–26, use the figure shown to find the value of each trigonometric function at the indicated real number or state that the expression is undefined.

23.  $\sec \frac{5\pi}{6}$

24.  $\tan \frac{4\pi}{3}$

25.  $\sec \frac{\pi}{2}$

26.  $\cot \pi$

27. If  $\sin t = \frac{2\sqrt{7}}{7}$ ,  $0 \leq t < \frac{\pi}{2}$ , use identities to find the remaining trigonometric functions.

In Exercises 28–30 evaluate each expression without using a calculator.

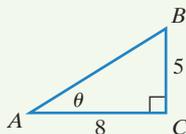

28.  $\tan 4.7 \cot 4.7$

29.  $\sin^2 \frac{\pi}{17} + \cos^2 \frac{\pi}{17}$

30.  $\tan^2 1.4 - \sec^2 1.4$

## 4.3

31. Use the triangle to find each of the six trigonometric functions of  $\theta$ .

In Exercises 32–35, find the exact value of each expression. Do not use a calculator.

32.  $\sin \frac{\pi}{6} + \tan^2 \frac{\pi}{3}$       33.  $\cos^2 \frac{\pi}{4} - \tan^2 \frac{\pi}{4}$

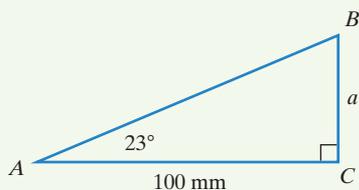

34.  $\sec^2 \frac{2\pi}{5} - \tan^2 \frac{2\pi}{5}$       35.  $\cos \frac{2\pi}{9} \sec \frac{2\pi}{9}$

In Exercises 36–37, find a cofunction with the same value as the given expression.

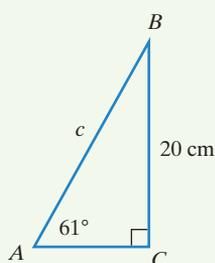

36.  $\sin 70^\circ$       37.  $\cos \frac{\pi}{2}$

In Exercises 38–40, find the measure of the side of the right triangle whose length is designated by a lowercase letter. Round answers to the nearest whole number.

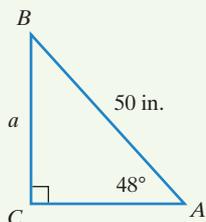

38.

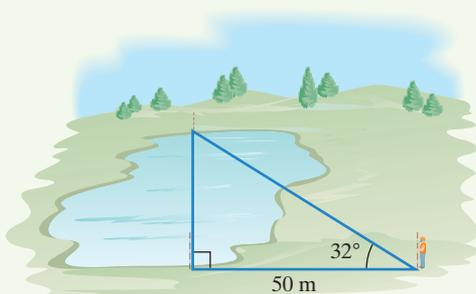

39.

40.

41. If  $\sin \theta = \frac{1}{4}$  and  $\theta$  is acute, find  $\tan\left(\frac{\pi}{2} - \theta\right)$ .
42. A hiker climbs for a half mile up a slope whose inclination is  $17^\circ$ . How many feet of altitude, to the nearest foot, does the hiker gain?
43. To find the distance across a lake, a surveyor took the measurements in the figure shown. What is the distance across the lake? Round to the nearest meter.

44. When a six-foot pole casts a four-foot shadow, what is the angle of elevation of the sun? Round to the nearest whole degree.

## 4.4

In Exercises 45–46, a point on the terminal side of angle  $\theta$  is given. Find the exact value of each of the six trigonometric functions of  $\theta$ , or state that the function is undefined.

45.  $(-1, -5)$       46.  $(0, -1)$

In Exercises 47–48, let  $\theta$  be an angle in standard position. Name the quadrant in which  $\theta$  lies.

47.  $\tan \theta > 0$  and  $\sec \theta > 0$       48.  $\tan \theta > 0$  and  $\cos \theta < 0$

In Exercises 49–51, find the exact value of each of the remaining trigonometric functions of  $\theta$ .

49.  $\cos \theta = \frac{2}{5}$ ,  $\sin \theta < 0$       50.  $\tan \theta = -\frac{1}{3}$ ,  $\sin \theta > 0$

51.  $\cot \theta = 3$ ,  $\cos \theta < 0$

In Exercises 52–56, find the reference angle for each angle.

52.  $265^\circ$       53.  $\frac{5\pi}{8}$       54.  $-410^\circ$

55.  $\frac{17\pi}{6}$       56.  $-\frac{11\pi}{3}$

In Exercises 57–67, find the exact value of each expression. Do not use a calculator.

57.  $\sin 240^\circ$       58.  $\tan 120^\circ$       59.  $\sec \frac{7\pi}{4}$

60.  $\cos \frac{11\pi}{6}$       61.  $\cot(-210^\circ)$       62.  $\csc\left(-\frac{2\pi}{3}\right)$

63.  $\sin\left(-\frac{\pi}{3}\right)$       64.  $\sin 495^\circ$       65.  $\tan \frac{13\pi}{4}$

66.  $\sin \frac{22\pi}{3}$       67.  $\cos\left(-\frac{35\pi}{6}\right)$

## 4.5

In Exercises 68–73, determine the amplitude and period of each function. Then graph one period of the function.

68.  $y = 3 \sin 4x$       69.  $y = -2 \cos 2x$

70.  $y = 2 \cos \frac{1}{2}x$       71.  $y = \frac{1}{2} \sin \frac{\pi}{3}x$

72.  $y = -\sin \pi x$       73.  $y = 3 \cos \frac{x}{3}$

In Exercises 74–78, determine the amplitude, period, and phase shift of each function. Then graph one period of the function.

74.  $y = 2 \sin(x - \pi)$       75.  $y = -3 \cos(x + \pi)$

76.  $y = \frac{3}{2} \cos\left(2x + \frac{\pi}{4}\right)$       77.  $y = \frac{5}{2} \sin\left(2x + \frac{\pi}{2}\right)$

78.  $y = -3 \sin\left(\frac{\pi}{3}x - 3\pi\right)$

In Exercises 79–80, use a vertical shift to graph one period of the function.

79.  $y = \sin 2x + 1$       80.  $y = 2 \cos \frac{1}{3}x - 2$

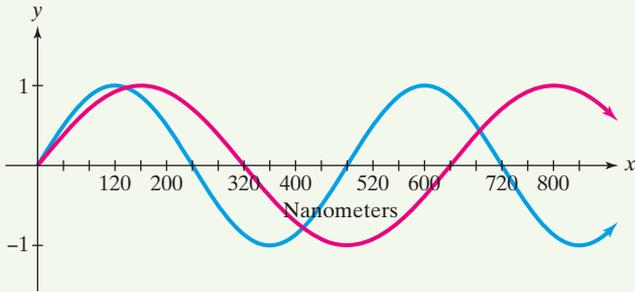

81. The function

$$y = 98.6 + 0.3 \sin\left(\frac{\pi}{12}x - \frac{11\pi}{12}\right)$$

models variation in body temperature,  $y$ , in  $^\circ\text{F}$ ,  $x$  hours after midnight.

- a. What is body temperature at midnight?
  - b. What is the period of the body temperature cycle?
  - c. When is body temperature highest? What is the body temperature at this time?
  - d. When is body temperature lowest? What is the body temperature at this time?
  - e. Graph one period of the body temperature function.
82. Light waves can be modeled by sine functions. The graphs show waves of red and blue light. Write an equation in the form  $y = A \sin Bx$  that models each of these light waves.

4.6

In Exercises 83–89, graph two full periods of the given tangent or cotangent function.

- 83.  $y = 4 \tan 2x$
- 84.  $y = -2 \tan \frac{\pi}{4} x$
- 85.  $y = \tan(x + \pi)$
- 86.  $y = -\tan\left(x - \frac{\pi}{4}\right)$
- 87.  $y = 2 \cot 3x$
- 88.  $y = -\frac{1}{2} \cot \frac{\pi}{2} x$
- 89.  $y = 2 \cot\left(x + \frac{\pi}{2}\right)$

In Exercises 90–93, graph two full periods of the given cosecant or secant function.

- 90.  $y = 3 \sec 2\pi x$
- 91.  $y = -2 \csc \pi x$
- 92.  $y = 3 \sec(x + \pi)$
- 93.  $y = \frac{5}{2} \csc(x - \pi)$

4.7

In Exercises 94–112, find the exact value of each expression. Do not use a calculator.

- 94.  $\sin^{-1} 1$
- 95.  $\cos^{-1} 1$
- 96.  $\tan^{-1} 1$
- 97.  $\sin^{-1}\left(-\frac{\sqrt{3}}{2}\right)$
- 98.  $\cos^{-1}\left(-\frac{1}{2}\right)$
- 99.  $\tan^{-1}\left(-\frac{\sqrt{3}}{3}\right)$
- 100.  $\cos\left(\sin^{-1} \frac{\sqrt{2}}{2}\right)$
- 101.  $\sin(\cos^{-1} 0)$
- 102.  $\tan\left[\sin^{-1}\left(-\frac{1}{2}\right)\right]$
- 103.  $\tan\left[\cos^{-1}\left(-\frac{\sqrt{3}}{2}\right)\right]$
- 104.  $\csc\left(\tan^{-1} \frac{\sqrt{3}}{3}\right)$
- 105.  $\cos\left(\tan^{-1} \frac{3}{4}\right)$

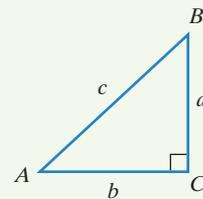

- 106.  $\sin\left(\cos^{-1} \frac{3}{5}\right)$
- 107.  $\tan\left[\sin^{-1}\left(-\frac{3}{5}\right)\right]$
- 108.  $\tan\left[\cos^{-1}\left(-\frac{4}{5}\right)\right]$
- 109.  $\sin\left[\tan^{-1}\left(-\frac{1}{3}\right)\right]$
- 110.  $\sin^{-1}\left(\sin \frac{\pi}{3}\right)$
- 111.  $\sin^{-1}\left(\sin \frac{2\pi}{3}\right)$
- 112.  $\sin^{-1}\left(\cos \frac{2\pi}{3}\right)$

In Exercises 113–114, use a right triangle to write each expression as an algebraic expression. Assume that  $x$  is positive and that the given inverse trigonometric function is defined for the expression in  $x$ .

- 113.  $\cos\left(\tan^{-1} \frac{x}{2}\right)$
- 114.  $\sec\left(\sin^{-1} \frac{1}{x}\right)$

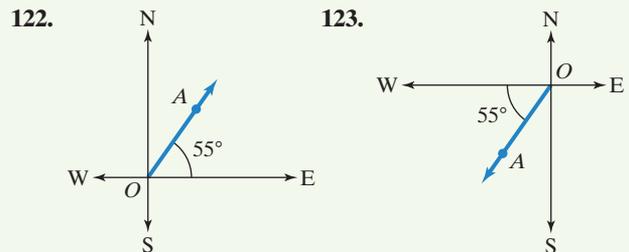

4.8

In Exercises 115–118, solve the right triangle shown in the figure. Round lengths to two decimal places and express angles to the nearest tenth of a degree.

- 115.  $A = 22.3^\circ, c = 10$
- 116.  $B = 37.4^\circ, b = 6$
- 117.  $a = 2, c = 7$
- 118.  $a = 1.4, b = 3.6$
- 119. From a point on level ground 80 feet from the base of a building, the angle of elevation is  $25.6^\circ$ . Approximate the height of the building to the nearest foot.
- 120. Two buildings with flat roofs are 60 yards apart. The height of the shorter building is 40 yards. From its roof, the angle of elevation to the edge of the roof of the taller building is  $40^\circ$ . Find the height of the taller building to the nearest yard.
- 121. You want to measure the height of an antenna on the top of a 125-foot building. From a point in front of the building, you measure the angle of elevation to the top of the building to be  $68^\circ$  and the angle of elevation to the top of the antenna to be  $71^\circ$ . How tall is the antenna, to the nearest tenth of a foot?

In Exercises 122–123, use the figures shown to find the bearing from  $O$  to  $A$ .

- 124. A ship is due west of a lighthouse. A second ship is 12 miles south of the first ship. The bearing from the second ship to the lighthouse is  $N 64^\circ E$ . How far, to the nearest tenth of a mile, is the first ship from the lighthouse?

125. From city A to city B, a plane flies 850 miles at a bearing of N 58° E. From city B to city C, the plane flies 960 miles at a bearing of S 32° E.
- Find, to the nearest tenth of a mile, the distance from city A to city C.
  - What is the bearing from city A to city C?

In Exercises 126–127, an object moves in simple harmonic motion described by the given equation, where  $t$  is measured in seconds and  $d$  in centimeters. In each exercise, find:

- the maximum displacement
- the frequency
- the time required for one cycle.

126.  $d = 20 \cos \frac{\pi}{4}t$       127.  $d = \frac{1}{2} \sin 4t$

In Exercises 128–129, an object is attached to a coiled spring. In Exercise 128, the object is pulled down (negative direction from the rest position) and then released. In Exercise 129, the object is propelled downward from its rest position. Write an equation for the distance of the object from its rest position after  $t$  seconds.

Distance from Rest Position at $t = 0$	Amplitude	Period
128. 30 inches	30 inches	2 seconds
129. 0 inches	$\frac{1}{4}$ inch	5 seconds

## CHAPTER 4 TEST

- Convert  $135^\circ$  to an exact radian measure.
- Find the length of the arc on a circle of radius 20 feet intercepted by a  $75^\circ$  central angle. Express arc length in terms of  $\pi$ . Then round your answer to two decimal places.
- Find a positive angle less than  $2\pi$  that is coterminal with  $\frac{16\pi}{3}$ .
  - Find the reference angle for  $\frac{16\pi}{3}$ .
- If  $(-2, 5)$  is a point on the terminal side of angle  $\theta$ , find the exact value of each of the six trigonometric functions of  $\theta$ .
- Determine the quadrant in which  $\theta$  lies if  $\cos \theta < 0$  and  $\cot \theta > 0$ .
- If  $\cos \theta = \frac{1}{3}$  and  $\tan \theta < 0$ , find the exact value of each of the remaining trigonometric functions of  $\theta$ .

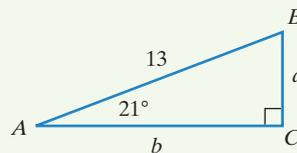

In Exercises 7–12, find the exact value of each expression. Do not use a calculator.

- $\tan \frac{\pi}{6} \cos \frac{\pi}{3} - \cos \frac{\pi}{2}$
- $\tan 300^\circ$
- $\sin \frac{7\pi}{4}$
- $\sec \frac{22\pi}{3}$
- $\cot\left(-\frac{8\pi}{3}\right)$
- $\tan\left(\frac{7\pi}{3} + n\pi\right)$ ,  $n$  is an integer.
- If  $\sin \theta = a$  and  $\cos \theta = b$ , represent each of the following in terms of  $a$  and  $b$ .
  - $\sin(-\theta) + \cos(-\theta)$
  - $\tan \theta - \sec \theta$

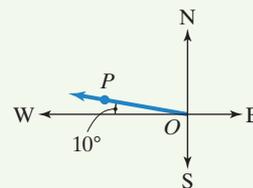

In Exercises 14–17, graph one period of each function.

- $y = 3 \sin 2x$
- $y = -2 \cos\left(x - \frac{\pi}{2}\right)$
- $y = 2 \tan \frac{x}{2}$
- $y = -\frac{1}{2} \csc \pi x$

- Find the exact value of  $\tan\left[\cos^{-1}\left(-\frac{1}{2}\right)\right]$ .
- Write  $\sin\left(\cos^{-1}\frac{x}{3}\right)$  as an algebraic expression. Assume that  $x > 0$  and  $\frac{x}{3}$  is in the domain of the inverse cosine function.
- Solve the right triangle in the figure shown. Round lengths to one decimal place.

- The angle of elevation to the top of a building from a point on the ground 30 yards from its base is  $37^\circ$ . Find the height of the building to the nearest yard.
- A 73-foot rope from the top of a circus tent pole is anchored to the flat ground 43 feet from the bottom of the pole. Find the angle, to the nearest tenth of a degree, that the rope makes with the pole.
- Use the figure to find the bearing from  $O$  to  $P$ .

- An object moves in simple harmonic motion described by  $d = -6 \cos \pi t$ , where  $t$  is measured in seconds and  $d$  in inches. Find **a.** the maximum displacement, **b.** the frequency, and **c.** the time required for one oscillation.
- Why are trigonometric functions ideally suited to model phenomena that repeat in cycles?

## CUMULATIVE REVIEW EXERCISES (CHAPTERS P–4)

Solve each equation or inequality in Exercises 1–6.

1.  $x^2 = 18 + 3x$
2.  $x^3 + 5x^2 - 4x - 20 = 0$
3.  $\log_2 x + \log_2(x - 2) = 3$
4.  $\sqrt{x - 3} + 5 = x$
5.  $x^3 - 4x^2 + x + 6 = 0$
6.  $|2x - 5| \leq 11$
7. If  $f(x) = \sqrt{x - 6}$ , find  $f^{-1}(x)$ .
8. Divide  $20x^3 - 6x^2 - 9x + 10$  by  $5x + 2$ .
9. Write as a single logarithm and evaluate:  $\log 25 + \log 40$ .
10. Convert  $\frac{14\pi}{9}$  radians to degrees.
11. Find the maximum number of positive and negative real roots of the equation  $3x^4 - 2x^3 + 5x^2 + x - 9 = 0$ .

In Exercises 12–16, graph each equation.

12.  $f(x) = \frac{x}{x^2 - 1}$
13.  $(x - 2)^2 + y^2 = 1$
14.  $y = (x - 1)(x + 2)^2$
15.  $y = \sin\left(2x + \frac{\pi}{2}\right)$ , from 0 to  $2\pi$
16.  $y = 2 \tan 3x$ ; Graph two complete cycles.
17. You invest in a new play. The cost includes an overhead of \$30,000, plus production costs of \$2500 per performance. A sold-out performance brings you \$3125. How many sold-out performances must be played in order for you to break even?
18. Use the exponential growth model  $A = A_0e^{kt}$  to solve this exercise. In 2000, there were 110 million cellphone subscribers in the United States. By 2010, there were 303 million subscribers. (Source: CTIA)
  - a. Find the exponential function that models the data.
  - b. According to the model, in which year were there 400 million cellphone subscribers in the United States?
19. The rate of heat lost through insulation varies inversely as the thickness of the insulation. The rate of heat lost through a 3.5-inch thickness of insulation is 2200 Btu per hour. What is the rate of heat lost through a 5-inch thickness of the same insulation?
20. A tower is 200 feet tall. To the nearest degree, find the angle of elevation from a point 50 feet from the base of the tower to the top of the tower.

*This page intentionally left blank*

# ANALYTIC TRIGONOMETRY

## CHAPTER

# 5

*You enjoy watching your friend* participate in the shot put at college track and field events. After a few full turns in a circle, she throws (“puts”) an 8-pound, 13-ounce shot from the shoulder. The range of her throwing distance continues to improve. Knowing that you are studying trigonometry, she asks if there is some way that a trigonometric expression might help achieve her best possible distance in the event.

### HERE’S WHERE YOU’LL FIND THESE APPLICATIONS:

This problem appears as Exercise 79 in Exercise Set 5.3. In the solution, you will obtain critical information about athletic performance using a trigonometric identity. In this chapter, we derive important categories of identities involving trigonometric functions. You will learn how to use these identities to better understand your periodic world.

## SECTION 5.1

## Verifying Trigonometric Identities

*Objective*

- 1 Use the fundamental trigonometric identities to verify identities.

Do you enjoy solving puzzles? The process is a natural way to develop problem-solving skills that are important in every area of our lives. Engaging in problem solving for sheer pleasure releases chemicals in the brain that enhance our feeling of well-being. Perhaps this is why puzzles have fascinated people for over 12,000 years.

Thousands of relationships exist among the six trigonometric functions. Verifying these relationships is like solving a puzzle. Why? There are no rigid rules for the process. Thus, proving a trigonometric relationship requires you to be creative in your approach to problem solving. By learning to establish these relationships, you will become a better, more confident

problem solver. Furthermore, you may enjoy the feeling of satisfaction that accompanies solving each “puzzle.”

**The Fundamental Identities**

In Chapter 4, we used the unit circle to establish relationships among the trigonometric functions. The fundamental identities listed in the following box are true for all values of  $x$  for which the expressions are defined.

**GREAT QUESTION!**

**Do I have to memorize the identities in the box?**

Yes. You may need to use variations of these fundamental identities. For example, instead of

$$\sin^2 x + \cos^2 x = 1$$

you might want to use

$$\sin^2 x = 1 - \cos^2 x$$

or

$$\cos^2 x = 1 - \sin^2 x.$$

Therefore, it is important to know each relationship well so that mental algebraic manipulation is possible.

**Fundamental Trigonometric Identities****Reciprocal Identities**

$$\begin{aligned} \sin x &= \frac{1}{\csc x} & \cos x &= \frac{1}{\sec x} & \tan x &= \frac{1}{\cot x} \\ \csc x &= \frac{1}{\sin x} & \sec x &= \frac{1}{\cos x} & \cot x &= \frac{1}{\tan x} \end{aligned}$$

**Quotient Identities**

$$\tan x = \frac{\sin x}{\cos x} \quad \cot x = \frac{\cos x}{\sin x}$$

**Pythagorean Identities**

$$\sin^2 x + \cos^2 x = 1 \quad 1 + \tan^2 x = \sec^2 x \quad 1 + \cot^2 x = \csc^2 x$$

**Even-Odd Identities**

$$\begin{aligned} \sin(-x) &= -\sin x & \cos(-x) &= \cos x & \tan(-x) &= -\tan x \\ \csc(-x) &= -\csc x & \sec(-x) &= \sec x & \cot(-x) &= -\cot x \end{aligned}$$

- 1 Use the fundamental trigonometric identities to verify identities.

**Using Fundamental Identities to Verify Other Identities**

The fundamental trigonometric identities are used to establish other relationships among trigonometric functions. To **verify an identity**, we show that one side of the identity can be simplified so that it is identical to the other side. Each side of the equation is manipulated independently of the other side of the equation. Start with the side containing the more complicated expression. If you substitute one or more

fundamental identities on the more complicated side, you will often be able to rewrite it in a form identical to that of the other side.

No one method or technique can be used to verify every identity. Some identities can be verified by rewriting the more complicated side so that it contains only sines and cosines.

### EXAMPLE 1 Changing to Sines and Cosines to Verify an Identity

Verify the identity:  $\sec x \cot x = \csc x$ .

#### SOLUTION

The left side of the equation contains the more complicated expression. Thus, we work with the left side. Let us express this side of the identity in terms of sines and cosines. Perhaps this strategy will enable us to transform the left side into  $\csc x$ , the expression on the right.

$$\begin{aligned} \sec x \cot x &= \frac{1}{\cos x} \cdot \frac{\cos x}{\sin x} && \text{Apply a reciprocal identity: } \sec x = \frac{1}{\cos x} \text{ and a} \\ &&& \text{quotient identity: } \cot x = \frac{\cos x}{\sin x}. \\ &= \frac{1}{\cancel{\cos x}} \cdot \frac{\cancel{\cos x}}{\sin x} && \text{Divide both the numerator and the denominator by} \\ &&& \text{csc } x, \text{ the common factor.} \\ &= \frac{1}{\sin x} && \text{Multiply the remaining factors in the numerator and} \\ &&& \text{denominator.} \\ &= \csc x && \text{Apply a reciprocal identity: } \csc x = \frac{1}{\sin x}. \end{aligned}$$

By working with the left side and simplifying it so that it is identical to the right side, we have verified the given identity. ●●●

## TECHNOLOGY

### Numeric and Graphic Connections

You can use a graphing utility to provide evidence of an identity. Enter each side of the identity separately under  $y_1$  and  $y_2$ . Then use the **TABLE** feature or the graphs. The table should show that the function values are the same except for those values of  $x$  for which  $y_1$ ,  $y_2$ , or both, are undefined. The graphs should appear to be identical.

Let's check the identity in Example 1:

$$\sec x \cot x = \csc x.$$

$y_1 = \sec x \cot x$   
Enter  $\sec x$  as  $\frac{1}{\cos x}$   
and  $\cot x$  as  $\frac{1}{\tan x}$ .

$y_2 = \csc x$   
Enter  $\csc x$  as  $\frac{1}{\sin x}$ .

#### Numeric Check

Display a table for  $y_1$  and  $y_2$ . We started our table at  $-\pi$  and used  $\Delta Tbl = \frac{\pi}{8}$ .

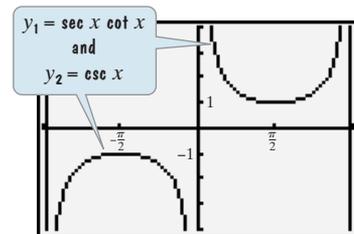

$x$	$y_1 = \sec x \cot x$	$y_2 = \csc x$
ERROR	ERROR	ERROR
-2.749	-2.613	-2.613
-2.356	-1.414	-1.414
-1.963	-1.082	-1.082
-1.571	ERROR	-1
-1.178	-1.082	-1.082
-0.7854	-1.414	-1.414

$x = -3.14159265359$

Function values are the same except for values of  $x$  for which  $y_1$ ,  $y_2$ , or both, are undefined.

#### Graphic Check

Display graphs for  $y_1$  and  $y_2$ .

$[-\pi, \pi, \frac{\pi}{2}]$  by  $[-4, 4, 1]$

The graphs appear to be identical.

 **Check Point 1** Verify the identity:  $\csc x \tan x = \sec x$ .

In verifying an identity, stay focused on your goal. When manipulating one side of the equation, continue to look at the other side to keep the desired form of the result in mind.

## GREAT QUESTION!

### What's the difference between solving a conditional equation and verifying that an equation is an identity?

You solve equations by working with both sides at once, adding, subtracting, multiplying, or dividing the sides by the same expression. You verify an identity by manipulating each side independently of the other side. Because you are familiar with solving conditional equations, it may feel strange to verify identities by working separately with the sides of the equation.

Here is an algebraic example that illustrates the difference between solving an equation and verifying an identity:

Solving an Equation	Verifying an Identity
Solve:	Verify:
$5(3x + 2) - 4 = -24$	$5(3x + 2) - 4 = 15x + 6$
$15x + 10 - 4 = -24$ <i>Use the distributive property. Continue working with both sides.</i>	Work with the left side of the equation.
$15x + 6 = -24$ <i>Simplify.</i>	$5(3x + 2) - 4 = 15x + 10 - 4$ <i>Use the distributive property.</i>
$15x = -30$ <i>Subtract 6 from both sides.</i>	$= 15x + 6$ <i>Simplify.</i>
$x = -2$ <i>Divide both sides by 15.</i>	By working with the left side and simplifying it so that it is identical to the right side, we have verified the identity.
The solution set is $\{-2\}$ .	

Why can't you verify an identity by such methods as adding the same expression to each side and obtaining a true statement? If you do this, you have already assumed that the given statement is true. You do not know that it is true until after you have verified it.

## EXAMPLE 2 Changing to Sines and Cosines to Verify an Identity

Verify the identity:  $\sin x \tan x + \cos x = \sec x$ .

### SOLUTION

The left side is more complicated, so we start with it. Notice that the left side contains the sum of two terms, but the right side contains only one term. This means that somewhere during the verification process, the two terms on the left side must be added to form one term.

Let's begin by expressing the left side of the identity so that it contains only sines and cosines. Thus, we apply a quotient identity and replace  $\tan x$  by  $\frac{\sin x}{\cos x}$ .

Perhaps this strategy will enable us to transform the left side into  $\sec x$ , the expression on the right.

$$\begin{aligned} \sin x \tan x + \cos x &= \sin x \left( \frac{\sin x}{\cos x} \right) + \cos x && \text{Apply a quotient identity: } \tan x = \frac{\sin x}{\cos x}. \\ &= \frac{\sin^2 x}{\cos x} + \cos x && \text{Multiply.} \\ &= \frac{\sin^2 x}{\cos x} + \cos x \cdot \frac{\cos x}{\cos x} && \text{The least common denominator is } \cos x. \\ &= \frac{\sin^2 x}{\cos x} + \frac{\cos^2 x}{\cos x} && \text{Write the second expression with a denominator of } \cos x. \\ &= \frac{\sin^2 x + \cos^2 x}{\cos x} && \text{Multiply.} \end{aligned}$$

## GREAT QUESTION!

### When proving identities, do I have to write the variable associated with each trigonometric function?

Yes. Do not get lazy and write

$$\sin \tan + \cos$$

for

$$\sin x \tan x + \cos x$$

because  $\sin$ ,  $\tan$ , and  $\cos$  are meaningless without specified variables.

$$\begin{aligned}
 &= \frac{\sin^2 x + \cos^2 x}{\cos x} && \text{Add numerators and place this sum} \\
 & && \text{over the least common denominator.} \\
 &= \frac{1}{\cos x} && \text{Apply a Pythagorean identity:} \\
 & && \sin^2 x + \cos^2 x = 1. \\
 &= \sec x && \text{Apply a reciprocal identity: } \sec x = \frac{1}{\cos x}.
 \end{aligned}$$

By working with the left side and arriving at the right side, the identity is verified. ●●●

**Check Point 2** Verify the identity:  $\cos x \cot x + \sin x = \csc x$ .

Some identities are verified using factoring to simplify a trigonometric expression.

### EXAMPLE 3 Using Factoring to Verify an Identity

Verify the identity:  $\cos x - \cos x \sin^2 x = \cos^3 x$ .

#### SOLUTION

We start with the more complicated side, the left side. Factor out the greatest common factor,  $\cos x$ , from each of the two terms.

$$\begin{aligned}
 \cos x - \cos x \sin^2 x &= \cos x(1 - \sin^2 x) && \text{Factor } \cos x \text{ from the two terms.} \\
 &= \cos x \cdot \cos^2 x && \text{Use a variation of } \sin^2 x + \cos^2 x = 1. \\
 & && \text{Solving for } \cos^2 x, \text{ we obtain} \\
 & && \cos^2 x = 1 - \sin^2 x. \\
 &= \cos^3 x && \text{Multiply.}
 \end{aligned}$$

We worked with the left side and arrived at the right side. Thus, the identity is verified. ●●●

**Check Point 3** Verify the identity:  $\sin x - \sin x \cos^2 x = \sin^3 x$ .

There is often more than one technique that can be used to verify an identity.

### EXAMPLE 4 Using Two Techniques to Verify an Identity

Verify the identity:  $\frac{1 + \sin \theta}{\cos \theta} = \sec \theta + \tan \theta$ .

#### SOLUTION

**Method 1. Separating a Single-Term Quotient into Two Terms** Let's separate the quotient on the left side into two terms using

$$\frac{a + b}{c} = \frac{a}{c} + \frac{b}{c}.$$

Perhaps this strategy will enable us to transform the left side into  $\sec \theta + \tan \theta$ , the sum on the right.

$$\begin{aligned}
 \frac{1 + \sin \theta}{\cos \theta} &= \frac{1}{\cos \theta} + \frac{\sin \theta}{\cos \theta} && \text{Divide each term in the numerator by } \cos \theta. \\
 &= \sec \theta + \tan \theta && \text{Apply a reciprocal identity and a quotient identity:} \\
 & && \sec \theta = \frac{1}{\cos \theta} \text{ and } \tan \theta = \frac{\sin \theta}{\cos \theta}.
 \end{aligned}$$

We worked with the left side and arrived at the right side. Thus, the identity is verified.

**Method 2. Changing to Sines and Cosines** We need to verify the identity  $\frac{1 + \sin \theta}{\cos \theta} = \sec \theta + \tan \theta$ . Let's work with the right side and express it so that it contains only sines and cosines.

$$\begin{aligned} \sec \theta + \tan \theta &= \frac{1}{\cos \theta} + \frac{\sin \theta}{\cos \theta} && \text{Apply a reciprocal identity and a quotient identity:} \\ & && \sec \theta = \frac{1}{\cos \theta} \text{ and } \tan \theta = \frac{\sin \theta}{\cos \theta}. \\ &= \frac{1 + \sin \theta}{\cos \theta} && \text{Add numerators. Put this sum over the common denominator.} \end{aligned}$$

We worked with the right side and arrived at the left side. Thus, the identity is verified. ●●●

 **Check Point 4** Verify the identity:  $\frac{1 + \cos \theta}{\sin \theta} = \csc \theta + \cot \theta$ .

How do we verify identities in which sums or differences of fractions with trigonometric functions appear on one side? Use the least common denominator and combine the fractions. This technique is especially useful when the other side of the identity contains only one term.

### EXAMPLE 5 Combining Fractional Expressions to Verify an Identity

Verify the identity:  $\frac{\cos x}{1 + \sin x} + \frac{1 + \sin x}{\cos x} = 2 \sec x$ .

#### SOLUTION

We start with the more complicated side, the left side. The least common denominator of the fractions is  $(1 + \sin x)(\cos x)$ . We express each fraction in terms of this least common denominator by multiplying the numerator and denominator by the extra factor needed to form  $(1 + \sin x)(\cos x)$ .

$$\begin{aligned} \frac{\cos x}{1 + \sin x} + \frac{1 + \sin x}{\cos x} &&& \text{The least common denominator is } (1 + \sin x)(\cos x). \\ &= \frac{\cos x(\cos x)}{(1 + \sin x)(\cos x)} + \frac{(1 + \sin x)(1 + \sin x)}{(1 + \sin x)(\cos x)} && \text{Rewrite each fraction with the least common denominator.} \\ &= \frac{\cos^2 x}{(1 + \sin x)(\cos x)} + \frac{1 + 2 \sin x + \sin^2 x}{(1 + \sin x)(\cos x)} && \text{Use the FOIL method to multiply } (1 + \sin x)(1 + \sin x). \\ &= \frac{\cos^2 x + 1 + 2 \sin x + \sin^2 x}{(1 + \sin x)(\cos x)} && \text{Add numerators. Put this sum over the least common denominator.} \\ &= \frac{(\sin^2 x + \cos^2 x) + 1 + 2 \sin x}{(1 + \sin x)(\cos x)} && \text{Regroup terms to apply a Pythagorean identity.} \\ &= \frac{1 + 1 + 2 \sin x}{(1 + \sin x)(\cos x)} && \text{Apply a Pythagorean identity: } \sin^2 x + \cos^2 x = 1. \\ &= \frac{2 + 2 \sin x}{(1 + \sin x)(\cos x)} && \text{Add constant terms in the numerator: } 1 + 1 = 2. \\ &= \frac{2(1 + \sin x)}{(1 + \sin x)(\cos x)} && \text{Factor and simplify.} \\ &= \frac{2}{\cos x} \\ &= 2 \sec x && \text{Apply a reciprocal identity: } \sec x = \frac{1}{\cos x}. \end{aligned}$$

We worked with the left side and arrived at the right side. Thus, the identity is verified. ●●●

### GREAT QUESTION!

**In Example 5, the left side contains the sum of two fractional expressions. You found a common denominator and combined them into one fraction. What should I do if I'm having problems with the fractions?**

Some students have difficulty verifying identities due to problems working with fractions. If this applies to you, review the section on rational expressions in Chapter P.

 **Check Point 5** Verify the identity:  $\frac{\sin x}{1 + \cos x} + \frac{1 + \cos x}{\sin x} = 2 \csc x$ .

Some identities are verified using a technique that may remind you of rationalizing a denominator.

**EXAMPLE 6** Multiplying the Numerator and Denominator by the Same Factor to Verify an Identity

Verify the identity:  $\frac{\sin x}{1 + \cos x} = \frac{1 - \cos x}{\sin x}$ .

**SOLUTION**

The suggestions given in the previous examples do not apply here. Everything is already expressed in terms of sines and cosines. Furthermore, there are no fractions to combine and neither side looks more complicated than the other. Let's solve the puzzle by working with the left side and making it look like the expression on the right. The expression on the right contains  $1 - \cos x$  in the numerator. This suggests multiplying the numerator and denominator of the left side by  $1 - \cos x$ . By doing this, we obtain a factor of  $1 - \cos x$  in the numerator, as in the numerator on the right.

**DISCOVERY**

Verify the identity in Example 6 by making the right side look like the left side. Start with the expression on the right. Multiply the numerator and denominator by  $1 + \cos x$ .

$$\frac{\sin x}{1 + \cos x} = \frac{\sin x}{1 + \cos x} \cdot \frac{1 - \cos x}{1 - \cos x} \quad \text{Multiply numerator and denominator by } 1 - \cos x.$$

$$= \frac{\sin x(1 - \cos x)}{1 - \cos^2 x} \quad \text{Multiply. Use } (A + B)(A - B) = A^2 - B^2, \text{ with } A = 1 \text{ and } B = \cos x, \text{ to multiply denominators.}$$

$$= \frac{\sin x(1 - \cos x)}{\sin^2 x} \quad \text{Use a variation of } \sin^2 x + \cos^2 x = 1. \text{ Solving for } \sin^2 x, \text{ we obtain } \sin^2 x = 1 - \cos^2 x.$$

$$= \frac{1 - \cos x}{\sin x} \quad \text{Simplify: } \frac{\sin x}{\sin^2 x} = \frac{\cancel{\sin x}}{\cancel{\sin x} \cdot \sin x} = \frac{1}{\sin x}.$$

We worked with the left side and arrived at the right side. Thus, the identity is verified. ...

**DISCOVERY**

Try simplifying

$$\frac{\frac{\sin x}{\cos x} + \sin x}{1 + \cos x}$$

by multiplying the two terms in the numerator and the two terms in the denominator by  $\cos x$ . This method for simplifying the complex fraction involves multiplying the numerator and the denominator by the least common denominator of all fractions in the expression. Do you prefer this simplification procedure over the method used on the right?
